Welcome to the *Amazon Simple Storage Service API Reference*. This guide explains the Amazon Simple Storage Service (Amazon S3) application programming interface (API). It describes various API operations, related request and response structures, and error codes. The current version of the Amazon S3 API is 2006-03-01.

Amazon S3 supports the REST API.

**Note**

Support for SOAP over HTTP is deprecated, but it is still available over HTTPS. However, new Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

Read the following about authentication and access control before going to specific API topics.

Requests to Amazon S3 can be authenticated or anonymous. Authenticated access requires credentials that AWS can use to authenticate your requests. When making REST API calls directly from your code, you create a signature using valid credentials and include the signature in your request. For information about various authentication methods and signature calculations, see [Authenticating Requests (AWS Signature Version 4)](p. 1004).

Making REST API calls directly from your code can be cumbersome. It requires you to write the necessary code to calculate a valid signature to authenticate your requests. We recommend the following alternatives instead:

- Use the AWS SDKs to send your requests (see [Sample Code and Libraries](Sample Code and Libraries)). With this option, you don't need to write code to calculate a signature for request authentication because the SDK clients authenticate your requests by using access keys that you provide. Unless you have a good reason not to, you should always use the AWS SDKs.
- Use the AWS CLI to make Amazon S3 API calls. For information about setting up the AWS CLI and example Amazon S3 commands see the following topics:
  - [Set Up the AWS CLI](Set Up the AWS CLI) in the *Amazon Simple Storage Service User Guide*.
  - [Using Amazon S3 with the AWS Command Line Interface](Using Amazon S3 with the AWS Command Line Interface) in the *AWS Command Line Interface User Guide*.

If you'd like to make your own REST API calls instead of using one of the above alternatives, there are some things to keep in mind. The REST API uses standard HTTP headers and status codes, so standard browsers and toolkits work as expected. In some areas, we have added functionality to HTTP (for example, we added headers to support access control). In these cases, we have done our best to add the new functionality in a way that matches the style of standard HTTP usage. For more information about making requests, see [Making requests](Making requests) in the *Amazon Simple Storage Service User Guide*. For additional details about developing using REST APIs, see [Developing with Amazon S3 using the REST API](Developing with Amazon S3 using the REST API) in the *Amazon Simple Storage Service User Guide*.

You can have valid credentials to authenticate your requests, but unless you have permissions you cannot create or access Amazon S3 resources. For example, you must have permissions to create an S3 bucket or get an object from your bucket. If you use the root user credentials of your AWS account, you have all the permissions. However, using root user credentials is not recommended. Instead, we recommend that...
you create IAM roles in your account and manage user permissions. For more information, see [Managing Access Permissions to Your Amazon S3 Resources](https://docs.aws.amazon.com/AmazonS3/latest/userguide) in the *Amazon Simple Storage Service User Guide*. 
Amazon S3 API Reference

This section contains the Amazon S3 API Reference documentation. The Amazon S3 APIs are grouped into three sets: Amazon Simple Storage Service, AWS S3 Control, and Amazon S3 on Outposts. There is no functional distinction between the three sets.

In general, APIs that apply bucket- and object-level actions are in the Amazon Simple Storage Service set, and APIs that apply account-level actions are in the AWS S3 Control set. With Amazon S3 on Outposts, you can create S3 buckets on AWS Outposts and easily store and retrieve objects on premises. You communicate with your Outposts bucket using an access point and endpoint connection over a virtual private cloud (VPC). If you don't find an API that you're looking for in one set, check one of the other sets.

Actions

The following actions are supported by Amazon S3:

- AbortMultipartUpload (p. 10)
- CompleteMultipartUpload (p. 13)
- CopyObject (p. 21)
- CreateBucket (p. 34)
- CreateMultipartUpload (p. 40)
- DeleteBucket (p. 50)
- DeleteBucketAnalyticsConfiguration (p. 52)
- DeleteBucketCors (p. 54)
- DeleteBucketEncryption (p. 56)
- DeleteBucketIntelligentTieringConfiguration (p. 58)
- DeleteBucketInventoryConfiguration (p. 60)
- DeleteBucketLifecycle (p. 62)
- DeleteBucketMetricsConfiguration (p. 64)
- DeleteBucketOwnershipControls (p. 66)
- DeleteBucketPolicy (p. 68)
- DeleteBucketReplication (p. 70)
- DeleteBucketTagging (p. 72)
- DeleteBucketWebsite (p. 74)
- DeleteObject (p. 76)
- DeleteObjects (p. 81)
- DeleteObjectTagging (p. 89)
- DeletePublicAccessBlock (p. 92)
- GetBucketAccelerateConfiguration (p. 94)
- GetBucketAcl (p. 97)
- GetBucketAnalyticsConfiguration (p. 100)
- GetBucketCors (p. 104)
- GetBucketEncryption (p. 108)
- GetBucketIntelligentTieringConfiguration (p. 111)
• **GetBucketInventoryConfiguration** (p. 114)
  • **GetBucketLifecycle** (p. 118)
  • **GetBucketLifecycleConfiguration** (p. 121)
  • **GetBucketLocation** (p. 125)
  • **GetBucketLogging** (p. 128)
  • **GetBucketMetricsConfiguration** (p. 131)
  • **GetBucketNotification** (p. 135)
  • **GetBucketNotificationConfiguration** (p. 137)
  • **GetBucketOwnershipControls** (p. 141)
  • **GetBucketPolicy** (p. 144)
  • **GetBucketPolicyStatus** (p. 147)
  • **GetBucketReplication** (p. 150)
  • **GetBucketRequestPayment** (p. 154)
  • **GetBucketTagging** (p. 156)
  • **GetBucketVersioning** (p. 159)
  • **GetBucketWebsite** (p. 162)
  • **GetObject** (p. 165)
  • **GetObjectAcl** (p. 178)
  • **GetObjectAttributes** (p. 183)
  • **GetObjectLegalHold** (p. 188)
  • **GetObjectLockConfiguration** (p. 190)
  • **GetObjectRetention** (p. 192)
  • **GetObjectTagging** (p. 194)
  • **GetObjectTorrent** (p. 197)
  • **GetPublicAccessBlock** (p. 200)
  • **HeadBucket** (p. 203)
  • **HeadObject** (p. 206)
  • **ListBucketAnalyticsConfigurations** (p. 217)
  • **ListBucketIntelligentTieringConfigurations** (p. 221)
  • **ListBucketInventoryConfigurations** (p. 224)
  • **ListBucketMetricsConfigurations** (p. 229)
  • **ListBuckets** (p. 233)
  • **ListMultipartUploads** (p. 235)
  • **ListObjects** (p. 244)
  • **ListObjectsV2** (p. 252)
  • **ListObjectVersions** (p. 262)
  • **ListParts** (p. 274)
  • **PutBucketAccelerateConfiguration** (p. 280)
  • **PutBucketAcl** (p. 283)
  • **PutBucketAnalyticsConfiguration** (p. 290)
  • **PutBucketCors** (p. 294)
  • **PutBucketEncryption** (p. 298)
  • **PutBucketIntelligentTieringConfiguration** (p. 302)
  • **PutBucketInventoryConfiguration** (p. 305)
  • **PutBucketLifecycle** (p. 310)
  • **PutBucketLifecycleConfiguration** (p. 316)
• **PutBucketLogging** (p. 322)
• **PutBucketMetricsConfiguration** (p. 326)
• **PutBucketNotification** (p. 331)
• **PutBucketNotificationConfiguration** (p. 334)
• **PutBucketOwnershipControls** (p. 340)
• **PutBucketPolicy** (p. 344)
• **PutBucketReplication** (p. 347)
• **PutBucketRequestPayment** (p. 353)
• **PutBucketTagging** (p. 356)
• **PutBucketVersioning** (p. 359)
• **PutBucketWebsite** (p. 364)
• **PutObject** (p. 371)
• **PutObjectAcl** (p. 384)
• **PutObjectLegalHold** (p. 392)
• **PutObjectLockConfiguration** (p. 395)
• **PutObjectRetention** (p. 398)
• **PutObjectTagging** (p. 401)
• **PutPublicAccessBlock** (p. 405)
• **RestoreObject** (p. 409)
• **SelectObjectContent** (p. 418)
• **UploadPart** (p. 426)
• **UploadPartCopy** (p. 433)
• **WriteGetObjectResponse** (p. 441)

The following actions are supported by Amazon S3 Control:

• **CreateAccessPoint** (p. 450)
• **CreateAccessPointForObjectLambda** (p. 454)
• **CreateBucket** (p. 457)
• **CreateJob** (p. 461)
• **CreateMultiRegionAccessPoint** (p. 468)
• **CreateStorageLensGroup** (p. 471)
• **DeleteAccessPoint** (p. 474)
• **DeleteAccessPointForObjectLambda** (p. 476)
• **DeleteAccessPointPolicy** (p. 478)
• **DeleteAccessPointPolicyForObjectLambda** (p. 480)
• **DeleteBucket** (p. 482)
• **DeleteBucketLifecycleConfiguration** (p. 484)
• **DeleteBucketPolicy** (p. 486)
• **DeleteBucketReplication** (p. 488)
• **DeleteBucketTagging** (p. 491)
• **DeleteJobTagging** (p. 493)
• **DeleteMultiRegionAccessPoint** (p. 495)
• **DeletePublicAccessBlock** (p. 498)
• **DeleteStorageLensConfiguration** (p. 500)
• **DeleteStorageLensConfigurationTagging** (p. 502)
• DeleteStorageLensGroup (p. 504)
• DescribeJob (p. 506)
• DescribeMultiRegionAccessPointOperation (p. 511)
• GetAccessPoint (p. 514)
• GetAccessPointConfigurationForObjectLambda (p. 518)
• GetAccessPointForObjectLambda (p. 520)
• GetAccessPointPolicy (p. 522)
• GetAccessPointPolicyForObjectLambda (p. 524)
• GetAccessPointPolicyStatus (p. 526)
• GetAccessPointPolicyStatusForObjectLambda (p. 528)
• GetBucket (p. 530)
• GetBucketLifecycleConfiguration (p. 533)
• GetBucketPolicy (p. 537)
• GetBucketReplication (p. 540)
• GetBucketTagging (p. 544)
• GetBucketVersioning (p. 547)
• GetJobTagging (p. 550)
• GetMultiRegionAccessPoint (p. 552)
• GetMultiRegionAccessPointPolicy (p. 554)
• GetMultiRegionAccessPointPolicyStatus (p. 556)
• GetMultiRegionAccessPointRoutes (p. 558)
• GetPublicAccessBlock (p. 560)
• GetStorageLensConfiguration (p. 563)
• GetStorageLensConfigurationTagging (p. 567)
• GetStorageLensGroup (p. 569)
• ListAccessPoints (p. 572)
• ListAccessPointsForObjectLambda (p. 575)
• ListJobs (p. 577)
• ListMultiRegionAccessPoints (p. 580)
• ListRegionalBuckets (p. 583)
• ListStorageLensConfigurations (p. 586)
• ListStorageLensGroups (p. 588)
• ListTagsForResource (p. 590)
• PutAccessPointConfigurationForObjectLambda (p. 592)
• PutAccessPointPolicy (p. 594)
• PutAccessPointPolicyForObjectLambda (p. 597)
• PutBucketLifecycleConfiguration (p. 600)
• PutBucketPolicy (p. 603)
• PutBucketReplication (p. 606)
• PutBucketTagging (p. 611)
• PutBucketVersioning (p. 614)
• PutJobTagging (p. 617)
• PutMultiRegionAccessPointPolicy (p. 620)
• PutPublicAccessBlock (p. 623)
• PutStorageLensConfiguration (p. 626)
• PutStorageLensConfigurationTagging (p. 630)
The following actions are supported by Amazon S3 on Outposts:

- CreateEndpoint (p. 648)
- DeleteEndpoint (p. 651)
- ListEndpoints (p. 653)
- ListOutpostsWithS3 (p. 656)
- ListSharedEndpoints (p. 659)

**Amazon S3**

The following actions are supported by Amazon S3:

- AbortMultipartUpload (p. 10)
- CompleteMultipartUpload (p. 13)
- CopyObject (p. 21)
- CreateBucket (p. 34)
- CreateMultipartUpload (p. 40)
- DeleteBucket (p. 50)
- DeleteBucketAnalyticsConfiguration (p. 52)
- DeleteBucketCors (p. 54)
- DeleteBucketEncryption (p. 56)
- DeleteBucketIntelligentTieringConfiguration (p. 58)
- DeleteBucketInventoryConfiguration (p. 60)
- DeleteBucketLifecycle (p. 62)
- DeleteBucketMetricsConfiguration (p. 64)
- DeleteBucketOwnershipControls (p. 66)
- DeleteBucketPolicy (p. 68)
- DeleteBucketReplication (p. 70)
- DeleteBucketTagging (p. 72)
- DeleteBucketWebsite (p. 74)
- DeleteObject (p. 76)
- DeleteObjects (p. 81)
- DeleteObjectTagging (p. 89)
- DeletePublicAccessBlock (p. 92)
- GetBucketAccelerateConfiguration (p. 94)
- GetBucketAcl (p. 97)
- GetBucketAnalyticsConfiguration (p. 100)
- GetBucketCors (p. 104)
- GetBucketEncryption (p. 108)

*SubmitMultiRegionAccessPointRoutes (p. 632)*
*TagResource (p. 635)*
*UntagResource (p. 637)*
*UpdateJobPriority (p. 639)*
*UpdateJobStatus (p. 642)*

- PutObjectAcl (p. 384)
- PutObjectLegalHold (p. 392)
- PutObjectLockConfiguration (p. 395)
- PutObjectRetention (p. 398)
- PutObjectTagging (p. 401)
- PutPublicAccessBlock (p. 405)
- RestoreObject (p. 409)
- SelectObjectContent (p. 418)
- UploadPart (p. 426)
- UploadPartCopy (p. 433)
- WriteGetObjectResponse (p. 441)
AbortMultipartUpload
Service: Amazon S3

This action aborts a multipart upload. After a multipart upload is aborted, no additional parts can be uploaded using that upload ID. The storage consumed by any previously uploaded parts will be freed. However, if any part uploads are currently in progress, those part uploads might or might not succeed. As a result, it might be necessary to abort a given multipart upload multiple times in order to completely free all storage consumed by all parts.

To verify that all parts have been removed, so you don't get charged for the part storage, you should call the ListParts action and ensure that the parts list is empty.

For information about permissions required to use the multipart upload, see Multipart Upload and Permissions.

The following operations are related to AbortMultipartUpload:

- CreateMultipartUpload
- UploadPart
- CompleteMultipartUpload
- ListParts
- ListMultipartUploads

Request Syntax

```
DELETE /Key+?uploadId=UploadId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 10)**

The bucket name to which the upload was taking place.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Key (p. 10)**

Key of the object for which the multipart upload was initiated.
Length Constraints: Minimum length of 1.

Required: Yes

**uploadid (p. 10)**

Upload ID that identifies the multipart upload.

Required: Yes

**x-amz-expected-bucket-owner (p. 10)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 10)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](#) in the *Amazon S3 User Guide*.

Valid Values: requester

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 204
x-amz-request-charged: RequestCharged
```

**Response Elements**

If the action is successful, the service sends back an HTTP 204 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 11)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**Errors**

**NoSuchUpload**

The specified multipart upload does not exist.

HTTP Status Code: 400

**Examples**

**Sample Request**

The following request aborts a multipart upload identified by its upload ID.
DELETE /example-object?
uploadId=VXBsb2FkIElEIGZvciBtb3ZpZS5tMnRzIHVwbG9hZ
HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string

Sample Response

This example illustrates one usage of AbortMultipartUpload.

HTTP/1.1 204 OK
x-amz-id-2: Weag1LuByRx9e6j50nimru9pO4ZVKnJ2Qz7/C1NPc7WAtRPFaOFg==
x-amz-request-id: 996c76696e6727732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 0
Connection: keep-alive
Server: AmazonS3

- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
CompleteMultipartUpload

Service: Amazon S3

Completes a multipart upload by assembling previously uploaded parts.

You first initiate the multipart upload and then upload all parts using the UploadPart operation. After successfully uploading all relevant parts of an upload, you call this action to complete the upload. Upon receiving this request, Amazon S3 concatenates all the parts in ascending order by part number to create a new object. In the Complete Multipart Upload request, you must provide the parts list. You must ensure that the parts list is complete. This action concatenates the parts that you provide in the list. For each part in the list, you must provide the part number and the ETag value, returned after that part was uploaded.

Processing of a Complete Multipart Upload request could take several minutes to complete. After Amazon S3 begins processing the request, it sends an HTTP response header that specifies a 200 OK response. While processing is in progress, Amazon S3 periodically sends white space characters to keep the connection from timing out. A request could fail after the initial 200 OK response has been sent. This means that a 200 OK response can contain either a success or an error. If you call the S3 API directly, make sure to design your application to parse the contents of the response and handle it appropriately. If you use AWS SDKs, SDKs handle this condition. The SDKs detect the embedded error and apply error handling per your configuration settings (including automatically retrying the request as appropriate). If the condition persists, the SDKs throws an exception (or, for the SDKs that don't use exceptions, they return the error).

Note that if CompleteMultipartUpload fails, applications should be prepared to retry the failed requests. For more information, see Amazon S3 Error Best Practices.

Important

You cannot use Content-Type: application/x-www-form-urlencoded with Complete Multipart Upload requests. Also, if you do not provide a Content-Type header, CompleteMultipartUpload returns a 200 OK response.

For more information about multipart uploads, see Uploading Objects Using Multipart Upload.

For information about permissions required to use the multipart upload API, see Multipart Upload and Permissions.

CompleteMultipartUpload has the following special errors:

- Error code: EntityTooSmall
  - Description: Your proposed upload is smaller than the minimum allowed object size. Each part must be at least 5 MB in size, except the last part.
  - 400 Bad Request
- Error code: InvalidPart
  - Description: One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.
  - 400 Bad Request
- Error code: InvalidPartOrder
  - Description: The list of parts was not in ascending order. The parts list must be specified in order by part number.
  - 400 Bad Request
- Error code: NoSuchUpload
  - Description: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.
  - 404 Not Found
The following operations are related to CompleteMultipartUpload:

- CreateMultipartUpload
- UploadPart
- AbortMultipartUpload
- ListParts
- ListMultipartUploads

**Request Syntax**

POST /Key+?uploadId=UploadId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-checksum-crc32: ChecksumCRC32
x-amz-checksum-crc32c: ChecksumCRC32C
x-amz-checksum-sha1: ChecksumSHA1
x-amz-checksum-sha256: ChecksumSHA256
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Part>
    <ChecksumCRC32>string</ChecksumCRC32>
    <ChecksumCRC32C>string</ChecksumCRC32C>
    <ChecksumSHA1>string</ChecksumSHA1>
    <ChecksumSHA256>string</ChecksumSHA256>
    <ETag>string</ETag>
    <PartNumber>integer</PartNumber>
  </Part>
  ...
</CompleteMultipartUpload>
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 14)**

Name of the bucket to which the multipart upload was initiated.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId outpostID.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Key (p. 14)**

Object key for which the multipart upload was initiated.
Length Constraints: Minimum length of 1.

Required: Yes

**uploadId (p. 14)**

ID for the initiated multipart upload.

Required: Yes

**x-amz-checksum-crc32 (p. 14)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32 checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-crc32c (p. 14)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32C checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-sha1 (p. 14)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 160-bit SHA-1 digest of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-sha256 (p. 14)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 256-bit SHA-256 digest of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-expected-bucket-owner (p. 14)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 14)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

**x-amz-server-side-encryption-customer-algorithm (p. 14)**

The server-side encryption (SSE) algorithm used to encrypt the object. This parameter is required only when the object was created using a checksum algorithm or if your bucket policy requires the use of SSE-C. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key (p. 14)**

The server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key-MD5 (p. 14)**

The MD5 server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.
Request Body

The request accepts the following data in XML format.

CompleteMultipartUpload (p. 14)

Root level tag for the CompleteMultipartUpload parameters.

Required: Yes

Part (p. 14)

Array of CompletedPart data types.

If you do not supply a valid Part with your request, the service sends back an HTTP 400 response.

Type: Array of CompletedPart (p. 689) data types

Required: No

Response Syntax

HTTP/1.1 200
x-amz-expiration: Expiration
x-amz-server-side-encryption: ServerSideEncryption
x-amz-version-id: VersionId
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<CompleteMultipartUploadResult>
  <Location>string</Location>
  <Bucket>string</Bucket>
  <Key>string</Key>
  <ETag>string</ETag>
  <ChecksumCRC32>string</ChecksumCRC32>
  <ChecksumCRC32C>string</ChecksumCRC32C>
  <ChecksumSHA1>string</ChecksumSHA1>
  <ChecksumSHA256>string</ChecksumSHA256>
</CompleteMultipartUploadResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-expiration (p. 16)

If the object expiration is configured, this will contain the expiration date (expiry-date) and rule ID (rule-id). The value of rule-id is URL-encoded.

x-amz-request-charged (p. 16)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

x-amz-server-side-encryption (p. 16)

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse
x-amz-server-side-encryption-aws-kms-key-id (p. 16)

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

x-amz-server-side-encryption-bucket-key-enabled (p. 16)

Indicates whether the multipart upload uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

x-amz-version-id (p. 16)

Version ID of the newly created object, in case the bucket has versioning turned on.

The following data is returned in XML format by the service.

CompleteMultipartUploadResult (p. 16)

Root level tag for the CompleteMultipartUploadResult parameters.

Required: Yes

Bucket (p. 16)

The name of the bucket that contains the newly created object. Does not return the access point ARN or access point alias if used.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form \textit{AccessPointName}\textunderscore\textit{AccountId}\textunderscore\textit{s3}\textunderscore\textit{accesspoint}\textunderscore\textit{Region}.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see \url{Using access points} in the \textit{Amazon S3 User Guide}.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form \textit{AccessPointName}\textunderscore\textit{AccountId}\textunderscore\textit{outpostID}\textunderscore\textit{s3-outposts}\textunderscore\textit{Region}.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see \url{What is S3 on Outposts?} in the \textit{Amazon S3 User Guide}.

Type: String

ChecksumCRC32 (p. 16)

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see \url{Checking object integrity} in the \textit{Amazon S3 User Guide}.

Type: String

ChecksumCRC32C (p. 16)

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see \url{Checking object integrity} in the \textit{Amazon S3 User Guide}.

Type: String

ChecksumSHA1 (p. 16)

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more
information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the Amazon S3 User Guide.

Type: String

**ChecksumSHA256 (p. 16)**

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the Amazon S3 User Guide.

Type: String

**ETag (p. 16)**

Entity tag that identifies the newly created object's data. Objects with different object data will have different entity tags. The entity tag is an opaque string. The entity tag may or may not be an MD5 digest of the object data. If the entity tag is not an MD5 digest of the object data, it will contain one or more nonhexadecimal characters and/or will consist of less than 32 or more than 32 hexadecimal digits. For more information about how the entity tag is calculated, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the Amazon S3 User Guide.

Type: String

**Key (p. 16)**

The object key of the newly created object.

Type: String

Length Constraints: Minimum length of 1.

**Location (p. 16)**

The URI that identifies the newly created object.

Type: String

### Examples

#### Sample Request

The following Complete Multipart Upload request specifies three parts in the `CompleteMultipartUpload` element.

```
POST /example-object?
uploadId=AAAsb2FkIElEIGZvciBlbHZpbmcncyWeeS1tb3ZpZS5tMnRzIRRwbG9hZA HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date:  Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 391
Authorization: authorization string

<CompleteMultipartUpload>
  <Part>
    <PartNumber>1</PartNumber>
    <ETag>"a54357aff0632cce46d942af68356b38"</ETag>
  </Part>
  <Part>
    <PartNumber>2</PartNumber>
    <ETag>"0c78aef83f66abc1fae8477f296d394"</ETag>
  </Part>
</CompleteMultipartUpload>
```
Sample Response

The following response indicates that an object was successfully assembled.

```
HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6j50nimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOfg==
x-amz-request-id: 656c76696e6727732072657175675374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
  <Location>http://Example-Bucket.s3.<Region>.amazonaws.com/Example-Object</Location>
  <Bucket>Example-Bucket</Bucket>
  <Key>Example-Object</Key>
  <ETag>"3858f62230ac3c915f300c664312c11f-9"</ETag>
</CompleteMultipartUploadResult>
```

Sample Response: Error specified in header

The following response indicates that an error occurred before the HTTP response header was sent.

```
HTTP/1.1 403 Forbidden
x-amz-id-2: Uuag1LuByRx9e6j50nimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOfg==
x-amz-request-id: 656c76696e6727732072657175675374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 237
Connection: keep-alive
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>AccessDenied</Code>
  <Message>Access Denied</Message>
  <RequestId>656c76696e6727732072657175675374</RequestId>
  <HostId>Uuag1LuByRx9e6j50nimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOfg==</HostId>
</Error>
```

Sample Response: Error specified in body

The following response indicates that an error occurred after the HTTP response header was sent. Note that while the HTTP status code is 200 OK, the request actually failed as described in the Error element.

```
HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6j50nimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOfg==
x-amz-request-id: 656c76696e6727732072657175675374
```

CopyObject
Service: Amazon S3

Creates a copy of an object that is already stored in Amazon S3.

Note
You can store individual objects of up to 5 TB in Amazon S3. You create a copy of your object up to 5 GB in size in a single atomic action using this API. However, to copy an object greater than 5 GB, you must use the multipart upload Upload Part - Copy (UploadPartCopy) API. For more information, see Copy Object Using the REST Multipart Upload API.

All copy requests must be authenticated. Additionally, you must have read access to the source object and write access to the destination bucket. For more information, see REST Authentication. Both the Region that you want to copy the object from and the Region that you want to copy the object to must be enabled for your account.

A copy request might return an error when Amazon S3 receives the copy request or while Amazon S3 is copying the files. If the error occurs before the copy action starts, you receive a standard Amazon S3 error. If the error occurs during the copy operation, the error response is embedded in the 200 OK response. This means that a 200 OK response can contain either a success or an error. If you call the S3 API directly, make sure to design your application to parse the contents of the response and handle it appropriately. If you use AWS SDKs, SDKs handle this condition. The SDKs detect the embedded error and apply error handling per your configuration settings (including automatically retrying the request as appropriate). If the condition persists, the SDKs throws an exception (or, for the SDKs that don't use exceptions, they return the error).

If the copy is successful, you receive a response with information about the copied object.

Note
If the request is an HTTP 1.1 request, the response is chunk encoded. If it were not, it would not contain the content-length, and you would need to read the entire body.

The copy request charge is based on the storage class and Region that you specify for the destination object. The request can also result in a data retrieval charge for the source if the source storage class bills for data retrieval. For pricing information, see Amazon S3 pricing.

Important
Amazon S3 transfer acceleration does not support cross-Region copies. If you request a cross-Region copy using a transfer acceleration endpoint, you get a 400 Bad Request error. For more information, see Transfer Acceleration.

Metadata
When copying an object, you can preserve all metadata (the default) or specify new metadata. However, the access control list (ACL) is not preserved and is set to private for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see Using ACLs.

To specify whether you want the object metadata copied from the source object or replaced with metadata provided in the request, you can optionally add the x-amz-metadata-directive header. When you grant permissions, you can use the s3:x-amz-metadata-directive condition key to enforce certain metadata behavior when objects are uploaded. For more information, see Specifying Conditions in a Policy in the Amazon S3 User Guide. For a complete list of Amazon S3-specific condition keys, see Actions, Resources, and Condition Keys for Amazon S3.

Note
x-amz-website-redirect-location is unique to each object and must be specified in the request headers to copy the value.
**x-amz-copy-source-if Headers**

To only copy an object under certain conditions, such as whether the Etag matches or whether the object was modified before or after a specified date, use the following request parameters:

- `x-amz-copy-source-if-match`
- `x-amz-copy-source-if-none-match`
- `x-amz-copy-source-if-unmodified-since`
- `x-amz-copy-source-if-modified-since`

If both the `x-amz-copy-source-if-match` and `x-amz-copy-source-if-unmodified-since` headers are present in the request and evaluate as follows, Amazon S3 returns 200 OK and copies the data:

- `x-amz-copy-source-if-match` condition evaluates to true
- `x-amz-copy-source-if-unmodified-since` condition evaluates to false

If both the `x-amz-copy-source-if-none-match` and `x-amz-copy-source-if-modified-since` headers are present in the request and evaluate as follows, Amazon S3 returns the 412 Precondition Failed response code:

- `x-amz-copy-source-if-none-match` condition evaluates to false
- `x-amz-copy-source-if-modified-since` condition evaluates to true

**Note**

All headers with the `x-amz-` prefix, including `x-amz-copy-source`, must be signed.

**Server-side encryption**

Amazon S3 automatically encrypts all new objects that are copied to an S3 bucket. When copying an object, if you don't specify encryption information in your copy request, the encryption setting of the target object is set to the default encryption configuration of the destination bucket. By default, all buckets have a base level of encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3). If the destination bucket has a default encryption configuration that uses server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS), dual-layer server-side encryption with AWS KMS keys (DSSE-KMS), or server-side encryption with customer-provided encryption keys (SSE-C), Amazon S3 uses the corresponding KMS key, or a customer-provided key to encrypt the target object copy.

When you perform a CopyObject operation, if you want to use a different type of encryption setting for the target object, you can use other appropriate encryption-related headers to encrypt the target object with a KMS key, an Amazon S3 managed key, or a customer-provided key. With server-side encryption, Amazon S3 encrypts your data as it writes your data to disks in its data centers and decrypts the data when you access it. If the encryption setting in your request is different from the default encryption configuration of the destination bucket, the encryption setting in your request takes precedence. If the source object for the copy is stored in Amazon S3 using SSE-C, you must provide the necessary encryption information in your request so that Amazon S3 can decrypt the object for copying. For more information about server-side encryption, see [Using Server-Side Encryption](#).

If a target object uses SSE-KMS, you can enable an S3 Bucket Key for the object. For more information, see [Amazon S3 Bucket Keys](#) in the [Amazon S3 User Guide](#).

**Access Control List (ACL)-Specific Request Headers**

When copying an object, you can optionally use headers to grant ACL-based permissions. By default, all objects are private. Only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or to predefined groups that are defined by Amazon S3. These permissions are then added to the ACL on the object. For more information, see [Access Control List (ACL) Overview](#) and [Managing ACLs Using the REST API](#).
If the bucket that you're copying objects to uses the bucket owner enforced setting for S3 Object Ownership, ACLs are disabled and no longer affect permissions. Buckets that use this setting only accept PUT requests that don’t specify an ACL or PUT requests that specify bucket owner full control ACLs, such as the bucket-owner-full-control canned ACL or an equivalent form of this ACL expressed in the XML format.

For more information, see  Controlling ownership of objects and disabling ACLs in the Amazon S3 User Guide.

**Note**  
If your bucket uses the bucket owner enforced setting for Object Ownership, all objects written to the bucket by any account will be owned by the bucket owner.

Checksums  
When copying an object, if it has a checksum, that checksum will be copied to the new object by default. When you copy the object over, you can optionally specify a different checksum algorithm to use with the x-amz-checksum-algorithm header.

Storage Class Options  
You can use the CopyObject action to change the storage class of an object that is already stored in Amazon S3 by using the StorageClass parameter. For more information, see Storage Classes in the Amazon S3 User Guide.

If the source object's storage class is GLACIER or DEEP_ARCHIVE, or the object's storage class is INTELLIGENT_TIERING and it's S3 Intelligent-Tiering access tier is Archive Access or Deep Archive Access, you must restore a copy of this object before you can use it as a source object for the copy operation. For more information, see RestoreObject. For more information, see Copying Objects.

Versioning  
By default, x-amz-copy-source header identifies the current version of an object to copy. If the current version is a delete marker, Amazon S3 behaves as if the object was deleted. To copy a different version, use the versionId subresource.

If you enable versioning on the target bucket, Amazon S3 generates a unique version ID for the object being copied. This version ID is different from the version ID of the source object. Amazon S3 returns the version ID of the copied object in the x-amz-version-id response header in the response.

If you do not enable versioning or suspend it on the target bucket, the version ID that Amazon S3 generates is always null.

The following operations are related to CopyObject:

- PutObject
- GetObject

**Request Syntax**

```
PUT /Key+ HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
x-amz-acl: ACL  
Cache-Control: CacheControl  
x-amz-checksum-algorithm: ChecksumAlgorithm  
Content-Disposition: ContentDisposition  
Content-Encoding: ContentEncoding  
Content-Language: ContentLanguage
```
URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 23)**

The name of the destination bucket.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-access-points.html) in the *Amazon S3 User Guide*.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form `AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com`. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see [What is S3 on Outposts?](https://docs.aws.amazon.com/AmazonS3/latest/userguide/what-is-s3-on-outposts.html) in the *Amazon S3 User Guide*.

Required: Yes

**Cache-Control (p. 23)**

Specifies caching behavior along the request/reply chain.

**Content-Disposition (p. 23)**

Specifies presentational information for the object.
Content-Encoding (p. 23)

Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field.

Content-Language (p. 23)

The language the content is in.

Content-Type (p. 23)

A standard MIME type describing the format of the object data.

Expires (p. 23)

The date and time at which the object is no longer cacheable.

Key (p. 23)

The key of the destination object.

Length Constraints: Minimum length of 1.

Required: Yes

x-amz-acl (p. 23)

The canned ACL to apply to the object.

This action is not supported by Amazon S3 on Outposts.

Valid Values: private | public-read | public-read-write | authenticated-read | aws-exec-read | bucket-owner-read | bucket-owner-full-control

x-amz-checksum-algorithm (p. 23)

Indicates the algorithm you want Amazon S3 to use to create the checksum for the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

x-amz-copy-source (p. 23)

Specifies the source object for the copy operation. You specify the value in one of two formats, depending on whether you want to access the source object through an access point:

- For objects not accessed through an access point, specify the name of the source bucket and the key of the source object, separated by a slash (/). For example, to copy the object reports/january.pdf from the bucket awsexamplebucket, use awsexamplebucket/reports/january.pdf. The value must be URL-encoded.

- For objects accessed through access points, specify the Amazon Resource Name (ARN) of the object as accessed through the access point, in the format arn:aws:s3:<Region>:<account-id>:accesspoint/<access-point-name>/object/<key>. For example, to copy the object reports/january.pdf through access point my-access-point owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3:us-west-2:123456789012:accesspoint/my-access-point/object/reports/january.pdf. The value must be URL encoded.

Note

Amazon S3 supports copy operations using access points only when the source and destination buckets are in the same AWS Region.

Alternatively, for objects accessed through Amazon S3 on Outposts, specify the ARN of the object as accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/object/<key>. For example, to copy the object reports/january.pdf through outpost my-outpost owned by account 123456789012 in Region us-west-2, use...

To copy a specific version of an object, append ?versionId=<version-id> to the value (for example, awsexamplebucket/reports/january.pdf?versionId=QUpfdndhf8438MNFDN93jdJnJFkdmqnh893). If you don't specify a version ID, Amazon S3 copies the latest version of the source object.

Pattern: /.+/.+

Required: Yes

**x-amz-copy-source-if-match (p. 23)**

Copies the object if its entity tag (ETag) matches the specified tag.

**x-amz-copy-source-if-modified-since (p. 23)**

Copies the object if it has been modified since the specified time.

**x-amz-copy-source-if-none-match (p. 23)**

Copies the object if its entity tag (ETag) is different than the specified ETag.

**x-amz-copy-source-if-unmodified-since (p. 23)**

Copies the object if it hasn't been modified since the specified time.

**x-amz-copy-source-server-side-encryption-customer-algorithm (p. 23)**

Specifies the algorithm to use when decrypting the source object (for example, AES256).

**x-amz-copy-source-server-side-encryption-customer-key (p. 23)**

Specifies the customer-provided encryption key for Amazon S3 to use to decrypt the source object. The encryption key provided in this header must be one that was used when the source object was created.

**x-amz-copy-source-server-side-encryption-customer-key-MD5 (p. 23)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

**x-amz-expected-bucket-owner (p. 23)**

The account ID of the expected destination bucket owner. If the destination bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-grant-full-control (p. 23)**

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-read (p. 23)**

Allows grantee to read the object data and its metadata.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-read-acp (p. 23)**

Allows grantee to read the object ACL.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-write-acp (p. 23)**

Allows grantee to write the ACL for the applicable object.
This action is not supported by Amazon S3 on Outposts.

**x-amz-metadata-directive (p. 23)**

Specifies whether the metadata is copied from the source object or replaced with metadata provided in the request.

Valid Values: COPY | REPLACE

**x-amz-object-lock-legal-hold (p. 23)**

Specifies whether you want to apply a legal hold to the copied object.

Valid Values: ON | OFF

**x-amz-object-lock-mode (p. 23)**

The Object Lock mode that you want to apply to the copied object.

Valid Values: GOVERNANCE | COMPLIANCE

**x-amz-object-lock-retain-until-date (p. 23)**

The date and time when you want the copied object's Object Lock to expire.

**x-amz-request-payer (p. 23)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](#) in the **Amazon S3 User Guide**.

Valid Values: requester

**x-amz-server-side-encryption (p. 23)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 23)**

Specifies the AWS KMS ID (Key ID, Key ARN, or Key Alias) to use for object encryption. All GET and PUT requests for an object protected by AWS KMS will fail if they're not made via SSL or using SigV4. For information about configuring any of the officially supported AWS SDKs and AWS CLI, see [Specifying the Signature Version in Request Authentication](#) in the **Amazon S3 User Guide**.

**x-amz-server-side-encryption-bucket-key-enabled (p. 23)**

Specifies whether Amazon S3 should use an S3 Bucket Key for object encryption with server-side encryption using AWS Key Management Service (AWS KMS) keys (SSE-KMS). Setting this header to true causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS.

Specifying this header with a COPY action doesn't affect bucket-level settings for S3 Bucket Key.

**x-amz-server-side-encryption-context (p. 23)**

Specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs. This value must be explicitly added to specify encryption context for CopyObject requests.

**x-amz-server-side-encryption-customer-algorithm (p. 23)**

Specifies the algorithm to use to when encrypting the object (for example, AES256).
**x-amz-server-side-encryption-customer-key (p. 23)**

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header.

**x-amz-server-side-encryption-customer-key-MD5 (p. 23)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

**x-amz-source-expected-bucket-owner (p. 23)**

The account ID of the expected source bucket owner. If the source bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-storage-class (p. 23)**

If the `x-amz-storage-class` header is not used, the copied object will be stored in the STANDARD Storage Class by default. The STANDARD storage class provides high durability and high availability. Depending on performance needs, you can specify a different Storage Class. Amazon S3 on Outposts only uses the OUTPOSTS Storage Class. For more information, see **Storage Classes** in the Amazon S3 User Guide.

Valid Values: STANDARD | REDUCED_REDUndANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

**x-amz-tagging (p. 23)**

The tag-set for the object destination object this value must be used in conjunction with the TaggingDirective. The tag-set must be encoded as URL Query parameters.

**x-amz-tagging-directive (p. 23)**

Specifies whether the object tag-set are copied from the source object or replaced with tag-set provided in the request.

Valid Values: COPY | REPLACE

**x-amz-website-redirect-location (p. 23)**

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. This value is unique to each object and is not copied when using the `x-amz-metadata-directive` header. Instead, you may opt to provide this header in combination with the directive.

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
x-amz-expiration: Expiration
x-amz-copy-source-version-id: CopySourceVersionId
x-amz-version-id: VersionId
x-amz-server-side-encryption: ServerSideEncryption
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-context: SSEKMSEncryptionContext
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-copy-source-version-id (p. 28)**

Version of the copied object in the destination bucket.

**x-amz-expiration (p. 28)**

If the object expiration is configured, the response includes this header.

**x-amz-request-charged (p. 28)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**x-amz-server-side-encryption (p. 28)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 28)**

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled (p. 28)**

Indicates whether the copied object uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

**x-amz-server-side-encryption-context (p. 28)**

If present, specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.

**x-amz-server-side-encryption-customer-algorithm (p. 28)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

**x-amz-server-side-encryption-customer-key-MD5 (p. 28)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

**x-amz-version-id (p. 28)**

Version ID of the newly created copy.
The following data is returned in XML format by the service.

**CopyObjectResult (p. 28)**

Root level tag for the CopyObjectResult parameters.

Required: Yes

**ChecksumCRC32 (p. 28)**

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumCRC32C (p. 28)**

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumSHA1 (p. 28)**

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumSHA256 (p. 28)**

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ETag (p. 28)**

Returns the ETag of the new object. The ETag reflects only changes to the contents of an object, not its metadata.

Type: String

**LastModified (p. 28)**

Creation date of the object.

Type: Timestamp

**Errors**

**ObjectNameInActiveTierError**

The source object of the COPY action is not in the active tier and is only stored in Amazon S3 Glacier.
HTTP Status Code: 400

Examples

Sample Request

This example copies `my-image.jpg` into the bucket `bucket`, with the key name `my-second-image.jpg`.

```
PUT /my-second-image.jpg HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
x-amz-copy-source: /bucket/my-image.jpg
Authorization: authorization string
```

Sample Response

This example illustrates one usage of CopyObject.

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed40pIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
x-amz-copy-source-version-id: 3/L4kqtJ3lcXroDTMmHz+mSpXd3TbrHY
+MTRCxf3vjVBH4ONr8X8gdRQBpUMLUo
x-amz-version-id: QUpfdndhfd8438MNFON93jdnFkdmqnh893
Date: Wed, 28 Oct 2009 22:52:00 GMT
Connection: close
Server: AmazonS3

<CopysObjectResult>
   <LastModified>2009-10-12T17:50:30.000Z</LastModified>
   <ETag>"9b2cf535f27731c974343645a3985328"</ETag>
</CopysObjectResult>
```

Sample Request: Copying a Specified Version of an Object

The following request copies the `my-image.jpg` key with the specified version ID, copies it into the bucket `bucket`, and gives it the `my-second-image.jpg` key.

```
PUT /my-second-image.jpg HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
x-amz-copy-source: /bucket/my-image.jpg?versionId=3/L4kqtJ3lcXroDTMmHz+mSpXd3TbrHY
+MTRCxf3vjVBH4ONr8X8gdRQBpUMLUo
Authorization: authorization string
```

Success Response: Copying a versioned object into a version-enabled bucket

The following response shows that an object was copied into a target bucket where versioning is enabled.

```
HTTP/1.1 200 OK
```
Success Response: Copying a versioned object into a version-suspended bucket

The following response shows that an object was copied into a target bucket where versioning is suspended. The parameter VersionId does not appear.

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51Tngc0F8eFidD9G9Z/2mkiDFu8yU9AS1ed40pIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
x-amz-copy-source-version-id: 3/L4kqt3lcpxrDmJ+rMSpXd3IbFHY
Date: Wed, 28 Oct 2009 22:32:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?><CopyObjectResult><LastModified>2009-10-28T22:32:00Z</LastModified><ETag>"9b2cf535f27731c974343645a5985328"</ETag></CopyObjectResult>
```

Example: Copy from unencrypted object to an object encrypted with server-side encryption with customer-provided encryption keys

The following example specifies the HTTP PUT header to copy an unencrypted object to an object encrypted with server-side encryption with customer-provided encryption keys (SSE-C).

```
PUT /exampleDestinationObject HTTP/1.1
Host: example-destination-bucket.s3.<Region>.amazonaws.com
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key: Base64(YourKey)
x-amz-server-side-encryption-customer-key-MD5 : Base64(MD5(YourKey))
x-amz-metadata-directive: metadata_directive
x-amz-copy-source: /example_source_bucket/exampleSourceObject
x-amz-copy-source-if-match: etag
x-amz-copy-source-if-none-match: etag
x-amz-copy-source-if-unmodified-since: time_stamp
x-amz-copy-source-if-modified-since: time_stamp

<request metadata>
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Date: date
```

API Version 2006-03-01
Example: Copy from an object encrypted with SSE-C to an object encrypted with SSE-C

The following example specifies the HTTP PUT header to copy an object encrypted with server-side encryption with customer-provided encryption keys to an object encrypted with server-side encryption with customer-provided encryption keys for key rotation.

```
PUT /exampleDestinationObject HTTP/1.1
Host: example-destination-bucket.s3.<Region>.amazonaws.com
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key: Base64(NewKey)
x-amz-server-side-encryption-customer-key-MD5: Base64(MD5(NewKey))
x-amz-metadata-directive: metadata_directive
x-amz-copy-source: /source_bucket/sourceObject
x-amz-copy-source-if-match: etag
x-amz-copy-source-if-none-match: etag
x-amz-copy-source-if-unmodified-since: time_stamp
x-amz-copy-source-if-modified-since: time_stamp
x-amz-copy-source-server-side-encryption-customer-algorithm: AES256
x-amz-copy-source-server-side-encryption-customer-key: Base64(OldKey)
x-amz-copy-source-server-side-encryption-customer-key-MD5: Base64(MD5(OldKey))

<request metadata>
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Date: date
```

CreateBucket
Service: Amazon S3

Creates a new S3 bucket. To create a bucket, you must register with Amazon S3 and have a valid AWS Access Key ID to authenticate requests. Anonymous requests are never allowed to create buckets. By creating the bucket, you become the bucket owner.

Not every string is an acceptable bucket name. For information about bucket naming restrictions, see Bucket naming rules.

If you want to create an Amazon S3 on Outposts bucket, see Create Bucket.

By default, the bucket is created in the US East (N. Virginia) Region. You can optionally specify a Region in the request body. To constrain the bucket creation to a specific Region, you can use LocationConstraint condition key. You might choose a Region to optimize latency, minimize costs, or address regulatory requirements. For example, if you reside in Europe, you will probably find it advantageous to create buckets in the Europe (Ireland) Region. For more information, see Accessing a bucket.

Note
If you send your create bucket request to the s3.amazonaws.com endpoint, the request goes to the us-east-1 Region. Accordingly, the signature calculations in Signature Version 4 must use us-east-1 as the Region, even if the location constraint in the request specifies another Region where the bucket is to be created. If you create a bucket in a Region other than US East (N. Virginia), your application must be able to handle 307 redirect. For more information, see Virtual hosting of buckets.

Permissions

In addition to s3:CreateBucket, the following permissions are required when your CreateBucket request includes specific headers:

- **Access control lists (ACLs)** - If your CreateBucket request specifies access control list (ACL) permissions and the ACL is public-read, public-read-write, authenticated-read, or if you specify access permissions explicitly through any other ACL, both s3:CreateBucket and s3:PutBucketAcl permissions are needed. If the ACL for the CreateBucket request is private or if the request doesn't specify any ACLs, only s3:CreateBucket permission is needed.

- **Object Lock** - If ObjectLockEnabledForBucket is set to true in your CreateBucket request, s3:PutBucketObjectLockConfiguration and s3:PutBucketVersioning permissions are required.

- **S3 Object Ownership** - If your CreateBucket request includes the x-amz-object-ownership header, then the s3:PutBucketOwnershipControls permission is required. By default, ObjectOwnership is set to BucketOwnerEnforced and ACLs are disabled. We recommend keeping ACLs disabled, except in uncommon use cases where you must control access for each object individually. If you want to change the ObjectOwnership setting, you can use the x-amz-object-ownership header in your CreateBucket request to set the ObjectOwnership setting of your choice. For more information about S3 Object Ownership, see Controlling object ownership in the Amazon S3 User Guide.

- **S3 Block Public Access** - If your specific use case requires granting public access to your S3 resources, you can disable Block Public Access. You can create a new bucket with Block Public Access enabled, then separately call the DeletePublicAccessBlock API. To use this operation, you must have the s3:PutBucketPublicAccessBlock permission. By default, all Block Public Access settings are enabled for new buckets. To avoid inadvertent exposure of your resources, we recommend keeping the S3 Block Public Access settings enabled. For more information about S3 Block Public Access, see Blocking public access to your Amazon S3 storage in the Amazon S3 User Guide.
Important
If your CreateBucket request sets BucketOwnerEnforced for Amazon S3 Object Ownership and specifies a bucket ACL that provides access to an external AWS account, your request fails with a 400 error and returns the InvalidBucketACLWithObjectOwnership error code. For more information, see Setting Object Ownership on an existing bucket in the Amazon S3 User Guide.

The following operations are related to CreateBucket:

- PutObject
- DeleteBucket

Request Syntax

```
PUT / HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-acl: ACL
x-amz-grant-full-control: GrantFullControl
x-amz-grant-read: GrantRead
x-amz-grant-read-acp: GrantReadACP
x-amz-grant-write: GrantWrite
x-amz-grant-write-acp: GrantWriteACP
x-amz-bucket-object-lock-enabled: ObjectLockEnabledForBucket
x-amz-object-ownership: ObjectOwnership
<?xml version="1.0" encoding="UTF-8"?>
<CreateBucketConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <LocationConstraint>string</LocationConstraint>
</CreateBucketConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 35)**

The name of the bucket to create.

Required: Yes

**x-amz-acl (p. 35)**

The canned ACL to apply to the bucket.

Valid Values: private | public-read | public-read-write | authenticated-read

**x-amz-bucket-object-lock-enabled (p. 35)**

Specifies whether you want S3 Object Lock to be enabled for the new bucket.

**x-amz-grant-full-control (p. 35)**

Allows grantee the read, write, read ACP, and write ACP permissions on the bucket.

**x-amz-grant-read (p. 35)**

Allows grantee to list the objects in the bucket.

**x-amz-grant-read-acp (p. 35)**

Allows grantee to read the bucket ACL.

**x-amz-grant-write (p. 35)**

Allows grantee to create new objects in the bucket.
For the bucket and object owners of existing objects, also allows deletions and overwrites of those objects.

**x-amz-grant-write-acp (p. 35)**

Allows grantee to write the ACL for the applicable bucket.

**x-amz-object-ownership (p. 35)**

The container element for object ownership for a bucket’s ownership controls.

BucketOwnerPreferred - Objects uploaded to the bucket change ownership to the bucket owner if the objects are uploaded with the bucket-owner-full-control canned ACL.

ObjectWriter - The uploading account will own the object if the object is uploaded with the bucket-owner-full-control canned ACL.

BucketOwnerEnforced - Access control lists (ACLs) are disabled and no longer affect permissions. The bucket owner automatically owns and has full control over every object in the bucket. The bucket only accepts PUT requests that don’t specify an ACL or bucket owner full control ACLs, such as the bucket-owner-full-control canned ACL or an equivalent form of this ACL expressed in the XML format.

Valid Values: BucketOwnerPreferred | ObjectWriter | BucketOwnerEnforced

**Request Body**

The request accepts the following data in XML format.

**CreateBucketConfiguration (p. 35)**

Root level tag for the CreateBucketConfiguration parameters.

Required: Yes

**LocationConstraint (p. 35)**

Specifies the Region where the bucket will be created. If you don't specify a Region, the bucket is created in the US East (N. Virginia) Region (us-east-1).

Type: String

Required: No

**Response Syntax**

```
HTTP/1.1 200
Location: Location
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.
The response returns the following HTTP headers.

**Location (p. 36)**

A forward slash followed by the name of the bucket.

**Errors**

**BucketAlreadyExists**

The requested bucket name is not available. The bucket namespace is shared by all users of the system. Select a different name and try again.

HTTP Status Code: 400

**BucketAlreadyOwnedByYou**

The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

HTTP Status Code: 400

**Examples**

**Sample Request**

This request creates a bucket named `colorpictures`.

```
PUT / HTTP/1.1
Host: colorpictures.s3.<Region>.amazonaws.com
Content-Length: 0
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

**Sample Response**

This example illustrates one usage of CreateBucket.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJTO0pXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT

Location: /colorpictures
Content-Length: 0
Connection: close
Server: AmazonS3
```

**Sample Request: Setting the Region of a bucket**

The following request sets the Region for the bucket to Europe.
Sample Request: Creating a bucket and applying the ObjectWriter setting for S3 Object Ownership.

This request creates a bucket and applies the ObjectWriter setting for Object Ownership.

```
PUT / HTTP/1.1
Host: DOC-EXAMPLE-BUCKET.s3.<Region>.amazonaws.com
Content-Length: 0
x-amz-object-ownership: ObjectWriter
Date: Tue, 30 Nov 2021 12:00:00 GMT
Authorization: authorization string
```

Sample Response

This example illustrates one usage of CreateBucket.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzesD4rcKCHQUAdQkf3ShJTO0pUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Tue, 30 Nov 2021 12:00:00 GMT
Location: /DOC-EXAMPLE-BUCKET
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Request: Creating a bucket and configuring access permissions explicitly

This request creates a bucket named colorpictures and grants WRITE permission to the AWS account identified by an email address.

```
PUT HTTP/1.1
Host: colorpictures.s3.<Region>.amazonaws.com
x-amz-date: Sat, 07 Apr 2012 00:54:40 GMT
Authorization: authorization string
x-amz-grant-write: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

Sample Response

This example illustrates one usage of CreateBucket.
Sample Request: Creating a bucket and configuring access permission using a canned ACL

This request creates a bucket named `colorpictures` and sets the ACL to private.

```plaintext
PUT / HTTP/1.1
Host: colorpictures.s3.<Region>.amazonaws.com
Content-Length: 0
x-amz-acl: private
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

Sample Response

This example illustrates one usage of CreateBucket.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: YgIPIFBiKa2bj0KMg95z/0zo3emzU4dzsD4rcKCHQUAdQkF3ShJT00pXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
Location: /colorpictures
Content-Length: 0
Connection: close
Server: AmazonS3
```

CreateMultipartUpload
Service: Amazon S3

This action initiates a multipart upload and returns an upload ID. This upload ID is used to associate all of the parts in the specific multipart upload. You specify this upload ID in each of your subsequent upload part requests (see UploadPart). You also include this upload ID in the final request to either complete or abort the multipart upload request.

For more information about multipart uploads, see Multipart Upload Overview.

If you have configured a lifecycle rule to abort incomplete multipart uploads, the upload must complete within the number of days specified in the bucket lifecycle configuration. Otherwise, the incomplete multipart upload becomes eligible for an abort action and Amazon S3 aborts the multipart upload. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration.

For information about the permissions required to use the multipart upload API, see Multipart Upload and Permissions.

For request signing, multipart upload is just a series of regular requests. You initiate a multipart upload, send one or more requests to upload parts, and then complete the multipart upload process. You sign each request individually. There is nothing special about signing multipart upload requests. For more information about signing, see Authenticating Requests (AWS Signature Version 4).

Note
After you initiate a multipart upload and upload one or more parts, to stop being charged for storing the uploaded parts, you must either complete or abort the multipart upload. Amazon S3 frees up the space used to store the parts and stop charging you for storing them only after you either complete or abort a multipart upload.

Server-side encryption is for data encryption at rest. Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it when you access it. Amazon S3 automatically encrypts all new objects that are uploaded to an S3 bucket. When doing a multipart upload, if you don't specify encryption information in your request, the encryption setting of the uploaded parts is set to the default encryption configuration of the destination bucket. By default, all buckets have a base level of encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3). If the destination bucket has a default encryption configuration that uses server-side encryption with an AWS Key Management Service (AWS KMS) key (SSE-KMS), or a customer-provided encryption key (SSE-C), Amazon S3 uses the corresponding KMS key, or a customer-provided key to encrypt the uploaded parts. When you perform a CreateMultipartUpload operation, if you want to use a different type of encryption setting for the uploaded parts, you can request that Amazon S3 encrypts the object with a KMS key, an Amazon S3 managed key, or a customer-provided key. If the encryption setting in your request is different from the default encryption configuration of the destination bucket, the encryption setting in your request takes precedence. If you choose to provide your own encryption key, the request headers you provide in UploadPart and UploadPartCopy requests must match the headers you used in the request to initiate the upload by using CreateMultipartUpload. You can request that Amazon S3 save the uploaded parts encrypted with server-side encryption with an Amazon S3 managed key (SSE-S3), an AWS Key Management Service (AWS KMS) key (SSE-KMS), or a customer-provided encryption key (SSE-C).

To perform a multipart upload with encryption by using an AWS KMS key, the requester must have permission to the kms:Decrypt and kms:GenerateDataKey* actions on the key. These permissions are required because Amazon S3 must decrypt and read data from the encrypted file parts before it completes the multipart upload. For more information, see Multipart upload API and permissions and Protecting data using server-side encryption with AWS KMS in the Amazon S3 User Guide.

If your AWS Identity and Access Management (IAM) user or role is in the same AWS account as the KMS key, then you must have these permissions on the key policy. If your IAM user or role belongs to a different account than the key, then you must have the permissions on both the key policy and your IAM user or role.
For more information, see Protecting Data Using Server-Side Encryption.

Access Permissions

When copying an object, you can optionally specify the accounts or groups that should be granted specific permissions on the new object. There are two ways to grant the permissions using the request headers:

- Specify a canned ACL with the `x-amz-acl` request header. For more information, see Canned ACL.
- Specify access permissions explicitly with the `x-amz-grant-read`, `x-amz-grant-read-acp`, `x-amz-grant-write-acp`, and `x-amz-grant-full-control` headers. These parameters map to the set of permissions that Amazon S3 supports in an ACL. For more information, see Access Control List (ACL) Overview.

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

Server-Side Encryption-Specific Request Headers

Amazon S3 encrypts data by using server-side encryption with an Amazon S3 managed key (SSE-S3) by default. Server-side encryption is for data encryption at rest. Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it when you access it. You can request that Amazon S3 encrypts data at rest by using server-side encryption with other key options. The option you use depends on whether you want to use KMS keys (SSE-KMS) or provide your own encryption keys (SSE-C).

- Use KMS keys (SSE-KMS) that include the AWS managed key (`aws/s3`) and AWS KMS customer managed keys stored in AWS Key Management Service (AWS KMS) – If you want AWS to manage the keys used to encrypt data, specify the following headers in the request.
  - `x-amz-server-side-encryption`
  - `x-amz-server-side-encryption-aws-kms-key-id`
  - `x-amz-server-side-encryption-context`

  **Note**
  If you specify `x-amz-server-side-encryption:aws:kms`, but don't provide `x-amz-server-side-encryption-aws-kms-key-id`, Amazon S3 uses the AWS managed key (`aws/s3` key) in AWS KMS to protect the data.

  **Important**
  All GET and PUT requests for an object protected by AWS KMS fail if you don't make them by using Secure Sockets Layer (SSL), Transport Layer Security (TLS), or Signature Version 4.

  For more information about server-side encryption with AWS KMS keys (SSE-KMS), see Protecting Data Using Server-Side Encryption with KMS keys.

- Use customer-provided encryption keys (SSE-C) – If you want to manage your own encryption keys, provide all the following headers in the request.
  - `x-amz-server-side-encryption-customer-algorithm`
  - `x-amz-server-side-encryption-customer-key`
  - `x-amz-server-side-encryption-customer-key-MD5`

  For more information about server-side encryption with customer-provided encryption keys (SSE-C), see Protecting data using server-side encryption with customer-provided encryption keys (SSE-C).

Access-Control-List (ACL)-Specific Request Headers

You also can use the following access control–related headers with this operation. By default, all objects are private. Only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or to predefined groups defined by Amazon S3. These permissions are then added to the access control list (ACL) on the object. For more information, see
Using ACLs. With this operation, you can grant access permissions using one of the following two methods:

- Specify a canned ACL (x-amz-acl) — Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, see Canned ACL.
- Specify access permissions explicitly — To explicitly grant access permissions to specific AWS accounts or groups, use the following headers. Each header maps to specific permissions that Amazon S3 supports in an ACL. For more information, see Access Control List (ACL) Overview. In the header, you specify a list of grantees who get the specific permission. To grant permissions explicitly, use:
  - x-amz-grant-read
  - x-amz-grant-write
  - x-amz-grant-read-acp
  - x-amz-grant-write-acp
  - x-amz-grant-full-control

You specify each grantee as a type=value pair, where the type is one of the following:

- id – if the value specified is the canonical user ID of an AWS account
- uri – if you are granting permissions to a predefined group
- emailAddress – if the value specified is the email address of an AWS account

Note
Using email addresses to specify a grantee is only supported in the following AWS Regions:

- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Europe (Ireland)
- South America (São Paulo)

For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.

For example, the following x-amz-grant-read header grants the AWS accounts identified by account IDs permissions to read object data and its metadata:

```
x-amz-grant-read: id="11112222333", id="444455556666"
```

The following operations are related to CreateMultipartUpload:

- UploadPart
- CompleteMultipartUpload
- AbortMultipartUpload
- ListParts
- ListMultipartUploads

Request Syntax

```
POST /{Key+}?uploads HTTP/1.1
```

API Version 2006-03-01
URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 42)**

The name of the bucket to which to initiate the upload

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Cache-Control (p. 42)**

Specifies caching behavior along the request/reply chain.

**Content-Disposition (p. 42)**

Specifies presentational information for the object.

**Content-Encoding (p. 42)**

Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field.
**Content-Language (p. 42)**

The language the content is in.

**Content-Type (p. 42)**

A standard MIME type describing the format of the object data.

**Expires (p. 42)**

The date and time at which the object is no longer cacheable.

**Key (p. 42)**

Object key for which the multipart upload is to be initiated.

Length Constraints: Minimum length of 1.

Required: Yes

**x-amz-acl (p. 42)**

The canned ACL to apply to the object.

This action is not supported by Amazon S3 on Outposts.

Valid Values: `private` | `public-read` | `public-read-write` | `authenticated-read` | `aws-exec-read` | `bucket-owner-read` | `bucket-owner-full-control`

**x-amz-checksum-algorithm (p. 42)**

Indicates the algorithm you want Amazon S3 to use to create the checksum for the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

Valid Values: `CRC32` | `CRC32C` | `SHA1` | `SHA256`

**x-amz-expected-bucket-owner (p. 42)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-grant-full-control (p. 42)**

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-read (p. 42)**

Allows grantee to read the object data and its metadata.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-read-acp (p. 42)**

Allows grantee to read the object ACL.

This action is not supported by Amazon S3 on Outposts.

**x-amz-grant-write-acp (p. 42)**

Allows grantee to write the ACL for the applicable object.

This action is not supported by Amazon S3 on Outposts.

**x-amz-object-lock-legal-hold (p. 42)**

Specifies whether you want to apply a legal hold to the uploaded object.
Valid Values: ON | OFF

**x-amz-object-lock-mode (p. 42)**

Specifies the Object Lock mode that you want to apply to the uploaded object.

Valid Values: GOVERNANCE | COMPLIANCE

**x-amz-object-lock-retain-until-date (p. 42)**

Specifies the date and time when you want the Object Lock to expire.

**x-amz-request-payer (p. 42)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/DownloadObjectRequesterPays.html) in the *Amazon S3 User Guide*.

Valid Values: requester

**x-amz-server-side-encryption (p. 42)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 42)**

Specifies the ID (Key ID, Key ARN, or Key Alias) of the symmetric encryption customer managed key to use for object encryption. All GET and PUT requests for an object protected by AWS KMS will fail if they're not made via SSL or using SigV4. For information about configuring any of the officially supported AWS SDKs and AWS CLI, see [Specifying the Signature Version in Request Authentication](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Specifying-the-Signature-Version.html) in the *Amazon S3 User Guide*.

**x-amz-server-side-encryption-bucket-key-enabled (p. 42)**

Specifies whether Amazon S3 should use an S3 Bucket Key for object encryption with server-side encryption using AWS Key Management Service (AWS KMS) keys (SSE-KMS). Setting this header to true causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS.

Specifying this header with an object action doesn't affect bucket-level settings for S3 Bucket Key.

**x-amz-server-side-encryption-context (p. 42)**

Specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.

**x-amz-server-side-encryption-customer-algorithm (p. 42)**

Specifies the algorithm to use to when encrypting the object (for example, AES256).

**x-amz-server-side-encryption-customer-key (p. 42)**

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header.

**x-amz-server-side-encryption-customer-key-MD5 (p. 42)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.
x-amz-storage-class (p. 42)

By default, Amazon S3 uses the STANDARD Storage Class to store newly created objects. The STANDARD storage class provides high durability and high availability. Depending on performance needs, you can specify a different Storage Class. Amazon S3 on Outposts only uses the OUTPOSTS Storage Class. For more information, see Storage Classes in the Amazon S3 User Guide.

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

x-amz-tagging (p. 42)

The tag-set for the object. The tag-set must be encoded as URL Query parameters.

x-amz-website-redirect-location (p. 42)

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata.

Response Syntax

HTTP/1.1 200
x-amz-abort-date: AbortDate
x-amz-abort-rule-id: AbortRuleId
x-amz-server-side-encryption: ServerSideEncryption
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-context: SSEKMSEncryptionContext
x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled
x-amz-request-charged: RequestCharged
x-amz-checksum-algorithm: ChecksumAlgorithm
<?xml version="1.0" encoding="UTF-8"?>
<InitiateMultipartUploadResult>
  <Bucket>string</Bucket>
  <Key>string</Key>
  <UploadId>string</UploadId>
</InitiateMultipartUploadResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-abort-date (p. 46)

If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration.

The response also includes the x-amz-abort-rule-id header that provides the ID of the lifecycle configuration rule that defines this action.
x-amz-abort-rule-id (p. 46)

This header is returned along with the x-amz-abort-date header. It identifies the applicable lifecycle configuration rule that defines the action to abort incomplete multipart uploads.

x-amz-checksum-algorithm (p. 46)

The algorithm that was used to create a checksum of the object.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

x-amz-request-charged (p. 46)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

x-amz-server-side-encryption (p. 46)

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse

x-amz-server-side-encryption-aws-kms-key-id (p. 46)

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

x-amz-server-side-encryption-bucket-key-enabled (p. 46)

Indicates whether the multipart upload uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

x-amz-server-side-encryption-context (p. 46)

If present, specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.

x-amz-server-side-encryption-customer-algorithm (p. 46)

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

x-amz-server-side-encryption-customer-key-MD5 (p. 46)

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

The following data is returned in XML format by the service.

InitiateMultipartUploadResult (p. 46)

Root level tag for the InitiateMultipartUploadResult parameters.

Required: Yes

Bucket (p. 46)

The name of the bucket to which the multipart upload was initiated. Does not return the access point ARN or access point alias if used.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-
accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Type: String

Key (p. 46)

Object key for which the multipart upload was initiated.

Type: String

Length Constraints: Minimum length of 1.

UploadId (p. 46)

ID for the initiated multipart upload.

Type: String

Examples

Sample Request

This action initiates a multipart upload for the example-object object.

```plaintext
POST /example-object?uploads HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

Sample Response

This example illustrates one usage of CreateMultipartUpload.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Bucket>example-bucket</Bucket>
  <Key>example-object</Key>
  <UploadId>VXBsb2FkIElEIGZvciA2aWWpbmcncyBteS1tb3ZpZS5tMnRzIHVwbG9hZA</UploadId>
</InitiateMultipartUploadResult>
```
Example: Initiate a multipart upload using server-side encryption with customer-provided encryption keys

This example, which initiates a multipart upload request, specifies server-side encryption with customer-provided encryption keys by adding relevant headers.

```
POST /example-object?uploads HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Authorization: authorization string
Date: Wed, 28 May 2014 19:34:57 +0000
x-amz-server-side-encryption-customer-key: g0lCFa3DV40jJ25SQJ1uKRFqISWorC/8SEEXAMPLE
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbV2example
x-amz-server-side-encryption-customer-algorithm: AES256
```

Sample Response

In the response, Amazon S3 returns an UploadId. In addition, Amazon S3 returns the encryption algorithm and the MD5 digest of the encryption key that you provided in the request.

```
HTTP/1.1 200 OK
x-amz-id-2: 36HRCaIGp57F1fVwVRcvd3hNn9WoBGfEaCVHCTct8QWf00qxdHazQUgfoXAbhFWD
x-amz-request-id: 50FA1D691B62CA43
Date: Wed, 28 May 2014 19:34:58 GMT
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbV2m3tFg==
Transfer-Encoding: chunked

<?xml version="1.0" encoding="UTF-8"?>
  <Bucket>example-bucket</Bucket>
  <Key>example-object</Key>
  <UploadId>EXAMPLEJZ6e0YupT2h66iePQCc9IEbYbDuy4RTpMeoSMLPRpBZ5o1u8Fe5RonpvnWskKG53tI2LB9VDP1CgTy.Gq2Vx0</UploadId>
</InitiateMultipartUploadResult>
```

DeleteBucket

Service: Amazon S3

Deletes the S3 bucket. All objects (including all object versions and delete markers) in the bucket must be deleted before the bucket itself can be deleted.

The following operations are related to DeleteBucket:

- CreateBucket
- DeleteObject

Request Syntax

DELETE / HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 50)

- Specifies the bucket being deleted.
  - Required: Yes

x-amz-expected-bucket-owner (p. 50)

- The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

This request deletes the bucket named quotes.

DELETE / HTTP/1.1
Host: quotes.s3.<Region>.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
Sample Response

HTTP/1.1 204 No Content
x-amz-id-2: JuKZqmXuiwFeDQxhD7M8KtsKobSzWA1QEjLbMTagkKdBX2z7I1/jGhDeJ3j6s80
x-amz-request-id: 32FE2CEB32F5EE25
Date: Wed, 01 Mar 2006 12:00:00 GMT
Connection: close
Server: AmazonS3

DeleteBucketAnalyticsConfiguration
Service: Amazon S3

Deletes an analytics configuration for the bucket (specified by the analytics configuration ID).

To use this operation, you must have permissions to perform the s3:PutAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about the Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis.

The following operations are related to DeleteBucketAnalyticsConfiguration:

- GetBucketAnalyticsConfiguration  
- ListBucketAnalyticsConfigurations  
- PutBucketAnalyticsConfiguration

Request Syntax

DELETE /?analytics&id=Id HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 52)**

The name of the bucket from which an analytics configuration is deleted.

Required: Yes

**id (p. 52)**

The ID that identifies the analytics configuration.

Required: Yes

**x-amz-expected-bucket-owner (p. 52)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.
Examples

Sample Request

The following DELETE request deletes the analytics configuration with the ID list1.

```
DELETE ?/analytics&id=list1 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 14 May 2014 02:11:22 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The analytics configuration with the ID list1 for the bucket has been removed.

```
HTTP/1.1 204 No Content
x-amz-id-2: 0FmFIWsh/PpBuzZ0JFRC55ZGVmQW4SHJ7xVDqKwhEdJmf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: 0CF038E98CF63097
Date: Wed, 14 May 2014 02:11:22 GMT
Server: AmazonS3
```

DeleteBucketCors
Service: Amazon S3

Deletes the CORS configuration information set for the bucket.

To use this operation, you must have permission to perform the s3:PutBucketCORS action. The bucket owner has this permission by default and can grant this permission to others.

For information about CORS, see Enabling Cross-Origin Resource Sharing in the Amazon S3 User Guide.

Related Resources
- PutBucketCors
- RESTOPTIONSobject

Request Syntax

DELETE /?cors HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 54)

Specifies the bucket whose CORS configuration is being deleted.
Required: Yes

x-amz-expected-bucket-owner (p. 54)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Retrieve cors subresource

The following DELETE request deletes the CORS subresource from the specified bucket. This action removes CORS configuration that is stored in the subresource.
Sample Request

This example illustrates one usage of DeleteBucketCors.

```
DELETE /?cors HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Tue, 13 Dec 2011 19:14:42 GMT
Authorization: signatureValue
```

DeleteBucketEncryption
Service: Amazon S3

This implementation of the DELETE action resets the default encryption for the bucket as server-side encryption with Amazon S3 managed keys (SSE-S3). For information about the bucket default encryption feature, see Amazon S3 Bucket Default Encryption in the Amazon S3 User Guide.

To use this operation, you must have permissions to perform the s3:PutEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to your Amazon S3 Resources in the Amazon S3 User Guide.

The following operations are related to DeleteBucketEncryption:

- PutBucketEncryption
- GetBucketEncryption

Request Syntax

DELETE /?encryption HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 56)**

The name of the bucket containing the server-side encryption configuration to delete.

Required: Yes

**x-amz-expected-bucket-owner (p. 56)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

The following DELETE request resets the default encryption for the bucket as server-side encryption with Amazon S3 managed keys (SSE-S3).
DELETE ?/encryption HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 06 Sep 2017 12:00:00 GMT
Authorization: signatureValue

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response confirming that default encryption for the bucket has been reset as server-side encryption with Amazon S3 managed keys (SSE-S3).

HTTP/1.1 204 No Content
x-amz-id-2: 0FmFIWsh/PpBuzZ0JFRC55ZGvmQW45HJ7xVDqKwhEdJmf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: 0CF038E9BCF63097
Date: Wed, 06 Sep 2017 12:00:00 GMT
Server: AmazonS3

DeleteBucketIntelligentTieringConfiguration

Service: Amazon S3

Deletes the S3 Intelligent-Tiering configuration from the specified bucket.

The S3 Intelligent-Tiering storage class is designed to optimize storage costs by automatically moving data to the most cost-effective storage access tier, without performance impact or operational overhead. S3 Intelligent-Tiering delivers automatic cost savings in three low latency and high throughput access tiers. To get the lowest storage cost on data that can be accessed in minutes to hours, you can choose to activate additional archiving capabilities.

The S3 Intelligent-Tiering storage class is the ideal storage class for data with unknown, changing, or unpredictable access patterns, independent of object size or retention period. If the size of an object is less than 128 KB, it is not monitored and not eligible for auto-tiering. Smaller objects can be stored, but they are always charged at the Frequent Access tier rates in the S3 Intelligent-Tiering storage class.

For more information, see Storage class for automatically optimizing frequently and infrequently accessed objects.

Operations related to DeleteBucketIntelligentTieringConfiguration include:

- GetBucketIntelligentTieringConfiguration
- PutBucketIntelligentTieringConfiguration
- ListBucketIntelligentTieringConfigurations

Request Syntax

DELETE /?intelligent-tiering&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 58)

The name of the Amazon S3 bucket whose configuration you want to modify or retrieve.

Required: Yes

id (p. 58)

The ID used to identify the S3 Intelligent-Tiering configuration.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

DeleteBucketInventoryConfiguration
Service: Amazon S3

Deletes an inventory configuration (identified by the inventory ID) from the bucket.

To use this operation, you must have permissions to perform the s3:PutInventoryConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about the Amazon S3 inventory feature, see Amazon S3 Inventory.

Operations related to DeleteBucketInventoryConfiguration include:

- GetBucketInventoryConfiguration
- PutBucketInventoryConfiguration
- ListBucketInventoryConfigurations

Request Syntax

```
DELETE /?inventory&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 60)**

The name of the bucket containing the inventory configuration to delete.

Required: Yes

**id (p. 60)**

The ID used to identify the inventory configuration.

Required: Yes

**x-amz-expected-bucket-owner (p. 60)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.
Examples

Sample Request

The following DELETE request deletes the inventory configuration with the ID list1.

```plaintext
DELETE /inventory&id=list1 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 14 May 2014 02:11:22 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The inventory configuration with the ID list1 for the bucket has been removed.

```plaintext
HTTP/1.1 204 No Content
x-amz-id-2: 0FmFIWsh/PpBuzZ0JFRc55ZGvmQW45HJ7xVdqKwhEd3mf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: 0CF038E9BF63097
Date: Wed, 14 May 2014 02:11:22 GMT
Server: AmazonS3
```

DeleteBucketLifecycle
Service: Amazon S3

Deletes the lifecycle configuration from the specified bucket. Amazon S3 removes all the lifecycle configuration rules in the lifecycle subresource associated with the bucket. Your objects never expire, and Amazon S3 no longer automatically deletes any objects on the basis of rules contained in the deleted lifecycle configuration.

To use this operation, you must have permission to perform the s3:PutLifecycleConfiguration action. By default, the bucket owner has this permission and the bucket owner can grant this permission to others.

There is usually some time lag before lifecycle configuration deletion is fully propagated to all the Amazon S3 systems.

For more information about the object expiration, see Elements to Describe Lifecycle Actions.

Related actions include:
- PutBucketLifecycleConfiguration
- GetBucketLifecycleConfiguration

Request Syntax

DELETE /?lifecycle HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 62)

The bucket name of the lifecycle to delete.

Required: Yes

x-amz-expected-bucket-owner (p. 62)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.
Examples

Sample Request

The following DELETE request deletes the lifecycle subresource from the specified bucket. This removes lifecycle configuration stored in the subresource.

```
DELETE /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 14 Dec 2011 05:37:16 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. Objects in your bucket no longer expire.

```
HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRx9e6j5OnimzSAMPLEtRpfTa0Aa==
x-amz-request-id: 656c76696e672SAMPLE5657374
Date: Wed, 14 Dec 2011 05:37:16 GMT
Connection: keep-alive
Server: AmazonS3
```

DeleteBucketMetricsConfiguration
Service: Amazon S3

Deletes a metrics configuration for the Amazon CloudWatch request metrics (specified by the metrics configuration ID) from the bucket. Note that this doesn't include the daily storage metrics.

To use this operation, you must have permissions to perform the s3:PutMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch.

The following operations are related to DeleteBucketMetricsConfiguration:

- GetBucketMetricsConfiguration
- PutBucketMetricsConfiguration
- ListBucketMetricsConfigurations
- Monitoring Metrics with Amazon CloudWatch

Request Syntax

DELETE /?metrics&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 64)**

The name of the bucket containing the metrics configuration to delete.

Required: Yes

**id (p. 64)**

The ID used to identify the metrics configuration. The ID has a 64 character limit and can only contain letters, numbers, periods, dashes, and underscores.

Required: Yes

**x-amz-expected-bucket-owner (p. 64)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204
Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

```
DELETE /metrics?id=ExampleMetrics HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
```

Sample Response

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

```
HTTP/1.1 204 No Content
x-amz-id-2: ITnGT1y4REXAMPLEPi4hk1TXouTF0hccUjo0iCPEXAMPLEutBj3M7fPGLW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
```

**DeleteBucketOwnershipControls**

Service: Amazon S3

Removes OwnershipControls for an Amazon S3 bucket. To use this operation, you must have the `s3:PutBucketOwnershipControls` permission. For more information about Amazon S3 permissions, see Specifying Permissions in a Policy.

For information about Amazon S3 Object Ownership, see Using Object Ownership.

The following operations are related to `DeleteBucketOwnershipControls`:

- GetBucketOwnershipControls (p. 141)
- PutBucketOwnershipControls (p. 340)

**Request Syntax**

```
DELETE /?ownershipControls HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 66)**

The Amazon S3 bucket whose OwnershipControls you want to delete.

Required: Yes

**x-amz-expected-bucket-owner (p. 66)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 204
```

**Response Elements**

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

**Examples**

**Sample DeleteBucketOwnershipControls Request**

This example illustrates one usage of `DeleteBucketOwnershipControls`.

```
DELETE /example-bucket?/ownershipControls HTTP/1.1
```

API Version 2006-03-01
66
Sample DeleteBucketOwnershipControls Response

This example illustrates one usage of DeleteBucketOwnershipControls.

HTTP/1.1 204 No Content

**DeleteBucketPolicy**  
Service: Amazon S3

This implementation of the DELETE action uses the policy subresource to delete the policy of a specified bucket. If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the DeleteBucketPolicy permissions on the specified bucket and belong to the bucket owner's account to use this operation.

If you don't have DeleteBucketPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 405 Method Not Allowed error.

**Important**  
To ensure that bucket owners don't inadvertently lock themselves out of their own buckets, the root principal in a bucket owner's AWS account can perform the GetBucketPolicy, PutBucketPolicy, and DeleteBucketPolicy API actions, even if their bucket policy explicitly denies the root principal's access. Bucket owner root principals can only be blocked from performing these API actions by VPC endpoint policies and AWS Organizations policies.

For more information about bucket policies, see [Using Bucket Policies and UserPolicies](#).

The following operations are related to DeleteBucketPolicy

- CreateBucket
- DeleteObject

**Request Syntax**

```
DELETE /?policy HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 68)**

The bucket name.

Required: Yes

**x-amz-expected-bucket-owner (p. 68)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 204
```
Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

This request deletes the bucket named BucketName.

DELETE /?policy HTTP/1.1
Host: BucketName.s3.<Region>.amazonaws.com
Date: Tue, 04 Apr 2010 20:34:56 GMT
Authorization: signatureValue

Sample Response

This example illustrates one usage of DeleteBucketPolicy.

HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRx9e6j5OnimrSAMPLEtRPfTa0Fg==
x-amz-request-id: 656c76696e672SAMPLE5657374
Date: Tue, 04 Apr 2010 20:34:56 GMT
Connection: keep-alive
Server: AmazonS3

DeleteBucketReplication
Service: Amazon S3

Deletes the replication configuration from the bucket.

To use this operation, you must have permissions to perform the s3:PutReplicationConfiguration action. The bucket owner has these permissions by default and can grant it to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

Note
It can take a while for the deletion of a replication configuration to fully propagate.

For information about replication configuration, see Replication in the Amazon S3 User Guide.

The following operations are related to DeleteBucketReplication:

- PutBucketReplication
- GetBucketReplication

Request Syntax

DELETE /?replication HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 70)
The bucket name.
Required: Yes

x-amz-expected-bucket-owner (p. 70)
The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

The following DELETE request deletes the replication subresource from the specified bucket. This removes the replication configuration that is set for the bucket.
DELETE /?replication HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 11 Feb 2015 05:37:16 GMT
20150211T171320Z
Authorization: authorization string

Sample Response

When the replication subresource has been deleted, Amazon S3 returns a 204 No Content response. It will not replicate new objects that are stored in the examplebucket bucket.

HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRx9e6j50imrSAMPLEtRPfTa0Aa==
x-amz-request-id: 656c76696e672example
Date: Wed, 11 Feb 2015 05:37:16 GMT
Connection: keep-alive
Server: AmazonS3

DeleteBucketTagging
Service: Amazon S3

Deletes the tags from the bucket.

To use this operation, you must have permission to perform the s3:PutBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

The following operations are related to DeleteBucketTagging:

- GetBucketTagging
- PutBucketTagging

Request Syntax

```
DELETE /?tagging HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 72)**

The bucket that has the tag set to be removed.

Required: Yes

**x-amz-expected-bucket-owner (p. 72)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

The following DELETE request deletes the tag set from the specified bucket.

```
DELETE /?tagging HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 14 Dec 2011 05:37:16 GMT
```

API Version 2006-03-01
Authorization: signatureValue

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The tag set for the bucket has been removed.

HTTP/1.1 204 No Content
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

DeleteBucketWebsite
Service: Amazon S3

This action removes the website configuration for a bucket. Amazon S3 returns a 200 OK response upon successfully deleting a website configuration on the specified bucket. You will get a 200 OK response if the website configuration you are trying to delete does not exist on the bucket. Amazon S3 returns a 404 response if the bucket specified in the request does not exist.

This DELETE action requires the S3:DeleteBucketWebsite permission. By default, only the bucket owner can delete the website configuration attached to a bucket. However, bucket owners can grant other users permission to delete the website configuration by writing a bucket policy granting them the S3:DeleteBucketWebsite permission.

For more information about hosting websites, see Hosting Websites on Amazon S3.

The following operations are related to DeleteBucketWebsite:

- GetBucketWebsite
- PutBucketWebsite

Request Syntax

DELETE /?website HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 74)**

The bucket name for which you want to remove the website configuration.

Required: Yes

**x-amz-expected-bucket-owner (p. 74)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample Request

This request deletes the website configuration on the specified bucket.
DELETE ?website HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

Sample Response

This example illustrates one usage of DeleteBucketWebsite.

HTTP/1.1 204 No Content
x-amz-id-2: aws-s3integ-s3ws-31008.sea31.amazon.com
x-amz-request-id: AF1DD829D3B49707
Date: Thu, 03 Feb 2011 22:10:26 GMT
Server: AmazonS3

DeleteObject
Service: Amazon S3

Removes the null version (if there is one) of an object and inserts a delete marker, which becomes the latest version of the object. If there isn’t a null version, Amazon S3 does not remove any objects but will still respond that the command was successful.

To remove a specific version, you must use the version Id subresource. Using this subresource permanently deletes the version. If the object deleted is a delete marker, Amazon S3 sets the response header, x-amz-delete-marker, to true.

If the object you want to delete is in a bucket where the bucket versioning configuration is MFA Delete enabled, you must include the x-amz-mfa request header in the DELETE versionId request. Requests that include x-amz-mfa must use HTTPS.

For more information about MFA Delete, see Using MFA Delete. To see sample requests that use versioning, see Sample Request.

You can delete objects by explicitly calling DELETE Object or configure its lifecycle (PutBucketLifecycle) to enable Amazon S3 to remove them for you. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them the s3:DeleteObject, s3:DeleteObjectVersion, and s3:PutLifeCycleConfiguration actions.

The following action is related to DeleteObject:

• PutObject

Request Syntax

DELETE /Key+?versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-mfa: MFA
x-amz-request-payer: RequestPayer
x-amz-bypass-governance-retention: BypassGovernanceRetention
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 76)

The bucket name of the bucket containing the object.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

API Version 2006-03-01
76
**Key (p. 76)**

Key name of the object to delete.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 76)**

VersionId used to reference a specific version of the object.

**x-amz-bypass-governance-retention (p. 76)**

Indicates whether S3 Object Lock should bypass Governance-mode restrictions to process this operation. To use this header, you must have the s3:BypassGovernanceRetention permission.

**x-amz-expected-bucket-owner (p. 76)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-mfa (p. 76)**

The concatenation of the authentication device's serial number, a space, and the value that is displayed on your authentication device. Required to permanently delete a versioned object if versioning is configured with MFA delete enabled.

**x-amz-request-payer (p. 76)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/downloading_objects.html) in the *Amazon S3 User Guide*.

Valid Values: requester

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 204
x-amz-delete-marker: DeleteMarker
x-amz-version-id: VersionId
x-amz-request-charged: RequestCharged
```

**Response Elements**

If the action is successful, the service sends back an HTTP 204 response.

The response returns the following HTTP headers.

**x-amz-delete-marker (p. 77)**

Indicates whether the specified object version that was permanently deleted was (true) or was not (false) a delete marker before deletion. In a simple DELETE, this header indicates whether (true) or not (false) the current version of the object is a delete marker.

**x-amz-request-charged (p. 77)**

If present, indicates that the requester was successfully charged for the request.

---

API Version 2006-03-01
Valid Values: requester

**x-amz-version-id (p. 77)**

Returns the version ID of the delete marker created as a result of the DELETE operation.

**Examples**

**Sample Request**

The following request deletes the object my-second-image.jpg.

```
DELETE /my-second-image.jpg HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
```

**Sample Response**

This example illustrates one usage of DeleteObject.

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdAIIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wI0I xl+zbwZl63pt7
x-amz-request-id: 0A49CE4060975EAC
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

**Sample Request: Deleting a specified version of an object**

The following request deletes the specified version of the object my-third-image.jpg.

```
DELETE /my-third-image.jpg?versionId=UIORUnfndfiufdisojhr398493jfdkJFJjkndnqUifhew98493jJFJ HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 0
```

**Sample Response**

This example illustrates one usage of DeleteObject.

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdAIIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wI0I xl+zbwZl63pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: UIORUnfndfiufdisojhr398493jfdkJFJjkndnqUifhew98493jJFJ
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
```
Sample Response: If the object deleted is a delete marker

This example illustrates one usage of DeleteObject.

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdaIlfg5m/F1YsVi1LT1W94/xUQxMsF7xiEbla0wiIOIx1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 3/L4kq7J1cpXroDTDmJ+rmSpXd3dIhrHY
+MTRCxf3vJVBH40rX8gdRQBPULUo
x-amz-delete-marker: true
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Request: Deleting a specified version of an object in an MFA-enabled bucket

The following request deletes the specified version of the object `my-third-image.jpg`, which is stored in an MFA-enabled bucket.

```
DELETE /my-third-image.jpg?versionId=UIORUnfndfiuf HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-mfa:[SerialNumber] [AuthenticationCode]
Authorization: authorization string
Content-Type: text/plain
Content-Length: 0
```

Sample Response

This example illustrates one usage of DeleteObject.

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdaIlfg5m/F1YsVi1LT1W94/xUQxMsF7xiEbla0wiIOIx1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: UIORUnfndfiuf
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

DeleteObjects
Service: Amazon S3

This action enables you to delete multiple objects from a bucket using a single HTTP request. If you know the object keys that you want to delete, then this action provides a suitable alternative to sending individual delete requests, reducing per-request overhead.

The request contains a list of up to 1000 keys that you want to delete. In the XML, you provide the object key names, and optionally, version IDs if you want to delete a specific version of the object from a versioning-enabled bucket. For each key, Amazon S3 performs a delete action and returns the result of that delete, success, or failure, in the response. Note that if the object specified in the request is not found, Amazon S3 returns the result as deleted.

The action supports two modes for the response: verbose and quiet. By default, the action uses verbose mode in which the response includes the result of deletion of each key in your request. In quiet mode the response includes only keys where the delete action encountered an error. For a successful deletion, the action does not return any information about the delete in the response body.

When performing this action on an MFA Delete enabled bucket, that attempts to delete any versioned objects, you must include an MFA token. If you do not provide one, the entire request will fail, even if there are non-versioned objects you are trying to delete. If you provide an invalid token, whether there are versioned keys in the request or not, the entire Multi-Object Delete request will fail. For information about MFA Delete, see [MFA Delete](#).

Finally, the Content-MD5 header is required for all Multi-Object Delete requests. Amazon S3 uses the header value to ensure that your request body has not been altered in transit.

The following operations are related to DeleteObjects:

- CreateMultipartUpload
- UploadPart
- CompleteMultipartUpload
- ListParts
- AbortMultipartUpload

Request Syntax

```
POST /?delete HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-mfa: MFA
x-amz-request-payer: Requester
x-amz-bypass-governance-retention: BypassGovernanceRetention
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
<?xml version="1.0" encoding="UTF-8"?>
<Delete xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
    <Object>
        <Key>string</Key>
        <VersionId>string</VersionId>
    </Object>
    ...
    <Quiet>boolean</Quiet>
</Delete>
```

URI Request Parameters

The request uses the following URI parameters.

API Version 2006-03-01
**Bucket (p. 81)**

The bucket name containing the objects to delete.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-accesspoints.html) in the *Amazon S3 User Guide*.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form `AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com`. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see [What is S3 on Outposts?](https://docs.aws.amazon.com/AmazonS3/latest/userguide/what-is-s3onoutposts.html) in the *Amazon S3 User Guide*.

Required: Yes

**x-amz-bypass-governance-retention (p. 81)**

Specifies whether you want to delete this object even if it has a Governance-type Object Lock in place. To use this header, you must have the `s3:BypassGovernanceRetention` permission.

**x-amz-expected-bucket-owner (p. 81)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-mfa (p. 81)**

The concatenation of the authentication device's serial number, a space, and the value that is displayed on your authentication device. Required to permanently delete a versioned object if versioning is configured with MFA delete enabled.

**x-amz-request-payer (p. 81)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/downloading-requester-pays-buckets.html) in the *Amazon S3 User Guide*.

Valid Values: requester

**x-amz-sdk-checksum-algorithm (p. 81)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding `x-amz-checksum` or `x-amz-trailer` header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/object-integrity.html) in the *Amazon S3 User Guide*.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

This checksum algorithm must be the same for all parts and it match the checksum value supplied in the CreateMultipartUpload request.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Request Body**

The request accepts the following data in XML format.
Delete (p. 81)

Root level tag for the Delete parameters.

Required: Yes

Object (p. 81)

The object to delete.

Type: Array of ObjectIdentifier (p. 775) data types

Required: Yes

Quiet (p. 81)

Element to enable quiet mode for the request. When you add this element, you must set its value to true.

Type: Boolean

Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult>
  <Deleted>
    <DeleteMarker>boolean</DeleteMarker>
    <DeleteMarkerVersionId>string</DeleteMarkerVersionId>
    <Key>string</Key>
    <VersionId>string</VersionId>
  </Deleted>
  ...
</DeleteResult>

Error

  <Code>string</Code>
  <Key>string</Key>
  <Message>string</Message>
  <VersionId>string</VersionId>
</Error>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 83)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.

DeleteResult (p. 83)

Root level tag for the DeleteResult parameters.
Required: Yes

**Deleted (p. 83)**

Container element for a successful delete. It identifies the object that was successfully deleted.

Type: Array of **DeletedObject (p. 707)** data types

**Error (p. 83)**

Container for a failed delete action that describes the object that Amazon S3 attempted to delete and the error it encountered.

Type: Array of **Error (p. 715)** data types

**Examples**

**Sample Request: Multi-object delete resulting in mixed success/error response**

This example illustrates a Multi-Object Delete request to delete objects that result in mixed success and errors response. The following request deletes two objects from a bucket (bucketname). In this example, the requester does not have permission to delete the sample2.txt object.

```
POST /?delete HTTP/1.1
Host: bucketname.s3.<Region>.amazonaws.com
Accept: */*
x-amz-date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qrEE121PAqw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLe6JwkZAD1ei6hp9XZIee=
Content-Length: 125
Connection: Keep-Alive

<Delete>
  <Object>
    <Key>sample1.txt</Key>
  </Object>
  <Object>
    <Key>sample2.txt</Key>
  </Object>
</Delete>
```

**Sample Response**

The response includes a DeleteResult element that includes a Deleted element for the item that Amazon S3 successfully deleted and an Error element that Amazon S3 did not delete because you didn't have permission to delete the object.

```
HTTP/1.1 200 OK
x-amz-id-2: 5h4FxSNCUS7wP5z92eGCWDshNpMnRuXvETa4HH3Lv9H6VAIr0jU7tH9kM7X+njXx
x-amz-request-id: A437B3B641629AEE
Date: Fri, 02 Dec 2011 01:55:42 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 251

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>sample1.txt</Key>
  </Deleted>
</DeleteResult>
```
Sample Request: Deleting an object from a versioned bucket

If you delete an item from a versioning enabled bucket, all versions of that object remain in the bucket; however, Amazon S3 inserts a delete marker. For more information, see Object Versioning.

The following scenarios describe the behavior of a multi-object Delete request when versioning is enabled for your bucket.

Case 1 - Simple Delete: In the following sample request, the multi-object delete request specifies only one key.

```
POST /?delete HTTP/1.1
Host: bucketname.s3.<Region>.amazonaws.com
Accept: */*
x-amz-date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qzEl21IAuw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLe6JwkZAD1ei6hp9XZIee=
Content-Length: 79
Connection: Keep-Alive

<Delete>
  <Object>
    <Key>SampleDocument.txt</Key>
  </Object>
</Delete>
```

Sample Response

Because versioning is enabled on the bucket, Amazon S3 does not delete the object. Instead, it adds a delete marker for this object. The following response indicates that a delete marker was added (the DeleteMarker element in the response as a value of true) and the version number of the delete marker it added.

```
HTTP/1.1 200 OK
x-amz-id-2: P5xqruhYx1refdw3rEzmJh8z5KDtgzb+/FB7oiQaSci9Yaxd8olYXc7d11la+b+
  x-amz-request-id: 264A17BF16E9E80A
Date: Wed, 30 Nov 2011 03:39:32 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 276

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>SampleDocument.txt</Key>
    <DeleteMarker>true</DeleteMarker>
    <DeleteMarkerVersionId>NeQt5xeFTfgPJD8B4CGWnkSLtluMr11s</DeleteMarkerVersionId>
  </Deleted>
</DeleteResult>
```
Case 2 - Versioned Delete

The following request attempts to delete a specific version of an object.

```plaintext
POST /?delete HTTP/1.1
Host: bucketname.s3.<Region>.amazonaws.com
Accept: */*
x-amz-date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qrzEl21PAqw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLE6JwkZAD1ei6hp9XZ1xx=
Content-Length: 140
Connection: Keep-Alive

<Delete>
  <Object>
    <Key>SampleDocument.txt</Key>
    <VersionId>OYcLXagmS.WaD..oyH4KRGruB95_YhLs7</VersionId>
  </Object>
</Delete>
```

Sample Response

In this case, Amazon S3 deletes the specific object version from the bucket and returns the following response. In the response, Amazon S3 returns the key and version ID of the object deleted.

```plaintext
HTTP/1.1 400 Bad Request
x-amz-id-2: P3xqrhuhYxlrefdw3rEzmJh8z5KDtGzb+/
FB7oiQaScI9Yaxd8Yc7d1111xx+
x-amz-request-id: 264A17BF16E9E80A
Date: Wed, 30 Nov 2011 03:39:32 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 219

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>SampleDocument.txt</Key>
    <VersionId>OYcLXagmS.WaD..oyH4KRGruB95_YhLs7</VersionId>
  </Deleted>
</DeleteResult>
```

Case 3 - Versioned delete of a delete marker

In the preceding example, the request refers to a delete marker (instead of an object), then Amazon S3 deletes the delete marker. The effect of this action is to make your object reappear in your bucket. Amazon S3 returns a response that indicates the delete marker it deleted (DeleteMarker element with value true) and the version ID of the delete marker.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: IIPUZrto1xDEmWsKOae9J1SZe6yWfTye3HQ3T2iAe0ZE4XHa6NKvAJcPpSizZaBz
x-amz-request-id: D6B284CEC9B0E4E
Date: Wed, 30 Nov 2011 03:43:25 GMT
Content-Type: application/xml

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>SampleDocument.txt</Key>
    <VersionId>OYcLXagmS.WaD..oyH4KRGruB95_YhLs7</VersionId>
  </Deleted>
</DeleteResult>
```
Sample Response

In general, when a multi-object Delete request results in Amazon S3 either adding a delete marker or removing a delete marker, the response returns the following elements.

```
<DeleteMarker>true</DeleteMarker>
/DeleteMarkerVersionId>
/DeleteResult>
```

Sample Request: Malformed XML in the request

This example shows how Amazon S3 responds to a request that includes a malformed XML document. The following request sends a malformed XML document (missing the Delete end element).

```
POST /?delete HTTP/1.1
Host: bucketname.s3.<Region>.amazonaws.com
Accept: */*
x-amz-date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qrEEl21PAqw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLe6JwkZAD1ei6hp9XZIee=
Content-Length: 104
Connection: Keep-Alive

/Delete>
/Object>
<Key>404.txt</Key>
</Object>
/Object>
<Key>a.txt</Key>
</Object>
```

Sample Response

The response returns the error messages that describe the error.

```
HTTP/1.1 200 OK
x-amz-id-2: P3xqruhuYx1rUfvd3zEznUh8z5KDtgzb+/FB7oiQaScI9Yaxd8o1Yxc7d111ab+
x-amz-request-id: 264A17BF1E9E80A
Date: Wed, 30 Nov 2011 03:39:32 GMT
Content-Type: application/xml
Server: AmazonS3
```

Sample Request to DeleteObjects containing a carriage return

The following example illustrates the use of an XML entity code as a substitution for a carriage return. This DeleteObjects request deletes an object with the key parameter: /some/prefix/objectwith\rcarriagereturn (where the \r is the carriage return).

```xml
<Delete xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
   <Object>
       <Key>/some/prefix/objectwith&#13;carriagereturn</Key>
   </Object>
</Delete>
```

DeleteObjectTagging

Service: Amazon S3

Removes the entire tag set from the specified object. For more information about managing object tags, see Object Tagging.

To use this operation, you must have permission to perform the s3:DeleteObjectTagging action.

To delete tags of a specific object version, add the versionId query parameter in the request. You will need permission for the s3:DeleteObjectVersionTagging action.

The following operations are related to DeleteObjectTagging:

- PutObjectTagging
- GetObjectTagging

Request Syntax

```
DELETE /{Key+}?tagging&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 89)**

The bucket name containing the objects from which to remove the tags.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Key (p. 89)**

The key that identifies the object in the bucket from which to remove all tags.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 89)**

The versionId of the object that the tag-set will be removed from.

**x-amz-expected-bucket-owner (p. 89)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
Request Body

The request does not have a request body.

Response Syntax

<table>
<thead>
<tr>
<th>HTTP/1.1</th>
<th>204</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-version-id:</td>
<td>VersionId</td>
</tr>
</tbody>
</table>

Response Elements

If the action is successful, the service sends back an HTTP 204 response.

The response returns the following HTTP headers.

**x-amz-version-id (p. 90)**

The versionId of the object the tag-set was removed from.

Examples

Sample Request

The following DELETE request deletes the tag set from the specified object.

```
DELETE /exampleobject?tagging HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 25 Nov 2016 12:00:00 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The tag set for the object has been removed.

```
HTTP/1.1 204 No Content
x-amz-versionid: VersionId
Date: Wed, 25 Nov 2016 12:00:00 GMT
Connection: close
Server: AmazonS3
```

DeletePublicAccessBlock
Service: Amazon S3

Removes the PublicAccessBlock configuration for an Amazon S3 bucket. To use this operation, you must have the s3:PutBucketPublicAccessBlock permission. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

The following operations are related to DeletePublicAccessBlock:

- Using Amazon S3 Block Public Access
- GetPublicAccessBlock
- PutPublicAccessBlock
- GetBucketPolicyStatus

Request Syntax

DELETE /?publicAccessBlock HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 92)**

The Amazon S3 bucket whose PublicAccessBlock configuration you want to delete.

Required: Yes

**x-amz-expected-bucket-owner (p. 92)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

**GetBucketAccelerateConfiguration**

Service: Amazon S3

This implementation of the GET action uses the accelerate subresource to return the Transfer Acceleration state of a bucket, which is either Enabled or Suspended. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to and from Amazon S3.

To use this operation, you must have permission to perform the s3:GetAccelerateConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to your Amazon S3 Resources in the Amazon S3 User Guide.

You set the Transfer Acceleration state of an existing bucket to Enabled or Suspended by using the PutBucketAccelerateConfiguration operation.

A GET accelerate request does not return a state value for a bucket that has no transfer acceleration state. A bucket has no Transfer Acceleration state if a state has never been set on the bucket.

For more information about transfer acceleration, see Transfer Acceleration in the Amazon S3 User Guide.

The following operations are related to GetBucketAccelerateConfiguration:

- **PutBucketAccelerateConfiguration**

**Request Syntax**

```
GET /?accelerate HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-request-payer: Requester
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 94)**

The name of the bucket for which the accelerate configuration is retrieved.

Required: Yes

**x-amz-expected-bucket-owner (p. 94)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 94)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

**Request Body**

The request does not have a request body.
Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<AccelerateConfiguration>
  <Status>string</Status>
</AccelerateConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 95)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.

**AccelerateConfiguration (p. 95)**

Root level tag for the AccelerateConfiguration parameters.

Required: Yes

**Status (p. 95)**

The accelerate configuration of the bucket.

Type: String

Valid Values: Enabled | Suspended

Examples

This implementation of the GET action returns the following responses.

**Example**

If the transfer acceleration state is set to Enabled on a bucket, the response is as follows:

```
  <Status>Enabled</Status>
</AccelerateConfiguration>
```

**Example**

If the transfer acceleration state is set to Suspended on a bucket, the response is as follows:

```
  <Status>Suspended</Status>
</AccelerateConfiguration>
```
Example

If the transfer acceleration state on a bucket has never been set to Enabled or Suspended, the response is as follows:

```xml
```

Retrieve the transfer acceleration configuration for a bucket

The following example shows a GET /?accelerate request to retrieve the transfer acceleration state of the bucket named examplebucket.

```xml
  <Status>Enabled</Status>
</AccelerateConfiguration>
```

Example

The following is a sample of the response body (only) that shows bucket transfer acceleration is enabled.

```
GET /?accelerate HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
```

GetBucketAcl
Service: Amazon S3

This implementation of the GET action uses the acl subresource to return the access control list (ACL) of a bucket. To use GET to return the ACL of the bucket, you must have READ_ACP access to the bucket. If READ_ACP permission is granted to the anonymous user, you can return the ACL of the bucket without using an authorization header.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Note
If your bucket uses the bucket owner enforced setting for S3 Object Ownership, requests to read ACLs are still supported and return the bucket-owner-full-control ACL with the owner being the account that created the bucket. For more information, see Controlling object ownership and disabling ACLs in the Amazon S3 User Guide.

The following operations are related to GetBucketAcl:

- ListObjects

Request Syntax

GET /?acl HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 97)**

Specifies the S3 bucket whose ACL is being requested.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

**x-amz-expected-bucket-owner (p. 97)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<AccessControlPolicy>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee>
        <DisplayName>string</DisplayName>
        <EmailAddress>string</EmailAddress>
        <ID>string</ID>
        <xsi:type>string</xsi:type>
        <URI>string</URI>
      </Grantee>
      <Permission>string</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

AccessControlPolicy (p. 98)

Root level tag for the AccessControlPolicy parameters.

Required: Yes

Grants (p. 98)

A list of grants.

Type: Array of Grant (p. 732) data types

Owner (p. 98)

Container for the bucket owner's display name and ID.

Type: Owner (p. 786) data type

Examples

Sample Request

The following request returns the ACL of the specified bucket.

GET ?acl HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string

Sample Response
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed4OpIszj7UDNEHGran

GetBucketAnalyticsConfiguration
Service: Amazon S3

This implementation of the GET action returns an analytics configuration (identified by the analytics configuration ID) from the bucket.

To use this operation, you must have permissions to perform the s3:GetAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon S3 User Guide.

For information about Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis in the Amazon S3 User Guide.

The following operations are related to GetBucketAnalyticsConfiguration:

- DeleteBucketAnalyticsConfiguration
- ListBucketAnalyticsConfigurations
- PutBucketAnalyticsConfiguration

Request Syntax

```
GET /?analytics&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 100)

The name of the bucket from which an analytics configuration is retrieved.

Required: Yes

id (p. 100)

The ID that identifies the analytics configuration.

Required: Yes

x-amz-expected-bucket-owner (p. 100)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

AnalyticsConfiguration (p. 100)

Root level tag for the AnalyticsConfiguration parameters.

Required: Yes

Filter (p. 100)

The filter used to describe a set of objects for analyses. A filter must have exactly one prefix, one tag, or one conjunction (AnalyticsAndOperator). If no filter is provided, all objects will be considered in any analysis.

Type: AnalyticsFilter (p. 678) data type

Id (p. 100)

The ID that identifies the analytics configuration.

Type: String

StorageClassAnalysis (p. 100)

Contains data related to access patterns to be collected and made available to analyze the tradeoffs between different storage classes.

Type: StorageClassAnalysis (p. 836) data type
Examples

Configure an Analytics Report

The following GET request for the bucket examplebucket returns the inventory configuration with the ID list1:

```
GET /?analytics&id=list1 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
```

Example

The following is a sample response to the preceding GET request.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJ7OOpXUueF6QKo
x-amz-request-id: 236A8905248E5A02
Date: Mon, 31 Oct 2016 12:00:00 GMT
Server: AmazonS3
Content-Length: length

<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Id>list1</Id>

GetBucketCors
Service: Amazon S3

Returns the Cross-Origin Resource Sharing (CORS) configuration information set for the bucket.

To use this operation, you must have permission to perform the s3:GetBucketCORS action. By default, the bucket owner has this permission and can grant it to others.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

For more information about CORS, see Enabling Cross-Origin Resource Sharing.

The following operations are related to GetBucketCors:

- PutBucketCors
- DeleteBucketCors

Request Syntax

GET /?cors HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 104)

The bucket name for which to get the cors configuration.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

x-amz-expected-bucket-owner (p. 104)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<corsConfiguration>
  <corsRule>
    <allowedHeader>string</allowedHeader>
    <allowedMethod>string</allowedMethod>
    <allowedOrigin>string</allowedOrigin>
    <exposeHeader>string</exposeHeader>
    <id>string</id>
    <maxAgeSeconds>integer</maxAgeSeconds>
  </corsRule>
</corsConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**CORSConfiguration** *(p. 105)*

Root level tag for the CORSConfiguration parameters.

Required: Yes

**CORSRule** *(p. 105)*

A set of origins and methods (cross-origin access that you want to allow). You can add up to 100 rules to the configuration.

Type: Array of **CORSRule** *(p. 698)* data types

Examples

**Configure CORS Sample Request**

The following PUT request adds the cors subresource to a bucket (examplebucket).

```
PUT /?cors HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Tue, 21 Aug 2012 17:54:50 GMT
Content-MD5: 8dYiLewFWZyGgV2Q5FNI4W==
Authorization: authorization string
Content-Length: 216

<corsConfiguration>
  <corsRule>
    <allowedOrigin>http://www.example.com</allowedOrigin>
    <allowedMethod>PUT</allowedMethod>
    <allowedMethod>POST</allowedMethod>
    <allowedMethod>DELETE</allowedMethod>
    <allowedHeader>*</allowedHeader>
    <maxAgeSeconds>3000</maxAgeSeconds>
  </corsRule>
</corsConfiguration>
```
<ExposeHeader>x-amz-server-side-encryption</ExposeHeader>
</CORSRule>
</CORSConfiguration>

Example

This is the sample response to the preceding request.

HTTP/1.1 200 OK
x-amz-id-2: CCshOvb0PfxzhwOADyC4qHj/Ck3F9Q0viXKw3rivZ+GcBoZ500ahvEJfPisZB7B
x-amz-request-id: BDC4B83DF5096B8E
Date: Tue, 21 Aug 2012 17:54:50 GMT
Server: AmazonS3

Sample Request: Retrieve cors subresource

The following example gets the cors subresource of a bucket.

GET /?cors HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Tue, 13 Dec 2011 19:14:42 GMT
Authorization: signatureValue

Example

Sample Response

HTTP/1.1 200 OK
x-amz-id-2: 0FmFIWsh/PpBuzzZ0JFRCC55ZGMqQ4SHJ7xVDqKwhEdJmf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: 0CF05E9BCF63097
Date: Tue, 13 Dec 2011 19:14:42 GMT
Server: AmazonS3
Content-Length: 270
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
  </CORSRule>
  <ExposeHeader>x-amz-server-side-encryption</ExposeHeader>
</CORSConfiguration>

GetBucketEncryption
Service: Amazon S3

Returns the default encryption configuration for an Amazon S3 bucket. By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3). For information about the bucket default encryption feature, see Amazon S3 Bucket Default Encryption in the Amazon S3 User Guide.

To use this operation, you must have permission to perform the s3:GetEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

The following operations are related to GetBucketEncryption:

- PutBucketEncryption
- DeleteBucketEncryption

Request Syntax

```
GET /?encryption HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 108)**

The name of the bucket from which the server-side encryption configuration is retrieved.

Required: Yes

**x-amz-expected-bucket-owner (p. 108)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ServerSideEncryptionConfiguration>
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <KMSMasterKeyID>string</KMSMasterKeyID>
      <SSEAlgorithm>String</SSEAlgorithm>
    </ApplyServerSideEncryptionByDefault>
    <BucketKeyEnabled>boolean</BucketKeyEnabled>
  </Rule>
  ...
</ServerSideEncryptionConfiguration>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

ServerSideEncryptionConfiguration (p. 108)

Root level tag for the ServerSideEncryptionConfiguration parameters.

Required: Yes

Rule (p. 108)

Container for information about a particular server-side encryption configuration rule.

Type: Array of ServerSideEncryptionRule (p. 829) data types

Examples

Sample Request: Retrieve the encryption configuration for an S3 bucket

The following example shows a GET /?encryption request.

```
GET /?encryption HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 06 Sep 2017 12:00:00 GMT
Authorization: authorization string
Content-Length: length
```

Sample Response

This example illustrates one usage of GetBucketEncryption.

```
HTTP/1.1 200 OK
x-amz-id-2: kDmqsuw5FDmgLmxQaUkd9A4NJ/PIiE0c1rAU/ue2Yp60toXs4I5k5fqlwZsA6fV
+wJQCzRRwygQ=
x-amz-request-id: 5D8706FCB2673B7D
Date: Wed, 06 Sep 2017 12:00:00 GMT
Transfer-Encoding: chunked
Server: AmazonS3

  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>aws:kms</SSEAlgorithm>
      <KMSKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSKeyID>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

GetBucketIntelligentTieringConfiguration
Service: Amazon S3

Gets the S3 Intelligent-Tiering configuration from the specified bucket.

The S3 Intelligent-Tiering storage class is designed to optimize storage costs by automatically moving data to the most cost-effective storage access tier, without performance impact or operational overhead. S3 Intelligent-Tiering delivers automatic cost savings in three low latency and high throughput access tiers. To get the lowest storage cost on data that can be accessed in minutes to hours, you can choose to activate additional archiving capabilities.

The S3 Intelligent-Tiering storage class is the ideal storage class for data with unknown, changing, or unpredictable access patterns, independent of object size or retention period. If the size of an object is less than 128 KB, it is not monitored and not eligible for auto-tiering. Smaller objects can be stored, but they are always charged at the Frequent Access tier rates in the S3 Intelligent-Tiering storage class.

For more information, see Storage class for automatically optimizing frequently and infrequently accessed objects.

Operations related to GetBucketIntelligentTieringConfiguration include:

- DeleteBucketIntelligentTieringConfiguration
- PutBucketIntelligentTieringConfiguration
- ListBucketIntelligentTieringConfigurations

Request Syntax

GET /?intelligent-tiering&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 111)**

The name of the Amazon S3 bucket whose configuration you want to modify or retrieve.

Required: Yes

**id (p. 111)**

The ID used to identify the S3 Intelligent-Tiering configuration.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<IntelligentTieringConfiguration>
  <Id>string</Id>
</IntelligentTieringConfiguration>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**IntelligentTieringConfiguration (p. 111)**

Root level tag for the IntelligentTieringConfiguration parameters.

Required: Yes

**Filter (p. 111)**

Specifies a bucket filter. The configuration only includes objects that meet the filter's criteria.

Type: IntelligentTieringFilter (p. 740) data type

**Id (p. 111)**

The ID used to identify the S3 Intelligent-Tiering configuration.

Type: String

**Status (p. 111)**

Specifies the status of the configuration.

Type: String

Valid Values: Enabled | Disabled

**Tiering (p. 111)**

Specifies the S3 Intelligent-Tiering storage class tier of the configuration.

Type: Array of Tiering (p. 841) data types

**See Also**

GetBucketInventoryConfiguration
Service: Amazon S3

Returns an inventory configuration (identified by the inventory configuration ID) from the bucket.

To use this operation, you must have permissions to perform the s3:GetInventoryConfiguration action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about the Amazon S3 inventory feature, see Amazon S3 Inventory.

The following operations are related to GetBucketInventoryConfiguration:

- DeleteBucketInventoryConfiguration
- ListBucketInventoryConfigurations
- PutBucketInventoryConfiguration

Request Syntax

GET /?inventory&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 114)

The name of the bucket containing the inventory configuration to retrieve.

Required: Yes

id (p. 114)

The ID used to identify the inventory configuration.

Required: Yes

x-amz-expected-bucket-owner (p. 114)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<InventoryConfiguration>
  <Destination>
    <S3BucketDestination>
      <AccountId>string</AccountId>
    </S3BucketDestination>
  </Destination>
</InventoryConfiguration>
<Bucket>string</Bucket>
<Encryption>
  <SSE-KMS>
    <KeyId>string</KeyId>
  </SSE-KMS>
  <SSE-S3>
  </SSE-S3>
</Encryption>
<Prefix>string</Prefix>
</S3BucketDestination>

<IsEnabled>boolean</IsEnabled>
<Filter>
  <Prefix>string</Prefix>
</Filter>
<Id>string</Id>
<IncludedObjectVersions>string</IncludedObjectVersions>

<OptionalFields>
  <Field>string</Field>
</OptionalFields>

<Schedule>
  <Frequency>string</Frequency>
</Schedule>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**InventoryConfiguration (p. 114)**

Root level tag for the InventoryConfiguration parameters.

Required: Yes

**Destination (p. 114)**

Contains information about where to publish the inventory results.

Type: InventoryDestination (p. 743) data type

**Filter (p. 114)**

Specifies an inventory filter. The inventory only includes objects that meet the filter's criteria.

Type: InventoryFilter (p. 745) data type

**Id (p. 114)**

The ID used to identify the inventory configuration.

Type: String

**IncludedObjectVersions (p. 114)**

Object versions to include in the inventory list. If set to All, the list includes all the object versions, which adds the version-related fields VersionId, IsLatest, and DeleteMarker to the list. If set to Current, the list does not contain these version-related fields.

Type: String

Valid Values: All | Current
**IsEnabled** *(p. 114)*

Specifies whether the inventory is enabled or disabled. If set to `true`, an inventory list is generated. If set to `false`, no inventory list is generated.

Type: Boolean

**OptionalFields** *(p. 114)*

Contains the optional fields that are included in the inventory results.

Type: Array of strings

Valid Values: `Size` | `LastModifiedDate` | `StorageClass` | `ETag` | `IsMultipartUploaded` | `ReplicationStatus` | `ObjectLockRetainUntilDate` | `ObjectLockMode` | `ObjectLockLegalHoldStatus` | `IntelligentTieringAccessTier` | `BucketKeyStatus` | `ChecksumAlgorithm` | `ObjectAccessControlList` | `ObjectOwner`

**Schedule** *(p. 114)*

Specifies the schedule for generating inventory results.

Type: `InventorySchedule` *(p. 748)* data type

**Examples**

**Sample Request: Configure an inventory report**

The following GET request for the bucket `examplebucket` returns the inventory configuration with the ID `list1`.

```
GET /?inventory&id=list1 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
```

**Sample Response**

This example illustrates one usage of `GetBucketInventoryConfiguration`.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUA6qkf3Shjt0O0pXueF6QKo

**GetBucketLifecycle**
Service: Amazon S3

**Important**
For an updated version of this API, see GetBucketLifecycleConfiguration. If you configured a bucket lifecycle using the filter element, you should see the updated version of this topic. This topic is provided for backward compatibility.

Returns the lifecycle configuration information set on the bucket. For information about lifecycle configuration, see Object Lifecycle Management.

To use this operation, you must have permission to perform the s3:GetLifecycleConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

GetBucketLifecycle has the following special error:

- Error code: NoSuchLifecycleConfiguration
  - Description: The lifecycle configuration does not exist.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client

The following operations are related to GetBucketLifecycle:

- GetBucketLifecycleConfiguration
- PutBucketLifecycle
- DeleteBucketLifecycle

**Request Syntax**

```
GET /lifecycle HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 118)**

The name of the bucket for which to get the lifecycle information.

Required: Yes

**x-amz-expected-bucket-owner (p. 118)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<LifecycleConfiguration>
  <Rule>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>integer</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
    <Expiration>
      <Date>timestamp</Date>
      <Days>integer</Days>
      <ExpiredObjectDeleteMarker>boolean</ExpiredObjectDeleteMarker>
    </Expiration>
    <ID>string</ID>
    <NoncurrentVersionExpiration>
      <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
      <NoncurrentDays>integer</NoncurrentDays>
    </NoncurrentVersionExpiration>
    <NoncurrentVersionTransition>
      <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
      <NoncurrentDays>integer</NoncurrentDays>
      <StorageClass>string</StorageClass>
    </NoncurrentVersionTransition>
    <Prefix>string</Prefix>
    <Status>string</Status>
    <Transition>
      <Date>timestamp</Date>
      <Days>integer</Days>
      <StorageClass>string</StorageClass>
    </Transition>
  </Rule>
  ...
</LifecycleConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

LifecycleConfiguration (p. 119)

Root level tag for the LifecycleConfiguration parameters.

Required: Yes

Rule (p. 119)

Container for a lifecycle rule.

Type: Array of Rule (p. 819) data types

Examples

Sample Request: Retrieve a lifecycle subresource

This example is a GET request to retrieve the lifecycle subresource from the specified bucket, and an example response with the returned lifecycle configuration.
Sample Response

This example illustrates one usage of GetBucketLifecycle.

HTTP/1.1 200 OK

GetBucketLifecycleConfiguration

Service: Amazon S3

**Note**

Bucket lifecycle configuration now supports specifying a lifecycle rule using an object key name prefix, one or more object tags, or a combination of both. Accordingly, this section describes the latest API. The response describes the new filter element that you can use to specify a filter to select a subset of objects to which the rule applies. If you are using a previous version of the lifecycle configuration, it still works. For the earlier action, see GetBucketLifecycle.

Returns the lifecycle configuration information set on the bucket. For information about lifecycle configuration, see Object Lifecycle Management.

To use this operation, you must have permission to perform the s3:GetLifecycleConfiguration action. The bucket owner has this permission, by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

GetBucketLifecycleConfiguration has the following special error:

- **Error code:** NoSuchLifecycleConfiguration
  - **Description:** The lifecycle configuration does not exist.
  - **HTTP Status Code:** 404 Not Found
  - **SOAP Fault Code Prefix:** Client

The following operations are related to GetBucketLifecycleConfiguration:

- GetBucketLifecycle
- PutBucketLifecycle
- DeleteBucketLifecycle

**Request Syntax**

```
GET /?lifecycle HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 121)**

The name of the bucket for which to get the lifecycle information.

Required: Yes

**x-amz-expected-bucket-owner (p. 121)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<LifecycleConfiguration>
  <Rule>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>integer</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>

    </Transition>
    ...
  </Rule>
  ...
</LifecycleConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
LifecycleConfiguration (p. 122)

Root level tag for the LifecycleConfiguration parameters.

Required: Yes

Rule (p. 122)

Container for a lifecycle rule.

Type: Array of LifecycleRule (p. 755) data types

Examples

Sample Request

This example illustrates one usage of GetBucketLifecycleConfiguration.

```
GET /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2012 00:17:21 GMT
Authorization: signatureValue
```

Sample Response

This example illustrates one usage of GetBucketLifecycleConfiguration.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4RYmXa3rPli4hkJXouTf0hccUjo0iCPjz6FnIutBj3M7fPGlW0D2Ewp

GetBucketLocation
Service: Amazon S3

Returns the Region the bucket resides in. You set the bucket's Region using the LocationConstraint request parameter in a CreateBucket request. For more information, see CreateBucket.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Note
We recommend that you use HeadBucket to return the Region that a bucket resides in. For backward compatibility, Amazon S3 continues to support GetBucketLocation.

The following operations are related to GetBucketLocation:

• GetObject
• CreateBucket

Request Syntax

GET /?location HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 125)

The name of the bucket for which to get the location.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

x-amz-expected-bucket-owner (p. 125)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<LocationConstraint>
  <LocationConstraint>string</LocationConstraint>
</LocationConstraint>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**LocationConstraint (p. 125)**

Root level tag for the LocationConstraint parameters.

Required: Yes

**LocationConstraint (p. 125)**

Specifies the Region where the bucket resides. For a list of all the Amazon S3 supported location constraints by Region, see Regions and Endpoints. Buckets in Region us-east-1 have a LocationConstraint of null.

Type: String

Examples

Sample Request

The following request returns the Region of the specified bucket.

```
GET /?location HTTP/1.1
Host: myBucket.s3.amazonaws.com
Date: Tue, 09 Oct 2007 20:26:04 +0000
Authorization: signatureValue
```

Sample Response

This example illustrates one usage of GetBucketLocation.

```
<?xml version="1.0" encoding="UTF-8"?>
<LocationConstraint xmlns="http://s3.amazonaws.com/doc/2006-03-01/">us-west-2</LocationConstraint>
```

See Also

GetBucketLogging
Service: Amazon S3

Returns the logging status of a bucket and the permissions users have to view and modify that status.

The following operations are related to GetBucketLogging:

- CreateBucket
- PutBucketLogging

Request Syntax

GET /?logging HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 128)

The bucket name for which to get the logging information.
Required: Yes

x-amz-expected-bucket-owner (p. 128)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<BucketLoggingStatus>
  <LoggingEnabled>
    <TargetBucket>string</TargetBucket>
    <TargetGrants>
      <Grant>
        <Grantee>
          <DisplayName>string</DisplayName>
          <EmailAddress>string</EmailAddress>
          <ID>string</ID>
          <xsi:type>string</xsi:type>
          <URI>string</URI>
        </Grantee>
        <Permission>string</Permission>
      </Grant>
    </TargetGrants>
    <TargetPrefix>string</TargetPrefix>
  </LoggingEnabled>
</BucketLoggingStatus>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**BucketLoggingStatus (p. 128)**

Root level tag for the BucketLoggingStatus parameters.

Required: Yes

**LoggingEnabled (p. 128)**

Describes where logs are stored and the prefix that Amazon S3 assigns to all log object keys for a bucket. For more information, see [PUT Bucket logging](#) in the Amazon S3 API Reference.

Type: [LoggingEnabled (p. 760)](##) data type

Examples

Sample Request

The following request returns the logging status for mybucket.

```
GET ?logging HTTP/1.1
Host: mybucket.s3.<Region>.amazonaws.com
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string
```

Sample Response: Showing an enabled logging status

This example illustrates one usage of GetBucketLogging.

```
HTTP/1.1 200 OK
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<BucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <LoggingEnabled>
    <TargetBucket>mybucketlogs</TargetBucket>
    <TargetPrefix>mybucket-access_log-/</TargetPrefix>
    <TargetGrants>
      <Grant>
        <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail">
          <EmailAddress>user@company.com</EmailAddress>
        </Grantee>
        <Permission>READ</Permission>
      </Grant>
    </TargetGrants>
  </LoggingEnabled>
</BucketLoggingStatus>
```
Sample Response: Showing a disabled logging status

This example illustrates one usage of GetBucketLogging.

```xml
<?xml version="1.0" encoding="UTF-8"?>
```

GetBucketMetricsConfiguration

Service: Amazon S3

Gets a metrics configuration (specified by the metrics configuration ID) from the bucket. Note that this doesn't include the daily storage metrics.

To use this operation, you must have permissions to perform the s3:GetMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch.

The following operations are related to GetBucketMetricsConfiguration:

- PutBucketMetricsConfiguration
- DeleteBucketMetricsConfiguration
- ListBucketMetricsConfigurations
- Monitoring Metrics with Amazon CloudWatch

Request Syntax

```
GET /?metrics&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
```
<?xml version="1.0" encoding="UTF-8"?>
<MetricsConfiguration>
  <Id>string</Id>
  <Filter>
    <AccessPointArn>string</AccessPointArn>
    <And>
      <AccessPointArn>string</AccessPointArn>
      <Prefix>string</Prefix>
      <Tag>
        <Key>string</Key>
        <Value>string</Value>
      </Tag>
    </And>
    <Prefix>string</Prefix>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </Filter>
</MetricsConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**MetricsConfiguration (p. 131)**

Root level tag for the MetricsConfiguration parameters.

Required: Yes

**Filter (p. 131)**

Specifies a metrics configuration filter. The metrics configuration will only include objects that meet the filter's criteria. A filter must be a prefix, an object tag, an access point ARN, or a conjunction (MetricsAndOperator).

Type: [MetricsFilter](p. 765) data type

**Id (p. 131)**

The ID used to identify the metrics configuration. The ID has a 64 character limit and can only contain letters, numbers, periods, dashes, and underscores.

Type: String

Examples

**First Sample Request**

Retrieve a metrics configuration that filters metrics based on a specified prefix.

```
GET /?metrics&id=Documents HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
```
First Sample Response

This example illustrates one usage of GetBucketMetricsConfiguration.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Id>Documents</Id>
  <Filter>
    <Prefix>documents/</Prefix>
  </Filter>
</MetricsConfiguration>
```

Second Sample Request

Retrieve a metrics configuration that enables metrics for objects that start with a particular prefix and have specific tags applied.

```
GET /?metrics&id=ImportantBlueDocuments HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
```

Second Sample Response

This example illustrates one usage of GetBucketMetricsConfiguration.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Id>ImportantBlueDocuments</Id>
  <Filter>
    <And>
      <Prefix>documents/</Prefix>
      <Tag>
        <Key>priority</Key>
        <Value>high</Value>
      </Tag>
      <Tag>
        <Key>class</Key>
        <Value>blue</Value>
      </Tag>
    </And>
  </Filter>
</MetricsConfiguration>
```
Third Sample Request
Retrieve a metrics configuration that enables metrics for a specific access point.

GET /?metrics&id=ImportantDocumentsAccessPoint HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 26 Aug 2021 00:17:21 GMT
Authorization: signatureValue

Third Sample Response
This example illustrates one usage of GetBucketMetricsConfiguration.

HTTP/1.1 200 OK

GetBucketNotification
Service: Amazon S3

No longer used, see GetBucketNotificationConfiguration.

Request Syntax

```
GET /?notification HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket** *(p. 135)*

The name of the bucket for which to get the notification configuration.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

**x-amz-expected-bucket-owner** *(p. 135)*

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<NotificationConfiguration>
  <TopicConfiguration>
    <Event>string</Event>
    <Event>string</Event>
    ...
    <Id>string</Id>
    <Topic>string</Topic>
  </TopicConfiguration>
  <QueueConfiguration>
    <Event>string</Event>
    <Event>string</Event>
    ...
    <Id>string</Id>
    <Queue>string</Queue>
  </QueueConfiguration>
  <CloudFunctionConfiguration>
    <CloudFunction>string</CloudFunction>
  </CloudFunctionConfiguration>
</NotificationConfiguration>
```

API Version 2006-03-01
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**NotificationConfiguration (p. 135)**

Root level tag for the NotificationConfiguration parameters.

Required: Yes

**CloudFunctionConfiguration (p. 135)**

Container for specifying the AWS Lambda notification configuration.

Type: [CloudFunctionConfiguration](p. 685) data type

**QueueConfiguration (p. 135)**

This data type is deprecated. This data type specifies the configuration for publishing messages to an Amazon Simple Queue Service (Amazon SQS) queue when Amazon S3 detects specified events.

Type: [QueueConfigurationDeprecated](p. 799) data type

**TopicConfiguration (p. 135)**

This data type is deprecated. A container for specifying the configuration for publication of messages to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects specified events.

Type: [TopicConfigurationDeprecated](p. 844) data type

API Version 2006-03-01
GetBucketNotificationConfiguration
Service: Amazon S3

Returns the notification configuration of a bucket.

If notifications are not enabled on the bucket, the action returns an empty NotificationConfiguration element.

By default, you must be the bucket owner to read the notification configuration of a bucket. However, the bucket owner can use a bucket policy to grant permission to other users to read this configuration with the s3:GetBucketNotification permission.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

For more information about setting and reading the notification configuration on a bucket, see Setting Up Notification of Bucket Events. For more information about bucket policies, see Using Bucket Policies.

The following action is related to GetBucketNotification:

• PutBucketNotification

Request Syntax

GET /?notification HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 137)

The name of the bucket for which to get the notification configuration.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

x-amz-expected-bucket-owner (p. 137)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<NotificationConfiguration>
  <TopicConfiguration>
    <Event>string</Event>
    ...
    <Filter>
      <S3Key>
        <FilterRule>
          <Name>string</Name>
          <Value>string</Value>
        </FilterRule>
        ...
      </S3Key>
    </Filter>
    <Id>string</Id>
    <Topic>string</Topic>
  </TopicConfiguration>
  ...
  <QueueConfiguration>
    <Event>string</Event>
    ...
    <Filter>
      <S3Key>
        <FilterRule>
          <Name>string</Name>
          <Value>string</Value>
        </FilterRule>
        ...
      </S3Key>
    </Filter>
    <Id>string</Id>

          <Value>string</Value>
        </FilterRule>
      </S3Key>
    </Filter>
    <Id>string</Id>
    <CloudFunction>string</CloudFunction>
  </CloudFunctionConfiguration>
  ...
  <EventBridgeConfiguration>
  </EventBridgeConfiguration>
</NotificationConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
NotificationConfiguration (p. 138)

Root level tag for the NotificationConfiguration parameters.

Required: Yes

CloudFunctionConfiguration (p. 138)

Describes the AWS Lambda functions to invoke and the events for which to invoke them.

Type: Array of LambdaFunctionConfiguration (p. 751) data types

EventBridgeConfiguration (p. 138)

Enables delivery of events to Amazon EventBridge.

Type: EventBridgeConfiguration (p. 726) data type

QueueConfiguration (p. 138)

The Amazon Simple Queue Service queues to publish messages to and the events for which to publish messages.

Type: Array of QueueConfiguration (p. 797) data types

TopicConfiguration (p. 138)

The topic to which notifications are sent and the events for which notifications are generated.

Type: Array of TopicConfiguration (p. 842) data types

Examples

Sample Request

This request returns the notification configuration on the bucket quotes.s3.<Region>.amazonaws.com.

```
GET ?notification HTTP/1.1
Host: quotes.s3.<Region>.amazonaws.com
Date: Wed, 15 Oct 2014 16:59:03 GMT
Authorization: authorization string
```

Sample Response

This response returns that the notification configuration for the specified bucket.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfB1Ka2bj0KMgUAdQkf3ShJT00pXUueF6QKo
x-amz-request-id: 236AB905248E5A02
Date: Wed, 15 Oct 2014 16:59:04 GMT
Server: AmazonS3
<?xml version="1.0" encoding="UTF-8"?>

  <TopicConfiguration>
    <Id>YjVkM2Y0YmUtNGI3NC00ZjQyLWEwNGItNDIyYWUxY2I0N2M4</Id>
    <Topic>arn:aws:sns:us-east-1:account-id:s3notificationtopic2</Topic>
    <Event>s3:ReducedRedundancyLostObject</Event>
  </TopicConfiguration>
</NotificationConfiguration>
```

GetBucketOwnershipControls

Service: Amazon S3

Retrieves OwnershipControls for an Amazon S3 bucket. To use this operation, you must have the s3:GetBucketOwnershipControls permission. For more information about Amazon S3 permissions, see Specifying permissions in a policy.

For information about Amazon S3 Object Ownership, see Using Object Ownership.

The following operations are related to GetBucketOwnershipControls:

- PutBucketOwnershipControls (p. 340)
- DeleteBucketOwnershipControls (p. 66)

Request Syntax

```
GET /?ownershipControls HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 141)**

The name of the Amazon S3 bucket whose OwnershipControls you want to retrieve.

Required: Yes

**x-amz-expected-bucket-owner (p. 141)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<OwnershipControls>
  <Rule>
    <ObjectOwnership>string</ObjectOwnership>
  </Rule>
  ...
</OwnershipControls>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
OwnershipControls (p. 141)

Root level tag for the OwnershipControls parameters.

Required: Yes

Rule (p. 141)

The container element for an ownership control rule.

Type: Array of OwnershipControlsRule (p. 788) data types

Examples

Sample GetBucketOwnershipControls Request for BucketOwnerEnforced

This example illustrates one usage of GetBucketOwnershipControls.

```
GET /DOC-EXAMPLE-BUCKET?/ownershipControls HTTP/1.1
Host: DOC-EXAMPLE-BUCKET.s3.<Region>.amazonaws.com
Date: Mon, 29 Nov 2021 00:17:22 GMT
Authorization: signatureValue;
```

Sample GetBucketOwnershipControls Response

This example illustrates one usage of GetBucketOwnershipControls.

```
HTTP/1.1 200 OK
x-amz-id-2: Adphn7MaAHDEg9mh5JmcTN8mzyVX0JhIztSiQNaqTnxXXcYi4uiZbYdWc3JXmh/
XXVUUQw04Vs=
  x-amz-request-id: 252631E05F84A415
  Date: Mon, 29 Nov 2021 00:17:22 GMT
  Server: AmazonS3
  Content-Length: 194

<OwnershipControls xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Rule>
    <ObjectOwnership>BucketOwnerEnforced</ObjectOwnership>
  </Rule>
</OwnershipControls>
```

Sample GetBucketOwnershipControls Request for BucketOwnerPreferred

This example illustrates one usage of GetBucketOwnershipControls.

```
GET /DOC-EXAMPLE-BUCKET?/ownershipControls HTTP/1.1
Host: DOC-EXAMPLE-BUCKET.s3.<Region>.amazonaws.com
Date: Thu, 18 Jun 2017 00:17:22 GMT
Authorization: signatureValue;
```

Sample GetBucketOwnershipControls Response

This example illustrates one usage of GetBucketOwnershipControls.

**GetBucketPolicy**

Service: Amazon S3

Returns the policy of a specified bucket. If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the GetBucketPolicy permissions on the specified bucket and belong to the bucket owner's account in order to use this operation.

If you don't have GetBucketPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 405 Method Not Allowed error.

**Important**

To ensure that bucket owners don't inadvertently lock themselves out of their own buckets, the root principal in a bucket owner's AWS account can perform the GetBucketPolicy, PutBucketPolicy, and DeleteBucketPolicy API actions, even if their bucket policy explicitly denies the root principal's access. Bucket owner root principals can only be blocked from performing these API actions by VPC endpoint policies and AWS Organizations policies.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

For more information about bucket policies, see Using Bucket Policies and User Policies.

The following information about bucket policies, see Using Bucket Policies and User Policies.

The following information about bucket policies is related to GetBucketPolicy:

- GetObject

**Request Syntax**

```
GET /?policy HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 144)**

The bucket name for which to get the bucket policy.

To use this API operation against an access point, provide the alias of the access point in place of the bucket name.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

Required: Yes

**x-amz-expected-bucket-owner (p. 144)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200

{ Policy in JSON format }

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Examples

Sample Request

The following request returns the policy of the specified bucket.

GET ?policy HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string

Sample Response

This example illustrates one usage of GetBucketPolicy.

HTTP/1.1 200 OK

GetBucketPolicyStatus
Service: Amazon S3

Retrieves the policy status for an Amazon S3 bucket, indicating whether the bucket is public. In order to use this operation, you must have the s3:GetBucketPolicyStatus permission. For more information about Amazon S3 permissions, see Specifying Permissions in a Policy.

For more information about when Amazon S3 considers a bucket public, see The Meaning of “Public”.

The following operations are related to GetBucketPolicyStatus:

- Using Amazon S3 Block Public Access
- GetPublicAccessBlock
- PutPublicAccessBlock
- DeletePublicAccessBlock

Request Syntax

GET /?policyStatus HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 147)

The name of the Amazon S3 bucket whose policy status you want to retrieve.

Required: Yes

x-amz-expected-bucket-owner (p. 147)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<PolicyStatus>
  <IsPublic>boolean</IsPublic>
</PolicyStatus>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
**PolicyStatus (p. 147)**

Root level tag for the PolicyStatus parameters.

Required: Yes

**IsPublic (p. 147)**

The policy status for this bucket. TRUE indicates that this bucket is public. FALSE indicates that the bucket is not public.

Type: Boolean

**Examples**

**Sample Request**

The following request gets a bucket policy status.

```
GET /<bucket-name>?policyStatus HTTP/1.1
Host: <bucket-name>.s3.<Region>.amazonaws.com
x-amz-date: <Thu, 15 Nov 2016 00:17:21 GMT>
Authorization: <signatureValue>
```

**Sample Response**

This example illustrates one usage of GetBucketPolicyStatus.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hccUjo0iCPEXAMPLEutBj3M7fPGlW02SEWp
x-amz-request-id: 51991EXAMPLE5521
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
Content-Length: 0

<PolicyStatus>
  <IsPublic>TRUE</IsPublic>
</PolicyStatus>
```

GetBucketReplication
Service: Amazon S3

Returns the replication configuration of a bucket.

**Note**
It can take a while to propagate the put or delete a replication configuration to all Amazon S3 systems. Therefore, a get request soon after put or delete can return a wrong result.

For information about replication configuration, see [Replication](#) in the Amazon S3 User Guide.

This action requires permissions for the s3:GetReplicationConfiguration action. For more information about permissions, see [Using Bucket Policies and User Policies](#).

If you include the Filter element in a replication configuration, you must also include the DeleteMarkerReplication and Priority elements. The response also returns those elements.

For information about GetBucketReplication errors, see [List of replication-related error codes](#).

The following operations are related to GetBucketReplication:

- [PutBucketReplication](#)
- [DeleteBucketReplication](#)

**Request Syntax**

```
GET /?replication HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 150)**

The bucket name for which to get the replication information.

Required: Yes

**x-amz-expected-bucket-owner (p. 150)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ReplicationConfiguration>
  <Role>string</Role>
</ReplicationConfiguration>
```

API Version 2006-03-01
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
ReplicationConfiguration (p. 150)

Root level tag for the ReplicationConfiguration parameters.

Required: Yes

Role (p. 150)

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that Amazon S3 assumes when replicating objects. For more information, see How to Set Up Replication in the Amazon S3 User Guide.

Type: String

Rule (p. 150)

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

Type: Array of ReplicationRule (p. 807) data types

Examples

Sample Request: Retrieve replication configuration information

The following GET request retrieves information about the replication configuration set for the examplebucket bucket:

```
GET /?replication HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Tue, 10 Feb 2015 00:17:21 GMT
Authorization: authorization string
```

Sample Response

The following response shows that replication is enabled on the bucket. The empty prefix indicates that Amazon S3 will replicate all objects that are created in the examplebucket bucket. The Destination element identifies the target bucket where Amazon S3 creates the object replicas, and the storage class (STANDARD_IA) that Amazon S3 uses when creating replicas.

Amazon S3 assumes the specified IAM role to replicate objects on behalf of the bucket owner, which is the AWS account that created the bucket.

```

GetBucketRequestPayment
Service: Amazon S3

Returns the request payment configuration of a bucket. To use this version of the operation, you must be the bucket owner. For more information, see Requester Pays Buckets.

The following operations are related to GetBucketRequestPayment:

- ListObjects

Request Syntax

```
GET /?requestPayment HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 154)**

The name of the bucket for which to get the payment request configuration

Required: Yes

**x-amz-expected-bucket-owner (p. 154)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<RequestPaymentConfiguration>
  <Payer>string</Payer>
</RequestPaymentConfiguration>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**RequestPaymentConfiguration (p. 154)**

Root level tag for the RequestPaymentConfiguration parameters.

Required: Yes

**Payer (p. 154)**

Specifies who pays for the download and request fees.
Type: String

Valid Values: Requester | BucketOwner

Examples

Sample Request

The following request returns the payer for the bucket, colorpictures.

```
GET ?requestPayment HTTP/1.1
Host: colorpictures.s3.<Region>.amazonaws.com
Date: Wed, 01 Mar 2009 12:00:00 GMT
Authorization: authorization string
```

Sample Response

This response shows that the bucket is a Requester Pays bucket, meaning the person requesting a download from this bucket pays the transfer fees.

```
HTTP/1.1 200 OK

GetBucketTagging
Service: Amazon S3

Returns the tag set associated with the bucket.

To use this operation, you must have permission to perform the s3:GetBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

GetBucketTagging has the following special error:

- Error code: NoSuchTagSet
  - Description: There is no tag set associated with the bucket.

The following operations are related to GetBucketTagging:

- PutBucketTagging
- DeleteBucketTagging

Request Syntax

```
GET /?tagging HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket** *(p. 156)*

The name of the bucket for which to get the tagging information.

Required: Yes

**x-amz-expected-bucket-owner** *(p. 156)*

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<Tagging>
  <TagSet>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </TagSet>
</Tagging>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

Tagging (p. 156)

Root level tag for the Tagging parameters.

Required: Yes

TagSet (p. 156)

Contains the tag set.

Type: Array of Tag (p. 838) data types

Examples

Sample Request

The following request returns the tag set of the specified bucket.

GET ?tagging HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string

Sample Response

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

HTTP/1.1 200 OK
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

<Tagging>
  <TagSet>
    <Tag>
      <Key>Project</Key>
      <Value>Project One</Value>
    </Tag>
    <Tag>
      <Key>User</Key>
      <Value>jsmith</Value>
    </Tag>
  </TagSet>
</Tagging>

**GetBucketVersioning**

Service: Amazon S3

Returns the versioning state of a bucket.

To retrieve the versioning state of a bucket, you must be the bucket owner.

This implementation also returns the MFA Delete status of the versioning state. If the MFA Delete status is enabled, the bucket owner must use an authentication device to change the versioning state of the bucket.

The following operations are related to GetBucketVersioning:

- GetObject
- PutObject
- DeleteObject

**Request Syntax**

GET /?versioning HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 159)**

The name of the bucket for which to get the versioning information.

Required: Yes

**x-amz-expected-bucket-owner (p. 159)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<VersioningConfiguration>
  <Status>string</Status>
  <MfaDelete>string</MfaDelete>
</VersioningConfiguration>

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
**VersioningConfiguration (p. 159)**

Root level tag for the VersioningConfiguration parameters.

Required: Yes

**MFADelete (p. 159)**

Specifies whether MFA delete is enabled in the bucket versioning configuration. This element is only returned if the bucket has been configured with MFA delete. If the bucket has never been so configured, this element is not returned.

Type: String

Valid Values: Enabled | Disabled

**Status (p. 159)**

The versioning state of the bucket.

Type: String

Valid Values: Enabled | Suspended

**Examples**

**Example**

This example returns the versioning state of myBucket.

```
GET /?versioning HTTP/1.1
Host: myBucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
```

**Example**

There are three versioning states:

If you enabled versioning on a bucket, the response is:

```
  <Status>Enabled</Status>
</VersioningConfiguration>
```

**Example**

If you suspended versioning on a bucket, the response is:

```
  <Status>Suspended</Status>
</VersioningConfiguration>
```
Example

If you never enabled (or suspended) versioning on a bucket, the response is:

```xml
```

GetBucketWebsite
Service: Amazon S3

Returns the website configuration for a bucket. To host website on Amazon S3, you can configure a bucket as website by adding a website configuration. For more information about hosting websites, see Hosting Websites on Amazon S3.

This GET action requires the S3:GetBucketWebsite permission. By default, only the bucket owner can read the bucket website configuration. However, bucket owners can allow other users to read the website configuration by writing a bucket policy granting them the S3:GetBucketWebsite permission.

The following operations are related to GetBucketWebsite:

- DeleteBucketWebsite
- PutBucketWebsite

Request Syntax

GET /?website HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 162)**

The bucket name for which to get the website configuration.

Required: Yes

**x-amz-expected-bucket-owner (p. 162)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<WebsiteConfiguration>
  <RedirectAllRequestsTo>
    <HostName>string</HostName>
    <Protocol>string</Protocol>
  </RedirectAllRequestsTo>
  <IndexDocument>
    <Suffix>string</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>string</Key>
  </ErrorDocument>
  <RoutingRules>
    <RoutingRule>
      ...
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

WebsiteConfiguration (p. 162)

Root level tag for the WebsiteConfiguration parameters.

Required: Yes

ErrorDocument (p. 162)

The object key name of the website error document to use for 4XX class errors.

Type: ErrorDocument (p. 725) data type

IndexDocument (p. 162)

The name of the index document for the website (for example index.html).

Type: IndexDocument (p. 735) data type

RedirectAllRequestsTo (p. 162)

Specifies the redirect behavior of all requests to a website endpoint of an Amazon S3 bucket.

Type: RedirectAllRequestsTo (p. 804) data type

RoutingRules (p. 162)

Rules that define when a redirect is applied and the redirect behavior.

Type: Array of RoutingRule (p. 818) data types

Examples

Sample Request

This request retrieves website configuration on the specified bucket.

```
GET ?website HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Thu, 27 Jan 2011 00:49:20 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:n0Nhek72Ufg/u7Sm5C1dqRLs8XX=
```
Sample Response

This example illustrates one usage of GetBucketWebsite.

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShjT0O9pXUueF6QKo
x-amz-request-id: 3848CD259D811111
Date: Thu, 27 Jan 2011 00:49:26 GMT
Content-Length: 240
Content-Type: application/xml
Transfer-Encoding: chunked
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<WebsiteConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>404.html</Key>
  </ErrorDocument>
</WebsiteConfiguration>

GetObject
Service: Amazon S3

Retrieves objects from Amazon S3. To use GET, you must have READ access to the object. If you grant READ access to the anonymous user, you can return the object without using an authorization header.

An Amazon S3 bucket has no directory hierarchy such as you would find in a typical computer file system. You can, however, create a logical hierarchy by using object key names that imply a folder structure. For example, instead of naming an object sample.jpg, you can name it photos/2006/February/sample.jpg.

To get an object from such a logical hierarchy, specify the full key name for the object in the GET operation. For a virtual hosted-style request example, if you have the object photos/2006/February/sample.jpg, specify the resource as /photos/2006/February/sample.jpg. For a path-style request example, if you have the object photos/2006/February/sample.jpg in the bucket named examplebucket, specify the resource as /examplebucket/photos/2006/February/sample.jpg. For more information about request types, see HTTP Host Header Bucket Specification.

For more information about returning the ACL of an object, see GetObjectAcl.

If the object you are retrieving is stored in the S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive storage class, or S3 Intelligent-Tiering Archive or S3 Intelligent-Tiering Deep Archive tiers, before you can retrieve the object you must first restore a copy using RestoreObject. Otherwise, this action returns an InvalidObjectState error. For information about restoring archived objects, see Restoring Archived Objects.

Encryption request headers, like x-amz-server-side-encryption, should not be sent for GET requests if your object uses server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS), dual-layer server-side encryption with AWS KMS keys (DSSE-KMS), or server-side encryption with Amazon S3 managed encryption keys (SSE-S3). If your object does use these types of keys, you'll get an HTTP 400 Bad Request error.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you GET the object, you must use the following headers:

- x-amz-server-side-encryption-customer-algorithm
- x-amz-server-side-encryption-customer-key
- x-amz-server-side-encryption-customer-key-MD5

For more information about SSE-C, see Server-Side Encryption (Using Customer-Provided Encryption Keys).

Assuming you have the relevant permission to read object tags, the response also returns the x-amz-tagging-count header that provides the count of number of tags associated with the object. You can use GetObjectTagging to retrieve the tag set associated with an object.

Permissions

You need the relevant read object (or version) permission for this operation. For more information, see Specifying Permissions in a Policy. If the object that you request doesn't exist, the error that Amazon S3 returns depends on whether you also have the s3:ListBucket permission.

If you have the s3:ListBucket permission on the bucket, Amazon S3 returns an HTTP status code 404 (Not Found) error.

If you don't have the s3:ListBucket permission, Amazon S3 returns an HTTP status code 403 ("access denied") error.
Versioning

By default, the GET action returns the current version of an object. To return a different version, use the versionId subresource.

**Note**
- If you supply a versionId, you need the s3:GetObjectVersion permission to access a specific version of an object. If you request a specific version, you do not need to have the s3:GetObject permission. If you request the current version without a specific version ID, only s3:GetObject permission is required. s3:GetObjectVersion permission won't be required.
- If the current version of the object is a delete marker, Amazon S3 behaves as if the object was deleted and includes x-amz-delete-marker: true in the response.
- If the specified version is a delete marker, the response returns a 405 (Method Not Allowed) error and the Last-Modified: timestamp response header.

For more information about versioning, see [PutBucketVersioning](#).

Overriding Response Header Values

There are times when you want to override certain response header values in a GET response. For example, you might override the Content-Disposition response header value in your GET request.

You can override values for a set of response headers using the following query parameters. These response header values are sent only on a successful request, that is, when status code 200 OK is returned. The set of headers you can override using these parameters is a subset of the headers that Amazon S3 accepts when you create an object. The response headers that you can override for the GET response are Content-Type, Content-Language, Expires, Cache-Control, Content-Disposition, and Content-Encoding. To override these header values in the GET response, you use the following request parameters.

**Note**
You must sign the request, either using an Authorization header or a presigned URL, when using these parameters. They cannot be used with an unsigned (anonymous) request.

- `response-content-type`
- `response-content-language`
- `response-expires`
- `response-cache-control`
- `response-content-disposition`
- `response-content-encoding`

Overriding Response Header Values

If both of the If-Match and If-Unmodified-Since headers are present in the request as follows: If-Match condition evaluates to true, and; If-Unmodified-Since condition evaluates to false; then, S3 returns 200 OK and the data requested.

If both of the If-None-Match and If-Modified-Since headers are present in the request as follows: If-None-Match condition evaluates to false, and; If-Modified-Since condition evaluates to true; then, S3 returns 304 Not Modified response code.

For more information about conditional requests, see [RFC 7232](#).

The following operations are related to GetObject:

- `ListBuckets`
Request Syntax

GET /Key+xml.partNumber+?response-cache-control+ResponseCacheControl+&response-
content-disposition+ResponseContentDisposition+&response-
content-encoding+ResponseContentEncoding+&response-content-
language+ResponseContentLanguage+&response-content-type+ResponseContentType+&response-
expires+ResponseExpires+&versionId+VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
If-Match: IfMatch
If-Modified-Since: IfModifiedSince
If-None-Match: IfNoneMatch
If-Unmodified-Since: IfUnmodifiedSince
Range: Range
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-checksum-mode: ChecksumMode

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 167)

The bucket name containing the object.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When using an Object Lambda access point the hostname takes the form AccessPointName-AccountId.s3-object-lambda.Region.amazonaws.com.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

If-Match (p. 167)

Return the object only if its entity tag (ETag) is the same as the one specified; otherwise, return a 412 (precondition failed) error.

If-Modified-Since (p. 167)

Return the object only if it has been modified since the specified time; otherwise, return a 304 (not modified) error.

If-None-Match (p. 167)

Return the object only if its entity tag (ETag) is different from the one specified; otherwise, return a 304 (not modified) error.
If-Unmodified-Since (p. 167)

Return the object only if it has not been modified since the specified time; otherwise, return a 412 (precondition failed) error.

Key (p. 167)

Key of the object to get.

Length Constraints: Minimum length of 1.

Required: Yes

partNumber (p. 167)

Part number of the object being read. This is a positive integer between 1 and 10,000. Effectively performs a 'ranged' GET request for the part specified. Useful for downloading just a part of an object.

Range (p. 167)

Downloads the specified range bytes of an object. For more information about the HTTP Range header, see https://www.rfc-editor.org/rfc/rfc9110.html#name-range.

Note

Amazon S3 doesn't support retrieving multiple ranges of data per GET request.

response-cache-control (p. 167)

Sets the Cache-Control header of the response.

response-content-disposition (p. 167)

Sets the Content-Disposition header of the response

response-content-encoding (p. 167)

Sets the Content-Encoding header of the response.

response-content-language (p. 167)

Sets the Content-Language header of the response.

response-content-type (p. 167)

Sets the Content-Type header of the response.

response-expires (p. 167)

Sets the Expires header of the response.

versionId (p. 167)

VersionId used to reference a specific version of the object.

x-amz-checksum-mode (p. 167)

To retrieve the checksum, this mode must be enabled.

Valid Values: ENABLED

x-amz-expected-bucket-owner (p. 167)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 167)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket
has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-server-side-encryption-customer-algorithm (p. 167)

Specifies the algorithm to use to when decrypting the object (for example, AES256).

x-amz-server-side-encryption-customer-key (p. 167)

Specifies the customer-provided encryption key for Amazon S3 used to encrypt the data. This value is used to decrypt the object when recovering it and must match the one used when storing the data. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header.

x-amz-server-side-encryption-customer-key-MD5 (p. 167)

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
x-amz-delete-marker: DeleteMarker
accept-ranges: AcceptRanges
x-amz-expiration: Expiration
x-amz-restore: Restore
Last-Modified: LastModified
Content-Length: ContentLength
ETag: ETag
x-amz-checksum-crc52: ChecksumCRC52
x-amz-checksum-crc52c: ChecksumCRC52C
x-amz-checksum-sha1: ChecksumSHA1
x-amz-checksum-sha256: ChecksumSHA256
x-amz-missing-meta: MissingMeta
x-amz-version-id: VersionId
Cache-Control: CacheControl
Content-Disposition: ContentDisposition
Content-Encoding: ContentEncoding
Content-Language: ContentLanguage
Content-Range: ContentRange
Content-Type: ContentType
Expires: Expires
x-amz-website-redirect-location: WebsiteRedirectLocation
x-amz-server-side-encryption: ServerSideEncryption
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key-ids: SSECustomerKeyMD5
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled
x-amz-storage-class: StorageClass
x-amz-request-charged: RequestCharged
x-amz-replication-status: ReplicationStatus
x-amz-mp-parts-count: PartsCount
x-amz-tagging-count: TagCount
x-amz-object-lock-mode: ObjectLockMode
x-amz-object-lock-retain-until-date: ObjectLockRetainUntilDate
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

`accept-ranges (p. 169)`
Indicates that a range of bytes was specified.

`Cache-Control (p. 169)`
Specifies caching behavior along the request/reply chain.

`Content-Disposition (p. 169)`
Specifies presentational information for the object.

`Content-Encoding (p. 169)`
Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field.

`Content-Language (p. 169)`
The language the content is in.

`Content-Length (p. 169)`
Size of the body in bytes.

`Content-Range (p. 169)`
The portion of the object returned in the response.

`Content-Type (p. 169)`
A standard MIME type describing the format of the object data.

`ETag (p. 169)`
An entity tag (ETag) is an opaque identifier assigned by a web server to a specific version of a resource found at a URL.

`Expires (p. 169)`
The date and time at which the object is no longer cacheable.

`Last-Modified (p. 169)`
Date and time when the object was last modified.

`x-amz-checksum-crc32 (p. 169)`
The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

`x-amz-checksum-crc32c (p. 169)`
The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.
x-amz-checksum-sha1 (p. 169)

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

x-amz-checksum-sha256 (p. 169)

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

x-amz-delete-marker (p. 169)

Specifies whether the object retrieved was (true) or was not (false) a Delete Marker. If false, this response header does not appear in the response.

x-amz-expiration (p. 169)

If the object expiration is configured (see PUT Bucket lifecycle), the response includes this header. It includes the expiry-date and rule-id key-value pairs providing object expiration information. The value of the rule-id is URL-encoded.

x-amz-missing-meta (p. 169)

This is set to the number of metadata entries not returned in x-amz-meta headers. This can happen if you create metadata using an API like SOAP that supports more flexible metadata than the REST API. For example, using SOAP, you can create metadata whose values are not legal HTTP headers.

x-amz-mp-parts-count (p. 169)

The count of parts this object has. This value is only returned if you specify partNumber in your request and the object was uploaded as a multipart upload.

x-amz-object-lock-legal-hold (p. 169)

Indicates whether this object has an active legal hold. This field is only returned if you have permission to view an object's legal hold status.

Valid Values: ON | OFF

x-amz-object-lock-mode (p. 169)

The Object Lock mode currently in place for this object.

Valid Values: GOVERNANCE | COMPLIANCE

x-amz-object-lock-retain-until-date (p. 169)

The date and time when this object's Object Lock will expire.

x-amz-replication-status (p. 169)

Amazon S3 can return this if your request involves a bucket that is either a source or destination in a replication rule.

Valid Values: COMPLETE | PENDING | FAILED | REPLICA | COMPLETED

x-amz-request-charged (p. 169)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

x-amz-restore (p. 169)

Provides information about object restoration action and expiration time of the restored object copy.
**x-amz-server-side-encryption** *(p. 169)*

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id** *(p. 169)*

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled** *(p. 169)*

Indicates whether the object uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

**x-amz-server-side-encryption-customer-algorithm** *(p. 169)*

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

**x-amz-server-side-encryption-customer-key-MD5** *(p. 169)*

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

**x-amz-storage-class** *(p. 169)*

Provides storage class information of the object. Amazon S3 returns this header for all objects except for S3 Standard storage class objects.

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

**x-amz-tagging-count** *(p. 169)*

The number of tags, if any, on the object.

**x-amz-version-id** *(p. 169)*

Version of the object.

**x-amz-website-redirect-location** *(p. 169)*

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata.

The following data is returned in binary format by the service.

<varlistentry> **Body** *(p. 169)*  </varlistentry>

**Errors**

**InvalidObjectState**

Object is archived and inaccessible until restored.

HTTP Status Code: 400

**NoSuchKey**

The specified key does not exist.

HTTP Status Code: 400
**Examples**

**Sample Request**

The following request returns the object my-image.jpg.

```plaintext
GET /my-image.jpg HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Mon, 3 Oct 2016 22:32:00 GMT
Authorization: authorization string
```

**Sample Response**

This example illustrates one usage of GetObject.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed40pIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
Date: Mon, 3 Oct 2016 22:32:00 GMT
Last-Modified: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "fba9ddee5f27731c9771645a39863328"
Content-Length: 434234

[434234 bytes of object data]
```

**Sample Response: Object with associated tags**

If the object had tags associated with it, Amazon S3 returns the x-amz-tagging-count header with tag count.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed40pIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
Date: Mon, 3 Oct 2016 22:32:00 GMT
Last-Modified: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "fba9ddee5f27731c9771645a39863328"
Content-Length: 434234
x-amz-tagging-count: 2

[434234 bytes of object data]
```

**Sample Response: Object with an expiration**

If the object had expiration set using lifecycle configuration, you get the following response with the x-amz-expiration header.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed40pIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
Date: Wed, 28 Oct 2009 22:32:00 GMT
Last-Modified: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-expiration: expiry-date="Fri, 23 Dec 2012 00:00:00 GMT", rule-id="picture-deletion-rule"
```

API Version 2006-03-01

173
Sample Response if an object is archived in the S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive storage classes

If the object you are retrieving is stored in the S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive storage classes, you must first restore a copy using RestoreObject. Otherwise, this action returns an InvalidObjectState error.

HTTP/1.1 403 Forbidden
x-amz-request-id: CD4BD8A1310A11B3
x-amz-id-2: m9RDbQ0U0+RRBTj0UN1ChQ1eqMUnz9dv8b+KPG12gHFrJ2ZSrzMCoRP8RtPRzX9mb
Content-Type: application/xml
Date: Mon, 12 Nov 2012 23:53:21 GMT
Server: Amazon S3
Content-Length: 231

<Error>
  <Code>InvalidObjectState</Code>
  <Message>The action is not valid for the object's storage class</Message>
  <RequestId>9FEFFF118E15B86F</RequestId>
  <HostId>WVQ5kzhIT+oiufDC0i0Yv8W4Tk9eNcxW1/MK+hTS/av34Xy4rBU3zsavf0aaaaa</HostId>
</Error>

Sample Response if an object is archived with the S3 Intelligent-Tiering Archive or S3 Intelligent-Tiering Deep Archive tiers

If the object you are retrieving is stored in the S3 Intelligent-Tiering Archive or S3 Intelligent-Tiering Deep Archive tiers, you must first restore a copy using RestoreObject. Otherwise, this action returns an InvalidObjectState error. When restoring from Archive Access or Deep Archive Access tiers, the response will include StorageClass and AccessTier elements. Access tier valid values are ARCHIVE_ACCESS and DEEP_ARCHIVE_ACCESS. There is no syntax change if there is an ongoing restore.

HTTP/1.1 403 Forbidden
x-amz-request-id: CB6AWBC4332B23B7
x-amz-id-2: n3RRFT90+PJDuXut3nhGW2ehfhfNU5f55c+a2ceCC36ab7c7fe3a71Q273b9Q45b1R5

</Error>
Sample Response if the Latest Object Is a Delete Marker

Notice that the delete marker returns a 404 Not Found error.

```
HTTP/1.1 404 Not Found
x-amz-request-id: 318BC8BC148832E5
x-amz-id-2: eftik72aG6Ap5lTqzj7UDNEHGran
x-amz-version-id: 3GL4kqtlcXroDTDm3vJVBH40nt8X8g
x-amz-delete-marker: true
Date: Wed, 28 Oct 2009 22:32:00 GMT
Content-Type: text/plain
Connection: close
Server: AmazonS3
```

Sample Request: Getting a specified version of an object

The following request returns the specified version of an object.

```
GET /myObject?versionId=3/L4kqtlcXroDTDmpULo HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```

Sample Response: To a versioned object GET request

This example illustrates one usage of GetObject.

```
HTTP/1.1 200 OK
x-amz-id-2: eftik72aG6Ap5lTqzj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5

ETag: "0332beea17bf845f176c5c0d1ae7cf07"
Accept-Ranges: bytes
Content-Type: text/plain
Content-Length: 22
Server: AmazonS3
```

Sample Request: Range header

The following request specifies the HTTP Range header to retrieve the first 10 bytes of an object. For more information about the HTTP Range header, see https://www.rfc-editor.org/rfc/rfc9110.html#name-range.

Note
Amazon S3 doesn't support retrieving multiple ranges of data per GET request.

```
GET /example-object HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
x-amz-date: Fri, 28 Jan 2011 21:32:02 GMT
Range: bytes=0-9
Authorization: AWS AKIAIOSFODNN7EXAMPLE:Yxg83MZaEgh30Z3l0rLo5RTX110=
```

Sample Response

In the following sample response, note that the header values are set to the values specified in the true request.

```
HTTP/1.1 206 Partial Content
x-amz-id-2: MzRISOwyjmnupCzjI1WC06L5TTAzm7/JypPGXLh80VFgcJaaoK3K/W/hRAqKOpIEEp

Last-Modified: Fri, 28 Jan 2011 20:10:32 GMT
ETag: "b2419b1e3fd45d596ee22bf62aaaa2f"
Accept-Ranges: bytes
Content-Range: bytes 0-9/443
Content-Type: text/plain
Content-Length: 10
```
Sample: Get an object stored using server-side encryption with customer-provided encryption keys

If an object is stored in Amazon S3 using server-side encryption with customer-provided encryption keys, Amazon S3 needs encryption information so that it can decrypt the object before sending it to you in response to a GET request. You provide the encryption information in your GET request using the relevant headers, as shown in the following example request.

```
GET /example-object HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Accept: */*
Authorization: authorization string
Date: Wed, 28 May 2014 19:24:44 +0000
x-amz-server-side-encryption-customer-key:g01CfA3Dv40jZz5SQJ1ZukLRFqtISwocC/8SEKEXAMPLE
x-amz-server-side-encryption-customer-key-MD5:ZjQrne1X/iTcskbY2m3example
x-amz-server-side-encryption-customer-algorithm:AES256
```

Sample Response

The following sample response shows some of the response headers Amazon S3 returns. Note that it includes the encryption information in the response.

```
HTTP/1.1 200 OK
x-amz-id-2: ka5jRm8X3N12ZiY29Z989zg2tNSJPMcK+to7jNjxImXBbyChqc6tLAv+sau7Vjzh
x-amz-request-id: 195157E3E073D3F9
Date: Wed, 28 May 2014 19:24:45 GMT
Last-Modified: Wed, 28 May 2014 19:21:01 GMT
ETag: "c12022c9a3c6d3a28d29d90033a2b096"
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbY2m3example
```

GetObjectAcl
Service: Amazon S3

Returns the access control list (ACL) of an object. To use this operation, you must have s3:GetObjectAcl permissions or READ_ACP access to the object. For more information, see Mapping of ACL permissions and access policy permissions in the Amazon S3 User Guide

This action is not supported by Amazon S3 on Outposts.

By default, GET returns ACL information about the current version of an object. To return ACL information about a different version, use the versionId subresource.

Note
If your bucket uses the bucket owner enforced setting for S3 Object Ownership, requests to read ACLs are still supported and return the bucket-owner-full-control ACL with the owner being the account that created the bucket. For more information, see Controlling object ownership and disabling ACLs in the Amazon S3 User Guide.

The following operations are related to GetObjectAcl:

- GetObject
- GetObjectAttributes
- DeleteObject
- PutObject

Request Syntax

GET /{Key+}?acl&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 178)**

The bucket name that contains the object for which to get the ACL information.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName.AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

Required: Yes

**Key (p. 178)**

The key of the object for which to get the ACL information.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 178)**

Used to reference a specific version of the object.
x-amz-expected-bucket-owner (p. 178)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 178)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<AccessControlPolicy>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee>
        <DisplayName>string</DisplayName>
        <EmailAddress>string</EmailAddress>
        <ID>string</ID>
        <xsi:type>string</xsi:type>
        <URI>string</URI>
      </Grantee>
      <Permission>string</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 179)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.

AccessControlPolicy (p. 179)

Root level tag for the AccessControlPolicy parameters.
Required: Yes

**Grants (p. 179)**

A list of grants.

Type: Array of **Grant (p. 732)** data types

**Owner (p. 179)**

Container for the bucket owner's display name and ID.

Type: **Owner (p. 786)** data type

**Errors**

**NoSuchKey**

The specified key does not exist.

HTTP Status Code: 400

**Examples**

**Sample Request**

The following request returns information, including the ACL, of the object `my-image.jpg`.

GET /my-image.jpg?acl HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string

**Sample Response**

This example illustrates one usage of GetObjectAcl.

HTTP/1.1 200 OK

GetObjectAttributes
Service: Amazon S3

Retrieves all the metadata from an object without returning the object itself. This action is useful if you're interested only in an object's metadata. To use GetObjectAttributes, you must have READ access to the object.

GetObjectAttributes combines the functionality of HeadObject and ListParts. All of the data returned with each of those individual calls can be returned with a single call to GetObjectAttributes.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you retrieve the metadata from the object, you must use the following headers:

- x-amz-server-side-encryption-customer-algorithm
- x-amz-server-side-encryption-customer-key
- x-amz-server-side-encryption-customer-key-MD5

For more information about SSE-C, see Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon S3 User Guide.

Note

- Encryption request headers, such as x-amz-server-side-encryption, should not be sent for GET requests if your object uses server-side encryption with AWS KMS keys stored in AWS Key Management Service (SSE-KMS) or server-side encryption with Amazon S3 managed keys (SSE-S3). If your object does use these types of keys, you'll get an HTTP 400 Bad Request error.
- The last modified property in this case is the creation date of the object.

Consider the following when using request headers:

- If both of the If-Match and If-Unmodified-Since headers are present in the request as follows, then Amazon S3 returns the HTTP status code 200 OK and the data requested:
  - If-Match condition evaluates to true.
  - If-Unmodified-Since condition evaluates to false.
- If both of the If-None-Match and If-Modified-Since headers are present in the request as follows, then Amazon S3 returns the HTTP status code 304 Not Modified:
  - If-None-Match condition evaluates to false.
  - If-Modified-Since condition evaluates to true.

For more information about conditional requests, see RFC 7232.

Permissions

The permissions that you need to use this operation depend on whether the bucket is versioned. If the bucket is versioned, you need both the s3:GetObjectVersion and s3:GetObjectVersionAttributes permissions for this operation. If the bucket is not versioned, you need the s3:GetObject and s3:GetObjectAttributes permissions. For more information, see Specifying Permissions in a Policy in the Amazon S3 User Guide. If the object that you request does not exist, the error Amazon S3 returns depends on whether you also have the s3:ListBucket permission.
• If you have the s3:ListBucket permission on the bucket, Amazon S3 returns an HTTP status code 404 Not Found ("no such key") error.
• If you don't have the s3:ListBucket permission, Amazon S3 returns an HTTP status code 403 Forbidden ("access denied") error.

The following actions are related to GetObjectAttributes:

• GetObject
• GetObjectAcl
• GetObjectLegalHold
• GetObjectLockConfiguration
• GetObjectRetention
• GetObjectTagging
• HeadObject
• ListObject
• ListParts

Request Syntax

GET /{Key+}?attributes&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-max-parts: MaxParts
x-amz-part-number-marker: PartNumberMarker
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-object-attributes: ObjectAttributes

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 184)

The name of the bucket that contains the object.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostID.s3-outsposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

Key (p. 184)

The object key.
Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 184)**

The version ID used to reference a specific version of the object.

**x-amz-expected-bucket-owner (p. 184)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-max-parts (p. 184)**

Sets the maximum number of parts to return.

**x-amz-object-attributes (p. 184)**

Specifies the fields at the root level that you want returned in the response. Fields that you do not specify are not returned.

Valid Values: ETag | Checksum | ObjectParts | StorageClass | ObjectSize

Required: Yes

**x-amz-part-number-marker (p. 184)**

Specifies the part after which listing should begin. Only parts with higher part numbers will be listed.

**x-amz-request-payer (p. 184)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Requester-Pays-Buckets.html) in the Amazon S3 User Guide.

Valid Values: requester

**x-amz-server-side-encryption-customer-algorithm (p. 184)**

Specifies the algorithm to use when encrypting the object (for example, AES256).

**x-amz-server-side-encryption-customer-key (p. 184)**

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header.

**x-amz-server-side-encryption-customer-key-MD5 (p. 184)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
x-amz-delete-marker: DeleteMarker
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**Last-Modified (p. 185)**

The creation date of the object.

**x-amz-delete-marker (p. 185)**

Specifies whether the object retrieved was (true) or was not (false) a delete marker. If false, this response header does not appear in the response.

**x-amz-request-charged (p. 185)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**x-amz-version-id (p. 185)**

The version ID of the object.

The following data is returned in XML format by the service.

**GetObjectAttributesOutput (p. 185)**

Root level tag for the GetObjectAttributesOutput parameters.

Required: Yes
Checksum (p. 185)

The checksum or digest of the object.

Type: Checksum (p. 683) data type

ETag (p. 185)

An ETag is an opaque identifier assigned by a web server to a specific version of a resource found at a URL.

Type: String

ObjectParts (p. 185)

A collection of parts associated with a multipart upload.

Type: GetObjectAttributesParts (p. 729) data type

ObjectSize (p. 185)

The size of the object in bytes.

Type: Long

StorageClass (p. 185)

Provides the storage class information of the object. Amazon S3 returns this header for all objects except for S3 Standard storage class objects.

For more information, see Storage Classes.

Type: String

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

Errors

NoSuchKey

The specified key does not exist.

HTTP Status Code: 400

**GetObjectLegalHold**  
Service: Amazon S3  

Gets an object's current legal hold status. For more information, see [Locking Objects](https://aws.amazon.com/about-aws/whats-new/2018/04/locking-objects/).

This action is not supported by Amazon S3 on Outposts.

The following action is related to `GetObjectLegalHold`:

- `GetObjectAttributes`

**Request Syntax**

```
GET /{Key+}?legal-hold&versionId=VersionId HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
ex-amz-request-payer: RequestPayer  
ex-amz-expected-bucket-owner: ExpectedBucketOwner
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 188)**

The bucket name containing the object whose legal hold status you want to retrieve.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](https://docs.aws.amazon.com/AmazonS3/latest/user-guide/using-access-points.html) in the [Amazon S3 User Guide](https://docs.aws.amazon.com/AmazonS3/latest/user-guide/using-access-points.html).

Required: Yes

**Key (p. 188)**

The key name for the object whose legal hold status you want to retrieve.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 188)**

The version ID of the object whose legal hold status you want to retrieve.

**x-amz-expected-bucket-owner (p. 188)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 188)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/user-guide/downloading-objects-from-requester-pays-buckets.html) in the *Amazon S3 User Guide*.

Valid Values: requester
Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?
 <LegalHold>
   <Status>string</Status>
 </LegalHold>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**LegalHold (p. 189)**

Root level tag for the LegalHold parameters.

Required: Yes

**Status (p. 189)**

Indicates whether the specified object has a legal hold in place.

Type: String

Valid Values: ON | OFF

GetObjectLockConfiguration
Service: Amazon S3

Gets the Object Lock configuration for a bucket. The rule specified in the Object Lock configuration will be applied by default to every new object placed in the specified bucket. For more information, see Locking Objects.

The following action is related to GetObjectLockConfiguration:

• GetObjectAttributes

Request Syntax
GET /?object-lock HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 190)
The bucket whose Object Lock configuration you want to retrieve.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

Required: Yes

x-amz-expected-bucket-owner (p. 190)
The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body
The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ObjectLockConfiguration>
  <ObjectLockEnabled>string</ObjectLockEnabled>
  <Rule>
    <DefaultRetention>
      <Days>integer</Days>
      <Mode>string</Mode>
      <Years>integer</Years>
    </DefaultRetention>
  </Rule>
</ObjectLockConfiguration>
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in XML format by the service.

**ObjectLockConfiguration (p. 190)**

- Root level tag for the ObjectLockConfiguration parameters.
  - Required: Yes

**ObjectLockEnabled (p. 190)**

- Indicates whether this bucket has an Object Lock configuration enabled. Enable ObjectLockEnabled when you apply ObjectLockConfiguration to a bucket.
  - Type: String
  - Valid Values: Enabled

**Rule (p. 190)**

- Specifies the Object Lock rule for the specified object. Enable this rule when you apply ObjectLockConfiguration to a bucket. Bucket settings require both a mode and a period. The period can be either Days or Years but you must select one. You cannot specify Days and Years at the same time.
  - Type: [ObjectLockRule (p. 779)] data type

GetObjectRetention
Service: Amazon S3

Retrieves an object's retention settings. For more information, see Locking Objects.

This action is not supported by Amazon S3 on Outposts.

The following action is related to GetObjectRetention:
• GetObjectAttributes

Request Syntax

```
GET /{Key+}?retention&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 192)**

The bucket name containing the object whose retention settings you want to retrieve.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

Required: Yes

**Key (p. 192)**

The key name for the object whose retention settings you want to retrieve.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 192)**

The version ID for the object whose retention settings you want to retrieve.

**x-amz-expected-bucket-owner (p. 192)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 192)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

API Version 2006-03-01
Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<Retention>
  <Mode>string</Mode>
  <RetainUntilDate>timestamp</RetainUntilDate>
</Retention>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

Retention (p. 193)

  Root level tag for the Retention parameters.

  Required: Yes

Mode (p. 193)

  Indicates the Retention mode for the specified object.

  Type: String

  Valid Values: GOVERNANCE | COMPLIANCE

RetainUntilDate (p. 193)

  The date on which this Object Lock Retention will expire.

  Type: Timestamp

GetObjectTagging

Service: Amazon S3

Returns the tag-set of an object. You send the GET request against the tagging subresource associated with the object.

To use this operation, you must have permission to perform the s3:GetObjectTagging action. By default, the GET action returns information about current version of an object. For a versioned bucket, you can have multiple versions of an object in your bucket. To retrieve tags of any other version, use the versionId query parameter. You also need permission for the s3:GetObjectVersionTagging action.

By default, the bucket owner has this permission and can grant this permission to others.

For information about the Amazon S3 object tagging feature, see Object Tagging.

The following actions are related to GetObjectTagging:

- DeleteObjectTagging
- GetObjectAttributes
- PutObjectTagging

Request Syntax

GET /{Key+}?tagging&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-request-payer: RequestPayer

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 194)**

The bucket name containing the object for which to get the tagging information.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Key (p. 194)**

Object key for which to get the tagging information.

Length Constraints: Minimum length of 1.

Required: Yes
**versionId (p. 194)**

The versionId of the object for which to get the tagging information.

**x-amz-expected-bucket-owner (p. 194)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 194)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](#) in the Amazon S3 User Guide.

Valid Values: requester

### Request Body

The request does not have a request body.

### Response Syntax

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Tagging>
  <TagSet>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </TagSet>
</Tagging>
```

### Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-version-id (p. 195)**

The versionId of the object for which you got the tagging information.

The following data is returned in XML format by the service.

**Tagging (p. 195)**

Root level tag for the Tagging parameters.

Required: Yes

**TagSet (p. 195)**

Contains the tag set.

Type: Array of Tag (p. 838) data types
Examples

Sample Request

The following request returns the tag set of the specified object.

```
GET /example-object?tagging HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Thu, 22 Sep 2016 21:33:08 GMT
Authorization: authorization string
```

Sample Response

This example illustrates one usage of GetObjectTagging.

```
HTTP/1.1 200 OK
Date: Thu, 22 Sep 2016 21:33:08 GMT
Connection: close
Server: AmazonS3
<?xml version="1.0" encoding="UTF-8"?>
<Tagging xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <TagSet>
    <Tag>
      <Key>tag1</Key>
      <Value>val1</Value>
    </Tag>
    <Tag>
      <Key>tag2</Key>
      <Value>val2</Value>
    </Tag>
  </TagSet>
</Tagging>
```

GetObjectTorrent
Service: Amazon S3

Returns torrent files from a bucket. BitTorrent can save you bandwidth when you're distributing large files.

Note
You can get torrent only for objects that are less than 5 GB in size, and that are not encrypted using server-side encryption with a customer-provided encryption key.

To use GET, you must have READ access to the object.

This action is not supported by Amazon S3 on Outposts.

The following action is related to GetObjectTorrent:

* GetObject

Request Syntax

```plaintext
GET /{Key+}?torrent HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 197)

The name of the bucket containing the object for which to get the torrent files.

Required: Yes

Key (p. 197)

The object key for which to get the information.

Length Constraints: Minimum length of 1.

Required: Yes

x-amz-expected-bucket-owner (p. 197)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 197)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged

Body

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 198)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in binary format by the service.

Examples

Getting torrent files in a bucket

This example retrieves the Torrent file for the Nelson object in the quotes bucket.

```
GET /quotes/Nelson?torrent HTTP/1.0
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```

Sample Response

This example illustrates one usage of GetObjectTorrent.

```
HTTP/1.1 200 OK
x-amz-request-id: 7CD745EBB7AB5ED9
Date: Wed, 25 Nov 2009 12:00:00 GMT
Content-Disposition: attachment; filename=Nelson.torrent;
Content-Type: application/x-bittorrent
Content-Length: 537
Server: AmazonS3

<body: a Bencoded dictionary as defined by the BitTorrent specification>
```

- AWS SDK for Ruby V3
GetPublicAccessBlock

Service: Amazon S3

Retrieves the PublicAccessBlock configuration for an Amazon S3 bucket. To use this operation, you must have the s3:GetBucketPublicAccessBlock permission. For more information about Amazon S3 permissions, see Specifying Permissions in a Policy.

Important
When Amazon S3 evaluates the PublicAccessBlock configuration for a bucket or an object, it checks the PublicAccessBlock configuration for both the bucket (or the bucket that contains the object) and the bucket owner's account. If the PublicAccessBlock settings are different between the bucket and the account, Amazon S3 uses the most restrictive combination of the bucket-level and account-level settings.

For more information about when Amazon S3 considers a bucket or an object public, see The Meaning of "Public".

The following operations are related to GetPublicAccessBlock:

- Using Amazon S3 Block Public Access
- PutPublicAccessBlock
- GetPublicAccessBlock
- DeletePublicAccessBlock

Request Syntax

```
GET /?publicAccessBlock HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 200)**

The name of the Amazon S3 bucket whose PublicAccessBlock configuration you want to retrieve.

Required: Yes

**x-amz-expected-bucket-owner (p. 200)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<PublicAccessBlockConfiguration>
  <BlockPublicAcls>boolean</BlockPublicAcls>
</PublicAccessBlockConfiguration>
```
<PublicAccessBlockConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**PublicAccessBlockConfiguration (p. 200)**

Root level tag for the PublicAccessBlockConfiguration parameters.

Required: Yes

**BlockPublicAcls (p. 200)**

Specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to TRUE causes the following behavior:

- PUT Bucket ACL and PUT Object ACL calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

Type: Boolean

**BlockPublicPolicy (p. 200)**

Specifies whether Amazon S3 should block public bucket policies for this bucket. Setting this element to TRUE causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.

Type: Boolean

**IgnorePublicAcls (p. 200)**

Specifies whether Amazon S3 should ignore public ACLs for this bucket and objects in this bucket. Setting this element to TRUE causes Amazon S3 to ignore all public ACLs on this bucket and objects in this bucket.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.

Type: Boolean

**RestrictPublicBuckets (p. 200)**

Specifies whether Amazon S3 should restrict public bucket policies for this bucket. Setting this element to TRUE restricts access to this bucket to only AWS service principals and authorized users within this account if the bucket has a public policy.

Enabling this setting doesn't affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.

Type: Boolean
Examples

Sample Request

The following request gets a bucket PublicAccessBlock configuration.

```
GET /<bucket-name>?publicAccessBlock HTTP/1.1
Host: <bucket-name>.s3.<Region>.amazonaws.com
x-amz-date: <Thu, 15 Nov 2016 00:17:21 GMT>
Authorization: <signatureValue>
```

Sample Response

This example illustrates one usage of GetPublicAccessBlock.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4REXAMPLEPi4hk1TXouTf0hccUjo0iCPEXAMPLEutBj3M7fPG1W02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
Content-Length: 0

<PublicAccessBlockConfiguration>
  <BlockPublicAcls>TRUE</BlockPublicAcls>
  <IgnorePublicAcls>FALSE</IgnorePublicAcls>
  <BlockPublicPolicy>FALSE</BlockPublicPolicy>
  <RestrictPublicBuckets>FALSE</RestrictPublicBuckets>
</PublicAccessBlockConfiguration>
```

HeadBucket

Service: Amazon S3

This action is useful to determine if a bucket exists and you have permission to access it. The action returns a 200 OK if the bucket exists and you have permission to access it.

If the bucket does not exist or you do not have permission to access it, the HEAD request returns a generic 400 Bad Request, 403 Forbidden or 404 Not Found code. A message body is not included, so you cannot determine the exception beyond these error codes.

To use this operation, you must have permissions to perform the s3:ListBucket action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

To use this API operation against an access point, you must provide the alias of the access point in place of the bucket name or specify the access point ARN. When using the access point ARN, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using the AWS SDKs, you provide the ARN in place of the bucket name. For more information, see Using access points.

To use this API operation against an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

To use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Request Syntax

HEAD / HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 203)**

The bucket name.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with an Object Lambda access point, provide the alias of the Object Lambda access point in place of the bucket name. If the Object Lambda access point alias in a request is not valid, the error code InvalidAccessPointAliasError is returned. For more information about InvalidAccessPointAliasError, see List of Error Codes.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.
Required: Yes

**x-amz-expected-bucket-owner (p. 203)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

**NoSuchBucket**

The specified bucket does not exist.

HTTP Status Code: 400

**Examples**

**Sample Request**

This example illustrates one usage of HeadBucket.

```
HEAD / HTTP/1.1
Date: Fri, 10 Feb 2012 21:34:55 GMT
Authorization: authorization string
Host: myawsbucket.s3.amazonaws.com
Connection: Keep-Alive
```

**Sample Response**

This example illustrates one usage of HeadBucket.

```
HTTP/1.1 200 OK
x-amz-id-2: JuKZqmXuiwFeDQxhD7MBKtsKobSzWA1QEjLbTMTagkKdBX2z7I1/jGHDeJ3j6s80
x-amz-request-id: 32FE2CEB32F5EE25
x-amz-bucket-region: us-west-2
x-amz-access-point-alias: false
Date: Fri, 10 2012 21:34:56 GMT
Server: AmazonS3
```

HeadObject
Service: Amazon S3

The HEAD action retrieves metadata from an object without returning the object itself. This action is useful if you're only interested in an object's metadata. To use HEAD, you must have READ access to the object.

A HEAD request has the same options as a GET action on an object. The response is identical to the GET response except that there is no response body. Because of this, if the HEAD request generates an error, it returns a generic code, such as 400 Bad Request, 403 Forbidden, 404 Not Found, 405 Method Not Allowed, 412 Precondition Failed, or 304 Not Modified. It's not possible to retrieve the exact exception of these error codes.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you retrieve the metadata from the object, you must use the following headers:

- x-amz-server-side-encryption-customer-algorithm
- x-amz-server-side-encryption-customer-key
- x-amz-server-side-encryption-customer-key-MD5

For more information about SSE-C, see Server-Side Encryption (Using Customer-Provided Encryption Keys).

Note

- Encryption request headers, like x-amz-server-side-encryption, should not be sent for GET requests if your object uses server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS), dual-layer server-side encryption with AWS KMS keys (DSSE-KMS), or server-side encryption with Amazon S3 managed encryption keys (SSE-S3). If your object does use these types of keys, you'll get an HTTP 400 Bad Request error.
- The last modified property in this case is the creation date of the object.

Request headers are limited to 8 KB in size. For more information, see Common Request Headers.

Consider the following when using request headers:

- Consideration 1 – If both of the If-Match and If-Unmodified-Since headers are present in the request as follows:
  - If-Match condition evaluates to true, and;
  - If-Unmodified-Since condition evaluates to false;

  Then Amazon S3 returns 200 OK and the data requested.

- Consideration 2 – If both of the If-None-Match and If-Modified-Since headers are present in the request as follows:
  - If-None-Match condition evaluates to false, and;
  - If-Modified-Since condition evaluates to true;

  Then Amazon S3 returns the 304 Not Modified response code.

For more information about conditional requests, see RFC 7232.
Permissions

You need the relevant read object (or version) permission for this operation. For more information, see Actions, resources, and condition keys for Amazon S3. If the object you request doesn't exist, the error that Amazon S3 returns depends on whether you also have the s3:ListBucket permission.

- If you have the s3:ListBucket permission on the bucket, Amazon S3 returns an HTTP status code 404 error.
- If you don't have the s3:ListBucket permission, Amazon S3 returns an HTTP status code 403 error.

Versioning

- If the current version of the object is a delete marker, Amazon S3 behaves as if the object was deleted and includes x-amz-delete-marker: true in the response.
- If the specified version is a delete marker, the response returns a 405 (Method Not Allowed) error and the Last-Modified: timestamp response header.

The following actions are related to HeadObject:

- GetObject
- GetObjectAttributes

Request Syntax

```
HEAD /Key+?partNumber=PartNumber&versionId=VersionId HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
If-Match: IfMatch  
If-Modified-Since: IfModifiedSince  
If-None-Match: IfNoneMatch  
If-Unmodified-Since: IfUnmodifiedSince  
Range: Range  
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm  
x-amz-server-side-encryption-customer-key: SSECustomerKey  
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5  
x-amz-request-payer: RequestPayer  
x-amz-expected-bucket-owner: ExpectedBucketOwner  
x-amz-checksum-mode: ChecksumMode
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 207)**

The name of the bucket containing the object.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.
Required: Yes

**If-Match (p. 207)**

Return the object only if its entity tag (ETag) is the same as the one specified; otherwise, return a 412 (precondition failed) error.

**If-Modified-Since (p. 207)**

Return the object only if it has been modified since the specified time; otherwise, return a 304 (not modified) error.

**If-None-Match (p. 207)**

Return the object only if its entity tag (ETag) is different from the one specified; otherwise, return a 304 (not modified) error.

**If-Unmodified-Since (p. 207)**

Return the object only if it has not been modified since the specified time; otherwise, return a 412 (precondition failed) error.

**Key (p. 207)**

The object key.

Length Constraints: Minimum length of 1.

Required: Yes

**partNumber (p. 207)**

Part number of the object being read. This is a positive integer between 1 and 10,000. Effectively performs a ‘ranged’ HEAD request for the part specified. Useful querying about the size of the part and the number of parts in this object.

**Range (p. 207)**

HeadObject returns only the metadata for an object. If the Range is satisfiable, only the ContentLength is affected in the response. If the Range is not satisfiable, S3 returns a 416 - Requested Range Not Satisfiable error.

**versionId (p. 207)**

VersionId used to reference a specific version of the object.

**x-amz-checksum-mode (p. 207)**

To retrieve the checksum, this parameter must be enabled.

In addition, if you enable ChecksumMode and the object is encrypted with AWS Key Management Service (AWS KMS), you must have permission to use the kms:Decrypt action for the request to succeed.

Valid Values: ENABLED

**x-amz-expecte…**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 207)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.
Valid Values: requester

**x-amz-server-side-encryption-customer-algorithm (p. 207)**

Specifies the algorithm to use to when encrypting the object (for example, AES256).

**x-amz-server-side-encryption-customer-key (p. 207)**

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header.

**x-amz-server-side-encryption-customer-key-MD5 (p. 207)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

**Request Body**

The request does not have a request body.

**Response Syntax**

<table>

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.
The response returns the following HTTP headers.

**accept-ranges (p. 209)**

Indicates that a range of bytes was specified.

**Cache-Control (p. 209)**

Specifies caching behavior along the request/reply chain.

**Content-Disposition (p. 209)**

Specifies presentational information for the object.

**Content-Encoding (p. 209)**

Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field.

**Content-Language (p. 209)**

The language the content is in.

**Content-Length (p. 209)**

Size of the body in bytes.

**Content-Type (p. 209)**

A standard MIME type describing the format of the object data.

**ETag (p. 209)**

An entity tag (ETag) is an opaque identifier assigned by a web server to a specific version of a resource found at a URL.

**Expires (p. 209)**

The date and time at which the object is no longer cacheable.

**Last-Modified (p. 209)**

Date and time when the object was last modified.

**x-amz-archive-status (p. 209)**

The archive state of the head object.

Valid Values: ARCHIVE_ACCESS | DEEP_ARCHIVE_ACCESS

**x-amz-checksum-crc32 (p. 209)**

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-crc32c (p. 209)**

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-sha1 (p. 209)**

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more
information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

x-amz-checksum-sha256 (p. 209)

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

x-amz-delete-marker (p. 209)

Specifies whether the object retrieved was (true) or was not (false) a Delete Marker. If false, this response header does not appear in the response.

x-amz-expiration (p. 209)

If the object expiration is configured (see PUT Bucket lifecycle), the response includes this header. It includes the expiry-date and rule-id key-value pairs providing object expiration information. The value of the rule-id is URL-encoded.

x-amz-missing-meta (p. 209)

This is set to the number of metadata entries not returned in x-amz-meta headers. This can happen if you create metadata using an API like SOAP that supports more flexible metadata than the REST API. For example, using SOAP, you can create metadata whose values are not legal HTTP headers.

x-amz-mp-parts-count (p. 209)

The count of parts this object has. This value is only returned if you specify partNumber in your request and the object was uploaded as a multipart upload.

x-amz-object-lock-legal-hold (p. 209)

Specifies whether a legal hold is in effect for this object. This header is only returned if the requester has the s3:GetObjectLegalHold permission. This header is not returned if the specified version of this object has never had a legal hold applied. For more information about S3 Object Lock, see Object Lock.

Valid Values: ON | OFF

x-amz-object-lock-mode (p. 209)

The Object Lock mode, if any, that's in effect for this object. This header is only returned if the requester has the s3:GetObjectRetention permission. For more information about S3 Object Lock, see Object Lock.

Valid Values: GOVERNANCE | COMPLIANCE

x-amz-object-lock-retain-until-date (p. 209)

The date and time when the Object Lock retention period expires. This header is only returned if the requester has the s3:GetObjectRetention permission.

x-amz-replication-status (p. 209)

Amazon S3 can return this header if your request involves a bucket that is either a source or a destination in a replication rule.

In replication, you have a source bucket on which you configure replication and destination bucket or buckets where Amazon S3 stores object replicas. When you request an object (GetObject) or object metadata (HeadObject) from these buckets, Amazon S3 will return the x-amz-replication-status header in the response as follows:

- If requesting an object from the source bucket, Amazon S3 will return the x-amz-replication-status header if the object in your request is eligible for replication.
For example, suppose that in your replication configuration, you specify object prefix TaxDocs requesting Amazon S3 to replicate objects with key prefix TaxDocs. Any objects you upload with this key name prefix, for example TaxDocs/document1.pdf, are eligible for replication. For any object request with this key name prefix, Amazon S3 will return the x-amz-replication-status header with value PENDING, COMPLETED or FAILED indicating object replication status.

- **If requesting an object from a destination bucket**, Amazon S3 will return the x-amz-replication-status header with value REPLICA if the object in your request is a replica that Amazon S3 created and there is no replica modification replication in progress.

- **When replicating objects to multiple destination buckets**, the x-amz-replication-status header acts differently. The header of the source object will only return a value of COMPLETED when replication is successful to all destinations. The header will remain at value PENDING until replication has completed for all destinations. If one or more destinations fails replication the header will return FAILED.

For more information, see [Replication](#).

**Valid Values:** COMPLETE | PENDING | FAILED | REPLICA | COMPLETED

**x-amz-request-charged (p. 209)**

If present, indicates that the requester was successfully charged for the request.

**Valid Values:** requester

**x-amz-restore (p. 209)**

If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see [RestoreObject](#) or an archive copy is already restored.

If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example:

```
x-amz-restore: ongoing-request="false", expiry-date="Fri, 21 Dec 2012 00:00:00 GMT"
```

If the object restoration is in progress, the header returns the value ongoing-request="true".

For more information about archiving objects, see [Transitioning Objects: General Considerations](#).

**x-amz-server-side-encryption (p. 209)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).

**Valid Values:** AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 209)**

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled (p. 209)**

Indicates whether the object uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

**x-amz-server-side-encryption-customer-algorithm (p. 209)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.
x-amz-server-side-encryption-customer-key-MD5 (p. 209)

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

x-amz-storage-class (p. 209)

Provides storage class information of the object. Amazon S3 returns this header for all objects except for S3 Standard storage class objects.

For more information, see Storage Classes.

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

x-amz-version-id (p. 209)

Version of the object.

x-amz-website-redirect-location (p. 209)

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata.

Errors

NoSuchKey

The specified key does not exist.

HTTP Status Code: 400

Examples

Sample Request

The following request returns the metadata of an object.

```
HEAD /my-image.jpg HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:02236Q3V0RonhpaBX5sCYVf1bNRuU=
```

Sample Response

This example illustrates one usage of HeadObject.

```
HTTP/1.1 200 OK
x-amz-id-2: ef8yU9AS1ed4OpIszj7UDNEHGran
x-amz-request-id: 318BC8BC143432E5
x-amz-version-id: 3HL4kqtJ1cpXroDTdmjV8H40Nrijfk
Date: Wed, 28 Oct 2009 22:32:00 GMT
Last-Modified: Sun, 1 Jan 2006 12:00:00 GMT
ETag: "fba9dede5f27751c9771645a39863528"
Content-Length: 434234
```
Sample Response: With an expiration tag

If the object is scheduled to expire according to a lifecycle configuration set on the bucket, the response returns the `x-amz-expiration` tag with information about when Amazon S3 will delete the object. For more information, see Transitioning Objects: General Considerations.

Sample Request: Getting metadata from a specified version of an object

The following request returns the metadata of the specified version of an object.

Sample Response: To a versioned HEAD request

This example illustrates one usage of HeadObject.

Sample Request: For an S3 Glacier object

For an archived object, the `x-amz-restore` header provides the date when the restored copy expires, as shown in the following response. Even if the object is stored in S3 Glacier, all object metadata is still available.
Sample Response: S3 Glacier object
If the object is already restored, the `x-amz-restore` header provides the date when the restored copy will expire, as shown in the following response.

```
HTTP/1.1 200 OK
x-amz-id-2: FSVaTMjmBp3Izs1NnwBZeuz7M19i18UbxMbi08AAirHANJBo+hEftBuIESACOMj3p
x-amz-request-id: E5CEFCB143EB505A
Date: Tue, 13 Nov 2012 00:28:38 GMT
Last-Modified: Mon, 15 Oct 2012 21:58:07 GMT
x-amz-restore: ongoing-request="false", expiry-date="Wed, 07 Nov 2012 00:00:00 GMT"
ETag: "1accb31fcf202eba0c0f41fa2f09b4d7"
Accept-Ranges: bytes
Content-Type: binary/octet-stream
Content-Length: 300
Server: AmazonS3
```

Sample Response: In-progress restoration
If the restoration is in progress, the `x-amz-restore` header returns a message accordingly.

```
HTTP/1.1 200 OK
x-amz-id-2: b+V2mDiMHTdy1myoUBpctvmJl9SH9U/05Uum/jRtHxjh0+pCk55vByL4xu2TDv4GM
x-amz-request-id: E2E7B6AE4EB9B2B
Date: Tue, 13 Nov 2012 00:43:32 GMT
x-amz-restore: ongoing-request="true"
ETag: "1accb31fcf202eba0c0f41fa2f09b4d7"
Accept-Ranges: bytes
Content-Type: binary/octet-stream
Content-Length: 300
Server: AmazonS3
```

Sample Response: Object archived using S3 Intelligent-Tiering
If an object is stored using the S3 Intelligent-Tiering storage class and is currently in one of the archive tiers, then this action shows the current tier using the `x-amz-archive-status` header.

```
HTTP/1.1 200 OK
x-amz-id-2: FSVaTMjmBp3Izs1NnwBZeuz7M19i18UbxMbi08AAirHANJBo+hEftBuIESACOMj3p
x-amz-request-id: E5CEFCB143EB505A
Date: Fri, 13 Nov 2020 00:28:38 GMT
Last-Modified: Mon, 15 Oct 2012 21:58:07 GMT
ETag: "1accb31fcf202eba0c0f41fa2f09b4d7"
x-amz-storage-class: 'INTELLIGENT_TIERING'
x-amz-archive-status: 'ARCHIVE_ACCESS'
Accept-Ranges: bytes
```
Sample Response: Object archived using S3 Intelligent-Tiering with restore in progress

If an object is stored using the S3 Intelligent-Tiering storage class and is currently in the process of being restored from one of the archive tiers, then this action shows the current tier using the x-amz-archive-status header and the current restore status using the x-amz-restore header.

HTTP/1.1 200 OK
x-amz-id-2: FSVaTMjrmBp3Izs1NnwBOZeuv7M19iI8UbxMbi0BAiZHANJ8o+hEftBuIE5ACOMJp

ListBucketAnalyticsConfigurations
Service: Amazon S3

Lists the analytics configurations for the bucket. You can have up to 1,000 analytics configurations per bucket.

This action supports list pagination and does not return more than 100 configurations at a time. You should always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there will be a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis.

The following operations are related to ListBucketAnalyticsConfigurations:

- GetBucketAnalyticsConfiguration
- DeleteBucketAnalyticsConfiguration
- PutBucketAnalyticsConfiguration

Request Syntax

GET /?analytics&continuation-token=ContinuationToken HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 217)**

The name of the bucket from which analytics configurations are retrieved.

Required: Yes

**continuation-token (p. 217)**

The ContinuationToken that represents a placeholder from where this request should begin.

**x-amz-expected-bucket-owner (p. 217)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListBucketAnalyticsConfigurationResult (p. 217)**

Root level tag for the ListBucketAnalyticsConfigurationResult parameters.

Required: Yes

**AnalyticsConfiguration (p. 217)**

The list of analytics configurations for a bucket.

Type: Array of **AnalyticsConfiguration (p. 676)** data types

**ContinuationToken (p. 217)**

The marker that is used as a starting point for this analytics configuration list response. This value is present if it was sent in the request.

Type: String
IsTruncated (p. 217)

Indicates whether the returned list of analytics configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken will be provided for a subsequent request.

Type: Boolean

NextContinuationToken (p. 217)

NextContinuationToken is sent when isTruncated is true, which indicates that there are more analytics configurations to list. The next request must include this NextContinuationToken. The token is obfuscated and is not a usable value.

Type: String

Examples

Sample Request

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

GET /?analytics HTTP/1.1  
Host: example-bucket.s3.<Region>.amazonaws.com  
x-amz-date: 20160430T233541Z  
Authorization: authorization string

Sample Response

This example illustrates one usage of ListBucketAnalyticsConfigurations.

HTTP/1.1 200 OK  
x-amz-id-2: gyB+3jRPnrkN98ZajxHXR3u7EFM67bNgSAxexeEHndCX/7GRnfTXxReKUFQF28IfP

**ListBucketIntelligentTieringConfigurations**  
*Service: Amazon S3*

Lists the S3 Intelligent-Tiering configuration from the specified bucket.

The S3 Intelligent-Tiering storage class is designed to optimize storage costs by automatically moving data to the most cost-effective storage access tier, without performance impact or operational overhead. S3 Intelligent-Tiering delivers automatic cost savings in three low latency and high throughput access tiers. To get the lowest storage cost on data that can be accessed in minutes to hours, you can choose to activate additional archiving capabilities.

The S3 Intelligent-Tiering storage class is the ideal storage class for data with unknown, changing, or unpredictable access patterns, independent of object size or retention period. If the size of an object is less than 128 KB, it is not monitored and not eligible for auto-tiering. Smaller objects can be stored, but they are always charged at the Frequent Access tier rates in the S3 Intelligent-Tiering storage class.

For more information, see [Storage class for automatically optimizing frequently and infrequently accessed objects](#).

Operations related to `ListBucketIntelligentTieringConfigurations` include:

- [DeleteBucketIntelligentTieringConfiguration](#)
- [PutBucketIntelligentTieringConfiguration](#)
- [GetBucketIntelligentTieringConfiguration](#)

**Request Syntax**

```xml
GET /?intelligent-tiering&continuation-token=ContinuationToken HTTP/1.1
Host: Bucket.s3.amazonaws.com
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket** *(p. 221)*

The name of the Amazon S3 bucket whose configuration you want to modify or retrieve.

Required: Yes

**continuation-token** *(p. 221)*

The `ContinuationToken` that represents a placeholder from where this request should begin.

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListBucketIntelligentTieringConfigurationsOutput>
  <IsTruncated>boolean</IsTruncated>
  <ContinuationToken>string</ContinuationToken>
  <NextContinuationToken>string</NextContinuationToken>
  <IntelligentTieringConfiguration>
```

API Version 2006-03-01

221
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListBucketIntelligentTieringConfigurationsOutput (p. 221)**

Root level tag for the ListBucketIntelligentTieringConfigurationsOutput parameters.

Required: Yes

**ContinuationToken (p. 221)**

The ContinuationToken that represents a placeholder from where this request should begin.

Type: String

**IntelligentTieringConfiguration (p. 221)**

The list of S3 Intelligent-Tiering configurations for a bucket.

Type: Array of **IntelligentTieringConfiguration (p. 739)** data types

**IsTruncated (p. 221)**

Indicates whether the returned list of analytics configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken will be provided for a subsequent request.

Type: Boolean

**NextContinuationToken (p. 221)**

The marker used to continue this inventory configuration listing. Use the NextContinuationToken from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.

Type: String

ListBucketInventoryConfigurations
Service: Amazon S3

Returns a list of inventory configurations for the bucket. You can have up to 1,000 analytics configurations per bucket.

This action supports list pagination and does not return more than 100 configurations at a time. Always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there is a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetInventoryConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about the Amazon S3 inventory feature, see Amazon S3 Inventory

The following operations are related to ListBucketInventoryConfigurations:

- GetBucketInventoryConfiguration
- DeleteBucketInventoryConfiguration
- PutBucketInventoryConfiguration

Request Syntax

GET /?inventory&continuation-token=ContinuationToken HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 224)**

The name of the bucket containing the inventory configurations to retrieve.

Required: Yes

**continuation-token (p. 224)**

The marker used to continue an inventory configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

**x-amz-expected-bucket-owner (p. 224)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListInventoryConfigurationsResult>
  <ContinuationToken>string</ContinuationToken>
  <InventoryConfiguration>
    <S3BucketDestination>

    </Schedule>
  </InventoryConfiguration>
  ...
  <IsTruncated>boolean</IsTruncated>
  <NextContinuationToken>string</NextContinuationToken>
</ListInventoryConfigurationsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListInventoryConfigurationsResult (p. 225)**

Root level tag for the ListInventoryConfigurationsResult parameters.

Required: Yes

**ContinuationToken (p. 225)**

If sent in the request, the marker that is used as a starting point for this inventory configuration list response.

Type: String

**InventoryConfiguration (p. 225)**

The list of inventory configurations for a bucket.

Type: Array of InventoryConfiguration (p. 741) data types
**IsTruncated (p. 225)**

Tells whether the returned list of inventory configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken is provided for a subsequent request.

Type: Boolean

**NextContinuationToken (p. 225)**

The marker used to continue this inventory configuration listing. Use the NextContinuationToken from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.

Type: String

**Examples**

**Sample Request**

The following request returns the inventory configurations in example-bucket.

```
GET /?inventory HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
x-amz-date: 20160430T233541Z
Authorization: authorization string
Content-Type: text/plain
```

**Sample Response**

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

```

ListBucketMetricsConfigurations

Service: Amazon S3

Lists the metrics configurations for the bucket. The metrics configurations are only for the request metrics of the bucket and do not provide information on daily storage metrics. You can have up to 1,000 configurations per bucket.

This action supports list pagination and does not return more than 100 configurations at a time. Always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there is a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For more information about metrics configurations and CloudWatch request metrics, see Monitoring Metrics with Amazon CloudWatch.

The following operations are related to ListBucketMetricsConfigurations:

- PutBucketMetricsConfiguration
- GetBucketMetricsConfiguration
- DeleteBucketMetricsConfiguration

Request Syntax

```
GET /?metrics&continuation-token=ContinuationToken HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 229)**

The name of the bucket containing the metrics configurations to retrieve.

Required: Yes

**continuation-token (p. 229)**

The marker that is used to continue a metrics configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

**x-amz-expected-bucket-owner (p. 229)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request does not have a request body.
Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListMetricsConfigurationsResult>
  <IsTruncated>boolean</IsTruncated>
  <ContinuationToken>string</ContinuationToken>
  <NextContinuationToken>string</NextContinuationToken>
  <MetricsConfiguration>
    <Filter>
      <AccessPointArn>string</AccessPointArn>
      <And>
        <AccessPointArn>string</AccessPointArn>
        <Prefix>string</Prefix>
        <Tag>
          <Key>string</Key>
          <Value>string</Value>
        </Tag>
      </And>
      <Prefix>string</Prefix>
      <Tag>
        <Key>string</Key>
        <Value>string</Value>
      </Tag>
    </Filter>
    <Id>string</Id>
  </MetricsConfiguration>
  ...
</ListMetricsConfigurationsResult>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListMetricsConfigurationsResult (p. 230)**

Root level tag for the ListMetricsConfigurationsResult parameters.

Required: Yes

**ContinuationToken (p. 230)**

The marker that is used as a starting point for this metrics configuration list response. This value is present if it was sent in the request.

Type: String

**IsTruncated (p. 230)**

Indicates whether the returned list of metrics configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken will be provided for a subsequent request.

Type: Boolean

**MetricsConfiguration (p. 230)**

The list of metrics configurations for a bucket.

Type: Array of [MetricsConfiguration (p. 764)] data types
**NextContinuationToken (p. 230)**

The marker used to continue a metrics configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

Type: String

**Examples**

**Sample Request**

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

GET /?metrics HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue

**Sample Response**

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

HTTP/1.1 200 OK

ListBuckets
Service: Amazon S3

Returns a list of all buckets owned by the authenticated sender of the request. To use this operation, you must have the s3:ListAllMyBuckets permission.

For information about Amazon S3 buckets, see Creating, configuring, and working with Amazon S3 buckets.

Request Syntax

GET / HTTP/1.1
Host: s3.amazonaws.com

URI Request Parameters

The request does not use any URI parameters.

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListAllMyBucketsResult>
  <Buckets>
    <Bucket>
      <CreationDate>timestamp</CreationDate>
      <Name>string</Name>
    </Bucket>
  </Buckets>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
</ListAllMyBucketsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

ListAllMyBucketsResult (p. 233)

Root level tag for the ListAllMyBucketsResult parameters.

Required: Yes

Buckets (p. 233)

The list of buckets owned by the requester.

Type: Array of Bucket (p. 680) data types

Owner (p. 233)

The owner of the buckets listed.
Type: Owner (p. 786) data type

Examples

Sample Request

The following request returns a list of all buckets of the sender.

```
HTTP/1.1 200 OK
<ListAllMyBucketsResult>
  <Buckets>
    <Bucket>
      <CreationDate>2019-12-11T23:32:47+00:00</CreationDate>
      <String>DOC-EXAMPLE-BUCKET</String>
    </Bucket>
    <Bucket>
      <CreationDate>2019-11-10T23:32:13+00:00</CreationDate>
      <String>DOC-EXAMPLE-BUCKET2</String>
    </Bucket>
  </Buckets>
  <Owner>
    <DisplayName>Account+Name</DisplayName>
    <ID>AIDACKCEVSQ6C2EXAMPLE</ID>
  </Owner>
</ListAllMyBucketsResult>
```

**ListMultipartUploads**  
Service: Amazon S3

This action lists in-progress multipart uploads. An in-progress multipart upload is a multipart upload that has been initiated using the Initiate Multipart Upload request, but has not yet been completed or aborted.

This action returns at most 1,000 multipart uploads in the response. 1,000 multipart uploads is the maximum number of uploads a response can include, which is also the default value. You can further limit the number of uploads in a response by specifying the `max-uploads` parameter in the response. If additional multipart uploads satisfy the list criteria, the response will contain an `IsTruncated` element with the value true. To list the additional multipart uploads, use the `key-marker` and `upload-id-marker` request parameters.

In the response, the uploads are sorted by key. If your application has initiated more than one multipart upload using the same object key, then uploads in the response are first sorted by key. Additionally, uploads are sorted in ascending order within each key by the upload initiation time.

For more information on multipart uploads, see [Uploading Objects Using Multipart Upload](#).

For information on permissions required to use the multipart upload API, see [Multipart Upload and Permissions](#).

The following operations are related to `ListMultipartUploads`:

- `CreateMultipartUpload`
- `UploadPart`
- `CompleteMultipartUpload`
- `ListParts`
- `AbortMultipartUpload`

**Request Syntax**

```
GET /?uploads&delimiter=Delimiter&encoding-type=EncodingType&key-marker=KeyMarker&max-uploads=MaxUploads&prefix=Prefix&upload-id-marker=UploadIdMarker HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-request-payer: RequestPayer
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 235)**

The name of the bucket to which the multipart upload was initiated.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-{AccountID}.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](#) in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form `AccessPointName-{AccountID}.outpostId.s3-outposts.Region.amazonaws.com`. When
you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**delimiter (p. 235)**

Character you use to group keys.

All keys that contain the same string between the prefix, if specified, and the first occurrence of the delimiter after the prefix are grouped under a single result element, `CommonPrefixes`. If you don't specify the prefix parameter, then the substring starts at the beginning of the key. The keys that are grouped under `CommonPrefixes` result element are not returned elsewhere in the response.

**encoding-type (p. 235)**

Requests Amazon S3 to encode the object keys in the response and specifies the encoding method to use. An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.

Valid Values: `url`

**key-marker (p. 235)**

Together with `upload-id-marker`, this parameter specifies the multipart upload after which listing should begin.

If `upload-id-marker` is not specified, only the keys lexicographically greater than the specified `key-marker` will be included in the list.

If `upload-id-marker` is specified, any multipart uploads for a key equal to the `key-marker` might also be included, provided those multipart uploads have upload IDs lexicographically greater than the specified `upload-id-marker`.

**max-uploads (p. 235)**

Sets the maximum number of multipart uploads, from 1 to 1,000, to return in the response body. 1,000 is the maximum number of uploads that can be returned in a response.

**prefix (p. 235)**

Lists in-progress uploads only for those keys that begin with the specified prefix. You can use prefixes to separate a bucket into different grouping of keys. (You can think of using `prefix` to make groups in the same way that you'd use a folder in a file system.)

**upload-id-marker (p. 235)**

Together with `key-marker`, specifies the multipart upload after which listing should begin. If `key-marker` is not specified, the `upload-id-marker` parameter is ignored. Otherwise, any multipart uploads for a key equal to the `key-marker` might be included in the list only if they have an upload ID lexicographically greater than the specified `upload-id-marker`.

**x-amz-expected-bucket-owner (p. 235)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 235)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For
information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<ListMultipartUploadsResult>
  <Bucket>string</Bucket>
  <KeyMarker>string</KeyMarker>
  <UploadIdMarker>string</UploadIdMarker>
  <NextKeyMarker>string</NextKeyMarker>
  <Prefix>string</Prefix>
  <Delimiter>string</Delimiter>
  <NextUploadIdMarker>string</NextUploadIdMarker>
  <MaxUploads>integer</MaxUploads>
  <IsTruncated>boolean</IsTruncated>
  <Upload>
    <ChecksumAlgorithm>string</ChecksumAlgorithm>
    <Initiated>timestamp</Initiated>
    <Initiator>
      <DisplayName>string</DisplayName>
      <ID>string</ID>
    </Initiator>
    <Key>string</Key>
    <Owner>
      <DisplayName>string</DisplayName>
      <ID>string</ID>
    </Owner>
    <StorageClass>string</StorageClass>
    <UploadId>string</UploadId>
  </Upload>
  ...
  <CommonPrefixes>
    <Prefix>string</Prefix>
  </CommonPrefixes>
  ...
  <EncodingType>string</EncodingType>
</ListMultipartUploadsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 237)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.
ListMultipartUploadsResult (p. 237)

Root level tag for the ListMultipartUploadsResult parameters.

Required: Yes

Bucket (p. 237)

The name of the bucket to which the multipart upload was initiated. Does not return the access point ARN or access point alias if used.

Type: String

CommonPrefixes (p. 237)

If you specify a delimiter in the request, then the result returns each distinct key prefix containing the delimiter in a CommonPrefixes element. The distinct key prefixes are returned in the Prefix child element.

Type: Array of CommonPrefix (p. 687) data types

Delimiter (p. 237)

Contains the delimiter you specified in the request. If you don't specify a delimiter in your request, this element is absent from the response.

Type: String

EncodingType (p. 237)

Encoding type used by Amazon S3 to encode object keys in the response.

If you specify the encoding-type request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

Delimiter, KeyMarker, Prefix, NextKeyMarker, Key.

Type: String

Valid Values: url

IsTruncated (p. 237)

Indicates whether the returned list of multipart uploads is truncated. A value of true indicates that the list was truncated. The list can be truncated if the number of multipart uploads exceeds the limit allowed or specified by max uploads.

Type: Boolean

KeyMarker (p. 237)

The key at or after which the listing began.

Type: String

MaxUploads (p. 237)

Maximum number of multipart uploads that could have been included in the response.

Type: Integer

NextKeyMarker (p. 237)

When a list is truncated, this element specifies the value that should be used for the key-marker request parameter in a subsequent request.

Type: String
**NextUploadIdMarker (p. 237)**

When a list is truncated, this element specifies the value that should be used for the upload-id-marker request parameter in a subsequent request.

Type: String

**Prefix (p. 237)**

When a prefix is provided in the request, this field contains the specified prefix. The result contains only keys starting with the specified prefix.

Type: String

**Upload (p. 237)**

Container for elements related to a particular multipart upload. A response can contain zero or more Upload elements.

Type: Array of **MultipartUpload (p. 766)** data types

**UploadIdMarker (p. 237)**

Upload ID after which listing began.

Type: String

**Examples**

**Sample Request**

The following request lists three multipart uploads. The request specifies the max-uploads request parameter to set the maximum number of multipart uploads to return in the response body.

```
GET /?uploads&max-uploads=3 HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

**Sample Response**

The following sample response indicates that the multipart upload list was truncated and provides the NextKeyMarker and the NextUploadIdMarker elements. You specify these values in your subsequent requests to read the next set of multipart uploads. That is, send a subsequent request specifying key-marker=my-movie2.m2ts (value of the NextKeyMarker element) and upload-id-marker=YW55IGlkZWEgd2h5IGVsdmluZydzIHVwbG9hZCBmYWJsZWQ (value of the NextUploadIdMarker).

The sample response also shows a case of two multipart uploads in progress with the same key (my-movie.m2ts). That is, the response shows two uploads with the same key. This response shows the uploads sorted by key, and within each key the uploads are sorted in ascending order by the time the multipart upload was initiated.

```
HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6j5Onimru9p04ZVKnJ2Qz7/C1NPcfTWAtRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 1330
Connection: keep-alive
```
Sample Request: Using the delimiter and the prefix parameters

Assume you have a multipart upload in progress for the following keys in your bucket, example-bucket.

- photos/2006/January/sample.jpg
- photos/2006/February/sample.jpg
- photos/2006/March/sample.jpg
The following list multipart upload request specifies the delimiter parameter with value "/".

```
GET /?uploads&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

**Sample Response**

The following sample response lists multipart uploads on the specified bucket, example-bucket.

The response returns multipart upload for the sample.jpg key in an `<Upload>` element.

However, because all the other keys contain the specified delimiter, a distinct substring, from the beginning of the key to the first occurrence of the delimiter, from each of these keys is returned in a `<CommonPrefixes>` element. The key substrings, photos/ and videos/ in the `<CommonPrefixes>` element, indicate that there are one or more in-progress multipart uploads with these key prefixes.

This is a useful scenario if you use key prefixes for your objects to create a logical folder like structure. In this case, you can interpret the result as the folders photos/ and videos/ have one or more multipart uploads in progress.

```
  <Bucket>example-bucket</Bucket>
  <KeyMarker/>
  <UploadIdMarker/>
  <NextKeyMarker>sample.jpg</NextKeyMarker>
  <NextUploadIdMarker>Xgw4MJT6ZPAVxpY05AuGN7q4uWJ3M22ZYg1W99trdp4tp088.PT6.Mh00w2E17eutfAvQfQWoajgE_W2gpcxQw--</NextUploadIdMarker>
  <Delimiter>/</Delimiter>
  <Prefix/>
  <MaxUploads>1000</MaxUploads>
  <IsTruncated>false</IsTruncated>
  <Upload>
    <Key>sample.jpg</Key>
    <UploadId>Agw4MJT6ZPAVxpY05AuGN7q4uWJ3M22ZYg1W99trdp4tp088.PT6.Mh00w2E17eutfAvQfQWoajgE_W2gpcxQw--</UploadId>
    <Initiator>
      <ID>314133b66967d86f031c7249d1d9a80249109428335cd0ef1cdc487b4566cb1b</ID>
      <DisplayName>string</DisplayName>
    </Initiator>
    <Owner>
      <ID>314133b66967d86f031c7249d1d9a80249109428335cd0ef1cdc487b4566cb1b</ID>
      <DisplayName>string</DisplayName>
    </Owner>
    <StorageClass>STANDARD</StorageClass>
    <Initiated>2010-11-26T19:24:17.000Z</Initiated>
  </Upload>
  <CommonPrefixes>
    <Prefix>photos/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>videos/</Prefix>
  </CommonPrefixes>
</ListMultipartUploadsResult>
```
Sample Request

In addition to the delimiter parameter, you can filter results by adding a prefix parameter as shown in the following request.

```
GET /?uploads&delimiter=/&prefix=photos/2006/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

Sample Response

In this case, the response will include only multipart uploads for keys that start with the specified prefix. The value returned in the `<CommonPrefixes>` element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.

```
<?xml version="1.0" encoding="UTF-8"?>
  <Bucket>example-bucket</Bucket>
  <KeyMarker/>
  <UploadIdMarker/>
  <NextKeyMarker/>
  <NextUploadIdMarker/>
  <Delimiter>/</Delimiter>
  <Prefix>photos/2006/</Prefix>
  <MaxUploads>1000</MaxUploads>
  <IsTruncated>false</IsTruncated>
  <CommonPrefixes>
    <Prefix>photos/2006/February/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>photos/2006/January/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>photos/2006/March/</Prefix>
  </CommonPrefixes>
</ListMultipartUploadsResult>
```

ListObjects
Service: Amazon S3

Returns some or all (up to 1,000) of the objects in a bucket. You can use the request parameters as selection criteria to return a subset of the objects in a bucket. A 200 OK response can contain valid or invalid XML. Be sure to design your application to parse the contents of the response and handle it appropriately.

Important
This action has been revised. We recommend that you use the newer version, ListObjectsV2, when developing applications. For backward compatibility, Amazon S3 continues to support ListObjects.

The following operations are related to ListObjects:
- ListObjectsV2
- GetObject
- PutObject
- CreateBucket
- ListBuckets

Request Syntax
GET /?delimiter=Delimiter&encoding-type=EncodingType&marker=Marker&max-keys=MaxKeys&prefix=Prefix HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-optional-object-attributes: OptionalObjectAttributes

URI Request Parameters
The request uses the following URI parameters.

Bucket (p. 244)
The name of the bucket containing the objects.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes
delimiter (p. 244)
A delimiter is a character that you use to group keys.
encoding-type (p. 244)

Requests Amazon S3 to encode the object keys in the response and specifies the encoding method to use. An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.

Valid Values: url

marker (p. 244)

Marker is where you want Amazon S3 to start listing from. Amazon S3 starts listing after this specified key. Marker can be any key in the bucket.

max-keys (p. 244)

Sets the maximum number of keys returned in the response. By default, the action returns up to 1,000 key names. The response might contain fewer keys but will never contain more.

prefix (p. 244)

Limits the response to keys that begin with the specified prefix.

x-amz-expected-bucket-owner (p. 244)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-optional-object-attributes (p. 244)

Specifies the optional fields that you want returned in the response. Fields that you do not specify are not returned.

Valid Values: RestoreStatus

x-amz-request-payer (p. 244)

Confirms that the requester knows that she or he will be charged for the list objects request. Bucket owners need not specify this parameter in their requests.

Valid Values: requester

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<ListBucketResult>
  <IsTruncated>Boolean</IsTruncated>
  <Marker>string</Marker>
  <NextMarker>string</NextMarker>
  <Contents>
    <ChecksumAlgorithm>string</ChecksumAlgorithm>
    ...
    <ETag>string</ETag>
    <Key>string</Key>
    <LastModified>timestamp</LastModified>
    <Owner>
      <DisplayName>string</DisplayName>
      <ID>string</ID>
    </Owner>
  </Contents>
</ListBucketResult>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

`x-amz-request-charged (p. 245)`

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.

`ListBucketResult (p. 245)`

Root level tag for the ListBucketResult parameters.

Required: Yes

`CommonPrefixes (p. 245)`

All of the keys (up to 1,000) rolled up in a common prefix count as a single return when calculating the number of returns.

A response can contain `CommonPrefixes` only if you specify a delimiter.

`CommonPrefixes` contains all (if there are any) keys between Prefix and the next occurrence of the string specified by the delimiter.

`CommonPrefixes` lists keys that act like subdirectories in the directory specified by Prefix.

For example, if the prefix is `notes/` and the delimiter is a slash (`/`), as in `notes/summer/july`, the common prefix is `notes/summer/`. All of the keys that roll up into a common prefix count as a single return when calculating the number of returns.

Type: Array of `CommonPrefix (p. 687)` data types

`Contents (p. 245)`

Metadata about each object returned.

Type: Array of `Object (p. 773)` data types
**Delimiter** *(p. 245)*

Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the **CommonPrefixes** collection. These rolled-up keys are not returned elsewhere in the response. Each rolled-up result counts as only one return against the **MaxKeys** value.

Type: String

**EncodingType** *(p. 245)*

Encoding type used by Amazon S3 to encode object keys in the response.

Type: String

Valid Values: *url*

**IsTruncated** *(p. 245)*

A flag that indicates whether Amazon S3 returned all of the results that satisfied the search criteria.

Type: Boolean

**Marker** *(p. 245)*

Indicates where in the bucket listing begins. Marker is included in the response if it was sent with the request.

Type: String

**MaxKeys** *(p. 245)*

The maximum number of keys returned in the response body.

Type: Integer

**Name** *(p. 245)*

The bucket name.

Type: String

**NextMarker** *(p. 245)*

When the response is truncated (the **IsTruncated** element value in the response is *true*), you can use the key name in this field as the **marker** parameter in the subsequent request to get the next set of objects. Amazon S3 lists objects in alphabetical order.

**Note**

This element is returned only if you have the delimiter request parameter specified. If the response does not include the **NextMarker** element and it is truncated, you can use the value of the last **Key** element in the response as the **marker** parameter in the subsequent request to get the next set of object keys.

Type: String

**Prefix** *(p. 245)*

Keys that begin with the indicated prefix.

Type: String

**Errors**

**NoSuchBucket**

The specified bucket does not exist.
HTTP Status Code: 400

Examples

Sample Request

This request returns the objects in BucketName.

GET / HTTP/1.1
Host: BucketName.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain

Sample Response

This example illustrates one usage of ListObjects.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>bucket</Name>
  <Prefix/>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>false</IsTruncated>

            <DisplayName>webfile</DisplayName>
        </Owner>
    </Contents>
</ListBucketResult>

Sample Request: Using a prefix and delimiter

For this example, we assume that you have the following keys in your bucket:

- sample.jpg
- photos/2006/January/sample.jpg
- photos/2006/February/sample2.jpg
- photos/2006/February/sample3.jpg
- photos/2006/February/sample4.jpg
The following GET request specifies the delimiter parameter with a value of `/`.

```
GET /?delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

**Sample Response**

The key `sample.jpg` does not contain the delimiter character, and Amazon S3 returns it in the `Contents` element in the response. However, all of the other keys contain the delimiter character. Amazon S3 groups these keys and returns a single `CommonPrefixes` element with the `Prefix` value `photos/`, which is a substring from the beginning of these keys to the first occurrence of the specified delimiter.

```
  <Name>example-bucket</Name>
  <Prefix></Prefix>
  <Marker></Marker>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>sample.jpg</Key>
    <LastModified>2011-02-26T01:56:20.000Z</LastModified>
    <ETag>"bf1d737a4d46a19f3bc6d905cc8b902"</ETag>
    <Size>142863</Size>
    <Owner>
      <ID>canonical-user-id</ID>
      <DisplayName>display-name</DisplayName>
    </Owner>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>photos/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```

**Sample Request**

The following GET request specifies the delimiter parameter with the value `/`, and the prefix parameter with the value `photos/2006/`.

```
GET /?prefix=photos/2006/&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

**Sample Response**

In response, Amazon S3 returns only the keys that start with the specified prefix. Amazon S3 uses the delimiter character to group keys that contain the same substring until the first occurrence of
the delimiter character after the specified prefix. For each such key group, Amazon S3 returns one
CommonPrefixes element in the response. The keys grouped under this CommonPrefixes element
are not returned elsewhere in the response. The value returned in the CommonPrefixes element is
a substring that starts at the beginning of the key and ends at the first occurrence of the specified
delimiter after the prefix.

```xml
  <Name>example-bucket</Name>
  <Prefix>photos/2006/</Prefix>
  <Marker></Marker>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <CommonPrefixes>
    <Prefix>photos/2006/February/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>photos/2006/January/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```

ListObjectsV2

Service: Amazon S3

Returns some or all (up to 1,000) of the objects in a bucket with each request. You can use the request parameters as selection criteria to return a subset of the objects in a bucket. A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately. Objects are returned sorted in an ascending order of the respective key names in the list. For more information about listing objects, see Listing object keys programmatically in the Amazon S3 User Guide.

To use this operation, you must have READ access to the bucket.

To use this action in an AWS Identity and Access Management (IAM) policy, you must have permission to perform the s3:ListBucket action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon S3 User Guide.

Important
This section describes the latest revision of this action. We recommend that you use this revised API operation for application development. For backward compatibility, Amazon S3 continues to support the prior version of this API operation, ListObjects.

To get a list of your buckets, see ListBuckets.

The following operations are related to ListObjectsV2:

- GetObject
- PutObject
- CreateBucket

Request Syntax

```
GET /?list-type=2&continuation-token=ContinuationToken&delimiter=Delimiter&encoding-type=EncodingType&fetch-owner=FetchOwner&max-keys=MaxKeys&prefix=Prefix&start-after=StartAfter HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-optional-object-attributes: OptionalObjectAttributes
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 252)**

Bucket name to list.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When
you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access
point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What
is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**continuation-token (p. 252)**

ContinuationToken indicates to Amazon S3 that the list is being continued on this bucket with a
token. ContinuationToken is obfuscated and is not a real key.

**delimiter (p. 252)**

A delimiter is a character that you use to group keys.

**encoding-type (p. 252)**

Encoding type used by Amazon S3 to encode object keys in the response.

Valid Values: url

**fetch-owner (p. 252)**

The owner field is not present in ListObjectsV2 by default. If you want to return the owner field
with each key in the result, then set the FetchOwner field to true.

**max-keys (p. 252)**

Sets the maximum number of keys returned in the response. By default, the action returns up to
1,000 key names. The response might contain fewer keys but will never contain more.

**prefix (p. 252)**

Limits the response to keys that begin with the specified prefix.

**start-after (p. 252)**

StartAfter is where you want Amazon S3 to start listing from. Amazon S3 starts listing after this
specified key. StartAfter can be any key in the bucket.

**x-amz-expected-bucket-owner (p. 252)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the
request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-optional-object-attributes (p. 252)**

Specifies the optional fields that you want returned in the response. Fields that you do not specify
are not returned.

Valid Values: RestoreStatus

**x-amz-request-payer (p. 252)**

Confirms that the requester knows that she or he will be charged for the list objects request in V2
style. Bucket owners need not specify this parameter in their requests.

Valid Values: requester

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 253)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requestor

The following data is returned in XML format by the service.

**ListBucketResult (p. 253)**

Root level tag for the ListBucketResult parameters.

Required: Yes

**CommonPrefixes (p. 253)**

All of the keys (up to 1,000) rolled up into a common prefix count as a single return when calculating the number of returns.

A response can contain CommonPrefixes only if you specify a delimiter.
CommonPrefixes contains all (if there are any) keys between Prefix and the next occurrence of the string specified by a delimiter.

CommonPrefixes lists keys that act like subdirectories in the directory specified by Prefix.

For example, if the prefix is notes/ and the delimiter is a slash (/) as in notes/summer/july, the common prefix is notes/summer/. All of the keys that roll up into a common prefix count as a single return when calculating the number of returns.

Type: Array of CommonPrefix (p. 687) data types

Contents (p. 253)

Metadata about each object returned.

Type: Array of Object (p. 773) data types

ContinuationToken (p. 253)

If ContinuationToken was sent with the request, it is included in the response.

Type: String

Delimiter (p. 253)

Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response. Each rolled-up result counts as only one return against the MaxKeys value.

Type: String

EncodingType (p. 253)

Encoding type used by Amazon S3 to encode object key names in the XML response.

If you specify the encoding-type request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements: Delimiter, Prefix, Key, and StartAfter.

Type: String

Valid Values: url

IsTruncated (p. 253)

Set to false if all of the results were returned. Set to true if more keys are available to return. If the number of results exceeds that specified by MaxKeys, all of the results might not be returned.

Type: Boolean

KeyCount (p. 253)

KeyCount is the number of keys returned with this request. KeyCount will always be less than or equal to the MaxKeys field. For example, if you ask for 50 keys, your result will include 50 keys or fewer.

Type: Integer

MaxKeys (p. 253)

Sets the maximum number of keys returned in the response. By default, the action returns up to 1,000 key names. The response might contain fewer keys but will never contain more.

Type: Integer
**Name (p. 253)**

The bucket name.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-access-points.html) in the **Amazon S3 User Guide**.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form `AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com`. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see [What is S3 on Outposts?](https://docs.aws.amazon.com/AmazonS3/latest/userguide/what-s3-on-outposts.html) in the **Amazon S3 User Guide**.

Type: String

**NextContinuationToken (p. 253)**

NextContinuationToken is sent when `isTruncated` is true, which means there are more keys in the bucket that can be listed. The next list requests to Amazon S3 can be continued with this NextContinuationToken. NextContinuationToken is obfuscated and is not a real key.

Type: String

**Prefix (p. 253)**

Keys that begin with the indicated prefix.

Type: String

**StartAfter (p. 253)**

If `StartAfter` was sent with the request, it is included in the response.

Type: String

**Errors**

**NoSuchBucket**

The specified bucket does not exist.

HTTP Status Code: 400

**Examples**

**Sample Request: Listing keys**

This request returns the objects in bucket. The request specifies the `list-type` parameter, which indicates version 2 of the API operation.

```
GET /?list-type=2 HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
x-amz-date: 20160430T233541Z
Authorization: authorization string
Content-Type: text/plain
```

API Version 2006-03-01
Sample Response

This example illustrates one usage of ListObjectsV2.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>quotes</Name>
  <Prefix>E</Prefix>
  <StartAfter>ExampleGuide.pdf</StartAfter>
</ListBucketResult>
```

Sample Request: Listing keys using the max-keys, prefix, and start-after parameters

In addition to the list-type parameter that indicates version 2 of the API operation, the request also specifies additional parameters to retrieve up to three keys in the quotes bucket that start with E and occur lexicographically after ExampleGuide.pdf.

```plaintext
GET /?list-type=2&max-keys=3&prefix=E&start-after=ExampleGuide.pdf HTTP/1.1
Host: quotes.s3.<Region>.amazonaws.com
x-amz-date: 20160430T232933Z
Authorization: authorization string
```

Sample Response

This example illustrates one usage of ListObjectsV2.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>quotes</Name>
  <Prefix>E</Prefix>
  <StartAfter>ExampleGuide.pdf</StartAfter>
</ListBucketResult>
```
Sample Request: Listing keys by using the prefix and delimiter parameters

This example illustrates the use of the prefix and the delimiter parameters in the request. For this example, we assume that you have the following keys in your bucket:

- sample.jpg
- photos/2006/January/sample.jpg
- photos/2006/February/sample2.jpg
- photos/2006/February/sample3.jpg
- photos/2006/February/sample4.jpg

The following GET request specifies the delimiter parameter with a value of /.

```
GET /?list-type=2&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
x-amz-date: 20160430T235931Z
Authorization: authorization string
```

Sample Response

The key sample.jpg does not contain the delimiter character, and Amazon S3 returns it in the Contents element in the response. However, all of the other keys contain the delimiter character. Amazon S3 groups these keys and returns a single CommonPrefixes element with the Prefix value photos/. The Prefix element is a substring that starts at the beginning of these keys and ends at the first occurrence of the specified delimiter.

```
  <Name>example-bucket</Name>
  <Prefix/></Prefix>
  <KeyCount>2</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>sample.jpg</Key>
    <LastModified>2011-02-26T01:56:20.000Z</LastModified>
    <ETag>"bf1d737a4d46a19f3bed69805cc8b902"</ETag>
    <Size>142863</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>photos/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```
Sample Request

The following request specifies the `delimiter` parameter with the value `/`, and the `prefix` parameter with the value `photos/2006/`.

```plaintext
GET /?list-type=2&prefix=photos/2006/&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
x-amz-date: 20160501T000433Z
Authorization: authorization string
```

Sample Response

In response, Amazon S3 returns only the keys that start with the specified prefix. Further, Amazon S3 uses the delimiter character to group keys that contain the same substring until the first occurrence of the delimiter character after the specified prefix. For each such key group, Amazon S3 returns one `CommonPrefixes` element in the response. The keys grouped under this `CommonPrefixes` element are not returned elsewhere in the response. The `Prefix` value returned in the `CommonPrefixes` element is a substring that starts at the beginning of the key and ends at the first occurrence of the specified delimiter after the prefix.

**Note**

If you created folders by using the Amazon S3 console, you will see an additional 0-byte object with a key of `photos/2006/`. This object is created because of the way that the console supports folder structures. For more information, see Organizing objects in the Amazon S3 console using folders in the Amazon S3 User Guide.

```xml
  <Name>example-bucket</Name>
  <Prefix>photos/2006/</Prefix>
  <KeyCount>2</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <CommonPrefixes>
    <Prefix>photos/2006/February/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>photos/2006/January/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```

Sample Request: Using a continuation token

In this example, the initial request returns more than 1,000 keys. In response to this request, Amazon S3 returns the `IsTruncated` element with the value set to `true` and with a `NextContinuationToken` element.

```plaintext
GET /?list-type=2 HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
```

API Version 2006-03-01
Sample Response: Using a continuation token

This example illustrates one usage of ListObjectsV2.

HTTP/1.1 200 OK
x-amz-id-2: gyB+3jRPnzkN982ajxHXr3u7EFM67bNgSxxexeEHндCX/7GRnFTxReKUQF28IfP
x-amz-request-id: 5B3C7C725673C630
Date: Sat, 30 Apr 2016 23:29:37 GMT
Content-Type: application/xml
Content-Length: length
Connection: close
Server: AmazonS3

  <Name>bucket</Name>
  <Prefix></Prefix>
  <NextContinuationToken>1ueGcxLPRx1Tr/XYExHnhbYLgveDs2J/wm36Hy4vb0wM=</NextContinuationToken>
  <KeyCount>1000</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>true</IsTruncated>
  <Contents>
    <Key>happyface.jpg</Key>
    <LastModified>2014-11-21T19:40:05.000Z</LastModified>
    <ETag>"70ee1738b6b21e2c8a45f5a5ab0ee71"</ETag>
    <Size>11</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
...
</ListBucketResult>

Example

In the following subsequent request, we include a continuation-token query parameter in the request with the value of the NextContinuationToken element from the preceding response.

GET /?list-type=2 HTTP/1.1
GET /?list-type=2&continuation-token=1ueGcxLPRx1Tr/XYExHnhbYLgveDs2J/wm36Hy4vb0wM= HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Mon, 02 May 2016 23:17:07 GMT
Authorization: authorization string

Example

Amazon S3 returns a list of the next set of keys starting where the previous request ended.

ListObjectVersions
Service: Amazon S3

Returns metadata about all versions of the objects in a bucket. You can also use request parameters as selection criteria to return metadata about a subset of all the object versions.

Important
To use this operation, you must have permission to perform the s3:ListBucketVersions action. Be aware of the name difference.

Note
A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately.

To use this operation, you must have READ access to the bucket.

The following operations are related to ListObjectVersions:

- ListObjectsV2
- GetObject
- PutObject
- DeleteObject

Request Syntax

GET /?versions&delimiter=Delimiter&encoding-type=EncodingType&key-marker=KeyMarker&max-keys=MaxKeys&prefix=Prefix&version-id-marker=VersionIdMarker HTTP/1.1

Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-request-payer: RequestPayer
x-amz-optional-object-attributes: OptionalObjectAttributes

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 262)**

The bucket name that contains the objects.

Required: Yes
delimiter (p. 262)

A delimiter is a character that you specify to group keys. All keys that contain the same string between the prefix and the first occurrence of the delimiter are grouped under a single result element in CommonPrefixes. These groups are counted as one result against the max-keys limitation. These keys are not returned elsewhere in the response.

**encoding-type (p. 262)**

Requests Amazon S3 to encode the object keys in the response and specifies the encoding method to use. An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.

Valid Values: url
key-marker (p. 262)

Specifies the key to start with when listing objects in a bucket.

max-keys (p. 262)

Sets the maximum number of keys returned in the response. By default, the action returns up to 1,000 key names. The response might contain fewer keys but will never contain more. If additional keys satisfy the search criteria, but were not returned because max-keys was exceeded, the response contains <isTruncated>true</isTruncated>. To return the additional keys, see key-marker and version-id-marker.

prefix (p. 262)

Use this parameter to select only those keys that begin with the specified prefix. You can use prefixes to separate a bucket into different groupings of keys. (You can think of using prefix to make groups in the same way that you'd use a folder in a file system.) You can use prefix with delimiter to roll up numerous objects into a single result under CommonPrefixes.

version-id-marker (p. 262)

Specifies the object version you want to start listing from.

x-amz-expected-bucket-owner (p. 262)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-optional-object-attributes (p. 262)

Specifies the optional fields that you want returned in the response. Fields that you do not specify are not returned.

Valid Values: RestoreStatus

x-amz-request-payer (p. 262)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<ListVersionsResult>
  <IsTruncated>boolean</IsTruncated>
  <KeyMarker>string</KeyMarker>
  <VersionIdMarker>string</VersionIdMarker>
  <NextKeyMarker>string</NextKeyMarker>
  <NextVersionIdMarker>string</NextVersionIdMarker>
  <Version>
    <ChecksumAlgorithm>string</ChecksumAlgorithm>
    ...
</ListVersionsResult>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 263)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

The following data is returned in XML format by the service.

**ListVersionsResult (p. 263)**

Root level tag for the ListVersionsResult parameters.

Required: Yes

**CommonPrefixes (p. 263)**

All of the keys rolled up into a common prefix count as a single return when calculating the number of returns.
DeleteMarker (p. 263)

Container for an object that is a delete marker.

Type: Array of DeleteMarkerEntry (p. 708) data types

Delimiter (p. 263)

The delimiter grouping the included keys. A delimiter is a character that you specify to group keys. All keys that contain the same string between the prefix and the first occurrence of the delimiter are grouped under a single result element in CommonPrefixes. These groups are counted as one result against the max-keys limitation. These keys are not returned elsewhere in the response.

Type: String

EncodingType (p. 263)

Encoding type used by Amazon S3 to encode object key names in the XML response.

If you specify the encoding-type request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

KeyMarker, NextKeyMarker, Prefix, Key, and Delimiter.

Type: String

Valid Values: url

IsTruncated (p. 263)

A flag that indicates whether Amazon S3 returned all of the results that satisfied the search criteria. If your results were truncated, you can make a follow-up paginated request by using the NextKeyMarker and NextVersionIdMarker response parameters as a starting place in another request to return the rest of the results.

Type: Boolean

KeyMarker (p. 263)

Marks the last key returned in a truncated response.

Type: String

MaxKeys (p. 263)

Specifies the maximum number of objects to return.

Type: Integer

Name (p. 263)

The bucket name.

Type: String

NextKeyMarker (p. 263)

When the number of responses exceeds the value of MaxKeys, NextKeyMarker specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

Type: String
**NextVersionIdMarker (p. 263)**

When the number of responses exceeds the value of MaxKeys, NextVersionIdMarker specifies the first object version not returned that satisfies the search criteria. Use this value for the version-id-marker request parameter in a subsequent request.

Type: String

**Prefix (p. 263)**

Selects objects that start with the value supplied by this parameter.

Type: String

**Version (p. 263)**

Container for version information.

Type: Array of ObjectVersion (p. 782) data types

**VersionIdMarker (p. 263)**

Marks the last version of the key returned in a truncated response.

Type: String

**Examples**

**Sample Request**

The following request returns all of the versions of all of the objects in the specified bucket.

```
GET /?versions HTTP/1.1
Host: BucketName.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 +0000
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

**Sample Response**

This example illustrates one usage of ListObjectVersions.

```
<?xml version="1.0" encoding="UTF-8"?>

<ListVersionsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Name>bucket</Name>
  <Prefix>my</Prefix>
  <KeyMarker/>
  <VersionIdMarker/>
  <MaxKeys>5</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Version>
    <Key>my-image.jpg</Key>
    <VersionId>3/L4kqtl40NzF8gdRQHpUMLUo</VersionId>
    <IsLatest>true</IsLatest>
    <LastModified>2009-10-12T17:50:30.000Z</LastModified>
    <ETag>"fba9dede5f27731c9771645a39863328"</ETag>
    <Size>434234</Size>
    <StorageClass>STANDARD</StorageClass>
    <Owner>
```

API Version 2006-03-01

266
Sample Request

The following request returns objects in the order that they were stored, returning the most recently stored object first, starting with the value for key-marker.

GET /?versions&key-marker=key2 HTTP/1.1
Host: s3.amazonaws.com
Pragma: no-cache
Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg, */*

    </Owner>
    <StorageClass>STANDARD</StorageClass>
  </Version>
</ListVersionsResult>
```

Sample Request Using the prefix Parameter

This example returns objects whose keys begin with source.

```
GET /?versions&prefix=source HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 +0000
Authorization: authorization string
```
Sample Response

This example illustrates one usage of ListObjectVersions.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>mtp-versioning-fresh</Name>
  <Prefix>source</Prefix>
  <KeyMarker/>
  <VersionIdMarker/>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <DeleteMarker>
    <VersionId>qDhprLU80salcFUnz2DwGxKTznHs_JU0TvYqs.</VersionId>

    </Owner>
    <StorageClass>STANDARD</StorageClass>
  </Version>
</ListVersionsResult>
```

Sample Request: Using the key-marker and version-id-marker Parameters

The following example returns objects starting at the specified key (key-marker) and version ID (version-id-marker).

```
GET /?versions&key-marker=key3&version-id-marker=t46ZenlYTZBnj HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 +0000
Authorization: signatureValue
```

Sample Response

This example illustrates one usage of ListObjectVersions.

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>mtp-versioning-fresh</Name>
  <Prefix/>
```

API Version 2006-03-01
Sample Request: Using the `key-marker`, `version-id-marker`, and `max-keys` Parameters

The following request returns up to three (the value of `max-keys`) objects starting with the key specified by `key-marker` and the version ID specified by `version-id-marker`.

GET /?versions&key-marker=key3&version-id-marker=t46Zen1YTZBnj&max-keys=3
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 +0000
Authorization: authorization string

Sample Response

This example illustrates one usage of ListObjectVersions.
Sample Request: Using the delimiter and prefix Parameters

Assume you have the following keys in your bucket, example-bucket.

photos/2006/January/sample.jpg
photos/2006/February/sample.jpg
photos/2006/March/sample.jpg
videos/2006/March/sample.wmv
sample.jpg

The following GET versions request specifies the delimiter parameter with the value ‘/’.

```
GET /?versions&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Wed, 02 Feb 2011 20:34:56 GMT
Authorization: authorization string
```

Sample Response

The list of keys from the specified bucket is shown in the following response.

The response returns the sample.jpg key in a Version element. However, because all the other keys contain the specified delimiter, a distinct substring, from the beginning of the key to the first occurrence of the delimiter, from each of these keys is returned in a CommonPrefixes element. The key substrings, photos/ and videos/, in the CommonPrefixes element indicate that there are one or more keys with these key prefixes.

This is a useful scenario if you use key prefixes for your objects to create a logical folder-like structure. In this case, you can interpret the result as the folders photos/ and videos/ have one or more objects.
Example

In addition to the delimiter parameter, you can filter results by adding a prefix parameter as shown in the following request.

```
GET /?versions&prefix=photos/2006/&delimiter=/ HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Wed, 02 Feb 2011 19:34:02 GMT
Authorization: authorization string
```

Example

In this case, the response will include only object keys that start with the specified prefix. The value returned in the CommonPrefixes element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.

Note

If you created folders by using the Amazon S3 console, you will see an additional 0-byte object with a key of photos/2006/. This object is created because of the way that the console supports folder structures. For more information, see Organizing objects in the Amazon S3 console using folders in the Amazon S3 User Guide.

```
<?xml version="1.0" encoding="UTF-8"?>
  <Name>example-bucket</Name>
  <Prefix>photos/2006/</Prefix>
  <KeyMarker></KeyMarker>
  <VersionIdMarker></VersionIdMarker>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <CommonPrefixes>
    <Prefix>photos/index.html</Prefix>
    <Prefix>photos/2006/</Prefix>
  </CommonPrefixes>
</ListVersionsResult>
```

ListParts
Service: Amazon S3

Lists the parts that have been uploaded for a specific multipart upload. This operation must include the upload ID, which you obtain by sending the initiate multipart upload request (see CreateMultipartUpload). This request returns a maximum of 1,000 uploaded parts. The default number of parts returned is 1,000 parts. You can restrict the number of parts returned by specifying the max-parts request parameter. If your multipart upload consists of more than 1,000 parts, the response returns an IsTruncated field with the value of true, and a NextPartNumberMarker element. In subsequent ListParts requests you can include the part-number-marker query string parameter and set its value to the NextPartNumberMarker field value from the previous response.

If the upload was created using a checksum algorithm, you will need to have permission to the kms:Decrypt action for the request to succeed.

For more information on multipart uploads, see Uploading Objects Using Multipart Upload.

For information on permissions required to use the multipart upload API, see Multipart Upload and Permissions.

The following operations are related to ListParts:

- CreateMultipartUpload
- UploadPart
- CompleteMultipartUpload
- AbortMultipartUpload
- GetObjectAttributes
- ListMultipartUploads

Request Syntax

GET /Key+?max-parts=MaxParts&part-number-marker=PartNumberMarker&uploadId=UploadId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 274)

The name of the bucket to which the parts are being uploaded.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-Accountld.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-Accountld.outpostld.s3-outposts.Region.amazonaws.com.
you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Key (p. 274)**

Object key for which the multipart upload was initiated.

Length Constraints: Minimum length of 1.

Required: Yes

**max-parts (p. 274)**

Sets the maximum number of parts to return.

**part-number-marker (p. 274)**

Specifies the part after which listing should begin. Only parts with higher part numbers will be listed.

**uploadId (p. 274)**

Upload ID identifying the multipart upload whose parts are being listed.

Required: Yes

**x-amz-expected-bucket-owner (p. 274)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 274)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

**x-amz-server-side-encryption-customer-algorithm (p. 274)**

The server-side encryption (SSE) algorithm used to encrypt the object. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key (p. 274)**

The server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key-MD5 (p. 274)**

The MD5 server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**Request Body**

The request does not have a request body.
Response Syntax

HTTP/1.1 200
x-amz-abort-date: AbortDate
x-amz-abort-rule-id: AbortRuleId
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?><ListPartsResult>
  <Bucket>string</Bucket>
  <Key>string</Key>
  <UploadId>string</UploadId>

    <ETag>string</ETag>
    <LastModified>timestamp</LastModified>
    <PartNumber>integer</PartNumber>
    <Size>long</Size>
  </Part>
  ...
  <Initiator>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Initiator>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
  <StorageClass>string</StorageClass>
  <ChecksumAlgorithm>string</ChecksumAlgorithm>
</ListPartsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-abort-date (p. 276)**

If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, then the response includes this header indicating when the initiated multipart upload will become eligible for abort operation. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration](https://docs.aws.amazon.com/AmazonS3/latest/API/AbortingIncompleteUploads.html).

The response will also include the `x-amz-abort-rule-id` header that will provide the ID of the lifecycle configuration rule that defines this action.

**x-amz-abort-rule-id (p. 276)**

This header is returned along with the `x-amz-abort-date` header. It identifies applicable lifecycle configuration rule that defines the action to abort incomplete multipart uploads.

**x-amz-request-charged (p. 276)**

If present, indicates that the requester was successfully charged for the request.
Valid Values: requester

The following data is returned in XML format by the service.

**ListPartsResult (p. 276)**

Root level tag for the ListPartsResult parameters.

Required: Yes

**Bucket (p. 276)**

The name of the bucket to which the multipart upload was initiated. Does not return the access point ARN or access point alias if used.

Type: String

**ChecksumAlgorithm (p. 276)**

The algorithm that was used to create a checksum of the object.

Type: String

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Initiator (p. 276)**

Container element that identifies who initiated the multipart upload. If the initiator is an AWS account, this element provides the same information as the Owner element. If the initiator is an IAM User, this element provides the user ARN and display name.

Type: **Initiator** (p. 736) data type

**IsTruncated (p. 276)**

Indicates whether the returned list of parts is truncated. A true value indicates that the list was truncated. A list can be truncated if the number of parts exceeds the limit returned in the MaxParts element.

Type: Boolean

**Key (p. 276)**

Object key for which the multipart upload was initiated.

Type: String

Length Constraints: Minimum length of 1.

**MaxParts (p. 276)**

Maximum number of parts that were allowed in the response.

Type: Integer

**NextPartNumberMarker (p. 276)**

When a list is truncated, this element specifies the last part in the list, as well as the value to use for the part-number-marker request parameter in a subsequent request.

Type: Integer

**Owner (p. 276)**

Container element that identifies the object owner, after the object is created. If multipart upload is initiated by an IAM user, this element provides the parent account ID and display name.
Type: **Owner (p. 786)** data type

**Part (p. 276)**

Container for elements related to a particular part. A response can contain zero or more Part elements.

Type: Array of **Part (p. 790)** data types

**PartNumberMarker (p. 276)**

When a list is truncated, this element specifies the last part in the list, as well as the value to use for the part-number-marker request parameter in a subsequent request.

Type: Integer

**StorageClass (p. 276)**

Class of storage (STANDARD or REDUCED_REDUNDANCY) used to store the uploaded object.

Type: String

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

**UploadId (p. 276)**

Upload ID identifying the multipart upload whose parts are being listed.

Type: String

**Examples**

**Sample Request**

Assume you have uploaded parts with sequential part numbers starting with 1. The following List Parts request specifies max-parts and part-number-marker query parameters. The request lists the first two parts that follow part number 1, that is, you will get parts 2 and 3 in the response. If more parts exist, the result is a truncated result and therefore the response will return an IsTruncated element with the value true. The response will also return the NextPartNumberMarker element with the value 3, which should be used for the value of the part-number-marker request query string parameter in the next ListParts request.

```
GET /example-object?
uploadId=XXBsb2FkIElEIGZvciBlbHZpmmcncVcdS1tb3ZpZS5tMnRzEwG9hZA&max-parts=2&part-number-marker=1 HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

**Sample Response**

This example illustrates one usage of ListParts.

```
HTTP/1.1 200 OK

PutBucketAccelerateConfiguration

Service: Amazon S3

Sets the accelerate configuration of an existing bucket. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to Amazon S3.

To use this operation, you must have permission to perform the s3:PutAccelerateConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

The Transfer Acceleration state of a bucket can be set to one of the following two values:

- Enabled – Enables accelerated data transfers to the bucket.
- Suspended – Disables accelerated data transfers to the bucket.

The GetBucketAccelerateConfiguration action returns the transfer acceleration state of a bucket.

After setting the Transfer Acceleration state of a bucket to Enabled, it might take up to thirty minutes before the data transfer rates to the bucket increase.

The name of the bucket used for Transfer Acceleration must be DNS-compliant and must not contain periods (".").

For more information about transfer acceleration, see Transfer Acceleration.

The following operations are related to PutBucketAccelerateConfiguration:

- GetBucketAccelerateConfiguration
- CreateBucket

Request Syntax

```
PUT /?accelerate HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
<?xml version="1.0" encoding="UTF-8"?>
  <Status>string</Status>
</AccelerateConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 280)**

The name of the bucket for which the accelerate configuration is set.

Required: Yes

**x-amz-expected-bucket-owner (p. 280)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
x-amz-sdk-checksum-algorithm (p. 280)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

AccelerateConfiguration (p. 280)

Root level tag for the AccelerateConfiguration parameters.

Required: Yes

Status (p. 280)

Specifies the transfer acceleration status of the bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request: Add transfer acceleration configuration to set acceleration status

The following is an example of a PUT /?accelerate request that enables transfer acceleration for the bucket named examplebucket.

```
PUT /?accelerate HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: length

  <Status>Enabled</Status>
</AccelerateConfiguration>
```
Sample Response

This example illustrates one usage of PutBucketAccelerateConfiguration.

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJT00pXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Mon, 11 Apr 2016 12:00:00 GMT
Content-Length: 0
Server: AmazonS3

PutBucketAcl

Service: Amazon S3

Sets the permissions on an existing bucket using access control lists (ACL). For more information, see Using ACLs. To set the ACL of a bucket, you must have WRITE_ACP permission.

You can use one of the following two ways to set a bucket's permissions:

- Specify the ACL in the request body
- Specify permissions using request headers

**Note**
You cannot specify access permission using both the body and the request headers.

Depending on your application needs, you may choose to set the ACL on a bucket using either the request body or the headers. For example, if you have an existing application that updates a bucket ACL using the request body, then you can continue to use that approach.

**Important**
If your bucket uses the bucket owner enforced setting for S3 Object Ownership, ACLs are disabled and no longer affect permissions. You must use policies to grant access to your bucket and the objects in it. Requests to set ACLs or update ACLs fail and return the AccessControlListNotSupported error code. Requests to read ACLs are still supported. For more information, see Controlling object ownership in the Amazon S3 User Guide.

**Permissions**

You can set access permissions by using one of the following methods:

- Specify a canned ACL with the x-amz-acl request header. Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. Specify the canned ACL name as the value of x-amz-acl. If you use this header, you cannot use other access control-specific headers in your request. For more information, see Canned ACL.

- Specify access permissions explicitly with the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control headers. When using these headers, you specify explicit access permissions and grantees (AWS accounts or Amazon S3 groups) who will receive the permission. If you use these ACL-specific headers, you cannot use the x-amz-acl header to set a canned ACL. These parameters map to the set of permissions that Amazon S3 supports in an ACL. For more information, see Access Control List (ACL) Overview.

You specify each grantee as a type=value pair, where the type is one of the following:

- id – if the value specified is the canonical user ID of an AWS account
- uri – if you are granting permissions to a predefined group
- emailAddress – if the value specified is the email address of an AWS account

**Note**
Using email addresses to specify a grantee is only supported in the following AWS Regions:

- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Europe (Ireland)
• South America (São Paulo)
For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.

For example, the following x-amz-grant-write header grants create, overwrite, and delete objects permission to LogDelivery group predefined by Amazon S3 and two AWS accounts identified by their email addresses.

x-amz-grant-write: uri="http://acs.amazonaws.com/groups/s3/LogDelivery", id="111122223333", id="555566667777"

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

Grantee Values

You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:
• By the person's ID:

  DisplayName is optional and ignored in the request

• By URI:

• By Email address:

  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail"><EmailAddress><>Grantees@email.com<></EmailAddress>&</Grantee>

  The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

  **Note**
  Using email addresses to specify a grantee is only supported in the following AWS Regions:
  • US East (N. Virginia)
  • US West (N. California)
  • US West (Oregon)
  • Asia Pacific (Singapore)
  • Asia Pacific (Sydney)
  • Asia Pacific (Tokyo)
  • Europe (Ireland)
  • South America (São Paulo)
  For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.

  The following operations are related to PutBucketAcl:

  • CreateBucket
  • DeleteBucket

API Version 2006-03-01
• **GetObjectAcl**

**Request Syntax**

```plaintext
PUT /?acl HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-acl: ACL
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-grant-full-control: GrantFullControl
x-amz-grant-read: GrantRead
x-amz-grant-read-acp: GrantReadACP
x-amz-grant-write: GrantWrite
x-amz-grant-write-acp: GrantWriteACP
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
  <AccessControlList>
    <Grant>
      <Grantee>
        <DisplayName>string</DisplayName>
        <EmailAddress>string</EmailAddress>
        <ID>string</ID>
        <xsi:type>string</xsi:type>
        <URI>string</URI>
      </Grantee>
      <Permission>string</Permission>
    </Grant>
  </AccessControlList>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
</AccessControlPolicy>
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 285)**

The bucket to which to apply the ACL.

Required: Yes

**Content-MD5 (p. 285)**

The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to [RFC 1864](https://tools.ietf.org/html/rfc1864).

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-acl (p. 285)**

The canned ACL to apply to the bucket.

Valid Values: private | public-read | public-read-write | authenticated-read

**x-amz-expected-bucket-owner (p. 285)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
**x-amz-grant-full-control (p. 285)**

Allows grantee the read, write, read ACP, and write ACP permissions on the bucket.

**x-amz-grant-read (p. 285)**

Allows grantee to list the objects in the bucket.

**x-amz-grant-read-acp (p. 285)**

Allows grantee to read the bucket ACL.

**x-amz-grant-write (p. 285)**

Allows grantee to create new objects in the bucket.

For the bucket and object owners of existing objects, also allows deletions and overwrites of those objects.

**x-amz-grant-write-acp (p. 285)**

Allows grantee to write the ACL for the applicable bucket.

**x-amz-sdk-checksum-algorithm (p. 285)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding `x-amz-checksum` or `x-amz-trailer` header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Request Body**

The request accepts the following data in XML format.

**AccessControlPolicy (p. 285)**

Root level tag for the AccessControlPolicy parameters.

Required: Yes

**Grants (p. 285)**

A list of grants.

Type: Array of Grant (p. 732) data types

Required: No

**Owner (p. 285)**

Container for the bucket owner's display name and ID.

Type: Owner (p. 786) data type

Required: No

**Response Syntax**

```
HTTP/1.1 200
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request: Access permissions specified in the body

The following request grants access permission to the existing examplebucket bucket. The request specifies the ACL in the body. In addition to granting full control to the bucket owner, the XML specifies the following grants.

- Grant the AllUsers group READ permission on the bucket.
- Grant the LogDelivery group WRITE permission on the bucket.
- Grant an AWS account, identified by email address, WRITE_ACP permission.
- Grant an AWS account, identified by canonical user ID, READ_ACP permission.

```
PUT ?acl HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Content-Length: 1660
x-amz-date: Thu, 12 Apr 2012 20:04:21 GMT
Authorization: authorization string

  <Owner>

PutBucketAnalyticsConfiguration

Service: Amazon S3

Sets an analytics configuration for the bucket (specified by the analytics configuration ID). You can have up to 1,000 analytics configurations per bucket.

You can choose to have storage class analysis export analysis reports sent to a comma-separated values (CSV) flat file. See the DataExport request element. Reports are updated daily and are based on the object filters that you configure. When selecting data export, you specify a destination bucket and an optional destination prefix where the file is written. You can export the data to a destination bucket in a different account. However, the destination bucket must be in the same Region as the bucket that you are making the PUT analytics configuration to. For more information, see Amazon S3 Analytics – Storage Class Analysis.

Important
You must create a bucket policy on the destination bucket where the exported file is written to grant permissions to Amazon S3 to write objects to the bucket. For an example policy, see Granting Permissions for Amazon S3 Inventory and Storage Class Analysis.

To use this operation, you must have permissions to perform the s3:PutAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

PutBucketAnalyticsConfiguration has the following special errors:

- **HTTP Error: HTTP 400 Bad Request**
  - Code: InvalidArgument
  - Cause: Invalid argument.
- **HTTP Error: HTTP 400 Bad Request**
  - Code: TooManyConfigurations
  - Cause: You are attempting to create a new configuration but have already reached the 1,000-configuration limit.
- **HTTP Error: HTTP 403 Forbidden**
  - Code: AccessDenied
  - Cause: You are not the owner of the specified bucket, or you do not have the s3:PutAnalyticsConfiguration bucket permission to set the configuration on the bucket.

The following operations are related to PutBucketAnalyticsConfiguration:

- GetBucketAnalyticsConfiguration
- DeleteBucketAnalyticsConfiguration
- ListBucketAnalyticsConfigurations

Request Syntax

PUT /?analytics&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
  <Id>string</Id>
  <Filter>
    <And>
      <Prefix>string</Prefix>
    </And>
  </Filter>
</AnalyticsConfiguration>
<Tag>
  <Key>string</Key>
  <Value>string</Value>
</Tag>
...
</And>
<Prefix>string</Prefix>
<Tag>
  <Key>string</Key>
  <Value>string</Value>
</Tag>
</Filter>
<StorageClassAnalysis>
  <DataExport>
    <S3BucketDestination>
      <Bucket>string</Bucket>
      <BucketAccountId>string</BucketAccountId>
      <Prefix>string</Prefix>
    </S3BucketDestination>
    <Destination>
      <OutputSchemaVersion>string</OutputSchemaVersion>
    </Destination>
  </DataExport>
</StorageClassAnalysis>
</AnalyticsConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 290)**

The name of the bucket to which an analytics configuration is stored.

   Required: Yes

**id (p. 290)**

The ID that identifies the analytics configuration.

   Required: Yes

**x-amz-expected-bucket-owner (p. 290)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request accepts the following data in XML format.

**AnalyticsConfiguration (p. 290)**

Root level tag for the AnalyticsConfiguration parameters.

   Required: Yes

**Filter (p. 290)**

The filter used to describe a set of objects for analyses. A filter must have exactly one prefix, one tag, or one conjunction (AnalyticsAndOperator). If no filter is provided, all objects will be considered in any analysis.
Type: AnalyticsFilter (p. 678) data type

Required: No

Id (p. 290)

The ID that identifies the analytics configuration.

Type: String

Required: Yes

StorageClassAnalysis (p. 290)

Contains data related to access patterns to be collected and made available to analyze the tradeoffs between different storage classes.

Type: StorageClassAnalysis (p. 836) data type

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Example 1: Creating an analytics configuration

The following PUT request for the bucket examplebucket creates a new or replaces an existing analytics configuration with the ID report1. The configuration is defined in the request body.

```
PUT /?analytics&id=report1 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
Content-Length: length

<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Id>report1</Id>
  <Filter>
    <And>
      <Prefix>images/</Prefix>
      <Tag>
        <Key>dog</Key>
        <Value>corgi</Value>
      </Tag>
    </And>
  </Filter>
  <StorageClassAnalysis>
    <DataExport>
      <OutputSchemaVersion>V_1</OutputSchemaVersion>
      <Destination>
        <S3BucketDestination>
          <Format>CSV</Format>
        </S3BucketDestination>
      </Destination>
    </DataExport>
  </StorageClassAnalysis>
</AnalyticsConfiguration>
```
<BucketAccountId>123456789012</BucketAccountId>  
<Bucket>arn:aws:s3:::destination-bucket</Bucket>  
<Prefix>destination-prefix</Prefix>  
</S3BucketDestination>  
</Destination>  
</DataExport>  
</StorageClassAnalysis>  
</AnalyticsConfiguration>  

Sample Response

This example illustrates one usage of PutBucketAnalyticsConfiguration.

HTTP/1.1 200 OK  
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJT00pXUueF6QKo

PutBucketCors
Service: Amazon S3

Sets the cors configuration for your bucket. If the configuration exists, Amazon S3 replaces it.

To use this operation, you must be allowed to perform the s3:PutBucketCORS action. By default, the bucket owner has this permission and can grant it to others.

You set this configuration on a bucket so that the bucket can service cross-origin requests. For example, you might want to enable a request whose origin is http://www.example.com to access your Amazon S3 bucket at my.example.bucket.com by using the browser's XMLHttpRequest capability.

To enable cross-origin resource sharing (CORS) on a bucket, you add the cors subresource to the bucket. The cors subresource is an XML document in which you configure rules that identify origins and the HTTP methods that can be executed on your bucket. The document is limited to 64 KB in size.

When Amazon S3 receives a cross-origin request (or a pre-flight OPTIONS request) against a bucket, it evaluates the cors configuration on the bucket and uses the first CORSRule rule that matches the incoming browser request to enable a cross-origin request. For a rule to match, the following conditions must be met:

• The request's Origin header must match AllowedOrigin elements.
• The request method (for example, GET, PUT, HEAD, and so on) or the Access-Control-Request-Method header in case of a pre-flight OPTIONS request must be one of the AllowedMethod elements.
• Every header specified in the Access-Control-Request-Headers request header of a pre-flight request must match an AllowedHeader element.

For more information about CORS, go to Enabling Cross-Origin Resource Sharing in the Amazon S3 User Guide.

The following operations are related to PutBucketCors:

• GetBucketCors
• DeleteBucketCors
• RESTOPTIONSobject

Request Syntax

```
PUT /?cors HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
 xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
</CORSConfiguration>
```

API Version 2006-03-01
<MaxAgeSeconds>integer</MaxAgeSeconds>
</CORSRule>

...<CORSConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 294)**

Specifies the bucket impacted by the corsconfiguration.

Required: Yes

**Content-MD5 (p. 294)**

The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to [RFC 1864](https://tools.ietf.org/html/rfc1864).

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 294)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 294)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/checking-object-integrity.html) in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

**CORSConfiguration (p. 294)**

Root level tag for the CORSConfiguration parameters.

Required: Yes

**CORSRule (p. 294)**

A set of origins and methods (cross-origin access that you want to allow). You can add up to 100 rules to the configuration.

Type: Array of CORSRule (p. 698) data types

Required: Yes
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Example: CORS configuration on a bucket with two rules

- The first CORSRule allows cross-origin PUT, POST, and DELETE requests whose origin is http://www.example.com origins. The rule also allows all headers in a pre-flight OPTIONS request through the Access-Control-Request-Headers header. Therefore, in response to any pre-flight OPTIONS request, Amazon S3 will return any requested headers.
- The second rule allows cross-origin GET requests from all the origins. The "*" wildcard character refers to all origins.

```xml
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
    <AllowedMethod>PUT</AllowedMethod>
    <AllowedMethod>POST</AllowedMethod>
    <AllowedMethod>DELETE</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
  </CORSRule>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
  </CORSRule>
</CORSConfiguration>
```

Example: CORS configuration allows cross-origin PUT and POST requests from http://www.example.com

The cors configuration also allows additional optional configuration parameters as shown in the following cors configuration on a bucket. For example,

In the preceding configuration, CORSRule includes the following additional optional parameters:

- MaxAgeSeconds—Specifies the time in seconds that the browser will cache an Amazon S3 response to a pre-flight OPTIONS request for the specified resource. In this example, this parameter is 3000 seconds. Caching enables the browsers to avoid sending pre-flight OPTIONS request to Amazon S3 for repeated requests.
- ExposeHeader—Identifies the response header (in this case x-amz-server-side-encryption) that you want customers to be able to access from their applications (for example, from a JavaScript XMLHttpRequest object).

```xml
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
  </CORSRule>
</CORSConfiguration>
```
<AllowedMethod>PUT</AllowedMethod>
<AllowedMethod>POST</AllowedMethod>
<AllowedMethod>DELETE</AllowedMethod>
<AllowedHeader>*</AllowedHeader>
<MaxAgeSeconds>3000</MaxAgeSeconds>
<ExposeHeader>x-amz-server-side-encryption</ExposeHeader>
</CORSRule>
</CORSConfiguration>

PutBucketEncryption
Service: Amazon S3

This action uses the encryption subresource to configure default encryption and Amazon S3 Bucket Keys for an existing bucket.

By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3). You can optionally configure default encryption for a bucket by using server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS) or dual-layer server-side encryption with AWS KMS keys (DSSE-KMS). If you specify default encryption by using SSE-KMS, you can also configure Amazon S3 Bucket Keys. If you use PutBucketEncryption to set your default bucket encryption to SSE-KMS, you should verify that your KMS key ID is correct. Amazon S3 does not validate the KMS key ID provided in PutBucketEncryption requests.

Important
This action requires AWS Signature Version 4. For more information, see Authenticating Requests (AWS Signature Version 4).

To use this operation, you must have permission to perform the s3:PutEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon S3 User Guide.

The following operations are related to PutBucketEncryption:
- GetBucketEncryption
- DeleteBucketEncryption

Request Syntax

```
PUT /?encryption HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <KMSMasterKeyID>string</KMSMasterKeyID>
      <SSEAlgorithm>string</SSEAlgorithm>
    </ApplyServerSideEncryptionByDefault>
    <BucketKeyEnabled>boolean</BucketKeyEnabled>
  </Rule>
  ...
</ServerSideEncryptionConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 298)**

Specifies default encryption for a bucket using server-side encryption with different key options. By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3). You can optionally configure default encryption for a bucket by using server-side encryption with an AWS KMS key (SSE-KMS) or a customer-provided key (SSE-
C). For information about the bucket default encryption feature, see Amazon S3 Bucket Default Encryption in the Amazon S3 User Guide.

Required: Yes
Content-MD5 (p. 298)

The base64-encoded 128-bit MD5 digest of the server-side encryption configuration.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

x-amz-expected-bucket-owner (p. 298)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-sdk-checksum-algorithm (p. 298)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

ServerSideEncryptionConfiguration (p. 298)

Root level tag for the ServerSideEncryptionConfiguration parameters.

Required: Yes
Rule (p. 298)

Container for information about a particular server-side encryption configuration rule.

Type: Array of ServerSideEncryptionRule (p. 829) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

In the request, you specify the encryption configuration in the request body. The encryption configuration is specified as XML, as shown in the following examples that show setting encryption using SSE-S3, SSE-KMS, or DSSE-KMS.
Request Body for Setting SSE-S3

This example illustrates one usage of PutBucketEncryption.

```xml
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>AES256</SSEAlgorithm>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

Request Body for Setting SSE-KMS

This example illustrates one usage of PutBucketEncryption.

```xml
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>aws:kms:dsse</SSEAlgorithm>
      <KMSKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSKeyID>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

Set the Default Encryption Configuration for an S3 Bucket

The following is an example of a PUT /? encryption request that specifies to use SSE-KMS encryption.

```
PUT /?encryption HTTP/1.1
Host: examplebucket.<Region>s3.amazonaws.com
Date: Wed, 06 Sep 2017 12:00:00 GMT
Authorization: authorization
Content-Length: length

  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>aws:kms</SSEAlgorithm>
      <KMSKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSKeyID>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

PutBucketIntelligentTieringConfiguration
Service: Amazon S3

Puts a S3 Intelligent-Tiering configuration to the specified bucket. You can have up to 1,000 S3 Intelligent-Tiering configurations per bucket.

The S3 Intelligent-Tiering storage class is designed to optimize storage costs by automatically moving data to the most cost-effective storage access tier, without performance impact or operational overhead. S3 Intelligent-Tiering delivers automatic cost savings in three low latency and high throughput access tiers. To get the lowest storage cost on data that can be accessed in minutes to hours, you can choose to activate additional archiving capabilities.

The S3 Intelligent-Tiering storage class is the ideal storage class for data with unknown, changing, or unpredictable access patterns, independent of object size or retention period. If the size of an object is less than 128 KB, it is not monitored and not eligible for auto-tiering. Smaller objects can be stored, but they are always charged at the Frequent Access tier rates in the S3 Intelligent-Tiering storage class.

For more information, see Storage class for automatically optimizing frequently and infrequently accessed objects.

Operations related to PutBucketIntelligentTieringConfiguration include:

- DeleteBucketIntelligentTieringConfiguration
- GetBucketIntelligentTieringConfiguration
- ListBucketIntelligentTieringConfigurations

Note
You only need S3 Intelligent-Tiering enabled on a bucket if you want to automatically move objects stored in the S3 Intelligent-Tiering storage class to the Archive Access or Deep Archive Access tier.

PutBucketIntelligentTieringConfiguration has the following special errors:

HTTP 400 Bad Request Error

Code: InvalidArgument
Cause: Invalid Argument

HTTP 400 Bad Request Error

Code: TooManyConfigurations
Cause: You are attempting to create a new configuration but have already reached the 1,000-configuration limit.

HTTP 403 Forbidden Error

Cause: You are not the owner of the specified bucket, or you do not have the s3:PutIntelligentTieringConfiguration bucket permission to set the configuration on the bucket.

Request Syntax

PUT /?intelligent-tiering&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
<?xml version="1.0" encoding="UTF-8"?>
<Id>string</Id>
<Filter>
  <And>
    <Prefix>string</Prefix>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
    ...  
  </And>
  <Prefix>string</Prefix>
  <Tag>
    <Key>string</Key>
    <Value>string</Value>
  </Tag>
</Filter>
>Status>string</Status>
<Tiering>
  <AccessTier>string</AccessTier>
  <Days>integer</Days>
</Tiering>
...  
</IntelligentTieringConfiguration>

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 302)**

The name of the Amazon S3 bucket whose configuration you want to modify or retrieve.

Required: Yes

**id (p. 302)**

The ID used to identify the S3 Intelligent-Tiering configuration.

Required: Yes

**Request Body**

The request accepts the following data in XML format.

**IntelligentTieringConfiguration (p. 302)**

Root level tag for the IntelligentTieringConfiguration parameters.

Required: Yes

**Filter (p. 302)**

Specifies a bucket filter. The configuration only includes objects that meet the filter's criteria.

Type: IntelligentTieringFilter (p. 740) data type

Required: No

**Id (p. 302)**

The ID used to identify the S3 Intelligent-Tiering configuration.

Type: String
Required: Yes

**Status (p. 302)**

Specifies the status of the configuration.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**Tiering (p. 302)**

Specifies the S3 Intelligent-Tiering storage class tier of the configuration.

Type: Array of Tiering (p. 841) data types

Required: Yes

**Response Syntax**

```plaintext
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

PutBucketInventoryConfiguration
Service: Amazon S3

This implementation of the PUT action adds an inventory configuration (identified by the inventory ID) to the bucket. You can have up to 1,000 inventory configurations per bucket.

Amazon S3 inventory generates inventories of the objects in the bucket on a daily or weekly basis, and the results are published to a flat file. The bucket that is inventoried is called the source bucket, and the bucket where the inventory flat file is stored is called the destination bucket. The destination bucket must be in the same AWS Region as the source bucket.

When you configure an inventory for a source bucket, you specify the destination bucket where you want the inventory to be stored, and whether to generate the inventory daily or weekly. You can also configure what object metadata to include and whether to inventory all object versions or only current versions. For more information, see Amazon S3 Inventory in the Amazon S3 User Guide.

Important
You must create a bucket policy on the destination bucket to grant permissions to Amazon S3 to write objects to the bucket in the defined location. For an example policy, see Granting Permissions for Amazon S3 Inventory and Storage Class Analysis.

Permissions

To use this operation, you must have permission to perform the s3:PutInventoryConfiguration action. The bucket owner has this permission by default and can grant this permission to others.

The s3:PutInventoryConfiguration permission allows a user to create an S3 Inventory report that includes all object metadata fields available and to specify the destination bucket to store the inventory. A user with read access to objects in the destination bucket can also access all object metadata fields that are available in the inventory report.

To restrict access to an inventory report, see Restricting access to an Amazon S3 Inventory report in the Amazon S3 User Guide. For more information about the metadata fields available in S3 Inventory, see Amazon S3 Inventory lists in the Amazon S3 User Guide. For more information about permissions, see Permissions related to bucket subresource operations and Identity and access management in Amazon S3 in the Amazon S3 User Guide.

PutBucketInventoryConfiguration has the following special errors:

HTTP 400 Bad Request Error

Code: InvalidArgument

Cause: Invalid Argument

HTTP 400 Bad Request Error

Code: TooManyConfigurations

Cause: You are attempting to create a new configuration but have already reached the 1,000-configuration limit.

HTTP 403 Forbidden Error

Cause: You are not the owner of the specified bucket, or you do not have the s3:PutInventoryConfiguration bucket permission to set the configuration on the bucket.

The following operations are related to PutBucketInventoryConfiguration:
• GetBucketInventoryConfiguration
• DeleteBucketInventoryConfiguration
• ListBucketInventoryConfigurations

Request Syntax

PUT /?inventory&id=Id HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<InventoryConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Destination>
    <S3BucketDestination>
      <AccountId>string</AccountId>
      <Bucket>string</Bucket>
      <Encryption>
        <SSE-KMS>
          <KeyId>string</KeyId>
        </SSE-KMS>
        <SSE-S3/>
      </Encryption>
      <Format>string</Format>
      <Prefix>string</Prefix>
    </S3BucketDestination>
  </Destination>
  <IsEnabled>boolean</IsEnabled>
  <Filter>
    <Prefix>string</Prefix>
  </Filter>
  <Id>string</Id>
  <IncludedObjectVersions>string</IncludedObjectVersions>
  <OptionalFields>
    <Field>string</Field>
  </OptionalFields>
  <Schedule>
    <Frequency>string</Frequency>
  </Schedule>
</InventoryConfiguration>

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 306)

The name of the bucket where the inventory configuration will be stored.

Required: Yes

id (p. 306)

The ID used to identify the inventory configuration.

Required: Yes

x-amz-expected-bucket-owner (p. 306)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
Request Body

The request accepts the following data in XML format.

**InventoryConfiguration (p. 306)**

Root level tag for the InventoryConfiguration parameters.

Required: Yes

**Destination (p. 306)**

Contains information about where to publish the inventory results.

Type: InventoryDestination (p. 743) data type

Required: Yes

**Filter (p. 306)**

Specifies an inventory filter. The inventory only includes objects that meet the filter's criteria.

Type: InventoryFilter (p. 745) data type

Required: No

**Id (p. 306)**

The ID used to identify the inventory configuration.

Type: String

Required: Yes

**IncludedObjectVersions (p. 306)**

Object versions to include in the inventory list. If set to All, the list includes all the object versions, which adds the version-related fields VersionId, IsLatest, and DeleteMarker to the list. If set to Current, the list does not contain these version-related fields.

Type: String

Valid Values: All | Current

Required: Yes

**IsEnabled (p. 306)**

Specifies whether the inventory is enabled or disabled. If set to True, an inventory list is generated. If set to False, no inventory list is generated.

Type: Boolean

Required: Yes

**OptionalFields (p. 306)**

Contains the optional fields that are included in the inventory results.

Type: Array of strings

Valid Values: Size | LastModifiedDate | StorageClass | ETag | IsMultipartUploaded | ReplicationStatus | EncryptionStatus | ObjectLockRetainUntilDate | ObjectLockMode | ObjectLockLegalHoldStatus | IntelligentTieringAccessTier | BucketKeyStatus | ChecksumAlgorithm | ObjectAccessControlList | ObjectOwner
Schedule (p. 306)

Specifies the schedule for generating inventory results.

Type: InventorySchedule (p. 748) data type

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Example: Create an inventory configuration

The following PUT request and response for the bucket examplebucket creates a new or replaces an existing inventory configuration with the ID report1. The configuration is defined in the request body.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<InventoryConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Id>report1</Id>
  <IsEnabled>true</IsEnabled>
  <Filter>
    <Prefix>filterPrefix</Prefix>
  </Filter>
  <Destination>
    <S3BucketDestination>
      <Format>CSV</Format>
      <AccountId>123456789012</AccountId>
      <Bucket>arn:aws:s3:::destination-bucket</Bucket>
      <Prefix>prefix1</Prefix>
      <Encryption>
        <SSE-KMS>
          <KeyId>arn:aws:kms:us-west-2:111122233:1234abcd-12ab-34cd-56ef-1234567890ab</KeyId>
        </SSE-KMS>
      </Encryption>
    </S3BucketDestination>
  </Destination>
  <Schedule>
    <Frequency>Daily</Frequency>
  </Schedule>
  <IncludedObjectVersions>All</IncludedObjectVersions>
  <OptionalFields>
    <Field>Size</Field>
    <Field>LastModifiedDate</Field>
    <Field>ETag</Field>
    <Field>StorageClass</Field>
  </OptionalFields>
</InventoryConfiguration>
```

PutBucketLifecycle
Service: Amazon S3

Important
For an updated version of this API, see PutBucketLifecycleConfiguration. This version has been deprecated. Existing lifecycle configurations will work. For new lifecycle configurations, use the updated API.

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, see Object Lifecycle Management in the Amazon S3 User Guide.

By default, all Amazon S3 resources, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration) are private. Only the resource owner, the AWS account that created the resource, can access it. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, users must get the s3:PutLifecycleConfiguration permission.

You can also explicitly deny permissions. Explicit denial also supersedes any other permissions. If you want to prevent users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

For more information about permissions, see Managing Access Permissions to your Amazon S3 Resources in the Amazon S3 User Guide.

For more examples of transitioning objects to storage classes such as STANDARD_IA or ONEZONE_IA, see Examples of Lifecycle Configuration.

The following operations are related to PutBucketLifecycle:

- GetBucketLifecycle (Deprecated)
- GetBucketLifecycleConfiguration
- RestoreObject

By default, a resource owner—in this case, a bucket owner, which is the AWS account that created the bucket—can perform any of the operations. A resource owner can also grant others permission to perform the operation. For more information, see the following topics in the Amazon S3 User Guide:

- Specifying Permissions in a Policy
- Managing Access Permissions to your Amazon S3 Resources

Request Syntax

```
PUT /?lifecycle HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?><LifecycleConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">  
  <Rule>  
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>integer</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
  </Rule>
</LifecycleConfiguration>
```
<Expiration>
  <Date>timestamp</Date>
  <Days>integer</Days>
  <ExpiredObjectDeleteMarker>boolean</ExpiredObjectDeleteMarker>
</Expiration>

<ID>string</ID>

<NoncurrentVersionExpiration>
  <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
  <NoncurrentDays>integer</NoncurrentDays>
</NoncurrentVersionExpiration>

<NoncurrentVersionTransition>
  <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
  <NoncurrentDays>integer</NoncurrentDays>
  <StorageClass>string</StorageClass>
</NoncurrentVersionTransition>

<Prefix>string</Prefix>

<Status>string</Status>

<Transition>
  <Date>timestamp</Date>
  <Days>integer</Days>
  <StorageClass>string</StorageClass>
</Transition>

</Rule>

</LifecycleConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket** (p. 310)

Required: Yes

**Content-MD5** (p. 310)

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner** (p. 310)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm** (p. 310)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.
LifecycleConfiguration (p. 310)

Root level tag for the LifecycleConfiguration parameters.

Required: Yes

Rule (p. 310)

Specifies lifecycle configuration rules for an Amazon S3 bucket.

Type: Array of Rule (p. 819) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request: Body of a basic lifecycle configuration

In the request, you specify the lifecycle configuration in the request body. The lifecycle configuration is specified as XML. The following is an example of a basic lifecycle configuration. It specifies one rule. The Prefix in the rule identifies objects to which the rule applies. The rule also specifies two actions (Transition and Expiration). Each action specifies a timeline when Amazon S3 should perform the action. The Status indicates whether the rule is enabled or disabled.

```xml
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <Transition>
      <Date>value</Date>
      <StorageClass>storage class</StorageClass>
    </Transition>
    <Expiration>
      <Days>value</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

Sample Request: Body of a lifecycle configuration specifying noncurrent versions

If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object: one current version and zero or more noncurrent versions. The following lifecycle configuration specifies the actions (NoncurrentVersionTransition, NoncurrentVersionExpiration) that are specific to noncurrent object versions.

```xml
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <NoncurrentVersionTransition>
      <Date>value</Date>
      <StorageClass>storage class</StorageClass>
    </NoncurrentVersionTransition>
    <NoncurrentVersionExpiration>
      <Days>value</Days>
    </NoncurrentVersionExpiration>
  </Rule>
</LifecycleConfiguration>
```
Sample Request: Body of a lifecycle configuration that specifies a rule with AbortIncompleteMultipartUpload

You can use the multipart upload to upload large objects in parts. For more information about multipart uploads, see Multipart Upload Overview in the Amazon S3 User Guide. With lifecycle configuration, you can tell Amazon S3 to abort incomplete multipart uploads, which are identified by the key name prefix specified in the rule, if they don't complete within a specified number of days. When Amazon S3 aborts a multipart upload, it deletes all parts associated with the upload. This ensures that you don't have incomplete multipart uploads that have left parts stored in Amazon S3, so you don't have to pay storage costs for them. The following is an example lifecycle configuration that specifies a rule with the AbortIncompleteMultipartUpload action. This action tells Amazon S3 to abort incomplete multipart uploads seven days after initiation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>SomeKeyPrefix</Prefix>
    <Status>rule-status</Status>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>7</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
  </Rule>
</LifecycleConfiguration>
```

Add lifecycle configuration to a bucket that is not versioning-enabled

The following is a sample PUT /?lifecycle request that adds the lifecycle configuration to the examplebucket bucket. The lifecycle configuration specifies two rules, each with one action:

- The Transition action tells Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action tells Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

The sample response follows the sample request.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJD1IkcBaG6fb3QLY69A==
Authorization: authorization string
Content-Length: 415
<LifecycleConfiguration>
```
Add lifecycle configuration to a bucket that is versioning-enabled

The following is a sample PUT /?lifecycle request that adds the lifecycle configuration to the examplebucket bucket. The lifecycle configuration specifies two rules, each with one action. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The NoncurrentVersionExpiration action tells Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The NoncurrentVersionTransition action tells Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

The sample response follows the sample request.

PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:22 GMT
Content-MD5: 96rxH9mDqVNNkaZDddgnw==
Authorization: authorization string
Content-Length: 598

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
<Status>Enabled</Status>
<NoncurrentVersionTransition>
  <NoncurrentDays>0</NoncurrentDays>
  <StorageClass>GLACIER</StorageClass>
</NoncurrentVersionTransition>
</Rule>
</LifecycleConfiguration>

PutBucketLifecycleConfiguration

Service: Amazon S3

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. Keep in mind that this will overwrite an existing lifecycle configuration, so if you want to retain any configuration details, they must be included in the new lifecycle configuration. For information about lifecycle configuration, see Managing your storage lifecycle.

Note
Bucket lifecycle configuration now supports specifying a lifecycle rule using an object key name prefix, one or more object tags, or a combination of both. Accordingly, this section describes the latest API. The previous version of the API supported filtering based only on an object key name prefix, which is supported for backward compatibility. For the related API description, see PutBucketLifecycle.

Important
When making a request using the REST API, you must include the Content-MD5 header.

Rules

You specify the lifecycle configuration in your request body. The lifecycle configuration is specified as XML consisting of one or more rules. An Amazon S3 Lifecycle configuration can have up to 1,000 rules. This limit is not adjustable. Each rule consists of the following:

- A filter identifying a subset of objects to which the rule applies. The filter can be based on a key name prefix, object tags, or a combination of both.
- A status indicating whether the rule is in effect.
- One or more lifecycle transition and expiration actions that you want Amazon S3 to perform on the objects identified by the filter. If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object (one current version and zero or more noncurrent versions). Amazon S3 provides predefined actions that you can specify for current and noncurrent object versions.

For more information, see Object Lifecycle Management and Lifecycle Configuration Elements.

Permissions

By default, all Amazon S3 resources are private, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration). Only the resource owner (that is, the AWS account that created it) can access the resource. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, a user must get the s3:PutLifecycleConfiguration permission.

You can also explicitly deny permissions. An explicit deny also supersedes any other permissions. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources.

The following operations are related to PutBucketLifecycleConfiguration:

- Examples of Lifecycle Configuration
- GetBucketLifecycleConfiguration
- DeleteBucketLifecycle
Request Syntax

PUT /?lifecycle HTTP/1.1

            <ObjectSizeGreaterThan>long</ObjectSizeGreaterThan>
            <ObjectSizeLessThan>long</ObjectSizeLessThan>
            <Prefix>string</Prefix>
            <Tag>
                <Key>string</Key>
                <Value>string</Value>
            </Tag>
        </Filter>
        <ID>string</ID>
        <NoncurrentVersionExpiration>
            <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
            <NoncurrentDays>integer</NoncurrentDays>
        </NoncurrentVersionExpiration>
        <NoncurrentVersionTransition>
            <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
            <NoncurrentDays>integer</NoncurrentDays>
            <StorageClass>string</StorageClass>
        </NoncurrentVersionTransition>
        <Prefix>string</Prefix>
        <Status>string</Status>
        <Transition>
            <Date>timestamp</Date>
            <Days>integer</Days>
            <StorageClass>string</StorageClass>
        </Transition>
    </Rule>
    ...
</LifecycleConfiguration>

URI Request Parameters

The request uses the following URI parameters.
Bucket (p. 317)

The name of the bucket for which to set the configuration.

Required: Yes

x-amz-expected-bucket-owner (p. 317)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-sdk-checksum-algorithm (p. 317)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

LifecycleConfiguration (p. 317)

Root level tag for the LifecycleConfiguration parameters.

Required: Yes

Rule (p. 317)

A lifecycle rule for individual objects in an Amazon S3 bucket.

Type: Array of LifecycleRule (p. 755) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Example 1: Add lifecycle configuration - bucket not versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.

- The Transition action requests Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action requests Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>

Example

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJDILkcBaGGfb3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
Sample Response

This example illustrates one usage of PutBucketLifecycleConfiguration.

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDIJ0JJYcd+1j5nM/rUFiiiZ/fNbDOsd3JUE8NWMLNHvPfwMpd
x-amz-request-id: 9E26D08072A8EF9E
Date: Wed, 14 May 2014 02:11:22 GMT
Content-Length: 0
Server: AmazonS3
```

Example 2: Add lifecycle configuration - bucket is versioning-enabled

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The NoncurrentVersionExpiration action requests Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The NoncurrentVersionTransition action requests Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```
<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>30</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>
```

Example

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:21:48 GMT
Content-MD5: 96rxH9mDqVNKkaZddg==
Authorization: authorization string
Content-Length: 598

<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionSoonAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>0</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>

Sample Response

This example illustrates one usage of PutBucketLifecycleConfiguration.

HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbImMmoO/3bMdDTw/CnjArwje+J49Hf+j44yRb/VmbIkgI05A+PT98Cp/6k07hf+LD2mY=
x-amz-request-id: 02D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3

**PutBucketLogging**

Service: Amazon S3

Set the logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters. All logs are saved to buckets in the same AWS Region as the source bucket. To set the logging status of a bucket, you must be the bucket owner.

The bucket owner is automatically granted FULL_CONTROL to all logs. You use the Grantee request element to grant access to other people. The Permissions request element specifies the kind of access the grantee has to the logs.

**Important**

If the target bucket for log delivery uses the bucket owner enforced setting for S3 Object Ownership, you can't use the Grantee request element to grant access to others. Permissions can only be granted using policies. For more information, see Permissions for server access log delivery in the Amazon S3 User Guide.

**Grantee Values**

You can specify the person (grantee) to whom you're assigning access rights (by using request elements) in the following ways:

- By the person's ID:

  ```xml
  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser"><ID><ID></ID><DisplayName><GranteesEmail></DisplayName></Grantee>
  ```

  **DisplayName** is optional and ignored in the request.

- By Email address:

  ```xml
  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail"><EmailAddress><Grantees@email.com></EmailAddress></Grantee>
  ```

  The grantee is resolved to the CanonicalUser and, in a response to a GETObjectAcl request, appears as the CanonicalUser.

- By URI:

  ```xml
  ```

To enable logging, you use LoggingEnabled and its children request elements. To disable logging, you use an empty BucketLoggingStatus request element:

```xml
```

For more information about server access logging, see Server Access Logging in the Amazon S3 User Guide.

For more information about creating a bucket, see CreateBucket. For more information about returning the logging status of a bucket, see GetBucketLogging.

The following operations are related to PutBucketLogging:

- PutObject
- DeleteBucket
Request Syntax

```
PUT /?logging HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
  <LoggingEnabled>
    <TargetBucket>string</TargetBucket>
    <TargetGrants>
      <Grant>
        <Grantee>
          <DisplayName>string</DisplayName>
          <EmailAddress>string</EmailAddress>
          <ID>string</ID>
          <xsi:type>string</xsi:type>
          <URI>string</URI>
        </Grantee>
        <Permission>string</Permission>
      </Grant>
    </TargetGrants>
    <TargetPrefix>string</TargetPrefix>
  </LoggingEnabled>
</BucketLoggingStatus>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 323)**

The name of the bucket for which to set the logging parameters.

Required: Yes

**Content-MD5 (p. 323)**

The MD5 hash of the PutBucketLogging request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 323)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 323)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.
Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body
The request accepts the following data in XML format.

**BucketLoggingStatus (p. 323)**

Root level tag for the BucketLoggingStatus parameters.

Required: Yes

**LoggingEnabled (p. 323)**

Describes where logs are stored and the prefix that Amazon S3 assigns to all log object keys for a bucket. For more information, see [PUT Bucket logging](http://docs.aws.amazon.com/AmazonS3/latest/API/PUTBucketLogging.html) in the *Amazon S3 API Reference*.

Type: [LoggingEnabled (p. 760)](http://docs.aws.amazon.com/AmazonS3/latest/API/LoggingEnabled.html) data type

Required: No

Response Syntax

```text
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request

This request enables logging and gives the grantee of the bucket READ access to the logs.

Buckets that use the bucket owner enforced setting for Object Ownership to disable ACLs don't support target grants. For more information, see [Permissions for server access log delivery](http://docs.aws.amazon.com/AmazonS3/latest/UG/access-logs.html) in the *Amazon S3 User Guide*.

```
PUT ?logging HTTP/1.1
Host: quotes.s3.<Region>.amazonaws.com
Content-Length: 214
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string

<?xml version="1.0" encoding="UTF-8"?>
<BucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <LoggingEnabled>
    <TargetBucket>mybucketlogs</TargetBucket>
    <TargetPrefix>mybucket-access_log-/</TargetPrefix>
    <TargetGrants>
      <Grant>
        <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
                  xsi:type="AmazonCustomerByEmail">
          <EmailAddress>user@company.com</EmailAddress>
        </Grantee>
        <Permission>READ</Permission>
      </Grant>
    </TargetGrants>
  </LoggingEnabled>
</BucketLoggingStatus>
```

API Version 2006-03-01
Sample Response

This example illustrates one usage of PutBucketLogging.

HTTP/1.1 200 OK
x-amz-id-2: YgIPfBiKa2bj0KMg95r/0zo3emzU4dzsD4zcKCHQUAdQkf3ShJT0OpxUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT

Sample Request: Disabling logging

This request disables logging on the bucket quotes.

PUT ?logging HTTP/1.1
Host: quotes.s3.<Region>.amazonaws.com
Content-Length: 214
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string

<?xml version="1.0" encoding="UTF-8"?>

- AWS SDK for Python
- AWS SDK for Ruby V3
PutBucketMetricsConfiguration

Service: Amazon S3

Sets a metrics configuration (specified by the metrics configuration ID) for the bucket. You can have up to 1,000 metrics configurations per bucket. If you're updating an existing metrics configuration, note that this is a full replacement of the existing metrics configuration. If you don't include the elements you want to keep, they are erased.

To use this operation, you must have permissions to perform the `s3:PutMetricsConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch.

The following operations are related to PutBucketMetricsConfiguration:

- `DeleteBucketMetricsConfiguration`
- `GetBucketMetricsConfiguration`
- `ListBucketMetricsConfigurations`

PutBucketMetricsConfiguration has the following special error:

- Error code: TooManyConfigurations
  - Description: You are attempting to create a new configuration but have already reached the 1,000-configuration limit.
  - HTTP Status Code: HTTP 400 Bad Request

Request Syntax

```xml
PUT /?metrics&id=Id HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
x-amz-expected-bucket-owner: ExpectedBucketOwner  
<?xml version="1.0" encoding="UTF-8"?>  
  <Id>string</Id>  
  <Filter>  
    <AccessPointArn>string</AccessPointArn>  
    <And>  
      <AccessPointArn>string</AccessPointArn>  
      <Prefix>string</Prefix>  
      <Tag>  
        <Key>string</Key>  
        <Value>string</Value>  
      </Tag>  
      ...  
    </And>  
    <Prefix>string</Prefix>  
    <Tag>  
      <Key>string</Key>  
      <Value>string</Value>  
    </Tag>  
  </Filter>  
</MetricsConfiguration>
```
URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 326)**

The name of the bucket for which the metrics configuration is set.

Required: Yes

**id (p. 326)**

The ID used to identify the metrics configuration. The ID has a 64 character limit and can only contain letters, numbers, periods, dashes, and underscores.

Required: Yes

**x-amz-expected-bucket-owner (p. 326)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request accepts the following data in XML format.

**MetricsConfiguration (p. 326)**

Root level tag for the MetricsConfiguration parameters.

Required: Yes

**Filter (p. 326)**

Specifies a metrics configuration filter. The metrics configuration will only include objects that meet the filter's criteria. A filter must be a prefix, an object tag, an access point ARN, or a conjunction (MetricsAndOperator).

Type: **MetricsFilter (p. 765)** data type

Required: No

**Id (p. 326)**

The ID used to identify the metrics configuration. The ID has a 64 character limit and can only contain letters, numbers, periods, dashes, and underscores.

Type: String

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Examples

First Sample Request

Put a metric configuration that enables metrics for an entire bucket.

```
PUT /?metrics&id=EntireBucket HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
Content-Length: 159

<?xml version="1.0" encoding="UTF-8"?>
  <Id>EntireBucket</Id>
</MetricsConfiguration>
```

First Sample Response

This example illustrates one usage of PutBucketMetricsConfiguration.

```
HTTP/1.1 204 No Content
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hcccUjo0iCPEXAMPLEutBj3M7fPGLW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
```

Second Sample Request

Put a metrics configuration that enables metrics for objects that start with a particular prefix and also have specific tags applied.

```
PUT /?metrics&id=ImportantBlueDocuments HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:29 GMT
Authorization: signatureValue
Content-Length: 480

<?xml version="1.0" encoding="UTF-8"?>
  <Id>ImportantBlueDocuments</Id>
  <Filter>
    <And>
      <Prefix>documents/</Prefix>
      <Tag>
        <Key>priority</Key>
        <Value>high</Value>
      </Tag>
      <Tag>
        <Key>class</Key>
        <Value>blue</Value>
      </Tag>
    </And>
  </Filter>
</MetricsConfiguration>
```
Second Sample Response
This example illustrates one usage of PutBucketMetricsConfiguration.

HTTP/1.1 204 No Content
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hccUjo0iCPEXAMPLEutBj3M7fPGLW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:29 GMT
Server: AmazonS3

Third Sample Request
Put a metrics configuration that enables metrics for a specific access point.

PUT /?metrics&id=ImportantDocumentsAccessPoint HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
x-amz-date: Thu, 26 Aug 2021 00:17:29 GMT
Authorization: signatureValue
Content-Length: 480

<?xml version="1.0" encoding="UTF-8"?>
  <Id>ImportantDocumentsAccessPoint</Id>
  <Filter>
  </Filter>
</MetricsConfiguration>

Thirds Sample Response
This example illustrates one usage of PutBucketMetricsConfiguration.

HTTP/1.1 204 No Content
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hccUjo0iCPEXAMPLEutBj3M7fPGLW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 26 Aug 2021 00:17:29 GMT
Server: AmazonS3

PutBucketNotification
Service: Amazon S3

No longer used, see the PutBucketNotificationConfiguration operation.

Request Syntax

PUT /?notification HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner

  <TopicConfiguration>
    <Event>string</Event>
    ...
    <Id>string</Id>
    <Topic>string</Topic>
  </TopicConfiguration>
  <QueueConfiguration>
    <Event>string</Event>
    ...
    <Id>string</Id>
    <Queue>string</Queue>
  </QueueConfiguration>
  <CloudFunctionConfiguration>
    <CloudFunction>string</CloudFunction>
    ...
    <Id>string</Id>
    <InvocationRole>string</InvocationRole>
  </CloudFunctionConfiguration>
</NotificationConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 331)**

The name of the bucket.

Required: Yes

**Content-MD5 (p. 331)**

The MD5 hash of the PutPublicAccessBlock request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 331)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 331)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there
must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Request Body**

The request accepts the following data in XML format.

NotificationConfiguration (p. 331)

Root level tag for the NotificationConfiguration parameters.

Required: Yes

CloudFunctionConfiguration (p. 331)

Container for specifying the AWS Lambda notification configuration.

Type: CloudFunctionConfiguration (p. 685) data type

Required: No

QueueConfiguration (p. 331)

This data type is deprecated. This data type specifies the configuration for publishing messages to an Amazon Simple Queue Service (Amazon SQS) queue when Amazon S3 detects specified events.

Type: QueueConfigurationDeprecated (p. 799) data type

Required: No

TopicConfiguration (p. 331)

This data type is deprecated. A container for specifying the configuration for publication of messages to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects specified events.

Type: TopicConfigurationDeprecated (p. 844) data type

Required: No

**Response Syntax**

HTTP/1.1 200

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

• AWS SDK for Python
• AWS SDK for Ruby V3
PutBucketNotificationConfiguration

Service: Amazon S3

Enables notifications of specified events for a bucket. For more information about event notifications, see Configuring Event Notifications.

Using this API, you can replace an existing notification configuration. The configuration is an XML file that defines the event types that you want Amazon S3 to publish and the destination where you want Amazon S3 to publish an event notification when it detects an event of the specified type.

By default, your bucket has no event notifications configured. That is, the notification configuration will be an empty NotificationConfiguration.

<NotificationConfiguration>
</NotificationConfiguration>

This action replaces the existing notification configuration with the configuration you include in the request body.

After Amazon S3 receives this request, it first verifies that any Amazon Simple Notification Service (Amazon SNS) or Amazon Simple Queue Service (Amazon SQS) destination exists, and that the bucket owner has permission to publish to it by sending a test notification. In the case of AWS Lambda destinations, Amazon S3 verifies that the Lambda function permissions grant Amazon S3 permission to invoke the function from the Amazon S3 bucket. For more information, see Configuring Notifications for Amazon S3 Events.

You can disable notifications by adding the empty NotificationConfiguration element.

For more information about the number of event notification configurations that you can create per bucket, see Amazon S3 service quotas in AWS General Reference.

By default, only the bucket owner can configure notifications on a bucket. However, bucket owners can use a bucket policy to grant permission to other users to set this configuration with the required s3:PutBucketNotification permission.

Note

The PUT notification is an atomic operation. For example, suppose your notification configuration includes SNS topic, SQS queue, and Lambda function configurations. When you send a PUT request with this configuration, Amazon S3 sends test messages to your SNS topic. If the message fails, the entire PUT action will fail, and Amazon S3 will not add the configuration to your bucket.

If the configuration in the request body includes only one TopicConfiguration specifying only the s3:ReducedRedundancyLostObject event type, the response will also include the x-amz-sns-test-message-id header containing the message ID of the test notification sent to the topic.

The following action is related to PutBucketNotificationConfiguration:

- GetBucketNotificationConfiguration

Request Syntax

```
PUT /?notification HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-skip-destination-validation: SkipDestinationValidation
<?xml version="1.0" encoding="UTF-8"?>
  ...
</NotificationConfiguration>
```
<Event>string</Event>
...
<Filter>
  <S3Key>
    <FilterRule>
      <Name>string</Name>
      <Value>string</Value>
    </FilterRule>
  </S3Key>
</Filter>
<Id>string</Id>
<Topic>string</Topic>
</TopicConfiguration>
...
<QueueConfiguration>
  <Event>string</Event>
  ...
  <Filter>
    <S3Key>
      <FilterRule>
        <Name>string</Name>
        <Value>string</Value>
      </FilterRule>
    </S3Key>
  </Filter>
  <Id>string</Id>
  <Queue>string</Queue>
</QueueConfiguration>
...
<CloudFunctionConfiguration>
  <Event>string</Event>
  ...
  <Filter>
    <S3Key>
      <FilterRule>
        <Name>string</Name>
        <Value>string</Value>
      </FilterRule>
    </S3Key>
  </Filter>
  <Id>string</Id>
  <CloudFunction>string</CloudFunction>
</CloudFunctionConfiguration>
...
<EventBridgeConfiguration>
</EventBridgeConfiguration>
</NotificationConfiguration>

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 334)**

The name of the bucket.

Required: Yes

**x-amz-expected-bucket-owner (p. 334)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
**x-amz-skip-destination-validation (p. 334)**

Skips validation of Amazon SQS, Amazon SNS, and AWS Lambda destinations. True or false value.

**Request Body**

The request accepts the following data in XML format.

**NotificationConfiguration (p. 334)**

Root level tag for the NotificationConfiguration parameters.

Required: Yes

**CloudFunctionConfiguration (p. 334)**

Describes the AWS Lambda functions to invoke and the events for which to invoke them.

Type: Array of [LambdaFunctionConfiguration (p. 751)] data types

Required: No

**EventBridgeConfiguration (p. 334)**

Enables delivery of events to Amazon EventBridge.

Type: [EventBridgeConfiguration (p. 726)] data type

Required: No

**QueueConfiguration (p. 334)**

The Amazon Simple Queue Service queues to publish messages to and the events for which to publish messages.

Type: Array of [QueueConfiguration (p. 797)] data types

Required: No

**TopicConfiguration (p. 334)**

The topic to which notifications are sent and the events for which notifications are generated.

Type: Array of [TopicConfiguration (p. 842)] data types

Required: No

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

**Example 1: Configure notification to invoke a cloud function in Lambda**

The following notification configuration includes CloudFunctionConfiguration, which identifies the event type for which Amazon S3 can invoke a cloud function and the name of the cloud function to invoke.
<NotificationConfiguration>
  <CloudFunctionConfiguration>
    <Id>ObjectCreatedEvents</Id>
    <CloudFunction>arn:aws:lambda:us-west-2:35667example:function:CreateThumbnail</CloudFunction>
  </CloudFunctionConfiguration>
</NotificationConfiguration>

Example

The following PUT uploads the notification configuration. The action replaces the existing notification configuration.

PUT http://s3.<Region>.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 23:14:52 +0000
Content-Length: length

[request body]

Sample Response

This example illustrates one usage of PutBucketNotificationConfiguration.

HTTP/1.1 200 OK
x-amz-id-2: 8+FlwagBSoT2qpMaGlfcUKrKFR5W30e57UhhoBb17j+qkvpS2cSF1gJ5coLD53d2
x-amz-request-id: E5BA4600A3937335
Date: Fri, 31 Oct 2014 01:49:50 GMT
Content-Length: 0
Server: AmazonS3

Example 2: Configure a notification with multiple destinations

The following notification configuration includes the topic and queue configurations:

- A topic configuration identifying an SNS topic for Amazon S3 to publish events of the
  s3:ReducedRedundancyLostObject type.
- A queue configuration identifying an SQS queue for Amazon S3 to publish events of the
  s3:ObjectCreated:* type.

<NotificationConfiguration>
  <TopicConfiguration>
    <Topic>arn:aws:sns:us-east-1:356671443308:s3notificationtopic2</Topic>
    <Event>s3:ReducedRedundancyLostObject</Event>
  </TopicConfiguration>
  <QueueConfiguration>
    <Event>s3:ObjectCreated:*</Event>
  </QueueConfiguration>
</NotificationConfiguration>
<Queue>arn:aws:sqs:us-east-1:356671443308:s3notificationqueue</Queue>
<Event>s3:ObjectCreated:*</Event>
</QueueConfiguration>
</NotificationConfiguration>

Example

The following PUT request against the notification subresource of the examplebucket bucket sends the preceding notification configuration in the request body. The action replaces the existing notification configuration on the bucket.

```
PUT http://s3.<Region>.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 22:58:43 +0000
Content-Length: 391
Expect: 100-continue
```

Example 3: Configure a notification with object key name filtering

The following notification configuration contains a queue configuration identifying an Amazon SQS queue for Amazon S3 to publish events to of the s3:ObjectCreated:Put type. The events will be published whenever an object that has a prefix of images/ and a .jpg suffix is PUT to a bucket. For more examples of notification configurations that use filtering, see Configuring Event Notifications.

```
<NotificationConfiguration>
 <QueueConfiguration>
  <Id>1</Id>
  <Filter>
   <S3Key>
    <FilterRule>
     <Name>prefix</Name>
     <Value>images/</Value>
    </FilterRule>
    <FilterRule>
     <Name>suffix</Name>
     <Value>.jpg</Value>
    </FilterRule>
   </S3Key>
  </Filter>
 </QueueConfiguration>
</NotificationConfiguration>
```

Example

The following PUT request against the notification subresource of the examplebucket bucket sends the preceding notification configuration in the request body. The action replaces the existing notification configuration on the bucket.
PUT http://s3.<Region>.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 22:58:43 +0000
Content-Length: length
Expect: 100-continue

Sample Response
This example illustrates one usage of PutBucketNotificationConfiguration.

HTTP/1.1 200 OK
x-amz-id-2: SlvJLkfunoAGILZK3KqHSSUq4kwbudkrROmESoHOpDacULy+cxRoR15rfoyvg2A
x-amz-request-id: BB1BA8E12D6A80B7
Date: Mon, 13 Oct 2014 22:58:44 GMT
Content-Length: 0
Server: AmazonS3

PutBucketOwnershipControls
Service: Amazon S3

Creates or modifies OwnershipControls for an Amazon S3 bucket. To use this operation, you must have the s3:PutBucketOwnershipControls permission. For more information about Amazon S3 permissions, see Specifying permissions in a policy.

For information about Amazon S3 Object Ownership, see Using object ownership.

The following operations are related to PutBucketOwnershipControls:

- GetBucketOwnershipControls (p. 141)
- DeleteBucketOwnershipControls (p. 66)

Request Syntax

```
PUT /?ownershipControls HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<OwnershipControls xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Rule>
        <ObjectOwnership>string</ObjectOwnership>
    </Rule>
    ...
</OwnershipControls>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 340)**

The name of the Amazon S3 bucket whose OwnershipControls you want to set.

Required: Yes

**Content-MD5 (p. 340)**

The MD5 hash of the OwnershipControls request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 340)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

Request Body

The request accepts the following data in XML format.

**OwnershipControls (p. 340)**

Root level tag for the OwnershipControls parameters.

Required: Yes
Rule (p. 340)

The container element for an ownership control rule.

Type: Array of OwnershipControlsRule (p. 788) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request with BucketOwnerEnforced OwnershipControls

The following request puts a bucket OwnershipControls that specifies BucketOwnerEnforced.

PUT /DOC-EXAMPLE-BUCKET?ownershipControls= HTTP/1.1
Host:DOC-EXAMPLE-BUCKET.s3.<Region>.amazonaws.com
x-amz-date: 20211130T230132Z
x-amz-content-sha256: baf6c18574a73704c8227ae060df1c12ea0d964e19b949d06e9f763805fe2
Authorization: authorization string

<?xml version="1.0" encoding="UTF-8"?>
<OwnershipControls xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Rule>
    <ObjectOwnership>BucketOwnerEnforced</ObjectOwnership>
  </Rule>
</OwnershipControls>

Sample Response with BucketOwnerEnforced OwnershipControls

This example illustrates one usage of PutBucketOwnershipControls.

HTTP/1.1 200 OK
x-amz-id-2: zkDVX0gbz8oKcjNz7GPz8XhXkhnNAzHtA8/WOfShyEj6SbisSRdqITZvSuAMik7HK4PY
x-amz-request-id: BK7Y8MSG7Z0RFRCP
Date: Tue, 30 Nov 2021 23:01:33 GMT
Content-Length: 0
Server: AmazonS3

Sample Request with BucketOwnerPreferred OwnershipControls

The following request puts a bucket OwnershipControls that specifies BucketOwnerPreferred.

PUT /DOC-EXAMPLE-BUCKET?ownershipControls= HTTP/1.1
Sample Response with BucketOwnerPreferred OwnershipControls

This example illustrates one usage of PutBucketOwnershipControls.

```
HTTP/1.1 200 OK
x-amz-id-2: zkDVX0gbz8oKcjNz7GPz8XhXkhNAzHtA8/W0fShyEj65bisSRdqITZvSuAMik7HK4PY

Date: Thu, 18 Jun 2020 23:01:33 GMT
Content-Length: 0
Server: AmazonS3
```

Sample Request with ObjectWriter OwnershipControls

The following request puts a bucket OwnershipControls that specifies ObjectWriter.

```
PUT /DOC-EXAMPLE-BUCKET?ownershipControls= HTTP/1.1
Host:DOC-EXAMPLE-BUCKET.s3.<Region>.amazonaws.com
x-amz-date: 20200618T230132Z
x-amz-content-sha256: bafb46c18574a73704c8227aef060df1c12ea0d964e19b949d06e9f763805fe2
Authorization: authorization string
<?xml version="1.0" encoding="UTF-8"?>
<OwnershipControls xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Rule>
    <ObjectOwnership>ObjectWriter</ObjectOwnership>
  </Rule>
</OwnershipControls>
```

Sample Response with ObjectWriter OwnershipControls

This example illustrates one usage of PutBucketOwnershipControls.

```
HTTP/1.1 200 OK
x-amz-id-2: zkDVX0gbz8oKcjNz7GPz8XhXkhNAzHtA8/W0fShyEj65bisSRdqITZvSuAMik7HK4PY
+izDZZI0=
x-amz-request-id: BK7Y8M3G7Z0RFRCP
Date: Thu, 18 Jun 2020 23:01:33 GMT
Content-Length: 0
Server: AmazonS3
```

PutBucketPolicy
Service: Amazon S3

Applies an Amazon S3 bucket policy to an Amazon S3 bucket. If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the PutBucketPolicy permissions on the specified bucket and belong to the bucket owner's account in order to use this operation.

If you don’t have PutBucketPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner’s account, Amazon S3 returns a 405 Method Not Allowed error.

Important
To ensure that bucket owners don't inadvertently lock themselves out of their own buckets, the root principal in a bucket owner's AWS account can perform the GetBucketPolicy, PutBucketPolicy, and DeleteBucketPolicy API actions, even if their bucket policy explicitly denies the root principal's access. Bucket owner root principals can only be blocked from performing these API actions by VPC endpoint policies and AWS Organizations policies.

For more information, see [Bucket policy examples](#).

The following operations are related to PutBucketPolicy:

- CreateBucket
- DeleteBucket

Request Syntax

```plaintext
PUT /?policy HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-confirm-remove-self-bucket-access: ConfirmRemoveSelfBucketAccess
x-amz-expected-bucket-owner: ExpectedBucketOwner

{ Policy in JSON format }
```

URI Request Parameters

The request uses the following URI parameters.

- **Bucket** *(p. 344)*
  The name of the bucket.
  Required: Yes

- **Content-MD5** *(p. 344)*
  The MD5 hash of the request body.
  For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

- **x-amz-confirm-remove-self-bucket-access** *(p. 344)*
  Set this parameter to true to confirm that you want to remove your permissions to change this bucket policy in the future.
x-amz-expected-bucket-owner (p. 344)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-sdk-checksum-algorithm (p. 344)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in JSON format.

Policy (p. 344)

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request

The following request shows the PUT individual policy request for the bucket.

```
PUT /?policy HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Tue, 04 Apr 2010 20:34:56 GMT
Authorization: authorization string

{
    "Version":"2008-10-17",
    "Id":"aaaa-bbbb-cccc-dddd",
    "Statement" : [
        {
            "Effect":"Allow",
            "Sid":"1",
            "Principal" : {
                "AWS":["111122223333","444455556666"]
            },
            "Action":["s3:*"],
            "Resource":"arn:aws:s3:::bucket/*"
        }
    ]
}
```
Sample Response

This example illustrates one usage of PutBucketPolicy.

HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRSOnimru9SAMPLEAtRpfTaOFg==
x-amz-request-id: 656c76696e6727732SAMPLE7374
Date: Tue, 04 Apr 2010 20:34:56 GMT
Connection: keep-alive
Server: AmazonS3

PutBucketReplication
Service: Amazon S3

Creates a replication configuration or replaces an existing one. For more information, see Replication in the Amazon S3 User Guide.

Specify the replication configuration in the request body. In the replication configuration, you provide the name of the destination bucket or buckets where you want Amazon S3 to replicate objects, the IAM role that Amazon S3 can assume to replicate objects on your behalf, and other relevant information. You can invoke this request for a specific AWS Region by using the aws:RequestedRegion condition key.

A replication configuration must include at least one rule, and can contain a maximum of 1,000. Each rule identifies a subset of objects to replicate by filtering the objects in the source bucket. To choose additional subsets of objects to replicate, add a rule for each subset.

To specify a subset of the objects in the source bucket to apply a replication rule to, add the Filter element as a child of the Rule element. You can filter objects based on an object key prefix, one or more object tags, or both. When you add the Filter element in the configuration, you must also add the following elements: DeleteMarkerReplication, Status, and Priority.

Note
If you are using an earlier version of the replication configuration, Amazon S3 handles replication of delete markers differently. For more information, see Backward Compatibility.

For information about enabling versioning on a bucket, see Using Versioning.

Handling Replication of Encrypted Objects

By default, Amazon S3 doesn't replicate objects that are stored at rest using server-side encryption with KMS keys. To replicate AWS KMS-encrypted objects, add the following: SourceSelectionCriteria, SseKmsEncryptedObjects, Status, EncryptionConfiguration, and ReplicaKmsKeyID. For information about replication configuration, see Replicating Objects Created with SSE Using KMS keys.

For information on PutBucketReplication errors, see List of replication-related error codes.

Permissions

To create a PutBucketReplication request, you must have s3:PutReplicationConfiguration permissions for the bucket.

By default, a resource owner, in this case the AWS account that created the bucket, can perform this operation. The resource owner can also grant others permissions to perform the operation. For more information about permissions, see Specifying Permissions in a Policy and Managing Access Permissions to Your Amazon S3 Resources.

Note
To perform this operation, the user or role performing the action must have the iam:PassRole permission.

The following operations are related to PutBucketReplication:

- GetBucketReplication
- DeleteBucketReplication

Request Syntax

PUT /?replication HTTP/1.1
  <Role>string</Role>
  <Rule>
    <DeleteMarkerReplication>
      <Status>string</Status>
    </DeleteMarkerReplication>
    <Destination>
      <AccessControlTranslation>
        <Owner>string</Owner>
      </AccessControlTranslation>
      <Account>string</Account>
      <Bucket>string</Bucket>
      <EncryptionConfiguration>
        <ReplicaKmsKeyID>string</ReplicaKmsKeyID>
      </EncryptionConfiguration>
      <Metrics>
        <EventThreshold>
          <Minutes>integer</Minutes>
        </EventThreshold>
        <Status>string</Status>
      </Metrics>
      <ReplicationTime>
        <Status>string</Status>
        <Time>
          <Minutes>integer</Minutes>
        </Time>
      </ReplicationTime>
      <StorageClass>string</StorageClass>
      <ExistingObjectReplication>
        <Status>string</Status>
      </ExistingObjectReplication>
      <Filter>
        <And>
          <Prefix>string</Prefix>
          <Tag>
            <Key>string</Key>
            <Value>string</Value>
          </Tag>
          ...
        </And>
        <Prefix>string</Prefix>
        <Tag>
          <Key>string</Key>
          <Value>string</Value>
        </Tag>
      </Filter>
      <ID>string</ID>
      <Prefix>string</Prefix>
      <Priority>integer</Priority>
      <SourceSelectionCriteria>
        <ReplicaModifications>
          <Status>string</Status>
        </ReplicaModifications>
        <SseKmsEncryptedObjects>
          <Status>string</Status>
        </SseKmsEncryptedObjects>
      </SourceSelectionCriteria>
    </SourceSelectionCriteria>
    <ID>string</ID>
  </Rule>
</ReplicationConfiguration>
URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 347)**

The name of the bucket

Required: Yes

**Content-MD5 (p. 347)**

The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-bucket-object-lock-token (p. 347)**

A token to allow Object Lock to be enabled for an existing bucket.

**x-amz-expected-bucket-owner (p. 347)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 347)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32  |  CRC32C  |  SHA1  |  SHA256

Request Body

The request accepts the following data in XML format.

**ReplicationConfiguration (p. 347)**

Root level tag for the ReplicationConfiguration parameters.

Required: Yes

**Role (p. 347)**

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that Amazon S3 assumes when replicating objects. For more information, see How to Set Up Replication in the Amazon S3 User Guide.

Type: String

Required: Yes
Rule (p. 347)

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

Type: Array of ReplicationRule (p. 807) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request: Add a replication configuration

The following is a sample PUT request that creates a replication subresource on the specified bucket and saves the replication configuration in it. The replication configuration specifies a rule to replicate objects to the DOC-EXAMPLE-BUCKET bucket. The rule includes a filter to replicate only the objects created with the key name prefix TaxDocs and that have two specific tags.

After you add a replication configuration to your bucket, Amazon S3 assumes the AWS Identity and Access Management (IAM) role specified in the configuration to replicate objects on behalf of the bucket owner. The bucket owner is the AWS account that created the bucket.

Filtering using the <Filter> element is supported in the latest XML configuration. If you are using an earlier version of the XML configuration, you can filter only on key prefix. In that case, you add the <Prefix> element as a child of the <Rule>.

For more examples of replication configuration, see Replication Configuration Overview in the Amazon S3 User Guide.

PUT /?replication HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Wed, 11 Feb 2015 02:11:21 GMT
Content-MD5: q6yJD1IkBaGf5b3QLyG9A==
Authorization: authorization string
Content-Length: length

<ReplicationConfiguration>
  <Role>arn:aws:iam::35667example:role/CrossRegionReplicationRoleForS3</Role>
  <Rule>

Sample Response

This example illustrates one usage of PutBucketReplication.

HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXt3DDI30J3Ycd+1j5nM/rUFiiiiZ/fNbdOsd3JUE8NWMLNHXmvPfwMpdC
x-amz-request-id: 9E26D00072A0EF9E
Date: Wed, 11 Feb 2015 02:11:22 GMT
Content-Length: 0
Server: AmazonS3

Sample Request: Add a Replication Configuration with Amazon S3 Replication Time Control Enabled

You can use S3 Replication Time Control (S3 RTC) to replicate your data in the same AWS Region or across different AWS Regions in a predictable time frame. S3 RTC replicates 99.99 percent of new objects stored in Amazon S3 within 15 minutes. For more information, see Replicating objects using Replication Time Control.

PutBucketRequestPayment

Service: Amazon S3

Sets the request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download. For more information, see Requester Pays Buckets.

The following operations are related to PutBucketRequestPayment:

- CreateBucket
- GetBucketRequestPayment

Request Syntax

PUT /?requestPayment HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<RequestPaymentConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Payer string="string"/>
</RequestPaymentConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 353)**

The bucket name.

Required: Yes

**Content-MD5 (p. 353)**

The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 353)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 353)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.
Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

**RequestPaymentConfiguration (p. 353)**

Root level tag for the RequestPaymentConfiguration parameters.

Required: Yes

**Payer (p. 353)**

Specifies who pays for the download and request fees.

Type: String

Valid Values: Requester | BucketOwner

Required: Yes

Response Syntax

```xml
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request

This request creates a Requester Pays bucket named colorpictures.

```xml
PUT ?requestPayment HTTP/1.1
Host: colorpictures.s3.<Region>.amazonaws.com
Content-Length: 173
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

<RequestPaymentConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Payer>Requester</Payer>
</RequestPaymentConfiguration>
```

Sample Response

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

```xml
HTTP/1.1 200  OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJT0opXUueF6QKo
x-amz-request-id: 236A8905248E5A01
```

**PutBucketTagging**  
*Service: Amazon S3*

Sets the tags for a bucket.

Use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. Then, to see the cost of combined resources, organize your billing information according to resources with the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see [Cost Allocation and Tagging](#) and [Using Cost Allocation in Amazon S3 Bucket Tags](#).

**Note**  
When this operation sets the tags for a bucket, it will overwrite any current tags the bucket already has. You cannot use this operation to add tags to an existing list of tags.

To use this operation, you must have permissions to perform the `s3:PutBucketTagging` action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see [Permissions Related to Bucket Subresource Operations](#) and [Managing Access Permissions to Your Amazon S3 Resources](#).

**PutBucketTagging** has the following special errors. For more Amazon S3 errors see, [Error Responses](#).

- **InvalidTag** - The tag provided was not a valid tag. This error can occur if the tag did not pass input validation. For more information, see [Using Cost Allocation in Amazon S3 Bucket Tags](#).
- **MalformedXML** - The XML provided does not match the schema.
- **OperationAborted** - A conflicting conditional action is currently in progress against this resource. Please try again.
- **InternalError** - The service was unable to apply the provided tag to the bucket.

The following operations are related to **PutBucketTagging**:

- [GetBucketTagging](#)
- [DeleteBucketTagging](#)

**Request Syntax**

```xml
PUT /?tagging HTTP/1.1  
Host: Bucket.s3.amazonaws.com  
Content-MD5: ContentMD5  
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm  
x-amz-expected-bucket-owner: ExpectedBucketOwner  
<?xml version="1.0" encoding="UTF-8"?>  
<Tagging xmlns="http://s3.amazonaws.com/doc/2006-03-01/">  
  <TagSet>  
    <Tag>  
      <Key>string</Key>  
      <Value>string</Value>  
    </Tag>  
  </TagSet>  
</Tagging>
```

**URI Request Parameters**

The request uses the following URI parameters.
**Bucket (p. 356)**

The bucket name.

Required: Yes

**Content-MD5 (p. 356)**

The base-64 encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see [RFC 1864](https://www.rfc-editor.org/rfc/rfc1864).

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 356)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 356)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding `x-amz-checksum` or `x-amz-trailer` header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Request Body**

The request accepts the following data in XML format.

**Tagging (p. 356)**

Root level tag for the Tagging parameters.

Required: Yes

**TagSet (p. 356)**

A collection for a set of tags

Type: Array of `Tag (p. 838)` data types

Required: Yes

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Examples

Sample Request: Add tag set to a bucket

The following request adds a tag set to the existing examplebucket bucket.

```
PUT ?tagging HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Content-Length: 1660
x-amz-date: Thu, 12 Apr 2012 20:04:21 GMT
Authorization: authorization string

<Tagging>
  <TagSet>
    <Tag>
      <Key>Project</Key>
      <Value>Project One</Value>
    </Tag>
    <Tag>
      <Key>User</Key>
      <Value>jsmith</Value>
    </Tag>
  </TagSet>
</Tagging>
```

Sample Response

This example illustrates one usage of PutBucketTagging.

```
HTTP/1.1 204 No Content
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJT00pXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Oct 2012 12:00:00 GMT
```

PutBucketVersioning
Service: Amazon S3

Sets the versioning state of an existing bucket.

You can set the versioning state with one of the following values:

**Enabled**—Enables versioning for the objects in the bucket. All objects added to the bucket receive a unique version ID.

**Suspended**—Disables versioning for the objects in the bucket. All objects added to the bucket receive the version ID null.

If the versioning state has never been set on a bucket, it has no versioning state; a [GetBucketVersioning](https://docs.aws.amazon.com/AmazonS3/latest/API/API_GetBucketVersioning.html) request does not return a versioning state value.

In order to enable MFA Delete, you must be the bucket owner. If you are the bucket owner and want to enable MFA Delete in the bucket versioning configuration, you must include the `x-amz-mfa` request header and the `Status` and the `MfaDelete` request elements in a request to set the versioning state of the bucket.

**Important**
If you have an object expiration lifecycle configuration in your non-versioned bucket and you want to maintain the same permanent delete behavior when you enable versioning, you must add a noncurrent expiration policy. The noncurrent expiration lifecycle configuration will manage the deletes of the noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current and zero or more noncurrent object versions.) For more information, see [Lifecycle and Versioning](https://docs.aws.amazon.com/AmazonS3/latest/userguide/lifecycle-and-versioning.html).

The following operations are related to PutBucketVersioning:

- [CreateBucket](https://docs.aws.amazon.com/AmazonS3/latest/API/API_CreateBucket.html)
- [DeleteBucket](https://docs.aws.amazon.com/AmazonS3/latest/API/API_DeleteBucket.html)

**Request Syntax**

PUT /?versioning HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-mfa: MFA
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
  <MfaDelete>string</MfaDelete>
  <Status>string</Status>
</VersioningConfiguration>

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 359)**

The bucket name.

Required: Yes
Content-MD5 (p. 359)

The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

x-amz-expected-bucket-owner (p. 359)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-mfa (p. 359)

The concatenation of the authentication device's serial number, a space, and the value that is displayed on your authentication device.

x-amz-sdk-checksum-algorithm (p. 359)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

VersioningConfiguration (p. 359)

Root level tag for the VersioningConfiguration parameters.

Required: Yes

MFADelete (p. 359)

Specifies whether MFA delete is enabled in the bucket versioning configuration. This element is only returned if the bucket has been configured with MFA delete. If the bucket has never been so configured, this element is not returned.

Type: String

Valid Values: Enabled | Disabled

Required: No

Status (p. 359)

The versioning state of the bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Request

The following request enables versioning for the specified bucket.

```plaintext
PUT /?versioning HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

  <Status>Enabled</Status>
</VersioningConfiguration>
```

Sample Response

This example illustrates one usage of PutBucketVersioning.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiki2bj0KMrG95y/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJT00pUXueF6Qko
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
```

Sample Request

The following request suspends versioning for the specified bucket.

```plaintext
PUT /?versioning HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

  <Status>Suspended</Status>
</VersioningConfiguration>
```

Sample Response

This example illustrates one usage of PutBucketVersioning.
Sample Request

The following request enables versioning and MFA Delete on a bucket. Note the space between [SerialNumber] and [TokenCode] and that you must include Status whenever you use MfaDelete.

```plaintext
PUT /?versioning HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-mfa:[SerialNumber] [TokenCode]
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

<?xml version="1.0" encoding="UTF-8"?>
  <Status>Enabled</Status>
  <MfaDelete>Enabled</MfaDelete>
</VersioningConfiguration>
```

Sample Response

This example illustrates one usage of PutBucketVersioning.

```plaintext
HTTPS/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4zcKCHQUAdQkf3ShJT00pXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
Location: /colorpictures
Content-Length: 0
Connection: close
Server: AmazonS3
```

PutBucketWebsite

Service: Amazon S3

Sets the configuration of the website that is specified in the website subresource. To configure a bucket as a website, you can add this subresource on the bucket with website configuration information such as the file name of the index document and any redirect rules. For more information, see Hosting Websites on Amazon S3.

This PUT action requires the S3:PutBucketWebsite permission. By default, only the bucket owner can configure the website attached to a bucket; however, bucket owners can allow other users to set the website configuration by writing a bucket policy that grants them the S3:PutBucketWebsite permission.

To redirect all website requests sent to the bucket's website endpoint, you add a website configuration with the following elements. Because all requests are sent to another website, you don't need to provide index document name for the bucket.

- WebsiteConfiguration
- RedirectAllRequestsTo
  - HostName
  - Protocol

If you want granular control over redirects, you can use the following elements to add routing rules that describe conditions for redirecting requests and information about the redirect destination. In this case, the website configuration must provide an index document for the bucket, because some requests might not be redirected.

- WebsiteConfiguration
- IndexDocument
- Suffix
- ErrorDocument
- Key
- RoutingRules
  - RoutingRule
  - Condition
    - HttpErrorCodeReturnedEquals
    - KeyPrefixEquals
  - Redirect
    - Protocol
    - HostName
    - ReplaceKeyPrefixWith
    - ReplaceKeyWith
    - HttpRedirectCode

Amazon S3 has a limitation of 50 routing rules per website configuration. If you require more than 50 routing rules, you can use object redirect. For more information, see Configuring an Object Redirect in the Amazon S3 User Guide.

The maximum request length is limited to 128 KB.
Request Syntax

PUT /?website HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner

<?xml version="1.0" encoding="UTF-8"?>
<WebsiteConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <ErrorDocument>
    <Key>string</Key>
  </ErrorDocument>
  <IndexDocument>
    <Suffix>string</Suffix>
  </IndexDocument>
  <RedirectAllRequestsTo>
    <HostName>string</HostName>
    <Protocol>string</Protocol>
  </RedirectAllRequestsTo>
  <RoutingRules>
    <RoutingRule>
      <Condition>
        <HttpErrorCodeReturnedEquals>string</HttpErrorCodeReturnedEquals>
        <KeyPrefixEquals>string</KeyPrefixEquals>
      </Condition>
      <Redirect>
        <HostName>string</HostName>
        <HttpRedirectCode>string</HttpRedirectCode>
        <Protocol>string</Protocol>
        <ReplaceKeyPrefixWith>string</ReplaceKeyPrefixWith>
        <ReplaceKeyWith>string</ReplaceKeyWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 365)**

The bucket name.

Required: Yes

**Content-MD5 (p. 365)**

The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see [RFC 1864](https://www.rfc-editor.org/rfc/rfc1864).

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 365)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-sdk-checksum-algorithm (p. 365)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there...
must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

**WebsiteConfiguration (p. 365)**

Root level tag for the WebsiteConfiguration parameters.

Required: Yes

**ErrorDocument (p. 365)**

The name of the error document for the website.

Type: ErrorDocument (p. 725) data type

Required: No

**IndexDocument (p. 365)**

The name of the index document for the website.

Type: IndexDocument (p. 735) data type

Required: No

**RedirectAllRequestsTo (p. 365)**

The redirect behavior for every request to this bucket's website endpoint.

**Important**

If you specify this property, you can't specify any other property.

Type: RedirectAllRequestsTo (p. 804) data type

Required: No

**RoutingRules (p. 365)**

Rules that define when a redirect is applied and the redirect behavior.

Type: Array of RoutingRule (p. 818) data types

Required: No

Response Syntax

```
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Examples

Example 1: Configure bucket as a website (add website configuration)

The following request configures a bucket example.com as a website. The configuration in the request specifies index.html as the index document. It also specifies the optional error document, SomeErrorDocument.html.

```
PUT ?website HTTP/1.1
Host: example.com.s3.<Region>.amazonaws.com
Content-Length: 256
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01'/>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>SomeErrorDocument.html</Key>
  </ErrorDocument>
</WebsiteConfiguration>
```

Sample Response

This example illustrates one usage of PutBucketWebsite.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIIPifBiKa2bj0KMgUAdQkf3ShJT0pXUueF6QKo
x-amz-request-id: 80CD4368BD211111
Date: Thu, 27 Jan 2011 00:00:00 GMT
Content-Length: 0
Server: AmazonS3
```

Example 2: Configure bucket as a website but redirect all requests

The following request configures a bucket www.example.com as a website. However, the configuration specifies that all GET requests for the www.example.com bucket's website endpoint will be redirected to host example.com. This redirect can be useful when you want to serve requests for both http://www.example.com and http://example.com, but you want to maintain the website content in only one bucket, in this case, example.com.

```
PUT ?website HTTP/1.1
Host: www.example.com.s3.<Region>.amazonaws.com
Content-Length: length-value
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01'/>
  <RedirectAllRequestsTo>
    <HostName>example.com</HostName>
  </RedirectAllRequestsTo>
</WebsiteConfiguration>
```
Example 3: Configure bucket as a website and specify optional redirection rules

Example 1 is the simplest website configuration. It configures a bucket as a website by providing only an index document and an error document. You can further customize the website configuration by adding routing rules that redirect requests for one or more objects. For example, suppose that your bucket contained the following objects:

- index.html
- docs/article1.html
- docs/article2.html

If you decided to rename the folder from docs/ to documents/, you would need to redirect requests for prefix /docs to documents/. For example, a request for docs/article1.html will need to be redirected to documents/article1.html.

In this case, you update the website configuration and add a routing rule as shown in the following request.

```
PUT ?website HTTP/1.1
Host: www.example.com.s3.<Region>.amazonaws.com
Content-Length: length-value
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01'/>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>Error.html</Key>
  </ErrorDocument>
  <RoutingRules>
    <RoutingRule>
      <Condition>
        <KeyPrefixEquals>docs/</KeyPrefixEquals>
      </Condition>
      <Redirect>
        <ReplaceKeyPrefixWith>documents/</ReplaceKeyPrefixWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
```

Example 4: Configure a bucket as a website and redirect errors

You can use a routing rule to specify a condition that checks for a specific HTTP error code. When a page request results in this error, you can optionally reroute requests. For example, you might route requests to another host and optionally process the error. The routing rule in the following requests redirects requests to an EC2 instance in the event of an HTTP error 404. For illustration, the redirect also inserts an object key prefix report-404/ in the redirect. For example, if you request a page ExamplePage.html and it results in an HTTP 404 error, the request is routed to a page report-404/testPage.html on the specified EC2 instance. If there is no routing rule and the HTTP error 404 occurred, then Error.html would be returned.

```
PUT ?website HTTP/1.1
```

API Version 2006-03-01

368
Example 5: Configure a bucket as a website and redirect folder requests to a page

Suppose you have the following pages in your bucket:

- images/photo1.jpg
- images/photo2.jpg
- images/photo3.jpg

Now you want to route requests for all pages with the images/ prefix to go to a single page, errorpage.html. You can add a website configuration to your bucket with the routing rule shown in the following request.

```
PUT ?website HTTP/1.1
Host: www.example.com.s3.<Region>.amazonaws.com
Content-Length: 481
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/'>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>Error.html</Key>
  </ErrorDocument>
  <RoutingRules>
    <RoutingRule>
      <Condition>
        <KeyPrefixEquals>images/</KeyPrefixEquals>
      </Condition>
      <Redirect>
        <HostName>ec2-11-22-333-44.compute-1.amazonaws.com</HostName>
        <ReplaceKeyPrefixWith>report-404/</ReplaceKeyPrefixWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
```

- AWS SDK for Java V2
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
PutObject
Service: Amazon S3

Adds an object to a bucket. You must have WRITE permissions on a bucket to add an object to it.

**Note**
Amazon S3 never adds partial objects; if you receive a success response, Amazon S3 added the entire object to the bucket. You cannot use PutObject to only update a single piece of metadata for an existing object. You must put the entire object with updated metadata if you want to update some values.

Amazon S3 is a distributed system. If it receives multiple write requests for the same object simultaneously, it overwrites all but the last object written. To prevent objects from being deleted or overwritten, you can use Amazon S3 Object Lock.

To ensure that data is not corrupted traversing the network, use the `Content-MD5` header. When you use this header, Amazon S3 checks the object against the provided MD5 value and, if they do not match, returns an error. Additionally, you can calculate the MD5 while putting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value.

**Note**
- To successfully complete the `PutObject` request, you must have the `s3:PutObject` in your IAM permissions.
- To successfully change the objects acl of your `PutObject` request, you must have the `s3:PutObjectAcl` in your IAM permissions.
- To successfully set the tag-set with your `PutObject` request, you must have the `s3:PutObjectTagging` in your IAM permissions.
- The `Content-MD5` header is required for any request to upload an object with a retention period configured using Amazon S3 Object Lock. For more information about Amazon S3 Object Lock, see Amazon S3 Object Lock Overview in the Amazon S3 User Guide.

You have four mutually exclusive options to protect data using server-side encryption in Amazon S3, depending on how you choose to manage the encryption keys. Specifically, the encryption key options are Amazon S3 managed keys (SSE-S3), AWS KMS keys (SSE-KMS or DSSE-KMS), and customer-provided keys (SSE-C). Amazon S3 encrypts data with server-side encryption by using Amazon S3 managed keys (SSE-S3) by default. You can optionally tell Amazon S3 to encrypt data at rest by using server-side encryption with other key options. For more information, see Using Server-Side Encryption.

When adding a new object, you can use headers to grant ACL-based permissions to individual AWS accounts or to predefined groups defined by Amazon S3. These permissions are then added to the ACL on the object. By default, all objects are private. Only the owner has full access control. For more information, see Access Control List (ACL) Overview and Managing ACLs Using the REST API.

If the bucket that you're uploading objects to uses the bucket owner enforced setting for S3 Object Ownership, ACLs are disabled and no longer affect permissions. Buckets that use this setting only accept PUT requests that don't specify an ACL or PUT requests that specify bucket owner full control ACLs, such as the bucket-owner-full-control canned ACL or an equivalent form of this ACL expressed in the XML format. PUT requests that contain other ACLs (for example, custom grants to certain AWS accounts) fail and return a 400 error with the error code AccessControlListNotSupported. For more information, see Controlling ownership of objects and disabling ACLs in the Amazon S3 User Guide.

**Note**
If your bucket uses the bucket owner enforced setting for Object Ownership, all objects written to the bucket by any account will be owned by the bucket owner.

By default, Amazon S3 uses the STANDARD Storage Class to store newly created objects. The STANDARD storage class provides high durability and high availability. Depending on performance needs, you can
specify a different Storage Class. Amazon S3 on Outposts only uses the OUTPOSTS Storage Class. For more information, see Storage Classes in the Amazon S3 User Guide.

If you enable versioning for a bucket, Amazon S3 automatically generates a unique version ID for the object being stored. Amazon S3 returns this ID in the response. When you enable versioning for a bucket, if Amazon S3 receives multiple write requests for the same object simultaneously, it stores all of the objects. For more information about versioning, see Adding Objects to Versioning-Enabled Buckets. For information about returning the versioning state of a bucket, see GetBucketVersioning.

For more information about related Amazon S3 APIs, see the following:

- CopyObject
- DeleteObject

Request Syntax

PUT /Key+ HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-acl: ACL
Cache-Control: CacheControl
Content-Disposition: ContentDisposition
Content-Language: ContentLanguage
Content-Length: ContentLength
Content-MD5: ContentMD5
Content-Type: ContentType
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-checksum-crc32: ChecksumCRC32
x-amz-checksum-crc32c: ChecksumCRC32C
x-amz-checksum-sha1: ChecksumSHA1
x-amz-checksum-sha256: ChecksumSHA256
Expires: Expires
x-amz-grant-full-control: GrantFullControl
x-amz-grant-read: GrantRead
x-amz-grant-read-acp: GrantReadACP
x-amz-grant-write-acp: GrantWriteACP
x-amz-server-side-encryption: ServerSideEncryption
x-amz-storage-class: StorageClass
x-amz-website-redirect-location: WebsiteRedirectLocation
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-context: SSEKMSEncryptionContext
x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled
x-amz-request-payer: RequestPayer
x-amz-tagging: Tagging
x-amz-object-lock-mode: ObjectLockMode
x-amz-object-lock-retain-until-date: ObjectLockRetainUntilDate
x-amz-object-lock-legal-hold: ObjectLockLegalHoldStatus
x-amz-expected-bucket-owner: ExpectedBucketOwner

Body

URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 372)

The bucket name to which the PUT action was initiated.
When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Cache-Control (p. 372)**

Can be used to specify caching behavior along the request/reply chain. For more information, see http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.

**Content-Disposition (p. 372)**

Specifies presentational information for the object. For more information, see https://www.rfc-editor.org/rfc/rfc6266#section-4.

**Content-Encoding (p. 372)**

Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field. For more information, see https://www.rfc-editor.org/rfc/rfc9110.html#field.content-encoding.

**Content-Language (p. 372)**

The language the content is in.

**Content-Length (p. 372)**

Size of the body in bytes. This parameter is useful when the size of the body cannot be determined automatically. For more information, see https://www.rfc-editor.org/rfc/rfc9110.html#name-content-length.

**Content-MD5 (p. 372)**

The base64-encoded 128-bit MD5 digest of the message (without the headers) according to RFC 1864. This header can be used as a message integrity check to verify that the data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information about REST request authentication, see REST Authentication.

**Content-Type (p. 372)**

A standard MIME type describing the format of the contents. For more information, see https://www.rfc-editor.org/rfc/rfc9110.html#name-content-type.

**Expires (p. 372)**

The date and time at which the object is no longer cacheable. For more information, see https://www.rfc-editor.org/rfc/rfc7234#section-5.3.

**Key (p. 372)**

Object key for which the PUT action was initiated.

Length Constraints: Minimum length of 1.

Required: Yes
x-amz-acl (p. 372)

The canned ACL to apply to the object. For more information, see *Canned ACL*.

This action is not supported by Amazon S3 on Outposts.

Valid Values: private | public-read | public-read-write | authenticated-read | aws-exec-read | bucket-owner-read | bucket-owner-full-control

x-amz-checksum-crc32 (p. 372)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32 checksum of the object. For more information, see *Checking object integrity* in the *Amazon S3 User Guide*.

x-amz-checksum-crc32c (p. 372)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32C checksum of the object. For more information, see *Checking object integrity* in the *Amazon S3 User Guide*.

x-amz-checksum-sha1 (p. 372)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 160-bit SHA-1 digest of the object. For more information, see *Checking object integrity* in the *Amazon S3 User Guide*.

x-amz-checksum-sha256 (p. 372)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 256-bit SHA-256 digest of the object. For more information, see *Checking object integrity* in the *Amazon S3 User Guide*.

x-amz-expected-bucket-owner (p. 372)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-grant-full-control (p. 372)

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-read (p. 372)

Allows grantee to read the object data and its metadata.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-read-acp (p. 372)

Allows grantee to read the object ACL.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-write-acp (p. 372)

Allows grantee to write the ACL for the applicable object.

This action is not supported by Amazon S3 on Outposts.

x-amz-object-lock-legal-hold (p. 372)

Specifies whether a legal hold will be applied to this object. For more information about S3 Object Lock, see *Object Lock*.

Valid Values: ON | OFF
**x-amz-object-lock-mode (p. 372)**

The Object Lock mode that you want to apply to this object.

Valid Values: GOVERNANCE | COMPLIANCE

**x-amz-object-lock-retain-until-date (p. 372)**

The date and time when you want this object's Object Lock to expire. Must be formatted as a timestamp parameter.

**x-amz-request-payer (p. 372)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see [Downloading Objects in Requester Pays Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/RequesterPaysBuckets.html) in the *Amazon S3 User Guide*.

Valid Values: requester

**x-amz-sdk-checksum-algorithm (p. 372)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the *Amazon S3 User Guide*.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**x-amz-server-side-encryption (p. 372)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 372)**

If x-amz-server-side-encryption has a valid value of aws:kms or aws:kms:dsse, this header specifies the ID (Key ID, Key ARN, or Key Alias) of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object. If you specify x-amz-server-side-encryption:aws:kms or x-amz-server-side-encryption:aws:kms:dsse, but do not provide x-amz-server-side-encryption-aws-kms-key-id, Amazon S3 uses the AWS managed key (aws/s3) to protect the data. If the KMS key does not exist in the same account that's issuing the command, you must use the full ARN and not just the ID.

**x-amz-server-side-encryption-bucket-key-enabled (p. 372)**

Specifies whether Amazon S3 should use an S3 Bucket Key for object encryption with server-side encryption using AWS Key Management Service (AWS KMS) keys (SSE-KMS). Setting this header to true causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS.

Specifying this header with a PUT action doesn't affect bucket-level settings for S3 Bucket Key.

**x-amz-server-side-encryption-context (p. 372)**

Specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs. This value is stored as object metadata and automatically gets passed on to AWS KMS for future GetObject or CopyObject operations on this object. This value must be explicitly added during CopyObject operations.
**x-amz-server-side-encryption-customer-algorithm (p. 372)**

Specifies the algorithm to use to when encrypting the object (for example, AES256).

**x-amz-server-side-encryption-customer-key (p. 372)**

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header.

**x-amz-server-side-encryption-customer-key-MD5 (p. 372)**

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

**x-amz-storage-class (p. 372)**

By default, Amazon S3 uses the STANDARD Storage Class to store newly created objects. The STANDARD storage class provides high durability and high availability. Depending on performance needs, you can specify a different Storage Class. Amazon S3 on Outposts only uses the OUTPOSTS Storage Class. For more information, see Storage Classes in the Amazon S3 User Guide.

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

**x-amz-tagging (p. 372)**

The tag-set for the object. The tag-set must be encoded as URL Query parameters. (For example, "Key1=Value1")

**x-amz-website-redirect-location (p. 372)**

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see Object Key and Metadata.

In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```
x-amz-website-redirect-location: /anotherPage.html
```

In the following example, the request header sets the object redirect to another website:

```
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see Hosting Websites on Amazon S3 and How to Configure Website Page Redirects.

**Request Body**

The request accepts the following binary data.

**Body (p. 372)**

**Response Syntax**

<table>
<thead>
<tr>
<th>HTTP/1.1 200</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-expiration: <em>Expiration</em></td>
</tr>
<tr>
<td>ETag: <em>ETag</em></td>
</tr>
<tr>
<td>x-amz-checksum-crc32: <em>ChecksumCRC32</em></td>
</tr>
</tbody>
</table>

API Version 2006-03-01

376
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The response returns the following HTTP headers.

**ETag (p. 376)**

Entity tag for the uploaded object.

**x-amz-checksum-crc32 (p. 376)**

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](#) in the Amazon S3 User Guide.

**x-amz-checksum-crc32c (p. 376)**

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](#) in the Amazon S3 User Guide.

**x-amz-checksum-sha1 (p. 376)**

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](#) in the Amazon S3 User Guide.

**x-amz-checksum-sha256 (p. 376)**

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](#) in the Amazon S3 User Guide.

**x-amz-expiration (p. 376)**

If the expiration is configured for the object (see [PutBucketLifecycleConfiguration](#)), the response includes this header. It includes the expiry-date and rule-id key-value pairs that provide information about object expiration. The value of the rule-id is URL-encoded.

**x-amz-request-charged (p. 376)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**x-amz-server-side-encryption (p. 376)**

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse).
Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id (p. 376)**

If `x-amz-server-side-encryption` has a valid value of `aws:kms` or `aws:kms:dsse`, this header specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled (p. 376)**

Indicates whether the uploaded object uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

**x-amz-server-side-encryption-context (p. 376)**

If present, specifies the AWS KMS Encryption Context to use for object encryption. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs. This value is stored as object metadata and automatically gets passed on to AWS KMS for future GetObject or CopyObject operations on this object.

**x-amz-server-side-encryption-customer-algorithm (p. 376)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

**x-amz-server-side-encryption-customer-key-MD5 (p. 376)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

**x-amz-version-id (p. 376)**

Version of the object.

**Examples**

**Example 1: Upload an object**

The following request stores the `my-image.jpg` file in the `myBucket` bucket.

```
PUT /my-image.jpg HTTP/1.1
Host: myBucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 11434
x-amz-meta-author: Janet
Expect: 100-continue
[11434 bytes of object data]
```

**Sample Response: Versioning suspended**

This example illustrates one usage of PutObject.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdAilIfgSm/F1YsViT1LW94/xUQxMsF7xiEh1a0w1O1Ixl+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
Date: Wed, 12 Oct 2009 17:50:00 GMT
```
Sample Response: Expiration rule created using lifecycle configuration

If an expiration rule that was created on the bucket using lifecycle configuration applies to the object, you get a response with an `x-amz-expiration` header, as shown in the following response. For more information, see Transitioning Objects: General Considerations.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPdOdA1ilfGSm/FlYsViT1LW94/xUQxMsF7xiEbaOl0w1IOIxl+z1bWZ153pt7
x-amz-request-id: 0A49CE4060975EAC
Date: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-expiration: expiry-date="Fri, 23 Dec 2012 00:00:00 GMT", rule-id="1"
ETag: "1b2cf535f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Response: Versioning enabled

If the bucket has versioning enabled, the response includes the `x-amz-version-id` header.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPdOdA1ilfGSm/FlYsViT1LW94/xUQxMsF7xiEbaOl0w1IOIxl+z1bWZ153pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 43jfkodU8693jnFD9fj9j3HNNVfsQuIFDNsidf038jfdsjGFS1Rg
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf535f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

Example 2: Specifying the Reduced Redundancy Storage Class

The following request stores the image, `my-image.jpg`, in the `myBucket` bucket. The request specifies the `x-amz-storage-class` header to request that the object is stored using the REDUCED_REDUndANCY storage class.

```
PUT /my-image.jpg HTTP/1.1
Host: myBucket.s3.<Region>.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: image/jpg
Content-Length: 11434
Expect: 100-continue
x-amz-storage-class: REDUCED_REDUndANCY
```
Sample Response

This example illustrates one usage of PutObject.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdm0dAl1fgSm/F1YsVfTiT1W94/xzUqMsF7xiEbl0wi10Ix1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf535f77731e974343645a5985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

Example 3: Uploading an object and specifying access permissions explicitly

The following request stores the `TestObject.txt` file in the `myBucket` bucket. The request specifies various ACL headers to grant permission to AWS accounts that are specified with a canonical user ID and an email address.

```
PUT TestObject.txt HTTP/1.1
Host: myBucket.s3.<Region>.amazonaws.com
x-amz-date: Fri, 13 Apr 2012 05:40:14 GMT
Authorization: authorization string
x-amz-grant-write-acp: id=8a692ce4adf588a45321423d3f74dd8c71fa124ExampleCanonicalUserID
x-amz-grant-full-control: emailAddress="ExampleUser@amazon.com"
x-amz-grant-write: emailAddress="ExampleUser1@amazon.com",
emailAddress="ExampleUser2@amazon.com"
Content-Length: 300
Expect: 100-continue
Connection: Keep-Alive

...Object data in the body...
```

Sample Response

This example illustrates one usage of PutObject.

```
HTTP/1.1 200 OK
x-amz-id-2: RUxG2sZJUfS+ezeAS2i0Xj6w/ST6xqF/8pFNNHjTTrECW56SCAUWGr+7QLVoj1GH
x-amz-request-id: 8D017A908272908A
Date: Fri, 13 Apr 2012 05:40:25 GMT
ETag: "dd038b344cf9553547f8b395a814b274"
Content-Length: 0
Server: AmazonS3
```

Example 4: Using a canned ACL to set access permissions

The following request stores the `TestObject.txt` file in the `myBucket` bucket. The request uses an `x-amz-acl` header to specify a canned ACL that grants READ permission to the public.

```
PUT TestObject.txt HTTP/1.1
```

API Version 2006-03-01
380
Sample Response

This example illustrates one usage of PutObject.

HTTP/1.1 200 OK
x-amz-id-2: Yd6PS3xJFQeTYJ/3dDO7miqJfVMXXW0S2HiJo3WFs4b26oe2QCVXasxXLzdMfASd
x-amz-request-id: 80DF413BB3D28A25
Date: Fri, 13 Apr 2012 05:54:59 GMT
ETag: "dd038b344cf9553547f8b395a814b274"
Content-Length: 0
Server: AmazonS3

Example 5: Upload an object (Request server-side encryption using a customer-provided encryption key)

This example of an upload object requests server-side encryption and provides an encryption key.

PUT /example-object HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Accept: */*
Authorization:authorization string
Date: Wed, 28 May 2014 19:31:11 +0000
x-amz-server-side-encryption-customer-key:g0lCfA3Dv40jZz5SQJ1ZukLRFqtI5WorC/8SEEXAMPLE
x-amz-server-side-encryption-customer-key-MD5:ZjQrne1X/iTcskbY2example
x-amz-server-side-encryption-customer-algorithm:AES256

Sample Response

In the response, Amazon S3 returns the encryption algorithm and MD5 of the encryption key that you specified when uploading the object. The ETag that is returned is not the MD5 of the object.

HTTP/1.1 200 OK
x-amz-id-2: 7qoYGN7uMuFuYS6m7a41szH6in+hccE+4DXPmDZ7C9KqucjnZC1gI5msha16fbMG
x-amz-request-id: 06437EDD40C407C7
Date: Wed, 28 May 2014 19:31:12 GMT
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbY2example
ETag: "ae89237c20e759c5f479ecee02c6442f59"

Example 6: Upload an object and specify tags

This example of an upload object request specifies the optional x-amz-tagging header to add tags to the object.

API Version 2006-03-01
381
After the object is created, Amazon S3 stores the specified object tags in the tagging subresource that is associated with the object. For more information about tagging, see Object Tagging and Access Control Policies in the Amazon S3 User Guide.

```
PUT /example-object HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Accept: */*
Authorization: authorization string
Date: Thu, 22 Sep 2016 21:58:13 GMT
x-amz-tagging: tag1=value1&tag2=value2

[... bytes of object data]
```

Sample Response

This example illustrates one usage of PutObject.

```
HTTP/1.1 200 OK
x-amz-id-2: 7qoYGN7uMuFuYS6m7a4lszH6in+hccE+4DXPmdZ7C9KqucjnZC1gI5msha16fbMG
x-amz-request-id: 06437ED40C407C7
Date: Thu, 22 Sep 2016 21:58:17 GMT
```

Example 7: Upload an object and specify the checksum algorithm

This example of an upload object request specifies the additional checksum algorithm to use to verify the content of the object. For more information about using additional checksums, see Checking object integrity in the Amazon S3 User Guide.

```
PUT /example-object HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
x-amz-date: Mon, 22 Mar 2021 23:00:00 GMT
Authorization: authorization string
Content-Length: 268435456
x-amz-checksum-sha256: 0ea4be78f6c3948588172edc6d8789ffe3cec461f385e0ac447e581731c429b5

[268435456 bytes of object data in the body]
```

Sample Response

This example illustrates one usage of PutObject.

```
HTTP/1.1 200 OK
x-amz-id-2: 7qoYGN7uMuFuYS6m7a4lszH6in+hccE+4DXPmdZ7C9KqucjnZC1gI5msha16fbMG
x-amz-request-id: 49CFA2051300FBE9
Date: Mon, 22 Mar 2021 23:00:12 GMT
```

PutObjectAcl
Service: Amazon S3

Uses the acl subresource to set the access control list (ACL) permissions for a new or existing object in an S3 bucket. You must have WRITE_ACP permission to set the ACL of an object. For more information, see What permissions can I grant? in the Amazon S3 User Guide.

This action is not supported by Amazon S3 on Outposts.

Depending on your application needs, you can choose to set the ACL on an object using either the request body or the headers. For example, if you have an existing application that updates a bucket ACL using the request body, you can continue to use that approach. For more information, see Access Control List (ACL) Overview in the Amazon S3 User Guide.

Important
If your bucket uses the bucket owner enforced setting for S3 Object Ownership, ACLs are disabled and no longer affect permissions. You must use policies to grant access to your bucket and the objects in it. Requests to set ACLs or update ACLs fail and return the AccessControlListNotSupported error code. Requests to read ACLs are still supported. For more information, see Controlling object ownership in the Amazon S3 User Guide.

Permissions

You can set access permissions using one of the following methods:

- Specify a canned ACL with the x-amz-acl request header. Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. Specify the canned ACL name as the value of x-amz-acl. If you use this header, you cannot use other access control-specific headers in your request. For more information, see Canned ACL.

- Specify access permissions explicitly with the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control headers. When using these headers, you specify explicit access permissions and grantees (AWS accounts or Amazon S3 groups) who will receive the permission. If you use these ACL-specific headers, you cannot use x-amz-acl header to set a canned ACL. These parameters map to the set of permissions that Amazon S3 supports in an ACL. For more information, see Access Control List (ACL) Overview.

You specify each grantee as a type=value pair, where the type is one of the following:

- id – if the value specified is the canonical user ID of an AWS account
- uri – if you are granting permissions to a predefined group
- emailAddress – if the value specified is the email address of an AWS account

Note
Using email addresses to specify a grantee is only supported in the following AWS Regions:

- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Europe (Ireland)
- South America (São Paulo)

For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.
For example, the following x-amz-grant-read header grants list objects permission to the two AWS accounts identified by their email addresses.

x-amz-grant-read: emailAddress="xyz@amazon.com",
emailAddress="abc@amazon.com"

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

Grantee Values

You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:

- By the person's ID:

  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="CanonicalUser"><ID><ID></ID><DisplayName><GranteesEmail></DisplayName></Grantee>

  DisplayName is optional and ignored in the request.

- By URI:

  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="Group"><URI><http://acs.amazonaws.com/groups/global/AuthenticatedUsers></URI></Grantee>

- By Email address:

  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="AmazonCustomerByEmail"><EmailAddress><Grantees@email.com></EmailAddress></Grantee>

  The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

  Note
  Using email addresses to specify a grantee is only supported in the following AWS Regions:
  - US East (N. Virginia)
  - US West (N. California)
  - US West (Oregon)
  - Asia Pacific (Singapore)
  - Asia Pacific (Sydney)
  - Asia Pacific (Tokyo)
  - Europe (Ireland)
  - South America (São Paulo)
  For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.

Versioning

The ACL of an object is set at the object version level. By default, PUT sets the ACL of the current version of an object. To set the ACL of a different version, use the versionId subresource.

The following operations are related to PutObjectAcl:

- CopyObject
- GetObject
Request Syntax

```
PUT /{Key+}?acl&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-acl: ACL
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-grant-full-control: GrantFullControl
x-amz-grant-read: GrantRead
x-amz-grant-read-acp: GrantReadACP
x-amz-grant-write: GrantWrite
x-amz-grant-write-acp: GrantWriteACP
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
>  <AccessControlList>
    <Grant>
      <Grantee>
        <DisplayName>string</DisplayName>
        <EmailAddress>string</EmailAddress>
        <ID>string</ID>
        <xsi:type>string</xsi:type>
        <URI>string</URI>
      </Grantee>
      <Permission>string</Permission>
    </Grant>
  </AccessControlList>
  <Owner>
    <DisplayName>string</DisplayName>
    <ID>string</ID>
  </Owner>
</AccessControlPolicy>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket** *(p. 386)*

The bucket name that contains the object to which you want to attach the ACL.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

Required: Yes

**Content-MD5** *(p. 386)*

The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to RFC 1864.>

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**Key** *(p. 386)*

Key for which the PUT action was initiated.
When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Length Constraints: Minimum length of 1.

Required: Yes

versionId (p. 386)

VersionId used to reference a specific version of the object.

x-amz-acl (p. 386)

The canned ACL to apply to the object. For more information, see Canned ACL.

Valid Values: private | public-read | public-read-write | authenticated-read | aws-exec-read | bucket-owner-read | bucket-owner-full-control

x-amz-expected-bucket-owner (p. 386)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-grant-full-control (p. 386)

Allows grantee the read, write, read ACP, and write ACP permissions on the bucket.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-read (p. 386)

Allows grantee to list the objects in the bucket.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-read-acp (p. 386)

Allows grantee to read the bucket ACL.

This action is not supported by Amazon S3 on Outposts.

x-amz-grant-write (p. 386)

Allows grantee to create new objects in the bucket.

For the bucket and object owners of existing objects, also allows deletions and overwrites of those objects.

x-amz-grant-write-acp (p. 386)

Allows grantee to write the ACL for the applicable bucket.

This action is not supported by Amazon S3 on Outposts.

x-amz-request-payer (p. 386)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket
has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-sdk-checksum-algorithm (p. 386)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

AccessControlPolicy (p. 386)

Root level tag for the AccessControlPolicy parameters.

Required: Yes

Grants (p. 386)

A list of grants.

Type: Array of Grant (p. 732) data types

Required: No

Owner (p. 386)

Container for the bucket owner's display name and ID.

Type: Owner (p. 786) data type

Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 388)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester
Errors

NoSuchKey

The specified key does not exist.

HTTP Status Code: 400

Examples

Sample Request

The following request grants access permission to an existing object. The request specifies the ACL in the body. In addition to granting full control to the object owner, the XML specifies full control to an AWS account identified by its canonical user ID.

PUT /my-image.jpg?acl HTTP/1.1
Host: bucket.s3.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
Content-Length: 124

<AccessControlPolicy>
  <Owner>
    <ID>75aa57f09aa0c8caeb4f8c24e99d10f8e7faeebf76c078efc76caea54ba06a</ID>
    <DisplayName>CustomersName@amazon.com</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser">
        <ID>75aa57f09aa0c8caeb4f8c24e99d10f8e7faeebExampleCanonicalUserID</ID>
        <DisplayName>CustomerName@amazon.com</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>

Sample Response

The following shows a sample response when versioning on the bucket is enabled.

HTTP/1.1 200 OK
x-amz-id-2: eftixk72a6Ap51T9AS1ed4OpIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5

### PutObjectLegalHold

**Service:** Amazon S3

Applies a legal hold configuration to the specified object. For more information, see [Locking Objects](#).

This action is not supported by Amazon S3 on Outposts.

**Request Syntax**

```
PUT /{Key+}?legal-hold&versionId={VersionId} HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<LegalHold xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Status>string</Status>
</LegalHold>
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 392)**

The bucket name containing the object that you want to place a legal hold on.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](#) in the [Amazon S3 User Guide](#).

Required: Yes

**Content-MD5 (p. 392)**

The MD5 hash for the request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**Key (p. 392)**

The key name for the object that you want to place a legal hold on.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 392)**

The version ID of the object that you want to place a legal hold on.

**x-amz-expected-bucket-owner (p. 392)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 `Forbidden` (access denied).

**x-amz-request-payer (p. 392)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket
has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requestor

x-amz-sdk-checksum-algorithm (p. 392)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

LegalHold (p. 392)

Root level tag for the LegalHold parameters.

Required: Yes

Status (p. 392)

Indicates whether the specified object has a legal hold in place.

Type: String

Valid Values: ON | OFF

Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 393)

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

See Also

PutObjectLockConfiguration
Service: Amazon S3

Places an Object Lock configuration on the specified bucket. The rule specified in the Object Lock configuration will be applied by default to every new object placed in the specified bucket. For more information, see Locking Objects.

**Note**

- The DefaultRetention settings require both a mode and a period.
- The DefaultRetention period can be either Days or Years but you must select one. You cannot specify Days and Years at the same time.
- You can only enable Object Lock for new buckets. If you want to turn on Object Lock for an existing bucket, contact AWS Support.

**Request Syntax**

```
PUT /?object-lock HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-bucket-object-lock-token: Token
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
  <ObjectLockEnabled>String</ObjectLockEnabled>
  <Rule>
    <DefaultRetention>
      <Days>integer</Days>
      <Mode>string</Mode>
      <Years>integer</Years>
    </DefaultRetention>
  </Rule>
</ObjectLockConfiguration>
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 395)**

The bucket whose Object Lock configuration you want to create or replace.

Required: Yes

**Content-MD5 (p. 395)**

The MD5 hash for the request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-bucket-object-lock-token (p. 395)**

A token to allow Object Lock to be enabled for an existing bucket.

**x-amz-expected-bucket-owner (p. 395)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
x-amz-request-payer (p. 395)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-sdk-checksum-algorithm (p. 395)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

ObjectLockConfiguration (p. 395)

Root level tag for the ObjectLockConfiguration parameters.

Required: Yes

ObjectLockEnabled (p. 395)

Indicates whether this bucket has an Object Lock configuration enabled. Enable ObjectLockEnabled when you apply ObjectLockConfiguration to a bucket.

Type: String

Valid Values: Enabled

Required: No

Rule (p. 395)

Specifies the Object Lock rule for the specified object. Enable the this rule when you apply ObjectLockConfiguration to a bucket. Bucket settings require both a mode and a period. The period can be either Days or Years but you must select one. You cannot specify Days and Years at the same time.

Type: ObjectLockRule (p. 779) data type

Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 396)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

PutObjectRetention
Service: Amazon S3

Places an Object Retention configuration on an object. For more information, see Locking Objects. Users or accounts require the s3:PutObjectRetention permission in order to place an Object Retention configuration on objects. Bypassing a Governance Retention configuration requires the s3:BypassGovernanceRetention permission.

This action is not supported by Amazon S3 on Outposts.

Request Syntax

```
PUT /{Key+}?retention&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-bypass-governance-retention: BypassGovernanceRetention
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<Retention xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Mode>string</Mode>
  <RetainUntilDate>Timestamp</RetainUntilDate>
</Retention>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 398)**

The bucket name that contains the object you want to apply this Object Retention configuration to.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

Required: Yes

**Content-MD5 (p. 398)**

The MD5 hash for the request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**Key (p. 398)**

The key name for the object that you want to apply this Object Retention configuration to.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 398)**

The version ID for the object that you want to apply this Object Retention configuration to.

**x-amz-bypass-governance-retention (p. 398)**

Indicates whether this action should bypass Governance-mode restrictions.
x-amz-expected-bucket-owner (p. 398)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 398)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-sdk-checksum-algorithm (p. 398)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

Retention (p. 398)

Root level tag for the Retention parameters.

Required: Yes

Mode (p. 398)

Indicates the Retention mode for the specified object.

Type: String

Valid Values: GOVERNANCE | COMPLIANCE

Required: No

RetainUntilDate (p. 398)

The date on which this Object Lock Retention will expire.

Type: Timestamp

Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-request-charged (p. 399)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

PutObjectTagging
Service: Amazon S3

Sets the supplied tag-set to an object that already exists in a bucket. A tag is a key-value pair. For more information, see Object Tagging.

You can associate tags with an object by sending a PUT request against the tagging subresource that is associated with the object. You can retrieve tags by sending a GET request. For more information, see GetObjectTagging.

For tagging-related restrictions related to characters and encodings, see Tag Restrictions. Note that Amazon S3 limits the maximum number of tags to 10 tags per object.

To use this operation, you must have permission to perform the s3:PutObjectTagging action. By default, the bucket owner has this permission and can grant this permission to others.

To put tags of any other version, use the versionId query parameter. You also need permission for the s3:PutObjectVersionTagging action.

PutObjectTagging has the following special errors. For more Amazon S3 errors see, Error Responses.

- **InvalidTag** - The tag provided was not a valid tag. This error can occur if the tag did not pass input validation. For more information, see Object Tagging.
- **MalformedXML** - The XML provided does not match the schema.
- **OperationAborted** - A conflicting conditional action is currently in progress against this resource. Please try again.
- **InternalError** - The service was unable to apply the provided tag to the object.

The following operations are related to PutObjectTagging:

- GetObjectTagging
- DeleteObjectTagging

Request Syntax

```xml
PUT /{Key+}?tagging&versionId={VersionId} HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-request-payer: RequestPayer
<?xml version="1.0" encoding="UTF-8"?>
<TagSet>
  <Tag>
    <Key>string</Key>
    <Value>string</Value>
  </Tag>
</TagSet>
</Tagging>
```

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 401)**

The bucket name containing the object.
When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Content-MD5 (p. 401)**

The MD5 hash for the request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**Key (p. 401)**

Name of the object key.

Length Constraints: Minimum length of 1.

Required: Yes

**versionId (p. 401)**

The versionId of the object that the tag-set will be added to.

**x-amz-expected-bucket-owner (p. 401)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-request-payer (p. 401)**

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

**x-amz-sdk-checksum-algorithm (p. 401)**

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

**Request Body**

The request accepts the following data in XML format.
**Tagging (p. 401)**

Root level tag for the Tagging parameters.

Required: Yes

**TagSet (p. 401)**

A collection for a set of tags

Type: Array of [Tag (p. 838)] data types

Required: Yes

**Response Syntax**

```
HTTP/1.1 200
x-amz-version-id: VersionId
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**x-amz-version-id (p. 403)**

The versionId of the object the tag-set was added to.

**Examples**

**Sample Request: Add tag set to an object**

The following request adds a tag set to the existing object object-key in the examplebucket bucket.

```xml
PUT object-key?tagging HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Content-Length: length
Content-MD5: pUNXr/BjKK5G2UKExample==
x-amz-date: 20160923T001956Z
Authorization: authorization string
<Tagging>
  <TagSet>
    <Tag>
      <Key>tag1</Key>
      <Value>val1</Value>
    </Tag>
    <Tag>
      <Key>tag2</Key>
      <Value>val2</Value>
    </Tag>
  </TagSet>
</Tagging>
```

**Sample Response**

This example illustrates one usage of PutObjectTagging.

PutPublicAccessBlock
Service: Amazon S3

Creates or modifies the PublicAccessBlock configuration for an Amazon S3 bucket. To use this operation, you must have the s3:PutBucketPublicAccessBlock permission. For more information about Amazon S3 permissions, see Specifying Permissions in a Policy.

Important
When Amazon S3 evaluates the PublicAccessBlock configuration for a bucket or an object, it checks the PublicAccessBlock configuration for both the bucket (or the bucket that contains the object) and the bucket owner's account. If the PublicAccessBlock configurations are different between the bucket and the account, Amazon S3 uses the most restrictive combination of the bucket-level and account-level settings.

For more information about when Amazon S3 considers a bucket or an object public, see The Meaning of "Public".

The following operations are related to PutPublicAccessBlock:

- GetPublicAccessBlock
- DeletePublicAccessBlock
- GetBucketPolicyStatus
- Using Amazon S3 Block Public Access

Request Syntax

![Request Syntax](image)

URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 405)**

The name of the Amazon S3 bucket whose PublicAccessBlock configuration you want to set.

Required: Yes

**Content-MD5 (p. 405)**

The MD5 hash of the PutPublicAccessBlock request body.

For requests made using the AWS Command Line Interface (CLI) or AWS SDKs, this field is calculated automatically.

**x-amz-expected-bucket-owner (p. 405)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
x-amz-sdk-checksum-algorithm (p. 405)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Request Body

The request accepts the following data in XML format.

PublicAccessBlockConfiguration (p. 405)

Root level tag for the PublicAccessBlockConfiguration parameters.

Required: Yes

BlockPublicAcls (p. 405)

Specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to TRUE causes the following behavior:

• PUT Bucket ACL and PUT Object ACL calls fail if the specified ACL is public.
• PUT Object calls fail if the request includes a public ACL.
• PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

Type: Boolean

Required: No

BlockPublicPolicy (p. 405)

Specifies whether Amazon S3 should block public bucket policies for this bucket. Setting this element to TRUE causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.

Type: Boolean

Required: No

IgnorePublicAcls (p. 405)

Specifies whether Amazon S3 should ignore public ACLs for this bucket and objects in this bucket. Setting this element to TRUE causes Amazon S3 to ignore all public ACLs on this bucket and objects in this bucket.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.

Type: Boolean
Required: No

**RestrictPublicBuckets (p. 405)**

Specifies whether Amazon S3 should restrict public bucket policies for this bucket. Setting this element to TRUE restricts access to this bucket to only AWS service principals and authorized users within this account if the bucket has a public policy.

Enabling this setting doesn’t affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.

Type: Boolean

Required: No

### Response Syntax

```
HTTP/1.1 200
```

### Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

### Examples

**First Sample Request**

The following request puts a bucket PublicAccessBlock configuration that rejects public ACLs.

```
PUT /?publicAccessBlock HTTP/1.1
Host: <bucket-name>.s3.<Region>.amazonaws.com
x-amz-date: <Thu, 15 Nov 2016 00:17:21 GMT>
Authorization: <signatureValue>
<?xml version="1.0" encoding="UTF-8"?>
  <BlockPublicAcls>TRUE</BlockPublicAcls>
  <IgnorePublicAcls>FALSE</IgnorePublicAcls>
  <BlockPublicPolicy>FALSE</BlockPublicPolicy>
  <RestrictPublicBuckets>FALSE</RestrictPublicBuckets>
</PublicAccessBlockConfiguration>
```

**First Sample Response**

This example illustrates one usage of PutPublicAccessBlock.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4REXAMPLEPi4hk1TXouTf0hccUjo0iCPEXAMPLEutBj3M7fPGlW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
Content-Length: 0
```
Second Sample Request

The following request puts a bucket PublicAccessBlock configuration that ignores public ACLs and restricts access to public buckets.

```
PUT /?publicAccessBlock HTTP/1.1
Host: <bucket-name>.s3.<Region>.amazonaws.com
x-amz-date: <Thu, 15 Nov 2016 00:17:21 GMT>
Authorization: <signatureValue>

<?xml version="1.0" encoding="UTF-8"?>
  <BlockPublicAcls>FALSE</BlockPublicAcls>
  <IgnorePublicAcls>TRUE</IgnorePublicAcls>
  <BlockPublicPolicy>FALSE</BlockPublicPolicy>
  <RestrictPublicBuckets>TRUE</RestrictPublicBuckets>
</PublicAccessBlockConfiguration>
```

Second Sample Response

This example illustrates one usage of PutPublicAccessBlock.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hccUjo0iCPEXAMPLEutBj3M7fPG1WO2SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
Content-Length: 0
```

**RestoreObject**  
Service: Amazon S3

Restores an archived copy of an object back into Amazon S3

This action is not supported by Amazon S3 on Outposts.

This action performs the following types of requests:

- `select` - Perform a select query on an archived object
- `restore an archive` - Restore an archived object

For more information about the S3 structure in the request body, see the following:

- [PutObject](#)
- [Managing Access with ACLs](#) in the [Amazon S3 User Guide](#)
- [Protecting Data Using Server-Side Encryption](#) in the [Amazon S3 User Guide](#)

Define the SQL expression for the SELECT type of restoration for your query in the request body's `SelectParameters` structure. You can use expressions like the following examples.

- The following expression returns all records from the specified object.
  ```sql
  SELECT * FROM Object
  ```

- Assuming that you are not using any headers for data stored in the object, you can specify columns with positional headers.
  ```sql
  SELECT s._1, s._2 FROM Object s WHERE s._3 > 100
  ```

- If you have headers and you set the `fileHeaderInfo` in the CSV structure in the request body to `USE`, you can specify headers in the query. (If you set the `fileHeaderInfo` field to `IGNORE`, the first row is skipped for the query.) You cannot mix ordinal positions with header column names.
  ```sql
  SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
  ```

When making a select request, you can also do the following:

- To expedite your queries, specify the Expedited tier. For more information about tiers, see "Restoring Archives," later in this topic.

- Specify details about the data serialization format of both the input object that is being queried and the serialization of the CSV-encoded query results.

The following are additional important facts about the select feature:

- The output results are new Amazon S3 objects. Unlike archive retrievals, they are stored until explicitly deleted-manually or through a lifecycle configuration.

- You can issue more than one select request on the same Amazon S3 object. Amazon S3 doesn't duplicate requests, so avoid issuing duplicate requests.

- Amazon S3 accepts a select request even if the object has already been restored. A select request doesn't return error response 409.
Permissions

To use this operation, you must have permissions to perform the s3:RestoreObject action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon S3 User Guide.

Restoring objects

Objects that you archive to the S3 Glacier Flexible Retrieval Flexible Retrieval or S3 Glacier Deep Archive storage class, and S3 Intelligent-Tiering Archive or S3 Intelligent-Tiering Deep Archive tiers, are not accessible in real time. For objects in the S3 Glacier Flexible Retrieval Flexible Retrieval or S3 Glacier Deep Archive storage classes, you must first initiate a restore request, and then wait until a temporary copy of the object is available. If you want a permanent copy of the object, create a copy of it in the Amazon S3 Standard storage class in your S3 bucket. To access an archived object, you must restore the object for the duration (number of days) that you specify. For objects in the Archive Access or Deep Archive Access tiers of S3 Intelligent-Tiering, you must first initiate a restore request, and then wait until the object is moved into the Frequent Access tier.

To restore a specific object version, you can provide a version ID. If you don't provide a version ID, Amazon S3 restores the current version.

When restoring an archived object, you can specify one of the following data access tier options in the Tier element of the request body:

- **Expedited** - Expedited retrievals allow you to quickly access your data stored in the S3 Glacier Flexible Retrieval Flexible Retrieval storage class or S3 Intelligent-Tiering Archive tier when occasional urgent requests for restoring archives are required. For all but the largest archived objects (250 MB+), data accessed using Expedited retrievals is typically made available within 1–5 minutes. Provisioned capacity ensures that retrieval capacity for Expedited retrievals is available when you need it. Expedited retrievals and provisioned capacity are not available for objects stored in the S3 Glacier Deep Archive storage class or S3 Intelligent-Tiering Deep Archive tier.

- **Standard** - Standard retrievals allow you to access any of your archived objects within several hours. This is the default option for retrieval requests that do not specify the retrieval option. Standard retrievals typically finish within 3–5 hours for objects stored in the S3 Glacier Flexible Retrieval Flexible Retrieval storage class or S3 Intelligent-Tiering Archive tier. They typically finish within 12 hours for objects stored in the S3 Glacier Deep Archive storage class or S3 Intelligent-Tiering Deep Archive tier. Standard retrievals are free for objects stored in S3 Intelligent-Tiering.

- **Bulk** - Bulk retrievals free for objects stored in the S3 Glacier Flexible Retrieval and S3 Intelligent-Tiering storage classes, enabling you to retrieve large amounts, even petabytes, of data at no cost. Bulk retrievals typically finish within 5–12 hours for objects stored in the S3 Glacier Flexible Retrieval Flexible Retrieval storage class or S3 Intelligent-Tiering Archive tier. Bulk retrievals are also the lowest-cost retrieval option when restoring objects from S3 Glacier Deep Archive. They typically finish within 48 hours for objects stored in the S3 Glacier Deep Archive storage class or S3 Intelligent-Tiering Deep Archive tier.

For more information about archive retrieval options and provisioned capacity for Expedited data access, see Restoring Archived Objects in the Amazon S3 User Guide.

You can use Amazon S3 restore speed upgrade to change the restore speed to a faster speed while it is in progress. For more information, see Upgrading the speed of an in-progress restore in the Amazon S3 User Guide.

To get the status of object restoration, you can send a HEAD request. Operations return the x-amz-restore header, which provides information about the restoration status, in the response. You can use Amazon S3 event notifications to notify you when a restore is initiated or completed. For more information, see Configuring Amazon S3 Event Notifications in the Amazon S3 User Guide.

After restoring an archived object, you can update the restoration period by reissuing the request with a new period. Amazon S3 updates the restoration period relative to the current time and
charges only for the request—there are no data transfer charges. You cannot update the restoration period when Amazon S3 is actively processing your current restore request for the object.

If your bucket has a lifecycle configuration with a rule that includes an expiration action, the object expiration overrides the life span that you specify in a restore request. For example, if you restore an object copy for 10 days, but the object is scheduled to expire in 3 days, Amazon S3 deletes the object in 3 days. For more information about lifecycle configuration, see `PutBucketLifecycleConfiguration` and `Object Lifecycle Management` in *Amazon S3 User Guide*.

**Responses**

A successful action returns either the 200 OK or 202 Accepted status code.

- If the object is not previously restored, then Amazon S3 returns 202 Accepted in the response.
- If the object is previously restored, Amazon S3 returns 200 OK in the response.

Special errors:
- **Code**: RestoreAlreadyInProgress
  
  **Cause**: Object restore is already in progress. (This error does not apply to SELECT type requests.)
  
  **HTTP Status Code**: 409 Conflict
  
  **SOAP Fault Code Prefix**: Client

- **Code**: Glacier Expedited Retrieval Not Available
  
  **Cause**: expedited retrievals are currently not available. Try again later. (Returned if there is insufficient capacity to process the Expedited request. This error applies only to Expedited retrievals and not to S3 Standard or Bulk retrievals.)
  
  **HTTP Status Code**: 503
  
  **SOAP Fault Code Prefix**: N/A

The following operations are related to `RestoreObject`:

- `PutBucketLifecycleConfiguration`
- `GetBucketNotificationConfiguration`

**Request Syntax**

```xml
POST /{Key+}?restore&versionId=VersionId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-request-payer: RequestPayer
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-expected-bucket-owner: ExpectedBucketOwner
<?xml version="1.0" encoding="UTF-8"?>
<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Days>integer</Days>
</RestoreRequest>
```

</RestoreRequest>
URI Request Parameters

The request uses the following URI parameters.

Bucket (p. 411)

The bucket name containing the object to restore.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form `AccessPointName-AccountId.outpostID.s3-outposts.Region.amazonaws.com`. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

Key (p. 411)

Object key for which the action was initiated.

Length Constraints: Minimum length of 1.

Required: Yes

VersionId (p. 411)

VersionId used to reference a specific version of the object.

x-amz-expected-bucket-owner (p. 411)

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 411)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-sdk-checksum-algorithm (p. 411)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256
Request Body

The request accepts the following data in XML format.

**RestoreRequest (p. 411)**

Root level tag for the RestoreRequest parameters.

Required: Yes

**Days (p. 411)**

Lifetime of the active copy in days. Do not use with restores that specify `OutputLocation`.

The Days element is required for regular restores, and must not be provided for select requests.

Type: Integer

Required: No

**Description (p. 411)**

The optional description for the job.

Type: String

Required: No

**GlacierJobParameters (p. 411)**

S3 Glacier related parameters pertaining to this job. Do not use with restores that specify `OutputLocation`.

Type: `GlacierJobParameters (p. 731)` data type

Required: No

**OutputLocation (p. 411)**

Describes the location where the restore job's output is stored.

Type: `OutputLocation (p. 784)` data type

Required: No

**SelectParameters (p. 411)**

Describes the parameters for Select job types.

Type: `SelectParameters (p. 826)` data type

Required: No

**Tier (p. 411)**

Retrieval tier at which the restore will be processed.

Type: String

Valid Values: Standard | Bulk | Expedited

Required: No

**Type (p. 411)**

Type of restore request.

Type: String
Valid Values: SELECT
Required: No

Response Syntax

HTTP/1.1 200
x-amz-request-charged: RequestCharged
x-amz-restore-output-path: RestoreOutputPath

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

x-amz-request-charged (p. 415)
   If present, indicates that the requester was successfully charged for the request.
   Valid Values: requester

x-amz-restore-output-path (p. 415)
   Indicates the path in the provided S3 output location where Select results will be restored to.

Errors

ObjectAlreadyInActiveTierError
   This action is not allowed against this storage tier.
   HTTP Status Code: 400

Examples

Restore an object for 2 days using the expedited retrieval option

The following restore request restores a copy of the photo1.jpg object from S3 Glacier for a period of two days using the expedited retrieval option.

POST /photo1.jpg?restore HTTP/1.1
Host: examplebucket.dummy value
Date: Mon, 22 Oct 2012 01:49:52 GMT
Authorization: authorization string
Content-Length: content length
<RestoreRequest>
   <Days>2</Days>
   <GlacierJobParameters>
      <Tier>Expedited</Tier>
   </GlacierJobParameters>
</RestoreRequest>

Example

If the examplebucket does not have a restored copy of the object, Amazon S3 returns the following 202 Accepted response.
Note
If a copy of the object is already restored, Amazon S3 returns a 200 OK response, and updates only the restored copy's expiry time.

HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG116ekQhU7/2/cHR3Yb2fCb2S04nx1423Dqwg2XiQ0B/uz1zYQvPiB1ZNRcvw=
x-amz-request-id: 9F341CD3c4BA79E0
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3

Query an archive with a SELECT request

The following is an example SELECT restore request.

POST /object-one.csv?restore HTTP/1.1
Host: examplebucket.dummy value
Date: Date: Sat, 20 Oct 2012 23:54:05 GMT
Authorization: <>authorization string</>
Content-Length: <>content length</>

<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">

SelectObjectContent
Service: Amazon S3

This action filters the contents of an Amazon S3 object based on a simple structured query language (SQL) statement. In the request, along with the SQL expression, you must also specify a data serialization format (JSON, CSV, or Apache Parquet) of the object. Amazon S3 uses this format to parse object data into records, and returns only records that match the specified SQL expression. You must also specify the data serialization format for the response.

This action is not supported by Amazon S3 on Outposts.

For more information about Amazon S3 Select, see Selecting Content from Objects and SELECT Command in the Amazon S3 User Guide.

Permissions

You must have s3:GetObject permission for this operation. Amazon S3 Select does not support anonymous access. For more information about permissions, see Specifying Permissions in a Policy in the Amazon S3 User Guide.

Object Data Formats

You can use Amazon S3 Select to query objects that have the following format properties:
- CSV, JSON, and Parquet - Objects must be in CSV, JSON, or Parquet format.
- UTF-8 - UTF-8 is the only encoding type Amazon S3 Select supports.
- GZIP or BZIP2 - CSV and JSON files can be compressed using GZIP or BZIP2. GZIP and BZIP2 are the only compression formats that Amazon S3 Select supports for CSV and JSON files. Amazon S3 Select supports columnar compression for Parquet using GZIP or Snappy. Amazon S3 Select does not support whole-object compression for Parquet objects.
- Server-side encryption - Amazon S3 Select supports querying objects that are protected with server-side encryption.

For objects that are encrypted with customer-provided encryption keys (SSE-C), you must use HTTPS, and you must use the headers that are documented in the GetObject. For more information about SSE-C, see Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon S3 User Guide.

For objects that are encrypted with Amazon S3 managed keys (SSE-S3) and AWS KMS keys (SSE-KMS), server-side encryption is handled transparently, so you don't need to specify anything. For more information about server-side encryption, including SSE-S3 and SSE-KMS, see Protecting Data Using Server-Side Encryption in the Amazon S3 User Guide.

Working with the Response Body

Given the response size is unknown, Amazon S3 Select streams the response as a series of messages and includes a Transfer-Encoding header with chunked as its value in the response. For more information, see Appendix: SelectObjectContent Response.

GetObject Support

The SelectObjectContent action does not support the following GetObject functionality. For more information, see GetObject.

- Range: Although you can specify a scan range for an Amazon S3 Select request (see SelectObjectContentRequest - ScanRange in the request parameters), you cannot specify the range of bytes of an object to return.
- The GLACIER, DEEP_ARCHIVE, and REDUCED_REDUNDANCY storage classes, or the ARCHIVE_ACCESS and DEEP_ARCHIVE_ACCESS access tiers of the INTELLIGENT_TIERING storage class: You cannot query objects in the GLACIER, DEEP_ARCHIVE, or
REDUCED_REDUNDANCY storage classes, nor objects in the ARCHIVE_ACCESS or
DEEP_ARCHIVE_ACCESS access tiers of the INTELLIGENT_TIERING storage class. For more
information about storage classes, see Using Amazon S3 storage classes in the Amazon S3 User
Guide.

Special Errors

For a list of special errors for this operation, see List of SELECT Object Content Error Codes

The following operations are related to SelectObjectContent:

- GetObject
- GetBucketLifecycleConfiguration
- PutBucketLifecycleConfiguration

Request Syntax

</SelectObjectContentRequest>
URI Request Parameters

The request uses the following URI parameters.

**Bucket (p. 419)**

The S3 bucket.

Required: Yes

**Key (p. 419)**

The object key.

Length Constraints: Minimum length of 1.

Required: Yes

**x-amz-expected-bucket-owner (p. 419)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**x-amz-server-side-encryption-customer-algorithm (p. 419)**

The server-side encryption (SSE) algorithm used to encrypt the object. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key (p. 419)**

The server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

**x-amz-server-side-encryption-customer-key-MD5 (p. 419)**

The MD5 server-side encryption (SSE) customer managed key. This parameter is needed only when the object was created using a checksum algorithm. For more information, see Protecting data using SSE-C keys in the Amazon S3 User Guide.

Request Body

The request accepts the following data in XML format.

**SelectObjectContentRequest (p. 419)**

Root level tag for the SelectObjectContentRequest parameters.

Required: Yes

**Expression (p. 419)**

The expression that is used to query the object.

Type: String

Required: Yes

**ExpressionType (p. 419)**

The type of the provided expression (for example, SQL).
Type: String

Valid Values: SQL

Required: Yes

**InputSerialization (p. 419)**

Describes the format of the data in the object that is being queried.

Type: *InputSerialization (p. 737)* data type

Required: Yes

**OutputSerialization (p. 419)**

Describes the format of the data that you want Amazon S3 to return in response.

Type: *OutputSerialization (p. 785)* data type

Required: Yes

**RequestProgress (p. 419)**

Specifies if periodic request progress information should be enabled.

Type: *RequestProgress (p. 814)* data type

Required: No

**ScanRange (p. 419)**

Specifies the byte range of the object to get the records from. A record is processed when its first byte is contained by the range. This parameter is optional, but when specified, it must not be empty. See RFC 2616, Section 14.35.1 about how to specify the start and end of the range.

ScanRange may be used in the following ways:

- `<scanrange><start>50</start><end>100</end></scanrange>` - process only the records starting between the bytes 50 and 100 (inclusive, counting from zero)
- `<scanrange><start>50</start></scanrange>` - process only the records starting after the byte 50
- `<scanrange><end>50</end></scanrange>` - process only the records within the last 50 bytes of the file.

Type: *ScanRange (p. 824)* data type

Required: No

**Response Syntax**

```xml
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<Records>
  <Payload>blob</Payload>
</Records>
<Stats>
  <Details>
    <BytesProcessed>long</BytesProcessed>
    <BytesReturned>long</BytesReturned>
    <BytesScanned>long</BytesScanned>
  </Details>
</Stats>
```

API Version 2006-03-01

421
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**Payload (p. 421)**

Root level tag for the Payload parameters.

Required: Yes

**Cont (p. 421)**

The Continuation Event.

Type: [ContinuationEvent (p. 692)](#) data type

**End (p. 421)**

The End Event.

Type: [EndEvent (p. 714)](#) data type

**Progress (p. 421)**

The Progress Event.

Type: [ProgressEvent (p. 794)](#) data type

**Records (p. 421)**

The Records Event.

Type: [RecordsEvent (p. 801)](#) data type

**Stats (p. 421)**

The Stats Event.

Type: [StatsEvent (p. 835)](#) data type

**Examples**

**Example 1: CSV object**

The following select request retrieves all records from an object with data stored in CSV format. The OutputSerialization element directs Amazon S3 to return results in CSV.
You can try different queries in the Expression element:

- Assuming that you are not using column headers, you can identify columns using positional headers:

  ```sql
  SELECT s._1, s._2 FROM S3Object s WHERE s._3 > 100
  ```

- If you have column headers and you set the FileHeaderInfo to Use, you can identify columns by name in the expression:

  ```sql
  SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
  ```

- You can specify functions in the SQL expression:

  ```sql
  SELECT count(*) FROM S3Object s WHERE s._1 < 1
  ```

Example

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: GFihv3y6+kE7KG116kQhU7/2/CHR3Yb2fcBZ04nxI423Dqw2XiQ08/UY1zYQvP18lZNRc0vw=
x-amz-request-id: 9F341CD54C8A79E0
Date: Tue, 17 Oct 2017 23:54:05 GMT

A series of messages
```
Example 2: JSON object

The following select request retrieves all records from an object with data stored in JSON format. The OutputSerialization directs Amazon S3 to return results in CSV.

You can try different queries in the Expression element:

- You can filter by string comparison using record keys:
  
  ```
  SELECT s.country, s.city from S3Object s where s.city = 'Seattle'
  ```

- You can specify functions in the SQL expression:
  
  ```
  SELECT count(*) FROM S3Object s
  ```

```
POST /exampleobject.json?select&select-type=2 HTTP/1.1  
Host: examplebucket.s3.<Region>.amazonaws.com  
Date: Tue, 17 Oct 2017 01:49:52 GMT  
Authorization: authorization string  
Content-Length: content length

<?xml version="1.0" encoding="UTF-8"?>
<SelectRequest>
   <Expression>Select * from S3Object</Expression>
   <ExpressionType>SQL</ExpressionType>
   <InputSerialization>
      <CompressionType>GZIP</CompressionType>
      <JSON>
         <Type>DOCUMENT</Type>
      </JSON>
   </InputSerialization>
   <OutputSerialization>
      <CSV>
         <QuoteFields>ASNEEDED</QuoteFields>
         <RecordDelimiter>\n</RecordDelimiter>
         <FieldDelimiter>,</FieldDelimiter>
         <QuoteCharacter>"</QuoteCharacter>
         <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
      </CSV>
   </OutputSerialization>
</SelectRequest>
```

Example

The following is a sample response.

```
HTTP/1.1 200 OK  
x-amz-id-2: GFihv3y6+kE7KG116EkQhU7/2/chR3Yb2fCb2S04nx1423Dqwg2XiQ08/U2lzYQvP1B1ZNRc0vW=  
x-amz-request-id: 9F341CD58A48A79E0  
Date: Tue, 17 Oct 2017 23:54:05 GMT

A series of messages
```

Example 3: Parquet object

- The InputSerialization element describes the format of the data in the object that is being queried. It must specify CSV, JSON, or Parquet.
• The **OutputSerialization** element describes the format of the data that you want Amazon S3 to return in response to the query. It must specify CSV, JSON. Amazon S3 doesn't support outputting data in the Parquet format.

• The format of the **InputSerialization** doesn't need to match the format of the **OutputSerialization**. So, for example, you can specify JSON in the **InputSerialization** and CSV in the **OutputSerialization**.

```xml
POST /exampleobject.parquet?select&select-type=2 HTTP/1.1
Host: examplebucket.s3.<Region>.amazonaws.com
Date: Tue, 17 Oct 2017 01:49:52 GMT
Authorization: authorization string
Content-Length: content length

<?xml version="1.0" encoding="UTF-8"?>
<SelectRequest>
  <Expression>Select * from S3Object</Expression>
  <ExpressionType>SQL</ExpressionType>
  <InputSerialization>
    <CompressionType>NONE</CompressionType>
    <Parquet/>
  </InputSerialization>
  <OutputSerialization>
    <CSV>
      <QuoteFields>ASNEEDED</QuoteFields>
      <RecordDelimiter>
      <FieldDelimiter>,</FieldDelimiter>
      <QuoteCharacter>"</QuoteCharacter>
      <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
    </CSV>
  </OutputSerialization>
</SelectRequest>
```

UploadPart
Service: Amazon S3

Uploads a part in a multipart upload.

**Note**
In this operation, you provide part data in your request. However, you have an option to specify your existing Amazon S3 object as a data source for the part you are uploading. To upload a part from an existing object, you use the UploadPartCopy operation.

You must initiate a multipart upload (see CreateMultipartUpload) before you can upload any part. In response to your initiate request, Amazon S3 returns an upload ID, a unique identifier, that you must include in your upload part request.

Part numbers can be any number from 1 to 10,000, inclusive. A part number uniquely identifies a part and also defines its position within the object being created. If you upload a new part using the same part number that was used with a previous part, the previously uploaded part is overwritten.

For information about maximum and minimum part sizes and other multipart upload specifications, see Multipart upload limits in the Amazon S3 User Guide.

To ensure that data is not corrupted when traversing the network, specify the Content-MD5 header in the upload part request. Amazon S3 checks the part data against the provided MD5 value. If they do not match, Amazon S3 returns an error.

If the upload request is signed with Signature Version 4, then AWS S3 uses the x-amz-content-sha256 header as a checksum instead of Content-MD5. For more information see Authenticating Requests: Using the Authorization Header (AWS Signature Version 4).

**Note:** After you initiate multipart upload and upload one or more parts, you must either complete or abort multipart upload in order to stop getting charged for storage of the uploaded parts. Only after you either complete or abort multipart upload, Amazon S3 frees up the parts storage and stops charging you for the parts storage.

For more information on multipart uploads, go to Multipart Upload Overview in the Amazon S3 User Guide.

For information on the permissions required to use the multipart upload API, go to Multipart Upload and Permissions in the Amazon S3 User Guide.

Server-side encryption is for data encryption at rest. Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it when you access it. You have three mutually exclusive options to protect data using server-side encryption in Amazon S3, depending on how you choose to manage the encryption keys. Specifically, the encryption key options are Amazon S3 managed keys (SSE-S3), AWS KMS keys (SSE-KMS), and Customer-Provided Keys (SSE-C). Amazon S3 encrypts data with server-side encryption using Amazon S3 managed keys (SSE-S3) by default. You can optionally tell Amazon S3 to encrypt data at rest using server-side encryption with other key options. The option you use depends on whether you want to use KMS keys (SSE-KMS) or provide your own encryption key (SSE-C). If you choose to provide your own encryption key, the request headers you provide in the request must match the headers you used in the request to initiate the upload by using CreateMultipartUpload. For more information, go to Using Server-Side Encryption in the Amazon S3 User Guide.

Server-side encryption is supported by the S3 Multipart Upload actions. Unless you are using a customer-provided encryption key (SSE-C), you don’t need to specify the encryption parameters in each UploadPart request. Instead, you only need to specify the server-side encryption parameters in the initial Initiate Multipart request. For more information, see CreateMultipartUpload.

If you requested server-side encryption using a customer-provided encryption key (SSE-C) in your initiate multipart upload request, you must provide identical encryption information in each part upload using the following headers.
UploadPart has the following special errors:

- **Code: NoSuchUpload**
  - **Cause:** The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.
  - **HTTP Status Code:** 404 Not Found
  - **SOAP Fault Code Prefix:** Client

The following operations are related to UploadPart:

- **CreateMultipartUpload**
- **CompleteMultipartUpload**
- **AbortMultipartUpload**
- **ListParts**
- **ListMultipartUploads**

**Request Syntax**

```
PUT /Key+?partNumber=PartNumber&uploadId=UploadId HTTP/1.1
Host: Bucket.s3.amazonaws.com
Content-Length: ContentLength
Content-MD5: ContentMD5
x-amz-sdk-checksum-algorithm: ChecksumAlgorithm
x-amz-checksum-crc32: ChecksumCRC32
x-amz-checksum-crc32c: ChecksumCRC32c
x-amz-checksum-sha1: ChecksumSHA1
x-amz-checksum-sha256: ChecksumSHA256
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-request-payer: RequestPayer
x-amz-expected-bucket-owner: ExpectedBucketOwner

Body
```

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 427)**

The name of the bucket to which the multipart upload was initiated.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName-AccountId.s3-accesspoint.Region.amazonaws.com`. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using access points](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-access-points.html) in the *Amazon S3 User Guide*.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form
AccessPointName|AccountId|outpostID|s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

**Content-Length (p. 427)**

Size of the body in bytes. This parameter is useful when the size of the body cannot be determined automatically.

**Content-MD5 (p. 427)**

The base64-encoded 128-bit MD5 digest of the part data. This parameter is auto-populated when using the command from the CLI. This parameter is required if object lock parameters are specified.

**Key (p. 427)**

Object key for which the multipart upload was initiated.

Length Constraints: Minimum length of 1.

Required: Yes

**partNumber (p. 427)**

Part number of part being uploaded. This is a positive integer between 1 and 10,000.

Required: Yes

**uploadId (p. 427)**

Upload ID identifying the multipart upload whose part is being uploaded.

Required: Yes

**x-amz-checksum-crc32 (p. 427)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32 checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-crc32c (p. 427)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32C checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-sha1 (p. 427)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 160-bit SHA-1 digest of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-checksum-sha256 (p. 427)**

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 256-bit SHA-256 digest of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

**x-amz-expected-bucket-owner (p. 427)**

The account ID of the expected bucket owner. If the bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).
x-amz-request-payer (p. 427)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-sdk-checksum-algorithm (p. 427)

Indicates the algorithm used to create the checksum for the object when using the SDK. This header will not provide any additional functionality if not using the SDK. When sending this header, there must be a corresponding x-amz-checksum or x-amz-trailer header sent. Otherwise, Amazon S3 fails the request with the HTTP status code 400 Bad Request. For more information, see Checking object integrity in the Amazon S3 User Guide.

If you provide an individual checksum, Amazon S3 ignores any provided ChecksumAlgorithm parameter.

This checksum algorithm must be the same for all parts and it match the checksum value supplied in the CreateMultipartUpload request.

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

x-amz-server-side-encryption-customer-algorithm (p. 427)

Specifies the algorithm to use to when encrypting the object (for example, AES256).

x-amz-server-side-encryption-customer-key (p. 427)

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header. This must be the same encryption key specified in the initiate multipart upload request.

x-amz-server-side-encryption-customer-key-MD5 (p. 427)

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

Request Body

The request accepts the following binary data.

Body (p. 427)

Response Syntax

HTTP/1.1 200
x-amz-server-side-encryption: ServerSideEncryption
ETag: ETag
x-amz-checksum-crc32: ChecksumCRC32
x-amz-checksum-crc32c: ChecksumCRC32C
x-amz-checksum-sha1: ChecksumSHA1
x-amz-checksum-sha256: ChecksumSHA256
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

**ETag** *(p. 429)*

Entity tag for the uploaded object.

**x-amz-checksum-crc32** *(p. 429)*

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Checking_object_integrity.html) in the *Amazon S3 User Guide*.

**x-amz-checksum-crc32c** *(p. 429)*

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Checking_object_integrity.html) in the *Amazon S3 User Guide*.

**x-amz-checksum-sha1** *(p. 429)*

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Checking_object_integrity.html) in the *Amazon S3 User Guide*.

**x-amz-checksum-sha256** *(p. 429)*

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Checking_object_integrity.html) in the *Amazon S3 User Guide*.

**x-amz-request-charged** *(p. 429)*

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**x-amz-server-side-encryption** *(p. 429)*

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-server-side-encryption-aws-kms-key-id** *(p. 429)*

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled** *(p. 429)*

Indicates whether the multipart upload uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).
x-amz-server-side-encryption-customer-algorithm (p. 429)

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

x-amz-server-side-encryption-customer-key-MD5 (p. 429)

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

Examples

Sample Request

The following PUT request uploads a part (part number 1) in a multipart upload. The request includes the upload ID that you get in response to your Initiate Multipart Upload request.

```
PUT /my-movie.m2ts?partNumber=1&uploadId=VCVsb2FkIElEIGZvciBlbZZpbmcncy8teSltb3ZpZS5tMnRzIHVwbG9hZR HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Date:  Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 10485760
Content-MD5: pUNXr/BjKK5G2UKvaRRrOA==
Authorization: authorization string
***part data omitted***
```

Sample Response

The response includes the ETag header. You need to retain this value for use when you send the Complete Multipart Upload request.

```
HTTP/1.1 200 OK
x-amz-id-2: Vvag1LuByRx9e6j5Onimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFG==
x-amz-request-id: 656c76696e672773207265717567374
Date:  Mon, 1 Nov 2010 20:34:56 GMT
ETag: "b54357fa0f652ce46e942fa68366b38"
Content-Length: 0
Connection: keep-alive
Server: AmazonS3
```

Example: Upload a part with an encryption key in the request for server-side encryption

If you initiated a multipart upload with a request to save an object using server-side encryption with a customer-provided encryption key, each part upload must also include the same set of encryption-specific headers as shown in the following example request.

```
PUT /example-object?partNumber=1&uploadId=EXAMPLEJZ6e0YupT2h66iePQcCc9IEbYbDUy4RTpMeoSMLPRp8Z5o1u8FeSRonpvnsKKG55tI2LB9VDpjf833M5N4P3V8ta9WZe/5Sg1/o6F391Q92Vv8O9nuRz2/81dfA6X6gO0K9Xx52GhNd8GqWJvZmC6b3Px1hR2cE/2/3QYW+MVRdF7D/3RjXUJuqYjA== HTTP/1.1
Host: example-bucket.s3.<Region>.amazonaws.com
Authorization: authorization string
Date: Wed, 28 May 2014 19:40:11 +0000
x-amz-server-side-encryption-customer-key: g01CfA3Dv40jZz5SQJ1ZukLRFqtI5WorC/8SEEEXAMPLE
```
Example

In the response, Amazon S3 returns encryption-specific headers providing the encryption algorithm used and MD5 digest of the encryption key you provided in the request.

```
HTTP/1.1 100 Continue   HTTP/1.1 200 OK
x-amz-id-2: Zn8bf8aEFQ+kBnGP8c/JaAf95oWM68Q0PS9+SyFwkIZOHU62B1RLZi5oXw4cOCEt
x-amz-request-id: 5A37448A37622243
Date: Wed, 28 May 2014 19:40:12 GMT
ETag: "7e10e7d25dc4581d89b9285be5f384fd"
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbY2example
```

UploadPartCopy
Service: Amazon S3

Uploads a part by copying data from an existing object as data source. You specify the data source by adding the request header `x-amz-copy-source` in your request and a byte range by adding the request header `x-amz-copy-source-range` in your request.

For information about maximum and minimum part sizes and other multipart upload specifications, see [Multipart upload limits](https://docs.aws.amazon.com/AmazonS3/latest/userguide/multipart-uploads.html) in the *Amazon S3 User Guide*.  

**Note**
Instead of using an existing object as part data, you might use the [UploadPart](http://docs.aws.amazon.com/AmazonS3/latest/API/UploadPart.html) action and provide data in your request.

You must initiate a multipart upload before you can upload any part. In response to your initiate request, Amazon S3 returns a unique identifier, the upload ID, that you must include in your upload part request.

For more information about using the `UploadPartCopy` operation, see the following:

- For conceptual information about multipart uploads, see [Uploading Objects Using Multipart Upload](https://docs.aws.amazon.com/AmazonS3/latest/userguide/multipart-uploads.html) in the *Amazon S3 User Guide*.
- For information about permissions required to use the multipart upload API, see [Multipart Upload and Permissions](https://docs.aws.amazon.com/AmazonS3/latest/userguide/multipart-uploads-permissions.html) in the *Amazon S3 User Guide*.
- For information about copying objects using a single atomic action vs. a multipart upload, see [Operations on Objects](https://docs.aws.amazon.com/AmazonS3/latest/userguide/operations-on-objects.html) in the *Amazon S3 User Guide*.
- For information about using server-side encryption with customer-provided encryption keys with the `UploadPartCopy` operation, see [CopyObject](http://docs.aws.amazon.com/AmazonS3/latest/API/CopyObject.html) and [UploadPart](http://docs.aws.amazon.com/AmazonS3/latest/API/UploadPart.html).

Note the following additional considerations about the request headers `x-amz-copy-source-if-match`, `x-amz-copy-source-if-none-match`, `x-amz-copy-source-if-unmodified-since`, and `x-amz-copy-source-if-modified-since`:

- **Consideration 1** - If both of the `x-amz-copy-source-if-match` and `x-amz-copy-source-if-unmodified-since` headers are present in the request as follows:

  `x-amz-copy-source-if-match` condition evaluates to `true`, and;
  
  `x-amz-copy-source-if-unmodified-since` condition evaluates to `false`;

  Amazon S3 returns 200 OK and copies the data.

- **Consideration 2** - If both of the `x-amz-copy-source-if-none-match` and `x-amz-copy-source-if-modified-since` headers are present in the request as follows:

  `x-amz-copy-source-if-none-match` condition evaluates to `false`, and;
  
  `x-amz-copy-source-if-modified-since` condition evaluates to `true`;

  Amazon S3 returns 412 Precondition Failed response code.

**Versioning**

If your bucket has versioning enabled, you could have multiple versions of the same object. By default, `x-amz-copy-source` identifies the current version of the object to copy. If the current version is a delete marker and you don't specify a versionId in the `x-amz-copy-source`, Amazon S3 returns a 404 error, because the object does not exist. If you specify versionId in the `x-amz-copy-source-
source and the versionId is a delete marker, Amazon S3 returns an HTTP 400 error, because you are not allowed to specify a delete marker as a version for the x-amz-copy-source.

You can optionally specify a specific version of the source object to copy by adding the versionId subresource as shown in the following example:

```
x-amz-copy-source: /bucket/object?versionId=version id
```

Special errors

- **Code: NoSuchUpload**
  - Cause: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.
  - HTTP Status Code: 404 Not Found
- **Code: InvalidRequest**
  - Cause: The specified copy source is not supported as a byte-range copy source.
  - HTTP Status Code: 400 Bad Request

The following operations are related to UploadPartCopy:

- CreateMultipartUpload
- UploadPart
- CompleteMultipartUpload
- AbortMultipartUpload
- ListParts
- ListMultipartUploads

**Request Syntax**

PUT /Key+?partNumber=PartNumber&uploadId=UploadId HTTP/1.1
Host: Bucket.s3.amazonaws.com
x-amz-copy-source: CopySource
x-amz-copy-source-if-match: CopySourceIfMatch
x-amz-copy-source-if-modified-since: CopySourceIfModifiedSince
x-amz-copy-source-if-none-match: CopySourceIfNoneMatch
x-amz-copy-source-if-unmodified-since: CopySourceIfUnmodifiedSince
x-amz-copy-source-range: CopySourceRange
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key: SSECustomerKey
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-copy-source-server-side-encryption-customer-algorithm: CopySourceSSECustomerAlgorithm
x-amz-copy-source-server-side-encryption-customer-key: CopySourceSSECustomerKey
x-amz-copy-source-server-side-encryption-customer-key-MD5: CopySourceSSECustomerKeyMD5
x-amz-request-payer: Requester
x-amz-expected-bucket-owner: ExpectedBucketOwner
x-amz-source-expected-bucket-owner: ExpectedSourceBucketOwner

**URI Request Parameters**

The request uses the following URI parameters.

**Bucket (p. 434)**

The bucket name.

When using this action with an access point, you must direct requests to the access point hostname. The access point hostname takes the form AccessPointName-AccountId.s3-
accesspoint.Region.amazonaws.com. When using this action with an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using access points in the Amazon S3 User Guide.

When you use this action with Amazon S3 on Outposts, you must direct requests to the S3 on Outposts hostname. The S3 on Outposts hostname takes the form AccessPointName-AccountId.outpostId.s3-outposts.Region.amazonaws.com. When you use this action with S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name. For more information about S3 on Outposts ARNs, see What is S3 on Outposts? in the Amazon S3 User Guide.

Required: Yes

Key (p. 434)

Object key for which the multipart upload was initiated.

Length Constraints: Minimum length of 1.

Required: Yes

partNumber (p. 434)

Part number of part being copied. This is a positive integer between 1 and 10,000.

Required: Yes

uploadId (p. 434)

Upload ID identifying the multipart upload whose part is being copied.

Required: Yes

x-amz-copy-source (p. 434)

Specifies the source object for the copy operation. You specify the value in one of two formats, depending on whether you want to access the source object through an access point:

- For objects not accessed through an access point, specify the name of the source bucket and key of the source object, separated by a slash (/). For example, to copy the object reports/january.pdf from the bucket awsexamplebucket, use awsexamplebucket/reports/january.pdf. The value must be URL-encoded.

- For objects accessed through access points, specify the Amazon Resource Name (ARN) of the object as accessed through the access point, in the format arn:aws:s3:<Region>:<account-id>:accesspoint/<access-point-name>/object/<key>. For example, to copy the object reports/january.pdf through access point my-access-point owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3:us-west-2:123456789012:accesspoint/my-access-point/object/reports/january.pdf. The value must be URL-encoded.

Note

Amazon S3 supports copy operations using access points only when the source and destination buckets are in the same AWS Region.

Alternatively, for objects accessed through Amazon S3 on Outposts, specify the ARN of the object as accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/
<outpost-id>/object/<key>. For example, to copy the object reports/january.pdf through outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-
outpost/object/reports/january.pdf. The value must be URL-encoded.

To copy a specific version of an object, append ?versionId=<version-id> to the value (for example, awsexamplebucket/reports/january.pdf?)
versionId=QUpfdndhfd8438MNFDN93jdnJFkdmqnh893). If you don’t specify a version ID, Amazon S3 copies the latest version of the source object.

Pattern: `/\+\/*/\+

Required: Yes

x-amz-copy-source-if-match (p. 434)
Copies the object if its entity tag (ETag) matches the specified tag.

x-amz-copy-source-if-modified-since (p. 434)
Copies the object if it has been modified since the specified time.

x-amz-copy-source-if-none-match (p. 434)
Copies the object if its entity tag (ETag) is different than the specified ETag.

x-amz-copy-source-if-unmodified-since (p. 434)
Copies the object if it hasn’t been modified since the specified time.

x-amz-copy-source-range (p. 434)

The range of bytes to copy from the source object. The range value must use the form bytes=first-last, where the first and last are the zero-based byte offsets to copy. For example, bytes=0-9 indicates that you want to copy the first 10 bytes of the source. You can copy a range only if the source object is greater than 5 MB.

x-amz-copy-source-server-side-encryption-customer-algorithm (p. 434)

Specifies the algorithm to use when decrypting the source object (for example, AES256).

x-amz-copy-source-server-side-encryption-customer-key (p. 434)

Specifies the customer-provided encryption key for Amazon S3 to use to encrypt the source object. The encryption key provided in this header must be one that was used when the source object was created.

x-amz-copy-source-server-side-encryption-customer-key-MD5 (p. 434)

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

x-amz-expected-bucket-owner (p. 434)

The account ID of the expected destination bucket owner. If the destination bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

x-amz-request-payer (p. 434)

Confirms that the requester knows that they will be charged for the request. Bucket owners need not specify this parameter in their requests. If either the source or destination Amazon S3 bucket has Requester Pays enabled, the requester will pay for corresponding charges to copy the object. For information about downloading objects from Requester Pays buckets, see Downloading Objects in Requester Pays Buckets in the Amazon S3 User Guide.

Valid Values: requester

x-amz-server-side-encryption-customer-algorithm (p. 434)

Specifies the algorithm to use to when encrypting the object (for example, AES256).

x-amz-server-side-encryption-customer-key (p. 434)

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key.
The key must be appropriate for use with the algorithm specified in the \texttt{x-amz-server-side-encryption-customer-algorithm} header. This must be the same encryption key specified in the initiate multipart upload request.

\textbf{\texttt{x-amz-server-side-encryption-customer-key-MD5 (p. 434)}}

Specifies the 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.

\textbf{\texttt{x-amz-source-expected-bucket-owner (p. 434)}}

The account ID of the expected source bucket owner. If the source bucket is owned by a different account, the request fails with the HTTP status code 403 Forbidden (access denied).

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
x-amz-copy-source-version-id: CopySourceVersionId
x-amz-server-side-encryption: ServerSideEncryption
x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled
x-amz-request-charged: RequestCharged
<?xml version="1.0" encoding="UTF-8"?>
<CopyPartResult>
  <ETag>string</ETag>
  <LastModified>timestamp</LastModified>
  <ChecksumCRC32>string</ChecksumCRC32>
  <ChecksumSHA1>string</ChecksumSHA1>
  <ChecksumSHA256>string</ChecksumSHA256>
</CopyPartResult>
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

\textbf{\texttt{x-amz-copy-source-version-id (p. 437)}}

The version of the source object that was copied, if you have enabled versioning on the source bucket.

\textbf{\texttt{x-amz-request-charged (p. 437)}}

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

\textbf{\texttt{x-amz-server-side-encryption (p. 437)}}

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse
**x-amz-server-side-encryption-aws-kms-key-id (p. 437)**

If present, specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for the object.

**x-amz-server-side-encryption-bucket-key-enabled (p. 437)**

Indicates whether the multipart upload uses an S3 Bucket Key for server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

**x-amz-server-side-encryption-customer-algorithm (p. 437)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used.

**x-amz-server-side-encryption-customer-key-MD5 (p. 437)**

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

The following data is returned in XML format by the service.

**CopyPartResult (p. 437)**

Root level tag for the CopyPartResult parameters.

Required: Yes

**ChecksumCRC32 (p. 437)**

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumCRC32C (p. 437)**

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumSHA1 (p. 437)**

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

**ChecksumSHA256 (p. 437)**

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
**ETag (p. 437)**

Entity tag of the object.

Type: String

**LastModified (p. 437)**

Date and time at which the object was uploaded.

Type: Timestamp

**Examples**

**Sample Request**

The following PUT request uploads a part (part number 2) in a multipart upload. The request specifies a byte range from an existing object as the source of this upload. The request includes the upload ID that you get in response to your Initiate Multipart Upload request.

```
PUT /newobject?partNumber=2&uploadId=VCVsb2FkIElEIGZvciBlbZZpbmcncyBteS1tb3ZpZS5tMnRzIHVwbG9hZR HTTP/1.1
Host: target-bucket.s3.<Region>.amazonaws.com
Date: Mon, 11 Apr 2011 20:34:56 GMT
x-amz-copy-source: /source-bucket/sourceobject
x-amz-copy-source-range: bytes=500-6291456
Authorization: authorization string
```

**Sample Response**

The response includes the ETag value. You need to retain this value to use when you send the Complete Multipart Upload request.

```
HTTP/1.1 200 OK
x-amz-id-2: Vvag1LuByRx9e6j5Onimru9p04ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374
Date: Mon, 11 Apr 2011 20:34:56 GMT
Server: AmazonS3

<CopyPartResult>
  <LastModified>2011-04-11T20:34:56.000Z</LastModified>
  <ETag>"9b2cf535f277731c974343645a3985328"</ETag>
</CopyPartResult>
```

**Sample Request**

The following PUT request uploads a part (part number 2) in a multipart upload. The request does not specify the optional byte range header, but requests the entire source object copy as part 2. The request includes the upload ID that you got in response to your Initiate Multipart Upload request.

```
PUT /newobject?partNumber=2&uploadId=VCVsb2FkIElEIGZvciBlbZZpbmcncyBteS1tb3ZpZS5tMnRzIHVwbG9hZR HTTP/1.1
Host: target-bucket.s3.<Region>.amazonaws.com
Date: Mon, 11 Apr 2011 20:34:56 GMT
```

API Version 2006-03-01
Sample Response

The response includes the ETag value. You need to retain this value to use when you send the Complete Multipart Upload request.

HTTP/1.1 200 OK
x-amz-id-2: Vvag1LuByRx9e6j5Onimru9p04ZVKnj2Qz7/C1NpcfTWAtRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374

**WriteGetObjectResponse**

Service: Amazon S3

Passes transformed objects to a GetObject operation when using Object Lambda access points. For information about Object Lambda access points, see [Transforming objects with Object Lambda access points](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Transforming-objects-with-object-lambda-access-points.html) in the *Amazon S3 User Guide*.

This operation supports metadata that can be returned by GetObject, in addition to RequestRoute, RequestToken, StatusCode, ErrorCode, and ErrorMessage. The GetObject response metadata is supported so that the WriteGetObjectResponse caller, typically an AWS Lambda function, can provide the same metadata when it internally invokes GetObject. When WriteGetObjectResponse is called by a customer-owned Lambda function, the metadata returned to the end user GetObject call might differ from what Amazon S3 would normally return.

You can include any number of metadata headers. When including a metadata header, it should be prefixed with x-amz-meta. For example, x-amz-meta-my-custom-header: MyCustomValue. The primary use case for this is to forward GetObject metadata.

AWS provides some prebuilt Lambda functions that you can use with S3 Object Lambda to detect and redact personally identifiable information (PII) and decompress S3 objects. These Lambda functions are available in the AWS Serverless Application Repository, and can be selected through the AWS Management Console when you create your Object Lambda access point.

**Example 1: PII Access Control** - This Lambda function uses Amazon Comprehend, a natural language processing (NLP) service using machine learning to find insights and relationships in text. It automatically detects personally identifiable information (PII) such as names, addresses, dates, credit card numbers, and social security numbers from documents in your Amazon S3 bucket.

**Example 2: PII Redaction** - This Lambda function uses Amazon Comprehend, a natural language processing (NLP) service using machine learning to find insights and relationships in text. It automatically redacts personally identifiable information (PII) such as names, addresses, dates, credit card numbers, and social security numbers from documents in your Amazon S3 bucket.

**Example 3: Decompression** - The Lambda function S3ObjectLambdaDecompression, is equipped to decompress objects stored in S3 in one of six compressed file formats including bzip2, gzip, snappy, zlib, zstandard and ZIP.

For information on how to view and use these functions, see [Using AWS built Lambda functions](https://docs.aws.amazon.com/AmazonS3/latest/userguide/Using-AWS-built-Lambda-functions.html) in the *Amazon S3 User Guide*.

**Request Syntax**

```
POST /WriteGetObjectResponse HTTP/1.1
Host: s3.amazonaws.com
x-amz-request-route: RequestRoute
x-amz-request-token: RequestToken
x-amz-fwd-status: StatusCode
x-amz-fwd-error-code: ErrorCode
x-amz-fwd-error-message: ErrorMessage
x-amz-fwd-header-accept-ranges: AcceptRanges
x-amz-fwd-header-cache-control: CacheControl
x-amz-fwd-header-content-disposition: ContentDisposition
x-amz-fwd-header-content-encoding: ContentEncoding
x-amz-fwd-header-content-language: ContentLanguage
Content-Length: ContentLength
x-amz-fwd-header-content-range: ContentRange
x-amz-fwd-header-content-type: ContentType
x-amz-fwd-header-x-amz-checksum-crc32: ChecksumCRC32
x-amz-fwd-header-x-amz-checksum-crc32c: ChecksumCRC32C
x-amz-fwd-header-x-amz-checksum-sha1: ChecksumSHA1
```
x-amz-fwd-header-x-amz-checksum-sha256: ChecksumSHA256
x-amz-fwd-header-x-amz-delete-marker: DeleteMarker
x-amz-fwd-header-ETag: ETag
x-amz-fwd-header-Expires: Expires
x-amz-fwd-header-x-amz-expiration: Expiration
x-amz-fwd-header-Last-Modified: LastModified
x-amz-fwd-header-x-amz-missing-meta: MissingMeta
x-amz-fwd-header-x-amz-object-lock-mode: ObjectLockMode
x-amz-fwd-header-x-amz-object-lock-legal-hold: ObjectLockLegalHoldStatus
x-amz-fwd-header-x-amz-object-lock-retain-until-date: ObjectLockRetainUntilDate
x-amz-fwd-header-x-amz-mp-parts-count: PartsCount
x-amz-fwd-header-x-amz-restore: Restore
x-amz-fwd-header-x-amz-server-side-encryption: ServerSideEncryption
x-amz-fwd-header-x-amz-server-side-encryption-customer-algorithm: SSECustomerAlgorithm
x-amz-fwd-header-x-amz-server-side-encryption-aws-kms-key-id: SSEKMSKeyId
x-amz-fwd-header-x-amz-server-side-encryption-customer-key-MD5: SSECustomerKeyMD5
x-amz-fwd-header-x-amz-storage-class: StorageClass
x-amz-fwd-header-x-amz-tagging-count: TagCount
x-amz-fwd-header-x-amz-version-id: VersionId
x-amz-fwd-header-x-amz-server-side-encryption-bucket-key-enabled: BucketKeyEnabled

Body

URI Request Parameters

The request uses the following URI parameters.

**Content-Length (p. 441)**

The size of the content body in bytes.

**x-amz-fwd-error-code (p. 441)**

A string that uniquely identifies an error condition. Returned in the <Code> tag of the error XML response for a corresponding GetObject call. Cannot be used with a successful StatusCode header or when the transformed object is provided in the body. All error codes from S3 are sentence-cased. The regular expression (regex) value is "^[A-Z][a-zA-Z]+$".

**x-amz-fwd-error-message (p. 441)**

Contains a generic description of the error condition. Returned in the <Message> tag of the error XML response for a corresponding GetObject call. Cannot be used with a successful StatusCode header or when the transformed object is provided in body.

**x-amz-fwd-header-accept-ranges (p. 441)**

Indicates that a range of bytes was specified.

**x-amz-fwd-header-Cache-Control (p. 441)**

Specifies caching behavior along the request/reply chain.

**x-amz-fwd-header-Content-Disposition (p. 441)**

Specifies presentational information for the object.

**x-amz-fwd-header-Content-Encoding (p. 441)**

 Specifies what content encodings have been applied to the object and thus what decoding mechanisms must be applied to obtain the media-type referenced by the Content-Type header field.

**x-amz-fwd-header-Content-Language (p. 441)**

The language the content is in.
x-amz-fwd-header-Content-Range (p. 441)

The portion of the object returned in the response.

x-amz-fwd-header-Content-Type (p. 441)

A standard MIME type describing the format of the object data.

x-amz-fwd-header-ETag (p. 441)

An opaque identifier assigned by a web server to a specific version of a resource found at a URL.

x-amz-fwd-header-Expires (p. 441)

The date and time at which the object is no longer cacheable.

x-amz-fwd-header-Last-Modified (p. 441)

The date and time that the object was last modified.

x-amz-fwd-header-x-amz-checksum-crc32 (p. 441)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This specifies the base-64 encoded, 32-bit CRC32 checksum of the object returned by the Object Lambda function. This may not match the checksum for the object stored in Amazon S3. Amazon S3 will perform validation of the checksum values only when the original GetObject request required checksum validation. For more information about checksums, see Checking object integrity in the Amazon S3 User Guide.

Only one checksum header can be specified at a time. If you supply multiple checksum headers, this request will fail.

x-amz-fwd-header-x-amz-checksum-crc32c (p. 441)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This specifies the base-64 encoded, 32-bit CRC32C checksum of the object returned by the Object Lambda function. This may not match the checksum for the object stored in Amazon S3. Amazon S3 will perform validation of the checksum values only when the original GetObject request required checksum validation. For more information about checksums, see Checking object integrity in the Amazon S3 User Guide.

Only one checksum header can be specified at a time. If you supply multiple checksum headers, this request will fail.

x-amz-fwd-header-x-amz-checksum-sha1 (p. 441)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This specifies the base-64 encoded, 160-bit SHA-1 digest of the object returned by the Object Lambda function. This may not match the checksum for the object stored in Amazon S3. Amazon S3 will perform validation of the checksum values only when the original GetObject request required checksum validation. For more information about checksums, see Checking object integrity in the Amazon S3 User Guide.

Only one checksum header can be specified at a time. If you supply multiple checksum headers, this request will fail.

x-amz-fwd-header-x-amz-checksum-sha256 (p. 441)

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This specifies the base-64 encoded, 256-bit SHA-256 digest of the object returned by the Object Lambda function. This may not match the checksum for the object stored in Amazon S3. Amazon S3 will perform validation of the checksum values only when the original GetObject request required checksum validation. For more information about checksums, see Checking object integrity in the Amazon S3 User Guide.
Only one checksum header can be specified at a time. If you supply multiple checksum headers, this request will fail.

**x-amz-fwd-header-x-amz-delete-marker (p. 441)**

Specifies whether an object stored in Amazon S3 is (true) or is not (false) a delete marker.

**x-amz-fwd-header-x-amz-expiration (p. 441)**

If the object expiration is configured (see PUT Bucket lifecycle), the response includes this header. It includes the expiry-date and rule-id key-value pairs that provide the object expiration information. The value of the rule-id is URL-encoded.

**x-amz-fwd-header-x-amz-missing-meta (p. 441)**

Set to the number of metadata entries not returned in x-amz-meta headers. This can happen if you create metadata using an API like SOAP that supports more flexible metadata than the REST API. For example, using SOAP, you can create metadata whose values are not legal HTTP headers.

**x-amz-fwd-header-x-amz-mp-parts-count (p. 441)**

The count of parts this object has.

**x-amz-fwd-header-x-amz-object-lock-legal-hold (p. 441)**

Indicates whether an object stored in Amazon S3 has an active legal hold.

Valid Values: ON | OFF

**x-amz-fwd-header-x-amz-object-lock-mode (p. 441)**

Indicates whether an object stored in Amazon S3 has Object Lock enabled. For more information about S3 Object Lock, see Object Lock.

Valid Values: GOVERNANCE | COMPLIANCE

**x-amz-fwd-header-x-amz-object-lock-retain-until-date (p. 441)**

The date and time when Object Lock is configured to expire.

**x-amz-fwd-header-x-amz-replication-status (p. 441)**

Indicates if request involves bucket that is either a source or destination in a Replication rule. For more information about S3 Replication, see Replication.

Valid Values: COMPLETE | PENDING | FAILED | REPLICA | COMPLETED

**x-amz-fwd-header-x-amz-request-charged (p. 441)**

If present, indicates that the requester was successfully charged for the request.

Valid Values: requester

**x-amz-fwd-header-x-amz-restart (p. 441)**

Provides information about object restoration operation and expiration time of the restored object copy.

**x-amz-fwd-header-x-amz-server-side-encryption (p. 441)**

The server-side encryption algorithm used when storing requested object in Amazon S3 (for example, AES256, aws:kms).

Valid Values: AES256 | aws:kms | aws:kms:dsse

**x-amz-fwd-header-x-amz-server-side-encryption-aws-kms-key-id (p. 441)**

If present, specifies the ID (Key ID, Key ARN, or Key Alias) of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key that was used for stored in Amazon S3 object.
**x-amz-fwd-header-x-amz-server-side-encryption-bucket-key-enabled** (p. 441)

Indicates whether the object stored in Amazon S3 uses an S3 bucket key for server-side encryption with AWS KMS (SSE-KMS).

**x-amz-fwd-header-x-amz-server-side-encryption-customer-algorithm** (p. 441)

Encryption algorithm used if server-side encryption with a customer-provided encryption key was specified for object stored in Amazon S3.

**x-amz-fwd-header-x-amz-server-side-encryption-customer-key-MD5** (p. 441)

128-bit MD5 digest of customer-provided encryption key used in Amazon S3 to encrypt data stored in S3. For more information, see Protecting data using server-side encryption with customer-provided encryption keys (SSE-C).

**x-amz-fwd-header-x-amz-storage-class** (p. 441)

Provides storage class information of the object. Amazon S3 returns this header for all objects except for S3 Standard storage class objects.

For more information, see [Storage Classes](#).

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

**x-amz-fwd-header-x-amz-tagging-count** (p. 441)

The number of tags, if any, on the object.

**x-amz-fwd-header-x-amz-version-id** (p. 441)

An ID used to reference a specific version of the object.

**x-amz-fwd-status** (p. 441)

The integer status code for an HTTP response of a corresponding GetObject request. The following is a list of status codes.

- 200 - OK
- 206 - Partial Content
- 304 - Not Modified
- 400 - Bad Request
- 401 - Unauthorized
- 403 - Forbidden
- 404 - Not Found
- 405 - Method Not Allowed
- 409 - Conflict
- 411 - Length Required
- 412 - Precondition Failed
- 416 - Range Not Satisfiable
- 500 - Internal Server Error
- 503 - Service Unavailable

**x-amz-request-route** (p. 441)

Route prefix to the HTTP URL generated.

Required: Yes
x-amz-request-token (p. 441)

A single use encrypted token that maps WriteGetObjectResponse to the end user GetObject request.

Required: Yes

Request Body

The request accepts the following binary data.

Body (p. 441)

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample Response

The following illustrates a sample response.

```
HTTP/1.1 200 OK
x-amz-request-id: 19684529-d1aa-413e-9382-9ff490962d12
Date: Wed, 24 Feb 2021 10:57:53 GMT
Content-Length: 0
```

Sample Request

The following illustrates a sample request from a POST.

```
POST /WriteGetObjectResponse HTTP/1.1
Host: <RequestRoute>.s3-object-lambda.<Region>.amazonaws.com
x-amz-request-token: <RequestToken>
Authorization: authorization string
Content-Type: text/plain
Content-Length: 16
[16 bytes of object data]
```

Sample Error Response

The following response returns a ValidationError error because the RequestToken could not be decrypted.

```
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>ValidationError</Code>
  <Message>Invalid token</Message>
</Error>
```

Amazon S3 Control

The following actions are supported by Amazon S3 Control:

- CreateAccessPoint (p. 450)
- CreateAccessPointForObjectLambda (p. 454)
- CreateBucket (p. 457)
- CreateJob (p. 461)
- CreateMultiRegionAccessPoint (p. 468)
- CreateStorageLensGroup (p. 471)
- DeleteAccessPoint (p. 474)
- DeleteAccessPointForObjectLambda (p. 476)
- DeleteAccessPointPolicy (p. 478)
- DeleteAccessPointPolicyForObjectLambda (p. 480)
- DeleteBucket (p. 482)
- DeleteBucketLifecycleConfiguration (p. 484)
- DeleteBucketPolicy (p. 486)
- DeleteBucketReplication (p. 488)
- DeleteBucketTagging (p. 491)
- DeleteJobTagging (p. 493)
- DeleteMultiRegionAccessPoint (p. 495)
- DeletePublicAccessBlock (p. 498)
- DeleteStorageLensConfiguration (p. 500)
- DeleteStorageLensConfigurationTagging (p. 502)
- DeleteStorageLensGroup (p. 504)
- DescribeJob (p. 506)
- DescribeMultiRegionAccessPointOperation (p. 511)
- GetAccessPoint (p. 514)
- GetAccessPointConfigurationForObjectLambda (p. 518)
- GetAccessPointForObjectLambda (p. 520)
• GetAccessPointPolicy (p. 522)
• GetAccessPointPolicyForObjectLambda (p. 524)
• GetAccessPointPolicyStatus (p. 526)

CreateAccessPoint
Service: Amazon S3 Control

Creates an access point and associates it with the specified bucket. For more information, see Managing Data Access with Amazon S3 Access Points in the Amazon S3 User Guide.

Note
S3 on Outposts only supports VPC-style access points. For more information, see Accessing Amazon S3 on Outposts using virtual private cloud (VPC) only access points in the Amazon S3 User Guide.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to CreateAccessPoint:

• GetAccessPoint
• DeleteAccessPoint
• ListAccessPoints

Request Syntax

```
PUT /v20180820/accesspoint/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

<?xml version="1.0" encoding="UTF-8"?>
<CreateAccessPointRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <Bucket>string</Bucket>
  <VpcConfiguration>
    <VpcId>string</VpcId>
  </VpcConfiguration>
  <PublicAccessBlockConfiguration>
    <BlockPublicAcls>boolean</BlockPublicAcls>
    <BlockPublicPolicy>boolean</BlockPublicPolicy>
    <IgnorePublicAcls>boolean</IgnorePublicAcls>
    <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
  </PublicAccessBlockConfiguration>
  <BucketAccountId>string</BucketAccountId>
</CreateAccessPointRequest>
```

URI Request Parameters

The request uses the following URI parameters.

name (p. 450)

The name you want to assign to this access point.

Required: Yes

x-amz-account-id (p. 450)

The AWS account ID for the account that owns the specified access point.

API Version 2006-03-01
450
Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

CreateAccessPointRequest (p. 450)

Root level tag for the CreateAccessPointRequest parameters.

Required: Yes

Bucket (p. 450)

The name of the bucket that you want to associate this access point with.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Type: String

Required: Yes

BucketAccountId (p. 450)

The AWS account ID associated with the S3 bucket associated with this access point.

Type: String

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: No

PublicAccessBlockConfiguration (p. 450)

The PublicAccessBlock configuration that you want to apply to the access point.

Type: PublicAccessBlockConfiguration (p. 931) data type

Required: No

VpcConfiguration (p. 450)

If you include this field, Amazon S3 restricts access to this access point to requests from the specified virtual private cloud (VPC).

Note

This is required for creating an access point for Amazon S3 on Outposts buckets.
Type: \textit{VpcConfiguration (p. 996)} data type

Required: No

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<CreateAccessPointResult>
  <AccessPointArn>string</AccessPointArn>
  <Alias>string</Alias>
</CreateAccessPointResult>
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

\textbf{CreateAccessPointResult (p. 452)}

- \textbf{AccessPointArn (p. 452)}
  - The ARN of the access point.
  - \textbf{Note} This is only supported by Amazon S3 on Outposts.
  - Type: String

\textbf{Alias (p. 452)}

- The name or alias of the access point.
  - Type: String
  - Length Constraints: Maximum length of 63.
  - Pattern: ^[0-9a-zA-Z\-]{63}$

**Examples**

**Sample request for creating an access point for an Amazon S3 on Outposts bucket**

This request creates an access point for S3 on Outposts bucket.

```
PUT /v20180820/accesspoint/example-access-point HTTP/1.1
Host:s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
<?xml version="1.0" encoding="UTF-8"?>
  <CreateAccessPointRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/"
```

CreateAccessPointForObjectLambda

Service: Amazon S3 Control

Creates an Object Lambda Access Point. For more information, see Transforming objects with Object Lambda Access Points in the Amazon S3 User Guide.

The following actions are related to CreateAccessPointForObjectLambda:

- DeleteAccessPointForObjectLambda
- GetAccessPointForObjectLambda
- ListAccessPointsForObjectLambda

Request Syntax

```
PUT /v20180820/accesspointforobjectlambda/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<CreateAccessPointForObjectLambdaRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <Configuration>
    <AllowedFeatures>
      <AllowedFeature>string</AllowedFeature>
    </AllowedFeatures>
    <CloudWatchMetricsEnabled>boolean</CloudWatchMetricsEnabled>
    <SupportingAccessPoint>string</SupportingAccessPoint>
    <TransformationConfigurations>
      <TransformationConfiguration>
        <Actions>
          <Action>string</Action>
        </Actions>
        <ContentTransformation>
          <AwsLambda>
            <FunctionArn>string</FunctionArn>
            <FunctionPayload>string</FunctionPayload>
          </AwsLambda>
        </ContentTransformation>
      </TransformationConfiguration>
    </TransformationConfigurations>
  </Configuration>
</CreateAccessPointForObjectLambdaRequest>
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 454)**

The name you want to assign to this Object Lambda Access Point.

- Pattern: ^[a-z0-9-]*[a-z0-9]?$

**x-amz-account-id (p. 454)**

The AWS account ID for owner of the specified Object Lambda Access Point.

- Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request accepts the following data in XML format.

CreateAccessPointForObjectLambdaRequest (p. 454)

Root level tag for the CreateAccessPointForObjectLambdaRequest parameters.
Required: Yes
Configuration (p. 454)

Object Lambda Access Point configuration as a JSON document.
Type: ObjectLambdaConfiguration (p. 924) data type
Required: Yes

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8">
<CreateAccessPointForObjectLambdaResult>
  <ObjectLambdaAccessPointArn>string</ObjectLambdaAccessPointArn>
  <Alias>
    <Status>string</Status>
    <Value>string</Value>
  </Alias>
</CreateAccessPointForObjectLambdaResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

CreateAccessPointForObjectLambdaResult (p. 455)

Root level tag for the CreateAccessPointForObjectLambdaResult parameters.
Required: Yes
Alias (p. 455)

The alias of the Object Lambda Access Point.
Type: ObjectLambdaAccessPointAlias (p. 923) data type
ObjectLambdaAccessPointArn (p. 455)

Specifies the ARN for the Object Lambda Access Point.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 2048.
Pattern: arn:[^:]+:s3-object-lambda:[^:]*:\d{12}:accesspoint/.*

CreateBucket
Service: Amazon S3 Control

Note
This action creates an Amazon S3 on Outposts bucket. To create an S3 bucket, see Create Bucket in the Amazon S3 API Reference.

Creates a new Outposts bucket. By creating the bucket, you become the bucket owner. To create an Outposts bucket, you must have S3 on Outposts. For more information, see Using Amazon S3 on Outposts in Amazon S3 User Guide.

Not every string is an acceptable bucket name. For information on bucket naming restrictions, see Working with Amazon S3 Buckets.

S3 on Outposts buckets support:

- Tags
- LifecycleConfigurations for deleting expired objects

For a complete list of restrictions and Amazon S3 feature limitations on S3 on Outposts, see Amazon S3 on Outposts Restrictions and Limitations.

For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and x-amz-outpost-id in your API request, see the Examples section.

The following actions are related to CreateBucket for Amazon S3 on Outposts:

- PutObject
- GetBucket
- DeleteBucket
- CreateAccessPoint
- PutAccessPointPolicy

Request Syntax

```
PUT /v20180820/bucket/name HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-acl: ACL
x-amz-grant-full-control: GrantFullControl
x-amz-grant-read: GrantRead
x-amz-grant-read-acp: GrantReadACP
x-amz-grant-write: GrantWrite
x-amz-grant-write-acp: GrantWriteACP
x-amz-bucket-object-lock-enabled: ObjectLockEnabledForBucket
x-amz-outpost-id: OutpostId
<?xml version="1.0" encoding="UTF-8"?>
<CreateBucketConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <LocationConstraint>string</LocationConstraint>
</CreateBucketConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.

name (p. 457)

The name of the bucket.

Required: Yes

**x-amz-acl (p. 457)**

The canned ACL to apply to the bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

Valid Values: private | public-read | public-read-write | authenticated-read

**x-amz-bucket-object-lock-enabled (p. 457)**

Specifies whether you want S3 Object Lock to be enabled for the new bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-grant-full-control (p. 457)**

Allows grantee the read, write, read ACP, and write ACP permissions on the bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-grant-read (p. 457)**

Allows grantee to list the objects in the bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-grant-read-acp (p. 457)**

Allows grantee to read the bucket ACL.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-grant-write (p. 457)**

Allows grantee to create, overwrite, and delete any object in the bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-grant-write-acp (p. 457)**

Allows grantee to write the ACL for the applicable bucket.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**x-amz-outpost-id (p. 457)**

The ID of the Outposts where the bucket is being created.

**Note**
This ID is required by Amazon S3 on Outposts buckets.

Length Constraints: Minimum length of 1. Maximum length of 64.

**Request Body**

The request accepts the following data in XML format.
CreateBucketConfiguration (p. 457)

Root level tag for the CreateBucketConfiguration parameters.

Required: Yes

LocationConstraint (p. 457)

Specifies the Region where the bucket will be created. If you are creating a bucket on the US East (N. Virginia) Region (us-east-1), you do not need to specify the location.

Note
This is not supported by Amazon S3 on Outposts buckets.

Type: String

Valid Values: EU | eu-west-1 | us-west-1 | us-west-2 | ap-south-1 | ap-southeast-1 | ap-southeast-2 | ap-northeast-1 | sa-east-1 | cn-north-1 | eu-central-1

Required: No

Response Syntax

HTTP/1.1 200
Location: Location
<?xml version="1.0" encoding="UTF-8"?>
<CreateBucketResult>
  <BucketArn>string</BucketArn>
</CreateBucketResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The response returns the following HTTP headers.

Location (p. 459)

The location of the bucket.

The following data is returned in XML format by the service.

CreateBucketResult (p. 459)

Root level tag for the CreateBucketResult parameters.

Required: Yes

BucketArn (p. 459)

The Amazon Resource Name (ARN) of the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2,
use the URL encoding of `arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports`. The value must be URL encoded.

Type: String

Errors

BucketAlreadyExists

The requested Outposts bucket name is not available. The bucket namespace is shared by all users of the AWS Outposts in this Region. Select a different name and try again.

HTTP Status Code: 400

BucketAlreadyOwnedByYou

The Outposts bucket you tried to create already exists, and you own it.

HTTP Status Code: 400

Examples

Sample request to create an Amazon S3 on Outposts bucket

This request creates an Outposts bucket named `example-outpost-bucket`.

```
PUT /v20180820/bucket/example-outpost-bucket/ HTTP/1.1
Host:s3-outposts.<Region>.amazonaws.com
x-amz-outpost-id: op-01ac5d28a6a232904
Content-Length:
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

CreateJob
Service: Amazon S3 Control

You can use S3 Batch Operations to perform large-scale batch actions on Amazon S3 objects. Batch Operations can run a single action on lists of Amazon S3 objects that you specify. For more information, see S3 Batch Operations in the Amazon S3 User Guide.

This action creates a S3 Batch Operations job.

Related actions include:
- DescribeJob
- ListJobs
- UpdateJobPriority
- UpdateJobStatus
- JobOperation

Request Syntax

URI Request Parameters

The request uses the following URI parameters.

**x-amz-account-id** *(p. 461)*

The AWS account ID that creates the job.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**CreateJobRequest** *(p. 461)*

Root level tag for the CreateJobRequest parameters.

Required: Yes

**ClientRequestToken** *(p. 461)*

An idempotency token to ensure that you don't accidentally submit the same request twice. You can use any string up to the maximum length.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: Yes

**ConfirmationRequired** *(p. 461)*

Indicates whether confirmation is required before Amazon S3 runs the job. Confirmation is only required for jobs created through the Amazon S3 console.

Type: Boolean

Required: No

**Description** *(p. 461)*

A description for this job. You can use any string within the permitted length. Descriptions don't need to be unique and can be used for multiple jobs.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

**Manifest** *(p. 461)*

Configuration parameters for the manifest.

Type: **JobManifest** *(p. 889)* data type

Required: No
**ManifestGenerator (p. 461)**

The attribute container for the ManifestGenerator details. Jobs must be created with either a manifest file or a ManifestGenerator, but not both.

Type: [JobManifestGenerator (p. 890)](#) data type

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

**Operation (p. 461)**

The action that you want this job to perform on every object listed in the manifest. For more information about the available actions, see [Operations](#) in the [Amazon S3 User Guide](#).

Type: [JobOperation (p. 894)](#) data type

Required: Yes

**Priority (p. 461)**

The numerical priority for this job. Higher numbers indicate higher priority.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: Yes

**Report (p. 461)**

Configuration parameters for the optional job-completion report.

Type: [JobReport (p. 897)](#) data type

Required: Yes

**RoleArn (p. 461)**

The Amazon Resource Name (ARN) for the AWS Identity and Access Management (IAM) role that Batch Operations will use to run this job's action on every object in the manifest.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: arn:[^:\+\/:\d{12}:role/.*

Required: Yes

**Tags (p. 461)**

A set of tags to associate with the S3 Batch Operations job. This is an optional parameter.

Type: Array of [S3Tag (p. 971)](#) data types

Required: No

**Response Syntax**

```xml
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<CreateJobResult/>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

CreateJobResult (p. 465)

Root level tag for the CreateJobResult parameters.

Required: Yes

JobId (p. 465)

The ID for this job. Amazon S3 generates this ID automatically and returns it after a successful Create Job request.

Type: String

Pattern: [a-zA-Z0-9\-_]+

Errors

BadRequestException

HTTP Status Code: 400

IdempotencyException

HTTP Status Code: 400

InternalServiceException

HTTP Status Code: 500

TooManyRequestsException

HTTP Status Code: 400

CreateMultiRegionAccessPoint
Service: Amazon S3 Control

Creates a Multi-Region Access Point and associates it with the specified buckets. For more information about creating Multi-Region Access Points, see Creating Multi-Region Access Points in the Amazon S3 User Guide.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

This request is asynchronous, meaning that you might receive a response before the command has completed. When this request provides a response, it provides a token that you can use to monitor the status of the request with DescribeMultiRegionAccessPointOperation.

The following actions are related to CreateMultiRegionAccessPoint:

- DeleteMultiRegionAccessPoint
- DescribeMultiRegionAccessPointOperation
- GetMultiRegionAccessPoint
- ListMultiRegionAccessPoints

Request Syntax

POST /v20180820/async-requests/mrap/create HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<CreateMultiRegionAccessPointRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20">
  <ClientToken>string</ClientToken>
  <Details>
    <Name>string</Name>
    <PublicAccessBlock>
      <BlockPublicAcls>boolean</BlockPublicAcls>
      <BlockPublicPolicy>boolean</BlockPublicPolicy>
      <IgnorePublicAcls>boolean</IgnorePublicAcls>
      <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
    </PublicAccessBlock>
    <Regions>
      <Region>
        <Bucket>string</Bucket>
        <BucketAccountId>string</BucketAccountId>
      </Region>
    </Regions>
  </Details>
</CreateMultiRegionAccessPointRequest>

URI Request Parameters

The request uses the following URI parameters.

x-amz-account-id (p. 468)

The AWS account ID for the owner of the Multi-Region Access Point. The owner of the Multi-Region Access Point also must own the underlying buckets.

Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

**Request Body**

The request accepts the following data in XML format.

**CreateMultiRegionAccessPointRequest** *(p. 468)*

Root level tag for the CreateMultiRegionAccessPointRequest parameters.

Required: Yes

**ClientToken** *(p. 468)*

An idempotency token used to identify the request and guarantee that requests are unique.

Type: String

Length Constraints: Maximum length of 64.

Pattern: \S+
Required: Yes

**Details** *(p. 468)*

A container element containing details about the Multi-Region Access Point.

Type: `CreateMultiRegionAccessPointInput` *(p. 870)* data type

Required: Yes

**Response Syntax**

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<CreateMultiRegionAccessPointResult>
  <RequestTokenARN>string</RequestTokenARN>
</CreateMultiRegionAccessPointResult>

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**CreateMultiRegionAccessPointResult** *(p. 469)*

Root level tag for the CreateMultiRegionAccessPointResult parameters.

Required: Yes

**RequestTokenARN** *(p. 469)*

The request token associated with the request. You can use this token with `DescribeMultiRegionAccessPointOperation` to determine the status of asynchronous requests.

Type: String

Pattern: arn:.+

CreateStorageLensGroup
Service: Amazon S3 Control

Creates a new S3 Storage Lens group and associates it with the specified AWS account ID. An S3 Storage
Lens group is a custom grouping of objects based on prefix, suffix, object tags, object size, object age, or
a combination of these filters. For each Storage Lens group that you’ve created, you can also optionally
add AWS resource tags. For more information about S3 Storage Lens groups, see Working with S3
Storage Lens groups.

To use this operation, you must have the permission to perform the s3:CreateStorageLensGroup
action. If you’re trying to create a Storage Lens group with AWS resource tags, you must also have
permission to perform the s3:TagResource action. For more information about the required Storage
Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about Storage Lens groups errors, see List of Amazon S3 Storage Lens error codes.

Request Syntax

POST /v20180820/storagelensgroup HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<CreateStorageLensGroupRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
<Filter>
  <And>
    <MatchAnyPrefix>
      <Prefix>string</Prefix>
    </MatchAnyPrefix>
    <MatchAnySuffix>
      <Suffix>string</Suffix>
    </MatchAnySuffix>
    <MatchAnyTag>
      <Tag>
        <Key>string</Key>
        <Value>string</Value>
      </Tag>
    </MatchAnyTag>
    <MatchObjectAge>
      <DaysGreaterThan>integer</DaysGreaterThan>
      <DaysLessThan>integer</DaysLessThan>
    </MatchObjectAge>
    <MatchObjectSize>
      <BytesGreaterThan>long</BytesGreaterThan>
      <BytesLessThan>long</BytesLessThan>
    </MatchObjectSize>
  </And>
</Filter>
</CreateStorageLensGroupRequest>
URI Request Parameters

The request uses the following URI parameters.

**x-amz-account-id (p. 471)**

The AWS account ID that the Storage Lens group is created from and associated with.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**CreateStorageLensGroupRequest (p. 471)**

Root level tag for the CreateStorageLensGroupRequest parameters.

Required: Yes
StorageLensGroup (p. 471)

The Storage Lens group configuration.

Type: StorageLensGroup (p. 984) data type

Required: Yes

Tags (p. 471)

The AWS resource tags that you're adding to your Storage Lens group. This parameter is optional.

Type: Array of Tag (p. 992) data types

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

DeleteAccessPoint
Service: Amazon S3 Control

Deletes the specified access point.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of `x-amz-outpost-id` to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the `x-amz-outpost-id` derived by using the access point ARN, see the Examples section.

The following actions are related to DeleteAccessPoint:

- [CreateAccessPoint](#)
- [GetAccessPoint](#)
- [ListAccessPoints](#)

**Request Syntax**

```
DELETE /v20180820/accesspoint/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 474)**

The name of the access point you want to delete.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the access point accessed in the format `arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/accesspoint/<my-accesspoint-name>`. For example, to access the access point `reports-ap` through Outpost `my-outpost` owned by account `123456789012` in Region `us-west-2`, use the URL encoding of `arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/accesspoint/reports-ap`. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 474)**

The AWS account ID for the account that owns the specified access point.

Length Constraints: Maximum length of 64.

Pattern: `^\d{12}$`

Required: Yes

**Request Body**

The request does not have a request body.
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

DeleteAccessPoint syntax for Amazon S3 on Outposts

The following request deletes the access point of the specified Outpost.

```
DELETE /v20180820/accesspoint/example-access-point HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Authorization: authorization string
```

DeleteAccessPointForObjectLambda
Service: Amazon S3 Control

Deletes the specified Object Lambda Access Point.

The following actions are related to DeleteAccessPointForObjectLambda:

- CreateAccessPointForObjectLambda
- GetAccessPointForObjectLambda
- ListAccessPointsForObjectLambda

Request Syntax

```
DELETE /v20180820/accesspointforobjectlambda/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 476)**

The name of the access point you want to delete.
Pattern: ^[a-z0-9]([a-z0-9-]*[a-z0-9])?$
Required: Yes

**x-amz-account-id (p. 476)**

The account ID for the account that owns the specified Object Lambda Access Point.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

DeleteAccessPointPolicy
Service: Amazon S3 Control

Deletes the access point policy for the specified access point.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of `x-amz-outpost-id` to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of `s3-control`. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the `x-amz-outpost-id` derived by using the access point ARN, see the Examples section.

The following actions are related to DeleteAccessPointPolicy:

- PutAccessPointPolicy
- GetAccessPointPolicy

Request Syntax

```
DELETE /v20180820/accesspoint/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 478)**

The name of the access point whose policy you want to delete.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the `x-amz-outpost-id` as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the access point accessed in the format `arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/accesspoint/<my-accesspoint-name>`. For example, to access the access point `reports-ap` through Outpost `my-outpost` owned by account 123456789012 in Region `us-west-2`, use the URL encoding of `arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/accesspoint/reports-ap`. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 478)**

The account ID for the account that owns the specified access point.

Length Constraints: Maximum length of 64.

Pattern: `^[\d]{12}$`

Required: Yes

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample request syntax for using the DeleteAccessPointPolicy action with Amazon S3 on Outposts access point

This example illustrates one usage of DeleteAccessPointPolicy.

```plaintext
DELETE /v20180820/accesspoint/example-access-point/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
Authorization: authorization string
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
```

DeleteAccessPointPolicyForObjectLambda
Service: Amazon S3 Control

Removes the resource policy for an Object Lambda Access Point.

The following actions are related to DeleteAccessPointPolicyForObjectLambda:

- GetAccessPointPolicyForObjectLambda
- PutAccessPointPolicyForObjectLambda

## Request Syntax

DELETE /v20180820/accesspointforobjectlambda/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

## URI Request Parameters

The request uses the following URI parameters.

**name (p. 480)**

The name of the Object Lambda Access Point you want to delete the policy for.

Pattern: ^[a-z0-9-]*[a-z0-9]扥$?

Required: Yes

**x-amz-account-id (p. 480)**

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

## Request Body

The request does not have a request body.

## Response Syntax

HTTP/1.1 200

## Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

DeleteBucket
Service: Amazon S3 Control

Note
This action deletes an Amazon S3 on Outposts bucket. To delete an S3 bucket, see DeleteBucket in the Amazon S3 API Reference.

Deletes the Amazon S3 on Outposts bucket. All objects (including all object versions and delete markers) in the bucket must be deleted before the bucket itself can be deleted. For more information, see Using Amazon S3 on Outposts in Amazon S3 User Guide.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

• CreateBucket
• GetBucket
• DeleteObject

Request Syntax

DELETE /v20180820/bucket/name HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 482)

Specifies the bucket being deleted.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost:<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 482)

The account ID that owns the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample request to delete an Amazon S3 on Outposts bucket

This request deletes the Outposts bucket named example-outpost-bucket.

DELETE /v20180820/bucket/example-outpost-bucket/ HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-outpost-id: op-01ac5d28a6a232904
x-amz-account-id:example-account-id
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

DeleteBucketLifecycleConfiguration

Service: Amazon S3 Control

**Note**
This action deletes an Amazon S3 on Outposts bucket's lifecycle configuration. To delete an S3 bucket's lifecycle configuration, see DeleteBucketLifecycle in the Amazon S3 API Reference.

Deletes the lifecycle configuration from the specified Outposts bucket. Amazon S3 on Outposts removes all the lifecycle configuration rules in the lifecycle subresource associated with the bucket. Your objects never expire, and Amazon S3 on Outposts no longer automatically deletes any objects on the basis of rules contained in the deleted lifecycle configuration. For more information, see Using Amazon S3 on Outposts in Amazon S3 User Guide.

To use this operation, you must have permission to perform the s3-outposts:PutLifecycleConfiguration action. By default, the bucket owner has this permission and the Outposts bucket owner can grant this permission to others.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

For more information about object expiration, see Elements to Describe Lifecycle Actions.

Related actions include:
- PutBucketLifecycleConfiguration
- GetBucketLifecycleConfiguration

**Request Syntax**

DELETE /v20180820/bucket/name/lifecycleconfiguration HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 484)**

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes
**x-amz-account-id (p. 484)**

The account ID of the lifecycle configuration to delete.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

HTTP/1.1 200

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

Sample request to delete the lifecycle configuration of an Amazon S3 on Outposts bucket

This example illustrates one usage of DeleteBucketLifecycleConfiguration.

```
HTTP/1.1 DELETE /v20180820/bucket/example-outpost-bucket/lifecycleconfiguration
Host: s3-outposts.<Region>.amazonaws.com
x-amz-outpost-id: op-01ac5d28a6a232904
x-amz-account-id:example-account-id
```

DeleteBucketPolicy
Service: Amazon S3 Control

Note
This action deletes an Amazon S3 on Outposts bucket policy. To delete an S3 bucket policy, see DeleteBucketPolicy in the Amazon S3 API Reference.

This implementation of the DELETE action uses the policy subresource to delete the policy of a specified Amazon S3 on Outposts bucket. If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the s3-outposts:DeleteBucketPolicy permissions on the specified Outposts bucket and belong to the bucket owner's account to use this action. For more information, see Using Amazon S3 on Outposts in Amazon S3 User Guide.

If you don't have DeleteBucketPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 405 Method Not Allowed error.

Important
As a security precaution, the root user of the AWS account that owns a bucket can always use this action, even if the policy explicitly denies the root user the ability to perform this action.

For more information about bucket policies, see Using Bucket Policies and User Policies.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to DeleteBucketPolicy:

- GetBucketPolicy
- PutBucketPolicy

Request Syntax

```
DELETE /v20180820/bucket/name/policy HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

name (p. 486)

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 486)**

The account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

## Request Body

The request does not have a request body.

## Response Syntax

```
HTTP/1.1 200
```

## Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

## Examples

**Sample request for deleting a bucket policy for an Amazon S3 on Outposts bucket**

This example illustrates one usage of `DeleteBucketPolicy`.

```
DELETE v20180820/bucket/example-outpost-bucket/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
```

DeleteBucketReplication

Service: Amazon S3 Control

Note
This operation deletes an Amazon S3 on Outposts bucket's replication configuration. To delete an S3 bucket's replication configuration, see DeleteBucketReplication in the Amazon S3 API Reference.

Deletes the replication configuration from the specified S3 on Outposts bucket.

To use this operation, you must have permissions to perform the s3-outposts:PutReplicationConfiguration action. The Outposts bucket owner has this permission by default and can grant it to others. For more information about permissions, see Setting up IAM with S3 on Outposts and Managing access to S3 on Outposts buckets in the Amazon S3 User Guide.

Note
It can take a while to propagate PUT or DELETE requests for a replication configuration to all S3 on Outposts systems. Therefore, the replication configuration that's returned by a GET request soon after a PUT or DELETE request might return a more recent result than what's on the Outpost. If an Outpost is offline, the delay in updating the replication configuration on that Outpost can be significant.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

For information about S3 replication on Outposts configuration, see Replicating objects for S3 on Outposts in the Amazon S3 User Guide.

The following operations are related to DeleteBucketReplication:

• PutBucketReplication
• GetBucketReplication

Request Syntax

DELETE /v20180820/bucket/name/replication HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 488)

Specifies the S3 on Outposts bucket to delete the replication configuration for.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost:<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2,
use the URL encoding of `arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports`. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 488)**

The AWS account ID of the Outposts bucket to delete the replication configuration for.

Length Constraints: Maximum length of 64.

Pattern: `^[\d]{12}$`

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

**Sample Request**

The following DELETE request deletes the replication subresource from the specified S3 on Outposts bucket. This request removes the replication configuration that is set for the bucket.

```
DELETE /v20180820/bucket/example-outpost-bucket/replication HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-outpost-id: op-01ac5d28a6a232904
x-amz-account-id:example-account-id
```

DeleteBucketTagging
Service: Amazon S3 Control

Note
This action deletes an Amazon S3 on Outposts bucket's tags. To delete an S3 bucket tags, see DeleteBucketTagging in the Amazon S3 API Reference.

Deletes the tags from the Outposts bucket. For more information, see Using Amazon S3 on Outposts in Amazon S3 User Guide.

To use this action, you must have permission to perform the PutBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to DeleteBucketTagging:

- GetBucketTagging
- PutBucketTagging

Request Syntax

DELETE /v20180820/bucket/name/tagging HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 491)

The bucket ARN that has the tag set to be removed.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 491)

The AWS account ID of the Outposts bucket tag set to be removed.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

<table>
<thead>
<tr>
<th>HTTP/1.1 204</th>
</tr>
</thead>
</table>

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Examples

Sample request to delete tags for Amazon S3 on Outposts bucket

The following DELETE request deletes the tag set from the Outposts bucket example-outpost-bucket.

```
DELETE v20180820/bucket/example-outpost-bucket/tagging HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Date: Wed, 14 Dec 2020 05:37:16 GMT
Authorization: signatureValue
```

DeleteJobTagging
Service: Amazon S3 Control

Removes the entire tag set from the specified S3 Batch Operations job. To use the DeleteJobTagging operation, you must have permission to perform the s3:DeleteJobTagging action. For more information, see Controlling access and labeling jobs using tags in the Amazon S3 User Guide.

Related actions include:
- CreateJob
- GetJobTagging
- PutJobTagging

Request Syntax

DELETE /v20180820/jobs/id/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

id (p. 493)

The ID for the S3 Batch Operations job whose tags you want to delete.

Pattern: [a-zA-Z0-9\-_]+

Required: Yes

x-amz-account-id (p. 493)

The AWS account ID associated with the S3 Batch Operations job.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Errors

**InternalServiceException**

HTTP Status Code: 500

**NotFoundException**

HTTP Status Code: 400

**TooManyRequestsException**

HTTP Status Code: 400

DeleteMultiRegionAccessPoint

Service: Amazon S3 Control

Deletes a Multi-Region Access Point. This action does not delete the buckets associated with the Multi-Region Access Point, only the Multi-Region Access Point itself.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

This request is asynchronous, meaning that you might receive a response before the command has completed. When this request provides a response, it provides a token that you can use to monitor the status of the request with DescribeMultiRegionAccessPointOperation.

The following actions are related to DeleteMultiRegionAccessPoint:

- CreateMultiRegionAccessPoint
- DescribeMultiRegionAccessPointOperation
- GetMultiRegionAccessPoint
- ListMultiRegionAccessPoints

Request Syntax

POST /v20180820/async-requests/mrap/delete HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<DeleteMultiRegionAccessPointRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <ClientToken>string</ClientToken>
  <Details>
    <Name>string</Name>
  </Details>
</DeleteMultiRegionAccessPointRequest>

URI Request Parameters

The request uses the following URI parameters.

x-amz-account-id (p. 495)

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

DeleteMultiRegionAccessPointRequest (p. 495)

Root level tag for the DeleteMultiRegionAccessPointRequest parameters.
**Required:** Yes

**ClientToken (p. 495)**

An idempotency token used to identify the request and guarantee that requests are unique.

Type: String

Length Constraints: Maximum length of 64.

Pattern: \S+

Required: Yes

**Details (p. 495)**

A container element containing details about the Multi-Region Access Point.

Type: **DeleteMultiRegionAccessPointInput (p. 872)** data type

Required: Yes

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<DeleteMultiRegionAccessPointResult>
  <RequestTokenARN>string</RequestTokenARN>
</DeleteMultiRegionAccessPointResult>
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**DeleteMultiRegionAccessPointResult (p. 496)**

Root level tag for the DeleteMultiRegionAccessPointResult parameters.

Required: Yes

**RequestTokenARN (p. 496)**

The request token associated with the request. You can use this token with **DescribeMultiRegionAccessPointOperation** to determine the status of asynchronous requests.

Type: String

Pattern: arn:.+

DeletePublicAccessBlock
Service: Amazon S3 Control

Removes the PublicAccessBlock configuration for an AWS account. For more information, see Using Amazon S3 block public access.

Related actions include:

- GetPublicAccessBlock
- PutPublicAccessBlock

Request Syntax

DELETE /v20180820/configuration/publicAccessBlock HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

**x-amz-account-id (p. 498)**

The account ID for the AWS account whose PublicAccessBlock configuration you want to remove.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

DeleteStorageLensConfiguration
Service: Amazon S3 Control

Deletes the Amazon S3 Storage Lens configuration. For more information about S3 Storage Lens, see Assessing your storage activity and usage with Amazon S3 Storage Lens in the Amazon S3 User Guide.

Note
To use this action, you must have permission to perform the s3:DeleteStorageLensConfiguration action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

Request Syntax

```
DELETE /v20180820/storagelens/storagelensid HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

*storagelensid (p. 500)*

The ID of the S3 Storage Lens configuration.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: \[a-zA-Z0-9\-_\.]+\]

Required: Yes

*x-amz-account-id (p. 500)*

The account ID of the requester.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

DeleteStorageLensConfigurationTagging

Service: Amazon S3 Control

Deletes the Amazon S3 Storage Lens configuration tags. For more information about S3 Storage Lens, see Assessing your storage activity and usage with Amazon S3 Storage Lens in the Amazon S3 User Guide.

Note
To use this action, you must have permission to perform the s3:DeleteStorageLensConfigurationTagging action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

Request Syntax

```
DELETE /v20180820/storagelens/storagelensid/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

 URI Request Parameters

The request uses the following URI parameters.

storagelensid (p. 502)
The ID of the S3 Storage Lens configuration.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-_\./]+

Required: Yes

x-amz-account-id (p. 502)
The account ID of the requester.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

DeleteStorageLensGroup
Service: Amazon S3 Control

Deletes an existing S3 Storage Lens group.

To use this operation, you must have the permission to perform the s3:DeleteStorageLensGroup action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about Storage Lens groups errors, see List of Amazon S3 Storage Lens error codes.

Request Syntax

```
DELETE /v20180820/storagelensgroup/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 504)**

The name of the Storage Lens group that you're trying to delete.

- Length Constraints: Minimum length of 1. Maximum length of 64.
- Pattern: [a-zA-Z0-9-\_]+
- Required: Yes

**x-amz-account-id (p. 504)**

The AWS account ID used to create the Storage Lens group that you're trying to delete.

- Length Constraints: Maximum length of 64.
- Pattern: ^\d{12}$
- Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

DescribeJob
Service: Amazon S3 Control

Retrieves the configuration parameters and status for a Batch Operations job. For more information, see S3 Batch Operations in the Amazon S3 User Guide.

Related actions include:
- CreateJob
- ListJobs
- UpdateJobPriority
- UpdateJobStatus

Request Syntax

```plaintext
GET /v20180820/jobs/id HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**id (p. 506)**

The ID for the job whose information you want to retrieve.

Pattern: [a-zA-Z0-9\-\_]+

Required: Yes

**x-amz-account-id (p. 506)**

The AWS account ID associated with the S3 Batch Operations job.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```plaintext
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<DescribeJobResult>
  <Job>
    <ConfirmationRequired>boolean</ConfirmationRequired>
    <CreationTime>timestamp</CreationTime>

API Version 2006-03-01

508
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**DescribeJobResult (p. 506)**

Root level tag for the DescribeJobResult parameters.
Required: Yes

**Job (p. 506)**

Contains the configuration parameters and status for the job specified in the Describe Job request.

Type: [JobDescriptor (p. 882)](#) data type

**Errors**

**BadRequestException**

HTTP Status Code: 400

**InternalServiceException**

HTTP Status Code: 500

**NotFoundException**

HTTP Status Code: 400

**TooManyRequestsException**

HTTP Status Code: 400

DescribeMultiRegionAccessPointOperation
Service: Amazon S3 Control

Retrieves the status of an asynchronous request to manage a Multi-Region Access Point. For more information about managing Multi-Region Access Points and how asynchronous requests work, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to GetMultiRegionAccessPoint:

- CreateMultiRegionAccessPoint
- DeleteMultiRegionAccessPoint
- GetMultiRegionAccessPoint
- ListMultiRegionAccessPoints

Request Syntax

GET /20180820/async-requests/mrap/request_token+ HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

`request_token` (p. 511)

The request token associated with the request you want to know about. This request token is returned as part of the response when you make an asynchronous request. You provide this token to query about the status of the asynchronous action.

Pattern: arn:.*

Required: Yes

`x-amz-account-id` (p. 511)

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<DescribeMultiRegionAccessPointOperationResult>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**DescribeMultiRegionAccessPointOperationResult (p. 511)**

Root level tag for the DescribeMultiRegionAccessPointOperationResult parameters.

Required: Yes

**AsyncOperation (p. 511)**

A container element containing the details of the asynchronous operation.

Type: [AsyncOperation (p. 862)] data type
See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
GetAccessPoint
Service: Amazon S3 Control

Returns configuration information about the specified access point.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to GetAccessPoint:

- CreateAccessPoint
- DeleteAccessPoint
- ListAccessPoints

Request Syntax

GET /v20180820/accesspoint/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 514)

The name of the access point whose configuration information you want to retrieve.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the access point accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/accesspoint/<my-accesspoint-name>. For example, to access the access point reports-ap through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/accesspoint/reports-ap. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 514)

The AWS account ID for the account that owns the specified access point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes
Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointResult>
  <Name>string</Name>
  <Bucket>string</Bucket>
  <NetworkOrigin>string</NetworkOrigin>
  <VpcConfiguration>
    <VpcId>string</VpcId>
  </VpcConfiguration>
  <PublicAccessBlockConfiguration>
    <BlockPublicAcls>boolean</BlockPublicAcls>
    <BlockPublicPolicy>boolean</BlockPublicPolicy>
    <IgnorePublicAcls>boolean</IgnorePublicAcls>
    <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
  </PublicAccessBlockConfiguration>
  <CreationDate>timestamp</CreationDate>
  <Alias>string</Alias>
  <AccessPointArn>string</AccessPointArn>
  <Endpoints>
    <entry>
      <key>string</key>
      <value>string</value>
    </entry>
  </Endpoints>
  <BucketAccountId>string</BucketAccountId>
</getAccessPointResult>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetAccessPointResult (p. 515)

Root level tag for the GetAccessPointResult parameters.

Required: Yes

AccessPointArn (p. 515)

The ARN of the access point.

Type: String

Alias (p. 515)

The name or alias of the access point.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[0-9a-z\-\_\-]{63}$

API Version 2006-03-01

515
Bucket (p. 515)

The name of the bucket associated with the specified access point.

Type: String

BucketAccountId (p. 515)

The AWS account ID associated with the S3 bucket associated with this access point.

Type: String

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

CreationDate (p. 515)

The date and time when the specified access point was created.

Type: Timestamp

Endpoints (p. 515)

The VPC endpoint for the access point.

Type: String to string map

Key Length Constraints: Minimum length of 1. Maximum length of 64.

Name (p. 515)

The name of the specified access point.

Type: String

NetworkOrigin (p. 515)

Indicates whether this access point allows access from the public internet. If VpcConfiguration is specified for this access point, then NetworkOrigin is VPC, and the access point doesn't allow access from the public internet. Otherwise, NetworkOrigin is Internet, and the access point allows access from the public internet, subject to the access point and bucket access policies.

This will always be true for an Amazon S3 on Outposts access point

Type: String

Valid Values: Internet | VPC

PublicAccessBlockConfiguration (p. 515)

The PublicAccessBlock configuration that you want to apply to this Amazon S3 account. You can enable the configuration options in any combination. For more information about when Amazon S3 considers a bucket or object public, see The Meaning of "Public" in the Amazon S3 User Guide.

This data type is not supported for Amazon S3 on Outposts.

Type: PublicAccessBlockConfiguration (p. 931) data type
**VpcConfiguration (p. 515)**

Contains the virtual private cloud (VPC) configuration for the specified access point.

**Note**

This element is empty if this access point is an Amazon S3 on Outposts access point that is used by other AWS services.

Type: [VpcConfiguration (p. 996)](#) data type

**Examples**

Sample request syntax for getting an Amazon S3 on Outposts access point

The following request returns the access point of the specified S3 on Outposts access point.

```
GET /v20180820/accesspoint/example-access-point HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
Authorization: authorization string
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
```

**GetAccessPointConfigurationForObjectLambda**

Service: Amazon S3 Control

Returns configuration for an Object Lambda Access Point.

The following actions are related to `GetAccessPointConfigurationForObjectLambda`:

- **PutAccessPointConfigurationForObjectLambda**

**Request Syntax**

```
GET /v20180820/accesspointforobjectlambda/name/configuration HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 518)**

The name of the Object Lambda Access Point you want to return the configuration for.

Pattern: `^[a-z0-9][a-z0-9-]*(a-z0-9)]+$`

Required: Yes

**x-amz-account-id (p. 518)**

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: `^\d{12}$`

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointConfigurationForObjectLambdaResult>
  <Configuration>
    <AllowedFeatures>
      <AllowedFeature>string</AllowedFeature>
    </AllowedFeatures>
    <CloudWatchMetricsEnabled>boolean</CloudWatchMetricsEnabled>
    <SupportingAccessPoint>string</SupportingAccessPoint>
    <TransformationConfigurations>
      <TransformationConfiguration>
        <Actions>
          <Action>string</Action>
        </Actions>
      </TransformationConfiguration>
    </TransformationConfigurations>
  </Configuration>
</GetAccessPointConfigurationForObjectLambdaResult>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetAccessPointConfigurationForObjectLambdaResult** (p. 518)

Root level tag for the GetAccessPointConfigurationForObjectLambdaResult parameters.

Required: Yes

**Configuration** (p. 518)

Object Lambda Access Point configuration document.

Type: **ObjectLambdaConfiguration** (p. 924) data type

GetAccessPointForObjectLambda

Service: Amazon S3 Control

Returns configuration information about the specified Object Lambda Access Point

The following actions are related to GetAccessPointForObjectLambda:

- CreateAccessPointForObjectLambda
- DeleteAccessPointForObjectLambda
- ListAccessPointsForObjectLambda

Request Syntax

```
GET /v20180820/accesspointforobjectlambda/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 520)**

The name of the Object Lambda Access Point.

Pattern: ^[a-z0-9\[a-z0-9-]\[a-z0-9]]*$

Required: Yes

**x-amz-account-id (p. 520)**

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointForObjectLambdaResult
  <Name>string</Name>
  <PublicAccessBlockConfiguration
    <BlockPublicAcls>boolean</BlockPublicAcls>
    <BlockPublicPolicy>boolean</BlockPublicPolicy>
    <IgnorePublicAcls>boolean</IgnorePublicAcls>
    <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
  </PublicAccessBlockConfiguration>
  <CreationDate>timestamp</CreationDate>

API Version 2006-03-01
520
```
<Alias>
  <Status>string</Status>
  <Value>string</Value>
</Alias>
</GetAccessPointForObjectLambdaResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetAccessPointForObjectLambdaResult (p. 520)**

Root level tag for the GetAccessPointForObjectLambdaResult parameters.

Required: Yes

**Alias (p. 520)**

The alias of the Object Lambda Access Point.

Type: `ObjectLambdaAccessPointAlias (p. 923)` data type

**CreationDate (p. 520)**

The date and time when the specified Object Lambda Access Point was created.

Type: Timestamp

**Name (p. 520)**

The name of the Object Lambda Access Point.

Type: String

Pattern: `^[a-z0-9][-a-z0-9]*[a-z0-9]$`

**PublicAccessBlockConfiguration (p. 520)**

Configuration to block all public access. This setting is turned on and can not be edited.

Type: `PublicAccessBlockConfiguration (p. 931)` data type

GetAccessPointPolicy
Service: Amazon S3 Control

Returns the access point policy associated with the specified access point.

The following actions are related to GetAccessPointPolicy:

- PutAccessPointPolicy
- DeleteAccessPointPolicy

Request Syntax

GET /v20180820/accesspoint/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 522)
The name of the access point whose policy you want to retrieve.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the access point accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/accesspoint/<my-accesspoint-name>. For example, to access the access point reports-ap through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/accesspoint/reports-ap. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 522)
The account ID for the account that owns the specified access point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>

API Version 2006-03-01
522
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetAccessPointPolicyResult (p. 522)**

Root level tag for the GetAccessPointPolicyResult parameters.

Required: Yes

**Policy (p. 522)**

The access point policy associated with the specified access point.

Type: String

Examples

Sample request

The following request returns the access point of the specified Amazon S3 on Outposts.

```
GET /v20180820/accesspoint/example-access-point/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
Authorization: authorization string
x-amz-account-id: 123456789012
x-amz-outpost-id: op-123456
```

GetAccessPointPolicyForObjectLambda
Service: Amazon S3 Control

Returns the resource policy for an Object Lambda Access Point.

The following actions are related to GetAccessPointPolicyForObjectLambda:

- DeleteAccessPointPolicyForObjectLambda
- PutAccessPointPolicyForObjectLambda

Request Syntax

```plaintext
GET /v20180820/accesspointforobjectlambda/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 524)**

The name of the Object Lambda Access Point.

- Pattern: `^[a-z0-9]([a-z0-9-]*[a-z0-9])?$`
- Required: Yes

**x-amz-account-id (p. 524)**

The account ID for the account that owns the specified Object Lambda Access Point.

- Length Constraints: Maximum length of 64.
- Pattern: `^\d{12}$`
- Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```xml
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointPolicyForObjectLambdaResult>
  <Policy>string</Policy>
</GetAccessPointPolicyForObjectLambdaResult>
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
GetAccessPointPolicyForObjectLambdaResult (p. 524)

Root level tag for the GetAccessPointPolicyForObjectLambdaResult parameters.

Required: Yes

Policy (p. 524)

Object Lambda Access Point resource policy document.

Type: String

Examples

Sample resource policy

The following illustrates a sample resource policy.

```json
{
    "Version": "2008-10-17",
    "Statement":[
        {
            "Sid": "Grant account 123456789012 GetObject access",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": ["s3-object-lambda:GetObject"],
            "Resource": ["arn:aws:s3-object-lambda:us-east-1:123456789012:accesspoint/my-object-lambda-ap"]
        },
        {
            "Sid": "Grant account 444455556666 GetObject access",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::444455556666:root"
            },
            "Action": ["s3-object-lambda:GetObject"],
            "Resource": ["arn:aws:s3-object-lambda:us-east-1:123456789012:accesspoint/my-object-lambda-ap"]
        }
    ]
}
```

GetAccessPointPolicyStatus
Service: Amazon S3 Control

Indicates whether the specified access point currently has a policy that allows public access. For more information about public access through access points, see Managing Data Access with Amazon S3 access points in the Amazon S3 User Guide.

Request Syntax

GET /v20180820/accesspoint/name/policyStatus HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

**name (p. 526)**

The name of the access point whose policy status you want to retrieve.

Required: Yes

**x-amz-account-id (p. 526)**

The account ID for the account that owns the specified access point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointPolicyStatusResult>
  <PolicyStatus>
    <IsPublic>boolean</IsPublic>
  </PolicyStatus>
</GetAccessPointPolicyStatusResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetAccessPointPolicyStatusResult (p. 526)**

Root level tag for the GetAccessPointPolicyStatusResult parameters.
Ray required: Yes

**PolicyStatus (p. 526)**

Indicates the current policy status of the specified access point.

Type: PolicyStatus (p. 927) data type

**See Also**

GetAccessPointPolicyStatusForObjectLambda

Service: Amazon S3 Control

Returns the status of the resource policy associated with an Object Lambda Access Point.

Request Syntax

GET /v20180820/accesspointforobjectlambda/name/policyStatus HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 528)

The name of the Object Lambda Access Point.

- Pattern: ^[a-z0-9]\([a-z0-9-]*[a-z0-9]\)?$  
- Required: Yes

x-amz-account-id (p. 528)

The account ID for the account that owns the specified Object Lambda Access Point.

- Length Constraints: Maximum length of 64.
- Pattern: ^\d{12}$
- Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetAccessPointPolicyStatusForObjectLambdaResult>
  <PolicyStatus>
    <IsPublic>boolean</IsPublic>
  </PolicyStatus>
</GetAccessPointPolicyStatusForObjectLambdaResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetAccessPointPolicyStatusForObjectLambdaResult (p. 528)

Root level tag for the GetAccessPointPolicyStatusForObjectLambdaResult parameters.
Required: Yes

**PolicyStatus (p. 528)**

Indicates whether this access point policy is public. For more information about how Amazon S3 evaluates policies to determine whether they are public, see The Meaning of “Public” in the Amazon S3 User Guide.

Type: [PolicyStatus (p. 927)] data type

GetBucket
Service: Amazon S3 Control

Gets an Amazon S3 on Outposts bucket. For more information, see Using Amazon S3 on Outposts in the Amazon S3 User Guide.

If you are using an identity other than the root user of the AWS account that owns the Outposts bucket, the calling identity must have the s3-outposts:GetBucket permissions on the specified Outposts bucket and belong to the Outposts bucket owner's account in order to use this action. Only users from Outposts bucket owner account with the right permissions can perform actions on an Outposts bucket.

If you don't have s3-outposts:GetBucket permissions or you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 403 Access Denied error.

The following actions are related to GetBucket for Amazon S3 on Outposts:

- PutObject
- CreateBucket
- DeleteBucket

Request Syntax

GET /v20180820/bucket/name HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 530)

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 530)

The AWS account ID of the Outposts bucket.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body
The request does not have a request body.

Response Syntax
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?><GetBucketResult><Bucket>string</Bucket><PublicAccessBlockEnabled>boolean</PublicAccessBlockEnabled><CreationDate>timestamp</CreationDate></GetBucketResult>

Response Elements
If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetBucketResult** *(p. 531)*
- Root level tag for the GetBucketResult parameters.
  - Required: Yes

**Bucket** *(p. 531)*
- The Outposts bucket requested.
  - Type: String

**CreationDate** *(p. 531)*
- The creation date of the Outposts bucket.
  - Type: Timestamp

**PublicAccessBlockEnabled** *(p. 531)*
- Type: Boolean

Examples

**Sample request for getting Amazon S3 on Outposts bucket**

This example illustrates one usage of GetBucket.

```
GET /v20180820/bucket/example-outpost-bucket/ HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
```

GetBucketLifecycleConfiguration

Service: Amazon S3 Control

**Note**
This action gets an Amazon S3 on Outposts bucket's lifecycle configuration. To get an S3 bucket's lifecycle configuration, see GetBucketLifecycleConfiguration in the Amazon S3 API Reference.

Returns the lifecycle configuration information set on the Outposts bucket. For more information, see Using Amazon S3 on Outposts and for information about lifecycle configuration, see Object Lifecycle Management in Amazon S3 User Guide.

To use this action, you must have permission to perform the s3-outposts:GetLifecycleConfiguration action. The Outposts bucket owner has this permission, by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

GetBucketLifecycleConfiguration has the following special error:

- **Error code:** NoSuchLifecycleConfiguration
  - **Description:** The lifecycle configuration does not exist.
  - **HTTP Status Code:** 404 Not Found
  - **SOAP Fault Code Prefix:** Client

The following actions are related to GetBucketLifecycleConfiguration:

- PutBucketLifecycleConfiguration
- DeleteBucketLifecycleConfiguration

**Request Syntax**

```
GET /v20180820/bucket/name/lifecycleconfiguration HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 533)**

The Amazon Resource Name (ARN) of the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket...
reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 533)

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetBucketLifecycleConfigurationResult>
  <Rules>
    <Rule>
      <AbortIncompleteMultipartUpload>
        <DaysAfterInitiation>integer</DaysAfterInitiation>
      </AbortIncompleteMultipartUpload>
      <Expiration>
        <Date>timestamp</Date>
        <Days>integer</Days>
        <ExpiredObjectDeleteMarker>boolean</ExpiredObjectDeleteMarker>
      </Expiration>
      <Filter>
        <And>
          <ObjectSizeGreaterThan>long</ObjectSizeGreaterThan>
          <ObjectSizeLessThan>long</ObjectSizeLessThan>
          <Prefix>string</Prefix>
          <Tags>
            <S3Tag>
              <Key>string</Key>
              <Value>string</Value>
            </S3Tag>
          </Tags>
        </And>
      </Filter>
      <ID>string</ID>
      <NoncurrentVersionExpiration>
        <NewerNoncurrentVersions>integer</NewerNoncurrentVersions>
        <NoncurrentDays>integer</NoncurrentDays>
      </NoncurrentVersionExpiration>
    </Rule>
  </Rules>
</GetBucketLifecycleConfigurationResult>
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetBucketLifecycleConfigurationResult (p. 534)**

Root level tag for the GetBucketLifecycleConfigurationResult parameters.

Required: Yes

**Rules (p. 534)**

Container for the lifecycle rule of the Outposts bucket.

Type: Array of **LifecycleRule (p. 903)** data types

Examples

Sample request to get the lifecycle configuration of the Amazon S3 on Outposts bucket

The following example shows how to get the lifecycle configuration of the Outposts bucket.

```
GET /v20180820/bucket/example-outpost-bucket/lifecycleconfiguration HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
x-amz-date: Thu, 15 Nov 2012 00:17:21 GMT
Authorization: signatureValue
```

GetBucketPolicy
Service: Amazon S3 Control

**Note**
This action gets a bucket policy for an Amazon S3 on Outposts bucket. To get a policy for an S3 bucket, see GetBucketPolicy in the Amazon S3 API Reference.

Returns the policy of a specified Outposts bucket. For more information, see Using Amazon S3 on Outposts in the Amazon S3 User Guide.

If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the GetBucketPolicy permissions on the specified bucket and belong to the bucket owner's account in order to use this action.

Only users from Outposts bucket owner account with the right permissions can perform actions on an Outposts bucket. If you don't have s3-outposts:GetBucketPolicy permissions or you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 403 Access Denied error.

**Important**
As a security precaution, the root user of the AWS account that owns a bucket can always use this action, even if the policy explicitly denies the root user the ability to perform this action.

For more information about bucket policies, see Using Bucket Policies and User Policies.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to GetBucketPolicy:
- GetObject
- PutBucketPolicy
- DeleteBucketPolicy

**Request Syntax**

```plaintext
GET /v20180820/bucket/name/policy HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 537)**

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost:<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket
reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

x-amz-account-id (p. 537)

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?><GetBucketPolicyResult><Policy>string</Policy></GetBucketPolicyResult>
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetBucketPolicyResult (p. 538)

Root level tag for the GetBucketPolicyResult parameters.

Required: Yes

Policy (p. 538)

The policy of the Outposts bucket.

Type: String

**Examples**

Sample GetBucketPolicy request for an Amazon S3 on Outposts bucket

The following request gets the policy of the specified Outposts bucket example-outpost-bucket.

```
GET /v20180820/bucket/example-outpost-bucket/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```
See Also

GetBucketReplication
Service: Amazon S3 Control

**Note**
This operation gets an Amazon S3 on Outposts bucket's replication configuration. To get an S3 bucket's replication configuration, see GetBucketReplication in the Amazon S3 API Reference.

Returns the replication configuration of an S3 on Outposts bucket. For more information about S3 on Outposts, see Using Amazon S3 on Outposts in the Amazon S3 User Guide. For information about S3 replication on Outposts configuration, see Replicating objects for S3 on Outposts in the Amazon S3 User Guide.

**Note**
It can take a while to propagate PUT or DELETE requests for a replication configuration to all S3 on Outposts systems. Therefore, the replication configuration that's returned by a GET request soon after a PUT or DELETE request might return a more recent result than what's on the Outpost. If an Outpost is offline, the delay in updating the replication configuration on that Outpost can be significant.

This action requires permissions for the s3-outposts:GetReplicationConfiguration action. The Outposts bucket owner has this permission by default and can grant it to others. For more information about permissions, see Setting up IAM with S3 on Outposts and Managing access to S3 on Outposts bucket in the Amazon S3 User Guide.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

If you include the Filter element in a replication configuration, you must also include the DeleteMarkerReplication, Status, and Priority elements. The response also returns those elements.

For information about S3 on Outposts replication failure reasons, see Replication failure reasons in the Amazon S3 User Guide.

The following operations are related to GetBucketReplication:
- PutBucketReplication
- DeleteBucketReplication

**Request Syntax**

```
GET /v20180820/bucket/name/replication HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**
The request uses the following URI parameters.

**name (p. 540)**
Specifies the bucket to get the replication information for.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.
For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 540)**

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```xml
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetBucketReplicationResult>
  <ReplicationConfiguration>
    <Role>string</Role>
    <Rules>
      <Bucket>string</Bucket>

<Status>string</Status>
</Rule>
</Rules>
</ReplicationConfiguration>
</GetBucketReplicationResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetBucketReplicationResult (p. 541)**

Root level tag for the GetBucketReplicationResult parameters.

Required: Yes

**ReplicationConfiguration (p. 541)**

A container for one or more replication rules. A replication configuration must have at least one rule and you can add up to 100 rules. The maximum size of a replication configuration is 128 KB.

Type: ReplicationConfiguration (p. 938) data type

Examples

Sample request to get the replication configuration of an Amazon S3 on Outposts bucket

The following example shows how to get the replication configuration of an Outposts bucket.

GET /v20180820/bucket/example-outpost-bucket/replication HTTP/1.1

GetBucketTagging
Service: Amazon S3 Control

Note
This action gets an Amazon S3 on Outposts bucket's tags. To get an S3 bucket tags, see GetBucketTagging in the Amazon S3 API Reference.

Returns the tag set associated with the Outposts bucket. For more information, see Using Amazon S3 on Outposts in the Amazon S3 User Guide.

To use this action, you must have permission to perform the GetBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

GetBucketTagging has the following special error:

• Error code: NoSuchTagSetError
  • Description: There is no tag set associated with the bucket.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to GetBucketTagging:

• PutBucketTagging
• DeleteBucketTagging

Request Syntax

GET /v20180820/bucket/name/tagging HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 544)

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes
x-amz-account-id (p. 544)

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: \d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetBucketTaggingResult>
  <TagSet>
    <S3Tag>
      <Key>string</Key>
      <Value>string</Value>
    </S3Tag>
  </TagSet>
</GetBucketTaggingResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetBucketTaggingResult (p. 545)

Root level tag for the GetBucketTaggingResult parameters.

Required: Yes

TagSet (p. 545)

The tags set of the Outposts bucket.

Type: Array of S3Tag (p. 971) data types

Examples

Amazon S3 on Outposts request example for getting a tag set for an Outposts bucket

The following request gets the tag set of the specified Outposts bucket example-outpost-bucket.

GET /v20180820/bucket/example-outpost-bucket/tagging HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
x-amz-date: Wed, 28 Oct 2020 22:32:00 GMT
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Authorization: authorization string

GetBucketVersioning
Service: Amazon S3 Control

Note
This operation returns the versioning state for S3 on Outposts buckets only. To return the versioning state for an S3 bucket, see GetBucketVersioning in the Amazon S3 API Reference.

Returns the versioning state for an S3 on Outposts bucket. With S3 Versioning, you can save multiple distinct copies of your objects and recover from unintended user actions and application failures.

If you've never set versioning on your bucket, it has no versioning state. In that case, the GetBucketVersioning request does not return a versioning state value.

For more information about versioning, see Versioning in the Amazon S3 User Guide.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following operations are related to GetBucketVersioning for S3 on Outposts.

- PutBucketVersioning
- PutBucketLifecycleConfiguration
- GetBucketLifecycleConfiguration

Request Syntax

GET /v20180820/bucket/name/versioning HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 547)

The S3 on Outposts bucket to return the versioning state for.

Required: Yes

x-amz-account-id (p. 547)

The AWS account ID of the S3 on Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetBucketVersioningResult>
  <Status>string</Status>
  <MfaDelete>string</MfaDelete>
</GetBucketVersioningResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetBucketVersioningResult (p. 548)

Root level tag for the GetBucketVersioningResult parameters.

Required: Yes

MfaDelete (p. 548)

Specifies whether MFA delete is enabled in the bucket versioning configuration. This element is returned only if the bucket has been configured with MFA delete. If MFA delete has never been configured for the bucket, this element is not returned.

Type: String

Valid Values: Enabled | Disabled

Status (p. 548)

The versioning state of the S3 on Outposts bucket.

Type: String

Valid Values: Enabled | Suspended

Examples

Sample GetBucketVersioning request on an S3 on Outposts bucket

This request returns the versioning state for an S3 on Outposts bucket that's named example-outpost-bucket.

```
GET /v20180820/bucket/example-outpost-bucket/?versioning HTTP/1.1
Host:s3-outposts.region-code.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
x-amz-date: Wed, 25 May 2022 00:14:21 GMT
Authorization: signatureValue
```

Sample GetBucketVersioning response on a versioning-enabled S3 on Outposts bucket

If you enabled versioning on a bucket, the response is:
Sample GetBucketVersioning response on a versioning-suspended bucket

If you suspended versioning on a bucket, the response is:

```
<VersioningConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <Status>Suspended</Status>
</VersioningConfiguration>
```

Sample GetBucketVersioning response if you have never enabled versioning.

If you have never enabled versioning on a bucket, the response is:

```
<VersioningConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
</VersioningConfiguration>
```

GetJobTagging
Service: Amazon S3 Control

Returns the tags on an S3 Batch Operations job. To use the GetJobTagging operation, you must have permission to perform the s3:GetJobTagging action. For more information, see Controlling access and labeling jobs using tags in the Amazon S3 User Guide.

Related actions include:
- CreateJob
- PutJobTagging
- DeleteJobTagging

Request Syntax

GET /v20180820/jobs/id/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

**id (p. 550)**

The ID for the S3 Batch Operations job whose tags you want to retrieve.

Pattern: [a-zA-Z0-9\-_]+

Required: Yes

**x-amz-account-id (p. 550)**

The AWS account ID associated with the S3 Batch Operations job.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetJobTaggingResult>
  <Tags>
    <S3Tag>
      <Key>string</Key>
      <Value>string</Value>
    </S3Tag>
  </Tags>
</GetJobTaggingResult>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetJobTaggingResult** *(p. 550)*

Root level tag for the GetJobTaggingResult parameters.

Required: Yes

**Tags** *(p. 550)*

The set of tags associated with the S3 Batch Operations job.

Type: Array of [S3Tag](p. 971) data types

Errors

**InternalServiceException**

HTTP Status Code: 500

**NotFoundException**

HTTP Status Code: 400

**TooManyRequestsException**

HTTP Status Code: 400

GetMultiRegionAccessPoint
Service: Amazon S3 Control

Returns configuration information about the specified Multi-Region Access Point.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to GetMultiRegionAccessPoint:

- CreateMultiRegionAccessPoint
- DeleteMultiRegionAccessPoint
- DescribeMultiRegionAccessPointOperation
- ListMultiRegionAccessPoints

Request Syntax

GET /v20180820/mrap/instances/+name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 552)

The name of the Multi-Region Access Point whose configuration information you want to receive. The name of the Multi-Region Access Point is different from the alias. For more information about the distinction between the name and the alias of an Multi-Region Access Point, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

Length Constraints: Maximum length of 50.
Pattern: ^[a-z0-9]-[a-z0-9]{1,48}[a-z0-9]$
Required: Yes

x-amz-account-id (p. 552)

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetMultiRegionAccessPointResult (p. 552)

Root level tag for the GetMultiRegionAccessPointResult parameters.

Required: Yes

AccessPoint (p. 552)

A container element containing the details of the requested Multi-Region Access Point.

Type: MultiRegionAccessPointReport (p. 915) data type

GetMultiRegionAccessPointPolicy

Service: Amazon S3 Control

Returns the access control policy of the specified Multi-Region Access Point.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to GetMultiRegionAccessPointPolicy:

- GetMultiRegionAccessPointPolicyStatus
- PutMultiRegionAccessPointPolicy

Request Syntax

GET /v20180820/mrap/instances/name+/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 554)

Specifies the Multi-Region Access Point. The name of the Multi-Region Access Point is different from the alias. For more information about the distinction between the name and the alias of an Multi-Region Access Point, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$

Required: Yes

x-amz-account-id (p. 554)

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetMultiRegionAccessPointPolicyResult>
  <Policy>
    <Established>

API Version 2006-03-01
554
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in XML format by the service.

GetMultiRegionAccessPointPolicyResult (p. 554)

- Root level tag for the GetMultiRegionAccessPointPolicyResult parameters.
  - Required: Yes

Policy (p. 554)

- The policy associated with the specified Multi-Region Access Point.
  - Type: MultiRegionAccessPointPolicyDocument (p. 913) data type

See Also

GetMultiRegionAccessPointPolicyStatus
Service: Amazon S3 Control

Indicates whether the specified Multi-Region Access Point has an access control policy that allows public access.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to GetMultiRegionAccessPointPolicyStatus:

- GetMultiRegionAccessPointPolicy
- PutMultiRegionAccessPointPolicy

Request Syntax

GET /v20180820/mrap/instances/\{name\}/policystatus HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

**name (p. 556)**

Specifies the Multi-Region Access Point. The name of the Multi-Region Access Point is different from the alias. For more information about the distinction between the name and the alias of an Multi-Region Access Point, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$  

Required: Yes

**x-amz-account-id (p. 556)**

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200  
<?xml version="1.0" encoding="UTF-8"?>  
<GetMultiRegionAccessPointPolicyStatusResult>  
  <Established>

API Version 2006-03-01
556
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

GetMultiRegionAccessPointPolicyStatusResult (p. 556)

Root level tag for the GetMultiRegionAccessPointPolicyStatusResult parameters.

Required: Yes

Established (p. 556)

Indicates whether this access point policy is public. For more information about how Amazon S3 evaluates policies to determine whether they are public, see The Meaning of “Public” in the Amazon S3 User Guide.

Type: PolicyStatus (p. 927) data type

GetMultiRegionAccessPointRoutes
Service: Amazon S3 Control

Returns the routing configuration for a Multi-Region Access Point, indicating which Regions are active or passive.

To obtain routing control changes and failover requests, use the Amazon S3 failover control infrastructure endpoints in these five AWS Regions:

- us-east-1
- us-west-2
- ap-southeast-2
- ap-northeast-1
- eu-west-1

Note
Your Amazon S3 bucket does not need to be in these five Regions.

Request Syntax

GET /v20180820/mrap/instances/mrap+/routes HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

**mrap (p. 558)**

The Multi-Region Access Point ARN.

Length Constraints: Maximum length of 200.

Pattern: ^[a-zA-Z0-9\-\.\:]\{3,200}\$

Required: Yes

**x-amz-account-id (p. 558)**

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d\{12}\$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
```
<GetMultiRegionAccessPointRoutesResult>
  <Mrap>string</Mrap>
  <Routes>
    <Route>
      <Bucket>string</Bucket>
      <Region>string</Region>
      <TrafficDialPercentage>integer</TrafficDialPercentage>
    </Route>
  </Routes>
</GetMultiRegionAccessPointRoutesResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**GetMultiRegionAccessPointRoutesResult (p. 558)**

Root level tag for the GetMultiRegionAccessPointRoutesResult parameters.

Required: Yes

**Mrap (p. 558)**

The Multi-Region Access Point ARN.

Type: String

Length Constraints: Maximum length of 200.

Pattern: ^[a-zA-Z0-9\:.-]{3,200}$

**Routes (p. 558)**

The different routes that make up the route configuration. Active routes return a value of 100, and passive routes return a value of 0.

Type: Array of **MultiRegionAccessPointRoute (p. 917)** data types

See Also

GetPublicAccessBlock
Service: Amazon S3 Control

Retrieves the PublicAccessBlock configuration for an AWS account. For more information, see Using Amazon S3 block public access.

Related actions include:
- DeletePublicAccessBlock
- PutPublicAccessBlock

Request Syntax

GET /v20180820/configuration/publicAccessBlock HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

x-amz-account-id (p. 560)

The account ID for the AWS account whose PublicAccessBlock configuration you want to retrieve.

Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<PublicAccessBlockConfiguration>
  <BlockPublicAcls>boolean</BlockPublicAcls>
  <IgnorePublicAcls>boolean</IgnorePublicAcls>
  <BlockPublicPolicy>boolean</BlockPublicPolicy>
  <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
</PublicAccessBlockConfiguration>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

PublicAccessBlockConfiguration (p. 560)

Root level tag for the PublicAccessBlockConfiguration parameters.
Required: Yes  

**BlockPublicAcls (p. 560)**

Specifies whether Amazon S3 should block public access control lists (ACLs) for buckets in this account. Setting this element to TRUE causes the following behavior:

- PutBucketAcl and PutObjectAcl calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean  

**BlockPublicPolicy (p. 560)**

Specifies whether Amazon S3 should block public bucket policies for buckets in this account. Setting this element to TRUE causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean  

**IgnorePublicAcls (p. 560)**

Specifies whether Amazon S3 should ignore public ACLs for buckets in this account. Setting this element to TRUE causes Amazon S3 to ignore all public ACLs on buckets in this account and any objects that they contain.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean  

**RestrictPublicBuckets (p. 560)**

Specifies whether Amazon S3 should restrict public bucket policies for buckets in this account. Setting this element to TRUE restricts access to buckets with public policies to only AWS service principals and authorized users within this account.

Enabling this setting doesn't affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean  

**Errors**

**NoSuchPublicAccessBlockConfiguration**

Amazon S3 throws this exception if you make a GetPublicAccessBlock request against an account that doesn't have a PublicAccessBlockConfiguration set.
HTTP Status Code: 404

GetStorageLensConfiguration
Service: Amazon S3 Control

Gets the Amazon S3 Storage Lens configuration. For more information, see Assessing your storage activity and usage with Amazon S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

Note
To use this action, you must have permission to perform the s3:GetStorageLensConfiguration action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

Request Syntax

GET /v20180820/storagelens/storagelensid HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

storagelensid (p. 563)
The ID of the Amazon S3 Storage Lens configuration.
Length Constraints: Minimum length of 1. Maximum length of 64.
Pattern: [a-zA-Z0-9\-\._\.]+
Required: Yes

x-amz-account-id (p. 563)
The account ID of the requester.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

Amazon Simple Storage Service API Reference
Amazon S3 Control

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**StorageLensConfiguration (p. 563)**

Root level tag for the StorageLensConfiguration parameters.

Required: Yes

**AccountLevel (p. 563)**

A container for all the account-level configurations of your S3 Storage Lens configuration.

Type: [AccountLevel](p. 856) data type

**AwsOrg (p. 563)**

A container for the AWS organization for this S3 Storage Lens configuration.

Type: [StorageLensAwsOrg](p. 979) data type

**DataExport (p. 563)**

A container to specify the properties of your S3 Storage Lens metrics export including, the destination, schema and format.

Type: [StorageLensDataExport](p. 982) data type

**Exclude (p. 563)**

A container for what is excluded in this configuration. This container can only be valid if there is no Include container submitted, and it's not empty.

Type: [Exclude](p. 878) data type

**Id (p. 563)**

A container for the Amazon S3 Storage Lens configuration ID.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-\_\\.]+
Include (p. 563)
A container for what is included in this configuration. This container can only be valid if there is no Exclude container submitted, and it's not empty.
Type: Include (p. 881) data type

isEnabled (p. 563)
A container for whether the S3 Storage Lens configuration is enabled.
Type: Boolean

StorageLensArn (p. 563)
The Amazon Resource Name (ARN) of the S3 Storage Lens configuration. This property is read-only and follows the following format: arn:aws:s3:us-east-1:example-account-id:storage-lens/your-dashboard-name
Type: String
Pattern: arn:[a-z\-]+:s3:[a-z0-9\-]+:\d{12}:storage\-lens\/.*

GetStorageLensConfigurationTagging

Service: Amazon S3 Control

Gets the tags of Amazon S3 Storage Lens configuration. For more information about S3 Storage Lens, see Assessing your storage activity and usage with Amazon S3 Storage Lens in the Amazon S3 User Guide.

**Note**
To use this action, you must have permission to perform the s3:GetStorageLensConfigurationTagging action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

**Request Syntax**

```
GET /v20180820/storagelens/storagelensid/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**storagelensid (p. 567)**

The ID of the Amazon S3 Storage Lens configuration.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9-\-_\.]+

Required: Yes

**x-amz-account-id (p. 567)**

The account ID of the requester.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<GetStorageLensConfigurationTaggingResult>
  <Tags>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </Tags>
</GetStorageLensConfigurationTaggingResult>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in XML format by the service.

**GetStorageLensConfigurationTaggingResult (p. 567)**

Root level tag for the GetStorageLensConfigurationTaggingResult parameters.

Required: Yes

**Tags (p. 567)**

The tags of S3 Storage Lens configuration requested.

Type: Array of [StorageLensTag (p. 991)] data types

GetStorageLensGroup
Service: Amazon S3 Control

Retrieves the Storage Lens group configuration details.

To use this operation, you must have the permission to perform the s3:GetStorageLensGroup action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about Storage Lens groups errors, see List of Amazon S3 Storage Lens error codes.

Request Syntax

GET /v20180820/storagelensgroup/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

name (p. 569)

The name of the Storage Lens group that you're trying to retrieve the configuration details for.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9-\-_]+

Required: Yes

x-amz-account-id (p. 569)

The AWS account ID associated with the Storage Lens group that you're trying to retrieve the details for.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<StorageLensGroup>
  <Name>string</Name>
  <Filter>
    <And>
      <MatchAnyPrefix>

      </MatchAnyPrefix>
    </And>
  </Filter>
</StorageLensGroup>
MatchAnyTag>
  <Tag>
    <Key>string</Key>
    <Value>string</Value>
  </Tag>
</MatchAnyTag>
</MatchObjectAge>
</MatchObjectSize>
</And>
MatchAnyPrefix>
  <Prefix>string</Prefix>
</MatchAnyPrefix>
</MatchAnySuffix>
</MatchAnySuffix>
<MatchAnyTag>
  <Tag>
    <Key>string</Key>
    <Value>string</Value>
  </Tag>
</MatchAnyTag>
</MatchObjectAge>
</MatchObjectSize>
</Or />
<Filter>
  <StorageLensGroupArn>string</StorageLensGroupArn>
</StorageLensGroup>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in XML format by the service.

**StorageLensGroup (p. 569)**

Root level tag for the StorageLensGroup parameters.

Required: Yes

**Filter (p. 569)**

Sets the criteria for the Storage Lens group data that is displayed. For multiple filter conditions, the AND or OR logical operator is used.

Type: StorageLensGroupFilter (p. 986) data type

**Name (p. 569)**

Contains the name of the Storage Lens group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-_]+

**StorageLensGroupArn (p. 569)**

Contains the Amazon Resource Name (ARN) of the Storage Lens group. This property is read-only.

Type: String

Pattern: arn:[a-z\-]+:s3:[a-zA-Z0-9\-_]+:\d{12}:storage\-lens\-group\./.*

ListAccessPoints
Service: Amazon S3 Control

Returns a list of the access points that are owned by the current account that's associated with the specified bucket. You can retrieve up to 1000 access points per call. If the specified bucket has more than 1,000 access points (or the number specified in maxResults, whichever is less), the response will include a continuation token that you can use to list the additional access points.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to ListAccessPoints:
- CreateAccessPoint
- DeleteAccessPoint
- GetAccessPoint

Request Syntax

GET /v20180820/accesspoint?bucket=Bucket&maxResults=MaxResults&nextToken=NextToken HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

bucket (p. 572)

The name of the bucket whose associated access points you want to list.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

maxResults (p. 572)

The maximum number of access points that you want to include in the list. If the specified bucket has more than this number of access points, then the response will include a continuation token in the NextToken field that you can use to retrieve the next page of access points.

Valid Range: Minimum value of 0. Maximum value of 1000.

nextToken (p. 572)

A continuation token. If a previous call to ListAccessPoints returned a continuation token in the NextToken field, then providing that value here causes Amazon S3 to retrieve the next page of results.

x-amz-account-id (p. 572)

The AWS account ID for the account that owns the specified access points.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListAccessPointsResult>
  <AccessPointList>
    <AccessPoint>
      <AccessPointArn>string</AccessPointArn>
      <Alias>string</Alias>
      <Bucket>string</Bucket>
      <BucketAccountId>string</BucketAccountId>
      <Name>string</Name>
      <NetworkOrigin>string</NetworkOrigin>
      <VpcConfiguration>
        <VpcId>string</VpcId>
      </VpcConfiguration>
    </AccessPoint>
  </AccessPointList>
  <NextToken>string</NextToken>
</ListAccessPointsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

ListAccessPointsResult (p. 573)

Root level tag for the ListAccessPointsResult parameters.

Required: Yes

AccessPointList (p. 573)

Contains identification and configuration information for one or more access points associated with the specified bucket.

Type: Array of AccessPoint (p. 854) data types

NextToken (p. 573)

If the specified bucket has more access points than can be returned in one call to this API, this field contains a continuation token that you can provide in subsequent calls to this API to retrieve additional access points.

Type: String

Examples

Sample request syntax for ListAccessPoints for Amazon S3 on Outposts

The following request returns a list access points of the specified Amazon S3 on Outposts bucket example-outpost-bucket.

```
GET /v20180820/accesspoint?Bucket=example-outpost-bucket&MaxResults=MaxResults&NextToken=NextToken HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
Authorization: authorization string
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
```

ListAccessPointsForObjectLambda
Service: Amazon S3 Control

Returns some or all (up to 1,000) access points associated with the Object Lambda Access Point per call. If there are more access points than what can be returned in one call, the response will include a continuation token that you can use to list the additional access points.

The following actions are related to ListAccessPointsForObjectLambda:

- CreateAccessPointForObjectLambda
- DeleteAccessPointForObjectLambda
- GetAccessPointForObjectLambda

Request Syntax

GET /v20180820/accesspointforobjectlambda?maxResults=MaxResults&nextToken=NextToken
HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

maxResults (p. 575)

The maximum number of access points that you want to include in the list. The response may contain fewer access points but will never contain more. If there are more than this number of access points, then the response will include a continuation token in the NextToken field that you can use to retrieve the next page of access points.

Valid Range: Minimum value of 0. Maximum value of 1000.

nextToken (p. 575)

If the list has more access points than can be returned in one call to this API, this field contains a continuation token that you can provide in subsequent calls to this API to retrieve additional access points.

x-amz-account-id (p. 575)

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListAccessPointsForObjectLambdaResult>
  <ObjectLambdaAccessPointList>
    <ObjectLambdaAccessPoint>
      <Alias>
        <Status>string</Status>
        <Value>string</Value>
      </Alias>
      <Name>string</Name>
      <ObjectLambdaAccessPointArn>string</ObjectLambdaAccessPointArn>
    </ObjectLambdaAccessPoint>
  </ObjectLambdaAccessPointList>
  <NextToken>string</NextToken>
</ListAccessPointsForObjectLambdaResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

ListAccessPointsForObjectLambdaResult (p. 575)

Root level tag for the ListAccessPointsForObjectLambdaResult parameters.

Required: Yes

NextToken (p. 575)

If the list has more access points than can be returned in one call to this API, this field contains a continuation token that you can provide in subsequent calls to this API to retrieve additional access points.

Type: String

ObjectLambdaAccessPointList (p. 575)

Returns list of Object Lambda Access Points.

Type: Array of ObjectLambdaAccessPoint (p. 922) data types

**ListJobs**  
Service: Amazon S3 Control

Lists current S3 Batch Operations jobs and jobs that have ended within the last 30 days for the AWS account making the request. For more information, see [S3 Batch Operations](#) in the *Amazon S3 User Guide*.

Related actions include:

- `CreateJob`
- `DescribeJob`
- `UpdateJobPriority`
- `UpdateJobStatus`

**Request Syntax**

```
GET /v20180820/jobs?jobStatuses=JobStatuses&maxResults=MaxResults&nextToken=NextToken
HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

- **jobStatuses (p. 577)**
  
  The *List Jobs* request returns jobs that match the statuses listed in this element.

  Valid Values: `Active` | `Cancelled` | `Cancelling` | `Complete` | `Completing` | `Failed` | `Failing` | `New` | `Paused` | `Pausing` | `Preparing` | `Ready` | `Suspended`

- **maxResults (p. 577)**
  
  The maximum number of jobs that Amazon S3 will include in the *List Jobs* response. If there are more jobs than this number, the response will include a pagination token in the `NextToken` field to enable you to retrieve the next page of results.

  Valid Range: Minimum value of 0. Maximum value of 1000.

- **nextToken (p. 577)**
  
  A pagination token to request the next page of results. Use the token that Amazon S3 returned in the `NextToken` element of the `ListJobsResult` from the previous *List Jobs* request.

  Pattern: `^[A-Za-z0-9|\:\|\|\|=\|\?\|\#\|-\_]+$`

- **x-amz-account-id (p. 577)**
  
  The AWS account ID associated with the S3 Batch Operations job.

  Length Constraints: Maximum length of 64.

  Pattern: `^[d{12}$`

---

API Version 2006-03-01

577
Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListJobsResult>
  <NextToken>string</NextToken>
  <Jobs>
    <JobListDescriptor>
      <CreationTime>timestamp</CreationTime>
      <Description>string</Description>
      <JobId>string</JobId>
      <Operation>string</Operation>
      <Priority>integer</Priority>
      <ProgressSummary>
        <NumberOfTasksFailed>long</NumberOfTasksFailed>
        <NumberOfTasksSucceeded>long</NumberOfTasksSucceeded>
        <ElapsedTimeInActiveSeconds>long</ElapsedTimeInActiveSeconds>
        <TotalNumberOfTasks>long</TotalNumberOfTasks>
      </ProgressSummary>
      <Status>string</Status>
      <TerminationDate>timestamp</TerminationDate>
    </JobListDescriptor>
  </Jobs>
</ListJobsResult>

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListJobsResult (p. 578)**

Root level tag for the ListJobsResult parameters.

Required: Yes

**Jobs (p. 578)**

The list of current jobs and jobs that have ended within the last 30 days.

Type: Array of **JobListDescriptor (p. 887)** data types

**NextToken (p. 578)**

If the List Jobs request produced more than the maximum number of results, you can pass this value into a subsequent List Jobs request in order to retrieve the next page of results.

Type: String

Pattern: ^[A-Za-z0-9\+\:\/:\:\/\=\?\#\-\_]+$

API Version 2006-03-01
578
Errors

**InternalServiceException**

HTTP Status Code: 500

**InvalidNextTokenException**

HTTP Status Code: 400

**InvalidRequestException**

HTTP Status Code: 400

ListMultiRegionAccessPoints
Service: Amazon S3 Control

Returns a list of the Multi-Region Access Points currently associated with the specified AWS account. Each call can return up to 100 Multi-Region Access Points, the maximum number of Multi-Region Access Points that can be associated with a single account.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to ListMultiRegionAccessPoint:

- CreateMultiRegionAccessPoint
- DeleteMultiRegionAccessPoint
- DescribeMultiRegionAccessPointOperation
- GetMultiRegionAccessPoint

Request Syntax

GET /v20180820/mrap/instances?maxResults=MaxResults&nextToken=NextToken HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

maxResults (p. 580)
Not currently used. Do not use this parameter.
Valid Range: Minimum value of 0. Maximum value of 1000.

nextToken (p. 580)
Not currently used. Do not use this parameter.

x-amz-account-id (p. 580)
The AWS account ID for the owner of the Multi-Region Access Point.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

**ListMultiRegionAccessPointsResult (p. 580)**

Root level tag for the ListMultiRegionAccessPointsResult parameters.

Required: Yes

**AccessPoints (p. 580)**

The list of Multi-Region Access Points associated with the user.

Type: Array of MultiRegionAccessPointReport (p. 915) data types

**NextToken (p. 580)**

If the specified bucket has more Multi-Region Access Points than can be returned in one call to this action, this field contains a continuation token. You can use this token in subsequent calls to this action to retrieve additional Multi-Region Access Points.

Type: String

**ListRegionalBuckets**
Service: Amazon S3 Control

Returns a list of all Outposts buckets in an Outpost that are owned by the authenticated sender of the request. For more information, see [Using Amazon S3 on Outposts](#) in the Amazon S3 User Guide.

For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and `x-amz-outpost-id` in your request, see the [Examples](#) section.

**Request Syntax**

```
GET /v20180820/bucket?maxResults=MaxResults&nextToken=NextToken HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
x-amz-outpost-id: OutpostId
```

**URI Request Parameters**

The request uses the following URI parameters.

- **maxResults (p. 583)**
  
  Valid Range: Minimum value of 0. Maximum value of 1000.

- **nextToken (p. 583)**
  

- **x-amz-account-id (p. 583)**
  
  The AWS account ID of the Outposts bucket.
  
  Length Constraints: Maximum length of 64.
  
  Pattern: ^\d{12}$
  
  Required: Yes

- **x-amz-outpost-id (p. 583)**
  
  The ID of the AWS Outposts resource.
  
  **Note**
  This ID is required by Amazon S3 on Outposts buckets.
  
  Length Constraints: Minimum length of 1. Maximum length of 64.

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListRegionalBucketsResult>
  <RegionalBucketList>
    <RegionalBucket>
      <Bucket>string</Bucket>
    </RegionalBucket>
  </RegionalBucketList>
</ListRegionalBucketsResult>
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in XML format by the service.

**ListRegionalBucketsResult (p. 583)**

Root level tag for the ListRegionalBucketsResult parameters.

Required: Yes

**NextToken (p. 583)**

NextToken is sent when IsTruncated is true, which means there are more buckets that can be listed. The next list requests to Amazon S3 can be continued with this NextToken. NextToken is obfuscated and is not a real key.

Type: String

**RegionalBucketList (p. 583)**

Type: Array of **RegionalBucket (p. 935)** data types

Examples

**Sample request to list an account’s Outposts buckets**

This request lists regional buckets.

```
GET /v20180820/bucket HTTP /1.1
Host:s3-outposts.us-west-2.amazonaws.com
Content-Length: 0
x-amz-outpost-id: op-01ac5d28a6a23904
x-amz-account-id: example-account-id
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

**ListStorageLensConfigurations**
Service: Amazon S3 Control

Gets a list of Amazon S3 Storage Lens configurations. For more information about S3 Storage Lens, see [Assessing your storage activity and usage with Amazon S3 Storage Lens](https://docs.aws.amazon.com/AmazonS3/latest/userguide/assessing-storage-activity-using-s3-storage-lens.html) in the *Amazon S3 User Guide*.

**Note**
To use this action, you must have permission to perform the `s3:ListStorageLensConfigurations` action. For more information, see [Setting permissions to use Amazon S3 Storage Lens](https://docs.aws.amazon.com/AmazonS3/latest/userguide/setting-permissions-to-use-s3storage-lens.html) in the *Amazon S3 User Guide*.

**Request Syntax**

```plaintext
GET /v20180820/storagelens?nextToken=NextToken HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**
The request uses the following URI parameters.

- `nextToken` *(p. 586)*
  A pagination token to request the next page of results.

- `x-amz-account-id` *(p. 586)*
  The account ID of the requester.
  
  Length Constraints: Maximum length of 64.
  
  Pattern: `^[\d]{12}$`
  
  Required: Yes

**Request Body**
The request does not have a request body.

**Response Syntax**

```xml
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListStorageLensConfigurationsResult>
  <NextToken>string</NextToken>
  <StorageLensConfigurationList>
    <HomeRegion>string</HomeRegion>
    <Id>string</Id>
    <IsEnabled>boolean</IsEnabled>
    <StorageLensArn>string</StorageLensArn>
  </StorageLensConfigurationList>
  ...
</ListStorageLensConfigurationsResult>
```

**Response Elements**
If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
**ListStorageLensConfigurationsResult (p. 586)**

Root level tag for the ListStorageLensConfigurationsResult parameters.

Required: Yes

**NextToken (p. 586)**

If the request produced more than the maximum number of S3 Storage Lens configuration results, you can pass this value into a subsequent request to retrieve the next page of results.

Type: String

**StorageLensConfigurationList (p. 586)**

A list of S3 Storage Lens configurations.

Type: Array of [ListStorageLensConfigurationEntry (p. 907)] data types

**See Also**

ListStorageLensGroups
Service: Amazon S3 Control

Lists all the Storage Lens groups in the specified home Region.

To use this operation, you must have the permission to perform the s3:ListStorageLensGroups action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about Storage Lens groups errors, see List of Amazon S3 Storage Lens error codes.

Request Syntax

GET /v20180820/storagelensgroup?nextToken=NextToken HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

nextToken (p. 588)

The token for the next set of results, or null if there are no more results.

x-amz-account-id (p. 588)

The AWS account ID that owns the Storage Lens groups.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?><ListStorageLensGroupsResult><NextToken>string</NextToken><StorageLensGroupList><HomeRegion>string</HomeRegion><Name>string</Name><StorageLensGroupArn>string</StorageLensGroupArn></StorageLensGroupList>...
</ListStorageLensGroupsResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.
ListStorageLensGroupsResult (p. 588)

Root level tag for the ListStorageLensGroupsResult parameters.

Required: Yes

NextToken (p. 588)

If NextToken is returned, there are more Storage Lens groups results available. The value of NextToken is a unique pagination token for each page. Make the call again using the returned token to retrieve the next page. Keep all other arguments unchanged. Each pagination token expires after 24 hours.

Type: String

StorageLensGroupList (p. 588)

The list of Storage Lens groups that exist in the specified home Region.

Type: Array of ListStorageLensGroupEntry (p. 909) data types

ListTagsForResource

Service: Amazon S3 Control

This operation allows you to list all the AWS resource tags for the specified resource.

To use this operation, you must have the permission to perform the s3:ListTagsForResource action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about S3 Tagging errors, see List of Amazon S3 Tagging error codes.

**Note**
This operation is only supported for S3 Storage Lens groups.

**Request Syntax**

```
GET /v20180820/tags/resourceArn+ HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

**URI Request Parameters**

The request uses the following URI parameters.

**resourceArn (p. 590)**

The Amazon Resource Name (ARN) of the S3 resource that you want to list the tags for.

Length Constraints: Maximum length of 1011.

Pattern: arn:[^:]+:s3:[^:].*

Required: Yes

**x-amz-account-id (p. 590)**

The AWS account ID of the resource owner.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<ListTagsForResourceResult>
  <Tags>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </Tags>
</ListTagsForResourceResult>
```

API Version 2006-03-01

590
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in XML format by the service.

`ListTagsForResourceResult` (p. 590)

Root level tag for the `ListTagsForResourceResult` parameters.

Required: Yes

`Tags` (p. 590)

The AWS resource tags that are associated with the resource.

Type: Array of `Tag` (p. 992) data types

Array Members: Minimum number of 0 items. Maximum number of 50 items.

PutAccessPointConfigurationForObjectLambda

Service: Amazon S3 Control

Replaces configuration for an Object Lambda Access Point.

The following actions are related to PutAccessPointConfigurationForObjectLambda:

- GetAccessPointConfigurationForObjectLambda

Request Syntax

```xml
PUT /v20180820/accesspointforobjectlambda/name/configuration HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8">
<PutAccessPointConfigurationForObjectLambdaRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <Configuration>
    <AllowedFeatures>
      <AllowedFeature/string/>
    </AllowedFeatures>
    <CloudWatchMetricsEnabled/boolean/>
    <SupportingAccessPoint/string/>
    <TransformationConfigurations>
      <TransformationConfiguration>
        <Actions>
          <Action/string/>
        </Actions>
        <ContentTransformation>
          <AwsLambda>
            <FunctionArn/string/>
            <FunctionPayload/string/>
          </AwsLambda>
        </ContentTransformation>
      </TransformationConfiguration>
    </TransformationConfigurations>
  </Configuration>
</PutAccessPointConfigurationForObjectLambdaRequest>
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 592)**

The name of the Object Lambda Access Point.

Pattern: `^[a-z0-9](\-[a-z0-9])*$`

Required: Yes

**x-amz-account-id (p. 592)**

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: `^[a-z0-9]+$`

Required: Yes
Request Body

The request accepts the following data in XML format.

**PutAccessPointConfigurationForObjectLambdaRequest (p. 592)**

Root level tag for the PutAccessPointConfigurationForObjectLambdaRequest parameters.

Required: Yes

**Configuration (p. 592)**

Object Lambda Access Point configuration document.

Type: *ObjectLambdaConfiguration (p. 924)* data type

Required: Yes

Response Syntax

```
HTTP/1.1 200
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

PutAccessPointPolicy
Service: Amazon S3 Control

Associates an access policy with the specified access point. Each access point can have only one policy, so a request made to this API replaces any existing policy associated with the specified access point.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to PutAccessPointPolicy:
- GetAccessPointPolicy
- DeleteAccessPointPolicy

Request Syntax

```
PUT /v20180820/accesspoint/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
  <Policy>string</Policy>
</PutAccessPointPolicyRequest>
```

URI Request Parameters

The request uses the following URI parameters.

**name (p. 594)**

The name of the access point that you want to associate with the specified policy.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the access point accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/accesspoint/<my-accesspoint-name>. For example, to access the access point reports-ap through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/accesspoint/reports-ap. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 594)**

The AWS account ID for owner of the bucket associated with the specified access point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

API Version 2006-03-01
594
Required: Yes

Request Body

The request accepts the following data in XML format.

**PutAccessPointPolicyRequest** *(p. 594)*

Root level tag for the PutAccessPointPolicyRequest parameters.

Required: Yes

**Policy** *(p. 594)*

The policy that you want to apply to the specified access point. For more information about access point policies, see [Managing data access with Amazon S3 access points](https://docs.aws.amazon.com/AmazonS3/latest/API/AmazonS3API_v2006-03-01.html#PutAccessPointPolicy) in the *Amazon S3 User Guide*.

Type: String

Required: Yes

Response Syntax

| HTTP/1.1 200 |

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample request syntax for the PutAccessPointPolicy action for Amazon S3 on Outposts access point

This example illustrates one usage of PutAccessPointPolicy.

```
PUT /v20180820/accesspoint/example-access-point/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Wed, 28 Oct 2020 22:32:00 GMT
Authorization: authorization string
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
<?xml version="1.0" encoding="UTF-8"?>
  <Policy>
    {
      "Version":"2012-10-17",
      "Id":"AccessPointPolicy-for-example-access-point",
      "Statement":[
        {
          "Sid":"st1",
          "Effect":"Allow",
          "Principal":{
            "AWS":"example-account-id"
          },
          "Action":"s3-outposts:*",
          "Resource":"arn:aws:s3-outposts:your-Region:example-account-id:outpost/op-01ac5d28a6a232904/accesspoint/example-access-point"
        }
      ]
    }
  </Policy>
</PutAccessPointPolicyRequest>
```

PutAccessPointPolicyForObjectLambda
Service: Amazon S3 Control

Creates or replaces resource policy for an Object Lambda Access Point. For an example policy, see Creating Object Lambda Access Points in the Amazon S3 User Guide.

The following actions are related to PutAccessPointPolicyForObjectLambda:

- DeleteAccessPointPolicyForObjectLambda
- GetAccessPointPolicyForObjectLambda

Request Syntax

PUT /v20180820/accesspointforobjectlambda/name/policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
  xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/"
  <Policy>string</Policy>
</PutAccessPointPolicyForObjectLambdaRequest>

URI Request Parameters

The request uses the following URI parameters.

**name (p. 597)**

The name of the Object Lambda Access Point.

Pattern: ^[a-z0-9][a-z0-9-]*[a-z0-9]$?

Required: Yes

**x-amz-account-id (p. 597)**

The account ID for the account that owns the specified Object Lambda Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**PutAccessPointPolicyForObjectLambdaRequest (p. 597)**

Root level tag for the PutAccessPointPolicyForObjectLambdaRequest parameters.

Required: Yes

**Policy (p. 597)**

Object Lambda Access Point resource policy document.
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample resource policy

The following illustrates a sample resource policy.

```
{
    "Version": "2008-10-17",
    "Statement": [
        {
            "Sid": "Grant account 123456789012 GetObject access",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": ["s3-object-lambda:GetObject"],
            "Resource": ["arn:aws:s3-object-lambda:us-east-1:123456789012:accesspoint/my-object-lambda-ap"]
        },
        {
            "Sid": "Grant account 444455556666 GetObject access",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::444455556666:root"
            },
            "Action": ["s3-object-lambda:GetObject"],
            "Resource": ["arn:aws:s3-object-lambda:us-east-1:123456789012:accesspoint/my-object-lambda-ap"]
        }
    ]
}
```

PutBucketLifecycleConfiguration
Service: Amazon S3 Control

**Note**
This action puts a lifecycle configuration to an Amazon S3 on Outposts bucket. To put a lifecycle configuration to an S3 bucket, see [PutBucketLifecycleConfiguration](https://aws.amazon.com/documentation/s3-api-reference/) in the Amazon S3 API Reference.

Creates a new lifecycle configuration for the S3 on Outposts bucket or replaces an existing lifecycle configuration. Outposts buckets only support lifecycle configurations that delete/expire objects after a certain period of time and abort incomplete multipart uploads.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of `x-amz-outpost-id` to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of `s3-control`. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the `x-amz-outpost-id` derived by using the access point ARN, see the Examples section.

The following actions are related to PutBucketLifecycleConfiguration:
- [GetBucketLifecycleConfiguration](https://aws.amazon.com/documentation/s3-api-reference/)
- [DeleteBucketLifecycleConfiguration](https://aws.amazon.com/documentation/s3-api-reference/)

**Request Syntax**

```
PUT /v20180820/bucket/name/lifecycleconfiguration HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>

        <Prefix>string</Prefix>
      </And>
      <Tag>
        <Key>string</Key>
        <Value>string</Value>
      </Tag>
    </Filter>
  </Rule>
</LifecycleConfiguration>
```

API Version 2006-03-01

600
URI Request Parameters

The request uses the following URI parameters.

**name (p. 600)**

The name of the bucket for which to set the configuration.

Required: Yes

**x-amz-account-id (p. 600)**

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**LifecycleConfiguration (p. 600)**

Root level tag for the LifecycleConfiguration parameters.

Required: Yes

**Rules (p. 600)**

A lifecycle rule for individual objects in an Outposts bucket.

Type: Array of LifecycleRule (p. 903) data types

Required: No
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample PutBucketLifecycleConfiguration request on an Amazon S3 on Outposts bucket

This request puts a lifecycle configuration on an Outposts bucket named example-outpost-bucket.

```
PUT /v20180820/bucket/example-outpost-bucket/lifecycleconfiguration HTTP/1.1
Host:s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Content-Length: 0
Date: Wed, 01 Mar 2006 12:00:00 GMT

**PutBucketPolicy**
Service: Amazon S3 Control

**Note**
This action puts a bucket policy to an Amazon S3 on Outposts bucket. To put a policy on an S3 bucket, see **PutBucketPolicy** in the *Amazon S3 API Reference*.

Applies an Amazon S3 bucket policy to an Outposts bucket. For more information, see [Using Amazon S3 on Outposts](https://docs.aws.amazon.com/AmazonS3Outposts/latest/userguide/using-amazon-s3-on-outposts.html) in the *Amazon S3 User Guide*.

If you are using an identity other than the root user of the AWS account that owns the Outposts bucket, the calling identity must have the PutBucketPolicy permissions on the specified Outposts bucket and belong to the bucket owner's account in order to use this action.

If you don't have PutBucketPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a 405 Method Not Allowed error.

**Important**
As a security precaution, the root user of the AWS account that owns a bucket can always use this action, even if the policy explicitly denies the root user the ability to perform this action.

For more information about bucket policies, see [Using Bucket Policies and User Policies](https://docs.aws.amazon.com/AmazonS3/latest/userguide/bucket-policy.html).

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of `x-amz-outpost-id` to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of `s3-control`. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the `x-amz-outpost-id` derived by using the access point ARN, see the **Examples** section.

The following actions are related to PutBucketPolicy:

- [DeleteBucketPolicy](https://docs.aws.amazon.com/AmazonS3/latest/API/API_DeleteBucketPolicy.html)

**Request Syntax**

```xml
PUT /v20180820/bucket/name/policy HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
x-amz-confirm-remove-self-bucket-access: ConfirmRemoveSelfBucketAccess
<?xml version="1.0" encoding="UTF-8"?>
    <Policy>string</Policy>
</PutBucketPolicyRequest>
```

**URI Request Parameters**

The request uses the following URI parameters.

**name (p. 603)**

Specifies the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the `x-amz-outpost-id` as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format `arn:aws:s3-outposts:<Region>:<account-...`
id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 603)**

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**x-amz-confirm-remove-self-bucket-access (p. 603)**

Set this parameter to true to confirm that you want to remove your permissions to change this bucket policy in the future.

**Note**

This is not supported by Amazon S3 on Outposts buckets.

**Request Body**

The request accepts the following data in XML format.

**PutBucketPolicyRequest (p. 603)**

Root level tag for the PutBucketPolicyRequest parameters.

Required: Yes

**Policy (p. 603)**

The bucket policy as a JSON document.

Type: String

Required: Yes

**Response Syntax**

HTTP/1.1  200

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

Sample request for putting a bucket policy in an Amazon S3 on Outposts bucket

The following request shows the PUT an individual policy request for the Outposts bucket example-outpost-bucket.
PUT v20180820/bucket/example-outpost-bucket/policy HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Date: Tue, 04 Apr 2010 20:34:56 GMT
Authorization: authorization string
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
{
   "Version": "2012-10-17",
   "Id": "exampleS3OnOutpostBucketPolicy",
   "Statement": [
      {
         "Sid": "st1",
         "Effect": "Allow",
         "Principal": {
            "AWS": "example-account-id"
         },
         "Action": "s3-outposts:*",
         "Resource": "arn:aws:s3-outposts:<your-region>:example-account-id:outpost/op-01ac5d28a6a232904/bucket/example-outpost-bucket"
      }
   ]
}

PutBucketReplication
Service: Amazon S3 Control

Note
This action creates an Amazon S3 on Outposts bucket's replication configuration. To create an S3 bucket's replication configuration, see PutBucketReplication in the Amazon S3 API Reference.

Creates a replication configuration or replaces an existing one. For information about S3 replication on Outposts configuration, see Replicating objects for S3 on Outposts in the Amazon S3 User Guide.

Note
It can take a while to propagate PUT or DELETE requests for a replication configuration to all S3 on Outposts systems. Therefore, the replication configuration that's returned by a GET request soon after a PUT or DELETE request might return a more recent result than what's on the Outpost. If an Outpost is offline, the delay in updating the replication configuration on that Outpost can be significant.

Specify the replication configuration in the request body. In the replication configuration, you provide the following information:

- The name of the destination bucket or buckets where you want S3 on Outposts to replicate objects
- The AWS Identity and Access Management (IAM) role that S3 on Outposts can assume to replicate objects on your behalf
- Other relevant information, such as replication rules

A replication configuration must include at least one rule and can contain a maximum of 100. Each rule identifies a subset of objects to replicate by filtering the objects in the source Outposts bucket. To choose additional subsets of objects to replicate, add a rule for each subset.

To specify a subset of the objects in the source Outposts bucket to apply a replication rule to, add the Filter element as a child of the Rule element. You can filter objects based on an object key prefix, one or more object tags, or both. When you add the Filter element in the configuration, you must also add the following elements: DeleteMarkerReplication, Status, and Priority.

Using PutBucketReplication on Outposts requires that both the source and destination buckets must have versioning enabled. For information about enabling versioning on a bucket, see Managing S3 Versioning for your S3 on Outposts bucket.

For information about S3 on Outposts replication failure reasons, see Replication failure reasons in the Amazon S3 User Guide.

Handling Replication of Encrypted Objects

Outposts buckets are encrypted at all times. All the objects in the source Outposts bucket are encrypted and can be replicated. Also, all the replicas in the destination Outposts bucket are encrypted with the same encryption key as the objects in the source Outposts bucket.

Permissions

To create a PutBucketReplication request, you must have s3-outposts:PutReplicationConfiguration permissions for the bucket. The Outposts bucket owner has this permission by default and can grant it to others. For more information about permissions, see Setting up IAM with S3 on Outposts and Managing access to S3 on Outposts buckets.

Note
To perform this operation, the user or role must also have the iam:CreateRole and iam:PassRole permissions. For more information, see Granting a user permissions to pass a role to an AWS service.
All Amazon S3 on Outposts REST API requests for this action require an additional parameter of `x-amz-outpost-id` to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of `s3-control`. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the `x-amz-outpost-id` derived by using the access point ARN, see the Examples section.

The following operations are related to PutBucketReplication:

- GetBucketReplication
- DeleteBucketReplication

### Request Syntax

```
PUT /v20180820/bucket/name/replication HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<ReplicationConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <Role>string</Role>
  <Rules>
    <Rule>
      <Bucket>string</Bucket>
      <DeleteMarkerReplication>
        <Status>string</Status>
      </DeleteMarkerReplication>
      <Destination>
        <AccessControlTranslation>
          <Owner>string</Owner>
        </AccessControlTranslation>
        <Account>string</Account>
        <Bucket>string</Bucket>
        <EncryptionConfiguration>
          <ReplicaKmsKeyID>string</ReplicaKmsKeyID>
        </EncryptionConfiguration>
        <Metrics>
          <EventThreshold>
            <Minutes>integer</Minutes>
          </EventThreshold>
          <Status>string</Status>
        </Metrics>
        <ReplicationTime>
          <Status>string</Status>
          <Time>
            <Minutes>integer</Minutes>
          </Time>
        </ReplicationTime>
        <StorageClass>string</StorageClass>
      </Destination>
      <ExistingObjectReplication>
        <Status>string</Status>
      </ExistingObjectReplication>
      <Filter>
        <And>
          <Prefix>string</Prefix>
        </And>
        <Tags>
          <S3Tag>
            <Key>string</Key>
            <Value>string</Value>
          </S3Tag>
        </Tags>
      </Filter>
    </Rule>
  </Rules>
</ReplicationConfiguration>
```
URI Request Parameters

The request uses the following URI parameters.

**name (p. 607)**

Specifies the S3 on Outposts bucket to set the configuration for.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>. For example, to access the bucket reports through Outpost my-outpost owned by account 123456789012 in Region us-west-2, use the URL encoding of arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 607)**

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**ReplicationConfiguration (p. 607)**

Root level tag for the ReplicationConfiguration parameters.

Required: Yes
**Role (p. 607)**

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that S3 on Outposts assumes when replicating objects. For information about S3 replication on Outposts configuration, see Setting up replication in the Amazon S3 User Guide.

Type: String

Required: Yes

**Rules (p. 607)**

A container for one or more replication rules. A replication configuration must have at least one rule and can contain an array of 100 rules at the most.

Type: Array of ReplicationRule (p. 939) data types

Required: Yes

**Response Syntax**

| HTTP/1.1  200 |

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

**Sample Request: Add a replication configuration to an Amazon S3 on Outposts bucket**

The following sample PUT request creates a replication subresource on the specified Outposts bucket named example-outpost-bucket and saves the replication configuration in it. The replication configuration specifies a rule to replicate objects to the example-outpost-bucket bucket. The rule includes a filter to replicate only the objects that are created with the key name prefix TaxDocs and that have two specific tags.

After you add a replication configuration to your Outposts bucket, S3 on Outposts assumes the AWS Identity and Access Management (IAM) role that's specified in the configuration to replicate objects on behalf of the Outposts bucket owner. The bucket owner is the AWS account that created the Outposts bucket.

Filtering by using the Filter element is supported in the latest XML configuration. The earlier version of the XML configuration isn't supported.

For more examples of S3 replication on Outposts configuration, see Creating replication rules on Outposts in the Amazon S3 User Guide.

```
PUT /v20180820/bucket/example-outpost-bucket/replication HTTP/1.1
Host:s3-outposts.<Region>.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Authorization: authorization string

<ReplicationConfiguration>
  <Role>arn:aws:iam::35667example:role/ReplicationRoleForS3Outposts</Role>
  <Rules>
  ...
  </Rules>
</ReplicationConfiguration>
```
<ReplicationConfiguration>
  <Rules>
    <Rule>
      <ID>rule1</ID>
      <Status>Enabled</Status>
      <Priority>1</Priority>
      <DeleteMarkerReplication>
        <Status>Disabled</Status>
      </DeleteMarkerReplication>
      <Filter>
        <And>
          <Prefix>TaxDocs</Prefix>
          <Tag>
            <Key>key1</Key>
            <Value>value1</Value>
          </Tag>
          <Tag>
            <Key>key2</Key>
            <Value>value2</Value>
          </Tag>
        </And>
      </Filter>
      <Destination>
        <Bucket>arn:aws:s3-outposts:us-east-1:example-account-id:outpost/DESTINATION-OUTPOST-ID/accesspoint/DESTINATION-OUTPOSTS-BUCKET-ACCESS-POINT</Bucket>
      </Destination>
    </Rule>
  </Rules>
</ReplicationConfiguration>

PutBucketTagging
Service: Amazon S3 Control

**Note**
This action puts tags on an Amazon S3 on Outposts bucket. To put tags on an S3 bucket, see **PutBucketTagging** in the Amazon S3 API Reference.

Sets the tags for an S3 on Outposts bucket. For more information, see Using Amazon S3 on Outposts in the Amazon S3 User Guide.

Use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. Then, to see the cost of combined resources, organize your billing information according to resources with the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see Cost allocation and tagging.

**Note**
Within a bucket, if you add a tag that has the same key as an existing tag, the new value overwrites the old value. For more information, see Using cost allocation in Amazon S3 bucket tags.

To use this action, you must have permissions to perform the s3-outposts:PutBucketTagging action. The Outposts bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing access permissions to your Amazon S3 resources.

PutBucketTagging has the following special errors:

- **Error code: InvalidTagError**
  - Description: The tag provided was not a valid tag. This error can occur if the tag did not pass input validation. For information about tag restrictions, see User-Defined Tag Restrictions and AWS-Generated Cost Allocation Tag Restrictions.

- **Error code: MalformedXMLError**
  - Description: The XML provided does not match the schema.

- **Error code: OperationAbortedError**
  - Description: A conflicting conditional action is currently in progress against this resource. Try again.

- **Error code: InternalError**
  - Description: The service was unable to apply the provided tag to the bucket.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following actions are related to PutBucketTagging:

- **GetBucketTagging**
- **DeleteBucketTagging**

**Request Syntax**

```
PUT /v20180820/bucket/name/tagging HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
```

API Version 2006-03-01

611
x-amz-account-id: AccountId

```xml
<xml version="1.0" encoding="UTF-8"/>
<Tagging xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <TagSet>
    <S3Tag>
      <Key>string</Key>
      <Value>string</Value>
    </S3Tag>
  </TagSet>
</Tagging>
```

### URI Request Parameters

The request uses the following URI parameters.

**name (p. 611)**

The Amazon Resource Name (ARN) of the bucket.

For using this parameter with Amazon S3 on Outposts with the REST API, you must specify the name and the x-amz-outpost-id as well.

For using this parameter with S3 on Outposts with the AWS SDK and CLI, you must specify the ARN of the bucket accessed in the format `arn:aws:s3-outposts:<Region>:<account-id>:outpost/<outpost-id>/bucket/<my-bucket-name>`. For example, to access the bucket `reports` through Outpost `my-outpost` owned by account `123456789012` in Region `us-west-2`, use the URL encoding of `arn:aws:s3-outposts:us-west-2:123456789012:outpost/my-outpost/bucket/reports`. The value must be URL encoded.

Required: Yes

**x-amz-account-id (p. 611)**

The AWS account ID of the Outposts bucket.

Length Constraints: Maximum length of 64.

Pattern: `^\d{12}$`

Required: Yes

### Request Body

The request accepts the following data in XML format.

**Tagging (p. 611)**

Root level tag for the Tagging parameters.

Required: Yes

**TagSet (p. 611)**

A collection for a set of tags.

Type: Array of `S3Tag (p. 971)` data types

Required: Yes
Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Examples

Sample request: Add tag set to an Amazon S3 on Outposts bucket

The following request adds a tag set to the existing example-outpost-bucket bucket.

```
PUT v20180820/bucket/example-outpost-bucket/tagging HTTP/1.1
Host: s3-outposts.<Region>.amazonaws.com
Content-Length: 1660
x-amz-date: Thu, 12 Nov 2020 20:04:21 GMT
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Authorization: authorization string

<Tagging>
  <TagSet>
    <Tag>
      <Key>Project</Key>
      <Value>Project One</Value>
    </Tag>
    <Tag>
      <Key>User</Key>
      <Value>jsmith</Value>
    </Tag>
  </TagSet>
</Tagging>
```

PutBucketVersioning
Service: Amazon S3 Control

Note
This operation sets the versioning state for S3 on Outposts buckets only. To set the versioning state for an S3 bucket, see PutBucketVersioning in the Amazon S3 API Reference.

Sets the versioning state for an S3 on Outposts bucket. With S3 Versioning, you can save multiple distinct copies of your objects and recover from unintended user actions and application failures.

You can set the versioning state to one of the following:

- **Enabled** - Enables versioning for the objects in the bucket. All objects added to the bucket receive a unique version ID.
- **Suspended** - Suspends versioning for the objects in the bucket. All objects added to the bucket receive the version ID null.

If you've never set versioning on your bucket, it has no versioning state. In that case, a GetBucketVersioning request does not return a versioning state value.

When you enable S3 Versioning, for each object in your bucket, you have a current version and zero or more noncurrent versions. You can configure your bucket S3 Lifecycle rules to expire noncurrent versions after a specified time period. For more information, see Creating and managing a lifecycle configuration for your S3 on Outposts bucket in the Amazon S3 User Guide.

If you have an object expiration lifecycle configuration in your non-versioned bucket and you want to maintain the same permanent delete behavior when you enable versioning, you must add a noncurrent expiration policy. The noncurrent expiration lifecycle configuration will manage the deletes of the noncurrent object versions in the version-enabled bucket. For more information, see Versioning in the Amazon S3 User Guide.

All Amazon S3 on Outposts REST API requests for this action require an additional parameter of x-amz-outpost-id to be passed with the request. In addition, you must use an S3 on Outposts endpoint hostname prefix instead of s3-control. For an example of the request syntax for Amazon S3 on Outposts that uses the S3 on Outposts endpoint hostname prefix and the x-amz-outpost-id derived by using the access point ARN, see the Examples section.

The following operations are related to PutBucketVersioning for S3 on Outposts.

- GetBucketVersioning
- PutBucketLifecycleConfiguration
- GetBucketLifecycleConfiguration

Request Syntax

```
PUT /v20180820/bucket/name/versioning HTTP/1.1
Host: Bucket.s3-control.amazonaws.com
x-amz-account-id: AccountId
x-amz-mfa: MFA
<?xml version="1.0" encoding="UTF-8"?>
<VersioningConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/"
    <MfaDelete>string</MfaDelete>
    <Status>string</Status>
</VersioningConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.
name (p. 614)

The S3 on Outposts bucket to set the versioning state for.
Required: Yes

x-amz-account-id (p. 614)

The AWS account ID of the S3 on Outposts bucket.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

x-amz-mfa (p. 614)

The concatenation of the authentication device's serial number, a space, and the value that is displayed on your authentication device.

Request Body

The request accepts the following data in XML format.

VersioningConfiguration (p. 614)

Root level tag for the VersioningConfiguration parameters.
Required: Yes

MFADelete (p. 614)

Specifies whether MFA delete is enabled or disabled in the bucket versioning configuration for the S3 on Outposts bucket.
Type: String
Valid Values: Enabled | Disabled
Required: No

Status (p. 614)

Sets the versioning state of the S3 on Outposts bucket.
Type: String
Valid Values: Enabled | Suspended
Required: No

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Examples

Sample PutBucketVersioning request on an Amazon S3 on Outposts bucket

This request sets the versioning state on an S3 on Outposts bucket that's named example-outpost-bucket.

```
PUT /v20180820/bucket/example-outpost-bucket/?versioning HTTP/1.1
Host:s3-outposts.region-code.amazonaws.com
x-amz-account-id: example-account-id
x-amz-outpost-id: op-01ac5d28a6a232904
Content-Length: 0
Date: Wed, 25 May 2022 12:00:00 GMT
Content-MD5: q6yJDlIkcBaGGfb3QLY69A==
Authorization: authorization string

<Status>Enabled</Status>
</VersioningConfiguration>
```

PutJobTagging
Service: Amazon S3 Control

Sets the supplied tag-set on an S3 Batch Operations job.

A tag is a key-value pair. You can associate S3 Batch Operations tags with any job by sending a PUT request against the tagging subresource that is associated with the job. To modify the existing tag set, you can either replace the existing tag set entirely, or make changes within the existing tag set by retrieving the existing tag set using GetJobTagging, modify that tag set, and use this action to replace the tag set with the one you modified. For more information, see Controlling access and labeling jobs using tags in the Amazon S3 User Guide.

Note

• If you send this request with an empty tag set, Amazon S3 deletes the existing tag set on the Batch Operations job. If you use this method, you are charged for a Tier 1 Request (PUT). For more information, see Amazon S3 pricing.
• For deleting existing tags for your Batch Operations job, a DeleteJobTagging request is preferred because it achieves the same result without incurring charges.
• A few things to consider about using tags:
  • Amazon S3 limits the maximum number of tags to 50 tags per job.
  • You can associate up to 50 tags with a job as long as they have unique tag keys.
  • A tag key can be up to 128 Unicode characters in length, and tag values can be up to 256 Unicode characters in length.
  • The key and values are case sensitive.
• For tagging-related restrictions related to characters and encodings, see User-Defined Tag Restrictions in the AWS Billing and Cost Management User Guide.

To use the PutJobTagging operation, you must have permission to perform the s3:PutJobTagging action.

Related actions include:
• CreateJob
• GetJobTagging
• DeleteJobTagging

Request Syntax

```
PUT /v20180820/jobs/id/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<PutJobTaggingRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/"
  <Tags>
    <S3Tag>
      <Key>string</Key>
      <Value>string</Value>
    </S3Tag>
  </Tags>
</PutJobTaggingRequest>
```

API Version 2006-03-01

617
URI Request Parameters

The request uses the following URI parameters.

**id (p. 617)**

The ID for the S3 Batch Operations job whose tags you want to replace.

Pattern: [a-zA-Z0-9\-\_\]+

Required: Yes

**x-amz-account-id (p. 617)**

The AWS account ID associated with the S3 Batch Operations job.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**PutJobTaggingRequest (p. 617)**

Root level tag for the PutJobTaggingRequest parameters.

Required: Yes

**Tags (p. 617)**

The set of tags to associate with the S3 Batch Operations job.

Type: Array of [S3Tag (p. 971)] data types

Required: Yes

Response Syntax

| HTTP/1.1 200 |

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

**InternalServiceException**

HTTP Status Code: 500

**NotFoundException**

HTTP Status Code: 400
TooManyRequestsException

HTTP Status Code: 400

TooManyTagsException

Amazon S3 throws this exception if you have too many tags in your tag set.

HTTP Status Code: 400

PutMultiRegionAccessPointPolicy
Service: Amazon S3 Control

Associates an access control policy with the specified Multi-Region Access Point. Each Multi-Region Access Point can have only one policy, so a request made to this action replaces any existing policy that is associated with the specified Multi-Region Access Point.

This action will always be routed to the US West (Oregon) Region. For more information about the restrictions around managing Multi-Region Access Points, see Managing Multi-Region Access Points in the Amazon S3 User Guide.

The following actions are related to PutMultiRegionAccessPointPolicy:

- GetMultiRegionAccessPointPolicy
- GetMultiRegionAccessPointPolicyStatus

Request Syntax

POST /v20180820/async-requests/mrap/put-policy HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
  <ClientToken>string</ClientToken>
  <Details>
    <Name>string</Name>
    <Policy>string</Policy>
  </Details>
</PutMultiRegionAccessPointPolicyRequest>

URI Request Parameters

The request uses the following URI parameters.

x-amz-account-id (p. 620)

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

PutMultiRegionAccessPointPolicyRequest (p. 620)

Root level tag for the PutMultiRegionAccessPointPolicyRequest parameters.

Required: Yes

ClientToken (p. 620)

An idempotency token used to identify the request and guarantee that requests are unique.
Type: String
Length Constraints: Maximum length of 64.
Pattern: \S+
Required: Yes

Details (p. 620)
A container element containing the details of the policy for the Multi-Region Access Point.
Type: PutMultiRegionAccessPointPolicyInput (p. 933) data type
Required: Yes

Response Syntax
HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<PutMultiRegionAccessPointPolicyResult>
  <RequestTokenARN>string</RequestTokenARN>
</PutMultiRegionAccessPointPolicyResult>

Response Elements
If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in XML format by the service.

PutMultiRegionAccessPointPolicyResult (p. 621)
Root level tag for the PutMultiRegionAccessPointPolicyResult parameters.
Required: Yes

RequestTokenARN (p. 621)
The request token associated with the request. You can use this token with
DescribeMultiRegionAccessPointOperation to determine the status of asynchronous requests.
Type: String
Pattern: arn:.+

PutPublicAccessBlock
Service: Amazon S3 Control

Creates or modifies the PublicAccessBlock configuration for an AWS account. For this operation, users must have the s3:PutAccountPublicAccessBlock permission. For more information, see Using Amazon S3 block public access.

Related actions include:
• GetPublicAccessBlock
• DeletePublicAccessBlock

Request Syntax

```xml
PUT /v20180820/configuration/publicAccessBlock HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<PublicAccessBlockConfiguration xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <BlockPublicAcls>boolean</BlockPublicAcls>
  <IgnorePublicAcls>boolean</IgnorePublicAcls>
  <BlockPublicPolicy>boolean</BlockPublicPolicy>
  <RestrictPublicBuckets>boolean</RestrictPublicBuckets>
</PublicAccessBlockConfiguration>
```

URI Request Parameters

The request uses the following URI parameters.

**x-amz-account-id (p. 623)**

The account ID for the AWS account whose PublicAccessBlock configuration you want to set.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**PublicAccessBlockConfiguration (p. 623)**

Root level tag for the PublicAccessBlockConfiguration parameters.

Required: Yes

**BlockPublicAcls (p. 623)**

Specifies whether Amazon S3 should block public access control lists (ACLs) for buckets in this account. Setting this element to TRUE causes the following behavior:

- PutBucketAcl and PutObjectAcl calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.
Enabling this setting doesn't affect existing policies or ACLs.
This property is not supported for Amazon S3 on Outposts.
Type: Boolean
Required: No

**BlockPublicPolicy (p. 623)**

Specifies whether Amazon S3 should block public bucket policies for buckets in this account. Setting this element to `TRUE` causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.
This property is not supported for Amazon S3 on Outposts.
Type: Boolean
Required: No

**IgnorePublicAcls (p. 623)**

Specifies whether Amazon S3 should ignore public ACLs for buckets in this account. Setting this element to `TRUE` causes Amazon S3 to ignore all public ACLs on buckets in this account and any objects that they contain.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.
This property is not supported for Amazon S3 on Outposts.
Type: Boolean
Required: No

**RestrictPublicBuckets (p. 623)**

Specifies whether Amazon S3 should restrict public bucket policies for buckets in this account. Setting this element to `TRUE` restricts access to buckets with public policies to only AWS service principals and authorized users within this account.

Enabling this setting doesn't affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.
This property is not supported for Amazon S3 on Outposts.
Type: Boolean
Required: No

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

PutStorageLensConfiguration
Service: Amazon S3 Control

Puts an Amazon S3 Storage Lens configuration. For more information about S3 Storage Lens, see Working with Amazon S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

**Note**
To use this action, you must have permission to perform the s3:PutStorageLensConfiguration action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

**Request Syntax**

```
PUT /v20180820/storagelens/storagelensid HTTP/1.1
Host: s3-control.amazonaws.com

icao Request Parameters

The request uses the following URI parameters.

**storagelensid (p. 626)**

The ID of the S3 Storage Lens configuration.

Length Constraints: Minimum length of 1. Maximum length of 64.
Pattern: [a-zA-Z0-9-\_/\.]+  
Required: Yes

**x-amz-account-id (p. 626)**  
The account ID of the requester.  
Length Constraints: Maximum length of 64.  
Pattern: ^\d{12}$  
Required: Yes

**Request Body**

The request accepts the following data in XML format.

**PutStorageLensConfigurationRequest (p. 626)**

Root level tag for the PutStorageLensConfigurationRequest parameters.

Required: Yes

**StorageLensConfiguration (p. 626)**

The S3 Storage Lens configuration.

Type: StorageLensConfiguration (p. 980) data type

Required: Yes

**Tags (p. 626)**

The tag set of the S3 Storage Lens configuration.

*Note*

You can set up to a maximum of 50 tags.

Type: Array of StorageLensTag (p. 991) data types

Required: No

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

PutStorageLensConfigurationTagging

Service: Amazon S3 Control

Put or replace tags on an existing Amazon S3 Storage Lens configuration. For more information about S3 Storage Lens, see Assessing your storage activity and usage with Amazon S3 Storage Lens in the Amazon S3 User Guide.

**Note**
To use this action, you must have permission to perform the s3:PutStorageLensConfigurationTagging action. For more information, see Setting permissions to use Amazon S3 Storage Lens in the Amazon S3 User Guide.

**Request Syntax**

```
PUT /v20180820/storagelens/storagelensid/tagging HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<PutStorageLensConfigurationTaggingRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20">
  <Tags>
    <Tag>
      <Key>string</Key>
      <Value>string</Value>
    </Tag>
  </Tags>
</PutStorageLensConfigurationTaggingRequest>
```

**URI Request Parameters**

The request uses the following URI parameters.

**storagelensid (p. 630)**

The ID of the S3 Storage Lens configuration.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-\_\.]+

Required: Yes

**x-amz-account-id (p. 630)**

The account ID of the requester.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request accepts the following data in XML format.

**PutStorageLensConfigurationTaggingRequest (p. 630)**

Root level tag for the PutStorageLensConfigurationTaggingRequest parameters.
Tags (p. 630)

The tag set of the S3 Storage Lens configuration.

Note
You can set up to a maximum of 50 tags.

Type: Array of StorageLensTag (p. 991) data types

Required: Yes

Response Syntax

HTTP/1.1 200

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

SubmitMultiRegionAccessPointRoutes
Service: Amazon S3 Control

Submits an updated route configuration for a Multi-Region Access Point. This API operation updates the routing status for the specified Regions from active to passive, or from passive to active. A value of 0 indicates a passive status, which means that traffic won't be routed to the specified Region. A value of 100 indicates an active status, which means that traffic will be routed to the specified Region. At least one Region must be active at all times.

When the routing configuration is changed, any in-progress operations (uploads, copies, deletes, and so on) to formerly active Regions will continue to run to their final completion state (success or failure). The routing configurations of any Regions that aren't specified remain unchanged.

Note
Updated routing configurations might not be immediately applied. It can take up to 2 minutes for your changes to take effect.

To submit routing control changes and failover requests, use the Amazon S3 failover control infrastructure endpoints in these five AWS Regions:

- us-east-1
- us-west-2
- ap-southeast-2
- ap-northeast-1
- eu-west-1

Note
Your Amazon S3 bucket does not need to be in these five Regions.

Request Syntax

```
PATCH /v20180820/mrap/instances/mrap+/routes HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<SubmitMultiRegionAccessPointRoutesRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
  <RouteUpdates>
    <Route>
      <Bucket>string</Bucket>
      <Region>string</Region>
      <TrafficDialPercentage>integer</TrafficDialPercentage>
    </Route>
  </RouteUpdates>
</SubmitMultiRegionAccessPointRoutesRequest>
```

URI Request Parameters

The request uses the following URI parameters.

**mrap (p. 632)**

The Multi-Region Access Point ARN.

Length Constraints: Maximum length of 200.

Pattern: ^[a-zA-Z0-9\:.-]{3,200}$
Required: Yes

**x-amz-account-id (p. 632)**

The AWS account ID for the owner of the Multi-Region Access Point.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

**Request Body**

The request accepts the following data in XML format.

**SubmitMultiRegionAccessPointRoutesRequest (p. 632)**

Root level tag for the SubmitMultiRegionAccessPointRoutesRequest parameters.

Required: Yes

**RouteUpdates (p. 632)**

The different routes that make up the new route configuration. Active routes return a value of 100, and passive routes return a value of 0.

Type: Array of **MultiRegionAccessPointRoute (p. 917)** data types

Required: Yes

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Examples**

**Sample request for initiating failover**

In the following example, the request to submit these routing changes to initiate a failover is sent to the failover control infrastructure in the `us-east-1` Region. In this example, the `eu-north-1` Region is set to active, and the `ap-northeast-3` Region is set to passive. In other words, the `ap-northeast-3` Region is failed over to the `eu-north-1` Region.

```
PATCH /v20180820/mrap/instances/<Multi-Region Access Point>/routes HTTP/1.1
Host: example-account-id.s3-control.us-east-1.amazonaws.com

<SubmitMultiRegionAccessPointRoutesRequest>
  <RouteUpdates>
    <Route>
      <Region>eu-north-1</Region>
      <Bucket>example-bucket-eu-north-1</Bucket>
      <TrafficDialPercentage>100</TrafficDialPercentage>
    </Route>
  </RouteUpdates>
</SubmitMultiRegionAccessPointRoutesRequest>
```
Sample request for setting a Region to active status

The following request updates the route configuration of the eu-north-1 Region to active. The request is sent to the failover control infrastructure in the eu-west-1 Region.

```
PATCH /v20180820/mrap/instances/<Multi-Region Access Point>/routes HTTP/1.1
Host: example-account-id.s3-control.eu-west-1.amazonaws.com

<SubmitMultiRegionAccessPointRoutesRequest>
  <RouteUpdates>
    <Route>
      <Region>eu-north-1</Region>
      <Bucket>example-bucket-eu-north-1</Bucket>
      <TrafficDialPercentage>100</TrafficDialPercentage>
    </Route>
  </RouteUpdates>
</SubmitMultiRegionAccessPointRoutesRequest>
```

TagResource
Service: Amazon S3 Control

Creates a new AWS resource tag or updates an existing resource tag. You can add up to 50 AWS resource tags for each S3 resource.

To use this operation, you must have the permission to perform the s3:TagResource action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about S3 Tagging errors, see List of Amazon S3 Tagging error codes.

Note
This operation is only supported for S3 Storage Lens groups.

Request Syntax

POST /v20180820/tags/resourceArn+ HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>
<TagResourceRequest xmlns="http://awss3control.amazonaws.com/doc/2018-08-20/">
<Tags>
<Tag>
<Key>string</Key>
<Value>string</Value>
</Tag>
</Tags>
</TagResourceRequest>

URI Request Parameters

The request uses the following URI parameters.

resourceArn (p. 635)

The Amazon Resource Name (ARN) of the S3 resource that you're trying to add tags to.

Length Constraints: Maximum length of 1011.

Pattern: arn:[^-]+:s3:[^-].*

Required: Yes

x-amz-account-id (p. 635)

The AWS account ID that created the S3 resource that you're trying to add tags to.

Length Constraints: Maximum length of 64.

Pattern: \^d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

TagResourceRequest (p. 635)

Root level tag for the TagResourceRequest parameters.
**Tags (p. 635)**

The AWS resource tags that you want to add to the specified S3 resource.

Type: Array of Tag (p. 992) data types

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: Yes

**Response Syntax**

```
HTTP/1.1 204
```

**Response Elements**

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

**See Also**

UntagResource
Service: Amazon S3 Control

This operation removes the specified AWS resource tags from an S3 resource.

To use this operation, you must have the permission to perform the s3:UntagResource action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about S3 Tagging errors, see List of Amazon S3 Tagging error codes.

Note
This operation is only supported for S3 Storage Lens groups.

Request Syntax

```
DELETE /v20180820/tags/resourceArn+?tagKeys=TagKeys HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
```

URI Request Parameters

The request uses the following URI parameters.

resourceArn (p. 637)

The Amazon Resource Name (ARN) of the S3 resource that you want to remove the resource tags from.

Length Constraints: Maximum length of 1011.

Pattern: arn:[^:]+:s3:[^:]*

Required: Yes

tagKeys (p. 637)

The tag key pair of the S3 resource tag that you're trying to remove.

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Pattern: ^\([\p{L}\p{Z}\p{N}_.:/=+-@]*\)\*

Required: Yes

x-amz-account-id (p. 637)

The AWS account ID that owns the resource that you're trying to remove the tags from.

Length Constraints: Maximum length of 64.

Pattern: ^\d\{12\}$

Required: Yes

Request Body

The request does not have a request body.
Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

UpdateJobPriority
Service: Amazon S3 Control

Updates an existing S3 Batch Operations job's priority. For more information, see S3 Batch Operations in the Amazon S3 User Guide.

Related actions include:
- CreateJob
- ListJobs
- DescribeJob
- UpdateJobStatus

Request Syntax

POST /v20180820/jobs/id/priority?priority=Priority HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters

The request uses the following URI parameters.

id (p. 639)
- The ID for the job whose priority you want to update.
  - Pattern: [a-zA-Z0-9-\-_]+
  - Required: Yes

priority (p. 639)
- The priority you want to assign to this job.
  - Valid Range: Minimum value of 0. Maximum value of 2147483647.
  - Required: Yes

x-amz-account-id (p. 639)
- The AWS account ID associated with the S3 Batch Operations job.
  - Length Constraints: Maximum length of 64.
  - Pattern: ^\d{12}$
  - Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<xml version="1.0" encoding="UTF-8">
<UpdateJobPriorityResult>
  <JobId>string</JobId>
  <Priority>integer</Priority>
</UpdateJobPriorityResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

UpdateJobPriorityResult (p. 639)

Root level tag for the UpdateJobPriorityResult parameters.

Required: Yes

JobId (p. 639)

The ID for the job whose priority Amazon S3 updated.

Type: String

Pattern: [a-zA-Z0-9-\_\-]+

Priority (p. 639)

The new priority assigned to the specified job.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Errors

BadRequestException

HTTP Status Code: 400

InternalServiceException

HTTP Status Code: 500

NotFoundException

HTTP Status Code: 400

TooManyRequestsException

HTTP Status Code: 400

UpdateJobStatus
Service: Amazon S3 Control

Updates the status for the specified job. Use this action to confirm that you want to run a job or to cancel an existing job. For more information, see S3 Batch Operations in the Amazon S3 User Guide.

Related actions include:
- CreateJob
- ListJobs
- DescribeJob
- UpdateJobStatus

Request Syntax
POST /v20180820/jobs/id/status?
requestedJobStatus=RequestedJobStatus&statusUpdateReason=StatusUpdateReason HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId

URI Request Parameters
The request uses the following URI parameters.

id (p. 642)
The ID of the job whose status you want to update.
Pattern: [a-zA-Z0-9-_]+
Required: Yes

requestedJobStatus (p. 642)
The status that you want to move the specified job to.
Valid Values: Cancelled | Ready
Required: Yes

statusUpdateReason (p. 642)
A description of the reason why you want to change the specified job's status. This field can be any string up to the maximum length.
Length Constraints: Minimum length of 1. Maximum length of 256.

x-amz-account-id (p. 642)
The AWS account ID associated with the S3 Batch Operations job.
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes
Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
<?xml version="1.0" encoding="UTF-8"?>
<UpdateJobStatusResult>
  <JobId>string</JobId>
  <Status>string</Status>
  <StatusUpdateReason>String</StatusUpdateReason>
</UpdateJobStatusResult>

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in XML format by the service.

UpdateJobStatusResult (p. 643)

Root level tag for the UpdateJobStatusResult parameters.

Required: Yes

JobId (p. 643)

The ID for the job whose status was updated.

Type: String

Pattern: [a-zA-Z0-9\-_]+

Status (p. 643)

The current status for the specified job.

Type: String

Valid Values: Active | Cancelled | Cancelling | Complete | Completing | Failed | Failing | New | Paused | Pausing | Preparing | Ready | Suspended

StatusUpdateReason (p. 643)

The reason that the specified job's status was updated.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Errors

BadRequestException

HTTP Status Code: 400

InternalServerError
HTTP Status Code: 500

**JobStatusException**

HTTP Status Code: 400

**NotFoundException**

UpdateStorageLensGroup
Service: Amazon S3 Control

Updates the existing Storage Lens group.

To use this operation, you must have the permission to perform the s3:UpdateStorageLensGroup action. For more information about the required Storage Lens Groups permissions, see Setting account permissions to use S3 Storage Lens groups.

For information about Storage Lens groups errors, see List of Amazon S3 Storage Lens error codes.

Request Syntax

PUT /v20180820/storagelensgroup/name HTTP/1.1
Host: s3-control.amazonaws.com
x-amz-account-id: AccountId
<?xml version="1.0" encoding="UTF-8"?>

</MatchObjectSize>
</Or>
</Filter>
</StorageLensGroup>
</UpdateStorageLensGroupRequest>

URI Request Parameters

The request uses the following URI parameters.

**name (p. 645)**

The name of the Storage Lens group that you want to update.

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-_]+

Required: Yes

**x-amz-account-id (p. 645)**

The AWS account ID of the Storage Lens group owner.

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: Yes

Request Body

The request accepts the following data in XML format.

**UpdateStorageLensGroupRequest (p. 645)**

Root level tag for the UpdateStorageLensGroupRequest parameters.

Required: Yes

**StorageLensGroup (p. 645)**

The JSON file that contains the Storage Lens group configuration.
Type: StorageLensGroup (p. 984) data type

Required: Yes

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Amazon S3 on Outposts

The following actions are supported by Amazon S3 on Outposts:

- CreateEndpoint (p. 648)
- DeleteEndpoint (p. 651)
- ListEndpoints (p. 653)
- ListOutpostsWithS3 (p. 656)
- ListSharedEndpoints (p. 659)
CreateEndpoint
Service: Amazon S3 on Outposts

Creates an endpoint and associates it with the specified Outpost.

**Note**
It can take up to 5 minutes for this action to finish.

Related actions include:
- DeleteEndpoint
- ListEndpoints

**Request Syntax**

```plaintext
POST /S3Outposts/CreateEndpoint HTTP/1.1
Content-type: application/json
{
    "AccessType": "string",
    "CustomerOwnedIpv4Pool": "string",
    "OutpostId": "string",
    "SecurityGroupId": "string",
    "SubnetId": "string"
}
```

**URI Request Parameters**
The request does not use any URI parameters.

**Request Body**
The request accepts the following data in JSON format.

**AccessType (p. 648)**
The type of access for the network connectivity for the Amazon S3 on Outposts endpoint. To use the AWS VPC, choose Private. To use the endpoint with an on-premises network, choose CustomerOwnedIp. If you choose CustomerOwnedIp, you must also provide the customer-owned IP address pool (CoIP pool).

**Note**
Private is the default access type value.

Type: String

Valid Values: Private | CustomerOwnedIp

Required: No

**CustomerOwnedIpv4Pool (p. 648)**
The ID of the customer-owned IPv4 address pool (CoIP pool) for the endpoint. IP addresses are allocated from this pool for the endpoint.

Type: String

Pattern: ^ipv4pool-coip-([0-9a-f]{17})$

Required: No
OutpostId (p. 648)

The ID of the AWS Outposts.

Type: String

Pattern: `^(op-[a-f0-9]{17}|d{12}|ec2)$`

Required: Yes

SecurityGroupId (p. 648)

The ID of the security group to use with the endpoint.

Type: String

Pattern: `^sg-([0-9a-f]{8}|[0-9a-f]{17})$`

Required: Yes

SubnetId (p. 648)

The ID of the subnet in the selected VPC. The endpoint subnet must belong to the Outpost that has Amazon S3 on Outposts provisioned.

Type: String

Pattern: `^subnet-([0-9a-f]{8}|[0-9a-f]{17})$`

Required: Yes

Response Syntax

HTTP/1.1 200
Content-type: application/json

```
{
  "EndpointArn": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**EndpointArn (p. 649)**

The Amazon Resource Name (ARN) of the endpoint.

Type: String

Pattern: `^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):s3-outposts:[a-z \-0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|\d{12}|ec2)/endpoint/[a-zA-Z0-9-9]{19}$`

Errors

AccessDeniedException

Access was denied for this action.
HTTP Status Code: 403

**ConflictException**

There was a conflict with this action, and it could not be completed.

HTTP Status Code: 409

**InternalServerException**

There was an exception with the internal server.

HTTP Status Code: 500

**OutpostOfflineException**

The service link connection to your Outposts home Region is down. Check your connection and try again.

HTTP Status Code: 400

**ResourceNotFoundException**

The requested resource was not found.

HTTP Status Code: 404

**ThrottlingException**

The request was denied due to request throttling.

HTTP Status Code: 429

**ValidationException**

There was an exception validating this data.

HTTP Status Code: 400

DeleteEndpoint
Service: Amazon S3 on Outposts

Deletes an endpoint.

**Note**
It can take up to 5 minutes for this action to finish.

Related actions include:
- [CreateEndpoint](#)
- [ListEndpoints](#)

**Request Syntax**

```
DELETE /S3Outposts/DeleteEndpoint?endpointId=EndpointId&outpostId=OutpostId HTTP/1.1
```

**URI Request Parameters**
The request uses the following URI parameters.

**EndpointId (p. 651)**
The ID of the endpoint.

Pattern: `^[a-zA-Z0-9]{19}$`

Required: Yes

**OutpostId (p. 651)**
The ID of the AWS Outposts.

Pattern: `^([a-f0-9]{17}|\d{12}|ec2)$`

Required: Yes

**Request Body**
The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 200
```

**Response Elements**
If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

**AccessDeniedException**

Access was denied for this action.

HTTP Status Code: 403
InternalServerException

There was an exception with the internal server.

HTTP Status Code: 500

OutpostOfflineException

The service link connection to your Outposts home Region is down. Check your connection and try again.

HTTP Status Code: 400

ResourceNotFoundException

The requested resource was not found.

HTTP Status Code: 404

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 429

ValidationException

There was an exception validating this data.

HTTP Status Code: 400

ListEndpoints
Service: Amazon S3 on Outposts

Lists endpoints associated with the specified Outpost.

Related actions include:
- CreateEndpoint
- DeleteEndpoint

Request Syntax
GET /S3Outposts/ListEndpoints?maxResults=MaxResults&nextToken=NextToken HTTP/1.1

URI Request Parameters
The request uses the following URI parameters.

MaxResults (p. 653)
The maximum number of endpoints that will be returned in the response.
Valid Range: Minimum value of 0. Maximum value of 100.

NextToken (p. 653)
If a previous response from this operation included a NextToken value, provide that value here to retrieve the next page of results.
Pattern: ^[A-Za-z0-9+\:/=\?#-_.]+$

Request Body
The request does not have a request body.

Response Syntax
HTTP/1.1 200
Content-type: application/json
{
   "Endpoints": [
       {
           "AccessType": "string",
           "CidrBlock": "string",
           "CreationTime": number,
           "CustomerOwnedIpv4Pool": "string",
           "EndpointArn": "string",
           "FailedReason": {
               "ErrorCode": "string",
               "Message": "string"
           },
           "NetworkInterfaces": [
               {
                   "NetworkInterfaceId": "string"
               }
           ]
       }
   ]
}

API Version 2006-03-01
Endpoints (p. 653)

The list of endpoints associated with the specified Outpost.

Type: Array of Endpoint (p. 997) objects

NextToken (p. 653)

If the number of endpoints associated with the specified Outpost exceeds MaxResults, you can include this value in subsequent calls to this operation to retrieve more results.

Type: String

Pattern: ^[A-Za-z0-9\-\:/\=\?\#-\_]\+$

Errors

AccessDeniedException

Access was denied for this action.

HTTP Status Code: 403

InternalServerException

There was an exception with the internal server.

HTTP Status Code: 500

ResourceNotFoundException

The requested resource was not found.

HTTP Status Code: 404

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 429

ValidationException

There was an exception validating this data.
HTTP Status Code: 400

ListOutpostsWithS3
Service: Amazon S3 on Outposts

Lists the Outposts with S3 on Outposts capacity for your AWS account. Includes S3 on Outposts that you have access to as the Outposts owner, or as a shared user from Resource Access Manager (RAM).

Request Syntax
GET /S3Outposts/ListOutpostsWithS3?maxResults=MaxResults&nextToken=NextToken HTTP/1.1

URI Request Parameters
The request uses the following URI parameters.

MaxResults (p. 656)

The maximum number of Outposts to return. The limit is 100.
Valid Range: Minimum value of 0. Maximum value of 100.

NextToken (p. 656)

When you can get additional results from the ListOutpostsWithS3 call, a NextToken parameter is returned in the output. You can then pass in a subsequent command to the NextToken parameter to continue listing additional Outposts.

Pattern: ^[A-Za-z0-9\+\:/\=\?\#-_]+$

Request Body
The request does not have a request body.

Response Syntax
HTTP/1.1 200
Content-type: application/json

{  "NextToken": "string",
   "Outposts": [
      {  "CapacityInBytes": number,
         "OutpostArn": "string",
         "OutpostId": "string",
         "OwnerId": "string",
         "S3OutpostArn": "string"
      }
   ]
}

Response Elements
If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
NextToken (p. 656)

Returns a token that you can use to call ListOutpostsWithS3 again and receive additional results, if there are any.

Type: String

Pattern: ^[A-Za-z0-9\+\:/\=\?\#-_]+$

Outposts (p. 656)

Returns the list of Outposts that have the following characteristics:
• outposts that have S3 provisioned
• outposts that are Active (not pending any provisioning nor decommissioned)
• outposts to which the the calling AWS account has access

Type: Array of Outpost (p. 1002) objects

Errors

AccessDeniedException

Access was denied for this action.

HTTP Status Code: 403

InternalServerException

There was an exception with the internal server.

HTTP Status Code: 500

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 429

ValidationException

There was an exception validating this data.

HTTP Status Code: 400

ListSharedEndpoints
Service: Amazon S3 on Outposts

Lists all endpoints associated with an Outpost that has been shared by AWS Resource Access Manager (RAM).

Related actions include:

- CreateEndpoint
- DeleteEndpoint

Request Syntax

GET /S3Outposts/ListSharedEndpoints?
maxResults=MaxResults&nextToken=NextToken&outpostId=OutpostId HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

MaxResults (p. 659)

The maximum number of endpoints that will be returned in the response.

Valid Range: Minimum value of 0. Maximum value of 100.

NextToken (p. 659)

If a previous response from this operation included a NextToken value, you can provide that value here to retrieve the next page of results.

Pattern: ^[A-Za-z0-9\+\:\/\=\?\#\-\_]+$

OutpostId (p. 659)

The ID of the AWS Outpost.

Pattern: ^(op-[a-f0-9]{17}|d[12]|ec2)$

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

{  
  "Endpoints": [  
    
  
  ]
}

"AccessType": "string",
"CidrBlock": "string",

AbortIncompleteMultipartUpload
Service: Amazon S3

Specifies the days since the initiation of an incomplete multipart upload that Amazon S3 will wait before permanently removing all parts of the upload. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration in the Amazon S3 User Guide.

Contents

DaysAfterInitiation

Specifies the number of days after which Amazon S3 aborts an incomplete multipart upload.

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AccelerateConfiguration
Service: Amazon S3

Configures the transfer acceleration state for an Amazon S3 bucket. For more information, see Amazon S3 Transfer Acceleration in the Amazon S3 User Guide.

Contents

Status

Specifies the transfer acceleration status of the bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AccessControlPolicy
Service: Amazon S3

Contains the elements that set the ACL permissions for an object per grantee.

Contents

Grants

A list of grants.

Type: Array of Grant (p. 732) data types

Required: No

Owner

Container for the bucket owner's display name and ID.

Type: Owner (p. 786) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AccessControlTranslation
Service: Amazon S3

A container for information about access control for replicas.

Contents

Owner

Specifies the replica ownership. For default and valid values, see PUT bucket replication in the Amazon S3 API Reference.

Type: String

Valid Values: Destination

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AnalyticsAndOperator
Service: Amazon S3

A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator must have at least two predicates in any combination, and an object must match all of the predicates for the filter to apply.

Contents

Prefix
The prefix to use when evaluating an AND predicate: The prefix that an object must have to be included in the metrics results.

Type: String
Required: No

Tags
The list of tags to use when evaluating an AND predicate.

Type: Array of Tag (p. 838) data types
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AnalyticsConfiguration
Service: Amazon S3

Specifies the configuration and any analyses for the analytics filter of an Amazon S3 bucket.

Contents

Id

The ID that identifies the analytics configuration.

Type: String
Required: Yes

StorageClassAnalysis

Contains data related to access patterns to be collected and made available to analyze the tradeoffs between different storage classes.

Type: StorageClassAnalysis (p. 836) data type
Required: Yes

Filter

The filter used to describe a set of objects for analyses. A filter must have exactly one prefix, one tag, or one conjunction (AnalyticsAndOperator). If no filter is provided, all objects will be considered in any analysis.

Type: AnalyticsFilter (p. 678) data type
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AnalyticsExportDestination
Service: Amazon S3
Where to publish the analytics results.

Contents

S3BucketDestination
A destination signifying output to an S3 bucket.
Type: AnalyticsS3BucketDestination (p. 679) data type
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AnalyticsFilter
Service: Amazon S3

The filter used to describe a set of objects for analyses. A filter must have exactly one prefix, one tag, or one conjunction (AnalyticsAndOperator). If no filter is provided, all objects will be considered in any analysis.

Contents

And

A conjunction (logical AND) of predicates, which is used in evaluating an analytics filter. The operator must have at least two predicates.

Type: AnalyticsAndOperator (p. 675) data type

Required: No

Prefix

The prefix to use when evaluating an analytics filter.

Type: String

Required: No

Tag

The tag to use when evaluating an analytics filter.

Type: Tag (p. 838) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AnalyticsS3BucketDestination
Service: Amazon S3

Contains information about where to publish the analytics results.

Contents

**Bucket**

The Amazon Resource Name (ARN) of the bucket to which data is exported.

Type: String

Required: Yes

**Format**

Specifies the file format used when exporting data to Amazon S3.

Type: String

Valid Values: CSV

Required: Yes

**BucketAccountId**

The account ID that owns the destination S3 bucket. If no account ID is provided, the owner is not validated before exporting data.

*Note*

Although this value is optional, we strongly recommend that you set it to help prevent problems if the destination bucket ownership changes.

Type: String

Required: No

**Prefix**

The prefix to use when exporting data. The prefix is prepended to all results.

Type: String

Required: No

See Also

- [AWS SDK for Ruby V3](https://aws.amazon.com/sdk-for-ruby/)
Bucket
Service: Amazon S3

In terms of implementation, a Bucket is a resource. An Amazon S3 bucket name is globally unique, and the namespace is shared by all AWS accounts.

Contents

CreationDate

Date the bucket was created. This date can change when making changes to your bucket, such as editing its bucket policy.

Type: Timestamp

Required: No

Name

The name of the bucket.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BucketLifecycleConfiguration
Service: Amazon S3

Specifies the lifecycle configuration for objects in an Amazon S3 bucket. For more information, see Object Lifecycle Management in the Amazon S3 User Guide.

Contents

Rules

A lifecycle rule for individual objects in an Amazon S3 bucket.

Type: Array of LifecycleRule (p. 755) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BucketLoggingStatus
Service: Amazon S3

Container for logging status information.

Contents

LoggingEnabled

Describes where logs are stored and the prefix that Amazon S3 assigns to all log object keys for a bucket. For more information, see PUT Bucket logging in the Amazon S3 API Reference.

Type: LoggingEnabled (p. 760) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Checksum
Service: Amazon S3

Contains all the possible checksum or digest values for an object.

Contents

**ChecksumCRC32**

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the *Amazon S3 User Guide*.

Type: String

Required: No

**ChecksumCRC32C**

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the *Amazon S3 User Guide*.

Type: String

Required: No

**ChecksumSHA1**

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the *Amazon S3 User Guide*.

Type: String

Required: No

**ChecksumSHA256**

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see [Checking object integrity](https://docs.aws.amazon.com/AmazonS3/latest/userguide/CheckingObjectIntegrity.html) in the *Amazon S3 User Guide*.

Type: String

Required: No

CloudFunctionConfiguration
Service: Amazon S3

Container for specifying the AWS Lambda notification configuration.

Contents

CloudFunction

Lambda cloud function ARN that Amazon S3 can invoke when it detects events of the specified type.

Type: String

Required: No

Event

This member has been deprecated.

The bucket event for which to send notifications.

Type: String

Required: No

Events

Bucket events for which to send notifications.

Type: Array of strings

Required: No
Id

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

Type: String
Required: No

InvocationRole

The role supporting the invocation of the Lambda function

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CommonPrefix

Service: Amazon S3

Container for all (if there are any) keys between Prefix and the next occurrence of the string specified by a delimiter. CommonPrefixes lists keys that act like subdirectories in the directory specified by Prefix. For example, if the prefix is notes/ and the delimiter is a slash (/) as in notes/summer/july, the common prefix is notes/summer/.

Contents

Prefix

Container for the specified common prefix.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**CompletedMultipartUpload**  
Service: Amazon S3

The container for the completed multipart upload details.

**Contents**

**Parts**

Array of CompletedPart data types.

If you do not supply a valid Part with your request, the service sends back an HTTP 400 response.

Type: Array of [CompletedPart](p. 689) data types

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
CompletedPart
Service: Amazon S3
Details of the parts that were uploaded.

Contents

ChecksumCRC32
The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumCRC32C
The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA1
The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA256
The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ETag
Entity tag returned when the part was uploaded.

Type: String
Required: No

PartNumber
Part number that identifies the part. This is a positive integer between 1 and 10,000.

Type: Integer
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Condition**
Service: Amazon S3

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the /docs folder, redirect to the /documents folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

**Contents**

**HttpGetCodeReturnedEquals**

The HTTP error code when the redirect is applied. In the event of an error, if the error code equals this value, then the specified redirect is applied. Required when parent element Condition is specified and sibling KeyPrefixEquals is not specified. If both are specified, then both must be true for the redirect to be applied.

Type: String

Required: No

**KeyPrefixEquals**

The object key name prefix when the redirect is applied. For example, to redirect requests for ExamplePage.html, the key prefix will be ExamplePage.html. To redirect request for all pages with the prefix docs/, the key prefix will be /docs, which identifies all objects in the docs/ folder. Required when the parent element Condition is specified and sibling HttpErrorCodeReturnedEquals is not specified. If both conditions are specified, both must be true for the redirect to be applied.

**Important**
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see *XML related object key constraints.*

Type: String

Required: No

CopyObjectResult

Service: Amazon S3

Container for all response elements.

Contents

ChecksumCRC32

The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

Required: No

ChecksumCRC32C

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

Required: No

ChecksumSHA1

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

Required: No

ChecksumSHA256

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String

Required: No

ETag

Returns the ETag of the new object. The ETag reflects only changes to the contents of an object, not its metadata.

Type: String

Required: No

LastModified

Creation date of the object.
Type: Timestamp
Required: No

Service: Amazon S3

Container for all response elements.

Contents

ChecksumCRC32
The base64-encoded, 32-bit CRC32 checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumCRC32C
The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA1
The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA256
The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ETag
Entity tag of the object.

Type: String
Required: No

LastModified
Date and time at which the object was uploaded.

Type: Timestamp
Required: No

CORSConfiguration
Service: Amazon S3

Describes the cross-origin access configuration for objects in an Amazon S3 bucket. For more information, see Enabling Cross-Origin Resource Sharing in the Amazon S3 User Guide.

Contents

CORSRules

A set of origins and methods (cross-origin access that you want to allow). You can add up to 100 rules to the configuration.

Type: Array of CORSRule (p. 698) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CORSRule
Service: Amazon S3

 Specifies a cross-origin access rule for an Amazon S3 bucket.

Contents

AllowedMethods

An HTTP method that you allow the origin to execute. Valid values are GET, PUT, HEAD, POST, and DELETE.

Type: Array of strings

Required: Yes

AllowedOrigins

One or more origins you want customers to be able to access the bucket from.

Type: Array of strings

Required: Yes

AllowedHeaders

Headers that are specified in the Access-Control-Request-Headers header. These headers are allowed in a preflight OPTIONS request. In response to any preflight OPTIONS request, Amazon S3 returns any requested headers that are allowed.

Type: Array of strings

Required: No

ExposeHeaders

One or more headers in the response that you want customers to be able to access from their applications (for example, from a JavaScript XMLHttpRequest object).

Type: Array of strings

Required: No

ID

Unique identifier for the rule. The value cannot be longer than 255 characters.

Type: String

Required: No

MaxAgeSeconds

The time in seconds that your browser is to cache the preflight response for the specified resource.

Type: Integer

Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
CreateBucketConfiguration
Service: Amazon S3

The configuration information for the bucket.

Contents

LocationConstraint

Specifies the Region where the bucket will be created. If you don't specify a Region, the bucket is created in the US East (N. Virginia) Region (us-east-1).

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CSVInput

Service: Amazon S3

Describes how an uncompressed comma-separated values (CSV)-formatted input object is formatted.

Contents

AllowQuotedRecordDelimiter

Specifies that CSV field values may contain quoted record delimiters and such records should be allowed. Default value is FALSE. Setting this value to TRUE may lower performance.

Type: Boolean
Required: No

Comments

A single character used to indicate that a row should be ignored when the character is present at the start of that row. You can specify any character to indicate a comment line. The default character is #.

Default: #
Type: String
Required: No

FieldDelimiter

A single character used to separate individual fields in a record. You can specify an arbitrary delimiter.

Type: String
Required: No

FileHeaderInfo

Describes the first line of input. Valid values are:
• NONE: First line is not a header.
• IGNORE: First line is a header, but you can't use the header values to indicate the column in an expression. You can use column position (such as _1, _2, …) to indicate the column (SELECT s._1 FROM OBJECT s).
• USE: First line is a header, and you can use the header value to identify a column in an expression (SELECT "name" FROM OBJECT).

Type: String
Valid Values: USE | IGNORE | NONE
Required: No

QuoteCharacter

A single character used for escaping when the field delimiter is part of the value. For example, if the value is a, b, Amazon S3 wraps this field value in quotation marks, as follows: " a , b ".

Type: String
Default: "
Ancestors: CSV

Type: String
Required: No

**QuoteEscapeCharacter**

A single character used for escaping the quotation mark character inside an already escaped value. For example, the value "" a , b "" is parsed as " a , b ".

Type: String
Required: No

**RecordDelimiter**

A single character used to separate individual records in the input. Instead of the default value, you can specify an arbitrary delimiter.

Type: String
Required: No

**See Also**

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
CSVOutput
Service: Amazon S3

Describes how uncompressed comma-separated values (CSV)-formatted results are formatted.

Contents

**FieldDelimiter**

The value used to separate individual fields in a record. You can specify an arbitrary delimiter.

- **Type:** String
- **Required:** No

**QuoteCharacter**

A single character used for escaping when the field delimiter is part of the value. For example, if the value is `a, b`, Amazon S3 wraps this field value in quotation marks, as follows: "a, b".

- **Type:** String
- **Required:** No

**QuoteEscapeCharacter**

The single character used for escaping the quote character inside an already escaped value.

- **Type:** String
- **Required:** No

**QuoteFields**

Indicates whether to use quotation marks around output fields.

- **ALWAYS:** Always use quotation marks for output fields.
- **ASNEEDED:** Use quotation marks for output fields when needed.

- **Type:** String
- **Valid Values:** ALWAYS | ASNEEDED
- **Required:** No

**RecordDelimiter**

A single character used to separate individual records in the output. Instead of the default value, you can specify an arbitrary delimiter.

- **Type:** String
- **Required:** No

DefaultRetention
Service: Amazon S3

The container element for specifying the default Object Lock retention settings for new objects placed in
the specified bucket.

Note

• The DefaultRetention settings require both a mode and a period.
• The DefaultRetention period can be either Days or Years but you must select one. You
  cannot specify Days and Years at the same time.

Contents

Days

The number of days that you want to specify for the default retention period. Must be used with
Mode.

Type: Integer
Required: No

Mode

The default Object Lock retention mode you want to apply to new objects placed in the specified
bucket. Must be used with either Days or Years.

Type: String

Valid Values: GOVERNANCE | COMPLIANCE
Required: No

Years

The number of years that you want to specify for the default retention period. Must be used with
Mode.

Type: Integer
Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
Delete
Service: Amazon S3

Container for the objects to delete.

Contents

Objects

The object to delete.

Type: Array of ObjectIdentifier (p. 775) data types

Required: Yes

Quiet

Element to enable quiet mode for the request. When you add this element, you must set its value to true.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeletedObject
Service: Amazon S3

Information about the deleted object.

Contents

DeleteMarker

Indicates whether the specified object version that was permanently deleted was (true) or was not (false) a delete marker before deletion. In a simple DELETE, this header indicates whether (true) or not (false) the current version of the object is a delete marker.

Type: Boolean
Required: No

DeleteMarkerVersionId

The version ID of the delete marker created as a result of the DELETE operation. If you delete a specific object version, the value returned by this header is the version ID of the object version deleted.

Type: String
Required: No

Key

The name of the deleted object.

Type: String
Length Constraints: Minimum length of 1.
Required: No

VersionId

The version ID of the deleted object.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteMarkerEntry
Service: Amazon S3

Information about the delete marker.

Contents

IsLatest

Specifies whether the object is (true) or is not (false) the latest version of an object.

Type: Boolean
Required: No

Key

The object key.

Type: String
Length Constraints: Minimum length of 1.
Required: No

LastModified

Date and time when the object was last modified.

Type: Timestamp
Required: No

Owner

The account that created the delete marker.

Type: Owner (p. 786) data type
Required: No

VersionId

Version ID of an object.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteMarkerReplication
Service: Amazon S3

Specifies whether Amazon S3 replicates delete markers. If you specify a Filter in your replication configuration, you must also include a DeleteMarkerReplication element. If your Filter includes a Tag element, the DeleteMarkerReplication Status must be set to Disabled, because Amazon S3 does not support replicating delete markers for tag-based rules. For an example configuration, see Basic Rule Configuration.

For more information about delete marker replication, see Basic Rule Configuration.

Note
If you are using an earlier version of the replication configuration, Amazon S3 handles replication of delete markers differently. For more information, see Backward Compatibility.

Contents

Status

Indicates whether to replicate delete markers.

Note
Indicates whether to replicate delete markers.

Type: String

Valid Values: Enabled | Disabled

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Destination
Service: Amazon S3

Specifies information about where to publish analysis or configuration results for an Amazon S3 bucket and S3 Replication Time Control (S3 RTC).

Contents

Bucket

The Amazon Resource Name (ARN) of the bucket where you want Amazon S3 to store the results.

Type: String
Required: Yes

AccessControlTranslation

Specify this only in a cross-account scenario (where source and destination bucket owners are not the same), and you want to change replica ownership to the AWS account that owns the destination bucket. If this is not specified in the replication configuration, the replicas are owned by same AWS account that owns the source object.

Type: AccessControlTranslation (p. 674) data type
Required: No

Account

Destination bucket owner account ID. In a cross-account scenario, if you direct Amazon S3 to change replica ownership to the AWS account that owns the destination bucket by specifying the AccessControlTranslation property, this is the account ID of the destination bucket owner. For more information, see Replication Additional Configuration: Changing the Replica Owner in the Amazon S3 User Guide.

Type: String
Required: No

EncryptionConfiguration

A container that provides information about encryption. If SourceSelectionCriteria is specified, you must specify this element.

Type: EncryptionConfiguration (p. 713) data type
Required: No

Metrics

A container specifying replication metrics-related settings enabling replication metrics and events.

Type: Metrics (p. 762) data type
Required: No

ReplicationTime

A container specifying S3 Replication Time Control (S3 RTC), including whether S3 RTC is enabled and the time when all objects and operations on objects must be replicated. Must be specified together with a Metrics block.

Type: ReplicationTime (p. 811) data type
Required: No

**StorageClass**

The storage class to use when replicating objects, such as S3 Standard or reduced redundancy. By default, Amazon S3 uses the storage class of the source object to create the object replica.

For valid values, see the `StorageClass` element of the PUT Bucket replication action in the [Amazon S3 API Reference](https://docs.aws.amazon.com/AmazonS3/latest/API/PUTBucketReplication.html).

Type: String

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

Required: No

---

API Version 2006-03-01
711
Encryption
Service: Amazon S3

Contains the type of server-side encryption used.

Contents

EncryptionType

The server-side encryption algorithm used when storing job results in Amazon S3 (for example, AES256, aws:kms).

Type: String

Valid Values: AES256 | aws:kms | aws:kms:dsse

Required: Yes

KMSContext

If the encryption type is aws:kms, this optional value can be used to specify the encryption context for the restore results.

Type: String

Required: No

KMSKeyId

If the encryption type is aws:kms, this optional value specifies the ID of the symmetric encryption customer managed key to use for encryption of job results. Amazon S3 only supports symmetric encryption KMS keys. For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EncryptionConfiguration

Service: Amazon S3

Specifies encryption-related information for an Amazon S3 bucket that is a destination for replicated objects.

Contents

ReplicaKmsKeyId

Specifies the ID (Key ARN or Alias ARN) of the customer managed AWS KMS key stored in AWS Key Management Service (KMS) for the destination bucket. Amazon S3 uses this key to encrypt replica objects. Amazon S3 only supports symmetric encryption KMS keys. For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**EndEvent**  
Service: Amazon S3

A message that indicates the request is complete and no more messages will be sent. You should not assume that the request is complete until the client receives an EndEvent.

**Contents**

The members of this exception structure are context-dependent.

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
Error

Service: Amazon S3

Container for all error elements.

Contents

Code

The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. The following is a list of Amazon S3 error codes. For more information, see Error responses.

- **Code**: AccessDenied
  - **Description**: Access Denied
  - **HTTP Status Code**: 403 Forbidden
  - **SOAP Fault Code Prefix**: Client

- **Code**: AccountProblem
  - **Description**: There is a problem with your AWS account that prevents the action from completing successfully. Contact AWS Support for further assistance.
  - **HTTP Status Code**: 403 Forbidden
  - **SOAP Fault Code Prefix**: Client

- **Code**: AllAccessDisabled
  - **Description**: All access to this Amazon S3 resource has been disabled. Contact AWS Support for further assistance.
  - **HTTP Status Code**: 403 Forbidden
  - **SOAP Fault Code Prefix**: Client

- **Code**: AmbiguousGrantByEmailAddress
  - **Description**: The email address you provided is associated with more than one account.
  - **HTTP Status Code**: 400 Bad Request
  - **SOAP Fault Code Prefix**: Client

- **Code**: AuthorizationHeaderMalformed
  - **Description**: The authorization header you provided is invalid.
  - **HTTP Status Code**: 400 Bad Request
  - **HTTP Status Code**: N/A

- **Code**: BadDigest
  - **Description**: The Content-MD5 you specified did not match what we received.
  - **HTTP Status Code**: 400 Bad Request
  - **SOAP Fault Code Prefix**: Client

- **Code**: BucketAlreadyExists
  - **Description**: The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.
  - **HTTP Status Code**: 409 Conflict
  - **SOAP Fault Code Prefix**: Client

- **Code**: BucketAlreadyOwnedByYou
  - **Description**: The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
  - **Code**: 409 Conflict (in all Regions except the North Virginia Region)
• **SOAP Fault Code Prefix**: Client
  • **Code**: BucketNotEmpty
    • **Description**: The bucket you tried to delete is not empty.
    • **HTTP Status Code**: 409 Conflict
    • **SOAP Fault Code Prefix**: Client
  • **Code**: CredentialsNotSupported
    • **Description**: This request does not support credentials.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: CrossLocationLoggingProhibited
    • **Description**: Cross-location logging not allowed. Buckets in one geographic location cannot log information to a bucket in another location.
    • **HTTP Status Code**: 403 Forbidden
    • **SOAP Fault Code Prefix**: Client
  • **Code**: EntityTooSmall
    • **Description**: Your proposed upload is smaller than the minimum allowed object size.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: EntityTooLarge
    • **Description**: Your proposed upload exceeds the maximum allowed object size.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: ExpiredToken
    • **Description**: The provided token has expired.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: IllegalVersioningConfigurationException
    • **Description**: Indicates that the versioning configuration specified in the request is invalid.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: IncompleteBody
    • **Description**: You did not provide the number of bytes specified by the Content-Length HTTP header
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: IncorrectNumberOfFilesInPostRequest
    • **Description**: POST requires exactly one file upload per request.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: InlineDataTooLarge
    • **Description**: Inline data exceeds the maximum allowed size.
    • **HTTP Status Code**: 400 Bad Request
    • **SOAP Fault Code Prefix**: Client
  • **Code**: InternalError
    • **Description**: We encountered an internal error. Please try again.
    • **HTTP Status Code**: 500 Internal Server Error
Amazon Simple Storage Service API Reference
Amazon S3

- **SOAP Fault Code Prefix: Server**
  - **Code:** InvalidAccessKeyId
    - **Description:** The AWS access key ID you provided does not exist in our records.
    - **HTTP Status Code:** 403 Forbidden
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidAddressingHeader
    - **Description:** You must specify the Anonymous role.
    - **HTTP Status Code:** N/A
    - **SOAP Fault Code Prefix:** Client

- **SOAP Fault Code Prefix: Client**
  - **Code:** InvalidArgument
    - **Description:** Invalid Argument
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidBucketName
    - **Description:** The specified bucket is not valid.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidBucketState
    - **Description:** The request is not valid with the current state of the bucket.
    - **HTTP Status Code:** 409 Conflict
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidDigest
    - **Description:** The Content-MD5 you specified is not valid.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidEncryptionAlgorithmError
    - **Description:** The encryption request you specified is not valid. The valid value is AES256.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidLocationConstraint
    - **Description:** The specified location constraint is not valid. For more information about Regions, see [How to Select a Region for Your Buckets](#).
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidObjectState
    - **Description:** The action is not valid for the current state of the object.
    - **HTTP Status Code:** 403 Forbidden
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidPart
    - **Description:** One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client
  - **Code:** InvalidPartOrder
    - **Description:** The list of parts was not in ascending order. Parts list must be specified in order by part number.
• **HTTP Status Code**: 400 Bad Request
• **SOAP Fault Code Prefix**: Client

• **Code**: InvalidPayer
  • **Description**: All access to this object has been disabled. Please contact AWS Support for further assistance.
• **HTTP Status Code**: 403 Forbidden
• **SOAP Fault Code Prefix**: Client

• **Code**: InvalidPolicyDocument
  • **Description**: The content of the form does not meet the conditions specified in the policy document.
• **HTTP Status Code**: 400 Bad Request
• **SOAP Fault Code Prefix**: Client

• **Code**: InvalidRange
  • **Description**: The requested range cannot be satisfied.
• **HTTP Status Code**: 416 Requested Range Not Satisfiable
• **SOAP Fault Code Prefix**: Client

• **Code**: InvalidRequest
  • **Description**: Please use AWS4-HMAC-SHA256.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: SOAP requests must be made over an HTTPS connection.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: Amazon S3 Transfer Acceleration is not supported for buckets with non-DNS compliant names.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: Amazon S3 Transfer Acceleration is not supported for buckets with periods (.) in their names.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: Amazon S3 Transfer Accelerate endpoint only supports virtual style requests.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: Amazon S3 Transfer Accelerate is not configured on this bucket.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A

• **Code**: InvalidRequest
  • **Description**: Amazon S3 Transfer Accelerate is disabled on this bucket.
• **HTTP Status Code**: 400 Bad Request
  • **Code**: N/A
• **Code:** InvalidRequest
  • **Description:** Amazon S3 Transfer Acceleration is not supported on this bucket. Contact AWS Support for more information.
  • **HTTP Status Code:** 400 Bad Request
  • **Code:** N/A

• **Code:** InvalidRequest
  • **Description:** Amazon S3 Transfer Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.
  • **HTTP Status Code:** 400 Bad Request
  • **Code:** N/A

• **Code:** InvalidSecurity
  • **Description:** The provided security credentials are not valid.
  • **HTTP Status Code:** 403 Forbidden
  • **SOAP Fault Code Prefix:** Client

  • **Description:** The SOAP request body is invalid.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** InvalidStorageClass
  • **Description:** The storage class you specified is not valid.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** InvalidTargetBucketForLogging
  • **Description:** The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** InvalidToken
  • **Description:** The provided token is malformed or otherwise invalid.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** InvalidURI
  • **Description:** Couldn't parse the specified URI.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** KeyTooLongError
  • **Description:** Your key is too long.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** MalformedACLError
  • **Description:** The XML you provided was not well-formed or did not validate against our published schema.
  • **HTTP Status Code:** 400 Bad Request
  • **SOAP Fault Code Prefix:** Client

• **Code:** MalformedPOSTRequest
  • **Description:** The body of your POST request is not well-formed multipart/form-data.
- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MalformedXML

**Description**: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MaxMessageLengthExceeded

**Description**: Your request was too big.

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MaxPostPreDataLengthExceededError

**Description**: Your POST request fields preceding the upload file were too large.

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MetadataTooLarge

**Description**: Your metadata headers exceed the maximum allowed metadata size.

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MethodNotAllowed

**Description**: The specified method is not allowed against this resource.

- **HTTP Status Code**: 405 Method Not Allowed
- **SOAP Fault Code Prefix**: Client

**Code**: MissingAttachment

**Description**: A SOAP attachment was expected, but none were found.

- **HTTP Status Code**: N/A
- **SOAP Fault Code Prefix**: Client

**Code**: MissingContentLength

**Description**: You must provide the Content-Length HTTP header.

- **HTTP Status Code**: 411 Length Required
- **SOAP Fault Code Prefix**: Client

**Code**: MissingRequestBodyError

**Description**: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty."

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MissingSecurityElement

**Description**: The SOAP 1.1 request is missing a security element.

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: MissingSecurityHeader

**Description**: Your request is missing a required header.

- **HTTP Status Code**: 400 Bad Request
- **SOAP Fault Code Prefix**: Client

**Code**: NoLoggingStatusForKey
- Description: There is no such thing as a logging status subresource for a key.
- HTTP Status Code: 400 Bad Request
- SOAP Fault Code Prefix: Client
- Code: NoSuchBucket
  - Description: The specified bucket does not exist.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NoSuchBucketPolicy
  - Description: The specified bucket does not have a bucket policy.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NoSuchKey
  - Description: The specified key does not exist.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NoSuchLifecycleConfiguration
  - Description: The lifecycle configuration does not exist.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NoSuchUpload
  - Description: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NoSuchVersion
  - Description: Indicates that the version ID specified in the request does not match an existing version.
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client
- Code: NotImplemented
  - Description: A header you provided implies functionality that is not implemented.
  - HTTP Status Code: 501 Not Implemented
  - SOAP Fault Code Prefix: Server
- Code: NotSignedUp
  - Description: Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: Amazon S3
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client
- Code: OperationAborted
  - Description: A conflicting conditional action is currently in progress against this resource. Try again.
  - HTTP Status Code: 409 Conflict
  - SOAP Fault Code Prefix: Client
- Code: PermanentRedirect
  - Description: The bucket you are trying to access must be addressed using the specified endpoint. Send all future requests to this endpoint.
• **HTTP Status Code**: 301 Moved Permanently
  • **Code**: PreconditionFailed
    • **Description**: At least one of the preconditions you specified did not hold.
  • **HTTP Status Code**: 412 Precondition Failed
  • **SOAP Fault Code Prefix**: Client
• **Code**: Redirect
  • **Description**: Temporary redirect.
  • **HTTP Status Code**: 307 Moved Temporarily
  • **SOAP Fault Code Prefix**: Client
• **Code**: RestoreAlreadyIn Progress
  • **Description**: Object restore is already in progress.
  • **HTTP Status Code**: 409 Conflict
  • **SOAP Fault Code Prefix**: Client
• **Code**: RequestIsNotMultiPartContent
  • **Description**: Bucket POST must be of the enclosure-type multipart/form-data.
  • **HTTP Status Code**: 400 Bad Request
  • **SOAP Fault Code Prefix**: Client
• **Code**: RequestTimeout
  • **Description**: Your socket connection to the server was not read from or written to within the timeout period.
  • **HTTP Status Code**: 400 Bad Request
  • **SOAP Fault Code Prefix**: Client
• **Code**: RequestTimeTooSkewed
  • **Description**: The difference between the request time and the server's time is too large.
  • **HTTP Status Code**: 403 Forbidden
  • **SOAP Fault Code Prefix**: Client
• **Code**: RequestTorrentOfBucketError
  • **Description**: Requesting the torrent file of a bucket is not permitted.
  • **HTTP Status Code**: 400 Bad Request
  • **SOAP Fault Code Prefix**: Client
• **Code**: SignatureDoesNotMatch
  • **Description**: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see [REST Authentication](#) and [SOAP Authentication](#) for details.
  • **HTTP Status Code**: 403 Forbidden
  • **SOAP Fault Code Prefix**: Client
• **Code**: ServiceUnavailable
  • **Description**: Service is unable to handle request.
  • **HTTP Status Code**: 503 Service Unavailable
  • **SOAP Fault Code Prefix**: Server
• **Code**: SlowDown
  • **Description**: Reduce your request rate.
  • **HTTP Status Code**: 503 Slow Down
  • **SOAP Fault Code Prefix**: Server
• **Code**: TemporaryRedirect
• **Description:** You are being redirected to the bucket while DNS updates.
• **HTTP Status Code:** 307 Moved Temporarily
• **SOAP Fault Code Prefix:** Client
• **Code:** TokenRefreshRequired
  • **Description:** The provided token must be refreshed.
• **HTTP Status Code:** 400 Bad Request
• **SOAP Fault Code Prefix:** Client
• **Code:** TooMany Buckets
  • **Description:** You have attempted to create more buckets than allowed.
• **HTTP Status Code:** 400 Bad Request
• **SOAP Fault Code Prefix:** Client
• **Code:** UnexpectedContent
  • **Description:** This request does not support content.
• **HTTP Status Code:** 400 Bad Request
• **SOAP Fault Code Prefix:** Client
• **Code:** UnresolvableGrantByEmail Address
  • **Description:** The email address you provided does not match any account on record.
• **HTTP Status Code:** 400 Bad Request
• **SOAP Fault Code Prefix:** Client
• **Code:** UserKeyMustBeSpecified
  • **Description:** The bucket POST must contain the specified field name. If it is specified, check the order of the fields.
• **HTTP Status Code:** 400 Bad Request
• **SOAP Fault Code Prefix:** Client

**Type:** String

**Required:** No

**Key**

The error key.

**Type:** String

**Length Constraints:** Minimum length of 1.

**Required:** No

**Message**

The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don’t know how or don’t care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message.

**Type:** String

**Required:** No

**VersionId**

The version ID of the error.
Type: String
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**ErrorDocument**  
Service: Amazon S3  
The error information.

**Contents**

**Key**

The object key name to use when a 4XX class error occurs.

**Important**  
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
EventBridgeConfiguration
Service: Amazon S3

A container for specifying the configuration for Amazon EventBridge.

Contents
The members of this exception structure are context-dependent.

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
**ExistingObjectReplication**

Service: Amazon S3

Optional configuration to replicate existing source bucket objects. For more information, see [Replicating Existing Objects](#) in the *Amazon S3 User Guide*.

**Contents**

**Status**

Specifies whether Amazon S3 replicates existing source bucket objects.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
FilterRule
Service: Amazon S3

Specifies the Amazon S3 object key name to filter on and whether to filter on the suffix or prefix of the key name.

Contents

Name
The object key name prefix or suffix identifying one or more objects to which the filtering rule applies. The maximum length is 1,024 characters. Overlapping prefixes and suffixes are not supported. For more information, see Configuring Event Notifications in the Amazon S3 User Guide.

Type: String

Valid Values: prefix | suffix

Required: No

Value
The value that the filter searches for in object key names.

Type: String

Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GetObjectAttributesParts
Service: Amazon S3

A collection of parts associated with a multipart upload.

Contents

IsTruncated

Indicates whether the returned list of parts is truncated. A value of true indicates that the list was truncated. A list can be truncated if the number of parts exceeds the limit returned in the MaxParts element.

Type: Boolean
Required: No

MaxParts

The maximum number of parts allowed in the response.

Type: Integer
Required: No

NextPartNumberMarker

When a list is truncated, this element specifies the last part in the list, as well as the value to use for the PartNumberMarker request parameter in a subsequent request.

Type: Integer
Required: No

PartNumberMarker

The marker for the current part.

Type: Integer
Required: No

Parts

A container for elements related to a particular part. A response can contain zero or more Parts elements.

Type: Array of ObjectPart (p. 780) data types
Required: No

TotalPartsCount

The total number of parts.

Type: Integer
Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
GlacierJobParameters
Service: Amazon S3

Contents

Tier

Retrieval tier at which the restore will be processed.

Type: String

Valid Values: Standard | Bulk | Expedited

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Grant**  
Service: Amazon S3  
Container for grant information.

**Contents**

**Grantee**

The person being granted permissions.

Type: [Grantee](#) data type

Required: No

**Permission**

Specifies the permission given to the grantee.

Type: String

Valid Values: FULL_CONTROL | WRITE | WRITE_ACP | READ | READ_ACP

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
Grantee
Service: Amazon S3

Container for the person being granted permissions.

Contents

Type

Type of grantee
Type: String
Valid Values: CanonicalUser | AmazonCustomerByEmail | Group
Required: Yes

DisplayName

Screen name of the grantee.
Type: String
Required: No

EmailAddress

Email address of the grantee.

Note
Using email addresses to specify a grantee is only supported in the following AWS Regions:
• US East (N. Virginia)
• US West (N. California)
• US West (Oregon)
• Asia Pacific (Singapore)
• Asia Pacific (Sydney)
• Asia Pacific (Tokyo)
• Europe (Ireland)
• South America (São Paulo)
For a list of all the Amazon S3 supported Regions and endpoints, see Regions and Endpoints in the AWS General Reference.

Type: String
Required: No

ID

The canonical user ID of the grantee.
Type: String
Required: No

URI

URI of the grantee group.
Type: String
Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
IndexDocument

Service: Amazon S3

Container for the Suffix element.

Contents

Suffix

A suffix that is appended to a request that is for a directory on the website endpoint (for example, if the suffix is index.html and you make a request to samplebucket/images/ the data that is returned will be for the object with the key name images/index.html) The suffix must not be empty and must not include a slash character.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Initiator**
Service: Amazon S3

Container element that identifies who initiated the multipart upload.

**Contents**

**DisplayName**

Name of the Principal.

Type: String
Required: No

**ID**

If the principal is an AWS account, it provides the Canonical User ID. If the principal is an IAM User, it provides a user ARN value.

Type: String
Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](https://aws.amazon.com/sdk-for-cpp/
- [AWS SDK for Go](https://aws.amazon.com/sdk-for-go/
- [AWS SDK for Java V2](https://aws.amazon.com/sdk-for-java/
- [AWS SDK for Ruby V3](https://aws.amazon.com/sdk-for-ruby/)
InputSerialization
Service: Amazon S3

Describes the serialization format of the object.

Contents

CompressionType

Specifies object's compression format. Valid values: NONE, GZIP, BZIP2. Default Value: NONE.

Type: String

Valid Values: NONE | GZIP | BZIP2

Required: No

CSV

Describes the serialization of a CSV-encoded object.

Type: CSVInput (p. 701) data type

Required: No

JSON

Specifies JSON as object's input serialization format.

Type: JSONInput (p. 749) data type

Required: No

Parquet

Specifies Parquet as object's input serialization format.

Type: ParquetInput (p. 789) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
IntelligentTieringAndOperator
Service: Amazon S3

A container for specifying S3 Intelligent-Tiering filters. The filters determine the subset of objects to which the rule applies.

Contents

Prefix

An object key name prefix that identifies the subset of objects to which the configuration applies.

Type: String

Required: No

Tags

All of these tags must exist in the object's tag set in order for the configuration to apply.

Type: Array of Tag (p. 838) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
IntelligentTieringConfiguration
Service: Amazon S3

Specifies the S3 Intelligent-Tiering configuration for an Amazon S3 bucket.

For information about the S3 Intelligent-Tiering storage class, see Storage class for automatically optimizing frequently and infrequently accessed objects.

Contents

Id

The ID used to identify the S3 Intelligent-Tiering configuration.

Type: String

Required: Yes

Status

Specifies the status of the configuration.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

Tierings

Specifies the S3 Intelligent-Tiering storage class tier of the configuration.

Type: Array of Tiering (p. 841) data types

Required: Yes

Filter

Specifies a bucket filter. The configuration only includes objects that meet the filter's criteria.

Type: IntelligentTieringFilter (p. 740) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
IntelligentTieringFilter
Service: Amazon S3

The Filter is used to identify objects that the S3 Intelligent-Tiering configuration applies to.

Contents

And

A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator must have at least two predicates, and an object must match all of the predicates in order for the filter to apply.

Type: IntelligentTieringAndOperator (p. 738) data type

Required: No

Prefix

An object key name prefix that identifies the subset of objects to which the rule applies.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String

Required: No

Tag

A container of a key value name pair.

Type: Tag (p. 838) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InventoryConfiguration
Service: Amazon S3

Specifies the inventory configuration for an Amazon S3 bucket. For more information, see GET Bucket inventory in the Amazon S3 API Reference.

Contents

Destination

Contains information about where to publish the inventory results.

Type: InventoryDestination (p. 743) data type

Required: Yes

Id

The ID used to identify the inventory configuration.

Type: String

Required: Yes

IncludedObjectVersions

Object versions to include in the inventory list. If set to All, the list includes all the object versions, which adds the version-related fields VersionId, IsLatest, and DeleteMarker to the list. If set to Current, the list does not contain these version-related fields.

Type: String

Valid Values: All | Current

Required: Yes

IsEnabled

Specifies whether the inventory is enabled or disabled. If set to True, an inventory list is generated. If set to False, no inventory list is generated.

Type: Boolean

Required: Yes

Schedule

Specifies the schedule for generating inventory results.

Type: InventorySchedule (p. 748) data type

Required: Yes

Filter

Specifies an inventory filter. The inventory only includes objects that meet the filter's criteria.

Type: InventoryFilter (p. 745) data type

Required: No

OptionalFields

Contains the optional fields that are included in the inventory results.
Type: Array of strings

Valid Values: Size | LastModifieldate | StorageClass | ETag | IsMultipartUploaded | ReplicationStatus | EncryptionStatus | ObjectLockRetainUntilDate | ObjectLockMode | ObjectLockLegalHoldStatus | IntelligentTieringAccessTier | BucketKeyStatus | ChecksumAlgorithm | ObjectAccessControllist | ObjectOwner

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InventoryDestination
Service: Amazon S3

Specifies the inventory configuration for an Amazon S3 bucket.

Contents

S3BucketDestination

Contains the bucket name, file format, bucket owner (optional), and prefix (optional) where inventory results are published.

Type: InventoryS3BucketDestination (p. 746) data type

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

API Version 2006-03-01
InventoryEncryption
Service: Amazon S3

Contains the type of server-side encryption used to encrypt the inventory results.

Contents

SSEKMS

Specifies the use of SSE-KMS to encrypt delivered inventory reports.

Type: SSEKMS (p. 831) data type

Required: No

SSES3

Specifies the use of SSE-S3 to encrypt delivered inventory reports.

Type: SSES3 (p. 833) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InventoryFilter
Service: Amazon S3

Specifies an inventory filter. The inventory only includes objects that meet the filter’s criteria.

Contents

Prefix

The prefix that an object must have to be included in the inventory results.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InventoryS3BucketDestination
Service: Amazon S3

Contains the bucket name, file format, bucket owner (optional), and prefix (optional) where inventory results are published.

Contents

Bucket

The Amazon Resource Name (ARN) of the bucket where inventory results will be published.

Type: String

Required: Yes

Format

Specifies the output format of the inventory results.

Type: String

Valid Values: CSV | ORC | Parquet

Required: Yes

AccountId

The account ID that owns the destination S3 bucket. If no account ID is provided, the owner is not validated before exporting data.

Note

Although this value is optional, we strongly recommend that you set it to help prevent problems if the destination bucket ownership changes.

Type: String

Required: No

Encryption

Contains the type of server-side encryption used to encrypt the inventory results.

Type: InventoryEncryption(p. 744) data type

Required: No

Prefix

The prefix that is prepended to all inventory results.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
InventorySchedule
Service: Amazon S3

Specifies the schedule for generating inventory results.

Contents

Frequency

Specifies how frequently inventory results are produced.

Type: String

Valid Values: Daily | Weekly

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JSONInput
Service: Amazon S3

Specifies JSON as object's input serialization format.

Contents

Type

The type of JSON. Valid values: Document, Lines.

Type: String

Valid Values: DOCUMENT | LINES

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JSONOutput
Service: Amazon S3

Specifies JSON as request's output serialization format.

Contents

RecordDelimiter

The value used to separate individual records in the output. If no value is specified, Amazon S3 uses a newline character ('\n').

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LambdaFunctionConfiguration

Service: Amazon S3

A container for specifying the configuration for AWS Lambda notifications.

Contents

Events

The Amazon S3 bucket event for which to invoke the AWS Lambda function. For more information, see Supported Event Types in the Amazon S3 User Guide.

Type: Array of strings

Required: Yes

LambdaFunctionArn

The Amazon Resource Name (ARN) of the AWS Lambda function that Amazon S3 invokes when the specified event type occurs.

Type: String

Required: Yes

Filter

Specifies object key name filtering rules. For information about key name filtering, see Configuring event notifications using object key name filtering in the Amazon S3 User Guide.

Type: NotificationConfigurationFilter (p. 772) data type

Required: No

Id

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
LifecycleConfiguration
Service: Amazon S3

Container for lifecycle rules. You can add as many as 1000 rules.

For more information see, Managing your storage lifecycle in the Amazon S3 User Guide.

Contents

Rules

Specifies lifecycle configuration rules for an Amazon S3 bucket.

Type: Array of Rule (p. 819) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**LifecycleExpiration**  
Service: Amazon S3

Container for the expiration for the lifecycle of the object.

For more information see, *Managing your storage lifecycle* in the *Amazon S3 User Guide*.

**Contents**

**Date**

Indicates at what date the object is to be moved or deleted. The date value must conform to the ISO 8601 format. The time is always midnight UTC.

Type: Timestamp  
Required: No

**Days**

Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer.

Type: Integer  
Required: No

**ExpiredObjectDeleteMarker**

Indicates whether Amazon S3 will remove a delete marker with no noncurrent versions. If set to true, the delete marker will be expired; if set to false the policy takes no action. This cannot be specified with Days or Date in a Lifecycle Expiration Policy.

Type: Boolean  
Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
**LifecycleRule**

Service: Amazon S3

A lifecycle rule for individual objects in an Amazon S3 bucket.

For more information see, [Managing your storage lifecycle](https://docs.aws.amazon.com/AmazonS3/latest/userguide/lifecycle-how-to-manage-lifecycle.html) in the *Amazon S3 User Guide*.

**Contents**

**Status**

If 'Enabled', the rule is currently being applied. If 'Disabled', the rule is not currently being applied.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**AbortIncompleteMultipartUpload**

Specifies the days since the initiation of an incomplete multipart upload that Amazon S3 will wait before permanently removing all parts of the upload. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration](https://docs.aws.amazon.com/AmazonS3/latest/userguide/lifecycle-how-to-manage-lifecycle.html) in the *Amazon S3 User Guide*.

Type: [AbortIncompleteMultipartUpload](#) data type

Required: No

**Expiration**

Specifies the expiration for the lifecycle of the object in the form of date, days and, whether the object has a delete marker.

Type: [LifecycleExpiration](#) data type

Required: No

**Filter**

The Filter is used to identify objects that a Lifecycle Rule applies to. A Filter must have exactly one of Prefix, Tag, or And specified. Filter is required if the LifecycleRule does not contain a Prefix element.

Type: [LifecycleRuleFilter](#) data type

Required: No

**ID**

Unique identifier for the rule. The value cannot be longer than 255 characters.

Type: String

Required: No

**NoncurrentVersionExpiration**

Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime.

Type: [NoncurrentVersionExpiration](#) data type
Required: No

**NoncurrentVersionTransitions**

Specifies the transition rule for the lifecycle rule that describes when noncurrent objects transition to a specific storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request that Amazon S3 transition noncurrent object versions to a specific storage class at a set period in the object's lifetime.

Type: Array of [NoncurrentVersionTransition](p. 769) data types

Required: No

**Prefix**

*This member has been deprecated.*

Prefix identifying one or more objects to which the rule applies. This is no longer used; use **Filter** instead.

**Important**

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Type: String

Required: No

**Transitions**

Specifies when an Amazon S3 object transitions to a specified storage class.

Type: Array of [Transition](p. 846) data types

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
LifecycleRuleAndOperator
Service: Amazon S3

This is used in a Lifecycle Rule Filter to apply a logical AND to two or more predicates. The Lifecycle Rule will apply to any object matching all of the predicates configured inside the And operator.

Contents

ObjectSizeGreaterThan
Minimum object size to which the rule applies.
Type: Long
Required: No

ObjectSizeLessThan
Maximum object size to which the rule applies.
Type: Long
Required: No

Prefix
Prefix identifying one or more objects to which the rule applies.
Type: String
Required: No

Tags
All of these tags must exist in the object's tag set in order for the rule to apply.
Type: Array of Tag data types
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LifecycleRuleFilter
Service: Amazon S3

The Filter is used to identify objects that a Lifecycle Rule applies to. A Filter must have exactly one of Prefix, Tag, or And specified.

Contents

And

This is used in a Lifecycle Rule Filter to apply a logical AND to two or more predicates. The Lifecycle Rule will apply to any object matching all of the predicates configured inside the And operator.

Type: LifecycleRuleAndOperator (p. 757) data type

Required: No

ObjectSizeGreaterThan

Minimum object size to which the rule applies.

Type: Long

Required: No

ObjectSizeLessThan

Maximum object size to which the rule applies.

Type: Long

Required: No

Prefix

Prefix identifying one or more objects to which the rule applies.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String

Required: No

Tag

This tag must exist in the object's tag set in order for the rule to apply.

Type: Tag (p. 838) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LoggingEnabled
Service: Amazon S3

Describes where logs are stored and the prefix that Amazon S3 assigns to all log object keys for a bucket. For more information, see PUT Bucket logging in the Amazon S3 API Reference.

Contents

TargetBucket

Specifies the bucket where you want Amazon S3 to store server access logs. You can have your logs delivered to any bucket that you own, including the same bucket that is being logged. You can also configure multiple buckets to deliver their logs to the same target bucket. In this case, you should choose a different TargetPrefix for each source bucket so that the delivered log files can be distinguished by key.

Type: String
Required: Yes

TargetPrefix

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.

Type: String
Required: Yes

TargetGrants

Container for granting information.

Buckets that use the bucket owner enforced setting for Object Ownership don't support target grants. For more information, see Permissions for server access log delivery in the Amazon S3 User Guide.

Type: Array of TargetGrant (p. 840) data types
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
MetadataEntry
Service: Amazon S3

A metadata key-value pair to store with an object.

Contents

Name

Name of the object.

Type: String

Required: No

Value

Value of the object.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Metrics**
Service: Amazon S3

A container specifying replication metrics-related settings enabling replication metrics and events.

**Contents**

**Status**

Specifies whether the replication metrics are enabled.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**EventThreshold**

A container specifying the time threshold for emitting the `s3:Replication:OperationMissedThreshold` event.

Type: [ReplicationTimeValue](p. 812) data type

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
MetricsAndOperator
Service: Amazon S3

A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator must have at least two predicates, and an object must match all of the predicates in order for the filter to apply.

Contents

AccessPointArn
The access point ARN used when evaluating an AND predicate.
Type: String
Required: No

Prefix
The prefix used when evaluating an AND predicate.
Type: String
Required: No

Tags
The list of tags used when evaluating an AND predicate.
Type: Array of Tag (p. 838) data types
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**MetricsConfiguration**
Service: Amazon S3

Specifies a metrics configuration for the CloudWatch request metrics (specified by the metrics configuration ID) from an Amazon S3 bucket. If you're updating an existing metrics configuration, note that this is a full replacement of the existing metrics configuration. If you don't include the elements you want to keep, they are erased. For more information, see [PutBucketMetricsConfiguration](#).  

**Contents**

**Id**

The ID used to identify the metrics configuration. The ID has a 64 character limit and can only contain letters, numbers, periods, dashes, and underscores.

Type: String

Required: Yes

**Filter**

Specifies a metrics configuration filter. The metrics configuration will only include objects that meet the filter's criteria. A filter must be a prefix, an object tag, an access point ARN, or a conjunction (MetricsAndOperator).

Type: [MetricsFilter](#) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
MetricsFilter
Service: Amazon S3

Specifies a metrics configuration filter. The metrics configuration only includes objects that meet
the filter's criteria. A filter must be a prefix, an object tag, an access point ARN, or a conjunction
(MetricsAndOperator). For more information, see PutBucketMetricsConfiguration.

Contents

AccessPointArn
The access point ARN used when evaluating a metrics filter.

Type: String
Required: No

And
A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator
must have at least two predicates, and an object must match all of the predicates in order for the
filter to apply.

Type: MetricsAndOperator (p. 763) data type
Required: No

Prefix
The prefix used when evaluating a metrics filter.

Type: String
Required: No

Tag
The tag used when evaluating a metrics filter.

Type: Tag (p. 838) data type
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
MultipartUpload
Service: Amazon S3

Container for the MultipartUpload for the Amazon S3 object.

Contents

ChecksumAlgorithm
The algorithm that was used to create a checksum of the object.
Type: String
Valid Values: CRC32 | CRC32C | SHA1 | SHA256
Required: No

Initiated
Date and time at which the multipart upload was initiated.
Type: Timestamp
Required: No

Initiator
Identifies who initiated the multipart upload.
Type: Initiator (p. 736) data type
Required: No

Key
Key of the object for which the multipart upload was initiated.
Type: String
Length Constraints: Minimum length of 1.
Required: No

Owner
Specifies the owner of the object that is part of the multipart upload.
Type: Owner (p. 786) data type
Required: No

StorageClass
The class of storage used to store the object.
Type: String
Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW
Required: No

UploadId
Upload ID that identifies the multipart upload.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NoncurrentVersionExpiration
Service: Amazon S3

Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime.

Contents

NewerNoncurrentVersions

Specifies how many newer noncurrent versions must exist before Amazon S3 can perform the associated action on a given version. If there are this many more recent noncurrent versions, Amazon S3 will take the associated action. For more information about noncurrent versions, see Lifecycle configuration elements in the Amazon S3 User Guide.

Type: Integer
Required: No

NoncurrentDays

Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. The value must be a non-zero positive integer. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the Amazon S3 User Guide.

Type: Integer
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NoncurrentVersionTransition
Service: Amazon S3

Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA, ONEZONE_IA, INTELLIGENT_TIERING, GLACIER_IR, GLACIER, or DEEP_ARCHIVE storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request that Amazon S3 transition noncurrent object versions to the STANDARD_IA, ONEZONE_IA, INTELLIGENT_TIERING, GLACIER_IR, GLACIER, or DEEP_ARCHIVE storage class at a specific period in the object's lifetime.

Contents

NewerNoncurrentVersions

Specifies how many newer noncurrent versions must exist before Amazon S3 can perform the associated action on a given version. If there are this many more recent noncurrent versions, Amazon S3 will take the associated action. For more information about noncurrent versions, see Lifecycle configuration elements in the Amazon S3 User Guide.

Type: Integer
Required: No

NoncurrentDays

Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates How Long an Object Has Been Noncurrent in the Amazon S3 User Guide.

Type: Integer
Required: No

StorageClass

The class of storage used to store the object.

Type: String

Valid Values: GLACIER | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | DEEP_ARCHIVE | GLACIER_IR

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NotificationConfiguration
Service: Amazon S3

A container for specifying the notification configuration of the bucket. If this element is empty, notifications are turned off for the bucket.

Contents

EventBridgeConfiguration

Enables delivery of events to Amazon EventBridge.

Type: EventBridgeConfiguration (p. 726) data type

Required: No

LambdaFunctionConfigurations

Describes the AWS Lambda functions to invoke and the events for which to invoke them.

Type: Array of LambdaFunctionConfiguration (p. 751) data types

Required: No

QueueConfigurations

The Amazon Simple Queue Service queues to publish messages to and the events for which to publish messages.

Type: Array of QueueConfiguration (p. 797) data types

Required: No

TopicConfigurations

The topic to which notifications are sent and the events for which notifications are generated.

Type: Array of TopicConfiguration (p. 842) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NotificationConfigurationDeprecated
Service: Amazon S3

Contents

CloudFunctionConfiguration

Container for specifying the AWS Lambda notification configuration.

Type: CloudFunctionConfiguration (p. 685) data type

Required: No

QueueConfiguration

This data type is deprecated. This data type specifies the configuration for publishing messages to an Amazon Simple Queue Service (Amazon SQS) queue when Amazon S3 detects specified events.

Type: QueueConfigurationDeprecated (p. 799) data type

Required: No

TopicConfiguration

This data type is deprecated. A container for specifying the configuration for publication of messages to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects specified events.

Type: TopicConfigurationDeprecated (p. 844) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
NotificationConfigurationFilter
Service: Amazon S3

Specifies object key name filtering rules. For information about key name filtering, see Configuring event notifications using object key name filtering in the Amazon S3 User Guide.

Contents

Key

A container for object key name prefix and suffix filtering rules.

Type: S3KeyFilter (p. 821) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Object
Service: Amazon S3

An object consists of data and its descriptive metadata.

Contents

ChecksumAlgorithm
The algorithm that was used to create a checksum of the object.

Type: Array of strings

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Required: No

ETag
The entity tag is a hash of the object. The ETag reflects changes only to the contents of an object, not its metadata. The ETag may or may not be an MD5 digest of the object data. Whether or not it is depends on how the object was created and how it is encrypted as described below:

- Objects created by the PUT Object, POST Object, or Copy operation, or through the AWS Management Console, and are encrypted by SSE-S3 or plaintext, have ETags that are an MD5 digest of their object data.
- Objects created by the PUT Object, POST Object, or Copy operation, or through the AWS Management Console, and are encrypted by SSE-C or SSE-KMS, have ETags that are not an MD5 digest of their object data.
- If an object is created by either the Multipart Upload or Part Copy operation, the ETag is not an MD5 digest, regardless of the method of encryption. If an object is larger than 16 MB, the AWS Management Console will upload or copy that object as a Multipart Upload, and therefore the ETag will not be an MD5 digest.

Type: String

Required: No

Key
The name that you assign to an object. You use the object key to retrieve the object.

Type: String

Length Constraints: Minimum length of 1.

Required: No

LastModified
Creation date of the object.

Type: Timestamp

Required: No

Owner
The owner of the object

Type: Owner (p. 786) data type

Required: No
RestoreStatus

Specifies the restoration status of an object. Objects in certain storage classes must be restored before they can be retrieved. For more information about these storage classes and how to work with archived objects, see Working with archived objects in the Amazon S3 User Guide.

Type: RestoreStatus (p. 817) data type

Required: No

Size

Size in bytes of the object

Type: Long

Required: No

StorageClass

The class of storage used to store the object.

Type: String

Valid Values: STANDARD | REDUCED_REDUndancy | GLACIER | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectIdentifier
Service: Amazon S3

Object Identifier is unique value to identify objects.

Contents

Key

Key name of the object.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String
Length Constraints: Minimum length of 1.
Required: Yes

VersionId

VersionId for the specific version of the object to delete.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLockConfiguration
Service: Amazon S3

The container element for Object Lock configuration parameters.

Contents

ObjectLockEnabled

Indicates whether this bucket has an Object Lock configuration enabled. Enable ObjectLockEnabled when you apply ObjectLockConfiguration to a bucket.

Type: String

Valid Values: Enabled

Required: No

Rule

Specifies the Object Lock rule for the specified object. Enable this rule when you apply ObjectLockConfiguration to a bucket. Bucket settings require both a mode and a period. The period can be either Days or Years but you must select one. You cannot specify Days and Years at the same time.

Type: ObjectLockRule (p. 779) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLockLegalHold
Service: Amazon S3

A legal hold configuration for an object.

Contents

Status

Indicates whether the specified object has a legal hold in place.

Type: String

Valid Values: ON | OFF

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLockRetention
Service: Amazon S3

A Retention configuration for an object.

Contents

Mode
Indicates the Retention mode for the specified object.

Type: String
Valid Values: GOVERNANCE | COMPLIANCE
Required: No

RetainUntilDate
The date on which this Object Lock Retention will expire.

Type: Timestamp
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLockRule
Service: Amazon S3

The container element for an Object Lock rule.

Contents

DefaultRetention

The default Object Lock retention mode and period that you want to apply to new objects placed in the specified bucket. Bucket settings require both a mode and a period. The period can be either Days or Years but you must select one. You cannot specify Days and Years at the same time.

Type: DefaultRetention (p. 705) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectPart
Service: Amazon S3

A container for elements related to an individual part.

Contents

ChecksumCRC32

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32 checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumCRC32C

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA1

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA256

The base64-encoded, 256-bit SHA-256 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

PartNumber

The part number identifying the part. This value is a positive integer between 1 and 10,000.

Type: Integer
Required: No

Size

The size of the uploaded part in bytes.

Type: Long
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectVersion
Service: Amazon S3

The version of an object.

Contents

ChecksumAlgorithm

The algorithm that was used to create a checksum of the object.

Type: Array of strings

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Required: No

ETag

The entity tag is an MD5 hash of that version of the object.

Type: String

Required: No

IsLatest

Specifies whether the object is (true) or is not (false) the latest version of an object.

Type: Boolean

Required: No

Key

The object key.

Type: String

Length Constraints: Minimum length of 1.

Required: No

LastModified

Date and time when the object was last modified.

Type: Timestamp

Required: No

Owner

Specifies the owner of the object.

Type: Owner (p. 786) data type

Required: No

RestoreStatus

Specifies the restoration status of an object. Objects in certain storage classes must be restored before they can be retrieved. For more information about these storage classes and how to work with archived objects, see Working with archived objects in the Amazon S3 User Guide.
Type: \texttt{RestoreStatus (p. 817)} data type

Required: No

\textbf{Size}

Size in bytes of the object.

Type: \texttt{Long}

Required: No

\textbf{StorageClass}

The class of storage used to store the object.

Type: \texttt{String}

Valid Values: STANDARD

Required: No

\textbf{VersionId}

Version ID of an object.

Type: \texttt{String}

Required: No

\textbf{See Also}

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- \texttt{AWS SDK for C++}
- \texttt{AWS SDK for Go}
- \texttt{AWS SDK for Java V2}
- \texttt{AWS SDK for Ruby V3}
OutputLocation
Service: Amazon S3

Describes the location where the restore job's output is stored.

Contents

S3

Describes an S3 location that will receive the results of the restore request.

Type: S3Location (p. 822) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
OutputSerialization
Service: Amazon S3

Describes how results of the Select job are serialized.

Contents

CSV

Describes the serialization of CSV-encoded Select results.

Type: CSVOutput (p. 703) data type

Required: No

JSON

Specifies JSON as request's output serialization format.

Type: JSONOutput (p. 750) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Owner**

Service: Amazon S3

Container for the owner's display name and ID.

**Contents**

**DisplayName**

Container for the display name of the owner. This value is only supported in the following AWS Regions:
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Europe (Ireland)
- South America (São Paulo)

Type: String

Required: No

**ID**

Container for the ID of the owner.

Type: String

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](https://aws.amazon.com/sdk-for-cpp/)

- [AWS SDK for Ruby V3](https://aws.amazon.com/sdk-for-ruby/)

---

API Version: 2006-03-01

Page: 786
OwnershipControls
Service: Amazon S3

The container element for a bucket's ownership controls.

Contents

Rules

The container element for an ownership control rule.

Type: Array of OwnershipControlsRule (p. 788) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
OwnershipControlsRule
Service: Amazon S3

The container element for an ownership control rule.

Contents

ObjectOwnership

The container element for object ownership for a bucket's ownership controls.

BucketOwnerPreferred - Objects uploaded to the bucket change ownership to the bucket owner if the objects are uploaded with the bucket-owner-full-control canned ACL.

ObjectWriter - The uploading account will own the object if the object is uploaded with the bucket-owner-full-control canned ACL.

BucketOwnerEnforced - Access control lists (ACLs) are disabled and no longer affect permissions. The bucket owner automatically owns and has full control over every object in the bucket. The bucket only accepts PUT requests that don't specify an ACL or bucket owner full control ACLs, such as the bucket-owner-full-control canned ACL or an equivalent form of this ACL expressed in the XML format.

Type: String

Valid Values: BucketOwnerPreferred | ObjectWriter | BucketOwnerEnforced

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ParquetInput
Service: Amazon S3

Container for Parquet.

Contents

The members of this exception structure are context-dependent.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
Part
Service: Amazon S3

Container for elements related to a part.

Contents

ChecksumCRC32

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 32-bit CRC32 checksum of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumCRC32C

The base64-encoded, 32-bit CRC32C checksum of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA1

The base64-encoded, 160-bit SHA-1 digest of the object. This will only be present if it was uploaded with the object. With multipart uploads, this may not be a checksum value of the object. For more information about how checksums are calculated with multipart uploads, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ChecksumSHA256

This header can be used as a data integrity check to verify that the data received is the same data that was originally sent. This header specifies the base64-encoded, 256-bit SHA-256 digest of the object. For more information, see Checking object integrity in the Amazon S3 User Guide.

Type: String
Required: No

ETag

Entity tag returned when the part was uploaded.

Type: String
Required: No

LastModified

Date and time at which the part was uploaded.

Type: Timestamp
Required: No
PartNumber

Part number identifying the part. This is a positive integer between 1 and 10,000.

Type: Integer
Required: No

Size

Size in bytes of the uploaded part data.

Type: Long
Required: No

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PolicyStatus
Service: Amazon S3

The container element for a bucket's policy status.

Contents

IsPublic

The policy status for this bucket. TRUE indicates that this bucket is public. FALSE indicates that the bucket is not public.

Type: Boolean
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Progress
Service: Amazon S3

This data type contains information about progress of an operation.

Contents

BytesProcessed
The current number of uncompressed object bytes processed.
Type: Long
Required: No

BytesReturned
The current number of bytes of records payload data returned.
Type: Long
Required: No

BytesScanned
The current number of object bytes scanned.
Type: Long
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ProgressEvent
Service: Amazon S3

This data type contains information about the progress event of an operation.

Contents

Details

The Progress event details.

Type: Progress (p. 793) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PublicAccessBlockConfiguration

Service: Amazon S3

The PublicAccessBlock configuration that you want to apply to this Amazon S3 bucket. You can enable the configuration options in any combination. For more information about when Amazon S3 considers a bucket or object public, see The Meaning of "Public" in the Amazon S3 User Guide.

Contents

BlockPublicAcls

Specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to TRUE causes the following behavior:

- PUT Bucket ACL and PUT Object ACL calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

Type: Boolean

Required: No

BlockPublicPolicy

Specifies whether Amazon S3 should block public bucket policies for this bucket. Setting this element to TRUE causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.

Type: Boolean

Required: No

IgnorePublicAcls

Specifies whether Amazon S3 should ignore public ACLs for this bucket and objects in this bucket. Setting this element to TRUE causes Amazon S3 to ignore all public ACLs on this bucket and objects in this bucket.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.

Type: Boolean

Required: No

RestrictPublicBuckets

Specifies whether Amazon S3 should restrict public bucket policies for this bucket. Setting this element to TRUE restricts access to this bucket to only AWS service principals and authorized users within this account if the bucket has a public policy.

Enabling this setting doesn't affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.

Type: Boolean

Required: No

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
QueueConfiguration
Service: Amazon S3

Specifies the configuration for publishing messages to an Amazon Simple Queue Service (Amazon SQS) queue when Amazon S3 detects specified events.

Contents

Events

A collection of bucket events for which to send notifications

Type: Array of strings

Valid Values:
- s3:ReducedRedundancyLostObject
- s3:ObjectCreated:* 
- s3:ObjectCreated:Put
- s3:ObjectCreated:Post
- s3:ObjectCreated:Copy
- s3:ObjectCreated:CompleteMultipartUpload
- s3:ObjectRemoved:* 
- s3:ObjectRemoved:Delete
- s3:ObjectRemoved:DeleteMarkerCreated
- s3:ObjectRestore:* 
- s3:ObjectRestore:Post
- s3:ObjectRestore:Completed
- s3:Replication:* 
- s3:Replication:OperationFailedReplication
- s3:Replication:OperationNotTracked
- s3:Replication:OperationMissedThreshold
- s3:Replication:OperationReplicatedAfterThreshold
- s3:LifecycleTransition
- s3:IntelligentTiering
- s3:ObjectAcl:Put
- s3:LifecycleExpiration:* 
- s3:LifecycleExpiration:Delete
- s3:LifecycleExpiration:DeleteMarkerCreated
- s3:ObjectTagging:* 
- s3:ObjectTagging:Put
- s3:ObjectTagging:Delete

Required: Yes

QueueArn

The Amazon Resource Name (ARN) of the Amazon SQS queue to which Amazon S3 publishes a message when it detects events of the specified type.

Type: String

Required: Yes

Filter

Specifies object key name filtering rules. For information about key name filtering, see Configuring event notifications using object key name filtering in the Amazon S3 User Guide.

Type: NotificationConfigurationFilter (p. 772) data type

Required: No

Id

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
QueueConfigurationDeprecated

Service: Amazon S3

This data type is deprecated. Use QueueConfiguration for the same purposes. This data type specifies the configuration for publishing messages to an Amazon Simple Queue Service (Amazon SQS) queue when Amazon S3 detects specified events.

Contents

Event

This member has been deprecated.

The bucket event for which to send notifications.

Type: String

Required: No

Events

A collection of bucket events for which to send notifications.

Type: Array of strings

Required: No

Id

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

Type: String
Queue

The Amazon Resource Name (ARN) of the Amazon SQS queue to which Amazon S3 publishes a message when it detects events of the specified type.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
RecordsEvent
Service: Amazon S3

The container for the records event.

Contents

Payload

The byte array of partial, one or more result records.

Type: Base64-encoded binary data object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Redirect**

Service: Amazon S3

Specifies how requests are redirected. In the event of an error, you can specify a different error code to return.

**Contents**

**HostName**

The host name to use in the redirect request.

Type: String

Required: No

**HttpRedirectCode**

The HTTP redirect code to use on the response. Not required if one of the siblings is present.

Type: String

Required: No

**Protocol**

Protocol to use when redirecting requests. The default is the protocol that is used in the original request.

Type: String

Valid Values: http | https

Required: No

**ReplaceKeyPrefixWith**

The object key prefix to use in the redirect request. For example, to redirect requests for all pages with prefix docs/ (objects in the docs/ folder) to documents/, you can set a condition block with KeyPrefixEquals set to docs/ and in the Redirect set ReplaceKeyPrefixWith to /documents. Not required if one of the siblings is present. Can be present only if ReplaceKeyWith is not provided.

**Important**

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Type: String

Required: No

**ReplaceKeyWith**

The specific object key to use in the redirect request. For example, redirect request to error.html.

Not required if one of the siblings is present. Can be present only if ReplaceKeyPrefixWith is not provided.

**Important**

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RedirectAllRequestsTo
Service: Amazon S3

Specifies the redirect behavior of all requests to a website endpoint of an Amazon S3 bucket.

Contents

HostName

Name of the host where requests are redirected.

Type: String
Required: Yes

Protocol

Protocol to use when redirecting requests. The default is the protocol that is used in the original request.

Type: String
Valid Values: http | https
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaModifications
Service: Amazon S3

A filter that you can specify for selection for modifications on replicas. Amazon S3 doesn't replicate replica modifications by default. In the latest version of replication configuration (when Filter is specified), you can specify this element and set the status to Enabled to replicate modifications on replicas.

Note
If you don't specify the Filter element, Amazon S3 assumes that the replication configuration is the earlier version, V1. In the earlier version, this element is not allowed.

Contents

Status

Specifies whether Amazon S3 replicates modifications on replicas.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationConfiguration
Service: Amazon S3

A container for replication rules. You can add up to 1,000 rules. The maximum size of a replication configuration is 2 MB.

Contents

Role

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that Amazon S3 assumes when replicating objects. For more information, see How to Set Up Replication in the Amazon S3 User Guide.

Type: String

Required: Yes

Rules

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

Type: Array of ReplicationRule (p. 807) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationRule
Service: Amazon S3

Specifies which Amazon S3 objects to replicate and where to store the replicas.

Contents

Destination
A container for information about the replication destination and its configurations including enabling the S3 Replication Time Control (S3 RTC).

Type: Destination (p. 710) data type

Required: Yes

Status
Specifies whether the rule is enabled.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

DeleteMarkerReplication
Specifies whether Amazon S3 replicates delete markers. If you specify a Filter in your replication configuration, you must also include a DeleteMarkerReplication element. If your Filter includes a Tag element, the DeleteMarkerReplication Status must be set to Disabled, because Amazon S3 does not support replicating delete markers for tag-based rules. For an example configuration, see Basic Rule Configuration.

For more information about delete marker replication, see Basic Rule Configuration.

Note
If you are using an earlier version of the replication configuration, Amazon S3 handles replication of delete markers differently. For more information, see Backward Compatibility.

Type: DeleteMarkerReplication (p. 709) data type

Required: No

ExistingObjectReplication
Optional configuration to replicate existing source bucket objects. For more information, see Replicating Existing Objects in the Amazon S3 User Guide.

Type: ExistingObjectReplication (p. 727) data type

Required: No

Filter
A filter that identifies the subset of objects to which the replication rule applies. A Filter must specify exactly one Prefix, Tag, or an And child element.

Type: ReplicationRuleFilter (p. 810) data type

Required: No

ID
A unique identifier for the rule. The maximum value is 255 characters.
Type: String
Required: No

Prefix

This member has been deprecated.

An object key name prefix that identifies the object or objects to which the rule applies. The maximum prefix length is 1,024 characters. To include all objects in a bucket, specify an empty string.

Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String
Required: No

Priority

The priority indicates which rule has precedence whenever two or more replication rules conflict. Amazon S3 will attempt to replicate objects according to all replication rules. However, if there are two or more rules with the same destination bucket, then objects will be replicated according to the rule with the highest priority. The higher the number, the higher the priority.

For more information, see Replication in the Amazon S3 User Guide.

Type: Integer
Required: No

SourceSelectionCriteria

A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer managed key stored in AWS Key Management Service (SSE-KMS).

Type: SourceSelectionCriteria (p. 830) data type
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationRuleAndOperator
Service: Amazon S3

A container for specifying rule filters. The filters determine the subset of objects to which the rule applies. This element is required only if you specify more than one filter.

For example:

- If you specify both a Prefix and a Tag filter, wrap these filters in an And tag.
- If you specify a filter based on multiple tags, wrap the Tag elements in an And tag.

Contents

Prefix

An object key name prefix that identifies the subset of objects to which the rule applies.

Type: String

Required: No

Tags

An array of tags containing key and value pairs.

Type: Array of Tag (p. 838) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationRuleFilter
Service: Amazon S3

A filter that identifies the subset of objects to which the replication rule applies. A Filter must specify exactly one Prefix, Tag, or an And child element.

Contents

And

A container for specifying rule filters. The filters determine the subset of objects to which the rule applies. This element is required only if you specify more than one filter. For example:

- If you specify both a Prefix and a Tag filter, wrap these filters in an And tag.
- If you specify a filter based on multiple tags, wrap the Tag elements in an And tag.

Type: ReplicationRuleAndOperator (p. 809) data type

Required: No

Prefix

An object key name prefix that identifies the subset of objects to which the rule applies.

Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Type: String

Required: No

Tag

A container for specifying a tag key and value.

The rule applies only to objects that have the tag in their tag set.

Type: Tag (p. 838) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationTime
Service: Amazon S3

A container specifying S3 Replication Time Control (S3 RTC) related information, including whether S3 RTC is enabled and the time when all objects and operations on objects must be replicated. Must be specified together with a Metrics block.

Contents

Status

Specifies whether the replication time is enabled.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

Time

A container specifying the time by which replication should be complete for all objects and operations on objects.

Type: ReplicationTimeValue (p. 812) data type

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationTimeValue
Service: Amazon S3

A container specifying the time value for S3 Replication Time Control (S3 RTC) and replication metrics EventThreshold.

Contents

Minutes

Contains an integer specifying time in minutes.

Valid value: 15

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RequestPaymentConfiguration
Service: Amazon S3

Container for Payer.

Contents

Payer

Specifies who pays for the download and request fees.

Type: String

Valid Values: Requester | BucketOwner

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RequestProgress
Service: Amazon S3

Container for specifying if periodic QueryProgress messages should be sent.

Contents

Enabled

Specifies whether periodic QueryProgress frames should be sent. Valid values: TRUE, FALSE. Default value: FALSE.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**RestoreRequest**  
Service: Amazon S3

Container for restore job parameters.

**Contents**

**Days**

Lifetime of the active copy in days. Do not use with restores that specify `OutputLocation`. The Days element is required for regular restores, and must not be provided for select requests.

Type: Integer

Required: No

**Description**

The optional description for the job.

Type: String

Required: No

**GlacierJobParameters**

S3 Glacier related parameters pertaining to this job. Do not use with restores that specify `OutputLocation`.

Type: [GlacierJobParameters](p. 731) data type

Required: No

**OutputLocation**

Describes the location where the restore job's output is stored.

Type: [OutputLocation](p. 784) data type

Required: No

**SelectParameters**

Describes the parameters for Select job types.

Type: [SelectParameters](p. 826) data type

Required: No

**Tier**

Retrieval tier at which the restore will be processed.

Type: String

Valid Values: Standard | Bulk | Expedited

Required: No

**Type**

Type of restore request.

Type: String
Valid Values: SELECT
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
**RestoreStatus**

Service: Amazon S3

Specifies the restoration status of an object. Objects in certain storage classes must be restored before they can be retrieved. For more information about these storage classes and how to work with archived objects, see [Working with archived objects](#) in the *Amazon S3 User Guide*.

**Contents**

**IsRestoreInProgress**

Specifies whether the object is currently being restored. If the object restoration is in progress, the header returns the value `TRUE`. For example:

```
x-amz-optional-object-attributes: IsRestoreInProgress="true"
```

If the object restoration has completed, the header returns the value `FALSE`. For example:

```
x-amz-optional-object-attributes: IsRestoreInProgress="false",
  RestoreExpiryDate="2012-12-21T00:00:00.000Z"
```

If the object hasn't been restored, there is no header response.

Type: Boolean

Required: No

**RestoreExpiryDate**

Indicates when the restored copy will expire. This value is populated only if the object has already been restored. For example:

```
x-amz-optional-object-attributes: IsRestoreInProgress="false",
  RestoreExpiryDate="2012-12-21T00:00:00.000Z"
```

Type: Timestamp

Required: No

**See Also**

RoutingRule
Service: Amazon S3

Specifies the redirect behavior and when a redirect is applied. For more information about routing rules, see Configuring advanced conditional redirects in the Amazon S3 User Guide.

Contents

Redirect

Container for redirect information. You can redirect requests to another host, to another page, or with another protocol. In the event of an error, you can specify a different error code to return.

Type: Redirect (p. 802) data type

Required: Yes

Condition

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the /docs folder, redirect to the /documents folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

Type: Condition (p. 691) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
### Rule

Service: Amazon S3

Specifies lifecycle rules for an Amazon S3 bucket. For more information, see [Put Bucket Lifecycle Configuration](https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutBucketLifecycleConfiguration.html) in the *Amazon S3 API Reference*. For examples, see [Put Bucket Lifecycle Configuration Examples](https://docs.aws.amazon.com/AmazonS3/latest/API/put_bucket_lifecycle_configuration.html).

#### Contents

**Prefix**

Object key prefix that identifies one or more objects to which this rule applies.

**Important**

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](https://docs.aws.amazon.com/AmazonS3/latest/API/put_bucket_lifecycle_configuration.html).

- **Type:** String
- **Required:** Yes

**Status**

If `Enabled`, the rule is currently being applied. If `Disabled`, the rule is not currently being applied.

- **Type:** String
- **Valid Values:** `Enabled` | `Disabled`
- **Required:** Yes

**AbortIncompleteMultipartUpload**

Specifies the days since the initiation of an incomplete multipart upload that Amazon S3 will wait before permanently removing all parts of the upload. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration](https://docs.aws.amazon.com/AmazonS3/latest/userguide/bucket-lifecycle-configuration.html) in the *Amazon S3 User Guide*.

- **Type:** `AbortIncompleteMultipartUpload` (p. 671) data type
- **Required:** No

**Expiration**

Specifies the expiration for the lifecycle of the object.

- **Type:** `LifecycleExpiration` (p. 754) data type
- **Required:** No

**ID**

Unique identifier for the rule. The value can't be longer than 255 characters.

- **Type:** String
- **Required:** No

**NoncurrentVersionExpiration**

Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object’s lifetime.
NoncurrentVersionExpiration

Type: NoncurrentVersionExpiration (p. 768) data type

Required: No

NoncurrentVersionExpiration

Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA, ONEZONE_IA, INTELLIGENT_TIERING, GLACIER_IR, GLACIER, or DEEP_ARCHIVE storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request that Amazon S3 transition noncurrent object versions to the STANDARD_IA, ONEZONE_IA, INTELLIGENT_TIERING, GLACIER_IR, GLACIER, or DEEP_ARCHIVE storage class at a specific period in the object's lifetime.

Type: NoncurrentVersionExpiration (p. 769) data type

Required: No

Transition

Specifies when an object transitions to a specified storage class. For more information about Amazon S3 lifecycle configuration rules, see Transitioning Objects Using Amazon S3 Lifecycle in the Amazon S3 User Guide.

Type: Transition (p. 846) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3KeyFilter
Service: Amazon S3

A container for object key name prefix and suffix filtering rules.

Contents

FilterRules

A list of containers for the key-value pair that defines the criteria for the filter rule.

Type: Array of [FilterRule (p. 728)] data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++]
- [AWS SDK for Go]
- [AWS SDK for Java V2]
- [AWS SDK for Ruby V3]
**S3Location**
Service: Amazon S3

Describes an Amazon S3 location that will receive the results of the restore request.

**Contents**

**BucketName**

The name of the bucket where the restore results will be placed.

Type: String

Required: Yes

**Prefix**

The prefix that is prepended to the restore results for this request.

Type: String

Required: Yes

**AccessControlList**

A list of grants that control access to the staged results.

Type: Array of Grant (p. 732) data types

Required: No

**CannedACL**

The canned ACL to apply to the restore results.

Type: String

Valid Values: private | public-read | public-read-write | authenticated-read | aws-exec-read | bucket-owner-read | bucket-owner-full-control

Required: No

**Encryption**

Contains the type of server-side encryption used.

Type: Encryption (p. 712) data type

Required: No

**StorageClass**

The class of storage used to store the restore results.

Type: String

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR | SNOW

Required: No

**Tagging**

The tag-set that is applied to the restore results.
Type: [Tagging](p. 839) data type

Required: No

**UserMetadata**

A list of metadata to store with the restore results in S3.

Type: Array of [MetadataEntry](p. 761) data types

Required: No

**See Also**

- [AWS SDK for Ruby V3](https://aws.amazon.com/sdk-for-aws/ruby/)

API Version 2006-03-01

823
ScanRange
Service: Amazon S3

Specifies the byte range of the object to get the records from. A record is processed when its first byte is contained by the range. This parameter is optional, but when specified, it must not be empty. See RFC 2616, Section 14.35.1 about how to specify the start and end of the range.

Contents

End

Specifies the end of the byte range. This parameter is optional. Valid values: non-negative integers. The default value is one less than the size of the object being queried. If only the End parameter is supplied, it is interpreted to mean scan the last N bytes of the file. For example, `<scanrange><end>50</end></scanrange>` means scan the last 50 bytes.

Type: Long

Required: No

Start

Specifies the start of the byte range. This parameter is optional. Valid values: non-negative integers. The default value is 0. If only Start is supplied, it means scan from that point to the end of the file. For example, `<scanrange><start>50</start></scanrange>` means scan from byte 50 until the end of the file.

Type: Long

Required: No

See Also

SelectObjectContentEventStream

Service: Amazon S3

The container for selecting objects from a content event stream.

Contents

Cont

The Continuation Event.

Type: ContinuationEvent (p. 692) data type

Required: No

End

The End Event.

Type: EndEvent (p. 714) data type

Required: No

Progress

The Progress Event.

Type: ProgressEvent (p. 794) data type

Required: No

Records

The Records Event.

Type: RecordsEvent (p. 801) data type

Required: No

Stats

The Stats Event.

Type: StatsEvent (p. 835) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SelectParameters
Service: Amazon S3

Describes the parameters for Select job types.

Contents

Expression
The expression that is used to query the object.
Type: String
Required: Yes

ExpressionType
The type of the provided expression (for example, SQL).
Type: String
Valid Values: SQL
Required: Yes

InputSerialization
Describes the serialization format of the object.
Type: InputSerialization (p. 737) data type
Required: Yes

OutputSerialization
Describes how the results of the Select job are serialized.
Type: OutputSerialization (p. 785) data type
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ServerSideEncryptionByDefault

Service: Amazon S3

Describes the default server-side encryption to apply to new objects in the bucket. If a PUT Object request doesn't specify any server-side encryption, this default encryption will be applied. If you don't specify a customer managed key at configuration, Amazon S3 automatically creates an AWS KMS key in your AWS account the first time that you add an object encrypted with SSE-KMS to a bucket. By default, Amazon S3 uses this KMS key for SSE-KMS. For more information, see PUT Bucket encryption in the Amazon S3 API Reference.

Contents

SSEAlgorithm

Server-side encryption algorithm to use for the default encryption.

Type: String

Valid Values: AES256 | aws:kms | aws:kms:dsse

Required: Yes

KMSMasterKeyID

AWS Key Management Service (KMS) customer AWS KMS key ID to use for the default encryption. This parameter is allowed if and only if SSEAlgorithm is set to aws:kms.

You can specify the key ID, key alias, or the Amazon Resource Name (ARN) of the KMS key.

- Key ID: 1234abcd-12ab-34cd-56ef-1234567890ab
- Key ARN: arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
- Key Alias: alias/alias-name

If you use a key ID, you can run into a LogDestination undeliverable error when creating a VPC flow log.

If you are using encryption with cross-account or AWS service operations you must use a fully qualified KMS key ARN. For more information, see Using encryption for cross-account operations.

Important

Amazon S3 only supports symmetric encryption KMS keys. For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ServerSideEncryptionConfiguration
Service: Amazon S3

Specifies the default server-side-encryption configuration.

Contents

Rules

Container for information about a particular server-side encryption configuration rule.

Type: Array of ServerSideEncryptionRule (p. 829) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ServerSideEncryptionRule
Service: Amazon S3

Specifies the default server-side encryption configuration.

Contents

ApplyServerSideEncryptionByDefault

Specifies the default server-side encryption to apply to new objects in the bucket. If a PUT Object request doesn't specify any server-side encryption, this default encryption will be applied.

Type: ServerSideEncryptionByDefault (p. 827) data type

Required: No

BucketKeyEnabled

Specifies whether Amazon S3 should use an S3 Bucket Key with server-side encryption using KMS (SSE-KMS) for new objects in the bucket. Existing objects are not affected. Setting the BucketKeyEnabled element to true causes Amazon S3 to use an S3 Bucket Key. By default, S3 Bucket Key is not enabled.

For more information, see Amazon S3 Bucket Keys in the Amazon S3 User Guide.

Type: Boolean

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SourceSelectionCriteria
Service: Amazon S3

A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer managed key stored in AWS Key Management Service (SSE-KMS).

Contents

ReplicaModifications

A filter that you can specify for selections for modifications on replicas. Amazon S3 doesn't replicate replica modifications by default. In the latest version of replication configuration (when Filter is specified), you can specify this element and set the status to Enabled to replicate modifications on replicas.

Note
If you don't specify the Filter element, Amazon S3 assumes that the replication configuration is the earlier version, V1. In the earlier version, this element is not allowed

Type: ReplicaModifications (p. 805) data type

Required: No

SseKmsEncryptedObjects

A container for filter information for the selection of Amazon S3 objects encrypted with AWS KMS. If you include SourceSelectionCriteria in the replication configuration, this element is required.

Type: SseKmsEncryptedObjects (p. 832) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSEKMS
Service: Amazon S3

Specifies the use of SSE-KMS to encrypt delivered inventory reports.

Contents

KeyId

Specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key to use for encrypting inventory reports.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SseKmsEncryptedObjects
Service: Amazon S3

A container for filter information for the selection of S3 objects encrypted with AWS KMS.

Contents

Status

Specifies whether Amazon S3 replicates objects created with server-side encryption using an AWS KMS key stored in AWS Key Management Service.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSES3
Service: Amazon S3

Specifies the use of SSE-S3 to encrypt delivered inventory reports.

Contents

The members of this exception structure are context-dependent.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Stats
Service: Amazon S3

Container for the stats details.

Contents

BytesProcessed
The total number of uncompressed object bytes processed.
Type: Long
Required: No

BytesReturned
The total number of bytes of records payload data returned.
Type: Long
Required: No

BytesScanned
The total number of object bytes scanned.
Type: Long
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StatsEvent
Service: Amazon S3

Container for the Stats Event.

Contents

Details

The Stats event details.

Type: Stats (p. 834) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageClassAnalysis
Service: Amazon S3

Specifies data related to access patterns to be collected and made available to analyze the tradeoffs between different storage classes for an Amazon S3 bucket.

Contents

DataExport

Specifies how data related to the storage class analysis for an Amazon S3 bucket should be exported.

Type: StorageClassAnalysisDataExport (p. 837) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageClassAnalysisDataExport
Service: Amazon S3

Container for data related to the storage class analysis for an Amazon S3 bucket for export.

Contents

Destination

The place to store the data for an analysis.

Type: AnalyticsExportDestination (p. 677) data type

Required: Yes

OutputSchemaVersion

The version of the output schema to use when exporting data. Must be V_1.

Type: String

Valid Values: V_1

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Tag
Service: Amazon S3

A container of a key value name pair.

Contents

Key

Name of the object key.
Type: String
Length Constraints: Minimum length of 1.
Required: Yes

Value

Value of the tag.
Type: String
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Tagging
Service: Amazon S3

Container for TagSet elements.

Contents

TagSet

A collection for a set of tags

Type: Array of Tag (p. 838) data types

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**TargetGrant**

Service: Amazon S3

Container for granting information.

Buckets that use the bucket owner enforced setting for Object Ownership don't support target grants. For more information, see Permissions server access log delivery in the Amazon S3 User Guide.

**Contents**

**Grantee**

Container for the person being granted permissions.

Type: Grantee (p. 733) data type

Required: No

**Permission**

Logging permissions assigned to the grantee for the bucket.

Type: String

Valid Values: FULL_CONTROL | READ | WRITE

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**Tiering**
Service: Amazon S3

The S3 Intelligent-Tiering storage class is designed to optimize storage costs by automatically moving data to the most cost-effective storage access tier, without additional operational overhead.

**Contents**

**AccessTier**

S3 Intelligent-Tiering access tier. See [Storage class for automatically optimizing frequently and infrequently accessed objects](#) for a list of access tiers in the S3 Intelligent-Tiering storage class.

Type: String

Valid Values: ARCHIVE_ACCESS | DEEP_ARCHIVE_ACCESS

Required: Yes

**Days**

The number of consecutive days of no access after which an object will be eligible to be transitioned to the corresponding tier. The minimum number of days specified for Archive Access tier must be at least 90 days and Deep Archive Access tier must be at least 180 days. The maximum can be up to 2 years (730 days).

Type: Integer

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**TopicConfiguration**

Service: Amazon S3

A container for specifying the configuration for publication of messages to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects specified events.

**Contents**

**Events**

The Amazon S3 bucket event about which to send notifications. For more information, see [Supported Event Types](https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-event-types.html) in the *Amazon S3 User Guide*.

Type: Array of strings

Valid Values:

- s3:ReducedRedundancyLostObject
- s3:ObjectCreated:*
- s3:ObjectCreated:Put
- s3:ObjectCreated:Post
- s3:ObjectCreated:Copy
- s3:ObjectCreated:CompleteMultipartUpload
- s3:ObjectRemoved:*
- s3:ObjectRemoved:Delete
- s3:ObjectRemoved:DeleteMarkerCreated
- s3:ObjectRestore:*
- s3:ObjectRestore:Post
- s3:ObjectRestore:Completed
- s3:Replication:*
- s3:Replication:OperationFailedReplication
- s3:Replication:OperationNotTracked
- s3:Replication:OperationMissedThreshold
- s3:Replication:OperationReplicatedAfterThreshold
- s3:ObjectRestore:Delete
- s3:LifecycleTransition
- s3:IntelligentTiering
- s3:ObjectAcl:Put
- s3:LifecycleExpiration:*
- s3:LifecycleExpiration:Delete
- s3:LifecycleExpiration:DeleteMarkerCreated
- s3:ObjectTagging:*
- s3:ObjectTagging:Put
- s3:ObjectTagging:Delete

Required: Yes

**TopicArn**

The Amazon Resource Name (ARN) of the Amazon SNS topic to which Amazon S3 publishes a message when it detects events of the specified type.

Type: String

Required: Yes

**Filter**

Specifies object key name filtering rules. For information about key name filtering, see [Configuring event notifications using object key name filtering](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-object-key-name-filtering.html) in the *Amazon S3 User Guide*.

Type: [NotificationConfigurationFilter](https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Object-Post.html) data type

Required: No

**Id**

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

Type: String

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
## TopicConfigurationDeprecated

**Service:** Amazon S3

A container for specifying the configuration for publication of messages to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects specified events. This data type is deprecated. Use `TopicConfiguration` instead.

### Contents

#### Event

*This member has been deprecated.*

Bucket event for which to send notifications.

**Type:** String

Valid Values: 
- s3:ReducedRedundancyLostObject
- s3:ObjectCreated:* | s3:ObjectCreated:Put | s3:ObjectCreated:Post | s3:ObjectCreated:Copy
- s3:ObjectRestore:* | s3:ObjectRestore:Post | s3:ObjectRestore:Completed
- s3:Replication:* | s3:Replication:OperationFailedReplication
- s3:Replication:OperationNotTracked | s3:Replication:OperationMissedThreshold
- s3:Replication:OperationReplicatedAfterThreshold | s3:ObjectRestore:Delete
- s3:LifecycleTransition | s3:IntelligentTiering | s3:ObjectAcl:Put
- s3:LifecycleExpiration:* | s3:LifecycleExpiration:Delete
- s3:LifecycleExpiration:DeleteMarkerCreated | s3:ObjectTagging:* | s3:ObjectTagging:Put | s3:ObjectTagging:Delete

Required: No

#### Events

A collection of events related to objects

**Type:** Array of strings

Valid Values: 
- s3:ReducedRedundancyLostObject | s3:ObjectCreated:* | s3:ObjectCreated:Put | s3:ObjectCreated:Post | s3:ObjectCreated:Copy
- s3:ObjectRestore:* | s3:ObjectRestore:Post | s3:Object Restore:Completed
- s3:Replication:* | s3:Replication:OperationFailedReplication
- s3:Replication:OperationNotTracked | s3:Replication:OperationMissedThreshold
- s3:Replication:OperationReplicatedAfterThreshold | s3:ObjectRestore:Delete
- s3:LifecycleTransition | s3:IntelligentTiering | s3:ObjectAcl:Put
- s3:LifecycleExpiration:* | s3:LifecycleExpiration:Delete
- s3:LifecycleExpiration:DeleteMarkerCreated | s3:ObjectTagging:* | s3:ObjectTagging:Put | s3:ObjectTagging:Delete

Required: No

#### Id

An optional unique identifier for configurations in a notification configuration. If you don't provide one, Amazon S3 will assign an ID.

**Type:** String
Required: No

**Topic**

Amazon SNS topic to which Amazon S3 will publish a message to report the specified events for the bucket.

Type: String

Required: No

**See Also**

- [AWS SDK for Ruby V3](https://aws.amazon.com/sdk-for-ruby/)

API Version 2006-03-01
Transition Service: Amazon S3

Specifies when an object transitions to a specified storage class. For more information about Amazon S3 lifecycle configuration rules, see Transitioning Objects Using Amazon S3 Lifecycle in the Amazon S3 User Guide.

Contents

Date

Indicates when objects are transitioned to the specified storage class. The date value must be in ISO 8601 format. The time is always midnight UTC.

Type: Timestamp
Required: No

Days

Indicates the number of days after creation when objects are transitioned to the specified storage class. The value must be a positive integer.

Type: Integer
Required: No

StorageClass

The storage class to which you want the object to transition.

Type: String

Valid Values: GLACIER | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | DEEP_ARCHIVE | GLACIER_IR

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
VersioningConfiguration
Service: Amazon S3

Describes the versioning state of an Amazon S3 bucket. For more information, see PUT Bucket versioning in the Amazon S3 API Reference.

Contents

MFADelete

Specifies whether MFA delete is enabled in the bucket versioning configuration. This element is only returned if the bucket has been configured with MFA delete. If the bucket has never been so configured, this element is not returned.

Type: String

Valid Values: Enabled | Disabled

Required: No

Status

The versioning state of the bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
WebsiteConfiguration
Service: Amazon S3

Specifies website configuration parameters for an Amazon S3 bucket.

Contents

ErrorDocument

The name of the error document for the website.

Type: ErrorDocument (p. 725) data type

Required: No

IndexDocument

The name of the index document for the website.

Type: IndexDocument (p. 735) data type

Required: No

RedirectAllRequestsTo

The redirect behavior for every request to this bucket's website endpoint.

Important
If you specify this property, you can't specify any other property.

Type: RedirectAllRequestsTo (p. 804) data type

Required: No

RoutingRules

Rules that define when a redirect is applied and the redirect behavior.

Type: Array of RoutingRule (p. 818) data types

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

Amazon S3 Control

The following data types are supported by Amazon S3 Control:

- AbortIncompleteMultipartUpload (p. 852)
- AccessControlTranslation (p. 853)
- AccessPoint (p. 854)
• AccountLevel (p. 856)
• ActivityMetrics (p. 858)
• AdvancedCostOptimizationMetrics (p. 859)
• AdvancedDataProtectionMetrics (p. 860)
• AsyncErrorDetails (p. 861)
• AsyncOperation (p. 862)
• AsyncRequestParameters (p. 864)
• AsyncResponseDetails (p. 865)
• AwsLambdaTransformation (p. 866)
• BucketLevel (p. 867)
• CloudWatchMetrics (p. 868)
• CreateBucketConfiguration (p. 869)
• CreateMultiRegionAccessPointInput (p. 870)
• DeleteMarkerReplication (p. 871)
• DeleteMultiRegionAccessPointInput (p. 872)
• Destination (p. 873)
• DetailedStatusCodesMetrics (p. 875)
• EncryptionConfiguration (p. 876)
• EstablishedMultiRegionAccessPointPolicy (p. 877)
• Exclude (p. 878)
• ExistingObjectReplication (p. 879)
• GeneratedManifestEncryption (p. 880)
• Include (p. 881)
• JobDescriptor (p. 882)
• JobFailure (p. 886)
• JobListDescriptor (p. 887)
• JobManifest (p. 889)
• JobManifestGenerator (p. 890)
• JobManifestGeneratorFilter (p. 891)
• JobManifestLocation (p. 892)
• JobManifestSpec (p. 893)
• JobOperation (p. 894)
• JobProgressSummary (p. 896)
• JobReport (p. 897)
• JobTimers (p. 899)
• LambdaInvokeOperation (p. 900)
• LifecycleConfiguration (p. 901)
• LifecycleExpiration (p. 902)
• LifecycleRule (p. 903)
• LifecycleRuleAndOperator (p. 905)
• LifecycleRuleFilter (p. 906)
• ListStorageLensConfigurationEntry (p. 907)
• ListStorageLensGroupEntry (p. 909)
• MatchObjectAge (p. 910)
• MatchObjectSize (p. 911)
• Metrics (p. 912)
• MultiRegionAccessPointPolicyDocument (p. 913)
• MultiRegionAccessPointRegionalResponse (p. 914)
• MultiRegionAccessPointReport (p. 915)
• MultiRegionAccessPointRoute (p. 917)
• MultiRegionAccessPointsAsyncResponse (p. 919)
• NoncurrentVersionExpiration (p. 920)
• NoncurrentVersionTransition (p. 921)
• ObjectLambdaAccessPoint (p. 922)
• ObjectLambdaAccessPointAlias (p. 923)
• ObjectLambdaConfiguration (p. 924)
• ObjectLambdaContentTransformation (p. 925)
• ObjectLambdaTransformationConfiguration (p. 926)
• PolicyStatus (p. 927)
• PrefixLevel (p. 928)
• PrefixLevelStorageMetrics (p. 929)
• ProposedMultiRegionAccessPointPolicy (p. 930)
• PublicAccessBlockConfiguration (p. 931)
• PutMultiRegionAccessPointPolicyInput (p. 933)
• Region (p. 934)
• RegionalBucket (p. 935)
• RegionReport (p. 936)
• ReplicaModifications (p. 937)
• ReplicationConfiguration (p. 938)
• ReplicationRule (p. 939)
• ReplicationRuleAndOperator (p. 941)
• ReplicationRuleFilter (p. 942)
• ReplicationTime (p. 943)
• ReplicationTimeValue (p. 944)
• S3AccessControlList (p. 945)
• S3AccessControlPolicy (p. 946)
• S3BucketDestination (p. 947)
• S3CopyObjectOperation (p. 949)
• S3DeleteObjectTaggingOperation (p. 952)
• S3GeneratedManifestDescriptor (p. 953)

- Tagging (p. 993)
- Transition (p. 994)
- VersioningConfiguration (p. 995)
- VpcConfiguration (p. 996)
AbortIncompleteMultipartUpload
Service: Amazon S3 Control

The container for abort incomplete multipart upload

Contents

DaysAfterInitiation

Specifies the number of days after which Amazon S3 aborts an incomplete multipart upload to the Outposts bucket.

Type: Integer
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AccessControlTranslation
Service: Amazon S3 Control

A container for information about access control for replicas.

Note
This is not supported by Amazon S3 on Outposts buckets.

Contents

Owner

Specifies the replica ownership.

Type: String

Valid Values: Destination

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AccessPoint
Service: Amazon S3 Control
An access point used to access a bucket.

Contents

Bucket
The name of the bucket associated with this access point.
Type: String
Required: Yes

Name
The name of this access point.
Type: String
Required: Yes

NetworkOrigin
Indicates whether this access point allows access from the public internet. If VpcConfiguration is specified for this access point, then NetworkOrigin is VPC, and the access point doesn’t allow access from the public internet. Otherwise, NetworkOrigin is Internet, and the access point allows access from the public internet, subject to the access point and bucket access policies.
Type: String
Valid Values: Internet | VPC
Required: Yes

AccessPointArn
The ARN for the access point.
Type: String
Required: No

Alias
The name or alias of the access point.
Type: String
Length Constraints: Maximum length of 63.
Pattern: ^[\0-9a-z\-\&]{63}$
Required: No

BucketAccountId
The AWS account ID associated with the S3 bucket associated with this access point.
Type: String

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: No

**VpcConfiguration**

The virtual private cloud (VPC) configuration for this access point, if one exists.

**Note**
This element is empty if this access point is an Amazon S3 on Outposts access point that is used by other AWS services.

Type: [VpcConfiguration](p. 996) data type

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
AccountLevel
Service: Amazon S3 Control

A container element for the account-level Amazon S3 Storage Lens configuration.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

Contents

BucketLevel
A container element for the S3 Storage Lens bucket-level configuration.

Type: BucketLevel (p. 867) data type

Required: Yes

ActivityMetrics
A container element for S3 Storage Lens activity metrics.

Type: ActivityMetrics (p. 858) data type

Required: No

AdvancedCostOptimizationMetrics
A container element for S3 Storage Lens advanced cost-optimization metrics.

Type: AdvancedCostOptimizationMetrics (p. 859) data type

Required: No

AdvancedDataProtectionMetrics
A container element for S3 Storage Lens advanced data-protection metrics.

Type: AdvancedDataProtectionMetrics (p. 860) data type

Required: No

DetailedStatusCodesMetrics
A container element for detailed status code metrics.

Type: DetailedStatusCodesMetrics (p. 875) data type

Required: No

StorageLensGroupLevel
A container element for S3 Storage Lens groups metrics.

Type: StorageLensGroupLevel (p. 988) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ActivityMetrics
Service: Amazon S3 Control

The container element for Amazon S3 Storage Lens activity metrics. Activity metrics show details about how your storage is requested, such as requests (for example, All requests, Get requests, Put requests), bytes uploaded or downloaded, and errors.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

Contents

IsEnabled

A container that indicates whether activity metrics are enabled.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AdvancedCostOptimizationMetrics
Service: Amazon S3 Control

The container element for Amazon S3 Storage Lens advanced cost-optimization metrics. Advanced cost-optimization metrics provide insights that you can use to manage and optimize your storage costs, for example, lifecycle rule counts for transitions, expirations, and incomplete multipart uploads.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

Contents

IsEnabled

A container that indicates whether advanced cost-optimization metrics are enabled.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AdvancedDataProtectionMetrics
Service: Amazon S3 Control

The container element for Amazon S3 Storage Lens advanced data-protection metrics. Advanced data-protection metrics provide insights that you can use to perform audits and protect your data, for example replication rule counts within and across Regions.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

Contents

isEnabled

A container that indicates whether advanced data-protection metrics are enabled.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AsyncErrorDetails

Service: Amazon S3 Control

Error details for the failed asynchronous operation.

Contents

Code

A string that uniquely identifies the error condition.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

Message

A generic description of the error condition in English.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

RequestId

The ID of the request associated with the error.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

Resource

The identifier of the resource associated with the error.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AsyncOperation
Service: Amazon S3 Control

A container for the information about an asynchronous operation.

Contents

CreationTime
The time that the request was sent to the service.

Type: Timestamp
Required: No

Operation
The specific operation for the asynchronous request.

Type: String
Valid Values: CreateMultiRegionAccessPoint | DeleteMultiRegionAccessPoint | PutMultiRegionAccessPointPolicy
Required: No

RequestParameters
The parameters associated with the request.

Type: AsyncRequestParameters (p. 864) data type
Required: No

RequestStatus
The current status of the request.

Type: String
Required: No

RequestTokenARN
The request token associated with the request.

Type: String
Pattern: arn:.+
Required: No

ResponseDetails
The details of the response.

Type: AsyncResponseDetails (p. 865) data type
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
AsyncRequestParameters
Service: Amazon S3 Control

A container for the request parameters associated with an asynchronous request.

Contents

CreateMultiRegionAccessPointRequest
A container of the parameters for a CreateMultiRegionAccessPoint request.
Type: CreateMultiRegionAccessPointInput (p. 870) data type
Required: No

DeleteMultiRegionAccessPointRequest
A container of the parameters for a DeleteMultiRegionAccessPoint request.
Type: DeleteMultiRegionAccessPointInput (p. 872) data type
Required: No

PutMultiRegionAccessPointPolicyRequest
A container of the parameters for a PutMultiRegionAccessPointPolicy request.
Type: PutMultiRegionAccessPointPolicyInput (p. 933) data type
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AsyncResponseDetails
Service: Amazon S3 Control

A container for the response details that are returned when querying about an asynchronous request.

Contents

ErrorDetails

Error details for an asynchronous request.

Type: AsyncErrorDetails (p. 861) data type

Required: No

MultiRegionAccessPointDetails

The details for the Multi-Region Access Point.

Type: MultiRegionAccessPointsAsyncResponse (p. 919) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**AwsLambdaTransformation**
Service: Amazon S3 Control

AWS Lambda function used to transform objects through an Object Lambda Access Point.

**Contents**

**FunctionArn**

The Amazon Resource Name (ARN) of the AWS Lambda function.

Type: String

Pattern: (arn:(aws[a-zA-Z-]*)?:lambda:)?([a-z]{2}((-gov)|(-iso(b?))?-[a-z]+-\d{1}:)?(\d{12}:)?(function:)?([a-zA-Z0-9-]+)(:\$LATEST|[a-zA-Z0-9-]+))?

Required: Yes

**FunctionPayload**

Additional JSON that provides supplemental data to the Lambda function used to transform objects.

Type: String

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BucketLevel
Service: Amazon S3 Control

A container for the bucket-level configuration for Amazon S3 Storage Lens.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide.

Contents

ActivityMetrics

A container for the bucket-level activity metrics for S3 Storage Lens.

Type: ActivityMetrics (p. 858) data type

Required: No

AdvancedCostOptimizationMetrics

A container for bucket-level advanced cost-optimization metrics for S3 Storage Lens.

Type: AdvancedCostOptimizationMetrics (p. 859) data type

Required: No

AdvancedDataProtectionMetrics

A container for bucket-level advanced data-protection metrics for S3 Storage Lens.

Type: AdvancedDataProtectionMetrics (p. 860) data type

Required: No

DetailedStatusCodesMetrics

A container for bucket-level detailed status code metrics for S3 Storage Lens.

Type: DetailedStatusCodesMetrics (p. 875) data type

Required: No

PrefixLevel

A container for the prefix-level metrics for S3 Storage Lens.

Type: PrefixLevel (p. 928) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CloudWatchMetrics
Service: Amazon S3 Control

A container for enabling Amazon CloudWatch publishing for S3 Storage Lens metrics.

For more information about publishing S3 Storage Lens metrics to CloudWatch, see Monitor S3 Storage Lens metrics in CloudWatch in the Amazon S3 User Guide.

Contents

IsEnabled

A container that indicates whether CloudWatch publishing for S3 Storage Lens metrics is enabled. A value of true indicates that CloudWatch publishing for S3 Storage Lens metrics is enabled.

Type: Boolean

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateBucketConfiguration
Service: Amazon S3 Control

The container for the bucket configuration.

Note
This is not supported by Amazon S3 on Outposts buckets.

Contents

LocationConstraint

Specifies the Region where the bucket will be created. If you are creating a bucket on the US East (N. Virginia) Region (us-east-1), you do not need to specify the location.

Note
This is not supported by Amazon S3 on Outposts buckets.

Type: String

Valid Values: EU | eu-west-1 | us-west-1 | us-west-2 | ap-south-1 | ap-southeast-1 | ap-southeast-2 | ap-northeast-1 | sa-east-1 | cn-north-1 | eu-central-1

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateMultiRegionAccessPointInput
Service: Amazon S3 Control

A container for the information associated with a CreateMultiRegionAccessPoint request.

Contents

Name

The name of the Multi-Region Access Point associated with this request.

Type: String

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$  

Required: Yes

Regions

The buckets in different Regions that are associated with the Multi-Region Access Point.

Type: Array of Region (p. 934) data types

Required: Yes

PublicAccessBlock

The PublicAccessBlock configuration that you want to apply to this Amazon S3 account. You can enable the configuration options in any combination. For more information about when Amazon S3 considers a bucket or object public, see The Meaning of "Public" in the Amazon S3 User Guide.

This data type is not supported for Amazon S3 on Outposts.

Type: PublicAccessBlockConfiguration (p. 931) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteMarkerReplication
Service: Amazon S3 Control

Specifies whether S3 on Outposts replicates delete markers. If you specify a Filter element in your replication configuration, you must also include a DeleteMarkerReplication element. If your Filter includes a Tag element, the DeleteMarkerReplication element's Status child element must be set to Disabled, because S3 on Outposts does not support replicating delete markers for tag-based rules.

For more information about delete marker replication, see How delete operations affect replication in the Amazon S3 User Guide.

Contents

Status

Indicates whether to replicate delete markers.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteMultiRegionAccessPointInput
Service: Amazon S3 Control

A container for the information associated with a DeleteMultiRegionAccessPoint request.

Contents

Name

The name of the Multi-Region Access Point associated with this request.

Type: String

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Destination
Service: Amazon S3 Control

Specifies information about the replication destination bucket and its settings for an S3 on Outposts replication configuration.

Contents

Bucket

The Amazon Resource Name (ARN) of the access point for the destination bucket where you want S3 on Outposts to store the replication results.

Type: String

Required: Yes

AccessControlTranslation

Specify this property only in a cross-account scenario (where the source and destination bucket owners are not the same), and you want to change replica ownership to the AWS account that owns the destination bucket. If this property is not specified in the replication configuration, the replicas are owned by the same AWS account that owns the source object.

**Note**

This is not supported by Amazon S3 on Outposts buckets.

Type: [AccessControlTranslation](p. 853) data type

Required: No

Account

The destination bucket owner's account ID.

Type: String

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: No

EncryptionConfiguration

A container that provides information about encryption. If SourceSelectionCriteria is specified, you must specify this element.

**Note**

This is not supported by Amazon S3 on Outposts buckets.

Type: [EncryptionConfiguration](p. 876) data type

Required: No

Metrics

A container that specifies replication metrics-related settings.

Type: [Metrics](p. 912) data type

Required: No
ReplicationTime

A container that specifies S3 Replication Time Control (S3 RTC) settings, including whether S3 RTC is enabled and the time when all objects and operations on objects must be replicated. Must be specified together with a Metrics block.

Note
This is not supported by Amazon S3 on Outposts buckets.

Type: ReplicationTime (p. 943) data type

Required: No

StorageClass

The storage class to use when replicating objects. All objects stored on S3 on Outposts are stored in the OUTPOSTS storage class. S3 on Outposts uses the OUTPOSTS storage class to create the object replicas.

Note
Values other than OUTPOSTS are not supported by Amazon S3 on Outposts.

Type: String

Valid Values: STANDARD | REDUCED_REDUNDANCY | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | GLACIER | DEEP_ARCHIVE | OUTPOSTS | GLACIER_IR

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**DetailedStatusCodesMetrics**

Service: Amazon S3 Control

The container element for Amazon S3 Storage Lens detailed status code metrics. Detailed status code metrics generate metrics for HTTP status codes, such as 200 OK, 403 Forbidden, 503 Service Unavailable and others.

For more information about S3 Storage Lens, see Assessing your storage activity and usage with S3 Storage Lens in the Amazon S3 User Guide. For a complete list of S3 Storage Lens metrics, see S3 Storage Lens metrics glossary in the Amazon S3 User Guide.

**Contents**

**IsEnabled**

A container that indicates whether detailed status code metrics are enabled.

Type: Boolean

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EncryptionConfiguration
Service: Amazon S3 Control

Specifies encryption-related information for an Amazon S3 bucket that is a destination for replicated objects.

Note
This is not supported by Amazon S3 on Outposts buckets.

Contents

ReplicaKmsKeyId

Specifies the ID of the customer managed AWS KMS key that’s stored in AWS Key Management Service (AWS KMS) for the destination bucket. This ID is either the Amazon Resource Name (ARN) for the KMS key or the alias ARN for the KMS key. Amazon S3 uses this KMS key to encrypt replica objects. Amazon S3 supports only symmetric encryption KMS keys. For more information, see Symmetric encryption KMS keys in the AWS Key Management Service Developer Guide.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EstablishedMultiRegionAccessPointPolicy
Service: Amazon S3 Control

The last established access control policy for a Multi-Region Access Point.

When you update the policy, the update is first listed as the proposed policy. After the update is finished and all Regions have been updated, the proposed policy is listed as the established policy. If both policies have the same version number, the proposed policy is the established policy.

Contents

Policy

The details of the last established policy.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Exclude
Service: Amazon S3 Control

A container for what Amazon S3 Storage Lens will exclude.

Contents

Buckets

A container for the S3 Storage Lens bucket excludes.

Type: Array of strings
Pattern: arn:[^:]+:s3:.*
Required: No

Regions

A container for the S3 Storage Lens Region excludes.

Type: Array of strings
Pattern: [a-z0-9\-]+
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ExistingObjectReplication
Service: Amazon S3 Control

An optional configuration to replicate existing source bucket objects.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**Contents**

**Status**

Specifies whether Amazon S3 replicates existing source bucket objects.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**GeneratedManifestEncryption**  
Service: Amazon S3 Control

The encryption configuration to use when storing the generated manifest.

**Contents**

**SSEKMS**

Configuration details on how SSE-KMS is used to encrypt generated manifest objects.

Type: [SSEKMSEncryption](#)  
Required: No

**SSES3**

Specifies the use of SSE-S3 to encrypt generated manifest objects.

Type: [SSES3Encryption](#)  
Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
Include
Service: Amazon S3 Control

A container for what Amazon S3 Storage Lens configuration includes.

Contents

Buckets

A container for the S3 Storage Lens bucket includes.

Type: Array of strings

Pattern: arn:[^:\+]+:s3:.*

Required: No

Regions

A container for the S3 Storage Lens Region includes.

Type: Array of strings

Pattern: [a-z0-9\-]+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobDescriptor
Service: Amazon S3 Control

A container element for the job configuration and status information returned by a Describe Job request.

Contents

ConfirmationRequired
Indicates whether confirmation is required before Amazon S3 begins running the specified job. Confirmation is required only for jobs created through the Amazon S3 console.

Type: Boolean
Required: No

CreationTime
A timestamp indicating when this job was created.

Type: Timestamp
Required: No

Description
The description for this job, if one was provided in this job's Create Job request.

Type: String
Length Constraints: Minimum length of 1. Maximum length of 256.
Required: No

FailureReasons
If the specified job failed, this field contains information describing the failure.

Type: Array of JobFailure (p. 886) data types
Required: No

GeneratedManifestDescriptor
The attribute of the JobDescriptor containing details about the job's generated manifest.

Type: S3GeneratedManifestDescriptor (p. 953) data type
Required: No

JobArn
The Amazon Resource Name (ARN) for this job.

Type: String
Pattern: ^arn:[^:]+:s3:[a-zA-Z0-9-]+:\d{12}:job\./.*
Required: No

JobId
The ID for the specified job.
Type: String

Pattern: [a-zA-Z0-9\-_\_]+

Required: No

**Manifest**

The configuration information for the specified job's manifest object.

Type: `JobManifest (p. 889)` data type

Required: No

**ManifestGenerator**

The manifest generator that was used to generate a job manifest for this job.

Type: `JobManifestGenerator (p. 890)` data type

**Note:** This object is a Union. Only one member of this object can be specified or returned.

Required: No

**Operation**

The operation that the specified job is configured to run on the objects listed in the manifest.

Type: `JobOperation (p. 894)` data type

Required: No

**Priority**

The priority of the specified job.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

**ProgressSummary**

Describes the total number of tasks that the specified job has run, the number of tasks that succeeded, and the number of tasks that failed.

Type: `JobProgressSummary (p. 896)` data type

Required: No

**Report**

Contains the configuration information for the job-completion report if you requested one in the `Create Job` request.

Type: `JobReport (p. 897)` data type

Required: No

**RoleArn**

The Amazon Resource Name (ARN) for the AWS Identity and Access Management (IAM) role assigned to run the tasks for this job.
Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: arn:[^:]+:iam::\d{12}:role/.*

Required: No

Status

The current status of the specified job.

Type: String

Valid Values: Active | Cancelled | Cancelling | Complete | Completing | Failed | Failing | New | Paused | Pausing | Preparing | Ready | Suspended

Required: No

StatusUpdateReason

The reason for updating the job.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

SuspendedCause

The reason why the specified job was suspended. A job is only suspended if you create it through the Amazon S3 console. When you create the job, it enters the Suspended state to await confirmation before running. After you confirm the job, it automatically exits the Suspended state.

Type: String

Required: No

SuspendedDate

The timestamp when this job was suspended, if it has been suspended.

Type: Timestamp

Required: No

TerminationDate

A timestamp indicating when this job terminated. A job's termination date is the date and time when it succeeded, failed, or was canceled.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
JobFailure
Service: Amazon S3 Control

If this job failed, this element indicates why the job failed.

Contents

FailureCode

The failure code, if any, for the specified job.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

FailureReason

The failure reason, if any, for the specified job.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobListDescriptor
Service: Amazon S3 Control

Contains the configuration and status information for a single job retrieved as part of a job list.

Contents

CreationTime

A timestamp indicating when the specified job was created.

Type: Timestamp

Required: No

Description

The user-specified description that was included in the specified job's Create Job request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

JobId

The ID for the specified job.

Type: String

Pattern: [a-zA-Z0-9\-_\\]+

Required: No

Operation

The operation that the specified job is configured to run on every object listed in the manifest.

Type: String

Valid Values: LambdaInvoke | S3PutObjectCopy | S3PutObjectAcl | S3PutObjectTagging | S3DeleteObjectTagging | S3InitiateRestoreObject | S3PutObjectLegalHold | S3PutObjectRetention | S3ReplicateObject

Required: No

Priority

The current priority for the specified job.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

ProgressSummary

Describes the total number of tasks that the specified job has run, the number of tasks that succeeded, and the number of tasks that failed.

Type: JobProgressSummary (p. 896) data type
Required: No

**Status**

The specified job's current status.

Type: String

Valid Values: Active | Cancelled | Cancelling | Complete | Completing | Failed | Failing | New | Paused | Pausing | Preparing | Ready | Suspended

Required: No

**TerminationDate**

A timestamp indicating when the specified job terminated. A job's termination date is the date and time when it succeeded, failed, or was canceled.

Type: Timestamp

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobManifest
Service: Amazon S3 Control

Contains the configuration information for a job's manifest.

Contents

Location

Contains the information required to locate the specified job's manifest.

Type: JobManifestLocation (p. 892) data type

Required: Yes

Spec

Describes the format of the specified job's manifest. If the manifest is in CSV format, also describes the columns contained within the manifest.

Type: JobManifestSpec (p. 893) data type

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobManifestGenerator
Service: Amazon S3 Control

Configures the type of the job's ManifestGenerator.

Contents

**Important**
This data type is a UNION, so only one of the following members can be specified when used or returned.

S3JobManifestGenerator

The S3 job ManifestGenerator's configuration details.

Type: [S3JobManifestGenerator](p. 957) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobManifestGeneratorFilter
Service: Amazon S3 Control

The filter used to describe a set of objects for the job's manifest.

Contents

CreatedAfter

If provided, the generated manifest should include only source bucket objects that were created after this time.

Type: Timestamp

Required: No

CreatedBefore

If provided, the generated manifest should include only source bucket objects that were created before this time.

Type: Timestamp

Required: No

EligibleForReplication

Include objects in the generated manifest only if they are eligible for replication according to the Replication configuration on the source bucket.

Type: Boolean

Required: No

ObjectReplicationStatuses

If provided, the generated manifest should include only source bucket objects that have one of the specified Replication statuses.

Type: Array of strings

Valid Values: COMPLETED | FAILED | REPLICA | NONE

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobManifestLocation
Service: Amazon S3 Control

Contains the information required to locate a manifest object.

Contents

ETag

The ETag for the specified manifest object.

Type: String

Required: Yes

ObjectArn

The Amazon Resource Name (ARN) for a manifest object.

Important
When you're using XML requests, you must replace special characters (such as carriage returns) in object keys with their equivalent XML entity codes. For more information, see XML-related object key constraints in the Amazon S3 User Guide.

Type: String

Pattern: arn:[^:]+:s3:.*

Required: Yes

ObjectVersionId

The optional version ID to identify a specific version of the manifest object.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobManifestSpec
Service: Amazon S3 Control

Describes the format of a manifest. If the manifest is in CSV format, also describes the columns contained within the manifest.

Contents

Format

Indicates which of the available formats the specified manifest uses.

Type: String

Valid Values: S3BatchOperations_CSV_20180820 | S3InventoryReport_CSV_20161130

Required: Yes

Fields

If the specified manifest object is in the S3BatchOperations_CSV_20180820 format, this element describes which columns contain the required data.

Type: Array of strings

Valid Values: Ignore | Bucket | Key | VersionId

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
JobOperation
Service: Amazon S3 Control

The operation that you want this job to perform on every object listed in the manifest. For more information about the available operations, see Operations in the Amazon S3 User Guide.

Contents

LambdaInvoke

Directs the specified job to invoke an AWS Lambda function on every object in the manifest.

Type: LambdaInvokeOperation (p. 900) data type

Required: No

S3DeleteObjectTagging

Directs the specified job to execute a DELETE Object tagging call on every object in the manifest.

Type: S3DeleteObjectTaggingOperation (p. 952) data type

Required: No

S3InitiateRestoreObject

Directs the specified job to initiate restore requests for every archived object in the manifest.

Type: S3InitiateRestoreObjectOperation (p. 956) data type

Required: No

S3PutObjectAcl

Directs the specified job to run a PutObjectAcl call on every object in the manifest.

Type: S3SetObjectAclOperation (p. 967) data type

Required: No

S3PutObjectCopy

Directs the specified job to run a PUT Copy object call on every object in the manifest.

Type: S3CopyObjectOperation (p. 949) data type

Required: No

S3PutObjectLegalHold

Contains the configuration for an S3 Object Lock legal hold operation that an S3 Batch Operations job passes to every object to the underlying PutObjectLegalHold API operation. For more information, see Using S3 Object Lock legal hold with S3 Batch Operations in the Amazon S3 User Guide.

Type: S3SetObjectLegalHoldOperation (p. 968) data type

Required: No

S3PutObjectRetention

Contains the configuration parameters for the Object Lock retention action for an S3 Batch Operations job. Batch Operations passes every object to the underlying PutObjectRetention API operation. For more information, see Using S3 Object Lock retention with S3 Batch Operations in the Amazon S3 User Guide.
Type: S3SetObjectRetentionOperation (p. 969) data type

Required: No

S3PutObjectTagging

Directs the specified job to run a PUT Object tagging call on every object in the manifest.

Type: S3SetObjectTaggingOperation (p. 970) data type

Required: No

S3ReplicateObject

Directs the specified job to invoke ReplicateObject on every object in the job's manifest.

Type: S3ReplicateObjectOperation (p. 965) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobProgressSummary
Service: Amazon S3 Control

Describes the total number of tasks that the specified job has started, the number of tasks that succeeded, and the number of tasks that failed.

Contents

NumberOfTasksFailed

Type: Long
Valid Range: Minimum value of 0.
Required: No

NumberOfTasksSucceeded

Type: Long
Valid Range: Minimum value of 0.
Required: No

Timers

The JobTimers attribute of a job's progress summary.
Type: JobTimers (p. 899) data type
Required: No

TotalNumberOfTasks

Type: Long
Valid Range: Minimum value of 0.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobReport
Service: Amazon S3 Control

Contains the configuration parameters for a job-completion report.

Contents

Enabled

Indicates whether the specified job will generate a job-completion report.

Type: Boolean

Required: Yes

Bucket

The Amazon Resource Name (ARN) for the bucket where specified job-completion report will be stored.

Type: String

Pattern: arn:[^:]+:s3:.*

Required: No

Format

The format of the specified job-completion report.

Type: String

Valid Values: Report_CSV_20180820

Required: No

Prefix

An optional prefix to describe where in the specified bucket the job-completion report will be stored. Amazon S3 stores the job-completion report at <prefix>/job-<job-id>/report.json.

Type: String

Required: No

ReportScope

Indicates whether the job-completion report will include details of all tasks or only failed tasks.

Type: String

Valid Values: AllTasks | FailedTasksOnly

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
JobTimers
Service: Amazon S3 Control

Provides timing details for the job.

Contents

ElapsedTimeInActiveSeconds

Indicates the elapsed time in seconds the job has been in the Active job state.

Type: Long

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LambdaInvokeOperation
Service: Amazon S3 Control

Contains the configuration parameters for a Lambda Invoke operation.

Contents

FunctionArn

The Amazon Resource Name (ARN) for the AWS Lambda function that the specified job will invoke on every object in the manifest.

Type: String

Pattern: (arn:(aws[a-zA-Z-]*)?:lambda:)?(([a-z]{2})(-gov|(-iso(b?)))?-([a-z]+-\d{1}):-\d{12}:)?(function:)?([a-zA-Z0-9-._]+)(($LATEST|[a-zA-Z0-9-._]+))?  

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LifecycleConfiguration
Service: Amazon S3 Control

The container for the Outposts bucket lifecycle configuration.

Contents

Rules

A lifecycle rule for individual objects in an Outposts bucket.

Type: Array of LifecycleRule (p. 903) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LifecycleExpiration
Service: Amazon S3 Control

The container of the Outposts bucket lifecycle expiration.

Contents

Date
Indicates at what date the object is to be deleted. Should be in GMT ISO 8601 format.
Type: Timestamp
Required: No

Days
Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer.
Type: Integer
Required: No

ExpiredObjectDeleteMarker
Indicates whether Amazon S3 will remove a delete marker with no noncurrent versions. If set to true, the delete marker will be expired. If set to false, the policy takes no action. This cannot be specified with Days or Date in a Lifecycle Expiration Policy.
Type: Boolean
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LifecycleRule
Service: Amazon S3 Control

The container for the Outposts bucket lifecycle rule.

Contents

Status

If 'Enabled', the rule is currently being applied. If 'Disabled', the rule is not currently being applied.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

AbortIncompleteMultipartUpload

Specifies the days since the initiation of an incomplete multipart upload that Amazon S3 waits before permanently removing all parts of the upload. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Configuration in the Amazon S3 User Guide.

Type: AbortIncompleteMultipartUpload (p. 852) data type

Required: No

Expiration

Specifies the expiration for the lifecycle of the object in the form of date, days and, whether the object has a delete marker.

Type: LifecycleExpiration (p. 902) data type

Required: No

Filter

The container for the filter of lifecycle rule.

Type: LifecycleRuleFilter (p. 906) data type

Required: No

ID

Unique identifier for the rule. The value cannot be longer than 255 characters.

Type: String

Required: No

NoncurrentVersionExpiration

The noncurrent version expiration of the lifecycle rule.

Type: NoncurrentVersionExpiration (p. 920) data type

Required: No

NoncurrentVersionTransitions

Specifies the transition rule for the lifecycle rule that describes when noncurrent objects transition to a specific storage class. If your bucket is versioning-enabled (or versioning is suspended), you can
set this action to request that Amazon S3 transition noncurrent object versions to a specific storage
class at a set period in the object's lifetime.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

Type: Array of `NoncurrentVersionTransition (p. 921)` data types

**Required:** No

#### Transitions

Specifies when an Amazon S3 object transitions to a specified storage class.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

Type: Array of `Transition (p. 994)` data types

**Required:** No

#### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
LifecycleRuleAndOperator
Service: Amazon S3 Control

The container for the Outposts bucket lifecycle rule and operator.

Contents

**ObjectSizeGreaterThan**
Minimum object size to which the rule applies.
Type: Long
Required: No

**ObjectSizeLessThan**
Maximum object size to which the rule applies.
Type: Long
Required: No

**Prefix**
Prefix identifying one or more objects to which the rule applies.
Type: String
Required: No

**Tags**
All of these tags must exist in the object's tag set in order for the rule to apply.
Type: Array of [S3Tag (p. 971)] data types
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
LifecycleRuleFilter
Service: Amazon S3 Control

The container for the filter of the lifecycle rule.

Contents

And

The container for the AND condition for the lifecycle rule.

Type: LifecycleRuleAndOperator (p. 905) data type

Required: No

ObjectSizeGreaterThan

Minimum object size to which the rule applies.

Type: Long

Required: No

ObjectSizeLessThan

Maximum object size to which the rule applies.

Type: Long

Required: No

Prefix

Prefix identifying one or more objects to which the rule applies.

Important

When you're using XML requests, you must replace special characters (such as carriage returns) in object keys with their equivalent XML entity codes. For more information, see XML-related object key constraints in the Amazon S3 User Guide.

Type: String

Required: No

Tag

A container for a key-value name pair.

Type: S3Tag (p. 971) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ListStorageLensConfigurationEntry
Service: Amazon S3 Control

Part of ListStorageLensConfigurationResult. Each entry includes the description of the S3 Storage Lens configuration, its home Region, whether it is enabled, its Amazon Resource Name (ARN), and config ID.

Contents

HomeRegion
A container for the S3 Storage Lens home Region. Your metrics data is stored and retained in your designated S3 Storage Lens home Region.

Type: String
Pattern: [a-z0-9\-]+
Required: Yes

Id
A container for the S3 Storage Lens configuration ID.

Type: String
Length Constraints: Minimum length of 1. Maximum length of 64.
Pattern: [a-zA-Z0-9\-\_.]+
Required: Yes

StorageLensArn
The ARN of the S3 Storage Lens configuration. This property is read-only.

Type: String
Pattern: arn:([a-z\-]+):s3:([a-z0-9\-]+):\d{12}:storage\-lens\/.*
Required: Yes

IsEnabled
A container for whether the S3 Storage Lens configuration is enabled. This property is required.

Type: Boolean
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
ListStorageLensGroupEntry
Service: Amazon S3 Control

Each entry contains a Storage Lens group that exists in the specified home Region.

Contents

HomeRegion
Contains the AWS Region where the Storage Lens group was created.
Type: String
Pattern: [a-zA-Z0-9-]+
Required: Yes

Name
Contains the name of the Storage Lens group that exists in the specified home Region.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 64.
Pattern: [a-zA-Z0-9-\._]+
Required: Yes

StorageLensGroupArn
Contains the Amazon Resource Name (ARN) of the Storage Lens group. This property is read-only.
Type: String
Pattern: arn:[a-zA-Z-]+:s3:[a-zA-Z0-9-]+::storage-lens-group/.*
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
MatchObjectAge
Service: Amazon S3 Control

A filter condition that specifies the object age range of included objects in days. Only integers are supported.

Contents

DaysGreaterThan

Specifies the maximum object age in days. Must be a positive whole number, greater than the minimum object age and less than or equal to 2,147,483,647.

Type: Integer
Required: No

DaysLessThan

Specifies the minimum object age in days. The value must be a positive whole number, greater than 0 and less than or equal to 2,147,483,647.

Type: Integer
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
MatchObjectSize
Service: Amazon S3 Control

A filter condition that specifies the object size range of included objects in bytes. Only integers are supported.

Contents

BytesGreaterThanOrEqualTo

Specifies the minimum object size in Bytes. The value must be a positive number, greater than 0 and less than 5 TB.

Type: Long
Required: No

BytesLessThanOrEqualTo

Specifies the maximum object size in Bytes. The value must be a positive number, greater than the minimum object size and less than 5 TB.

Type: Long
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Metrics
Service: Amazon S3 Control

A container that specifies replication metrics-related settings.

Contents

Status

Specifies whether replication metrics are enabled.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

EventThreshold

A container that specifies the time threshold for emitting the s3:Replication:OperationMissedThreshold event.

Note

This is not supported by Amazon S3 on Outposts buckets.

Type: ReplicationTimeValue (p. 944) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
MultiRegionAccessPointPolicyDocument
Service: Amazon S3 Control

The Multi-Region Access Point access control policy.

When you update the policy, the update is first listed as the proposed policy. After the update is finished and all Regions have been updated, the proposed policy is listed as the established policy. If both policies have the same version number, the proposed policy is the established policy.

Contents

Established
The last established policy for the Multi-Region Access Point.
Type: EstablishedMultiRegionAccessPointPolicy (p. 877) data type
Required: No

Proposed
The proposed policy for the Multi-Region Access Point.
Type: ProposedMultiRegionAccessPointPolicy (p. 930) data type
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
MultiRegionAccessPointRegionalResponse
Service: Amazon S3 Control

Status information for a single Multi-Region Access Point Region.

Contents

Name

The name of the Region in the Multi-Region Access Point.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 64.
Required: No

RequestStatus

The current status of the Multi-Region Access Point in this Region.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
MultiRegionAccessPointReport
Service: Amazon S3 Control

A collection of statuses for a Multi-Region Access Point in the various Regions it supports.

Contents

Alias

The alias for the Multi-Region Access Point. For more information about the distinction between the name and the alias of an Multi-Region Access Point, see Managing Multi-Region Access Points.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-z][a-z0-9]*[.][mrap]$  

Required: No

CreatedAt

When the Multi-Region Access Point create request was received.

Type: Timestamp

Required: No

Name

The name of the Multi-Region Access Point.

Type: String

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$  

Required: No

PublicAccessBlock

The PublicAccessBlock configuration that you want to apply to this Amazon S3 account. You can enable the configuration options in any combination. For more information about when Amazon S3 considers a bucket or object public, see The Meaning of "Public" in the Amazon S3 User Guide.

This data type is not supported for Amazon S3 on Outposts.

Type: PublicAccessBlockConfiguration (p. 931) data type

Required: No

Regions

A collection of the Regions and buckets associated with the Multi-Region Access Point.

Type: Array of RegionReport (p. 936) data types

Required: No

Status

The current status of the Multi-Region Access Point.
CREATING and DELETING are temporary states that exist while the request is propagating and being completed. If a Multi-Region Access Point has a status of PARTIALLY.Created, you can retry creation or send a request to delete the Multi-Region Access Point. If a Multi-Region Access Point has a status of PARTIALLY.Deleted, you can retry a delete request to finish the deletion of the Multi-Region Access Point.

Type: String

Valid Values: READY | INCONSISTENT.Across.Regions | CREATING | PARTIALLY.Created | PARTIALLY.Deleted | DELETING

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**MultiRegionAccessPointRoute**  
Service: Amazon S3 Control

A structure for a Multi-Region Access Point that indicates where Amazon S3 traffic can be routed. Routes can be either active or passive. Active routes can process Amazon S3 requests through the Multi-Region Access Point, but passive routes are not eligible to process Amazon S3 requests.

Each route contains the Amazon S3 bucket name and the AWS Region that the bucket is located in. The route also includes the `TrafficDialPercentage` value, which shows whether the bucket and Region are active (indicated by a value of 100) or passive (indicated by a value of 0).

**Contents**

**TrafficDialPercentage**

The traffic state for the specified bucket or AWS Region.

A value of 0 indicates a passive state, which means that no new traffic will be routed to the Region.

A value of 100 indicates an active state, which means that traffic will be routed to the specified Region.

When the routing configuration for a Region is changed from active to passive, any in-progress operations (uploads, copies, deletes, and so on) to the formerly active Region will continue to run to until a final success or failure status is reached.

If all Regions in the routing configuration are designated as passive, you'll receive an `InvalidRequest` error.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 100.

Required: Yes

**Bucket**

The name of the Amazon S3 bucket for which you'll submit a routing configuration change. Either the Bucket or the Region value must be provided. If both are provided, the bucket must be in the specified Region.

Type: String

Required: No

**Region**

The AWS Region to which you'll be submitting a routing configuration change. Either the Bucket or the Region value must be provided. If both are provided, the bucket must be in the specified Region.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
MultiRegionAccessPointsAsyncResponse
Service: Amazon S3 Control

The Multi-Region Access Point details that are returned when querying about an asynchronous request.

Contents

Regions

A collection of status information for the different Regions that a Multi-Region Access Point supports.

Type: Array of MultiRegionAccessPointRegionalResponse (p. 914) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NoncurrentVersionExpiration
Service: Amazon S3 Control

The container of the noncurrent version expiration.

Contents

NewerNoncurrentVersions

Specifies how many noncurrent versions S3 on Outposts will retain. If there are this many more recent noncurrent versions, S3 on Outposts will take the associated action. For more information about noncurrent versions, see Lifecycle configuration elements in the Amazon S3 User Guide.

Type: Integer
Required: No

NoncurrentDays

Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the Amazon S3 User Guide.

Type: Integer
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NoncurrentVersionTransition
Service: Amazon S3 Control

The container for the noncurrent version transition.

Contents

NoncurrentDays

Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates How Long an Object Has Been Noncurrent in the Amazon S3 User Guide.

Type: Integer
Required: No

StorageClass

The class of storage used to store the object.

Type: String
Valid Values: GLACIER | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | DEEP_ARCHIVE
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLambdaAccessPoint
Service: Amazon S3 Control

An access point with an attached AWS Lambda function used to access transformed data from an Amazon S3 bucket.

Contents

Name

The name of the Object Lambda Access Point.
Type: String
Pattern: \^[a-z0-9-]\([a-z0-9\-]+[a-z0-9]\)?\$
Required: Yes

Alias

The alias of the Object Lambda Access Point.
Type: ObjectLambdaAccessPointAlias (p. 923) data type
Required: No

ObjectLambdaAccessPointArn

Specifies the ARN for the Object Lambda Access Point.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 2048.
Pattern: arn:\[^:\+\:]+s3-object-lambda:\[^:\+\:]*\d{12}:accesspoint/.*
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLambdaAccessPointAlias
Service: Amazon S3 Control

The alias of an Object Lambda Access Point. For more information, see How to use a bucket-style alias for your S3 bucket Object Lambda Access Point.

Contents

Status

The status of the Object Lambda Access Point alias. If the status is PROVISIONING, the Object Lambda Access Point is provisioning the alias and the alias is not ready for use yet. If the status is READY, the Object Lambda Access Point alias is successfully provisioned and ready for use.

Type: String

Valid Values: PROVISIONING | READY

Required: No

Value

The alias value of the Object Lambda Access Point.

Type: String

Pattern: ^[0-9a-z\-\ ]{3,63}

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ObjectLambdaConfiguration

Service: Amazon S3 Control

A configuration used when creating an Object Lambda Access Point.

Contents

SupportingAccessPoint

Standard access point associated with the Object Lambda Access Point.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Pattern: arn:[^:]+:s3:[^:]*:\d{12}:accesspoint/.*

Required: Yes

TransformationConfigurations

A container for transformation configurations for an Object Lambda Access Point.

Type: Array of ObjectLambdaTransformationConfiguration (p. 926) data types

Required: Yes

AllowedFeatures

A container for allowed features. Valid inputs are GetObject-Range, GetObject-PartNumber, HeadObject-Range, and HeadObject-PartNumber.

Type: Array of strings

Valid Values: GetObject-Range | GetObject-PartNumber | HeadObject-Range | HeadObject-PartNumber

Required: No

CloudWatchMetricsEnabled

A container for whether the CloudWatch metrics configuration is enabled.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

API Version 2006-03-01
ObjectLambdaContentTransformation
Service: Amazon S3 Control

A container for AwsLambdaTransformation.

Contents

**Important**
This data type is a UNION, so only one of the following members can be specified when used or returned.

**AwsLambda**
A container for an AWS Lambda function.

Type: [AwsLambdaTransformation](p. 866) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
**ObjectLambdaTransformationConfiguration**

Service: Amazon S3 Control

A configuration used when creating an Object Lambda Access Point transformation.

**Contents**

**Actions**

A container for the action of an Object Lambda Access Point configuration. Valid inputs are GetObject, ListObjects, HeadObject, and ListObjectsV2.

- Type: Array of strings
- Valid Values: GetObject | HeadObject | ListObjects | ListObjectsV2
- Required: Yes

**ContentTransformation**

A container for the content transformation of an Object Lambda Access Point configuration.

- Type: `ObjectLambdaContentTransformation (p. 925)` data type
- Note: This object is a Union. Only one member of this object can be specified or returned.
- Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
PolicyStatus
Service: Amazon S3 Control

Indicates whether this access point policy is public. For more information about how Amazon S3 evaluates policies to determine whether they are public, see The Meaning of “Public” in the Amazon S3 User Guide.

Contents

IsPublic

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PrefixLevel
Service: Amazon S3 Control
A container for the prefix-level configuration.

Contents

StorageMetrics
A container for the prefix-level storage metrics for S3 Storage Lens.
Type: PrefixLevelStorageMetrics (p. 929) data type
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PrefixLevelStorageMetrics
Service: Amazon S3 Control

A container for the prefix-level storage metrics for S3 Storage Lens.

Contents

IsEnabled

A container for whether prefix-level storage metrics are enabled.

Type: Boolean
Required: No

SelectionCriteria

Type: SelectionCriteria (p. 972) data type
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ProposedMultiRegionAccessPointPolicy
Service: Amazon S3 Control

The proposed access control policy for the Multi-Region Access Point.

When you update the policy, the update is first listed as the proposed policy. After the update is finished and all Regions have been updated, the proposed policy is listed as the established policy. If both policies have the same version number, the proposed policy is the established policy.

Contents

Policy

The details of the proposed policy.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PublicAccessBlockConfiguration
Service: Amazon S3 Control

The PublicAccessBlock configuration that you want to apply to this Amazon S3 account. You can enable the configuration options in any combination. For more information about when Amazon S3 considers a bucket or object public, see The Meaning of "Public" in the Amazon S3 User Guide.

This data type is not supported for Amazon S3 on Outposts.

Contents

BlockPublicAcls

Specifies whether Amazon S3 should block public access control lists (ACLs) for buckets in this account. Setting this element to TRUE causes the following behavior:
- PutBucketAcl and PutObjectAcl calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean

Required: No

BlockPublicPolicy

Specifies whether Amazon S3 should block public bucket policies for buckets in this account. Setting this element to TRUE causes Amazon S3 to reject calls to PUT Bucket policy if the specified bucket policy allows public access.

Enabling this setting doesn't affect existing bucket policies.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean

Required: No

IgnorePublicAcls

Specifies whether Amazon S3 should ignore public ACLs for buckets in this account. Setting this element to TRUE causes Amazon S3 to ignore all public ACLs on buckets in this account and any objects that they contain.

Enabling this setting doesn't affect the persistence of any existing ACLs and doesn't prevent new public ACLs from being set.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean

Required: No

RestrictPublicBuckets

Specifies whether Amazon S3 should restrict public bucket policies for buckets in this account. Setting this element to TRUE restricts access to buckets with public policies to only AWS service principals and authorized users within this account.
Enabling this setting doesn't affect previously stored bucket policies, except that public and cross-account access within any public bucket policy, including non-public delegation to specific accounts, is blocked.

This property is not supported for Amazon S3 on Outposts.

Type: Boolean
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PutMultiRegionAccessPointPolicyInput
Service: Amazon S3 Control

A container for the information associated with a PutMultiRegionAccessPoint request.

Contents

Name

The name of the Multi-Region Access Point associated with the request.

Type: String

Length Constraints: Maximum length of 50.

Pattern: ^[a-z0-9][-a-z0-9]{1,48}[a-z0-9]$ 

Required: Yes

Policy

The policy details for the PutMultiRegionAccessPoint request.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Region
Service: Amazon S3 Control

A Region that supports a Multi-Region Access Point as well as the associated bucket for the Region.

Contents

Bucket

The name of the associated bucket for the Region.

Type: String

Required: Yes

BucketAccountId

The AWS account ID that owns the Amazon S3 bucket that's associated with this Multi-Region Access Point.

Type: String

Length Constraints: Maximum length of 64.

Pattern: ^\d{12}$

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RegionalBucket
Service: Amazon S3 Control

The container for the regional bucket.

Contents

Bucket

Type: String

Required: Yes

CreationDate

The creation date of the regional bucket

Type: Timestamp

Required: Yes

PublicAccessBlockEnabled

Type: Boolean

Required: Yes

BucketArn

The Amazon Resource Name (ARN) for the regional bucket.

Type: String

Required: No

OutpostId

The AWS Outposts ID of the regional bucket.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RegionReport
Service: Amazon S3 Control

A combination of a bucket and Region that's part of a Multi-Region Access Point.

Contents

Bucket

The name of the bucket.
Type: String
Required: No

BucketAccountId

The AWS account ID that owns the Amazon S3 bucket that's associated with this Multi-Region Access Point.
Type: String
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: No

Region

The name of the Region.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 64.
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaModifications
Service: Amazon S3 Control

A filter that you can use to specify whether replica modification sync is enabled. S3 on Outposts replica modification sync can help you keep object metadata synchronized between replicas and source objects. By default, S3 on Outposts replicates metadata from the source objects to the replicas only. When replica modification sync is enabled, S3 on Outposts replicates metadata changes made to the replica copies back to the source object, making the replication bidirectional.

To replicate object metadata modifications on replicas, you can specify this element and set the Status of this element to Enabled.

**Note**
You must enable replica modification sync on the source and destination buckets to replicate replica metadata changes between the source and the replicas.

Contents

**Status**

Specifies whether S3 on Outposts replicates modifications to object metadata on replicas.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationConfiguration
Service: Amazon S3 Control

A container for one or more replication rules. A replication configuration must have at least one rule and you can add up to 100 rules. The maximum size of a replication configuration is 128 KB.

Contents

Role

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that S3 on Outposts assumes when replicating objects. For information about S3 replication on Outposts configuration, see Setting up replication in the Amazon S3 User Guide.

Type: String
Required: Yes

Rules

A container for one or more replication rules. A replication configuration must have at least one rule and can contain an array of 100 rules at the most.

Type: Array of ReplicationRule (p. 939) data types
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationRule
Service: Amazon S3 Control

Specifies which S3 on Outposts objects to replicate and where to store the replicas.

Contents

Bucket

The Amazon Resource Name (ARN) of the access point for the source Outposts bucket that you want S3 on Outposts to replicate the objects from.

Type: String
Required: Yes

Destination

A container for information about the replication destination and its configurations.

Type: Destination (p. 873) data type
Required: Yes

Status

Specifies whether the rule is enabled.

Type: String
Valid Values: Enabled | Disabled
Required: Yes

DeleteMarkerReplication

Specifies whether S3 on Outposts replicates delete markers. If you specify a Filter element in your replication configuration, you must also include a DeleteMarkerReplication element. If your Filter includes a Tag element, the DeleteMarkerReplication element's Status child element must be set to Disabled, because S3 on Outposts doesn't support replicating delete markers for tag-based rules.

For more information about delete marker replication, see How delete operations affect replication in the Amazon S3 User Guide.

Type: DeleteMarkerReplication (p. 871) data type
Required: No

ExistingObjectReplication

An optional configuration to replicate existing source bucket objects.

Note
This is not supported by Amazon S3 on Outposts buckets.

Type: ExistingObjectReplication (p. 879) data type
Required: No

Filter

A filter that identifies the subset of objects to which the replication rule applies. A Filter element must specify exactly one Prefix, Tag, or And child element.
Type: ReplicationRuleFilter (p. 942) data type

Required: No

ID

A unique identifier for the rule. The maximum value is 255 characters.

Type: String

Required: No

Prefix

This member has been deprecated.

An object key name prefix that identifies the object or objects to which the rule applies. The maximum prefix length is 1,024 characters. To include all objects in an Outposts bucket, specify an empty string.

Important

When you're using XML requests, you must replace special characters (such as carriage returns) in object keys with their equivalent XML entity codes. For more information, see XML-related object key constraints in the Amazon S3 User Guide.

Type: String

Required: No

Priority

The priority indicates which rule has precedence whenever two or more replication rules conflict. S3 on Outposts attempts to replicate objects according to all replication rules. However, if there are two or more rules with the same destination Outposts bucket, then objects will be replicated according to the rule with the highest priority. The higher the number, the higher the priority.

For more information, see Creating replication rules on Outposts in the Amazon S3 User Guide.

Type: Integer

Required: No

SourceSelectionCriteria

A container that describes additional filters for identifying the source Outposts objects that you want to replicate. You can choose to enable or disable the replication of these objects.

Type: SourceSelectionCriteria (p. 973) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationRuleAndOperator
Service: Amazon S3 Control

A container for specifying rule filters. The filters determine the subset of objects to which the rule applies. This element is required only if you specify more than one filter.

For example:

• If you specify both a Prefix and a Tag filter, wrap these filters in an And element.
• If you specify a filter based on multiple tags, wrap the Tag elements in an And element.

Contents

Prefix

An object key name prefix that identifies the subset of objects that the rule applies to.

Type: String

Required: No

Tags

An array of tags that contain key and value pairs.

Type: Array of S3Tag (p. 971) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ReplicationRuleFilter
Service: Amazon S3 Control

A filter that identifies the subset of objects to which the replication rule applies. A Filter element must specify exactly one Prefix, Tag, or And child element.

Contents

And

A container for specifying rule filters. The filters determine the subset of objects that the rule applies to. This element is required only if you specify more than one filter. For example:

- If you specify both a Prefix and a Tag filter, wrap these filters in an And element.
- If you specify a filter based on multiple tags, wrap the Tag elements in an And element.

Type: ReplicationRuleAndOperator (p. 941) data type

Required: No

Prefix

An object key name prefix that identifies the subset of objects that the rule applies to.

Important
When you're using XML requests, you must replace special characters (such as carriage returns) in object keys with their equivalent XML entity codes. For more information, see XML-related object key constraints in the Amazon S3 User Guide.

Type: String

Required: No

Tag

A container for a key-value name pair.

Type: S3Tag (p. 971) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationTime
Service: Amazon S3 Control

A container that specifies S3 Replication Time Control (S3 RTC) related information, including whether S3 RTC is enabled and the time when all objects and operations on objects must be replicated.

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**Contents**

**Status**

Specifies whether S3 Replication Time Control (S3 RTC) is enabled.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**Time**

A container that specifies the time by which replication should be complete for all objects and operations on objects.

Type: ReplicationTimeValue (p. 944) data type

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicationTimeValue
Service: Amazon S3 Control

A container that specifies the time value for S3 Replication Time Control (S3 RTC). This value is also used for the replication metrics EventThreshold element.

Note
This is not supported by Amazon S3 on Outposts buckets.

Contents

Minutes

Contains an integer that specifies the time period in minutes.

Valid value: 15
Type: Integer
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3AccessControlList
Service: Amazon S3 Control

Contents

Owner

Type: S3ObjectOwner (p. 964) data type

Required: Yes

Grants

Type: Array of S3Grant (p. 954) data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3AccessControlPolicy
Service: Amazon S3 Control

Contents

AccessControlList

Type: S3AccessControlList (p. 945) data type

Required: No

CannedAccessControlList

Type: String

Valid Values: private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3BucketDestination
Service: Amazon S3 Control

A container for the bucket where the Amazon S3 Storage Lens metrics export files are located.

Contents

AccountId
The account ID of the owner of the S3 Storage Lens metrics export bucket.
Type: String
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: Yes

Arn
The Amazon Resource Name (ARN) of the bucket. This property is read-only and follows the following format: arn:aws:s3:us-east-1:example-account-id:bucket/your-destination-bucket-name
Type: String
Pattern: arn:[^:]+:s3:.*
Required: Yes

Format
Type: String
Valid Values: CSV  | Parquet
Required: Yes

OutputSchemaVersion
The schema version of the export file.
Type: String
Valid Values: V_1
Required: Yes

Encryption
The container for the type encryption of the metrics exports in this bucket.
Type: StorageLensDataExportEncryption (p. 983) data type
Required: No

Prefix
The prefix of the destination bucket where the metrics export will be delivered.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3CopyObjectOperation

Service: Amazon S3 Control

Contains the configuration parameters for a PUT Copy object operation. S3 Batch Operations passes every object to the underlying CopyObject API operation. For more information about the parameters for this operation, see CopyObject.

Contents

AccessControlGrants

Type: Array of S3Grant (p. 954) data types

Required: No

BucketKeyEnabled

Specifies whether Amazon S3 should use an S3 Bucket Key for object encryption with server-side encryption using AWS KMS (SSE-KMS). Setting this header to true causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS.

Specifying this header with an object action doesn't affect bucket-level settings for S3 Bucket Key.

Type: Boolean

Required: No

CannedAccessControlList

Type: String

Valid Values: private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control

Required: No

ChecksumAlgorithm

Indicates the algorithm that you want Amazon S3 to use to create the checksum. For more information, see Checking object integrity in the Amazon S3 User Guide.

Type: String

Valid Values: CRC32 | CRC32C | SHA1 | SHA256

Required: No

MetadataDirective

Type: String

Valid Values: COPY | REPLACE

Required: No

ModifiedSinceConstraint

Type: Timestamp

Required: No
**NewObjectMetadata**

If you don't provide this parameter, Amazon S3 copies all the metadata from the original objects. If you specify an empty set, the new objects will have no tags. Otherwise, Amazon S3 assigns the supplied tags to the new objects.

Type: `S3ObjectMetadata (p. 962)` data type

Required: No

**NewObjectTagging**

Type: Array of `S3Tag (p. 971)` data types

Required: No

**ObjectLockLegalHoldStatus**

The legal hold status to be applied to all objects in the Batch Operations job.

Type: String

Valid Values: OFF | ON

Required: No

**ObjectLockMode**

The retention mode to be applied to all objects in the Batch Operations job.

Type: String

Valid Values: COMPLIANCE | GOVERNANCE

Required: No

**ObjectLockRetainUntilDate**

The date when the applied object retention configuration expires on all objects in the Batch Operations job.

Type: Timestamp

Required: No

**RedirectLocation**

Specifies an optional metadata property for website redirects, `x-amz-website-redirect-location`. Allows webpage redirects if the object is accessed through a website endpoint.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Required: No

**RequesterPays**

Type: Boolean

Required: No

**SSEAwsKmsKeyId**
**StorageClass**

Type: String

Valid Values: STANDARD | STANDARD_IA | ONEZONE_IA | GLACIER | INTELLIGENT_TIERING | DEEP_ARCHIVE | GLACIER_IR

Required: No

**TargetKeyPrefix**

Specifies the folder prefix that you want the objects to be copied into. For example, to copy objects into a folder named `Folder1` in the destination bucket, set the `TargetKeyPrefix` property to `Folder1`.

Type: String

Required: No

**TargetResource**

Specifies the destination bucket Amazon Resource Name (ARN) for the batch copy operation. For example, to copy objects to a bucket named `destinationBucket`, set the `TargetResource` property to `arn:aws:s3:::destinationBucket`.

Type: String

Pattern: `arn:\[^:\]+:s3:.*`

Required: No

**UnModifiedSinceConstraint**

Type: Timestamp

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3DeleteObjectTaggingOperation
Service: Amazon S3 Control

Contains no configuration parameters because the DELETE Object tagging (DeleteObjectTagging) API operation accepts only the bucket name and key name as parameters, which are defined in the job's manifest.

Contents

The members of this exception structure are context-dependent.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3GeneratedManifestDescriptor
Service: Amazon S3 Control

Describes the specified job's generated manifest. Batch Operations jobs created with a ManifestGenerator populate details of this descriptor after execution of the ManifestGenerator.

Contents

Format

The format of the generated manifest.

Type: String

Valid Values: S3InventoryReport_CSV_20211130

Required: No

Location

Contains the information required to locate a manifest object.

Type: JobManifestLocation (p. 892) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3Grant
Service: Amazon S3 Control

Contents

Grantee

Type: S3Grantee (p. 955) data type
Required: No

Permission

Type: String
Valid Values: FULL_CONTROL | READ | WRITE | READ_ACP | WRITE_ACP
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3Grantee
Service: Amazon S3 Control

Contents

DisplayName

Type: String
Required: No

Identifier

Type: String
Required: No

TypeIdentifier

Type: String
Valid Values: id | emailAddress | uri
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
S3InitiateRestoreObjectOperation
Service: Amazon S3 Control

Contains the configuration parameters for a POST Object restore job. S3 Batch Operations passes every object to the underlying RestoreObject API operation. For more information about the parameters for this operation, see RestoreObject.

Contents

ExpirationInDays

This argument specifies how long the S3 Glacier or S3 Glacier Deep Archive object remains available in Amazon S3. S3 Initiate Restore Object jobs that target S3 Glacier and S3 Glacier Deep Archive objects requireExpirationInDays set to 1 or greater.

Conversely, do not setExpirationInDays when creating S3 Initiate Restore Object jobs that target S3 Intelligent-Tiering Archive Access and Deep Archive Access tier objects. Objects in S3 Intelligent-Tiering archive access tiers are not subject to restore expiry, so specifyingExpirationInDays results in restore request failure.

S3 Batch Operations jobs can operate either on S3 Glacier and S3 Glacier Deep Archive storage class objects or on S3 Intelligent-Tiering Archive Access and Deep Archive Access storage tier objects, but not both types in the same job. If you need to restore objects of both types you must create separate Batch Operations jobs.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

GlacierJobTier

S3 Batch Operations supports STANDARD and BULK retrieval tiers, but not the EXPEDITED retrieval tier.

Type: String

Valid Values: BULK | STANDARD

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3JobManifestGenerator
Service: Amazon S3 Control

The container for the service that will create the S3 manifest.

Contents

EnableManifestOutput
Determines whether or not to write the job's generated manifest to a bucket.

Type: Boolean
Required: Yes

SourceBucket
The source bucket used by the ManifestGenerator.

Type: String
Pattern: arn:[^:]+:s3:.*
Required: Yes

ExpectedBucketOwner
The AWS account ID that owns the bucket the generated manifest is written to. If provided the generated manifest bucket's owner AWS account ID must match this value, else the job fails.

Type: String
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: No

Filter
Specifies rules the S3JobManifestGenerator should use to use to decide whether an object in the source bucket should or should not be included in the generated job manifest.

Type: JobManifestGeneratorFilter (p. 891) data type
Required: No

ManifestOutputLocation
Specifies the location the generated manifest will be written to.

Type: S3ManifestOutputLocation (p. 959) data type
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
S3ManifestOutputLocation
Service: Amazon S3 Control

Location details for where the generated manifest should be written.

Contents

Bucket
The bucket ARN the generated manifest should be written to.
Type: String
Pattern: arn:[^:]+:s3:.*
Required: Yes

ManifestFormat
The format of the generated manifest.
Type: String
Valid Values: S3InventoryReport_CSV_20211130
Required: Yes

ExpectedManifestBucketOwner
The Account ID that owns the bucket the generated manifest is written to.
Type: String
Length Constraints: Maximum length of 64.
Pattern: ^\d{12}$
Required: No

ManifestEncryption
Specifies what encryption should be used when the generated manifest objects are written.
Type: GeneratedManifestEncryption (p. 880) data type
Required: No

ManifestPrefix
Prefix identifying one or more objects to which the manifest applies.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3ObjectLockLegalHold
Service: Amazon S3 Control

Whether S3 Object Lock legal hold will be applied to objects in an S3 Batch Operations job.

Contents

Status

The Object Lock legal hold status to be applied to all objects in the Batch Operations job.

Type: String

Valid Values: OFF | ON

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2

S3Retention
Service: Amazon S3 Control

Contains the S3 Object Lock retention mode to be applied to all objects in the S3 Batch Operations job. If you don't provide Mode and RetainUntilDate data types in your operation, you will remove the retention from your objects. For more information, see Using S3 Object Lock retention with S3 Batch Operations in the Amazon S3 User Guide.

Contents

Mode

The Object Lock retention mode to be applied to all objects in the Batch Operations job.

Type: String

Valid Values: COMPLIANCE | GOVERNANCE

Required: No

RetainUntilDate

The date when the applied Object Lock retention will expire on all objects set by the Batch Operations job.

Type: Timestamp

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3SetObjectAclOperation
Service: Amazon S3 Control

Contains the configuration parameters for a PUT Object ACL operation. S3 Batch Operations passes every object to the underlying PutObjectAcl API operation. For more information about the parameters for this operation, see PutObjectAcl.

Contents

AccessControlPolicy

Type: S3AccessControlPolicy (p. 946) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3SetObjectLegalHoldOperation
Service: Amazon S3 Control

Contains the configuration for an S3 Object Lock legal hold operation that an S3 Batch Operations job
passes to every object to the underlying PutObjectLegalHold API operation. For more information,
see Using S3 Object Lock legal hold with S3 Batch Operations in the Amazon S3 User Guide.

Contents

LegalHold

Contains the Object Lock legal hold status to be applied to all objects in the Batch Operations job.

Type: S3ObjectLockLegalHold (p. 961) data type

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3SetObjectRetentionOperation
Service: Amazon S3 Control

Contains the configuration parameters for the Object Lock retention action for an S3 Batch Operations job. Batch Operations passes every object to the underlying PutObjectRetention API operation. For more information, see Using S3 Object Lock retention with S3 Batch Operations in the Amazon S3 User Guide.

Contents

Retention

Contains the Object Lock retention mode to be applied to all objects in the Batch Operations job. For more information, see Using S3 Object Lock retention with S3 Batch Operations in the Amazon S3 User Guide.

Type: S3Retention (p. 966) data type

Required: Yes

BypassGovernanceRetention

Indicates if the action should be applied to objects in the Batch Operations job even if they have Object Lock GOVERNANCE type in place.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3SetObjectTaggingOperation
Service: Amazon S3 Control

Contains the configuration parameters for a PUT Object Tagging operation. S3 Batch Operations passes every object to the underlying PutObjectTagging API operation. For more information about the parameters for this operation, see PutObjectTagging.

Contents

TagSet

Type: Array of S3Tag data types

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3Tag
Service: Amazon S3 Control

A container for a key-value name pair.

Contents

Key

Key of the tag
Type: String
Pattern: ^([\p{L}\p{Z}\p{N}_\.:/=\-@]*)$
Required: Yes

Value

Value of the tag
Type: String
Length Constraints: Minimum length of 0. Maximum length of 256.
Pattern: ^([\p{L}\p{Z}\p{N}_\.:/=\-@]*)$
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**SelectionCriteria**

Service: Amazon S3 Control

**Contents**

**Delimiter**

A container for the delimiter of the selection criteria being used.

Type: String

Length Constraints: Maximum length of 1.

Required: No

**MaxDepth**

The max depth of the selection criteria

Type: Integer

Required: No

**MinStorageBytesPercentage**

The minimum number of storage bytes percentage whose metrics will be selected.

**Note**

You must choose a value greater than or equal to 1.0.

Type: Double

Valid Range: Minimum value of 0.1. Maximum value of 100.

Required: No

**See Also**

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
SourceSelectionCriteria
Service: Amazon S3 Control

A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects.

Contents

ReplicaModifications

A filter that you can use to specify whether replica modification sync is enabled. S3 on Outposts replica modification sync can help you keep object metadata synchronized between replicas and source objects. By default, S3 on Outposts replicates metadata from the source objects to the replicas only. When replica modification sync is enabled, S3 on Outposts replicates metadata changes made to the replica copies back to the source object, making the replication bidirectional.

To replicate object metadata modifications on replicas, you can specify this element and set the Status of this element to Enabled.

Note
You must enable replica modification sync on the source and destination buckets to replicate replica metadata changes between the source and the replicas.

Type: ReplicaModifications (p. 937) data type

Required: No

SseKmsEncryptedObjects

A filter that you can use to select Amazon S3 objects that are encrypted with server-side encryption by using AWS Key Management Service (AWS KMS) keys. If you include SourceSelectionCriteria in the replication configuration, this element is required.

Note
This is not supported by Amazon S3 on Outposts buckets.

Type: SseKmsEncryptedObjects (p. 975) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSEKMS
Service: Amazon S3 Control

Contents

KeyId

A container for the ARN of the SSE-KMS encryption. This property is read-only and follows the following format: arn:aws:kms:us-east-1:example-account-id:key/example-9a73-4afc-8d29-8f5900cef44e

Type: String
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SseKmsEncryptedObjects
Service: Amazon S3 Control

A container for filter information that you can use to select S3 objects that are encrypted with AWS Key Management Service (AWS KMS).

**Note**
This is not supported by Amazon S3 on Outposts buckets.

**Contents**

**Status**
Specifies whether Amazon S3 replicates objects that are created with server-side encryption by using an AWS KMS key stored in AWS Key Management Service.

Type: String

Valid Values: Enabled | Disabled

Required: Yes

**See Also**
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
SSEKMSEncryption
Service: Amazon S3 Control

Configuration for the use of SSE-KMS to encrypt generated manifest objects.

Contents

KeyId

Specifies the ID of the AWS Key Management Service (AWS KMS) symmetric encryption customer managed key to use for encrypting generated manifest objects.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSES3
Service: Amazon S3 Control

Contents

The members of this exception structure are context-dependent.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSES3Encryption
Service: Amazon S3 Control

Configuration for the use of SSE-S3 to encrypt generated manifest objects.

Contents

The members of this exception structure are context-dependent.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensAwsOrg

Service: Amazon S3 Control

The AWS organization for your S3 Storage Lens.

Contents

Arn

A container for the Amazon Resource Name (ARN) of the AWS organization. This property is read-only and follows the following format: arn:aws:organizations:us-east-1:example-account-id:organization/o-ex2l495dck

Type: String

Pattern: arn:[a-z\-]+:organizations::\d{12}:organization\//o-[a-z0-9]{10,32}

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensConfiguration
Service: Amazon S3 Control

A container for the Amazon S3 Storage Lens configuration.

Contents

AccountLevel
A container for all the account-level configurations of your S3 Storage Lens configuration.

Type: AccountLevel (p. 856) data type

Required: Yes

Id
A container for the Amazon S3 Storage Lens configuration ID.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: [a-zA-Z0-9\-\_\.]+

Required: Yes

IsEnabled
A container for whether the S3 Storage Lens configuration is enabled.

Type: Boolean

Required: Yes

AwsOrg
A container for the AWS organization for this S3 Storage Lens configuration.

Type: StorageLensAwsOrg (p. 979) data type

Required: No

DataExport
A container to specify the properties of your S3 Storage Lens metrics export including, the
destination, schema and format.

Type: StorageLensDataExport (p. 982) data type

Required: No

Exclude
A container for what is excluded in this configuration. This container can only be valid if there is no
Include container submitted, and it's not empty.

Type: Exclude (p. 878) data type

Required: No

Include
A container for what is included in this configuration. This container can only be valid if there is no
Exclude container submitted, and it's not empty.
Type: Include (p. 881) data type

Required: No

StorageLensArn

The Amazon Resource Name (ARN) of the S3 Storage Lens configuration. This property is read-only and follows the following format: 

```
arn:aws:s3:us-east-1:example-account-id:storage-lens/your-dashboard-name
```

Type: String

Pattern: 

```
arn:[a-z\-]+:s3:[a-z0-9\-]+:\d{12}:storage\-lens\/*
```

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**StorageLensDataExport**  
Service: Amazon S3 Control

A container to specify the properties of your S3 Storage Lens metrics export, including the destination, schema, and format.

**Contents**

**CloudWatchMetrics**

A container for enabling Amazon CloudWatch publishing for S3 Storage Lens metrics.

Type: `CloudWatchMetrics (p. 868)` data type

Required: No

**S3BucketDestination**

A container for the bucket where the S3 Storage Lens metrics export will be located.

**Note**  
This bucket must be located in the same Region as the storage lens configuration.

Type: `S3BucketDestination (p. 947)` data type

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensDataExportEncryption
Service: Amazon S3 Control

A container for the encryption of the S3 Storage Lens metrics exports.

Contents

SSEKMS

Type: SSEKMS (p. 974) data type

Required: No

SSES3

Type: SSES3 (p. 977) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroup
Service: Amazon S3 Control

A custom grouping of objects that include filters for prefixes, suffixes, object tags, object size, or object age. You can create an S3 Storage Lens group that includes a single filter or multiple filter conditions. To specify multiple filter conditions, you use AND or OR logical operators.

Contents

Filter
Sets the criteria for the Storage Lens group data that is displayed. For multiple filter conditions, the AND or OR logical operator is used.
Type: StorageLensGroupFilter (p. 986) data type
Required: Yes

Name
Contains the name of the Storage Lens group.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 64.
Pattern: [a-zA-Z0-9\-\_]+
Required: Yes

StorageLensGroupArn
Contains the Amazon Resource Name (ARN) of the Storage Lens group. This property is read-only.
Type: String
Pattern: arn:[a-z-]+:s3:[a-z0-9-]+::\d{12}:storage\-lens\-group\./.*
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroupAndOperator
Service: Amazon S3 Control

A logical operator that allows multiple filter conditions to be joined for more complex comparisons of Storage Lens group data.

Contents

MatchAnyPrefix
Contains a list of prefixes. At least one prefix must be specified. Up to 10 prefixes are allowed.

Type: Array of strings
Required: No

MatchAnySuffix
Contains a list of suffixes. At least one suffix must be specified. Up to 10 suffixes are allowed.

Type: Array of strings
Required: No

MatchAnyTag
Contains the list of object tags. At least one object tag must be specified. Up to 10 object tags are allowed.

Type: Array of S3Tag (p. 971) data types
Required: No

MatchObjectAge
Contains DaysGreaterThan and DaysLessThan to define the object age range (minimum and maximum number of days).

Type: MatchObjectAge (p. 910) data type
Required: No

MatchObjectSize
Contains BytesGreaterThan and BytesLessThan to define the object size range (minimum and maximum number of Bytes).

Type: MatchObjectSize (p. 911) data type
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroupFilter
Service: Amazon S3 Control

The filter element sets the criteria for the Storage Lens group data that is displayed. For multiple filter conditions, the AND or OR logical operator is used.

Contents

And

A logical operator that allows multiple filter conditions to be joined for more complex comparisons of Storage Lens group data. Objects must match all of the listed filter conditions that are joined by the And logical operator. Only one of each filter condition is allowed.

Type: StorageLensGroupAndOperator (p. 985) data type

Required: No

MatchAnyPrefix

Contains a list of prefixes. At least one prefix must be specified. Up to 10 prefixes are allowed.

Type: Array of strings

Required: No

MatchAnySuffix

Contains a list of suffixes. At least one suffix must be specified. Up to 10 suffixes are allowed.

Type: Array of strings

Required: No

MatchAnyTag

Contains the list of S3 object tags. At least one object tag must be specified. Up to 10 object tags are allowed.

Type: Array of S3Tag (p. 971) data types

Required: No

MatchObjectAge

Contains DaysGreaterThan and DaysLessThan to define the object age range (minimum and maximum number of days).

Type: MatchObjectAge (p. 910) data type

Required: No

MatchObjectSize

Contains BytesGreaterThan and BytesLessThan to define the object size range (minimum and maximum number of Bytes).

Type: MatchObjectSize (p. 911) data type

Required: No

Or

A single logical operator that allows multiple filter conditions to be joined. Objects can match any of the listed filter conditions, which are joined by the Or logical operator. Only one of each filter condition is allowed.
Type: StorageLensGroupOrOperator (p. 990) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroupLevel
Service: Amazon S3 Control

Specifies the Storage Lens groups to include in the Storage Lens group aggregation.

Contents

SelectionCriteria

Indicates which Storage Lens group ARNs to include or exclude in the Storage Lens group aggregation. If this value is left null, then all Storage Lens groups are selected.

Type: StorageLensGroupLevelSelectionCriteria (p. 989) data type

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroupLevelSelectionCriteria
Service: Amazon S3 Control

Indicates which Storage Lens group ARNs to include or exclude in the Storage Lens group aggregation. You can only attach Storage Lens groups to your Storage Lens dashboard if they're included in your Storage Lens group aggregation. If this value is left null, then all Storage Lens groups are selected.

Contents

Exclude

Indicates which Storage Lens group ARNs to exclude from the Storage Lens group aggregation.

Type: Array of strings

Pattern: arn:[a-z\-]+:s3:[a-z0-9\-]+:\d{12}:storage\-lens\-group\/.*

Required: No

Include

Indicates which Storage Lens group ARNs to include in the Storage Lens group aggregation.

Type: Array of strings

Pattern: arn:[a-z\-]+:s3:[a-z0-9\-]+:\d{12}:storage\-lens\-group\/.*

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StorageLensGroupOrOperator

Service: Amazon S3 Control

A container element for specifying Or rule conditions. The rule conditions determine the subset of objects to which the Or rule applies. Objects can match any of the listed filter conditions, which are joined by the Or logical operator. Only one of each filter condition is allowed.

Contents

MatchAnyPrefix

Filters objects that match any of the specified prefixes.

Type: Array of strings

Required: No

MatchAnySuffix

Filters objects that match any of the specified suffixes.

Type: Array of strings

Required: No

MatchAnyTag

Filters objects that match any of the specified S3 object tags.

Type: Array of S3Tag (p. 971) data types

Required: No

MatchObjectAge

Filters objects that match the specified object age range.

Type: MatchObjectAge (p. 910) data type

Required: No

MatchObjectSize

Filters objects that match the specified object size range.

Type: MatchObjectSize (p. 911) data type

Required: No

See Also

StorageLensTag
Service: Amazon S3 Control

Contents

**Key**

Type: String
Pattern: `^([\p{L}\p{Z}\p{N}\p{_}\p{.}\p{:/}=+\-@}]*)$`
Required: Yes

**Value**

Type: String
Length Constraints: Minimum length of 0. Maximum length of 256.
Pattern: `^([\p{L}\p{Z}\p{N}\p{_}\p{.}\p{:/}=+\-@}]*)$`
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

Tag
Service: Amazon S3 Control

An AWS resource tag that's associated with your S3 resource. You can add tags to new objects when you upload them, or you can add object tags to existing objects.

**Note**
This data type is only supported for S3 Storage Lens groups.

**Contents**

**Key**

The tag key for your AWS resource. A tag key can be up to 128 Unicode characters in length and is case-sensitive. System created tags that begin with `aws:` aren't supported.

Type: String

Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+-@]*)$`

Required: Yes

**Value**

The tag value for your AWS resource. A tag value can be up to 256 Unicode characters in length and is case-sensitive.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Pattern: `^([\p{L}\p{Z}\p{N}_.:/=+-@]*)$`

Required: Yes

**See Also**

Tagging
Service: Amazon S3 Control

Contents

TagSet
A collection for a set of tags.
Type: Array of S3Tag (p. 971) data types
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Transition
Service: Amazon S3 Control

Specifies when an object transitions to a specified storage class. For more information about Amazon S3 Lifecycle configuration rules, see Transitioning objects using Amazon S3 Lifecycle in the Amazon S3 User Guide.

Contents

Date

Indicates when objects are transitioned to the specified storage class. The date value must be in ISO 8601 format. The time is always midnight UTC.

Type: Timestamp
Required: No

Days

Indicates the number of days after creation when objects are transitioned to the specified storage class. The value must be a positive integer.

Type: Integer
Required: No

StorageClass

The storage class to which you want the object to transition.

Type: String

Valid Values: GLACIER | STANDARD_IA | ONEZONE_IA | INTELLIGENT_TIERING | DEEP_ARCHIVE

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
VersioningConfiguration
Service: Amazon S3 Control

Describes the versioning state of an Amazon S3 on Outposts bucket. For more information, see PutBucketVersioning.

Contents

MFADelete

Specifies whether MFA delete is enabled or disabled in the bucket versioning configuration for the S3 on Outposts bucket.

Type: String

Valid Values: Enabled | Disabled

Required: No

Status

Sets the versioning state of the S3 on Outposts bucket.

Type: String

Valid Values: Enabled | Suspended

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
VpcConfiguration
Service: Amazon S3 Control

The virtual private cloud (VPC) configuration for an access point.

Contents

VpcId

If this field is specified, this access point will only allow connections from the specified VPC ID.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

Amazon S3 on Outposts

The following data types are supported by Amazon S3 on Outposts:

- Endpoint (p. 997)
- FailedReason (p. 1000)
- NetworkInterface (p. 1001)
- Outpost (p. 1002)
Amazon S3 on Outposts

Endpoint

Service: Amazon S3 on Outposts

Amazon S3 on Outposts Access Points simplify managing data access at scale for shared datasets in S3 on Outposts. S3 on Outposts uses endpoints to connect to AWS Outposts buckets so that you can perform actions within your virtual private cloud (VPC). For more information, see Accessing S3 on Outposts using VPC-only access points in the Amazon Simple Storage Service User Guide.

Contents

AccessType

The type of connectivity used to access the Amazon S3 on Outposts endpoint.

Type: String

Valid Values: Private | CustomerOwnedIp

Required: No

CidrBlock

The VPC CIDR committed by this endpoint.

Type: String

Required: No

CreationTime

The time the endpoint was created.

Type: Timestamp

Required: No

CustomerOwnedIpv4Pool

The ID of the customer-owned IPv4 address pool used for the endpoint.

Type: String

Pattern: ^ipv4pool-coip-([0-9a-f]{17})$

Required: No

EndpointArn

The Amazon Resource Name (ARN) of the endpoint.

Type: String

Pattern: ^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):s3-outposts:[a-z \-0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|ec2)/endpoint/[a-zA-Z0-9]{19}$

Required: No

FailedReason

The failure reason, if any, for a create or delete endpoint operation.

Type: FailedReason (p. 1000) object

Required: No

API Version 2006-03-01

997
NetworkInterfaces

The network interface of the endpoint.
Type: Array of NetworkInterface (p. 1001) objects
Required: No

OutpostsId

The ID of the AWS Outposts.
Type: String
Pattern: ^(op-[a-f0-9]{17}|\d{12}|ec2)$
Required: No

SecurityGroupId

The ID of the security group used for the endpoint.
Type: String
Pattern: ^sg-(\[0-9a-f\]{8}|\[0-9a-f\]{17})$
Required: No

Status

The status of the endpoint.
Type: String
Valid Values: Pending | Available | Deleting | Create_Failed | Delete_Failed
Required: No

SubnetId

The ID of the subnet used for the endpoint.
Type: String
Pattern: ^subnet-(\[0-9a-f\]{8}|\[0-9a-f\]{17})$
Required: No

VpcId

The ID of the VPC used for the endpoint.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
FailedReason
Service: Amazon S3 on Outposts

The failure reason, if any, for a create or delete endpoint operation.

Contents

ErrorCode

The failure code, if any, for a create or delete endpoint operation.

Type: String
Required: No

Message

Additional error details describing the endpoint failure and recommended action.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NetworkInterface
Service: Amazon S3 on Outposts

The container for the network interface.

Contents

NetworkInterfaceId

The ID for the network interface.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Outpost
Service: Amazon S3 on Outposts

Contains the details for the Outpost object.

Contents

CapacityInBytes

The Amazon S3 capacity of the outpost in bytes.

Type: Long

Required: No

OutpostArn

Specifies the unique Amazon Resource Name (ARN) for the outpost.

Type: String

Pattern: ^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):outposts:[a-z\-0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}|ec2)$

Required: No

OutpostId

Specifies the unique identifier for the outpost.

Type: String

Pattern: ^(op-[a-f0-9]{17}|\d{12}|ec2)$

Required: No

OwnerId

Returns the AWS account ID of the outpost owner. Useful for comparing owned versus shared outposts.

Type: String

Pattern: ^\d{12}$

Required: No

S3OutpostArn

Specifies the unique S3 on Outposts ARN for use with AWS Resource Access Manager (AWS RAM).

Type: String

Pattern: ^arn:(aws|aws-cn|aws-us-gov|aws-iso|aws-iso-b):s3-outposts:[a-z \-0-9]*:[0-9]{12}:outpost/(op-[a-f0-9]{17}\d{12})/s3$

Required: No

Authenticating Requests (AWS Signature Version 4)

Every interaction with Amazon S3 is either authenticated or anonymous. This section explains request authentication with the AWS Signature Version 4 algorithm.

Authentication with AWS Signature Version 4 provides some or all of the following, depending on how you choose to sign your request:

- **Verification of the identity of the requester** – Authenticated requests require a signature that you create by using your access keys (access key ID, secret access key). For information about getting access keys, see [Understanding and Getting Your Security Credentials](https://docs.aws.amazon.com/general/latest/gr/security-credentials.html) in the AWS General Reference. If you are using temporary security credentials, the signature calculations also require a security token. For more information, see [Requesting Temporary Security Credentials](https://docs.aws.amazon.com/iam/latest/userguide/iam-auth-access-keys.html) in the IAM User Guide.

- **In-transit data protection** – In order to prevent tampering with a request while it is in transit, you use some of the request elements to calculate the request signature. Upon receiving the request, Amazon S3 calculates the signature by using the same request elements. If any request component received by Amazon S3 does not match the component that was used to calculate the signature, Amazon S3 will reject the request.

- **Protect against reuse of the signed portions of the request** – The signed portions (using AWS Signatures) of requests are valid within 15 minutes of the timestamp in the request. An unauthorized party who has access to a signed request can modify the unsigned portions of the request without affecting the request's validity in the 15 minute window. Because of this, we recommend that you maximize protection by signing request headers and body, making HTTPS requests to Amazon S3, and by using the `x-amz-content-sha256` condition key (see [Amazon S3 Signature Version 4 Authentication Specific Policy Keys](https://docs.aws.amazon.com/AmazonS3/latest/API/sig-v4-common-features.html#signature-policy-conditions)) in AWS policies to require users to sign Amazon S3 request bodies.

**Note**

Amazon S3 supports Signature Version 4, a protocol for authenticating inbound API requests to AWS services, in all AWS Regions. At this time, AWS Regions created before January 30, 2014...
will continue to support the previous protocol, Signature Version 2. Any new Regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those Regions must be made with Signature Version 4. For more information about AWS Signature Version 2, see Signing and Authenticating REST Requests in the Amazon Simple Storage Service User Guide.

Authentication Methods

You can express authentication information by using one of the following methods:

- **HTTP Authorization header** – Using the HTTP Authorization header is the most common method of authenticating an Amazon S3 request. All of the Amazon S3 REST operations (except for browser-based uploads using POST requests) require this header. For more information about the Authorization header value, and how to calculate signature and related options, see Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 1006).

- **Query string parameters** – You can use a query string to express a request entirely in a URL. In this case, you use query parameters to provide request information, including the authentication information. Because the request signature is part of the URL, this type of URL is often referred to as a presigned URL. You can use presigned URLs to embed clickable links, which can be valid for up to seven days, in HTML. For more information, see Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 1032).

Amazon S3 also supports browser-based uploads that use HTTP POST requests. With an HTTP POST request, you can upload content to Amazon S3 directly from the browser. For information about authenticating POST requests, see Browser-Based Uploads Using POST (AWS Signature Version 4) (p. 1046).

Introduction to Signing Requests

Authentication information that you send in a request must include a signature. To calculate a signature, you first concatenate select request elements to form a string, referred to as the *string to sign*. You then use a signing key to calculate the hash-based message authentication code (HMAC) of the string to sign.

In AWS Signature Version 4, you don't use your secret access key to sign the request. Instead, you first use your secret access key to derive a signing key. The derived signing key is specific to the date, service, and Region. For more information about how to derive a signing key in different programming languages, see Examples of how to derive a signing key for Signature Version 4.

The following diagram illustrates the general process of computing a signature.
The string to sign depends on the request type. For example, when you use the HTTP Authorization header or the query parameters for authentication, you use a varying combination of request elements to create the string to sign. For an HTTP POST request, the POST policy in the request is the string you sign. For more information about computing string to sign, follow links provided at the end of this section.

For signing key, the diagram shows series of calculations, where result of each step you feed into the next step. The final step is the signing key.

Upon receiving an authenticated request, Amazon S3 servers re-create the signature by using the authentication information that is contained in the request. If the signatures match, Amazon S3 processes your request; otherwise, the request is rejected.

For more information about authenticating requests, see the following topics:

- Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 1006)
- Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 1032)
- Browser-Based Uploads Using POST (AWS Signature Version 4) (p. 1046)

Authenticating Requests: Using the Authorization Header (AWS Signature Version 4)

Topics

- Overview (p. 1006)
- Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 1009)
- Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 1021)
- Signature Calculations for the Authorization Header: Including Trailing Headers (Chunked Upload) (AWS Signature Version 4) (p. 1028)

Overview

Using the HTTP Authorization header is the most common method of providing authentication information. Except for POST requests (p. 1047) and requests that are signed by using query parameters, all Amazon S3 operations use the Authorization request header to provide authentication information.

The following is an example of the Authorization header value. Line breaks are added to this example for readability:

```
Authorization: AWS4-HMAC-SHA256
Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,
SignedHeaders=host;range;x-amz-date,
Signature=fe5f80f77d5fa3beca038a248ff027d0465342fe2855dcd965176630326f1024
```

The following table describes the various components of the Authorization header value in the preceding example:
<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS4-HMAC-SHA256</td>
<td>The algorithm that was used to calculate the signature. You must provide this value when you use AWS Signature Version 4 for authentication. The string specifies AWS Signature Version 4 (AWS4) and the signing algorithm (HMAC-SHA256).</td>
</tr>
<tr>
<td>Credential</td>
<td>Your access key ID and the scope information, which includes the date, Region, and service that were used to calculate the signature. This string has the following form: &lt;your-access-key-id&gt;/&lt;date&gt;/&lt;aws-region&gt;/&lt;aws-service&gt;/aws4_request</td>
</tr>
<tr>
<td></td>
<td>Where:</td>
</tr>
<tr>
<td></td>
<td>• &lt;date&gt; value is specified using YYYYMMDD format.</td>
</tr>
<tr>
<td></td>
<td>• &lt;aws-service&gt; value is s3 when sending request to Amazon S3.</td>
</tr>
<tr>
<td>SignedHeaders</td>
<td>A semicolon-separated list of request headers that you used to compute Signature. The list includes header names only, and the header names must be in lowercase. For example: host;range;x-amz-date</td>
</tr>
<tr>
<td>Signature</td>
<td>The 256-bit signature expressed as 64 lowercase hexadecimal characters. For example: fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc963176630326f1024</td>
</tr>
<tr>
<td></td>
<td>Note that the signature calculations vary depending on the option you choose to transfer the payload.</td>
</tr>
</tbody>
</table>

The signature calculations vary depending on the method you choose to transfer the request payload. S3 supports the following options:

- **Transfer payload in a single chunk** – In this case, you have the following signature calculation options:
  
  - **Signed payload option** – You can optionally compute the entire payload checksum and include it in signature calculation. This provides added security but you need to read your payload twice or buffer it in memory.

    For example, in order to upload a file, you need to read the file first to compute a payload hash for signature calculation and again for transmission when you create the request. For smaller payloads, this approach might be preferable. However, for large files, reading the file twice can be inefficient, so you might want to upload data in chunks instead.

    We recommend you include payload checksum for added security.
Amazon Simple Storage Service API Reference
Overview

• **Unsigned payload option** – Do not include payload checksum in signature calculation.

• **Transfer payload in multiple chunks (chunked upload)** – In this case you transfer payload in chunks. You can transfer a payload in chunks regardless of the payload size.

You can break up your payload into chunks. These can be fixed or variable-size chunks. By uploading data in chunks, you avoid reading the entire payload to calculate the signature. Instead, for the first chunk, you calculate a seed signature that uses only the request headers. The second chunk contains the signature for the first chunk, and each subsequent chunk contains the signature for the chunk that precedes it. At the end of the upload, you send a final chunk with 0 bytes of data that contains the signature of the last chunk of the payload. For more information, see [Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4)](p. 1021).

When signing your requests, you can use either AWS Signature Version 4 or AWS Signature Version 4A. The key difference between the two is determined by how the signature is calculated. With AWS Signature Version 4A, the signature does not include Region-specific information and is calculated using the **AWS4-ECDSA-P256-SHA256** algorithm.

In addition to these options, you have the option of including a trailer with your request. In order to include a trailer with your request, you need to specify that in the header by setting `x-amz-content-sha256` to the appropriate value. If you are using a trailing header, you must include `x-amz-trailer` in the header and specify the trailing header names as a string in a comma-separated list. All trailing headers are written after the final chunk. If you're uploading the data in multiple chunks, you must send a final chunk with 0 bytes of data before sending the trailing header.

When you send a request, you must tell Amazon S3 which of the preceding options you have chosen in your signature calculation, by adding the `x-amz-content-sha256` header with one of the following values:

<table>
<thead>
<tr>
<th>Header value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual payload checksum value</td>
<td>This value is the actual checksum of your object and is only possible when you are uploading the data in a single chunk.</td>
</tr>
<tr>
<td>UNSIGNED-PAYLOAD</td>
<td>Use this when you are uploading the object as a single unsigned chunk.</td>
</tr>
<tr>
<td>STREAMING-UNSIGNED-PAYLOAD-TRAILER</td>
<td>Use this when sending an unsigned payload over multiple chunks. In this case you also have a trailing header after the chunk is uploaded.</td>
</tr>
<tr>
<td>STREAMING-AWS4-HMAC-SHA256-PAYLOAD</td>
<td>Use this when sending a payload over multiple chunks, and the chunks are signed using AWS4-HMAC-SHA256. This produces a SigV4 signature.</td>
</tr>
<tr>
<td>STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER</td>
<td>Use this when sending a payload over multiple chunks, and the chunks are signed using AWS4-HMAC-SHA256. This produces a SigV4 signature. In addition, the digest for the chunks is included as a trailing header.</td>
</tr>
</tbody>
</table>
Signature Calculation: Transfer Payload in a Single Chunk

<table>
<thead>
<tr>
<th>Header value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD</td>
<td>Use this when sending a payload over multiple chunks, and the chunks are signed using AWS4-ECDSA-P256-SHA256. This produces a SigV4A signature.</td>
</tr>
<tr>
<td>STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD-TRAILER</td>
<td>Use this when sending a payload over multiple chunks, and the chunks are signed using AWS4-ECDSA-P256-SHA256. This produces a SigV4A signature. In addition, the digest for the chunks is included as a trailing header.</td>
</tr>
</tbody>
</table>

Upon receiving the request, Amazon S3 re-creates the string to sign using information in the Authorization header and the date header. It then verifies with authentication service the signatures match. The request date can be specified by using either the HTTP Date or the x-amz-date header. If both headers are present, x-amz-date takes precedence.

If the signatures match, Amazon S3 processes your request; otherwise, your request will fail.

For more information, see the following topics:

- Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 1009)
- Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 1021)
- Signature Calculations for the Authorization Header: Including Trailing Headers (Chunked Upload) (AWS Signature Version 4) (p. 1028)

**Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)**

When using the Authorization header to authenticate requests, the header value includes, among other things, a signature. The signature calculations vary depending on the choice you make for transferring the payload (Overview (p. 1006)). This section explains signature calculations when you choose to transfer the payload in a single chunk. The example section (see Examples: Signature Calculations (p. 1015)) shows signature calculations and resulting Authorization headers that you can use as a test suite to verify your code.

**Important**

When transferring payload in a single chunk, you can optionally choose to include the payload hash in the signature calculations, referred as **signed payload** (if you don't include it, the payload is considered **unsigned**). The signing procedure discussed in the following section applies to both, but note the following differences:

- **Signed payload option** – You include the payload hash when constructing the canonical request (that then becomes part of StringToSign, as explained in the signature calculation section). You also specify the same value as the x-amz-content-sha256 header value when sending the request to S3.
- **Unsigned payload option** – You include the literal string UNSIGNED-PAYLOAD when constructing a canonical request, and set the same value as the x-amz-content-sha256 header value when sending the request to Amazon S3.
When you send your request to Amazon S3, the `x-amz-content-sha256` header value informs Amazon S3 whether the payload is signed or not. Amazon S3 can then create the signature accordingly for verification.

**Calculating a Signature**

To calculate a signature, you first need a string to sign. You then calculate an HMAC-SHA256 hash of the string to sign by using a signing key. The following diagram illustrates the process, including the various components of the string that you create for signing.

When Amazon S3 receives an authenticated request, it computes the signature and then compares it with the signature that you provided in the request. For that reason, you must compute the signature by using the same method that is used by Amazon S3. The process of putting a request in an agreed-upon form for signing is called canonicalization.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lowercase()</td>
<td>Convert the string to lowercase.</td>
</tr>
<tr>
<td>Hex()</td>
<td>Lowercase base 16 encoding.</td>
</tr>
<tr>
<td>SHA256Hash()</td>
<td>Secure Hash Algorithm (SHA) cryptographic hash function.</td>
</tr>
<tr>
<td>HMAC-SHA256()</td>
<td>Computes HMAC by using the SHA256 algorithm with the signing key provided.</td>
</tr>
<tr>
<td>Trim()</td>
<td>Remove any leading or trailing whitespace.</td>
</tr>
</tbody>
</table>
### Function Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UriEncode()</td>
<td>URI encode every byte. UriEncode() must enforce the following rules:</td>
</tr>
</tbody>
</table>
|            | • URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', ',', ';', ':', and '/'.
|            | • The space character is a reserved character and must be encoded as "%20" (and not as "+").
|            | • Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte.
|            | • Letters in the hexadecimal value must be uppercase, for example "%1A".
|            | • Encode the forward slash character, '>', everywhere except in the object key name. For example, if the object key name is photos/ Jan/sample.jpg, the forward slash in the key name is not encoded. |

**Important**

The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work.

To see an example of a UriEncode function in Java, see [Java Utilities](https://github.com) on the GitHub website.

### Task 1: Create a Canonical Request

This section provides an overview of creating a canonical request.

The following is the canonical request format that Amazon S3 uses to calculate a signature. For signatures to match, you must create a canonical request in this format:

```
<HTTPMethod>
<CanonicalURI>
<CanonicalQueryString>
<CanonicalHeaders>
<SignedHeaders>
<HashedPayload>
```

Where:

- **HTTPMethod** is one of the HTTP methods, for example GET, PUT, HEAD, and DELETE.
- **CanonicalURI** is the URI-encoded version of the absolute path component of the URI—everything starting with the "/" that follows the domain name and up to the end of the string or to the question mark character (?) if you have query string parameters. The URI in the following example, / examplebucket/myphoto.jpg, is the absolute path and you don't encode the "/" in the absolute path:
Note
You do not normalize URI paths for requests to Amazon S3. For example, you may have a bucket with an object named "my-object/example//photo.user". Normalizing the path changes the object name in the request to "my-object/example/photo.user". This is an incorrect path for that object.

- **CanonicalQueryString** specifies the URI-encoded query string parameters. You URI-encode name and values individually. You must also sort the parameters in the canonical query string alphabetically by key name. The sorting occurs after encoding. The query string in the following URI example is prefix=somePrefix&marker=someMarker&max-keys=20:

```plaintext
```

The canonical query string is as follows (line breaks are added to this example for readability):

```plaintext
UriEncode("marker") + "=" + UriEncode("someMarker") + "&" + 
UriEncode("max-keys") + "=" + UriEncode("20") + "&" + 
UriEncode("prefix") + "=" + UriEncode("somePrefix")
```

When a request targets a subresource, the corresponding query parameter value will be an empty string (""). For example, the following URI identifies the ACL subresource on the examplebucket bucket:

```plaintext
http://s3.amazonaws.com/examplebucket?acl
```

The CanonicalQueryString in this case is as follows:

```plaintext
UriEncode("acl") + "=" + ""
```

If the URI does not include a '?', there is no query string in the request, and you set the canonical query string to an empty string (""). You will still need to include the "\n".

- **CanonicalHeaders** is a list of request headers with their values. Individual header name and value pairs are separated by the newline character ("\n"). Header names must be in lowercase. You must sort the header names alphabetically to construct the string, as shown in the following example:

```plaintext
LowerCase(<HeaderValue1>) + ":" + Trim(<value>) + "\n"
LowerCase(<HeaderValue2>) + ":" + Trim(<value>) + "\n"
...
LowerCase(<HeaderValueN>) + ":" + Trim(<value>) + "\n"
```

The `LowerCase()` and `Trim()` functions used in this example are described in the preceding section.

The **CanonicalHeaders** list must include the following:

- HTTP host header.
- If the Content-Type header is present in the request, you must add it to the **CanonicalHeaders** list.
• Any x-amz-* headers that you plan to include in your request must also be added. For example, if you are using temporary security credentials, you need to include x-amz-security-token in your request. You must add this header in the list of CanonicalHeaders.

   **Note**
   The x-amz-content-sha256 header is required for all AWS Signature Version 4 requests. It provides a hash of the request payload. If there is no payload, you must provide the hash of an empty string.

The following is an example CanonicalHeaders string. The header names are in lowercase and sorted.

```
host:s3.amazonaws.com
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130708T220855Z
```

   **Note**
   For the purpose of calculating an authorization signature, only the host and any x-amz-* headers are required; however, in order to prevent data tampering, you should consider including all the headers in the signature calculation.

• SignedHeaders is an alphabetically sorted, semicolon-separated list of lowercase request header names. The request headers in the list are the same headers that you included in the CanonicalHeaders string. For example, for the previous example, the value of SignedHeaders would be as follows:

```
human;host;x-amz-content-sha256;x-amz-date
```

• HashedPayload is the hexadecimal value of the SHA256 hash of the request payload.

```
Hex(SHA256Hash(<payload>))
```

If there is no payload in the request, you compute a hash of the empty string as follows:

```
Hex(SHA256Hash("") )
```

The hash returns the following value:

```
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

For example, when you upload an object by using a PUT request, you provide object data in the body. When you retrieve an object by using a GET request, you compute the empty string hash.

### Task 2: Create a String to Sign

This section provides an overview of creating a string to sign. For step-by-step instructions, see [Task 2: Create a String to Sign](#) in the AWS General Reference.

The string to sign is a concatenation of the following strings:
"AWS4-HMAC-SHA256" + "\n" +
timeStampISO8601Format + "\n" +
<Scope> + "\n" +
Hex(SHA256Hash(<CanonicalRequest>))

The constant string AWS4-HMAC-SHA256 specifies the hash algorithm that you are using, HMAC-SHA256. The timeStamP is the current UTC time in ISO 8601 format (for example, 20130524T000000Z).

Scope binds the resulting signature to a specific date, an AWS Region, and a service. Thus, your resulting signature will work only in the specific Region and for a specific service. The signature is valid for seven days after the specified date.

date.Format(<YYYYMMDD>) + "/" + <region> + "/" + <service> + "/aws4_request"

For Amazon S3, the service string is s3. For a list of region strings, see Regions and Endpoints in the AWS General Reference. The Region column in this table provides the list of valid Region strings.

The following scope restricts the resulting signature to the us-east-1 Region and Amazon S3.

20130606/us-east-1/s3/aws4_request

Note
Scope must use the same date that you use to compute the signing key, as discussed in the following section.

Task 3: Calculate Signature

In AWS Signature Version 4, instead of using your AWS access keys to sign a request, you first create a signing key that is scoped to a specific Region and service. For more information about signing keys, see Introduction to Signing Requests (p. 1005).

DateKey = HMAC-SHA256("AWS4"+"<SecretAccessKey>", "<YYYYMMDD>")
DateRegionKey = HMAC-SHA256(<DateKey>, "<aws-region>")
DateRegionServiceKey = HMAC-SHA256(<DateRegionKey>, "<aws-service>")
SigningKey = HMAC-SHA256(<DateRegionServiceKey>, "aws4_request")

Note
Some use cases can process signature keys for up to 7 days. For more information see Share an Object with Others.

For a list of Region strings, see Regions and Endpoints in the AWS General Reference.

Using a signing key enables you to keep your AWS credentials in one safe place. For example, if you have multiple servers that communicate with Amazon S3, you share the signing key with those servers; you don’t have to keep a copy of your secret access key on each server. Signing key is valid for up to seven days. So each time you calculate signing key you will need to share the signing key with your servers. For more information, see Authenticating Requests (AWS Signature Version 4) (p. 1004).

The final signature is the HMAC-SHA256 hash of the string to sign, using the signing key as the key.

HMAC-SHA256(SigningKey, StringToSign)

For step-by-step instructions on creating a signature, see Task 3: Create a Signature in the AWS General Reference.
Examples: Signature Calculations

You can use the examples in this section as a reference to check signature calculations in your code. The calculations shown in the examples use the following data:

- Example access keys.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtFEMI/K7MDENG/bPxFriCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

- Request timestamp of 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- Bucket name examplebucket.
- The bucket is assumed to be in the US East (N. Virginia) Region. The credential Scope and the Signing Key calculations use us-east-1 as the Region specifier. For information about other Regions, see Regions and Endpoints in the AWS General Reference.
- You can use either path-style or virtual hosted–style requests. The following examples show how to sign a virtual hosted–style request, for example:

https://examplebucket.s3.amazonaws.com/photos/photo1.jpg

For more information, see Virtual Hosting of Buckets in the Amazon Simple Storage Service User Guide.

Example: GET Object

The following example gets the first 10 bytes of an object (test.txt) from examplebucket. For more information about the API action, see GetObject (p. 165).

GET /test.txt HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
Range: bytes=0-9
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z

Because this GET request does not provide any body content, the x-amz-content-sha256 value is the hash of the empty request body. The following steps show signature calculations and construction of the Authorization header.

1. **StringToSign**
   a. **CanonicalRequest**

   GET
   /test.txt
   host:examplebucket.s3.amazonaws.com
   range:bytes=0-9
   x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z
host; range; x-amz-content-sha256; x-amz-date
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855

In the canonical request string, the last line is the hash of the empty request body. The second line is empty because there are no query parameters in the request.

b. **StringToSign**

AWS4-HMAC-SHA256
20130524
20130524/us-east-1/s3/aws4_request
7344ae5b7ee6c3e7e6b0fe064f0412a37625d1fbff95c48bb2dc43964946972

2. **SigningKey**

signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"),"20130524"),"us-east-1"),"s3"),"aws4_request")

3. **Signature**

f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c036b0b41

4. **Authorization header**

The resulting Authorization header is as follows:

AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=host; range; x-amz-content-sha256; x-amz-date,Signature=f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c036b0b41

**Example: PUT Object**

This example PUT request creates an object (test$file.text) in examplebucket. The example assumes the following:

- You are requesting REDUCED_REDUNDANCY as the storage class by adding the x-amz-storage-class request header. For information about storage classes, see [Storage Classes](https://docs.aws.amazon.com/AmazonS3/latest/userguide/storage-classes.html) in the Amazon Simple Storage Service User Guide.
- The content of the uploaded file is a string, "Welcome to Amazon S3." The value of x-amz-content-sha256 in the request is based on this string.

For information about the API action, see [PutObject](https://docs.aws.amazon.com/AmazonS3/latest/API/RESTObjectPUT.html).

PUT test$file.text HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Fri, 24 May 2013 00:00:00 GMT
Authorization: SignatureToBeCalculated
The following steps show signature calculations.

1. **StringToSign**
   a. **CanonicalRequest**

   ```plaintext
   PUT
   /test%24file.text
   date:Fri, 24 May 2013 00:00:00 GMT
   host:examplebucket.s3.amazonaws.com
   x-amz-content-sha256:44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072
   x-amz-date:20130524T000000Z
   x-amz-storage-class:REDUCED_REDUNDANCY
   ``

   In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the hash of the body, which should be same as the `x-amz-content-sha256` header value.

   b. **StringToSign**

   ```plaintext
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   9e0e90d9c76de8fa5b200d8c849cd5b8dc7a3be3951ddb7f6a76b4158342019d
   ``

2. **SigningKey**

   ```plaintext
   signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"","20130524"),"us-east-1"),"s3"),"aws4_request")
   ``

3. **Signature**

   ```plaintext
   98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
   ``

4. **Authorization header**

   The resulting Authorization header is as follows:

   ```plaintext
   AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-class,Signature=98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
   ```
Example: GET Bucket Lifecycle

The following GET request retrieves the lifecycle configuration of examplebucket. For information about the API action, see GetBucketLifecycleConfiguration (p. 121).

```
GET ?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide any body content, the x-amz-content-sha256 header value is the hash of the empty request body. The following steps show signature calculations.

1. StringToSign
   a. CanonicalRequest

```
GET /lifecycle= HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z
host;x-amz-content-sha256;x-amz-date
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

In the canonical request, the last line is the hash of the empty request body.

b. StringToSign

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
9766c798316ff2757b517bc739a67f6213b4ab36dd5da2f94eaebf79c77395ca
```

2. SigningKey

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"),"20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. Signature

```
fea454ca298b7da1c68078a5d1bdfbbe0d65c699e0f91ac7a200a0136783543
```

4. Authorization header

The resulting Authorization header is as follows:
Example: Get Bucket (List Objects)

The following example retrieves a list of objects from examplebucket bucket. For information about the API action, see ListObjects (p. 244).

```
GET ?max-keys=2&prefix=J HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide a body, the value of x-amz-content-sha256 is the hash of the empty request body. The following steps show signature calculations.

1. **StringToSign**
   a. **CanonicalRequest**

   ```
   GET
   /max-keys=2&prefix=J
   host:examplebucket.s3.amazonaws.com
   x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   x-amz-date:20130524T000000Z
   host;x-amz-content-sha256;x-amz-date
   e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   ```

   In the canonical string, the last line is the hash of the empty request body.

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T0000000Z
   20130524/us-east-1/s3/aws4_request
df57d21db20da04d7fa30298dd4488ba3a2b47ca3a489c74750e0f1e7df1b9b7
   ```

2. **SigningKey**

   ```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"), "20130524"), "us-east-1"), "s3"), "aws4_request")
   ```

3. **Signature**

   ```
   34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
   ```
4. **Authorization header**

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/
s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-
date,Signature=34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
```
Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4)

As described in the [Overview](p. 1006), when authenticating requests using the Authorization header, you have an option of uploading the payload in chunks. You can send data in fixed size or variable size chunks. This section describes the signature calculation process in chunked upload, how you create the chunk body, and how the delayed signing works where you first upload the chunk, and send its signature in the subsequent chunk. The example section (see [Example: PUT Object](p. 1024)) shows signature calculations and resulting Authorization headers that you can use as a test suite to verify your code.

**Note**
When transferring data in a series of chunks, you must do one of the following:

- Explicitly specify the total content length (object length in bytes plus metadata in each chunk) using the Content-Length HTTP header. To do this, you must pre-compute the total length of the payload, including the metadata that you send in each chunk, before starting your request.
- Specify the Transfer-Encoding HTTP header. If you include the Transfer-Encoding header and specify any value other than identity, you must omit the Content-Length header.

For all requests, you must include the x-amz-decoded-content-length header, specifying the size of the object in bytes.

Each chunk signature calculation includes the signature of the previous chunk. To begin, you create a seed signature using only the headers. You use the seed signature in the signature calculation of the first chunk. For each subsequent chunk, you create a chunk signature that includes the signature of the previous chunk. Thus, the chunk signatures are chained together; that is, the signature of chunk \( n \) is a function \( F(chunk \ n, \ signature(chunk \ n-1)) \). The chaining ensures that you send the chunks in the correct order.

To perform a chunked upload, do the following:

1. Decide the payload chunk size. You need this when you write the code.
   
   The chunk size must be at least 8 KB. We recommend a chunk size of a least 64 KB for better performance. This chunk size applies to all chunks except the last one. The last chunk you send can be smaller than 8 KB. If your payload is small and can fit into one chunk, then it can be smaller than the 8 KB.

2. Create the seed signature for inclusion in the first chunk. For more information, see [Calculating the Seed Signature](p. 1022).

3. Create the first chunk and stream it. For more information, see [Defining the Chunk Body](p. 1024).

4. For each subsequent chunk, calculate the chunk signature that includes the previous signature in the string you sign, construct the chunk, and send it. For more information, see [Defining the Chunk Body](p. 1024).

5. Send the final additional chunk, which is the same as the other chunks in the construction, but it has zero data bytes. For more information, see [Defining the Chunk Body](p. 1024).
Calculating the Seed Signature

The following diagram illustrates the process of calculating the seed signature.

1. **Canonical Request**
   - **HTTP Verb**: "GET" | "PUT" | "POST" | ...
   - **Canonical URI**: "n"
   - **Canonical Query String**: "t"
   - **Canonical Headers**: "n"
   - **Signed Headers**: "w" + "STREAMING-AWS4-HMAC-SHA256-PAYLOAD"
   - **Unencoded**: "资源名称"
   - **Sorted by Query Parameter**: "name1=value1; name2=value2; ...
   - **Sorted by Header Name**: "name1=value1; name2=value2; ...
   - **Lowercase**: "name1=value1; name2=value2; ...
   - **Trim**: "name1=value1; name2=value2; ...

2. **StringToSign**
   - **AWS4-HMAC-SHA256**: "n" + "t"
   - **Timestamp**: "t"
   - **Scope**: "n"
   - **Hex(SHA256Hash(Canonical Request))**: "n" + "t"

3. **Signature**
   - **DateKey**: HMAC-SHA256("n"; "SecretAccessKey"); "YYYYMMDD"
   - **DateRegionKey**: HMAC-SHA256(DateKey; "aws-region")
   - **DateRegionServiceKey**: HMAC-SHA256(DateRegionKey; "aws-service")
   - **SigningKey**: HMAC-SHA256(DateRegionServiceKey; "sns4_request")

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lowercase()</td>
<td>Convert the string to lowercase.</td>
</tr>
<tr>
<td>Hex()</td>
<td>Lowercase base 16 encoding.</td>
</tr>
<tr>
<td>SHA256Hash()</td>
<td>Secure Hash Algorithm (SHA) cryptographic hash function.</td>
</tr>
<tr>
<td>HMAC-SHA256()</td>
<td>Computes HMAC by using the SHA256 algorithm with the signing key provided.</td>
</tr>
<tr>
<td>Trim()</td>
<td>Remove any leading or trailing whitespace.</td>
</tr>
<tr>
<td>UriEncode()</td>
<td>URI encode every byte. UriEncode() must enforce the following rules:</td>
</tr>
<tr>
<td></td>
<td>- URI encode every byte except the unreserved characters: 'A'-'Z',</td>
</tr>
<tr>
<td></td>
<td>'a'-'z', '0'-'9', '+', '-', '_', and '~'.</td>
</tr>
<tr>
<td></td>
<td>- The space character is a reserved character and must be encoded as</td>
</tr>
<tr>
<td></td>
<td>&quot;%20&quot; (and not as &quot;+&quot;).</td>
</tr>
</tbody>
</table>

API Version 2006-03-01
1022
Function | Description
--- | ---
| • Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte.  
• Letters in the hexadecimal value must be uppercase, for example "%1A".  
• Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is photos/Jan/sample.jpg, the forward slash in the key name is not encoded.  

**Important**  
The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work.

To see an example of a UriEncode function in Java, see [Java Utilities](https://github.com) on the GitHub website.

For information about the signing process, see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)](p. 1009). The process is the same, except that the creation of CanonicalRequest differs as follows:

• In addition to the request headers you plan to add, you must include the following headers:

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>x-amz-content-sha256</strong></td>
<td>This header is required for all AWS Signature Version 4 requests. Set the value to STREAMING-AWS4-HMAC-SHA256-PAYLOAD to indicate that the signature covers only headers and that there is no payload.</td>
</tr>
</tbody>
</table>
| **Content-Encoding** | Set the value to aws-chunked.  
Amazon S3 supports multiple content encodings. For example:  

Content-Encoding : aws-chunked, gzip  

That is, you can specify your custom content-encoding when using Signature Version 4 streaming API.  

**Note**  
Amazon S3 stores the resulting object without the aws-chunked encoding. Therefore, when you retrieve the object, it is not aws-chunked encoded. |
| **x-amz-decoded-content-length** | Set the value to the length, in bytes, of the data to be chunked, without counting any metadata. For example, if you are uploading a 4 GB file, set the value to 4294967296. This is the raw size of the object to be uploaded (data you want to store in Amazon S3). |
### Header

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Length</td>
<td>Set the value to the actual size of the transmitted HTTP body, which includes the length of your data (value set for <code>x-amz-decoded-content-length</code>), plus chunk metadata. Each chunk has metadata, such as the signature of the previous chunk. Chunk calculations are discussed in the following section. If you include the <code>Transfer-Encoding</code> header and specify any value other than <code>identity</code>, you must not include the Content-Length header.</td>
</tr>
</tbody>
</table>

You send the first chunk with the seed signature. You must construct the chunk as described in the following section.

### Defining the Chunk Body

All chunks include some metadata. Each chunk must conform to the following structure:

```
string(IntHexBase(chunk-size)) + ";chunk-signature=" + signature + \
chunk-data + \n```

Where:

- `IntHexBase()` is a function that you write to convert an integer chunk-size to hexadecimal. For example, if chunk-size is 65536, hexadecimal string is "10000".
- `chunk-size` is the size, in bytes, of the chunk-data, without metadata. For example, if you are uploading a 65 KB object and using a chunk size of 64 KB, you upload the data in three chunks: the first would be 64 KB, the second 1 KB, and the final chunk with 0 bytes.
- `signature` For each chunk, you calculate the signature using the following string to sign. For the first chunk, you use the seed-signature as the previous signature.

The size of the final chunk data that you send is 0, although the chunk body still contains metadata, including the signature of the previous chunk.

### Example: PUT Object

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:
The signature calculations in these examples use the following example security credentials.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

All examples use the request timestamp 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).

All examples use examplebucket as the bucket name.

The bucket is assumed to be in the US East (N. Virginia) Region, and the credential Scope and the Signing Key calculations use us-east-1 as the Region specifier. For more information, see Regions and Endpoints in the Amazon Web Services General Reference.

You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

https://examplebucket.s3.amazonaws.com/photos/photo1.jpg

For more information, see Virtual Hosting of Buckets in the Amazon Simple Storage Service User Guide.

The following example sends a PUT request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name chunkObject.txt.
- You are requesting REDUCED_REDUNDANCY as the storage class by adding the x-amz-storage-class request header.

For information about the API action, see PutObject (p. 371). The general request syntax is as follows:

```plaintext
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD
Content-encoding: aws-chunked
x-amz-decoded-content-length: 66560
Content-Length: 66824
<Payload>
```

The following steps show signature calculations.

1. **Seed signature — Create String to Sign**
   a. **CanonicalRequest**
      ```plaintext
      PUT /examplebucket/chunkObject.txt
      ```
content-encoding: aws-chunked
content-length: 66824
host: s3.amazonaws.com
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD
x-amz-date: 20130524T000000Z
x-amz-decoded-content-length: 66560
x-amz-storage-class: REDUCED_REDUndANCY

content-encoding: content-length; host; x-amz-content-sha256; x-amz-date; x-amz-decoded-content-length; x-amz-storage-class
STREAMING-AWS4-HMAC-SHA256-PAYLOAD

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of x-amz-content-sha256 header.

b. StringToSign

AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
cee3fed04b70867d036f722359b0b1f2f0e5d6f0e316455

Note
For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

2. SigningKey

signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"), "20130524"), "us-east-1"), "s3"), "aws4_request")

3. Seed Signature

4f232c4386841ef735655705268965c44a0e4690b4a4adea153f7db9fa80a0a9

4. Authorization header

The resulting Authorization header is as follows:

AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-class,Signature=4f232c4386841ef735655705268965c44a0e4690b4a4adea153f7db9fa80a0a9

5. Chunk 1: (65536 bytes, with value 97 for letter 'a')

a. Chunk string to sign:

AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
4f232c4386841ef735655705268965c44a0e4690b4a4adea153f7db9fa80a0a9
Signature Calculation: Transfer Payload in Multiple Chunks

Note
For information about each line in the string to sign, see the preceding diagram that shows various components of the string to sign (for example, the last three lines are, previous-signature, hash(""), and hash(current-chunk-data)).

b. Chunk signature:

ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648

c. Chunk data sent:

10000;chunk-signature=ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648
<65536-bytes>

6. Chunk 2: (1024 bytes, with value 97 for letter 'a')

a. Chunk string to sign:

AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648

c. Chunk data sent:

0;chunk-signature=b6c6ea8a5354eaf15b3cb7646744f4275b71ea724fed81ceb9323e279d449df9
Signature Calculations for the Authorization Header: Including Trailing Headers (Chunked Upload) (AWS Signature Version 4)

As described in the Overview (p. 1006), when authenticating requests using the Authorization header, you have an option of uploading the payload in chunks. This is covered in detail in Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 1021). When you send the data for the object in chunks, you also have the option of including trailing headers. This section describes the steps you need to take when you want to include a trailing header at the end of your multiple chunk upload.

Important
When you are including trailing headers, you must send the following in your initial header:

- You must set `x-amz-content-sha256` to an appropriate value that indicates a trailer will be included. To see the acceptable values for `x-amz-content-sha256`, see Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 1006).
- You must set `x-amz-trailer` to indicate the contents you are including in your trailing header.

Trailing headers are only sent after the chunks have been uploaded. Previous chunks are sent as normal and signed as described in the previous sections, including sending the final chunk with a payload of 0 bytes. The trailing headers are included as their own chunk and sent after the final chunk with a payload of 0 bytes. For example, if your data ended with a 100 KB chunk, you would send the following:

- Previous data chunks
- 100 KB final chunk of the object
- 0 bytes chunk signifying the end of the object
- Trailing headers chunk

Example: PUT Object

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

- All examples use the request timestamp 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- All examples use examplebucket as the bucket name.
- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential Scope and the Signing Key calculations use us-east-1 as the Region specifier. For more information, see Regions and Endpoints in the Amazon Web Services General Reference.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:
The following example sends a PUT request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name chunkObject.txt.
- You are requesting REDUCED_REDUNDANCY as the storage class by adding the x-amz-storage-class request header.
- The transfer is including a CRC32 checksum value as a trailing header.

For information about the API action, see `PutObject (p. 371)`. The general request syntax is as follows:

```
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
Content-Encoding: aws-chunked
x-amz-decoded-content-length: 66560
x-amz-trailer: x-amz-checksum-crc32c
Content-Length: 66824

<Payload>
```

The following steps show signature calculations.

1. **Seed signature — Create String to Sign**
   a. **CanonicalRequest**

```
PUT /examplebucket/chunkObject.txt
content-encoding:aws-chunked
host:s3.amazonaws.com
x-amz-content-sha256:STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
x-amz-date:20130524T000000Z
x-amz-decoded-content-length:66560
x-amz-trailer:x-amz-checksum-crc32c

content-encoding:host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-class;x-amz-trailer
STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
```
In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256` header.

**b. StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
44d48b8c2f70e815a0198cc73d7a546a73a93359c070abbbae6c7de112559
```

**Note**
For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

**2. SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"),"20130524"),"us-east-1"),"s3"),"aws4_request")
```

**3. Seed Signature**

```
106e2a8a18243abcf37539882f36619c00e2d6c72633413f02d3b74544bfcb8e
```

**4. Authorization header**

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-class,Signature=106e2a8a18243abcf37539882f36619c00e2d6c72633413f02d3b74544bfcb8e
```

**5. Chunk 1: (65536 bytes, with value 97 for letter ‘a’)**

**a. Chunk string to sign:**

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
106e2a8a18243abcf37539882f36619c00e2d6c72633413f02d3b74544bfcb8e
e3b0c44298fc1c149afbf4c8996fb92427ae4e4649b934ca499991b7852b855
bf718bf6f653bebc184e1479f1935b8da974701b893afcf49e701f3e2f9f9c5a
```

**Note**
For information about each line in the string to sign, see the preceding diagram that shows various components of the string to sign (for example, the last three lines are, `previous-signature`, `hash("")`, and `hash(current-chunk-data)`).

**b. Chunk signature:**
Signature Calculation: Including Trailing Headers

6. **Chunk 2: (1024 bytes, with value 97 for letter 'a')**
   a. Chunk string to sign:
   
   ```
   AWS4-HMAC-SHA256-PAYLOAD
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
   e3b0c4298fc1c149a9bf4c8996fb92427ae41e4649b934ca95991b7852b855
   41edece42d6e89bfb15a9ba6932e1c20cbc9f5a5d134645adb5db1b9737ea3
   ```
   b. Chunk signature:
   
   ```
   041169d545f3f4a02fe2e3d0666bf1798dd5f3417ae8ceed0e43690aafbe79d1
   ```
   c. Chunk data sent:
   
   ```
   400;chunk-signature=041169d545f3f4a02fe2e3d0666bf1798dd5f3417ae8ceed0e43690aafbe79d1
   ```

7. **Chunk 3: (0 byte data)**
   a. Chunk string to sign:
   
   ```
   AWS4-HMAC-SHA256-PAYLOAD
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   e05ab64fe1dfdbf0b5870abbaabdb063c371d4e96f2767e6934d90529c5ae850
   ```
   b. Chunk signature:
   
   ```
   e05ab64fe1dfdbf0b5870abbaabdb063c371d4e96f2767e6934d90529c5ae850
   ```
   c. Chunk data sent:
   
   ```
   0;chunk-signature=e05ab64fe1dfdbf0b5870abbaabdb063c371d4e96f2767e6934d90529c5ae850
   ```

8. **Chunk 4: Trailing headers**
   a. Trailer chunk string to sign:
   
   ```
   AWS4-HMAC-SHA256-TRAILER
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   e05ab64fe1dfdbf0b5870abbaabdb063c371d4e96f2767e6934d90529c5ae850
   2e4ab969aa65b1ad6def2db10e4d3a8260683d194dbaf757f90e8a37960a4b3c
   ```
   b. Chunk signature:
Authenticating Requests: Using Query Parameters (AWS Signature Version 4)

As described in the authentication overview (see Authentication Methods (p. 1005)), you can provide authentication information using query string parameters. Using query parameters to authenticate requests is useful when you want to express a request entirely in a URL. This method is also referred as presigning a URL.

A use case scenario for presigned URLs is that you can grant temporary access to your Amazon S3 resources. For example, you can embed a presigned URL on your website or alternatively use it in command line client (such as Curl) to download objects.

**Note**

You can also use the AWS CLI to create presigned URLs. For more information, see presign in the AWS CLI Command Reference.

The following is an example presigned URL.

```
https://s3.amazonaws.com/examplebucket/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=<your-access-key-id>/20130721/us-east-1/s3/aws4_request
&X-Amz-Date=20130721T201207Z
&X-Amz-Expires=86400
&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

In the example URL, note the following:

- The line feeds are added for readability.
- The X-Amz-Credential value in the URL shows the "/" character only for readability. In practice, it should be encoded as %2F. For example:

```
&X-Amz-Credential=<your-access-key-id>%2F20130721%2Fus-east-1%2Fs3%2Faws4_request
```

The following table describes the query parameters in the URL that provide authentication information.

<table>
<thead>
<tr>
<th>Query String Parameter Name</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Amz-Algorithm</td>
<td>Identifies the version of AWS Signature and the algorithm that you used to calculate the signature.</td>
</tr>
<tr>
<td>Query String Parameter Name</td>
<td>Example Value</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>X-Amz-Credential</td>
<td>In addition to your access key ID, this parameter also provides scope (AWS Region and service) for which the signature is valid. This value must match the scope you use in signature calculations, discussed in the following section. The general form for this parameter value is as follows:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;AWS Region&gt;/&lt;AWS service&gt;/aws4_request</code></td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>AKIAI0SF0DNN7EXAMPLE/20130721/us-east-1/s3/aws4_request</td>
</tr>
<tr>
<td></td>
<td>For Amazon S3, the <code>AWS-service</code> string is s3. For a list of S3 AWS-region strings, see Regions and Endpoints in the AWS General Reference.</td>
</tr>
<tr>
<td>X-Amz-Date</td>
<td>The date and time format must follow the ISO 8601 standard, and must be formatted with the &quot;yyyyMMddTHmmssZ&quot; format. For example if the date and time was &quot;08/01/2016 15:32:41.982-700&quot; then it must first be converted to UTC (Coordinated Universal Time) and then submitted as &quot;20160801T223241Z&quot;.</td>
</tr>
<tr>
<td>X-Amz-Expires</td>
<td>Provides the time period, in seconds, for which the generated presigned URL is valid. For example, 86400 (24 hours). This value is an integer. The minimum value you can set is 1, and the maximum is 604800 (seven days). A presigned URL can be valid for a maximum of seven days because the signing key you use in signature calculation is valid for up to seven days.</td>
</tr>
<tr>
<td>X-Amz-SignedHeaders</td>
<td>Lists the headers that you used to calculate the signature. The following headers are required in the signature calculations:</td>
</tr>
<tr>
<td></td>
<td>• The HTTP host header.</td>
</tr>
<tr>
<td></td>
<td>• Any <code>x-amz-*</code> headers that you plan to add to the request.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td>For added security, you should sign all the request headers that you plan to include in your request.</td>
</tr>
</tbody>
</table>
Calculating a Signature

The following diagram illustrates the signature calculation process.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lowercase()</td>
<td>Convert the string to lowercase.</td>
</tr>
<tr>
<td>Hex()</td>
<td>Lowercase base 16 encoding.</td>
</tr>
<tr>
<td>SHA256Hash()</td>
<td>Secure Hash Algorithm (SHA) cryptograhic hash function.</td>
</tr>
<tr>
<td>HMAC-SHA256()</td>
<td>Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.</td>
</tr>
</tbody>
</table>
## Calculating a Signature

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trim()</td>
<td>Remove any leading or trailing whitespace.</td>
</tr>
<tr>
<td>UriEncode()</td>
<td>URI encode every byte. UriEncode() must enforce the following rules:</td>
</tr>
<tr>
<td></td>
<td>• URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z',</td>
</tr>
<tr>
<td></td>
<td>'0'-'9', '+', '-', '_', and '~'.</td>
</tr>
<tr>
<td></td>
<td>• The space character is a reserved character and must be encoded as &quot;%20&quot;</td>
</tr>
<tr>
<td></td>
<td>(and not as &quot;+&quot;).</td>
</tr>
<tr>
<td></td>
<td>• Each URI encoded byte is formed by a '%' and the two-digit hexadecimal</td>
</tr>
<tr>
<td></td>
<td>value of the byte.</td>
</tr>
<tr>
<td></td>
<td>• Letters in the hexadecimal value must be uppercase, for example &quot;%1A&quot;.</td>
</tr>
<tr>
<td></td>
<td>• Encode the forward slash character, '/', everywhere except in the object</td>
</tr>
<tr>
<td></td>
<td>key name. For example, if the object key name is photos/Jan/sample.jpg, the</td>
</tr>
<tr>
<td></td>
<td>forward slash in the key name is not encoded.</td>
</tr>
</tbody>
</table>

### Important

The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work.

To see an example of a UriEncode function in Java, see [Java Utilities](https://github.com) on the GitHub website.

---

For more information about the signing process (details of creating a canonical request, string to sign, and signature calculations), see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)](https://aws.amazon.com) (p. 1009). The process is generally the same except that the creation of CanonicalRequest in a presigned URL differs as follows:

- You don't include a payload hash in the Canonical Request, because when you create a presigned URL, you don't know the payload content because the URL is used to upload an arbitrary payload. Instead, you use a constant string UNSIGNED-PAYLOAD.

- The Canonical Query String must include all the query parameters from the preceding table except for X-Amz-Signature.

- For S3, you must include the X-Amz-Security-Token query parameter in the URL if using credentials sourced from the STS service.

- Canonical Headers must include the HTTP host header. If you plan to include any of the x-amz-* headers, these headers must also be added for signature calculation. You can optionally add all other headers that you plan to include in your request. For added security, you should sign as many headers as possible. If you add a signed header that is also a signed query parameter, and they differ in value, you will receive an InvalidRequest error as the input is conflicting.
An Example

Suppose you have an object test.txt in your examplebucket bucket. You want to share this object with others for a period of 24 hours (86400 seconds) by creating a presigned URL.

```
https://s3.amazonaws.com/examplebucket/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request
&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

The following steps illustrate first the signature calculations and then construction of the presigned URL. The example makes the following additional assumptions:

- Request timestamp is Fri, 24 May 2013 00:00:00 GMT.
- The bucket is in the US East (N. Virginia) region, and the credential Scope and the Signing Key calculations use us-east-1 as the region specifier. For more information, see Regions and Endpoints in the AWS General Reference.

You can use this example as a test case to verify the signature that your code calculates; however, you must use the same bucket name, object key, time stamp, and the following example credentials:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtFEMI/K7MDENG/bPxFiCYEXvAMPLEKEY</td>
</tr>
</tbody>
</table>

1. **StringToSign**
   a. **CanonicalRequest**

   ```plaintext
   GET
   /test.txt
   X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE
   %2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
   host:examplebucket.s3.amazonaws.com
   host
   UNSIGNED-PAYLOAD
   ```

   b. **StringToSign**

   ```plaintext
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   3bfa292879f6447bcda7001decf97f4a55d650c8942174ae0a9121cf58ad04
   ```

2. **SigningKey**
Example 2

The following is an example (unrelated to the previous example) showing a presigned URL with the X-Amz-Security-Token parameter.

https://examplebucket.s3.us-east-1.amazonaws.com/test.txt?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20200524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host&X-Amz-Signature=aeed9bbcd4d02ee5c0109b86d86835f995330daae4c5685751d57751f604d404

Examples: Signature Calculations in AWS Signature Version 4

Topics
- Signature Calculation Examples Using Java (AWS Signature Version 4) (p. 1038)
- Examples of Signature Calculations Using C# (AWS Signature Version 4) (p. 1039)
This section provides examples of signature calculations written in Java and C#. The code samples send the following requests and use the HTTP Authorization header to provide authentication information:

- **PUT object** – Separate examples illustrate both uploading the full payload at once and uploading the payload in chunks. For information about using the Authorization header for authentication, see [Authenticating Requests: Using the Authorization Header (AWS Signature Version 4)](p. 1006).

- **GET object** – This example generates a presigned URL to get an object. Query parameters provide the signature and other authentication information. Users can paste a presigned URL in their browser to retrieve the object, or you can use the URL to create a clickable link. For information about using query parameters for authentication, see [Authenticating Requests: Using Query Parameters (AWS Signature Version 4)](p. 1032).

The rest of this section describes the examples in Java and C#. The topics include instructions for downloading the samples and for executing them.

### Signature Calculation Examples Using Java (AWS Signature Version 4)

The Java sample that shows signature calculation can be downloaded at [https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip](https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip). In RunAllSamples.java, the main() function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The sample creates an object from the text string provided in the code:

```java
PutS3ObjectSample.putS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
GetS3ObjectSample.getS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PresignedUrlSample.getPresignedUrlToS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PutS3ObjectChunkedSample.putS3ObjectChunked(bucketName, regionName, awsAccessKey, awsSecretKey);
```

To test the examples on a Linux-based computer

The following instructions are for the Linux operating system.

1. In a terminal, navigate to the directory that contains AWSS3SigV4JavaSamples.zip.
2. Extract the .zip file.
3. In a text editor, open the file ./com/amazonaws/services/s3/samples/RunAllSamples.java. Update code with the following information:

   - The name of a bucket where the new object can be created.

   **Note**
   The examples use a virtual-hosted style request to access the bucket. To avoid potential errors, ensure that your bucket name conforms to the bucket naming rules as explained in [Bucket Restrictions and Limitations](http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip) in the [Amazon Simple Storage Service User Guide](http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip).

   - AWS Region where the bucket resides.

   If bucket is in the US East (N. Virginia) region, use us-east-1 to specify the region. For a list of other AWS Regions, go to [Amazon Simple Storage Service (S3)](http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip) in the [AWS General Reference](http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip).

4. Compile the source code and store the compiled classes into the bin/ directory.

   ```bash
   javac -d bin -source 6 -verbose com
   ```
5. Change the directory to `bin/`, and then run `RunAllSamples`.

```
java com.amazonaws.services.s3.sample.RunAllSamples
```

The code runs all the methods in `main()`. For each request, the output will show the canonical request, the string to sign, and the signature.

### Examples of Signature Calculations Using C# (AWS Signature Version 4)

The C# sample that shows signature calculation can be downloaded at [https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip](https://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip). In `Program.cs`, the `main()` function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The code for signature calculation is in the `Signers` folder.

```csharp
PutS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");
Console.WriteLine("\n*************************");
PutS3ObjectChunkedSample.Run(awsRegion, bucketName, "MySampleFileChunked.txt");
Console.WriteLine("\n*************************");
GetS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");
Console.WriteLine("\n*************************");
PresignedUrlSample.Run(awsRegion bucketName, "MySampleFile.txt");
```

To test the examples with Microsoft Visual Studio 2010 or later

1. Extract the `.zip` file.
2. Start Visual Studio, and then open the `.sln` file.
3. Update the `App.config` file with valid security credentials.
4. Update the code as follows:

   - In `Program.cs`, provide the bucket name and the AWS Region where the bucket resides. The sample creates an object in this bucket.
5. Run the code.
6. To verify that the object was created, copy the presigned URL that the program creates, and then paste it in a browser window.

### Authenticating Requests: Browser-Based Uploads Using POST (AWS Signature Version 4)

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. Using HTTP POST to upload content simplifies uploads and reduces upload latency where users upload data to store in Amazon S3. This section describes how you authenticate HTTP POST requests. For more information about HTTP POST requests, how to create a form, create a POST policy, and an example, see [Browser-Based Uploads Using POST (AWS Signature Version 4)](https://docs.aws.amazon.com/AmazonS3/latest/API/samples/Browser-Form-HTTP-POST-CSharp.html).
To authenticate an HTTP POST request you do the following:

1. The form must include the following fields to provide signature and relevant information that Amazon S3 can use to re-calculate the signature upon receiving the request:

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy</td>
<td>The Base64-encoded security policy that describes what is permitted in the request. For signature calculation this policy is the string you sign. Amazon S3 must get this policy so it can re-calculate the signature.</td>
</tr>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm used. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256.</td>
</tr>
</tbody>
</table>
| x-amz-credential | In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation. It is a string of the following form: 

\[ <your-access-key-id>/\langle date \rangle/\langle aws-region \rangle/\langle aws-service \rangle/\text{aws4\_request} \]

For example:

AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request.

For Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the AWS General Reference. |
| x-amz-date       | It is the date value in ISO8601 format. For example, 20130728T000000Z. It is the same date you used in creating the signing key. This must also be the same value you provide in the policy (x-amz-date) that you signed. |
| x-amz-signature  | (AWS Signature Version 4) The HMAC-SHA256 hash of the security policy. For more information on options for the signature, see Add the signature to the HTTP request in the AWS General Reference. |

2. The POST policy must include the following elements:

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm that you used to calculation the signature. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256.</td>
</tr>
<tr>
<td>x-amz-credential</td>
<td>In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation.</td>
</tr>
</tbody>
</table>
### Calculating a Signature

The following diagram illustrates the signature calculation process.

To Calculate a Signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy to Base64. The result is the string to sign.
3. Create the signature as an HMAC-SHA256 hash of the string to sign. You will provide the signing key as key to the hash function.
4. Encode the signature by using hex encoding.

For more information about creating HTML forms, security policies, and an example, see the following subtopics:

- Creating an HTML Form (Using AWS Signature Version 4) (p. 1076)
- POST Policy (p. 1081)
Amazon S3 Signature Version 4 Authentication Specific Policy Keys

The following table shows the policy keys related Amazon S3 Signature Version 4 authentication that can be in Amazon S3 policies. In a bucket policy, you can add these conditions to enforce specific behavior when requests are authenticated by using Signature Version 4. For example policies, see [Bucket Policy Examples Using Signature Version 4 Related Condition Keys](p. 1043).

### Applicable Keys for s3:* Actions or any of the Amazon S3 Actions

<table>
<thead>
<tr>
<th>Applicable Keys</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s3:signatureversion</td>
<td>Identifies the version of AWS Signature that you want to support for authenticated requests. For authenticated requests, Amazon S3 supports both Signature Version 4 and Signature Version 2. You can add this condition in your bucket policy to require a specific signature version.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>&quot;AWS&quot; identifies Signature Version 2</td>
</tr>
<tr>
<td></td>
<td>&quot;AWS4-HMAC-SHA256&quot; identifies Signature Version 4</td>
</tr>
<tr>
<td>s3:authType</td>
<td>Amazon S3 supports various methods of authentication (see [Authenticating Requests (AWS Signature Version 4)](p. 1004)). You can optionally use this condition key to restrict incoming requests to use a specific authentication method. For example, you can allow only the HTTP Authorization header to be used in request authentication.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>REST-HEADER</td>
</tr>
<tr>
<td></td>
<td>REST-QUERY-STRING</td>
</tr>
<tr>
<td></td>
<td>POST</td>
</tr>
<tr>
<td>s3:signatureAge</td>
<td>The length of time, in milliseconds, that a signature is valid in an authenticated request. This condition works only for presigned URLs (the most restrictive condition wins). In Signature Version 2, this value is always set to 0. In Signature Version 4, the signing key is valid for up to seven days. Therefore, the signatures are</td>
</tr>
</tbody>
</table>
Applicable Keys | Description
--- | ---
also valid for up to seven days. You can use this condition to further limit the signature age. For more information, see [Introduction to Signing Requests](p. 1005). Example value: 100

s3:x-amz-content-sha256 | You can use this condition key to disallow unsigned content in your bucket.
When you use Signature Version 4, for requests that use the Authorization header, you add the x-amz-content-sha256 header in the signature calculation and then set its value to the hash payload.
You can use this condition key in your bucket policy to deny any uploads where payloads are not signed. For example:

- Deny uploads that use presigned URLs. For more information, see [Authenticating Requests: Using Query Parameters (AWS Signature Version 4)](p. 1032).
- Deny uploads that use Authorization header to authenticate requests but don't sign the payload. For more information, see [Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)](p. 1009).

Valid value: UNSIGNED-PAYLOAD

**Bucket Policy Examples Using Signature Version 4 Related Condition Keys**

Deny any Amazon S3 action on the examplebucket to anyone if request is authenticated using Signature Version 4.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Test",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "arn:aws:s3:::examplebucket/*",
            "Condition": {
                "StringEquals": {
                    "s3:signatureversion": "AWS4-HMAC-SHA256"
                }
            }
        }
    ]
}
```
The following bucket policy denies any Amazon S3 presigned URL request on objects in examplebucket if the signature is more than ten minutes old.

```json
{  
  "Version": "2012-10-17",
  "Statement": [
    
      {  
        "Sid": "Deny a presigned URL request if the signature is more than 10 min old",
        "Effect": "Deny",
        "Principal": "*",
        "Action": "s3:*",
        "Resource": "arn:aws:s3:::examplebucket3/*",
        "Condition": {
          "NumericGreaterThan": {
            "s3:signatureAge": 600000
          }
        }
      }
  ]
}
```

The following bucket policy allows only requests that use the Authorization header for request authentication. Any POST or presigned URL requests will be denied.

```json
{  
  "Version": "2012-10-17",
  "Statement": [

    {  
        "Sid": "Allow only requests that use Authorization header for request authentication. Deny POST or presigned URL requests.",
        "Effect": "Deny",
        "Principal": "*",
        "Action": "s3:*",
        "Resource": "arn:aws:s3:::examplebucket3/*",
        "Condition": {
          "StringNotEquals": {
            "s3:authType": "REST-HEADER"
          }
        }
      }
  ]
}
```

The following bucket policy denies any uploads with unsigned payloads, such as uploads using presigned URLs.

```json
{  
  "Version": "2012-10-17",
  "Statement": [

    {  
        "Sid": "Deny uploads with unsigned payloads.",
        "Effect": "Deny",
        "Principal": "*",
        "Action": "s3:*",
        "Resource": "arn:aws:s3:::examplebucket3/*",
        "Condition": {
          "StringEquals": {
            "s3:x-amz-content-sha256": "UNSIGNED-PAYLOAD"
          }
        }
      }
  ]
}

Browser-Based Uploads Using POST (AWS Signature Version 4)

This section discusses how to upload files directly to Amazon S3 through a browser using HTTP POST requests. It also contains information about how to use the AWS Amplify JavaScript library for browser-based file uploads to Amazon S3.

Topics
- POST Object (p. 1047)
- POST Object restore (p. 1060)
- Browser-Based Uploads Using HTTP POST (p. 1074)
- Calculating a Signature (p. 1075)
- Creating an HTML Form (Using AWS Signature Version 4) (p. 1076)
- POST Policy (p. 1081)
- Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 1086)
- Browser-Based Uploads to Amazon S3 Using the AWS Amplify Library (p. 1088)
POST Object

Description

The POST operation adds an object to a specified bucket by using HTML forms. POST is an alternate form of PUT that enables browser-based uploads as a way of putting objects in buckets. Parameters that are passed to PUT through HTTP headers are instead passed as form fields to POST in the multipart/form-data encoded message body. To add an object to a bucket, you must have WRITE access on the bucket. Amazon S3 never stores partial objects. If you receive a successful response, you can be confident that the entire object was stored.

Amazon S3 is a distributed system. Unless you've enabled versioning for a bucket, if Amazon S3 receives multiple write requests for the same object simultaneously, only the last version of the object written is stored.

To ensure that data is not corrupted while traversing the network, use the Content-MD5 form field. When you use this form field, Amazon S3 checks the object against the provided MD5 value. If they do not match, Amazon S3 returns an error. Additionally, you can calculate the MD5 value while posting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value. The ETag reflects only changes to the contents of an object, not its metadata.

Note
To configure your application to send the request headers before sending the request body, use the HTTP status code 100 (Continue). For POST operations, using this status code helps you avoid sending the message body if the message is rejected based on the headers (for example, because of an authentication failure or redirect). For more information about the HTTP status code 100 (Continue), go to Section 8.2.3 of http://www.ietf.org/rfc/rfc2616.txt.

Amazon S3 automatically encrypts all new objects that are uploaded to an S3 bucket. The encryption setting of an uploaded object depends on the default encryption configuration of the destination bucket. By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3).

If the destination bucket has an encryption configuration that uses server-side encryption with an AWS Key Management Service (AWS KMS) key (SSE-KMS), dual-layer server-side encryption with an AWS KMS key (DSSE-KMS), or a customer-provided encryption key (SSE-C), Amazon S3 uses the corresponding KMS key or customer-provided key to encrypt the uploaded object. When uploading an object, if you want to change the encryption setting of the uploaded object, you can specify the type of server-side encryption. You can configure SSE-S3, SSE-KMS, DSSE-KMS, or SSE-C. For more information, see Protecting data using server-side encryption in the Amazon Simple Storage Service User Guide.

Important
When constructing your request, make sure that the file field is the last field in the form.

Versioning

If you enable versioning for a bucket, POST automatically generates a unique version ID for the object being added. Amazon S3 returns this ID in the response by using the x-amz-version-id response header.

If you suspend versioning for a bucket, Amazon S3 always uses null as the version ID of the object stored in a bucket.

For more information about returning the versioning state of a bucket, see GET Bucket (Versioning Status) (p. 159).

Amazon S3 is a distributed system. If you enable versioning for a bucket and Amazon S3 receives multiple write requests for the same object simultaneously, all versions of the object are stored.
Requests

Syntax

Upload to Amazon S3
## Request Parameters

This implementation of the operation does not use request parameters.

## Form Fields

This operation can use the following form fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>The AWS access key ID of the owner of the bucket who grants an Anonymous user access for a request that satisfies the set of constraints in the policy.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Required if a policy document is included with the request.</td>
<td></td>
</tr>
<tr>
<td>acl</td>
<td>The specified Amazon S3 access control list (ACL). If the specified ACL is not valid, an error is generated. For more information about ACLs, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/AccessControlList.html">Access control list (ACL) overview</a> in the Amazon Simple Storage Service User Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: <code>private</code></td>
<td><code>public-read</code></td>
</tr>
<tr>
<td>Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires</td>
<td>The REST-specific headers. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutObject.html">PutObject</a>.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>

<tr>
<td></td>
<td>The file or text content must be the last field in the form.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>You cannot upload more than one file at a time.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: File or text content</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>key</td>
<td>The name of the uploaded key.</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>Name</td>
<td>To use the file name provided by the user, use the <code>${filename}</code> variable. For example, if a user named Mary uploads the file example.jpg and you specify /user/mary/${filename}, the key name is /user/mary/example.jpg. For more information, see Object key and metadata in the Amazon Simple Storage Service User Guide.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>The security policy that describes what is permitted in the request. Requests without a security policy are considered anonymous and work only on publicly writable buckets. For more information, see HTML forms and Upload examples in the Amazon Simple Storage Service User Guide.</td>
<td>Conditional</td>
</tr>
<tr>
<td>Name</td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Constraints: A security policy is required if the bucket is not publicly writable.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>The URL to which the client is redirected upon a successful upload.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>If success_action_redirect is not specified, Amazon S3 returns the empty document type specified in the success_action_status field.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>If Amazon S3 cannot interpret the URL, it acts as if the field is not present.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>The redirect field name is deprecated, and support for the redirect field name will be removed in the future.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| success_action_status| If you don't specify success_action_redirect, the status code is returned to the client when the upload succeeds.  
This field accepts the values 200, 201, or 204 (the default).  
If the value is set to 200 or 204, Amazon S3 returns an empty document with a 200 or 204 status code.  
If the value is set to 201, Amazon S3 returns an XML document with a 201 status code.  
If the value is not set or if it is set to a value that is not valid, Amazon S3 returns an empty document with a 204 status code.  
Type: String  
Default: None                                                                                                                                                                                                                                                                                                                                                     | No       |
| tagging              | The specified set of tags to add to the object. To add tags, use the following encoding scheme.                                                                                                                                                                                                                                                                                                                                                                                                | No       |

</tbody>
</table>
### Additional Checksum Request Form Fields

When uploading an object, you can specify various checksums that you would like to use to verify your data integrity. You can specify one additional checksum algorithm for Amazon S3 to use. For more information about additional checksum values, see [Checking object integrity](#) in the Amazon Simple Storage Service User Guide.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-checksum-algorithm</td>
<td>Indicates the algorithm used to create the checksum for the object. If a value is specified, you must include the matching checksum header. Otherwise, your request will generate a 400 error. Possible values include CRC32, CRC32C, SHA1, and SHA256.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-checksum-crc32</td>
<td>Specifies the base64-encoded, 32-bit CRC32 checksum of the object. This parameter is required if the value of x-amz-checksum-algorithm is CRC32.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>
Server-Side Encryption Specific Request Form Fields

Server-side encryption is data encryption at rest. Amazon S3 encrypts your data while writing it to disks in AWS data centers and decrypts your data when you access it. When uploading an object, you can specify the type of server-side encryption that you want Amazon S3 to use for encrypting the object.

There are four types of server-side encryption:

- **Server-side encryption with Amazon S3 managed keys (SSE-S3)** – Starting May 2022, all Amazon S3 buckets have encryption configured by default. The default option for server-side encryption is with SSE-S3. Each object is encrypted with a unique key. As an additional safeguard, SSE-S3 encrypts the key itself with a root key that it regularly rotates. SSE-S3 uses one of the strongest block ciphers available, 256-bit Advanced Encryption Standard (AES-256), to encrypt your data.

- **Server-side encryption with AWS KMS keys (SSE-KMS)** – SSE-KMS is provided through an integration of the AWS KMS service with Amazon S3. With AWS KMS, you have more control over your keys. For example, you can view separate keys, edit control policies, and follow the keys in AWS CloudTrail. Additionally, you can create and manage customer managed keys or use AWS managed keys that are unique to you, your service, and your Region.

- **Dual-layer server-side encryption with AWS KMS keys (DSSE-KMS)** – Dual-layer server-side encryption with AWS KMS keys (DSSE-KMS) is similar to SSE-KMS, but applies two individual layers of object-level encryption instead of one layer.

- **Server-side encryption with customer-provided keys (SSE-C)** – With SSE-C, you manage the encryption keys, and Amazon S3 manages the encryption as it writes to disks, and the decryption when you access your objects.

For more information, see [Protecting data using server-side encryption](https://docs.aws.amazon.com/AmazonS3/latest/userguide/server-side-encryption.html) in the *Amazon Simple Storage Service User Guide*.

Depending on which type of server-side encryption you want to use, specify the following form fields.

- **Use SSE-S3, SSE-KMS, or DSSE-KMS** – If you want to use these types of server-side encryption, specify the following form fields in the request.
### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies the server-side encryption algorithm to use when Amazon S3 creates an object. To use SSE-S3, specify AES256. To use SSE-KMS, specify aws:kms. To use DSSE-KMS, specify aws:kms:dsse.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: aws:kms, AES256, aws:kms:dsse</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption header has a valid value of aws:kms or aws:kms:dsse, this header specifies the ID of the AWS KMS key that was used to encrypt the object.</td>
<td>Yes, if the value of x-amz-server-side-encryption is aws:kms or aws:kms:dsse</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-context</td>
<td>If x-amz-server-side-encryption has a valid value of aws:kms or aws:kms:dsse, this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string that contains JSON-formatted key-value pairs for the encryption context.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-bucket-key-enabled</td>
<td>If x-amz-server-side-encryption has a valid value of aws:kms or aws:kms:dsse, this header specifies whether Amazon S3 should use an S3 Bucket Key with SSE-KMS or DSSE-KMS. Setting this header to true causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS or DSSE-KMS.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

If you specify `x-amz-server-side-encryption:aws:kms` or `x-amz-server-side-encryption:aws:kms:dsse`, but do not provide `x-amz-server-side-encryption-aws-kms-key-id`, Amazon S3 uses the AWS managed key (aws/S3) to protect the data.

- **Use SSE-C** – If you want to manage your own encryption keys, you must provide all the following form fields in the request.

  **Note**

  If you use SSE-C, the ETag value that Amazon S3 returns in the response is not the MD5 of the object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies the algorithm to use to when encrypting the object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
### Name | Description | Required
--- | --- | ---
| customer-algorithm | Default: None  
Valid Value: AES256  
Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-key and x-amz-server-side-encryption-customer-key-MD5 fields. | |
| x-amz-server-side-encryption-customer-key | Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object, and then it is discarded. Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header.  
Type: String  
Default: None  
Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key-MD5 fields. | Yes |
| x-amz-server-side-encryption-customer-key-MD5 | Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message-integrity check to ensure that the encryption key was transmitted without error.  
Type: String  
Default: None  
Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key fields. | Yes |

### Responses

#### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see [Common Response Headers](p. 1092).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| x-amz-checksum-crc32 | The base64-encoded, 32-bit CRC32 checksum of the object.  
Type: String |
| x-amz-checksum-crc32c | The base64-encoded, 32-bit CRC32C checksum of the object.  
Type: String |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-checksum-sha1</td>
<td>The base64-encoded, 160-bit SHA-1 digest of the object. Type: String</td>
</tr>
<tr>
<td>x-amz-checksum-sha256</td>
<td>The base64-encoded, 256-bit SHA-256 digest of the object. Type: String</td>
</tr>
<tr>
<td>x-amz-expiration</td>
<td>If an Expiration action is configured for the object as part of the bucket's lifecycle configuration, Amazon S3 returns this header. The header value includes an expiry-date component and a URL-encoded rule-id component. For version-enabled buckets, this header applies only to current versions. Amazon S3 does not provide a header to indicate when a noncurrent version is eligible for permanent deletion. For more information, see [PutBucketLifecycleConfiguration](p. 316). Type: String</td>
</tr>
<tr>
<td>success_action_redirect, redirect</td>
<td>The URL to which the client is redirected on a successful upload. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption</td>
<td>The server-side encryption algorithm that was used when storing this object in Amazon S3 (for example, AES256, aws:kms, aws:kms:dsse). Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption header has a valid value of aws:kms, this header specifies the ID of the KMS key that was used to encrypt the object. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-bucket-key-enabled</td>
<td>If x-amz-server-side-encryption has a valid value of aws:kms, this header indicates whether the object is encrypted with SSE-KMS by using an S3 Bucket Key. If this header is set to true, the object uses an S3 Bucket Key with SSE-KMS. Type: Boolean</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-</td>
<td>If SSE-C was requested, the response includes this header, which confirms the encryption algorithm that was used. Type: String</td>
</tr>
<tr>
<td>customer-algorithm</td>
<td>Valid Values: AES256</td>
</tr>
</tbody>
</table>
Amazon Simple Storage Service API Reference
Examples

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>If SSE-C was requested, the response includes this header to verify round-trip message integrity of the customer-provided encryption key.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>x-amz-version-id</td>
<td>Version of the object.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket</td>
<td>The name of the bucket that the object was stored in.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: PostResponse</td>
</tr>
<tr>
<td>ETag</td>
<td>The entity tag (ETag) is an MD5 hash of the object that you can use to do conditional GET operations by using the If-Modified request tag with the GET request operation. ETag reflects changes only to the contents of an object, not to its metadata.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>

</tbody>
</table>

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see [Error Responses](p. 1094).

**Examples**

**Sample Request**

```
POST /Neo HTTP/1.1
Content-Length: 4
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
```
Authorization: *authorization string*
Content-Type: text/plain
Expect: the 100-continue HTTP status code

**ObjectContent**

**Sample Response with Versioning Suspended**

The following is a sample response when bucket versioning is suspended:

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdAiiFgSm/F1YsViT1iW94/xUQxMsf7xiEbla0w1l0Ixl+zbwZl63pt7
x-amz-request-id: 0A9CE4060975EAC
x-amz-version-id: default
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf55f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

In this response, the version ID is null.

**Sample Response with Versioning Enabled**

The following is a sample response when bucket versioning is enabled.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdAiiFgSm/F1YsViT1iW94/xUQxMsf7xiEbla0w1l0Ixl+zbwZl63pt7
x-amz-request-id: 0A9CE4060975EAC
x-amz-version-id: 43jfkoDf843jnJFD9fj33HNVfsduFLDhNsf038jfsjsGDFSIRp
Date: Wed, 01 Mar 2006 12:00:00 GMT
ETag: "828ef3fda96f00ad9f27c383fc9ac7f"
Content-Length: 0
Connection: close
Server: AmazonS3
```

POST Object restore

Description

This operation performs the following types of requests:

- select – Perform a select query on an archived object
- restore an archive – Restore an archived object

To use this operation, you must have permissions to perform the s3:RestoreObject and s3:GetObject actions. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service User Guide.

Querying Archives with Select Requests

You use a select type of request to perform SQL queries on archived objects. The archived objects that are being queried by the select request must be formatted as uncompressed comma-separated values (CSV) files. You can run queries and custom analytics on your archived data without having to restore your data to a hotter Amazon S3 tier. For an overview about select requests, see Querying Archived Objects in the Amazon Simple Storage Service User Guide.

When making a select request, do the following:

- Define an output location for the select query's output. This must be an Amazon S3 bucket in the same AWS Region as the bucket that contains the archive object that is being queried. The AWS account that initiates the job must have permissions to write to the S3 bucket. You can specify the storage class and encryption for the output objects stored in the bucket. For more information about output, see Querying Archived Objects in the Amazon Simple Storage Service User Guide.

For more information about the S3 structure in the request body, see the following:

- PutObject (p. 371)
- Managing Access with ACLs in the Amazon Simple Storage Service User Guide
- Protecting Data Using Server-Side Encryption in the Amazon Simple Storage Service User Guide

- Define the SQL expression for the SELECT type of restoration for your query in the request body's SelectParameters structure. You can use expressions like the following examples.

The following expression returns all records from the specified object.

```
SELECT * FROM Object
```

Assuming that you are not using any headers for data stored in the object, you can specify columns with positional headers.

```
SELECT s._1, s._2 FROM Object s WHERE s._3 > 100
```

If you have headers and you set the fileHeaderInfo in the CSV structure in the request body to USE, you can specify headers in the query. (If you set the fileHeaderInfo field to IGNORE, the first row is skipped for the query.) You cannot mix ordinal positions with header column names.

```
SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
```
For more information about using SQL with S3 Glacier Select restore, see SQL Reference for Amazon S3 Select and S3 Glacier Select in the Amazon Simple Storage Service User Guide.

When making a select request, you can also do the following:

- To expedite your queries, specify the Expedited tier. For more information about tiers, see "Restoring Archives," later in this topic.
- Specify details about the data serialization format of both the input object that is being queried and the serialization of the CSV-encoded query results.

The following are additional important facts about the select feature:

- The output results are new Amazon S3 objects. Unlike archive retrievals, they are stored until explicitly deleted—manually or through a lifecycle policy.
- You can issue more than one select request on the same Amazon S3 object. Amazon S3 doesn't deduplicate requests, so avoid issuing duplicate requests.
- Amazon S3 accepts a select request even if the object has already been restored. A select request doesn't return error response 409.

## Restoring Archives

Objects in the GLACIER and DEEP_ARCHIVE storage classes are archived. To access an archived object, you must first initiate a restore request. This restores a temporary copy of the archived object. In a restore request, you specify the number of days that you want the restored copy to exist. After the specified period, Amazon S3 deletes the temporary copy but the object remains archived in the GLACIER or DEEP_ARCHIVE storage class that object was restored from.

To restore a specific object version, you can provide a version ID. If you don't provide a version ID, Amazon S3 restores the current version.

The time it takes restore jobs to finish depends on which storage class the object is being restored from and which data access tier you specify.

When restoring an archived object (or using a select request), you can specify one of the following data access tier options in the Tier element of the request body:

- **Expedited** - Expedited retrievals allow you to quickly access your data stored in the GLACIER storage class when occasional urgent requests for a subset of archives are required. For all but the largest archived objects (250 MB+), data accessed using Expedited retrievals are typically made available within 1–5 minutes. Provisioned capacity ensures that retrieval capacity for Expedited retrievals is available when you need it. Expedited retrievals and provisioned capacity are not available for the DEEP_ARCHIVE storage class.

- **Standard** - Standard retrievals allow you to access any of your archived objects within several hours. This is the default option for the GLACIER and DEEP_ARCHIVE retrieval requests that do not specify the retrieval option. Standard retrievals typically complete within 3–5 hours from the GLACIER storage class and typically complete within 12 hours from the DEEP_ARCHIVE storage class.

- **Bulk** - Bulk retrievals are Amazon S3 Glacier's lowest-cost retrieval option, enabling you to retrieve large amounts, even petabytes, of data inexpensively in a day. Bulk retrievals typically complete within 5–12 hours from the GLACIER storage class and typically complete within 48 hours from the DEEP_ARCHIVE storage class.

For more information about archive retrieval options and provisioned capacity for Expedited data access, see Restoring Archived Objects in the Amazon Simple Storage Service User Guide.
You can use Amazon S3 restore speed upgrade to change the restore speed to a faster speed while it is in progress. You upgrade the speed of an in-progress restoration by issuing another restore request to the same object, setting a new Tier request element. When issuing a request to upgrade the restore tier, you must choose a tier that is faster than the tier that the in-progress restore is using. You must not change any other parameters, such as the Days request element. For more information, see Upgrading the Speed of an In-Progress Restore in the Amazon Simple Storage Service User Guide.

To get the status of object restoration, you can send a HEAD request. Operations return the x-amz-restore header, which provides information about the restoration status, in the response. You can use Amazon S3 event notifications to notify you when a restore is initiated or completed. For more information, see Configuring Amazon S3 Event Notifications in the Amazon Simple Storage Service User Guide.

After restoring an archived object, you can update the restoration period by reissuing the request with a new period. Amazon S3 updates the restoration period relative to the current time and charges only for the request—there are no data transfer charges. You cannot update the restoration period when Amazon S3 is actively processing your current restore request for the object.

If your bucket has a lifecycle configuration with a rule that includes an expiration action, the object expiration overrides the life span that you specify in a restore request. For example, if you restore an object copy for 10 days, but the object is scheduled to expire in 3 days, Amazon S3 deletes the object in 3 days. For more information about lifecycle configuration, see PutBucketLifecycleConfiguration (p. 316) and Object Lifecycle Management in Amazon Simple Storage Service User Guide.

Requests

Syntax

POST /ObjectName?restore&versionId=VersionID HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Content-MD5: MD5

Note
The syntax shows some of the request headers. For a complete list, see "Request Headers," later in this topic.

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
Request Elements

The following is an XML example of a request body for restoring an archive.

```xml
<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Bulk</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

The following table explains the XML for archive restoration in the request body.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RestoreRequest</td>
<td>Container for restore information.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td>Days</td>
<td>Lifetime of the restored (active) copy. The minimum number of days that you can restore an object from S3 Glacier is 1. After the object copy reaches the specified lifetime, Amazon S3 removes it from the bucket. If you are restoring an archive, this element is required. Do not use this element with a SELECT type of request.</td>
<td>Yes, if restoring an archive</td>
</tr>
<tr>
<td></td>
<td>Type: Positive integer</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: RestoreRequest</td>
<td></td>
</tr>
<tr>
<td>GlacierJobParameters</td>
<td>Container for Glacier job parameters. Do not use this element with a SELECT type of request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>

<td>Describes the location that receives the results of the select restore request.</td>
<td>Yes, if request type is SELECT</td>
</tr>
<tr>
<td></td>
<td>Type: Container for Amazon S3</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: RestoreRequest</td>
<td></td>
</tr>
</tbody>
</table>

The SelectParameters container element contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>The SQL expression. For example:</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>• The following SQL expression retrieves the first column of the data from the object stored in CSV format:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[SELECT s._1 FROM Object s]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The following SQL expression returns everything from the object:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[SELECT * FROM Object]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: SelectParameters</td>
<td></td>
</tr>
<tr>
<td>ExpressionType</td>
<td>Identifies the expression type.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: SQL</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>InputSerialization</strong></td>
<td>Describes the serialization format of the object. Type: Container for CSV</td>
<td>Yes</td>
</tr>
<tr>
<td>Ancestors: SelectParameters</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>OutputSerialization</strong></td>
<td>Describes how the results of the select job are serialized. Type: Container for CSV</td>
<td>Yes</td>
</tr>
<tr>
<td>Ancestors: SelectParameters</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **CSV container element in the InputSerialization element** contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RecordDelimiter</strong></td>
<td>A single character used to separate individual records in the input. Instead of the default value, you can specify an arbitrary delimiter. Type: String Default: \n Ancestors: CSV</td>
<td>No</td>
</tr>
<tr>
<td><strong>FieldDelimiter</strong></td>
<td>A single character used to separate individual fields in a record. You can specify an arbitrary delimiter. Type: String Default: , Ancestors: CSV</td>
<td>No</td>
</tr>
<tr>
<td><strong>QuoteCharacter</strong></td>
<td>A single character used for escaping when the field delimiter is part of the value. Consider this example in a CSV file: &quot;a, b&quot; Wrapping the value in quotation marks makes this value a single field. If you don't use the quotation marks, the comma is a field delimiter (which makes it two separate field values, a and b). Type: String Default: &quot; Ancestors: CSV</td>
<td>No</td>
</tr>
<tr>
<td><strong>QuoteEscapeCharacter</strong></td>
<td>A single character used for escaping the quotation mark character inside an already escaped value. For example, the value &quot;&quot;&quot;&quot; a , b &quot;&quot;&quot;&quot; is parsed as &quot; a , b &quot;.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Type</strong>: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: &quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Ancestors</strong>: CSV</td>
<td></td>
</tr>
<tr>
<td><strong>FileHeaderInfo</strong></td>
<td>Describes the first line in the input data. It is one of the ENUM values.</td>
<td><strong>No</strong></td>
</tr>
<tr>
<td></td>
<td><strong>• NONE</strong>: First line is not a header.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>• IGNORE</strong>: First line is a header, but you can't use the header values to indicate the column in an expression. You can use column position (such as _1, _2, ...) to indicate the column (SELECT s._1 FROM OBJECT s).</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>• Use</strong>: First line is a header, and you can use the header value to identify a column in an expression (SELECT &quot;name&quot; FROM OBJECT).</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: Enum</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Valid values</strong>: NONE</td>
<td>USE</td>
</tr>
<tr>
<td></td>
<td><strong>Ancestors</strong>: CSV</td>
<td></td>
</tr>
<tr>
<td><strong>Comments</strong></td>
<td>A single character used to indicate that a row should be ignored when the character is present at the start of that row. You can specify any character to indicate a comment line.</td>
<td><strong>No</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Ancestors</strong>: CSV</td>
<td></td>
</tr>
</tbody>
</table>

**The CSV container element (in the OutputSerialization elements) contains the following elements.**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>QuoteFields</strong></td>

</tbody>
</table>
### Name | Description | Required
--- | --- | ---
**FieldDelimiter** | A single character used to separate individual fields in a record. You can specify an arbitrary delimiter. | No
| Type: String |  
| Default: `,` |  
| Ancestors: CSV |  

**QuoteCharacter** | A single character used for escaping when the field delimiter is part of the value. For example, if the value is `a, b`, Amazon S3 wraps this field value in quotation marks, as follows: `" a , b "`. | No
| Type: String |  
| Default: `"` |  
| Ancestors: CSV |  

**QuoteEscapeCharacter** | A single character used for escaping the quotation mark character inside an already escaped value. For example, if the value is `" a , b "`, Amazon S3 wraps the value in quotation marks, as follows: `""" a , b """`. | No
| Type: String |  
| Ancestors: CSV |  

The S3 container element (in the `OutputLocation` element) contains the following elements.

| Name | Description | Required
--- | --- | ---
**AccessControlList** | A list of grants that control access to the staged results. | No
| Type: Container for Grant |  
| Ancestors: S3 |  

**BucketName** | The name of the S3 bucket where the select restore results are stored. The bucket must be in the same AWS Region as the bucket that contains the input archive object. | Yes
| Type: String |  
| Ancestors: S3 |  

**CannedACL** | The canned access control list (ACL) to apply to the select restore results. | No
| Type: String |

### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption</td>
<td>Contains encryption information for the stored results.</td>
<td>No</td>
</tr>
<tr>
<td>Prefix</td>
<td>The prefix that is prepended to the select restore results. The maximum length for the prefix is 512 bytes.</td>
<td>Yes</td>
</tr>
<tr>
<td>StorageClass</td>
<td>The class of storage used to store the select request results.</td>
<td>No</td>
</tr>
<tr>
<td>Tagging</td>
<td>Container for tag information.</td>
<td>No</td>
</tr>
<tr>
<td>UserMetadata</td>
<td>Contains a list of metadata to store with the select restore results.</td>
<td>No</td>
</tr>
</tbody>
</table>

The Grantee container element (in the AccessControlList element) contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DisplayName</td>
<td>The screen name of the grantee.</td>
<td>No</td>
</tr>
<tr>
<td>EmailAddress</td>
<td>The email address of the grantee.</td>
<td>No</td>
</tr>
</tbody>
</table>

Ancestors: S3
The ID container element (in S3) contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>The canonical user ID of the grantee.</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the grantee.</td>
<td>No</td>
</tr>
<tr>
<td>URI</td>
<td>The URI of the grantee group.</td>
<td>No</td>
</tr>
</tbody>
</table>

The Encryption container element (in S3) contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>EncryptionType</td>
<td>The server-side encryption algorithm used when storing job results. The default is no encryption.</td>
<td>No</td>
</tr>
<tr>
<td>KMSContext</td>
<td>Optional. If the encryption type is aws:kms, you can use this value to specify the encryption context for the select restore results.</td>
<td>No</td>
</tr>
<tr>
<td>KMSKeyId</td>
<td>The AWS Key Management Service (AWS KMS) key ID to use for object encryption.</td>
<td>No</td>
</tr>
</tbody>
</table>

The TagSet container element (in the Tagging element) contains the following element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag</td>
<td>Contains tags.</td>
<td>No</td>
</tr>
</tbody>
</table>
The Tag container element (in the TagSet element) contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Name of the tag.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: Tag</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>Value of the tag.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: Tag</td>
<td></td>
</tr>
</tbody>
</table>

The MetadataEntry container element (in the UserMetadata element) contains the following key-value pair elements to store with an object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetadataKey</td>
<td>The metadata key.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors:</td>
<td></td>
</tr>
<tr>
<td>MetadataEntry</td>
<td>The metadata value.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors:</td>
<td></td>
</tr>
</tbody>
</table>

Responses

A successful operation returns either the 200 OK or 202 Accepted status code.

- If the object copy is not previously restored, then Amazon S3 returns 202 Accepted in the response.
- If the object copy is previously restored, Amazon S3 returns 200 OK in the response.

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 1092).

Response Elements

This operation does not return response elements.
## Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>RestoreAlreadyInProgress</td>
<td>Object restore is already in progress. (This error does not apply to SELECT type requests.)</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>Glacier Expedited Retrieval Not Available</td>
<td>Glacier expedited retrievals are currently not available. Try again later. (Returned if there is insufficient capacity to process the Expedited request. This error applies only to Expedited retrievals and not to Standard or Bulk retrievals.)</td>
<td>503 N/A</td>
<td></td>
</tr>
</tbody>
</table>

## Examples

### Restore an Object for Two Days Using the Expedited Retrieval Option

The following restore request restores a copy of the photo1.jpg object from S3 Glacier for a period of two days using the expedited retrieval option.

```
POST /photo1.jpg?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 22 Oct 2012 01:49:52 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Expedited</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

If the examplebucket does not have a restored copy of the object, Amazon S3 returns the following 202 Accepted response.

```
HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEk0hU7/2/chr3Yb2fCb2S04nxI423Dqwg2XiQ0B/U2lzYQvPiblZNRcovw=
x-amz-request-id: 9F341CD5C4BA79E0
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3
```

If a copy of the object is already restored, Amazon S3 returns a 200 OK response, and updates only the restored copy's expiry time.

### Query an Archive with a SELECT Request

The following is an example select restore request.
POST /object-one.csv?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Date: Sat, 20 Oct 2012 23:54:05 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>this is a description</Description>
  <SelectParameters>
    <InputSerialization>
      <CSV>
        <FileHeaderInfo>IGNORE</FileHeaderInfo>
        <Comments>#$</Comments>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <RecordDelimiter>
          
        </RecordDelimiter>
        <FieldDelimiter>,</FieldDelimiter>
        <QuoteCharacter>"</QuoteCharacter>
      </CSV>
    </InputSerialization>
    <ExpressionType>SQL</ExpressionType>
    <Expression>select * from object</Expression>
    <OutputSerialization>

        <QuoteFields>ALWAYS</QuoteFields>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <RecordDelimiter>
          
        </RecordDelimiter>
        <FieldDelimiter>\</FieldDelimiter>
        <QuoteCharacter>'</QuoteCharacter>
      </CSV>
    </OutputSerialization>
  </SelectParameters>
  <OutputLocation>
    <S3>
      <BucketName>example-output-bucket</BucketName>
      <Prefix>test-s3</Prefix>
      <AccessControlList>
        <Grant>
          <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail">
            <EmailAddress>jane-doe@example.com</EmailAddress>
          </Grantee>
          <Permission>FULL_CONTROL</Permission>
        </Grant>
        <UserMetadata>
          <MetadataEntry>
            <Name>test</Name>
            <Value>test-value</Value>
          </MetadataEntry>
          <MetadataEntry>
            <Name>other</Name>
            <Value>something else</Value>
          </MetadataEntry>
        </UserMetadata>
        <StorageClass>STANDARD</StorageClass>
      </S3>
    </OutputLocation>
  </RestoreRequest>

Amazon S3 returns the following 202 Accepted response.

HTTP/1.1 202 Accepted
Browser-Based Uploads Using HTTP POST

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. By using POST, end users can authenticate requests without having to pass data through a secure intermediary node that protects your credentials. Thus, HTTP POST has the potential to reduce latency.

The following figure shows an Amazon S3 upload using a POST request.

<table>
<thead>
<tr>
<th>Uploading Using POST</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. The user accesses your page from a web browser.</td>
</tr>
<tr>
<td>2. Your webpage contains an HTML form that contains all the information necessary for the user to upload content to Amazon S3.</td>
</tr>
</tbody>
</table>
The user uploads content to Amazon S3 through the web browser.

The process for sending browser-based POST requests is as follows:

1. Create a security policy specifying conditions that restrict what you want to allow in the request, such as the bucket name where objects can be uploaded, and key name prefixes that you want to allow for the object that is being created.
2. Create a signature that is based on the policy. For authenticated requests, the form must include a valid signature and the policy.
3. Create an HTML form that your users can access in order to upload objects to your Amazon S3 bucket.

The following section describes how to create a signature to authenticate a request. For information about creating forms and security policies, see Creating an HTML Form (Using AWS Signature Version 4) (p. 1076).

Calculating a Signature

For authenticated requests, the HTML form must include fields for a security policy and a signature.

- A security policy (see POST Policy (p. 1081)) controls what is allowed in the request.
- The security policy is the StringToSign (see Introduction to Signing Requests (p. 1005)) in your signature calculation.

To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy bytes to base64. The result is the StringToSign.
3. Create a signing key.
4. Use the signing key to sign the StringToSign using HMAC-SHA256 signing algorithm.
For more information about creating HTML forms, security policies, and an example, see the following:

- Creating an HTML Form (Using AWS Signature Version 4) (p. 1076)
- POST Policy (p. 1081)
- Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 1086)

Creating an HTML Form (Using AWS Signature Version 4)

Topics

- HTML Form Declaration (p. 1076)
- HTML Form Fields (p. 1077)

To allow users to upload content to Amazon S3 by using their browsers (HTTP POST requests), you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed request information.

This section describes how to create HTML forms. For a working example of browser-based upload using HTTP POST and related signature calculations for request authentication, see Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 1086).

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying charset=UTF-8 in the content attribute. The following is an example of UTF-8 encoding in the HTML heading.

```html
<html>
<head>
  ...
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
  ...
</head>
<body>

Following is an example of UTF-8 encoding in a request header.

Content-Type: text/html; charset=UTF-8

Note
The form data and boundaries (excluding the contents of the file) cannot exceed 20KB.

HTML Form Declaration

The HTML form declaration has the following three attributes:

- action – The URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is examplebucket, the URL is http://examplebucket.s3.amazonaws.com/.
Note
The key name is specified in a form field.

- **method** – The method must be POST.
- **enctype** – The enclosure type (enctype) must be set to multipart/form-data for both file uploads and text area uploads. For more information about enctype, see [RFC 1867](https://tools.ietf.org/html/rfc1867).

This is a form declaration for the bucket examplebucket.

```html
<form action="http://examplebucket.s3.amazonaws.com/" method="post"
enctype="multipart/form-data">
```

## HTML Form Fields

The following table describes a list of fields that you can use within a form. Among other fields, there is a signature field that you can use to authenticate requests. There are fields for you to specify the signature calculation algorithm (x-amz-algorithm), the credential scope (x-amz-credential) that you used to generate the signing key, and the date (x-amz-date) used to calculate the signature. Amazon S3 uses this information to re-create the signature. If the signatures match, Amazon S3 processes the request.

**Note**
The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) is used (for example, `C:\Program Files\directory1\file.txt` is interpreted as `file.txt`). If no file or file name is provided, the variable is replaced with an empty string.

If you don’t provide elements required for authenticated requests, such as the policy element, the request is assumed to be anonymous and will succeed only if you have configured the bucket for public read and write.

<table>

### HTML Form Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>The key name of the uploaded object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>To use the file name provided by the user, use the ${filename} variable. For example, if you upload a file photo1.jpg and you specify /user/user1/${filename} as key name, the file is stored as /user/user1/photo1.jpg.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_MultipartUploadPart.html">Object Key and Metadata</a> in the Amazon Simple Storage Service User Guide.</td>
<td></td>
</tr>
<tr>
<td>policy</td>
<td>The base64-encoded security policy that describes what is permitted in the request. For authenticated requests, a policy is required. Requests without a security policy are considered anonymous and will succeed only on a publicly writable bucket.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>success_action_redirect</td>
<td>The URL to which the client is redirected upon successful upload. If success_action_redirect is not specified, or Amazon S3 cannot interpret the URL, Amazon S3 returns the empty document type that is specified in the success_action_status field.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>If the upload fails, Amazon S3 returns an error and does not redirect the user to another URL.</td>
<td></td>
</tr>
<tr>
<td>Element Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>success_action_status</td>
<td>The status code returned to the client upon successful upload if success_action_redirect is not specified. Valid values are 200, 201, or 204 (default). If the value is set to 200 or 204, Amazon S3 returns an empty document with the specified status code. If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see POST Object (p. 1047). If the value is not set or is invalid, Amazon S3 returns an empty document with a 204 status code. <strong>Note</strong> Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting success_action_status to 201.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm used to authenticate the request. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256. This field is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>x-amz-credential</td>
<td>In addition to your access key ID, this field also provides scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: <code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;aws-region&gt;/&lt;aws-service&gt;/aws4_request</code> For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request For Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the AWS General Reference. This is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>Element Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>x-amz-date</td>
<td>It is the date value in ISO8601 format. For example, 20130728T000000Z. It is the same date you used in creating the signing key (for example, 20130728). This must also be the same value you provide in the policy (x-amz-date) that you signed. This is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>x-amz-security-token</td>
<td>A security token used by Amazon DevPay and session credentials If the request is using Amazon DevPay, it requires two x-amz-security-token form fields: one for the product token and one for the user token. For more information, see Using DevPay in the Amazon Simple Storage Service User Guide. If the request is using session credentials, it requires one x-amz-security-token form. For more information, see Requesting Temporary Security Credentials in the IAM User Guide.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-signature</td>
<td>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy. This field is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>x-amz-meta-*</td>
<td>Field names starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see PutObject (p. 371).</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-*</td>
<td>See POST Object (POST Object (p. 1047) for other x-amz-* headers.</td>
<td>No</td>
</tr>
<tr>
<td>file</td>
<td>File or text content. The file or content must be the last field in the form. You cannot upload more than one file at a time.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Conditional items are required for authenticated requests and are optional for anonymous requests.

Now that you know how to create forms, next you can create a security policy that you can sign. For more information, see POST Policy (p. 1081).
POST Policy

Topics

- Expiration (p. 1081)
- Condition Matching (p. 1081)
- Conditions (p. 1082)
- Character Escaping (p. 1085)

The policy required for making authenticated requests using HTTP POST is a UTF-8 and base64-encoded document written in JavaScript Object Notation (JSON) that specifies conditions that the request must meet. Depending on how you design your policy document, you can control the access granularity per-upload, per-user, for all uploads, or according to other designs that meet your needs.

This section describes the POST policy. For example signature calculations using POST policy, see Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 1086).

Note

Although the policy document is optional, we highly recommend that you use one in order to control what is allowed in the request. If you make the bucket publicly writable, you have no control at all over which users can write to your bucket.

The following is an example of a POST policy document.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [ 
    {"acl": "public-read" },
    {"bucket": "johnsmith" },
    {"starts-with", "$key", "user/eric/"]
  ]
}
```

The POST policy always contains the expiration and conditions elements. The example policy uses two condition matching types (exact matching and starts-with matching). The following sections describe these elements.

Expiration

The expiration element specifies the expiration date and time of the POST policy in ISO8601 GMT date format. For example, 2013-08-01T12:00:00.000Z specifies that the POST policy is not valid after midnight GMT on August 1, 2013.

Condition Matching

Following is a table that describes condition matching types that you can use to specify POST policy conditions (described in the next section). Although you must specify at least one condition for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

<table>
<thead>
<tr>
<th>Condition Match Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exact Matches</td>
<td>The form field value must match the value specified. This example indicates that the ACL must be set to public-read:</td>
</tr>
</tbody>
</table>
### Conditions

The specific conditions supported in a POST policy are described in [Conditions (p. 1082)](#).

#### Conditions

The conditions in a POST policy is an array of objects, each of which is used to validate the request. You can use these conditions to restrict what is allowed in the request. For example, the preceding policy conditions require the following:

<table>
<thead>
<tr>
<th>Condition Match Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;acl&quot;: &quot;public-read&quot;</td>
<td>The value must start with the specified value. This example indicates that the object key must start with user/user1:</td>
</tr>
<tr>
<td>&quot;starts-with&quot;, &quot;$key&quot;, &quot;user/user1/&quot;</td>
<td>Content-Types values for a <code>starts-with</code> condition that include commas are interpreted as lists. Each value in the list must meet the condition for the whole condition to pass. For example, given the following condition:</td>
</tr>
<tr>
<td>&quot;starts-with&quot;, &quot;$Content-Type&quot;, &quot;image/&quot;</td>
<td>The following value would pass the condition:</td>
</tr>
<tr>
<td>&quot;image/jpg,image/png,image/gif&quot;</td>
<td>The following value would not pass the condition:</td>
</tr>
<tr>
<td>&quot;image/jpg,text/plain&quot;</td>
<td>Data elements other than <code>Content-Type</code> are treated as strings, regardless of the presence of commas.</td>
</tr>
<tr>
<td>&quot;starts-with&quot;, &quot;$success_action_redirect&quot;, &quot;&quot;</td>
<td>To configure the POST policy to allow any content within a form field, use <code>starts-with</code> with an empty value (&quot;&quot;). This example allows any value for <code>success_action_redirect</code>:</td>
</tr>
<tr>
<td>&quot;content-length-range&quot;, 1048576, 10485760</td>
<td>For form fields that accept a range, separate the upper and lower limit with a comma. This example allows a file size from 1 to 10 MiB:</td>
</tr>
</tbody>
</table>
- Request must specify the johnsmith bucket name.
- Object key name must have the user/eric prefix.
- Object ACL must be set to public-read.

Each form field that you specify in a form (except x-amz-signature, file, policy, and field names that have an x-ignore- prefix) must appear in the list of conditions.

**Note**
All variables within the form are expanded prior to validating the POST policy. Therefore, all condition matching should be against the expanded form fields. Suppose that you want to restrict your object key name to a specific prefix (user/user1). In this case, you set the key form field to user/user1/${filename}. Your POST policy should be [ "starts-with", "$key", "user/user1/" ] (do not enter [ "starts-with", "$key", "user/user1/${filename}" ]). For more information, see Condition Matching (p. 1081).

Policy document conditions are described in the following table.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Specifies the ACL value that must be used in the form submission. This condition supports exact matching and starts-with condition match type discussed in the following section.</td>
</tr>
<tr>
<td>bucket</td>
<td>Specifies the acceptable bucket name. This condition supports exact matching condition match type.</td>
</tr>
<tr>
<td>content-length-range</td>
<td>The minimum and maximum allowable size for the uploaded content. This condition supports content-length-range condition match type.</td>
</tr>
<tr>
<td>Cache-Control</td>
<td>REST-specific headers. For more information, see POST Object (p. 1047). This condition supports exact matching and starts-with condition match type.</td>
</tr>
<tr>
<td>Content-Type</td>
<td></td>
</tr>
<tr>
<td>Content-Disposition</td>
<td></td>
</tr>
<tr>
<td>Content-Encoding</td>
<td></td>
</tr>
<tr>
<td>Expires</td>
<td></td>
</tr>
<tr>
<td>key</td>
<td>The acceptable key name or a prefix of the uploaded object. This condition supports exact matching and starts-with condition match type.</td>
</tr>
<tr>
<td>success_action_redirect redirect</td>
<td>The URL to which the client is redirected upon successful upload. This condition supports exact matching and starts-with condition match type.</td>
</tr>
<tr>
<td>success_action_status</td>
<td>The status code returned to the client upon successful upload if success_action_redirect is not specified.</td>
</tr>
</tbody>
</table>
## Conditions

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm that must be used during signature calculation. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256.</td>
</tr>
</tbody>
</table>
| x-amz-credential      | The credentials that you used to calculate the signature. It provides access key ID and scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: `<your-access-key-id>/<date>/<aws-region>/<aws-service>/aws4_request`
|                        | For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request. For Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the AWS General Reference. This is required if a POST policy document is included with the request. |
| x-amz-date            | The date value specified in the ISO8601 formatted string. For example, 20130728T000000Z. The date must be same that you used in creating the signing key for signature calculation.                                               |
| x-amz-security-token  | Amazon DevPay security token. Each request that uses Amazon DevPay requires two x-amz-security-token form fields: one for the product token and one for the user token. As a result, the values must be separated by commas. For example, if the user token is eW91dHV1ZQ== and the product token is b0hnNVNKWJIQTAl expired in Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the AWS General Reference. This is required if a POST policy document is included with the request. |
| x-amz-meta-*          | User-specified metadata. This condition supports exact matching and starts-with condition match type.                                                                                                        |
### Character Escaping

Characters that must be escaped within a POST policy document are described in the following table.

<table>
<thead>
<tr>
<th>Escape Sequence</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>\</code></td>
<td>Backslash</td>
</tr>
<tr>
<td><code>\$</code></td>
<td>Dollar symbol</td>
</tr>
<tr>
<td><code>\b</code></td>
<td>Backspace</td>
</tr>
<tr>
<td><code>\f</code></td>
<td>Form feed</td>
</tr>
<tr>
<td><code>\n</code></td>
<td>New line</td>
</tr>
<tr>
<td><code>\r</code></td>
<td>Carriage return</td>
</tr>
<tr>
<td><code>\t</code></td>
<td>Horizontal tab</td>
</tr>
<tr>
<td><code>\v</code></td>
<td>Vertical tab</td>
</tr>
<tr>
<td><code>\u</code></td>
<td>All Unicode characters</td>
</tr>
</tbody>
</table>

Now that you are acquainted with forms and policies, and understand how signing works, you can try a POST upload example. You need to write the code to calculate the signature. The example provides a sample form, and a POST policy that you can use to test your signature calculations. For more information, see [Example: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4)](p. 1086).
Example: Browser-Based Upload using HTTP POST
(Using AWS Signature Version 4)

This section shows an example of using an HTTP POST request to upload content directly to Amazon S3.

For more information on Signature Version 4, see Signature Version 4 Signing Process.

Uploading a File to Amazon S3 Using HTTP POST

This example provides a sample POST policy and a form that you can use to upload a file. The topic uses the example policy and fictitious credentials to show you the workflow and resulting signature and policy hash. You can use this data as test suite to verify your signature calculation code.

The example uses the following example credentials the signature calculations. You can use these credentials to verify your signature calculation code. However, you must then replace these with your own credentials when sending requests to AWS.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

Sample Policy and Form

The following POST policy supports uploads to Amazon S3 with specific conditions.

```json
{
  "expiration": "2015-12-30T12:00:00.000Z",
  "conditions": [
    {"bucket": "sigv4examplebucket"},
    "starts-with", "$key", "user/user1/"],
    {"acl": "public-read"},
    {"success_action_redirect": "http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html"},
    "starts-with", "$Content-Type", "image/"],
    {"x-amz-meta-uuid": "14365123651274"},
    {"x-amz-server-side-encryption": "AES256"},
    {"starts-with", "$x-amz-meta-tag", ""},
    {"x-amz-credential": "AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request"},
    {"x-amz-algorithm": "AWS4-HMAC-SHA256"},
    {"x-amz-date": "20151229T000000Z"}
  ]
}
```

This POST policy sets the following conditions on the request:

- The upload must occur before noon UTC on December 30, 2015.
- The content can be uploaded only to the sigv4examplebucket. The bucket must be in the region that you specified in the credential scope (x-amz-credential form parameter), because the signature you provided is valid only within this scope.
- You can provide any key name that starts with user/user1. For example, user/user1/MyPhoto.jpg.
- The ACL must be set to public-read.
• If the upload succeeds, the user's browser is redirected to http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html.
• The object must be an image file.
• The x-amz-meta-uuid tag must be set to 14365123651274.
• The x-amz-meta-tag can contain any value.

The following is a Base64-encoded version of this POST policy. You use this value as your StringToSign in signature calculation.

```
eyAiZXhwaXJhdGlvbii6IICiyMDE1LTEyLTMwVDEyOjAwOjAwLjAwMFIoIA0KICAiY29uZGl0aW9ucyI6I6IFsNCiAgICB7ImJ1Y2tldCI6ICJzaWd2NGV4YW1wbG ... AgIHsieC1hbXotYWxnb3JpdGhtIjogIkFXUzQtSE1BQy1TSEEyNTYifSwNCiAgICB7IngtYW16LWRhdGUiOiAiMjAxNTEyMjlUMDAwMDAwWiIgfQ0KICBdDQp9
```

When you copy/paste the preceding policy, it should have carriage returns and new lines for your computed hash to match this value (ie. ASCII text, with CRLF line terminators).

Using example credentials to create a signature, the signature value is as follows (in signature calculation, the date is same as the x-amz-date in the policy (20151229):

```
8afdbf4008c03f22c2cd3cdb72e4afbb1f6a588f3255ac628749a66d7f09699e
```

The following example form specifies the preceding POST policy and supports a POST request to the sigv4examplebucket. Copy/paste the content in a text editor and save it as exampleform.html. You can then upload image files to the specific bucket using the exampleform.html. Your request will succeed if the signature you provide matches the signature Amazon S3 calculates.

**Note**
You must update the bucket name, dates, credential, policy, and signature with valid values for this to successfully upload to S3.

```html
<html>
<head>
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
</head>
<body>
<form action="http://sigv4examplebucket.s3.amazonaws.com/" method="post" enctype="multipart/form-data">
  Key to upload:
  <input type="input" name="key" value="user/user1/${filename}" />
  <input type="hidden" name="acl" value="public-read" />
  <input type="hidden" name="success_action_redirect" value="http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html" />

  Content-Type:
  <input type="input" name="Content-Type" value="image/jpeg" />
  <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
  <input type="hidden" name="x-amz-server-side-encryption" value="AES256" />
  <input type="text" name="X-Amz-Credential" value="AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request" />
  <input type="text" name="X-Amz-Algorithm" value="AWS4-HMAC-SHA256" />
  <input type="text" name="X-Amz-Date" value="20151229T000000Z" />

  Tags for File:
  <input type="input" name="x-amz-meta-tag" value="" />

  File:
  <input type="file" name="file" />

<!-- The elements after this will be ignored -->
</form>
</body>
</html>
```
The post parameters are case insensitive. For example, you can specify `x-amz-signature` or `X-Amz-Signature`.

Browser-Based Uploads to Amazon S3 Using the AWS Amplify Library

This section describes how to upload files to Amazon S3 using the AWS Amplify JavaScript library.

For information about setting up the AWS Amplify library, see [AWS Amplify Installation and Configuration](#).

Using the AWS Amplify JavaScript library to Upload Files to Amazon S3

The AWS Amplify library Storage module gives a simple browser-based upload mechanism for managing user content in public or private Amazon S3 storage.

Example: AWS Amplify Manual Setup

The following example shows the manual setup for using the AWS Amplify Storage module. The default implementation of the Storage module uses Amazon S3.

```javascript
import Amplify from 'aws-amplify';
Amplify.configure(
  Auth: {
    identityPoolId: 'XX-XXXX-X:XXXXXXXX-XXXX-1234-abcd-1234567890ab', //REQUIRED - Amazon Cognito Identity Pool ID
    region: 'XX-XXXX-X', // REQUIRED - Amazon Cognito Region
    userPoolId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito User Pool ID
    userPoolWebClientId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito Web Client ID
  },
  Storage: {
    bucket: '', //REQUIRED - Amazon S3 bucket
    region: 'XX-XXXX-X', //OPTIONAL - Amazon service region
  }
);
```

Example: Put data into Amazon S3

The following example shows how to put public data into Amazon S3.

```javascript
Storage.put('test.txt', 'Hello')
  .then(result => console.log(result))
  .catch(err => console.log(err));
```

The following example shows how to put private data into Amazon S3.

```javascript
Storage.put('test.txt', 'Private Content', {
```
For more information about using the AWS Amplify Storage module, see [AWS Amplify Storage](https://docs.aws.amazon.com/amplify/latest/userguide/amplify-storage-intro.html).

**More Info**

[AWS Amplify Quick Start](https://docs.aws.amazon.com/amplify/latest/userguide/amplify-storage-intro.html)
## Common Request Headers

The following table describes headers that can be used by various types of Amazon S3 REST requests.

<table>
<thead>
<tr>
<th>Header Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization</td>
<td>The information required for request authentication. For more information, go to <a href="https://aws.amazon.com/documentation/s3/#the-authentication-header">The Authentication Header</a> in the Amazon Simple Storage Service Developer Guide. For anonymous requests this header is not required.</td>
</tr>
<tr>
<td>Content-Length</td>
<td>Length of the message (without the headers) according to RFC 2616. This header is required for PUTs and operations that load XML, such as logging and ACLs.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The content type of the resource in case the request has content in the body. Example: text/plain</td>
</tr>
<tr>
<td>Content-MD5</td>
<td>The base64 encoded 128-bit MD5 digest of the message (without the headers) according to RFC 1864. This header can be used as a message integrity check to verify that the data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information about REST request authentication, go to <a href="https://aws.amazon.com/documentation/s3/#rest-authentication">REST Authentication</a> in the Amazon Simple Storage Service Developer Guide.</td>
</tr>
<tr>
<td>Date</td>
<td>The date that can be used to create the signature contained in the Authorization header. If the Date header is to be used for signing it must be specified in the ISO 8601 basic format. In this case, the x-amz-date header is not needed. Note that when x-amz-date is present, it always overrides the value of the Date header. If the Date header is not used for signing, it can be one of the full date formats specified by <a href="https://tools.ietf.org/html/rfc2616">RFC 2616</a>, section 3.3. For example, the date/time \text{Wed, 01 Mar 2006 12:00:00 GMT} is a valid date/time header for use with Amazon S3. If you are using the Date header for signing, then it must be in the ISO 8601 basic YYYYMMDD 'T'HHMMSS 'Z' format. If Date is specified but is not in ISO 8601 basic format, then you must also include the x-amz-date header. If Date is specified in ISO 8601 basic format, then this is sufficient for signing requests and you do not need the x-amz-date header. For more information, see <a href="https://aws.amazon.com/documentation/s3/#handling-dates-in-signature-version-4">Handling Dates in Signature Version 4</a> in the Amazon Web Services Glossary.</td>
</tr>
<tr>
<td>Expect</td>
<td>When your application uses 100-continue, it does not send the request body until it receives an acknowledgment. If the message is rejected based on the headers, the body of the message is not sent. This header can be used only if you are sending a body. Valid Values: 100-continue</td>
</tr>
<tr>
<td>Header Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Host</td>
<td>For path-style requests, the value is s3.amazonaws.com. For virtual-style requests, the value is BucketName.s3.amazonaws.com. For more information, go to Virtual Hosting in the Amazon Simple Storage Service User Guide. This header is required for HTTP 1.1 (most toolkits add this header automatically); optional for HTTP/1.0 requests.</td>
</tr>
<tr>
<td>x-amz-content-sha256</td>
<td>When using signature version 4 to authenticate request, this header provides a hash of the request payload. For more information see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 1009). When uploading object in chunks, you set the value to STREAMING-AWS4-HMAC-SHA256-PAYLOAD to indicate that the signature covers only headers and that there is no payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 1021).</td>
</tr>
<tr>
<td>x-amz-date</td>
<td>The date used to create the signature in the Authorization header. The format must be ISO 8601 basic in the YYYYMMDD'T'HHMMSS'Z' format. For example, the date/time 20170210T120000Z is a valid x-amz-date for use with Amazon S3. x-amz-date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, then x-amz-date is not needed. When x-amz-date is present, it always overrides the value of the Date header. For more information, see Handling Dates in Signature Version 4 in the Amazon Web Services Glossary.</td>
</tr>
<tr>
<td>x-amz-security-token</td>
<td>This header can be used in the following scenarios:</td>
</tr>
<tr>
<td></td>
<td>• To provide security tokens for Amazon DevPay operations - Each request that uses Amazon DevPay requires two x-amz-security-token headers: one for the product token and one for the user token. When Amazon S3 receives an authenticated request, it compares the computed signature with the provided signature. Improperly formatted multi-value headers that are used to calculate a signature can cause authentication issues.</td>
</tr>
<tr>
<td></td>
<td>• To provide a security token when using temporary security credentials - When making requests using temporary security credentials that you obtained from IAM, you must provide a security token by using this header. To learn more about temporary security credentials, see Making Requests.</td>
</tr>
<tr>
<td></td>
<td>This header is required for requests that use Amazon DevPay and requests that are signed by using temporary security credentials.</td>
</tr>
</tbody>
</table>
# Common Response Headers

The following table describes response headers that are common to most Amazon S3 responses.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Length</td>
<td>The length in bytes of the body in the response.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The MIME type of the content. For example, Content-Type: text/html; charset=utf-8.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>Connection</td>
<td>A value that specifies whether the connection to the server is open or closed.</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
</tr>
<tr>
<td></td>
<td>Valid Values: open</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>Date</td>
<td>The date and time that Amazon S3 responded; for example, Wed, 01 Mar 2006 12:00:00 GMT.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>ETag</td>
<td>The entity tag (ETag) represents a specific version of the object. The ETag reflects changes only to the contents of an object, not its metadata. The ETag might or might not be an MD5 digest of the object data. Whether or not it is depends on how the object was created and how it is encrypted, as follows:</td>
</tr>
<tr>
<td></td>
<td>- Objects created through the AWS Management Console or by the PUT Object, POST Object, or Copy operation:</td>
</tr>
<tr>
<td></td>
<td>- Objects that are plaintext or encrypted by server-side encryption with Amazon S3 managed keys (SSE-S3) have ETags that are an MD5 digest of their data.</td>
</tr>
<tr>
<td></td>
<td>- Objects encrypted by server-side encryption with customer-provided keys (SSE-C) or AWS Key Management Service (AWS KMS) keys (SSE-KMS) have ETags that are not an MD5 digest of their object data.</td>
</tr>
<tr>
<td></td>
<td>- Objects created by either the Multipart Upload or Upload Part Copy operation have ETags that are not MD5 digests, regardless of the method of encryption.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Server</strong></td>
<td>The name of the server that created the response.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: AmazonS3</td>
</tr>
<tr>
<td><strong>x-amz-delete-marker</strong></td>
<td>A value that specifies whether the object returned was (true) or was not</td>
</tr>
<tr>
<td></td>
<td>(false) a delete marker.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td></td>
<td>Valid Values: true</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td><strong>x-amz-id-2</strong></td>
<td>A special token that is used together with the x-amz-request-id header to</td>
</tr>
<tr>
<td></td>
<td>help AWS troubleshoot problems. For information about AWS Support using</td>
</tr>
<tr>
<td></td>
<td>these request IDs, see Troubleshooting Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td><strong>x-amz-request-id</strong></td>
<td>A value created by Amazon S3 that uniquely identifies the request. This</td>
</tr>
<tr>
<td></td>
<td>value is used together with the x-amz-id-2 header to help AWS troubleshoot</td>
</tr>
<tr>
<td></td>
<td>problems. For information about AWS Support using these request IDs, see</td>
</tr>
<tr>
<td></td>
<td>Troubleshooting Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td><strong>x-amz-server-side-encryption</strong></td>
<td>The server-side encryption algorithm used when storing this object in Amazon</td>
</tr>
<tr>
<td></td>
<td>S3 (for example, AES256, aws:kms).</td>
</tr>
<tr>
<td></td>
<td>Valid Values: AES256</td>
</tr>
<tr>
<td><strong>x-amz-version-id</strong></td>
<td>The version of the object. When you enable versioning, Amazon S3 generates</td>
</tr>
<tr>
<td></td>
<td>a random number for objects added to a bucket. The value is UTF-8 encoded</td>
</tr>
<tr>
<td></td>
<td>and URL ready. When you PUT an object in a bucket where versioning has been</td>
</tr>
<tr>
<td></td>
<td>suspended, the version ID is always null.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid Values: null</td>
</tr>
<tr>
<td></td>
<td>Default: null</td>
</tr>
</tbody>
</table>
Error responses

This section provides reference information about Amazon S3 errors.

**Note**
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

**Topics**
- REST error responses (p. 1094)
- List of error codes (p. 1095)
- List of SELECT Object Content Error Codes (p. 1105)
- List of Replication-related error codes (p. 1112)
- List of Tagging-related error codes (p. 1113)
- List of Amazon S3 on Outposts error codes (p. 1114)
- List of Amazon S3 Storage Lens error codes (p. 1115)
- List of Amazon S3 Object Lambda error codes (p. 1119)
- List of Amazon S3 asynchronous error codes (p. 1122)

**REST error responses**

When an error occurs, the header information contains the following:

- Content-Type: application/xml
- An appropriate 3xx, 4xx, or 5xx HTTP status code

The body of the response also contains information about the error. The following sample error response shows the structure of response elements common to all REST error responses.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>NoSuchKey</Code>
  <Message>The resource you requested does not exist</Message>
  <Resource>/mybucket/myfoto.jpg</Resource>
  <RequestId>4442587FB7D0A2F9</RequestId>
</Error>
```

The following table explains the REST error response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see List of error codes (p. 1095).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: Error</td>
</tr>
</tbody>
</table>
List of error codes

The following table lists Amazon S3 error codes.

<table>
<thead>
<tr>
<th>Error code</th>
<th>Description</th>
<th>HTTP status code</th>
<th>SOAP fault code prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessControlListNotSupported</td>
<td>The bucket does not allow ACLs.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>AccessDenied</td>
<td>Access Denied</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>AccessPointAlreadyOwnedByYou</td>
<td>An access point with an identical name already exists in your account.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>Error code</td>
<td>Description</td>
<td>HTTP status code</td>
<td>SOAP fault code prefix</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>AccountProblem</td>
<td>There is a problem with your AWS account that prevents the operation from completing successfully. For further assistance, see <a href="#">Contact Us</a>.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>AllAccessDisabled</td>
<td>All access to this Amazon S3 resource has been disabled. For further assistance, see <a href="#">Contact Us</a>.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>AmbiguousGrantByEmailAddress</td>
<td>The email address that you provided is associated with more than one account.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>AuthorizationHeaderMalformed</td>
<td>The authorization header that you provided is not valid.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>BadDigest</td>
<td>The Content-MD5 or checksum value that you specified did not match what the server received.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>BucketAlreadyExists</td>
<td>The requested bucket name is not available. The bucket namespace is shared by all users of the system. Specify a different name and try again.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>BucketAlreadyOwnedByYou</td>
<td>The bucket that you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the US East (N. Virginia) Region (us-east-1). For legacy compatibility, if you re-create an existing bucket that you already own in us-east-1, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs). For Amazon S3 on Outposts, the bucket that you tried to create already exists in your Outpost and you own it.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>BucketNotEmpty</td>
<td>The bucket that you tried to delete is not empty.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>ClientTokenConflict</td>
<td>Your Multi-Region Access Point idempotency token was already used for a different request.</td>
<td>409 Conflict</td>

### List of SELECT Object Content Error Codes

The following table contains special errors that SELECT Object Content might return. For general information about Amazon S3 errors and a list of error codes, see [Error responses](p. 1094).

<table>
<thead>
<tr>
<th>Error code</th>
<th>Description</th>
<th>HTTP status code</th>
<th>SOAP fault code prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>AmbiguousFieldName</td>
<td>The field name matches to multiple fields in the file. Check the SQL expression and the file, and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>Busy</td>
<td>The service is unavailable. Try again later.</td>
<td>503</td>
<td>Client</td>
</tr>
<tr>
<td>CastFailed</td>
<td>An attempt to convert from one data type to another using CAST failed in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>ColumnTooLong</td>
<td>The length of a column in the result is greater than maxCharsPerColumn of 1 MB.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>CSVEscapingRecordDelimiter</td>
<td>A quoted record delimiter was found in the file. To allow quoted record delimiters, set AllowQuotedRecordDelimiter to 'TRUE'.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>Error code</td>
<td>Description</td>
<td>HTTP status code</td>
<td>SOAP fault code prefix</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>CSVParsingError</td>
<td>An error occurred while parsing the CSV file. Check the file and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>CSVUnescapedQuote</td>
<td>An unescaped quote was found while parsing the CSV file. To allow quoted record delimiters, set AllowQuotedRecordDelimiter to 'TRUE'.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EmptyRequestBody</td>
<td>The request body cannot be empty.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorBindingDoesNotExist</td>
<td>A column name or a path provided does not exist in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorInvalidArguments</td>
<td>There is an incorrect number of arguments in the function call in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorInvalidTimestampFormatPattern</td>
<td>The timestamp format string in the SQL expression is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorInvalidTimestampFormatPatternSymbol</td>
<td>The timestamp format pattern contains a symbol in the SQL expression that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorInvalidTimestampFormatPatternSymbolForParsing</td>
<td>The timestamp format pattern contains a valid format symbol that cannot be applied to timestamp parsing in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorInvalidTimestampFormatPatternToken</td>
<td>The timestamp format pattern contains a token in the SQL expression that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorLikePatternInvalidEscapeSequence</td>
<td>An argument given to the LIKE expression was not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorNegativeLimit</td>
<td>LIMIT must not be negative.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorTimestampFormatPatternDuplicateFields</td>
<td>The timestamp format pattern contains multiple format specifiers representing the timestamp field in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorTimestampFormatPatternHourClockAmPmMismatch</td>
<td>The timestamp format pattern contains a 12-hour hour of day format symbol but doesn't also contain an AM/PM field, or it contains a 24-hour hour of day format specifier and contains an AM/PM field in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>EvaluatorUnterminatedTimestampFormatPatternToken</td>
<td>The timestamp format pattern contains an unterminated token in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>Error code</td>
<td>Description</td>
<td>HTTP status code</td>
<td>SOAP fault code prefix</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>ExpressionTooLong</td>
<td>The SQL expression is too long. The maximum byte-length for an SQL expression is 256 KB.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>ExternalEvalException</td>
<td>The query cannot be evaluated. Check the file and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>IllegalSqlFunctionArgument</td>
<td>An illegal argument was used in the SQL function.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>IncorrectSqlFunctionArgument</td>
<td>A <em>incorrect</em> argument type was specified in a function call in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>IntegerOverflow</td>
<td>An integer overflow or underflow occurred in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InternalError</td>
<td>An internal error occurred.</td>
<td>500</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidCast</td>
<td>An attempt to convert from one data type to another using CAST failed in the SQL expression.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidColumnIndex</td>
<td>The column index in the SQL expression is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidCompressionFormat</td>
<td>The file is not in a supported compression format. Only GZIP and BZIP2 are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidDataSource</td>
<td>The data source type is not valid. Only CSV, JSON, and Parquet are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidDataType</td>
<td>The SQL expression contains a data type that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidExpressionType</td>
<td>The ExpressionType value is not valid. Only SQL expressions are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidFileHeaderInfo</td>
<td>The FileHeaderInfo value is not valid. Only NONE, USE, and IGNORE are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidJsonType</td>
<td>The JsonType value is not valid. Only DOCUMENT and LINES are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidKeyPath</td>
<td>The key path in the SQL expression is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidQuoteFields</td>
<td>The QuoteFields value is not valid. Only ALWAYS and ASNEEDED are supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>Error code</td>
<td>Description</td>
<td>HTTP status code</td>
<td>SOAP fault code prefix</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>InvalidRequestParameter</td>
<td>The value of a parameter in the SelectRequest element is not valid. Check the service API documentation and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidScanRange</td>
<td>The provided scan range is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidTableAlias</td>
<td>The SQL expression contains a table alias that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidTextEncoding</td>
<td>The encoding type is not valid. Only UTF-8 encoding is supported.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>JSONParsingError</td>
<td>An error occurred while parsing the JSON file. Check the file and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>LexerInvalidChar</td>
<td>The SQL expression contains a character that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>LexerInvalidIONLiteral</td>
<td>The SQL expression contains an operator that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>LexerInvalidLiteral</td>
<td>The SQL expression contains an operator that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>LexerInvalidOperator</td>
<td>The SQL expression contains a literal that is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>LikeInvalidInputs</td>
<td>The argument given to the LIKE clause in the SQL expression is not valid.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>MalformedXML</td>
<td>The XML provided was not well formed or did not validate against our published schema. Check the service documentation and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>MaxOperatorsExceeded</td>
<td>Failed to parse SQL expression, try reducing complexity. For example, reduce number of operators used.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>MissingRequiredParameter</td>
<td>The SelectRequest entity is missing a required parameter. Check the service documentation and try again.</td>
<td>400</td>
<td>Client</td>
</tr>
<tr>
<td>MultipleDataSourcesUnsupported</td>
<td>Multiple data sources are not supported.</td>

List of Amazon S3 Object Lambda error codes

The following table contains special errors that S3 Object Lambda might return. For information about general Amazon S3 errors and a list of error codes, see Error responses (p. 1094).

Error responses received from the supporting access points during non-GetObject requests are sent to the caller unaltered.
<table>
<thead>
<tr>
<th>Error code</th>
<th>Description</th>
<th>HTTP status code</th>
</tr>
</thead>
</table>
| LambdaInvalidResponse       | Returned to the original caller when WriteGetObjectResponse responds with ValidationException to AWS Lambda.  
  See the ValidationException message for more details. Not all cases of ValidationException result in a LambdaInvalidResponse error.                                                                                                           | 400 Bad Request   |
| LambdaInvocationFailed      | Lambda function invocation failed.  
  Callers might receive the following error when S3 Object Lambda is unable to successfully invoke the configured Lambda function.  
  The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID). | 400 Bad Request   |
| LambdaNotFound              | The AWS Lambda function was not found.  
  The configured Lambda function, version, or alias was not found when attempting to invoke it. Ensure that the S3 Object Lambda Access Point configuration points to the correct Lambda function ARN.  
  The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID). | 404 Not Found     |
| LambdaPermissionError       | The caller is not authorized to invoke the Lambda function.  
  The caller must have permission to invoke the Lambda function. Check the policies attached to the caller and ensure that they’ve been allowed to use lambda:Invoke for the configured function.  
  The error message might contain details about an eventual error returned by the AWS Lambda service when invoking the function (for example, status code, error code, error message and request ID). | 403 Forbidden     |

List of Amazon S3 asynchronous error codes

The following table contains special errors that asynchronous requests might return. For general information about Amazon S3 errors and a list of error codes, see Error responses (p. 1094).

These errors are returned when you query about the state of an asynchronous request, such as by using DescribeMultiRegionAccessPointOperation. Because these requests are asynchronous, all of these errors have a status code of 200 OK.

# Amazon S3 Resources

Following is a table that lists related resources that you'll find useful as you work with this service.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Simple Storage Service User Guide</td>
<td>The getting started guide provides a quick tutorial of the service based on a simple use case.</td>
</tr>
<tr>
<td>Amazon Simple Storage Service User Guide</td>
<td>The developer guide describes how to accomplish tasks using Amazon S3 operations.</td>
</tr>
<tr>
<td>Amazon S3 Technical FAQ</td>
<td>The FAQ covers the top 20 questions developers have asked about this product.</td>
</tr>
<tr>
<td>Amazon S3 Release Notes</td>
<td>The Release Notes give a high-level overview of the current release. They specifically note any new features, corrections, and known issues.</td>
</tr>
<tr>
<td>Tools for Amazon Web Services</td>
<td>A central starting point to find documentation, code samples, release notes, and other information to help you build innovative applications with AWS SDKs and tools.</td>
</tr>
<tr>
<td>AWS Management Console</td>
<td>The console allows you to perform most of the functions of Amazon S3 without programming.</td>
</tr>
<tr>
<td>Discussion Forums</td>
<td>A community-based forum for developers to discuss technical questions related to Amazon Web Services.</td>
</tr>
<tr>
<td>AWS Support Center</td>
<td>The home page for AWS Technical Support, including access to our Developer Forums, Technical FAQs, Service Status page, and Premium Support.</td>
</tr>
<tr>
<td>AWS Support</td>
<td>The primary web page for information about AWS Support, a one-on-one, fast-response support channel to help you build and run applications on AWS Infrastructure Services.</td>
</tr>
<tr>
<td>Amazon S3 product information</td>
<td>The primary web page for information about Amazon S3.</td>
</tr>
<tr>
<td>Contact Us</td>
<td>A central contact point for inquiries concerning AWS billing, account, events, abuse, etc.</td>
</tr>
<tr>
<td>Conditions of Use</td>
<td>Detailed information about the copyright and trademark usage at Amazon.com and other topics.</td>
</tr>
</tbody>
</table>
The following table describes the important changes in each release of the Amazon Simple Storage Service API Reference up to March 27, 2019. For changes after March 27, 2019, see the consolidated Document History in the Amazon Simple Storage Service User Guide.

- **API version**: 2006-03-01
- **Latest documentation update**: March 27, 2019

<table>
<thead>
<tr>
<th>Change</th>

<tbody>
<tr>
<td>New archive storage class</td>
<td>Amazon S3 now offers a new archive storage class, DEEP_ARCHIVE, for storing rarely accessed objects. For more information, see Storage Classes in the Amazon Simple Storage Service User Guide.</td>
<td>March 27, 2019</td>
</tr>
<tr>
<td>Support for Parquet-formatted Amazon S3 inventory files</td>
<td>Amazon S3 now supports the Apache Parquet (Parquet) format in addition to the Apache optimized row columnar (ORC) and comma-separated values (CSV) file formats for inventory output files. For more information, see Amazon S3 Inventory in the Amazon Simple Storage Service User Guide.</td>
<td>December 04, 2018</td>
</tr>
<tr>
<td>PUT directly to the GLACIER storage class</td>
<td>The Amazon S3 PUT and related operations now support specifying GLACIER as the storage class when creating objects. Previously, you had to transition to the GLACIER storage class from another Amazon S3 storage class. For more information about the GLACIER storage class, see Storage Classes in the Amazon Simple Storage Service User Guide.</td>
<td>November 26, 2018</td>
</tr>
<tr>
<td>Object Lock</td>
<td>Amazon S3 now supports locking objects using a Write Once Read Many (WORM) model. You can lock objects for a definite period of time using a retention period or indefinitely using a legal hold. For more information about Amazon S3 Object Lock, see Locking Objects in the Amazon Simple Storage Service User Guide.</td>
<td>November 26, 2018</td>
</tr>

<td>• CreateMultipartUpload (p. 40)</td>
<td></td>
</tr>
<tr>
<td>Block Public Access</td>
<td>Amazon S3 now includes the ability to block public access to buckets and objects on a per-bucket or account-wide basis. For more information, see Using Amazon S3 Block Public Access in the Amazon Simple Storage Service User Guide.</td>
<td>November 15, 2018</td>
</tr>
<tr>
<td>Filtering enhancements in cross-region replication (CRR) rules</td>
<td>In a CRR rule configuration, you can specify an object filter to choose a subset of objects to apply the rule to. Previously, you could filter only on an object key prefix. In this release, you can filter on an object key prefix, one or more object tags, or both. For more information, see Replication Configuration Overview in the Amazon Simple Storage Service User Guide. The following APIs are updated accordingly:</td>
<td>September 19, 2018</td>
</tr>
<tr>
<td></td>
<td>• PutBucketReplication (p. 347)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• GetBucketReplication (p. 150)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• DeleteBucketReplication (p. 70)</td>
<td></td>
</tr>
<tr>
<td>New storage class</td>
<td>Amazon S3 now offers a new storage class, ONEZONE_IA (IA, for infrequent access) for storing objects. For more information, see Storage Classes in the Amazon Simple Storage Service User Guide.</td>
<td>April 4, 2018</td>
</tr>
<tr>
<td>Amazon S3 Select</td>
<td>Amazon S3 Select is now generally available. This feature retrieves object content based on an SQL expression. For more information, see Selecting Content from Objects in the Amazon Simple Storage Service User Guide. The following API has been updated:</td>
<td>April 4, 2018</td>
</tr>
<tr>
<td></td>
<td>• SelectObjectContent (p. 418)</td>

<tr>
<td>Asia Pacific (Osaka-Local) Region</td>
<td>Amazon S3 is now available in the Asia Pacific (Osaka-Local) Region. For more information about Amazon S3 Regions and endpoints, see <a href="#">Regions and Endpoints</a> in the AWS General Reference. <strong>Important</strong> You can use the Asia Pacific (Osaka-Local) Region only in conjunction with the Asia Pacific (Tokyo) Region. To request access to Asia Pacific (Osaka-Local) Region, contact your sales representative.</td>
<td>February 12, 2018</td>
</tr>
<tr>
<td>Europe (Paris) Region</td>
<td>Amazon S3 is now available in the Europe (Paris) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the AWS General Reference.</td>
<td>December 18, 2017</td>
</tr>
<tr>
<td>China (Ningxia) Region</td>
<td>Amazon S3 is now available in the China (Ningxia) Region. For more information about Amazon S3 regions and endpoints, see <a href="#">Regions and Endpoints</a> in the AWS General Reference.</td>
<td>December 11, 2017</td>
</tr>
<tr>
<td>Querying archives with SQL</td>
<td>Amazon S3 now supports querying S3 Glacier data archives with SQL. For more information, see <a href="#">Querying Archived Objects</a> in the Amazon Simple Storage Service User Guide. The following API changed: • <a href="#">RestoreObject (p. 409)</a></td>
<td>November 29, 2017</td>
</tr>
<tr>
<td>SELECT Object Content (Preview)</td>
<td>Amazon S3 now supports the SELECT Object Content functionality as part of a Preview program. This feature retrieves object content based on an SQL expression. The following API has been added: • <a href="#">SelectObjectContent (p. 418)</a></td>
<td>November 29, 2017</td>
</tr>
<tr>
<td>Support for ORC-formatted Amazon S3 inventory files</td>
<td>Amazon S3 now supports the <a href="#">Apache optimized row columnar (ORC)</a> format in addition to comma-separated values (CSV) file format for inventory output files. For more information, see <a href="#">Amazon S3 Inventory</a> in the Amazon Simple Storage Service User Guide. The following APIs are updated accordingly: • <a href="#">GetBucketInventoryConfiguration (p. 114)</a> • <a href="#">PutBucketInventoryConfiguration (p. 305)</a></td>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| Default encryption for S3 buckets          | Amazon S3 default encryption provides a way to set the default encryption behavior for an S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3-managed keys (SSE-S3) or AWS KMS-managed keys (SSE-KMS). For more information, see [Amazon S3 Default Encryption for S3 Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/default-bucket-ssl.html) in the Amazon Simple Storage Service User Guide. The following APIs are updated accordingly:  
  - [DeleteBucketEncryption](https://docs.aws.amazon.com/AmazonS3/latest/API/DeleteBucketEncryption.html)  
  - [PutBucketEncryption](https://docs.aws.amazon.com/AmazonS3/latest/API/PutBucketEncryption.html) | November 06, 2017 |
| Encryption status in Amazon S3 inventory   | Amazon S3 now supports including encryption status in Amazon S3 inventory so you can see how your objects are encrypted at rest for compliance auditing or other purposes. You can also configure to encrypt Amazon S3 inventory with server-side encryption (SSE) or SSE-KMS so that all inventory files are encrypted accordingly. For more information, see [Amazon S3 Inventory](https://docs.aws.amazon.com/AmazonS3/latest/userguide/default-bucket-ssl.html) in the Amazon Simple Storage Service User Guide. The following APIs are updated accordingly:  
  - [GetBucketInventoryConfiguration](https://docs.aws.amazon.com/AmazonS3/latest/API/GetBucketInventoryConfiguration.html)  
  - [PutBucketInventoryConfiguration](https://docs.aws.amazon.com/AmazonS3/latest/API/PutBucketInventoryConfiguration.html) | November 06, 2017 |
| Cross-region replication (CRR) enhancements | Cross-region replication (CRR) now supports the following:  
  - In a cross-account scenario, you can add a CRR configuration to change replica ownership to the AWS account that owns the destination bucket. For more information, see [CRR: Change Replica Owner](https://docs.aws.amazon.com/AmazonS3/latest/userguide/default-bucket-ssl.html) in the Amazon Simple Storage Service User Guide.  
  - By default, Amazon S3 does not replicate objects in your source bucket that are created using server-side encryption using AWS KMS-managed keys. In your CRR configuration, you can now direct Amazon S3 to replicate these objects. For more information, see [CRR: Replicating Objects Created with SSE Using AWS KMS-Managed Encryption Keys](https://docs.aws.amazon.com/AmazonS3/latest/userguide/default-bucket-ssl.html) in the Amazon Simple Storage Service User Guide. The following APIs are updated accordingly:  
  - [GetBucketReplication](https://docs.aws.amazon.com/AmazonS3/latest/API/GetBucketReplication.html)  
  - [PutBucketReplication](https://docs.aws.amazon.com/AmazonS3/latest/API/PutBucketReplication.html) | November 06, 2017 |

<tr>
<td>Amazon S3 Inventory</td>
<td>Amazon S3 now supports storage inventory. Amazon S3 inventory provides a flat-file output of your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or a shared prefix (that is, objects that have names that begin with a common string). &lt;br&gt;&lt;br&gt;The following new API operations are for storage inventory: &lt;br&gt;&lt;br&gt;• [DeleteBucketInventoryConfiguration](p. 60) &lt;br&gt;• [GetBucketInventoryConfiguration](p. 114) &lt;br&gt;• [PutBucketInventoryConfiguration](p. 305) &lt;br&gt;• [ListBucketInventoryConfigurations](p. 224) &lt;br&gt;&lt;br&gt;For more information, see Amazon S3 Storage Inventory in the Amazon Simple Storage Service User Guide.</td>
<td>November 29, 2016</td>
</tr>
<tr>
<td>Amazon S3 Analytics – Storage Class Analysis</td>
<td>The new Amazon S3 analytics – storage class analysis feature observes data access patterns to help you determine when to transition less frequently accessed STANDARD storage to the STANDARD_IA (IA, for infrequent access) storage class. After storage class analysis observes the infrequent access patterns of a filtered set of data over a period of time, you can use the analysis results to help you improve your lifecycle configurations. This feature also includes a detailed daily analysis of your storage usage at the specified bucket, prefix, or tag level that you can export to a S3 bucket. &lt;br&gt;&lt;br&gt;The following new API operations are for storage class analysis: &lt;br&gt;&lt;br&gt;• [DeleteBucketAnalyticsConfiguration](p. 52) &lt;br&gt;• [GetBucketAnalyticsConfiguration](p. 100) &lt;br&gt;• [PutBucketAnalyticsConfiguration](p. 290) &lt;br&gt;• [ListBucketAnalyticsConfigurations](p. 217) &lt;br&gt;&lt;br&gt;For more information, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service User Guide.</td>
<td>November 29, 2016</td>
</tr>
<tr>
<td>Added S3 Glacier retrieval options to RestoreObject[p. 409]</td>
<td>Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier. For more information, see Restoring Archived Objects in the Amazon Simple Storage Service User Guide.</td>
<td>November 21, 2016</td>
</tr>
<tr>

</tbody>
</table>
| Bucket lifecycle configuration now supports the action to cancel incomplete multipart uploads | Bucket lifecycle configuration now supports the AbortIncompleteMultipartUpload action that you can use to direct Amazon S3 to cancel multipart uploads that don't complete within a specified number of days after being initiated. When a multipart upload becomes eligible for an abort operation, Amazon S3 deletes any uploaded parts and cancels the multipart upload. The following API operations have been updated to support the new action:  
  - PutBucketLifecycleConfiguration (p. 316) – The XML configuration now allows you to specify the AbortIncompleteMultipartUpload action in a lifecycle configuration rule.  
  - ListParts (p. 274) and CreateMultipartUpload (p. 40) – Both of these API operations now return two additional response headers (x-amz-abort-date, and x-amz-abort-rule-id) if the bucket has a lifecycle rule that specifies the AbortIncompleteMultipartUpload action. These headers in the response indicate when the initiated multipart upload will become eligible for an abort operation and which lifecycle rule is applicable. For conceptual information, see the following topics in the Amazon Simple Storage Service User Guide:  
    - Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle configuration  
    - Elements to Describe Lifecycle Actions | March 16, 2016 |
<p>| Amazon S3 Signature Version 4 now supports unsigned payloads          | Amazon S3 Signature Version 4 now supports unsigned payloads when authenticating requests using the Authorization header. Because you don't sign the payload, it does not provide the same security that comes with payload signing, but it provides similar performance characteristics as signature version 2. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 1009). | January 15, 2016 |
| Asia Pacific (Seoul) region                                           | Amazon S3 is now available in the Asia Pacific (Seoul) region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the AWS General Reference.                                                                                                                                                    | January 6, 2016   |
| Renamed the US Standard region                                        | Changed the region name string from US Standard to US East (N. Virginia). This is only a region name update, there is no change in the functionality.                                                                                                                                                                                                 | December 11, 2015 |</p>

<tbody>
<tr>
<td>New storage class</td>
<td>Amazon S3 now offers a new storage class, STANDARD_IA (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/storage-classes.html">Storage Classes</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/">Amazon Simple Storage Service User Guide</a>. Lifecycle configuration feature updates now allow you to transition objects to the STANDARD_IA storage class. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/object-lifecycle-management.html">Object Lifecycle Management</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/">Amazon Simple Storage Service User Guide</a>. Previously, the cross-region replication feature used the storage class of the source object for object replicas. Now, when you configure cross-region replication you can specify a storage class for the object replica created in the destination bucket. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/cross-region-replication.html">Cross-Region Replication</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/">Amazon Simple Storage Service User Guide</a>.</td>
<td>September 16, 2015</td>
</tr>
<tr>
<td>Event notifications</td>
<td>Amazon S3 event notifications have been updated to add notifications when objects are deleted and to add filtering on object names with prefix and suffix matching. For the relevant API operations, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Notification-Using-S3-PUTPolicyExample.html">PutBucketNotificationConfiguration</a> (p. 334), and <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Notification-Using-S3-PUTPolicyExample.html">GetBucketNotificationConfiguration</a> (p. 137). For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/configuring-event-notifications.html">Configuring Amazon S3 Event Notifications</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/">Amazon Simple Storage Service User Guide</a>.</td>
<td>July 28, 2015</td>
</tr>
<tr>
<td>Event notifications</td>
<td>Amazon S3 now supports new event types and destinations in a bucket notification configuration. Prior to this release, Amazon S3 supported only the s3:ReducedRedundancyLostObject event type and an Amazon SNS topic as the destination. For more information about the new event types, go to <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/setting-up-notification-of-bucket-events.html">Setting Up Notification of Bucket Events</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/">Amazon Simple Storage Service User Guide</a>. For the relevant API operations, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Notification-Using-S3-PUTPolicyExample.html">PutBucketNotificationConfiguration</a> (p. 334) and <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Notification-Using-S3-PUTPolicyExample.html">GetBucketNotificationConfiguration</a> (p. 137).</td>

</table>
| Server-side encryption with AWS Key Management Service (KMS) | Amazon S3 now supports server-side encryption using AWS Key Management Service (KMS). With server-side encryption with KMS, you manage the envelope key through KMS, and Amazon S3 calls KMS to access the envelope key within the permissions you set. For more information about server-side encryption with KMS, see [Protecting Data Using Server-Side Encryption with AWS Key Management Service](https://docs.aws.amazon.com/AmazonS3/latest/dev/ServerSideEncryptionUsingKMS.html) in the *Amazon Simple Storage Service User Guide*. The following Amazon S3 REST API operations support headers related to KMS.  
- PutObject (p. 371)  
- CopyObject (p. 21)  
- POST Object (p. 1047)  
- CreateMultipartUpload (p. 40)  
- UploadPart (p. 426) | November 12, 2014 |
| Europe (Frankfurt) Region | Amazon S3 is now available in the Europe (Frankfurt) Region region. | October 23, 2014 |
| Server-side encryption with customer-provided encryption keys | Amazon S3 now supports server-side encryption using customer-provided encryption keys (SSE-C). Server-side encryption enables you to request Amazon S3 to encrypt your data at rest. When using SSE-C, Amazon S3 encrypts your objects with the custom encryption keys that you provide. Since Amazon S3 performs the encryption for you, you get the benefits of using your own encryption keys without the cost of writing or executing your own encryption code. For more information about SSE-C, go to [Server-Side Encryption (Using Customer-Provided Encryption Keys)](https://docs.aws.amazon.com/AmazonS3/latest/dev/ServerSideEncryptionUsingCSE.html) in the *Amazon Simple Storage Service User Guide*. The following Amazon S3 REST API operations support headers related to SSE-C.  
- GetObject (p. 165)  
- HeadObject (p. 206)  
- PutObject (p. 371)  
- CopyObject (p. 21)  
- POST Object (p. 1047)  
- CreateMultipartUpload (p. 40)  
- UploadPart (p. 426)  
- UploadPartCopy (p. 433) | June 12, 2014 |

<td>-----------------------</td>
</tr>
<tr>
<td>Root domain support for website hosting</td>
<td>Amazon S3 now supports hosting static websites at the root domain. Visitors to your website can access your site from their browser without specifying &quot;www&quot; in the web address (e.g., &quot;example.com&quot;). Many customers already host static websites on Amazon S3 that are accessible from a &quot;www&quot; subdomain (e.g., &quot;www.example.com&quot;). Previously, to support root domain access, you needed to run your own web server to proxy root domain requests from browsers to your website on Amazon S3. Running a web server to proxy requests introduces additional costs, operational burden, and another potential point of failure. Now, you can take advantage of the high availability and durability of Amazon S3 for both &quot;www&quot; and root domain addresses. For an example walkthrough, go to Example: Setting Up a Static Website Using a Custom Domain in the Amazon Simple Storage Service User Guide. For conceptual information, go to Hosting Static Websites on Amazon S3 in the Amazon Simple Storage Service User Guide.</td>
<td>December 27, 2012</td>
</tr>
<tr>
<td>Support for Archiving Data to Amazon Glacier</td>
<td>Amazon S3 now supports a storage option that enables you to utilize Amazon Glacier's low-cost storage service for data archival. To archive objects, you define archival rules identifying objects and a timeline when you want Amazon S3 to archive these objects to S3 Glacier. You can easily set the rules on a bucket using the Amazon S3 console or programmatically using the Amazon S3 API or AWS SDKs. To support data archival rules, Amazon S3 lifecycle management API has been updated. For more information, see PutBucketLifecycleConfiguration. After you archive objects, you must first restore a copy before you can access the data. Amazon S3 offers a new API for you to initiate a restore. For more information, see RestoreObject. For conceptual information, go to Object Lifecycle Management in the Amazon Simple Storage Service User Guide.</td>
<td>November 13, 2012</td>
</tr>
<tr>
<td>Support for Website Page Redirects</td>
<td>For a bucket that is configured as a website, Amazon S3 now supports redirecting a request for an object to another object in the same bucket or to an external URL. You can configure redirect by adding the x-amz-website-redirect-location metadata to the object. The object upload API operations PutObject, CreateMultipartUpload, and POST Object allow you to configure the x-amz-website-redirect-location object metadata. For conceptual information, go to How to Configure Website Page Redirects in the Amazon Simple Storage Service User Guide.</td>

<tr>
<td>Cross-Origin Resource Sharing (CORS) support</td>
<td>Amazon S3 now supports Cross-Origin Resource Sharing (CORS). CORS defines a way in which client web applications that are loaded in one domain can interact with or access resources in a different domain. With CORS support in Amazon S3, you can build rich client-side web applications on top of Amazon S3 and selectively allow cross-domain access to your Amazon S3 resources. For more information, see Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service User Guide.</td>
<td>August 31, 2012</td>
</tr>
<tr>
<td>Cost Allocation Tagging support</td>
<td>Amazon S3 now supports cost allocation tagging, which allows you to label S3 buckets so you can more easily track their cost against projects or other criteria. For more information, see Cost Allocation Tagging in the Amazon Simple Storage Service User Guide.</td>
<td>August 21, 2012</td>
</tr>
<tr>
<td>Object Expiration support</td>
<td>You can use Object Expiration to schedule automatic removal of data after a configured time period. You set object expiration by adding lifecycle configuration to a bucket. For more information, see Transitioning Objects: General Considerations in the Amazon Simple Storage Service User Guide.</td>
<td>December 27, 2011</td>
</tr>
<tr>
<td>New Region supported</td>
<td>Amazon S3 now supports the South America (São Paulo) region. For more information, see Buckets and Regions in the Amazon Simple Storage Service User Guide.</td>
<td>December 14, 2011</td>
</tr>
<tr>
<td>Multi-Object Delete</td>
<td>Amazon S3 now supports Multi-Object Delete API that enables you to delete multiple objects in a single request. With this feature, you can remove large numbers of objects from Amazon S3 more quickly than using multiple individual DELETE requests. For more information about the API see, see DeleteObjects (p. 81). For conceptual information about the delete operation, see Deleting Objects in the Amazon Simple Storage Service User Guide.</td>
<td>December 7, 2011</td>
</tr>
<tr>
<td>New region supported</td>
<td>Amazon S3 now supports the US West (Oregon) region. For more information, see Buckets and Regions in the Amazon Simple Storage Service User Guide.</td>
<td>November 8, 2011</td>
</tr>
<tr>
<td>Server-side encryption support</td>
<td>Amazon S3 now supports server-side encryption. It enables you to request Amazon S3 to encrypt your data at rest, that is, encrypt your object data when Amazon S3 writes your data to disks in its data centers. To request server-side encryption, you must add the x-amz-server-side-encryption header to your request. To learn more about data encryption, go to Using Data Encryption in the Amazon Simple Storage Service User Guide.</td>

</tr>
<tr>
<td>Multipart Upload API extended to enable copying objects up to 5 TB</td>
<td>Prior to this release, Amazon S3 API supported copying objects (see CopyObject (p. 21)) of up to 5 GB in size. To enable copying objects larger than 5 GB, Amazon S3 extends the multipart upload API with a new operation, Upload Part (Copy). You can use this multipart upload operation to copy objects up to 5 TB in size. For conceptual information about multipart upload, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service User Guide. To learn more about the new API, see UploadPartCopy (p. 433).</td>
<td>June 21, 2011</td>
</tr>
<tr>
<td>SOAP API calls over HTTP disabled</td>
<td>To increase security, SOAP API calls over HTTP are disabled. Authenticated and anonymous SOAP requests must be sent to Amazon S3 using SSL.</td>
<td>June 6, 2011</td>
</tr>
<tr>
<td>Support for hosting static websites in Amazon S3</td>
<td>Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (e.g., <a href="http://mywebsite.com/subfolder">http://mywebsite.com/subfolder</a>) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For API information to configure your bucket as a website, see the following sections: - PutBucketWebsite (p. 364) - GetBucketWebsite (p. 162) - DeleteBucketWebsite (p. 74)</td>
<td>February 17, 2011</td>
</tr>
<tr>
<td>Response Header API Support</td>
<td>The GET Object REST API now allows you to change the response headers of the REST GET Object request for each request. That is, you can alter object metadata in the response, without altering the object itself. For more information, see GetObject (p. 165).</td>
<td>January 14, 2011</td>
</tr>
<tr>
<td>Large Object Support</td>
<td>Amazon S3 has increased the maximum size of an object you can store in an S3 bucket from 5 GB to 5 TB. If you are using the REST API you can upload objects of up to 5 GB size in a single PUT operation. For larger objects, you must use the Multipart Upload REST API to upload objects in parts. For conceptual information, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service User Guide. For multipart upload API information, see CreateMultipartUpload (p. 40), UploadPart (p. 426), CompleteMultipartUpload (p. 13), ListParts (p. 274), and ListMultipartUploads (p. 235)</td>

</tr>
<tr>
<td>Multipart upload</td>
<td>Multipart upload enables faster, more flexible uploads into Amazon S3. It allows you to upload a single object as a set of parts. For conceptual information, go to <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/UploadingObjectsUsingMultipartUpload.html">Uploading Objects Using Multipart Upload</a> in the Amazon Simple Storage Service User Guide. For multipart upload API information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_CreateMultipartUpload.html">CreateMultipartUpload</a> (p. 40), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_UploadPart.html">UploadPart</a> (p. 426), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_CompleteMultipartUpload.html">CompleteMultipartUpload</a> (p. 13), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_ListParts.html">ListParts</a> (p. 274), and <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_ListMultipartUploads.html">ListMultipartUploads</a> (p. 235).</td>
<td>November 10, 2010</td>
</tr>
<tr>
<td>Notifications</td>
<td>The Amazon S3 notifications feature enables you to configure a bucket so that Amazon S3 publishes a message to an Amazon Simple Notification Service (SNS) topic when Amazon S3 detects a key event on a bucket. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_GetBucketNotification.html">GET Bucket notification</a> (p. 137) and <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutBucketNotification.html">PUT Bucket notification</a> (p. 137).</td>
<td>July 14, 2010</td>
</tr>
<tr>
<td>Bucket policies</td>
<td>Bucket policies is an access management system you use to set access permissions on buckets, objects, and sets of objects. This functionality supplements and in many cases replaces access control lists.</td>
<td>July 6, 2010</td>
</tr>
<tr>
<td>Reduced Redundancy</td>
<td>Amazon S3 now enables you to reduce your storage costs by storing objects in Amazon S3 with reduced redundancy. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutObject.html">PUT Object</a> (p. 371).</td>
<td>May 12, 2010</td>
</tr>
<tr>
<td>New region supported</td>
<td>Amazon S3 now supports the Asia Pacific (Singapore) region and therefore new location constraints. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_GetBucketLocation.html">GET Bucket location</a> (p. 125) and <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutBucket.html">PUT Bucket</a> (p. 34).</td>
<td>April 28, 2010</td>
</tr>
<tr>
<td>Object Versioning</td>
<td>This release introduces object Versioning. All objects now have a key and a version. If you enable versioning for a bucket, Amazon S3 gives all objects added to a bucket a unique version ID. This feature enables you to recover from unintended overwrites and deletions. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_GetObject.html">GET Object</a> (p. 165), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_DeleteObject.html">DELETE Object</a> (p. 76), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutObject.html">PUT Object</a> (p. 371), <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutObjectCopy.html">PUT Object Copy</a> (p. 21), or <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_PutObject.html">POST Object</a> (p. 1047). The SOAP API does not support versioned objects.</td>
<td>February 8, 2010</td>
</tr>
<tr>
<td>New region supported</td>
<td>Amazon S3 now supports the US-West (Northern California) region. The new endpoint is s3-us-west-1.amazonaws.com. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/choose-region.html">How to Select a Region for Your Buckets</a> in the Amazon Simple Storage Service User Guide.</td>
<td>December 2, 2009</td>
</tr>
<tr>
<td>C# Library Support</td>
<td>AWS now provides Amazon S3 C# libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using language-specific API operations instead of REST or SOAP. These libraries provide basic functions (not included in the REST or SOAP APIs), such as request authentication, request retries, and error handling so that it's easier to get started.</td>

- Appendix: SelectObjectContent Response (p. 1142)
- Appendix: OPTIONS object (p. 1152)
- Appendix: SOAP API (p. 1154)
- Appendix: Lifecycle Configuration APIs (Deprecated) (p. 1182)
Appendix: SelectObjectContent Response

Description

The Amazon S3 Select operation filters the contents of an Amazon S3 object based on a simple structured query language (SQL) statement. Given the response size of this operation is unknown, Amazon S3 Select streams the response as a series of messages and includes a Transfer-Encoding header with `chunked` as its value in the response.

For more information about Amazon S3 Select, see Selecting Content from Objects in the Amazon Simple Storage Service User Guide.

For more information about using SQL with Amazon S3 Select, see SQL Reference for Amazon S3 Select and S3 Glacier Select in the Amazon Simple Storage Service User Guide.

Responses

A successful Amazon S3 Select Operation returns `200 OK` status code.

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 1092).

Response Body

Since the Amazon S3 Select response size is unknown, Amazon S3 streams the response as a series of messages and includes a Transfer-Encoding header with `chunked` as its value in the response. The following example shows the response format at the top level:

```
<Message 1>
<Message 2>
<Message 3>
......
<Message n>
```

Each message consists of two sections: the prelude and the data. The prelude section consists of 1) the total byte-length of the message, and 2) the combined byte-length of all the headers. The data section consists of 1) the headers, and 2) a payload.

Each section ends with a 4-byte big-endian integer checksum (CRC). Amazon S3 Select uses CRC32 (often referred to as GZIP CRC32) to calculate both CRCs. For more information about CRC32, see GZIP file format specification version 4.3.

Total message overhead including the prelude and both checksums is 16 bytes.

**Note**

All `integer` values within messages are in network byte order, or big-endian order.

The following diagram shows the components that make up a message and a header. Note that there are multiple headers per message.
Message:

```
<table>
<thead>
<tr>
<th>Prelude</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>total byte-length</td>
<td>headers byte-length</td>
</tr>
<tr>
<td>4 bytes</td>
<td>4 bytes</td>
</tr>
</tbody>
</table>
```

Headers (multiple headers per message):

```
<table>
<thead>
<tr>
<th>header name byte-length</th>
<th>header name (string)</th>
<th>header value type</th>
<th>header value (depends on header value type)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>variable length</td>
<td>1 byte</td>
<td>variable length</td>
</tr>
</tbody>
</table>
```

**Note**
For Amazon S3 Select, the header value type is always 7 (type=String). For this type, the header value consists of two components, a 2-byte big-endian integer length, and a UTF-8 string that is of that byte-length. The following diagram shows the components that make up Amazon S3 Select headers.

**Amazon S3 Select Headers (type=String):**

```
<table>
<thead>
<tr>
<th>header name byte-length</th>
<th>header name (UTF-8)</th>
<th>7</th>
<th>value string byte-length</th>
<th>value string (UTF-8)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>variable length</td>
<td>1 byte</td>
<td>2 bytes</td>
<td>variable length</td>
</tr>
</tbody>
</table>
```

Payload byte-length calculations (these two calculations are equivalent):

- `payload_length = total_length - header_length - sizeOf(total_length) - sizeOf(header_length) - sizeOf(prelude_crc) - sizeOf(message_crc)`
- `payload_length = total_length - header_length - 16`

Each message contains the following components:
• **Prelude**: Always fixed size of 8 bytes (two fields of 4 bytes each):
  • *First four bytes*: Total byte-length: Big-endian integer byte-length of the entire message (including the 4-byte total length field itself).
  • *Second four bytes*: Headers byte-length: Big-endian integer byte-length of the headers portion of the message (excluding the headers length field itself).
• **Prelude CRC**: 4-byte big-endian integer checksum (CRC) for the prelude portion of the message (excluding the CRC itself). The prelude has a separate CRC from the message CRC (see below), to ensure that corrupted byte-length information can be detected immediately, without causing pathological buffering behavior.
• **Headers**: A set of metadata annotating the message, such as the message type, payload format, and so on. Messages can have multiple headers, so this portion of the message can have different byte-lengths depending on the message type. Headers are key-value pairs, where both the key and value are UTF-8 strings. Headers can appear in any order within the headers portion of the message, and any given header type can only appear once.

For Amazon S3 Select, following is a list of header names and the set of valid values depending on the message type.

• **MessageType Header**:
  • HeaderName => "message-type"
  • Valid HeaderValues => "error", "event"
• **EventType Header**:
  • HeaderName => "event-type"
  • Valid HeaderValues => "Records", "Cont", "Progress", "Stats", "End"
• **ErrorCode Header**:
  • HeaderName => "error-code"
  • Valid HeaderValues => Error Code from the table in the List of SELECT Object Content Error Codes (p. 1105) section.
• **ErrorMessage Header**:
  • HeaderName => "error-message"
  • Valid HeaderValues => Error message returned by the service, to help diagnose request-level errors.
• **Payload**: Can be anything.
• **Message CRC**: 4-byte big-endian integer checksum (CRC) from the start of the message to the start of the checksum (that is, everything in the message excluding the message CRC itself).

Each header contains the following components. There can be multiple headers per message.

• **Header Name Byte-Length**: Byte-length of the header name.
• **Header Name**: Name of the header, indicating the header type. Valid values: "message-type" "event-type" "error-code" "error-message"
• **Header Value Type**: Enum indicating the header value type. For Amazon S3 Select, this is always 7.
• **Value String Byte-Length**: (For Amazon S3 Select) Byte-length of the header value string.
• **Header Value String**: (For Amazon S3 Select) Value of the header string. Valid values for this field vary based on the type of the header. See the sections below for valid values for each header type and message type.

For Amazon S3 Select, responses can be messages of the following types:

• **Records message**: Can contain a single record, partial records, or multiple records. Depending on the size of the result, a response can contain zero or more of these messages.
• **Continuation message**: Amazon S3 periodically sends this message to keep the TCP connection open. These messages appear in responses at random. The client must detect the message type and process accordingly.

• **Progress message**: Amazon S3 periodically sends this message, if requested. It contains information about the progress of a query that has started but has not yet completed.

• **Stats message**: Amazon S3 sends this message at the end of the request. It contains statistics about the query.

• **End message**: Indicates that the request is complete, and no more messages will be sent. You should not assume that the request is complete until the client receives an End message.

• **RequestLevelError message**: Amazon S3 sends this message if the request failed for any reason. It contains the error code and error message for the failure. If Amazon S3 sends a RequestLevelError message, it doesn't send an End message.

The following sections explain the structure of each message type in more detail.

For sample code and unit tests that use this protocol, see [AWS C Event Stream](https://github.com/aws/aws-c-event-stream) on the GitHub website.

**Records Message**

**Header specification**

Records messages contain three headers, as follows:
Payload specification

Records message payloads can contain a single record, partial records, or multiple records.

Continuation Message

Header specification

Continuation messages contain two headers, as follows:
### Progress Message

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Length</th>
<th>Message Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>“.event-type”</td>
<td>11 bytes</td>
<td>“event-type”</td>
<td>7 bytes</td>
</tr>
<tr>
<td>“.message-type”</td>
<td>13 bytes</td>
<td>“message-type”</td>
<td>7 bytes</td>
</tr>
</tbody>
</table>

**Payload specification**

Continuation messages have no payload.

**Progress Message**

**Header specification**

Progress messages contain three headers, as follows:
Progress message payload is an XML document containing information about the progress of a request.

- **BytesScanned** => Number of bytes that have been processed before being uncompressed (if the file is compressed).
- **BytesProcessed** => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- **BytesReturned** => Current number of bytes of records payload data returned by Amazon S3.

For uncompressed files, BytesScanned and BytesProcessed are equal.

Example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Progress>
  <BytesScanned>512</BytesScanned>
  <BytesProcessed>1024</BytesProcessed>
  <BytesReturned>1024</BytesReturned>
</Progress>
```
Stats Message

Header specification

Stats messages contain three headers, as follows:

Payload specification

Stats message payload is an XML document containing information about a request's stats when processing is complete.

- BytesScanned => Number of bytes that have been processed before being uncompressed (if the file is compressed).
- BytesProcessed => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- BytesReturned => Total number of bytes of records payload data returned by Amazon S3.

For uncompressed files, BytesScanned and BytesProcessed are equal.

Example:
End Message

Header specification

End messages contain two headers, as follows:

```
Payload specification

End messages have no payload.

Request Level Error Message

Header specification

Request-level error messages contain three headers, as follows:
```
For a list of possible error codes and error messages, see the List of SELECT Object Content Error Codes (p. 1105).

Payload specification

Request-level error messages have no payload.

Appendix: OPTIONS object

Description

A browser can send this preflight request to Amazon S3 to determine if it can send an actual request with the specific origin, HTTP method, and headers.

Amazon S3 supports cross-origin resource sharing (CORS) by enabling you to add a cors subresource on a bucket. When a browser sends this preflight request, Amazon S3 responds by evaluating the rules that are defined in the cors configuration.

If cors is not enabled on the bucket, then Amazon S3 returns a 403 Forbidden response.

For more information about CORS, go to Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service User Guide.

Requests

Syntax

```
OPTIONS /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Origin: Origin
Access-Control-Request-Method: HTTPMethod
Access-Control-Request-Headers: RequestHeader
```

Request Parameters

This operation does not introduce any specific request parameters, but it may contain any request parameters that are required by the actual request.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin</td>
<td>Identifies the origin of the cross-origin request to Amazon S3. For example, <a href="http://www.example.com">http://www.example.com</a>. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Access-Control-Request-Method</td>
<td>Identifies what HTTP method will be used in the actual request. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Access-Control-Request-Headers</td>
<td>A comma-delimited list of HTTP headers that will be sent in the actual request. For example, to put an object with server-side encryption, this preflight request will determine if it can include the x-amz-server-side-encryption header with the request.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Type:</strong> String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Default: None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Request Elements

This implementation of the operation does not use request elements.

### Responses

#### Response Headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Access-Control-Allow-Origin</strong></td>
<td>The origin you sent in your request. If the origin in your request is not allowed, Amazon S3 will not include this header in the response.</td>
</tr>
<tr>
<td><strong>Access-Control-Max-Age</strong></td>
<td>How long, in seconds, the results of the preflight request can be cached.</td>
</tr>
<tr>
<td><strong>Access-Control-Allow-Methods</strong></td>
<td>The HTTP method that was sent in the original request. If the method in the request is not allowed, Amazon S3 will not include this header in the response.</td>
</tr>
<tr>
<td><strong>Access-Control-Allow-Headers</strong></td>
<td>A comma-delimited list of HTTP headers that the browser can send in the actual request. If any of the requested headers is not allowed, Amazon S3 will not include that header in the response, nor will the response contain any of the headers with the Access-Control prefix.</td>
</tr>
<tr>
<td><strong>Access-Control-Expose-Headers</strong></td>
<td>A comma-delimited list of HTTP headers. This header provides the JavaScript client with access to these headers in the response to the actual request.</td>
</tr>
<tr>
<td><strong>Type:</strong> String</td>
<td></td>
</tr>
</tbody>
</table>

### Response Elements

This implementation of the operation does not return response elements.
Examples

Example : Send a preflight OPTIONS request to a cors enabled bucket

A browser can send this preflight request to Amazon S3 to determine if it can send the actual PUT request from http://www.example.com origin to the Amazon S3 bucket named examplebucket.

Sample Request

```
OPTIONS /exampleobject HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Origin: http://www.example.com
Access-Control-Request-Method: PUT
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: 6SvaESv3VULYPLik5lli71SPptSnBvDdGmnlkX1HFUl7uS2m1DF6td6KWKNjYMZX
x-amz-request-id: BDC4B83DF5096BBE
Date: Wed, 21 Aug 2012 23:09:55 GMT
Etag: "1f1fa1f1111llllllllllllc11aed1da1"
Access-Control-Allow-Origin: http://www.example.com
Access-Control-Allow-Methods: PUT
Access-Control-Expose-Headers: x-amz-request-id
Content-Length: 0
Server: AmazonS3
```

Appendix: SOAP API

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes the SOAP API with respect to service, bucket, and object operations. Note that SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

Topics

- Operations on the Service (SOAP API) (p. 1155)
- Operations on Buckets (SOAP API) (p. 1156)
- Operations on Objects (SOAP API) (p. 1165)
Operations on the Service (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on the Amazon S3 service.

Topics
• ListAllMyBuckets (SOAP API) (p. 1155)

ListAllMyBuckets (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The ListAllMyBuckets operation returns a list of all buckets owned by the sender of the request.

Example

Sample Request

```xml
<ListAllMyBuckets xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListAllMyBuckets>
```

Sample Response

```xml
<ListAllMyBucketsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Owner>
    <ID>bcaf1fffd86f41161ca5fb16fdd81034f</ID>
    <DisplayName>webfile</DisplayName>
  </Owner>
  <Buckets>
    <Bucket>
      <Name>quotes</Name>
      <CreationDate>2006-02-03T16:45:09.000Z</CreationDate>
    </Bucket>
    <Bucket>
      <Name>samples</Name>
      <CreationDate>2006-02-03T16:41:58.000Z</CreationDate>
    </Bucket>
  </Buckets>
</ListAllMyBucketsResult>
```

Response Body

• Owner:

This provides information that Amazon S3 uses to represent your identity for purposes of authentication and access control. ID is a unique and permanent identifier for the developer who
made the request. DisplayName is a human-readable name representing the developer who made
the request. It is not unique, and might change over time. We recommend that you match your
DisplayName to your Forum name.

- **Name:**

  The name of a bucket. Note that if one of your buckets was recently deleted, the name of the deleted
  bucket might still be present in this list for a period of time.

- **CreationDate:**

  The time that the bucket was created.

### Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to list
buckets, and you can only list buckets for which you are the owner.

### Operations on Buckets (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3
features will not be supported for SOAP. We recommend that you use either the REST API or the
AWS SDKs.

This section describes operations you can perform on Amazon S3 buckets.

**Topics**

- [CreateBucket (SOAP API)](p. 1156)
- [DeleteBucket (SOAP API)](p. 1157)
- [ListBucket (SOAP API)](p. 1158)
- [GetBucketAccessControlPolicy (SOAP API)](p. 1161)
- [SetBucketAccessControlPolicy (SOAP API)](p. 1162)
- [GetBucketLoggingStatus (SOAP API)](p. 1163)
- [SetBucketLoggingStatus (SOAP API)](p. 1164)

### CreateBucket (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3
features will not be supported for SOAP. We recommend that you use either the REST API or the
AWS SDKs.

The CreateBucket operation creates a bucket. Not every string is an acceptable bucket name. For
information on bucket naming restrictions, see [Working with Amazon S3 Buckets](#).

**Note**

To determine whether a bucket name exists, use ListBucket and set MaxKeys to 0. A
NoSuchBucket response indicates that the bucket is available, an AccessDenied response
indicates that someone else owns the bucket, and a Success response indicates that you own the
bucket or have permission to access it.

**Example Create a bucket named "quotes"**

**Sample Request**
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</CreateBucket>

Sample Response

  <CreateBucketResponse>
    <Bucket>quotes</Bucket>
  </CreateBucketResponse>
</CreateBucketResponse>

Elements

- **Bucket**: The name of the bucket you are trying to create.
- **AccessControlList**: The access control list for the new bucket. This element is optional. If not provided, the bucket is created with an access policy that gives the requester FULL_CONTROL access.

Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to create buckets.

Related Resources

- [ListBucket (SOAP API)](p. 1158)

DeleteBucket (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `DeleteBucket` operation deletes a bucket. All objects in the bucket must be deleted before the bucket itself can be deleted.

Example

This example deletes the "quotes" bucket.

Sample Request

<DeleteBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteBucket>
Sample Response

```xml
<DeleteBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteBucketResponse>
    <Code>204</Code>
    <Description>No Content</Description>
  </DeleteBucketResponse>
</DeleteBucketResponse>
```

Elements

- **Bucket**: The name of the bucket you want to delete.

Access Control

Only the owner of a bucket is allowed to delete it, regardless the access control policy on the bucket.

ListBucket (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The **ListBucket** operation returns information about some of the items in the bucket.

For a general introduction to the list operation, see the [Listing Object Keys](#).

Requests

This example lists up to 1000 keys in the "quotes" bucket that have the prefix "notes."

**Syntax**

```xml
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Prefix>notes/</Prefix>
  <Delimiter>/</Delimiter>
  <MaxKeys>1000</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Limits the response to keys which begin with the indicated prefix. You can use prefixes to separate a bucket into different sets of keys in a way similar to how a file system uses folders. Important Replacement must be made for object keys containing special characters (such as carriage returns) when using</td>
<td>No</td>
</tr>
</tbody>
</table>
### Name | Description | Required
--- | --- | ---
XML requests. For more information, see [XML related object key constraints](#). Type: String Default: None
**marker** Indicates where in the bucket to begin listing. The list will only include keys that occur lexicographically after marker. This is convenient for pagination: To get the next page of results use the last key of the current page as the marker. Type: String Default: None
**max-keys** The maximum number of keys you’d like to see in the response body. The server might return fewer than this many keys, but will not return more. Type: String Default: None
**delimiter** Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response. Type: String Default: None

### Success Response
This response assumes the bucket contains the following keys:

- notes/todos.txt
- notes/2005-05-23/customer_mtg_notes.txt
- notes/2005-05-23/phone_notes.txt
- notes/2005-05-28/sales_notes.txt

### Syntax

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>backups</Name>
  <Prefix>notes/</Prefix>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>notes/todos.txt</Key>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fda96f00ad9f27c383fc9ac7f"</ETag>
    <Size>5126</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
</ListBucketResult>
```
As you can see, many of the fields in the response echo the request parameters. IsTruncated, Contents, and CommonPrefixes are the only response elements that can contain new information.

Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contents</td>
<td>Metadata about each object returned.</td>
</tr>
<tr>
<td></td>
<td>Type: XML metadata</td>
</tr>
<tr>
<td></td>
<td>Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>CommonPrefixes</td>
<td>A response can contain CommonPrefixes only if you specify a delimiter.</td>
</tr>
<tr>
<td></td>
<td>When you do, CommonPrefixes contains all (if there are any) keys between</td>
</tr>
<tr>
<td></td>
<td>Prefix and the next occurrence of the string specified by delimiter. In effect,</td>
</tr>
<tr>
<td></td>
<td>CommonPrefixes lists keys that act like subdirectories in the directory specified</td>
</tr>
<tr>
<td></td>
<td>by Prefix. For example, if prefix is notes/ and delimiter is a slash (/), in</td>
</tr>

<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: ListBucketResult</td>
</tr>
</tbody>
</table>

**Response Body**

For information about the list response, see [Listing Keys Response](#).

**Access Control**

To list the keys of a bucket you need to have been granted READ access on the bucket.

**GetBucketAccessControlPolicy (SOAP API)**

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `GetBucketAccessControlPolicy` operation fetches the access control policy for a bucket.

**Example**

This example retrieves the access control policy for the "quotes" bucket.

**Sample Request**

```xml
   <Bucket>quotes</Bucket>
   <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
   <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
   <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetBucketAccessControlPolicy>
```

**Sample Response**

```xml
<AccessControlPolicy>
   <Owner>
      <ID>a9a7b886d6fd2441bf9b1c61be666e9</ID>
      <DisplayName>chriscustomer</DisplayName>
   </Owner>
   <GrantList>
      ...
   </GrantList>
</AccessControlPolicy>
```
Response Body

The response contains the access control policy for the bucket. For an explanation of this response, see SOAP Access Policy.

Access Control

You must have READ_ACP rights to the bucket in order to retrieve the access control policy for a bucket.

SetBucketAccessControlPolicy (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The SetBucketAccessControlPolicy operation sets the Access Control Policy for an existing bucket. If successful, the previous Access Control Policy for the bucket is entirely replaced with the specified Access Control Policy.

**Example**

Give the specified user (usually the owner) FULL_CONTROL access to the "quotes" bucket.

**Sample Request**

```xml
  <Bucket>quotes</Bucket>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6f41bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetBucketAccessControlPolicy>
```

**Sample Response**

```xml
  <!-- API Version 2006-03-01 -->
  <!-- API Version 2006-03-01 -->
</GetBucketAccessControlPolicyResponse>
```
Access Control

You must have WRITE_ACP rights to the bucket in order to set the access control policy for a bucket.

GetBucketLoggingStatus (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The GetBucketLoggingStatus retrieves the logging status for an existing bucket.

For a general introduction to this feature, see Server Logs.

Example

Sample Request

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  <soap:Body>
      <Bucket>mybucket</Bucket>
      <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
      <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
      <Signature>YOUR_SIGNATURE_HERE</Signature>
    </GetBucketLoggingStatus>
  </soap:Body>
</soap:Envelope>
```

Sample Response

```xml
<?xml version="1.0" encoding="utf-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
  <soapenv:Header>
  </soapenv:Header>
  <soapenv:Body>
      <GetBucketLoggingStatusResponse>
        <LoggingEnabled>
          <TargetBucket>mylogs</TargetBucket>
          <TargetPrefix>mybucket-access_log-</TargetPrefix>
        </LoggingEnabled>
      </GetBucketLoggingStatusResponse>
    </GetBucketLoggingStatusResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
Access Control

Only the owner of a bucket is permitted to invoke this operation.

SetBucketLoggingStatus (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `SetBucketLoggingStatus` operation updates the logging status for an existing bucket.

For a general introduction to this feature, see [Server Logs](#).

**Example**

This sample request enables server access logging for the 'mybucket' bucket, and configures the logs to be delivered to 'mylogs' under prefix 'access_log-

**Sample Request**

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/
    <soap:Body>
        <SetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
            <Bucket>myBucket</Bucket>
            <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
            <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
            <Signature>YOUR_SIGNATURE_HERE</Signature>
            <BucketLoggingStatus>
                <LoggingEnabled>
                    <TargetBucket>mylogs</TargetBucket>
                    <TargetPrefix>mybucket-access_log-</TargetPrefix>
                </LoggingEnabled>
            </BucketLoggingStatus>
        </SetBucketLoggingStatus>
    </soap:Body>
</soap:Envelope>
```

**Sample Response**

```xml
<?xml version="1.0" encoding="utf-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/
xmlns:xsd="http://www.w3.org/2001/XMLSchema-instance">
    <soapenv:Header>
    </soapenv:Header>
    <soapenv:Body>
    </soapenv:Body>
</soapenv:Envelope>
```

Access Control

Only the owner of a bucket is permitted to invoke this operation.
Operations on Objects (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on Amazon S3 objects.

Topics

- PutObjectInline (SOAP API) (p. 1165)
- PutObject (SOAP API) (p. 1167)
- CopyObject (SOAP API) (p. 1169)
- GetObject (SOAP API) (p. 1174)
- GetObjectExtended (SOAP API) (p. 1178)
- DeleteObject (SOAP API) (p. 1178)
- GetObjectAccessControlPolicy (SOAP API) (p. 1179)
- SetObjectAccessControlPolicy (SOAP API) (p. 1180)

PutObjectInline (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The PutObjectInline operation adds an object to a bucket. The data for the object is provided in the body of the SOAP message.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

PutObjectInline is not suitable for use with large objects. The system limits this operation to working with objects 1MB or smaller. PutObjectInline will fail with the InlineDataTooLargeError status code if the Data parameter encodes an object larger than 1MB. To upload large objects, consider using the non-inline PutObject API, or the REST API instead.

Example

This example writes some text and metadata into the "Nelson" object in the "quotes" bucket, give a user (usually the owner) FULL_CONTROL access to the object, and make the object readable by anonymous parties.

Sample Request

```xml
<PutObject Inline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
    <Bucket>quotes</Bucket>
    <Key>Nelson</Key>
</PutObject Inline>
```
<Metadata>
  <Name>Content-Type</Name>
  <Value>text/plain</Value>
</Metadata>

<Metadata>
  <Name>family</Name>
  <Value>Muntz</Value>
</Metadata>

<Data>aGEtaGE=</Data>

<ContentLength>5</ContentLength>

<AccessControlList>
  <Grant>
    <Grantee xsi:type="CanonicalUser">
      <ID>a9a7b886d6fde241bf9b1c61be666e9</ID>
      <DisplayName>chriscustomer</DisplayName>
    </Grantee>
    <Permission>FULL_CONTROL</Permission>
  </Grant>
  <Grant>
    <Grantee xsi:type="Group">
      <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
    </Grantee>
    <Permission>READ</Permission>
  </Grant>
</AccessControlList>

<AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>

<Timestamp>2006-03-01T12:00:00.183Z</Timestamp>

<Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>

</PutObjectInline>

Sample Response

  <PutObjectInlineResponse>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
  </PutObjectInlineResponse>
</PutObjectInlineResponse>

Elements

- **Bucket**: The bucket in which to add the object.

- **Key**: The key to assign to the object.

  **Important**
  
  Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.

- **Data**: The base 64 encoded form of the data.

- **ContentLength**: The length of the data in bytes.

- **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given FULL_CONTROL access to the object. If the object already exists, the preexisting access control policy is replaced.
Responses

- **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using GetObjectExtended. The ETag only reflects changes to the contents of an object, not its metadata.

- **LastModified**: The Amazon S3 timestamp for the saved object.

Access Control

You must have WRITE access to the bucket in order to put objects into the bucket.

PutObject (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The PutObject operation adds an object to a bucket. The data for the object is attached as a DIME attachment.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

**Example**

This example puts some data and metadata in the "Nelson" object of the "quotes" bucket, give a user (usually the owner) FULL_CONTROL access to the object, and make the object readable by anonymous parties. In this sample, the actual attachment is not shown.

Sample Request

```xml
<PutObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
</PutObject>
```
Sample Response

```xml
  <PutObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2006-03-01T12:00:00.183Z</LastModified>
  </PutObjectResponse>
</PutObjectResponse>
```

**Elements**

- **Bucket**: The bucket in which to add the object.
- **Key**: The key to assign to the object.

**Important**
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- **ContentLength**: The length of the data in bytes.
- **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given FULL_CONTROL access to the object. If the object already exists, the preexisting Access Control Policy is replaced.

**Responses**

- **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using GetObjectExtended. The ETag only reflects changes to the contents of an object, not its metadata.
- **LastModified**: The Amazon S3 timestamp for the saved object.

**Access Control**

To put objects into a bucket, you must have WRITE access to the bucket.

- CopyObject (SOAP API) (p. 1169)

CopyObject (SOAP API)

**Note**
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

**Description**

The CopyObject operation creates a copy of an object when you specify the key and bucket of a source object and the key and bucket of a target destination.

When copying an object, you can preserve all metadata (default) or specify new metadata. However, the ACL is not preserved and is set to private for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see Using ACLs.

All copy requests must be authenticated. Additionally, you must have read access to the source object and write access to the destination bucket. For more information, see Using Auth Access.

To only copy an object under certain conditions, such as whether the Etag matches or whether the object was modified before or after a specified date, use the request parameters CopySourceIfUnmodifiedSince, CopyIfUnmodifiedSince, CopySourceIfMatch, or CopySourceIfNoneMatch.

**Note**
You might need to configure the SOAP stack socket timeout for copying large objects.

**Request Syntax**

```xml
<CopyObject xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <SourceBucket>source_bucket</SourceBucket>
  <SourceObject>source_object</SourceObject>
  <DestinationBucket>destination_bucket</DestinationBucket>
  <DestinationObject>destination_object</DestinationObject>
  <MetadataDirective>{REPLACE | COPY}</MetadataDirective>
  <Metadata>
    <Name>metadata_name</Name>
    <Value>metadata_value</Value>
  </Metadata>
  ...
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="user_type">
        <ID>user_id</ID>
        <DisplayName>display_name</DisplayName>
      </Grantee>
      <Permission>permission</Permission>
    </Grant>
    ...
  </AccessControlList>
  <CopySourceIfMatch>etag</CopySourceIfMatch>
  <CopySourceIfNoneMatch>etag</CopySourceIfNoneMatch>
  <CopySourceIfModifiedSince>date_time</CopySourceIfModifiedSince>
  <CopySourceIfUnmodifiedSince>date_time</CopySourceIfUnmodifiedSince>
  <AWSAccessKeyId>AWSAccessKeyId</AWSAccessKeyId>
</CopyObject>
```
## Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SourceBucket</td>
<td>The name of the source bucket.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: A valid source bucket.</td>
<td></td>
</tr>
<tr>
<td>SourceKey</td>
<td>The key name of the source object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: The key for a valid source object to which you have READ access.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong> Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see <a href="#">XML related object key constraints</a>.</td>

<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>CopySourceIfMatch</td>
<td>Copies the object if its entity tag (ETag) matches the specified tag; otherwise return a PreconditionFailed.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None. If the Etag does not match, the object is not copied.</td>
<td></td>
</tr>
<tr>
<td>CopySourceIfNoneMatch</td>
<td>Copies the object if its entity tag (ETag) is different than the specified Etag; otherwise returns an error.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None.</td>
<td></td>
</tr>
<tr>
<td>CopySourceIfUnmodifiedSince</td>
<td>Copies the object if it hasn't been modified since the specified time; otherwise returns a PreconditionFailed.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: dateTime</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Required**
--- | --- | ---
CopySourceIfModifiedSince | Copies the object if it has been modified since the specified time; otherwise returns an error. | No

**Type:** dateTime  
**Default:** None

**Response Syntax**

```xml
<CopyObjectResponse xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"etag"</ETag>
    <LastModified>timestamp</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

**Response Elements**

Following is a list of response elements.

**Note**

The SOAP API does not return extra whitespace. Extra whitespace is only returned by the REST API.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Etag</td>
<td>Returns the etag of the new object. The ETag only reflects changes to the contents of an object, not its metadata.</td>
</tr>
<tr>
<td></td>
<td><strong>Type:</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Ancestor:</strong> CopyObjectResult</td>
</tr>
<tr>
<td>LastModified</td>
<td>Returns the date the object was last modified.</td>
</tr>
<tr>
<td></td>
<td><strong>Type:</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Ancestor:</strong> CopyObjectResult</td>
</tr>
</tbody>
</table>

For information about general response elements, see [Using REST Error Response Headers](#).

**Special Errors**

There are no special errors for this operation. For information about general Amazon S3 errors, see [List of error codes](#) (p. 1095).

**Examples**

This example copies the flotsam object from the pacific bucket to the jetsam object of the atlantic bucket, preserving its metadata.
Sample Request

```xml
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>pacific</SourceBucket>
  <SourceObject>flotsam</SourceObject>
  <DestinationBucket>atlantic</DestinationBucket>
  <DestinationObject>jetsam</DestinationObject>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7Rtt5Fmwe=</Signature>
</CopyObject>
```

Sample Response

```xml
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

This example copies the "tweedledee" object from the wonderland bucket to the "tweedledum" object of the wonderland bucket, replacing its metadata.

Sample Request

```xml
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>wonderland</SourceBucket>
  <SourceObject>tweedledee</SourceObject>
  <DestinationBucket>wonderland</DestinationBucket>
  <DestinationObject>tweedledum</DestinationObject>
  <MetadataDirective>REPLACE</MetadataDirective>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>relationship</Name>
    <Value>twins</Value>
  </Metadata>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7Rtt5Fmwe=</Signature>
</CopyObject>
```

Sample Response

```xml
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

Related Resources

- PutObject (SOAP API) (p. 1167)
- PutObjectInline (SOAP API) (p. 1165)
GetObject (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The GetObject operation returns the current version of an object. If you try to GetObject an object that has a delete marker as its current version, S3 returns a 404 error. You cannot use the SOAP API to retrieve a specified version of an object. To do that, use the REST API. For more information, see Versioning. For more options, use the GetObjectExtended (SOAP API) (p. 1178) operation.

Note
Object key names with the value "soap" aren't supported for virtual-hosted-style requests. For object key name values where "soap" is used, a path-style URL must be used instead.

Example

This example gets the "Nelson" object from the "quotes" bucket.

Sample Request

```xml
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Sample Response

```xml
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
  </GetObjectResponse>
</GetObjectResponse>
```

Elements

- **Bucket**: The bucket from which to retrieve the object.
- **Key**: The key that identifies the object.
Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

- GetMetadata: The metadata is returned with the object if this is true.
- GetData: The object data is returned if this is true.
- InlineData: If this is true, then the data is returned, base 64-encoded, as part of the SOAP body of the response. If false, then the data is returned as a SOAP attachment. The InlineData option is not suitable for use with large objects. The system limits this operation to working with 1MB of data or less. A GetObject request with the InlineData flag set will fail with the InlineDataTooLargeError status code if the resulting Data parameter would have encoded more than 1MB. To download large objects, consider calling GetObject without setting the InlineData flag, or use the REST API instead.

Returned Elements

- Metadata: The name-value paired metadata stored with the object.
- Data: If InlineData was true in the request, this contains the base 64 encoded object data.
- LastModified: The time that the object was stored in Amazon S3.
- ETag: The object's entity tag. This is a hash of the object that can be used to do conditional gets. The ETag only reflects changes to the contents of an object, not its metadata.

Access Control
You can read an object only if you have been granted READ access to the object.

SOAP Chunked and Resumable Downloads
To provide GET flexibility, Amazon S3 supports chunked and resumable downloads.

Select from the following:

- For large object downloads, you might want to break them into smaller chunks. For more information, see Range GETs (p. 1175)
- For GET operations that fail, you can design your application to download the remainder instead of the entire file. For more information, see REST GET Error Recovery (p. 1178)

Range GETs
For some clients, you might want to break large downloads into smaller downloads. To break a GET into smaller units, use Range.

Before you can break a GET into smaller units, you must determine its size. For example, the following request gets the size of the bigfile object.

```xml
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Prefix>bigfile</Prefix>
  <MaxKeys>1</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Amazon S3 returns the following response.

API Version 2006-03-01
1175
Following is a request that downloads the first megabyte from the bigfile object.

```xml
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>0</ByteRangeStart>
  <ByteRangeEnd>1048576</ByteRangeEnd>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Amazon S3 returns the first megabyte of the file and the Etag of the file.

```xml
  <Status>
    <Code>200</Code>
    <Description>OK</Description>
  </Status>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
  <Data>--first megabyte of bigfile--</Data>
  <LastModified>2006-01-01T12:00:00.000Z</LastModified>
  <ETag>"828ef3fd9f0f00ad9f27c383fc9ac7f"</ETag>
</GetObjectResponse>
```

To ensure the file did not change since the previous portion was downloaded, specify the IfMatch element. Although the IfMatch element is not required, it is recommended for content that is likely to change.

The following is a request that gets the remainder of the file, using the IfMatch request header.

```xml
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>1048576</ByteRangeStart>
  <ByteRangeEnd>2023276</ByteRangeEnd>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```
Amazon Simple Storage Service API Reference
Operations on Objects (SOAP API)

Amazon S3 returns the following response and the remainder of the file.

```xml
  <Status>
    <Code>200</Code>
    <Description>OK</Description>
  </Status>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>

Versioned GetObject

The following request returns the specified version of the object in the bucket.

```xml
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>

Sample Response

```xml
  <Status>
    <Code>200</Code>
    <Description>OK</Description>
  </Status>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
</GetObjectResponse>
```
REST GET Error Recovery

If an object GET fails, you can get the rest of the file by specifying the range to download. To do so, you must get the size of the object using ListBucket and perform a range GET on the remainder of the file. For more information, see GetObjectExtended (SOAP API) (p. 1178).

Related Resources

Operations on Objects (SOAP API) (p. 1165)

GetObjectExtended (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

GetObjectExtended is exactly like GetObject (SOAP API) (p. 1174), except that it supports the following additional elements that can be used to accomplish much of the same functionality provided by HTTP GET headers (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html).

GetObjectExtended supports the following elements in addition to those supported by GetObject:

- **ByteRangeStart, ByteRangeEnd:** These elements specify that only a portion of the object data should be retrieved. They follow the behavior of the HTTP byte ranges (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35).
- **IfModifiedSince:** Return the object only if the object's timestamp is later than the specified timestamp. (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.25)
- **IfUnmodifiedSince:** Return the object only if the object's timestamp is earlier than or equal to the specified timestamp. (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.28)
- **IfMatch:** Return the object only if its ETag matches the supplied tag(s). (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.24)
- **IfNoneMatch:** Return the object only if its ETag does not match the supplied tag(s). (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.26)
- **ReturnCompleteObjectOnConditionFailure:** ReturnCompleteObjectOnConditionFailure: If true, then if the request includes a range element and one or both of IfUnmodifiedSince/IfMatch elements, and the condition fails, return the entire object rather than a fault. This enables the If-Range functionality (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.27).

DeleteObject (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The DeleteObject operation removes the specified object from Amazon S3. Once deleted, there is no method to restore or undelete an object.
Note
If you delete an object that does not exist, Amazon S3 will return a success (not an error message).

Example
This example deletes the "Nelson" object from the "quotes" bucket.

Sample Request

```xml
<DeleteObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteObject>
```

Sample Response

```xml
<DeleteObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteObjectResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </DeleteObjectResponse>
</DeleteObjectResponse>
```

Elements

- **Bucket**: The bucket that holds the object.
- **Key**: The key that identifies the object.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Access Control

You can delete an object only if you have WRITE access to the bucket, regardless of who owns the object or what rights are granted to it.

GetObjectAccessControlPolicy (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The GetObjectAccessControlPolicy operation fetches the access control policy for an object.

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see [XML related object key constraints](#).

Example

This example retrieves the access control policy for the "Nelson" object from the "quotes" bucket.
Sample Request

```xml
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aToU39dZbqaEXAMPLE=</Signature>
</GetObjectAccessControlPolicy>
```

Sample Response

```xml
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d6fd24a541bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fd24a541bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>
```

Response Body

The response contains the access control policy for the bucket. For an explanation of this response, [SOAP Access Policy](#).

Access Control

You must have READ_ACP rights to the object in order to retrieve the access control policy for an object.

SetObjectAccessControlPolicy (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `SetObjectAccessControlPolicy` operation sets the access control policy for an existing object. If successful, the previous access control policy for the object is entirely replaced with the specified access control policy.

**Example**

This example gives the specified user (usually the owner) FULL_CONTROL access to the "Nelson" object from the "quotes" bucket.

Sample Request
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fd24a52fe8baef65f89a64e0193f23000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetObjectAccessControlPolicy>

Sample Response

  <SetObjectAccessControlPolicyResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </SetObjectAccessControlPolicyResponse>
</SetObjectAccessControlPolicyResponse>

Key

Important
Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Access Control

You must have WRITE_ACP rights to the object in order to set the access control policy for a bucket.

SOAP Error Responses

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

In SOAP, an error result is returned to the client as a SOAP fault, with the HTTP response code 500. If you do not receive a SOAP fault, then your request was successful. The Amazon S3 SOAP fault code is comprised of a standard SOAP 1.1 fault code (either "Server" or "Client") concatenated with the Amazon S3-specific error code. For example: "Server.InternalError" or "Client.NoSuchBucket". The SOAP fault string element contains a generic, human readable error message in English. Finally, the SOAP fault detail element contains miscellaneous information relevant to the error.

For example, if you attempt to delete the object "Fred", which does not exist, the body of the SOAP response contains a "NoSuchKey" SOAP fault.

The following example shows a sample SOAP error response.

<soapenv:Body>
  <soapenv:Fault>
    <Faultcode>soapenv:Client.NoSuchKey</Faultcode>
  </soapenv:Fault>
</soapenv:Body>
The specified key does not exist.

```
<Faultstring>The specified key does not exist.</Faultstring>

<Detail>
  <Key>Fred</Key>
</Detail>
</soapenv:Fault>
</soapenv:Body>
```

The following table explains the SOAP error response elements:

<table>
<thead>

Appendix: Lifecycle Configuration APIs (Deprecated)

Bucket lifecycle configuration is updated to support filters based on object tags. That is, you can now specify a rule that specifies key name prefix, one or more object tags, or both to select a subset of objects to which the rule applies. The APIs have been updated accordingly. The following topics describes the prior version of the PUT and GET bucket lifecycle operations for backward compatibility.

Topics
• PUT Bucket lifecycle (Deprecated) (p. 1184)
• GET Bucket lifecycle (Deprecated) (p. 1194)
PUT Bucket lifecycle (Deprecated)

Description

**Important**
For an updated version of this API, see [PutBucketLifecycleConfiguration](#) (p. 316). This version has been deprecated. Existing lifecycle configurations will work. For new lifecycle configurations, use the updated API.

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, see [Object Lifecycle Management](#) in the *Amazon Simple Storage Service User Guide*.

Permissions

By default, all Amazon S3 resources, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration) are private. Only the resource owner, the AWS account that created the resource, can access it. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, users must get the s3:PutLifecycleConfiguration permission.

You can also explicitly deny permissions. Explicit denial also supersedes any other permissions. If you want to prevent users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

For more information about permissions, see [Managing Access Permissions to Your Amazon S3 Resources](#) in the *Amazon Simple Storage Service User Guide*.

Requests

Syntax

```
PUT /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5

Lifecycle configuration in the request body
```

For details about authorization strings, see [Authenticating Requests (AWS Signature Version 4)](#) (p. 1004).

Request Parameters

This implementation of the operation does not use request parameters.
Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Request Body

In the request, you specify the lifecycle configuration in the request body. The lifecycle configuration is specified as XML. The following is an example of a basic lifecycle configuration. It specifies one rule. The Prefix in the rule identifies objects to which the rule applies. The rule also specifies two actions (Transition and Expiration). Each action specifies a timeline when Amazon S3 should perform the action. The Status indicates whether the rule is enabled or disabled.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <Transition>
      <Date>value</Date>
      <StorageClass>storage class</StorageClass>
    </Transition>
    <Expiration>
      <Days>value</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object: one current version and zero or more noncurrent versions. The following lifecycle configuration specifies the actions (NoncurrentVersionTransition, NoncurrentVersionExpiration) that are specific to noncurrent object versions.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>value</NoncurrentDays>
      <StorageClass>storage class</StorageClass>
    </NoncurrentVersionTransition>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>value</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
</LifecycleConfiguration>
```
You can use the multipart upload API to upload large objects in parts. For more information about multipart uploads, see Multipart Upload Overview in the Amazon Simple Storage Service User Guide. With lifecycle configuration, you can tell Amazon S3 to cancel incomplete multipart uploads, which are identified by the key name prefix specified in the rule, if they don’t complete within a specified number of days. When Amazon S3 cancels a multipart upload, it deletes all parts associated with the upload. This ensures that you don’t have incomplete multipart uploads that have left parts stored in Amazon S3, so you don’t have to pay storage costs for them. The following is an example lifecycle configuration that specifies a rule with the AbortIncompleteMultipartUpload action. This action tells Amazon S3 to cancel incomplete multipart uploads seven days after initiation.

```xml
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>someKeyPrefix</Prefix>
    <Status>rule-status</Status>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>7</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
  </Rule>
</LifecycleConfiguration>
```

The following table describes the XML elements in the lifecycle configuration.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortIncompleteMultipartUpload</td>
<td>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation.</td>
<td>Yes, if no other action is specified for the rule</td>
</tr>
<tr>
<td></td>

| LifecycleConfiguration      | Container for lifecycle rules. You can add as many as 1000 rules.  
Type: Container  
Children: Rule  
Ancestor: None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Yes      |
| ExpiredObjectDeleteMarker   | On a versioned bucket (a versioning-enabled or versioning-suspended bucket), you can add this element in the lifecycle configuration to tell Amazon S3 to delete expired object delete markers. For an example, see Example 8: Removing Expired Object Delete Markers in the Amazon Simple Storage Service User Guide. Don't add it to a non-versioned bucket, because that type of bucket cannot include delete markers.  
Type: String  
Valid values: true | false (the value false is allowed, but it is no-op, which means that Amazon S3 will not take action)  
Ancestor:Expiration                                                                                                                                                                                                                                                                                                                                                                                                                    | Yes, if Date and Days are absent |
| NoncurrentDays              | Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the Amazon Simple Storage Service User Guide.  
Type: Nonnegative Integer when used with NoncurrentVersionTransition, Positive Integer when used with NoncurrentVersionExpiration  
Ancestor:NoncurrentVersionExpiration or NoncurrentVersionTransition                                                                                                                                                                                                                                                                                                                                 | Yes      |
| NoncurrentVersionExpiration | Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions.  
Set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to tell Amazon S3 to delete noncurrent object versions at a specific period in the object's lifetime.  
Type: Container  
Children: NoncurrentDays

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 1092).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 1094).

Examples

Example 1: Add Lifecycle Configuration to a Bucket That Is Not Versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.
• The Transition action tells Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
• The Expiration action tells Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

```xml
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT `/?lifecycle` request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJD1lkcbAG6Gb3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXt3DDI30JYcd1j5nM/rUFiiiz/fNbD0sd3JUE8NwMLNHxmvPfwMpdC
x-amz-request-id: 9E26D0B72A8EF9E
```

API Version 2006-03-01
1191
Example 2: Add Lifecycle Configuration to a Versioning-enabled Bucket

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The `NoncurrentVersionExpiration` action tells Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The `NoncurrentVersionTransition` action tells Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```xml
<lifecycleConfiguration>
  <rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </rule>
  <rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>30</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </rule>
</lifecycleConfiguration>
```

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:21:48 GMT
Content-MD5: 96rugH9mDqVNkkazDdgnw==
Authorization: authorization string
Content-Length: 598

<lifecycleConfiguration>
  <rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </rule>
  <rule>
    <ID>TransitionSoonAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>0</NoncurrentDays>
    </NoncurrentVersionTransition>
  </rule>
</lifecycleConfiguration>
```
PUT Bucket lifecycle (Deprecated)

```xml
<StorageClass>GLACIER</StorageClass>
</NoncurrentVersionTransition>
</Rule>
</LifeCycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbIznMmoO//3bMdDTw/CnjArwje+J49Hf+j44yRb/VmbIKgI05A+PT98Cp/6k07hf+LD2mY=
x-amz-request-id: 02D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3
```

### Additional Examples

For more examples of transitioning objects to storage classes such as STANDARD_IA or ONEZONE_IA, see [Examples of Lifecycle Configuration](#).

### Related Resources

- [GetBucketLifecycleConfiguration](#) (p. 121)
- [POST Object restore](#) (p. 1060)

By default, a resource owner—in this case, a bucket owner, which is the AWS account that created the bucket—can perform any of the operations. A resource owner can also grant others permission to perform the operation. For more information, see the following topics in the Amazon Simple Storage Service User Guide:

- [Specifying Permissions in a Policy](#)
- [Managing Access Permissions to Your Amazon S3 Resources](#)
GET Bucket lifecycle (Deprecated)

Description

Important
For an updated version of this API, see GetBucketLifecycleConfiguration (p. 121). If you configured a bucket lifecycle using the <filter> element, you should see an updated version of this topic. This topic is provided for backward compatibility.

Returns the lifecycle configuration information set on the bucket. For information about lifecycle configuration, go to Object Lifecycle Management in the Amazon Simple Storage Service User Guide.

To use this operation, you must have permission to perform the s3:GetLifecycleConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service User Guide.

Requests

Syntax

GET /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 1090).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 1092).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

**Name**  
Transition

**Description**  
This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the STANDARD_IA, ONEZONE_IA, or GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.

- If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class.
- When your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of the objects identified in the rule.

**Note**
A versioning-enabled or versioning-suspended bucket can contain many versions of an object. This action has no effect on the noncurrent object versions. To transition noncurrent objects, you must use the NoncurrentVersionTransition action.
