Welcome

Amazon DynamoDB provides low-level API actions for managing database tables and indexes, and for creating, reading, updating and deleting data. DynamoDB also provides API actions for accessing and processing stream records.

**Note**
This API Reference describes the low-level API for Amazon DynamoDB. Instead of making requests to the low-level API directly from your application, we recommend that you use one of the AWS Software Development Kits (SDKs) for your programming language. The AWS SDKs take care of request authentication, serialization, and connection management. For more information, see Overview of AWS SDK Support for DynamoDB in the Amazon DynamoDB Developer Guide.

At the end of each API action description there are links to the equivalent CLI command and programming-specific language method. Similarly, at the end of each API datatype description, there are links to the equivalent programming-specific language type.
The following actions are supported by Amazon DynamoDB:

- BatchExecuteStatement (p. 6)
- BatchGetItem (p. 10)
- BatchWriteItem (p. 18)
- CreateBackup (p. 27)
- CreateGlobalTable (p. 30)
- CreateTable (p. 33)
- DeleteBackup (p. 44)
- DeleteItem (p. 47)
- DeleteTable (p. 56)
- DescribeBackup (p. 61)
- DescribeContinuousBackups (p. 64)
- DescribeContributorInsights (p. 66)
- DescribeEndpoints (p. 69)
- DescribeExport (p. 70)
- DescribeGlobalTable (p. 72)
- DescribeGlobalTableSettings (p. 74)
- DescribeImport (p. 78)
- DescribeKinesisStreamingDestination (p. 81)
- DescribeLimits (p. 83)
- DescribeTable (p. 86)
- DescribeTableReplicaAutoScaling (p. 91)
- DescribeTimeToLive (p. 94)
- DisableKinesisStreamingDestination (p. 96)
- EnableKinesisStreamingDestination (p. 99)
- ExecuteStatement (p. 102)
- ExecuteTransaction (p. 108)
- ExportTableToPointInTime (p. 114)
- GetItem (p. 118)
- ImportTable (p. 124)
- ListBackups (p. 129)
- ListContributorInsights (p. 132)
- ListExports (p. 134)
- ListGlobalTables (p. 137)
- ListImports (p. 140)
- ListTables (p. 143)
- ListTagsOfResource (p. 146)
- PutItem (p. 148)
- Query (p. 158)
- RestoreTableFromBackup (p. 171)
- RestoreTableToPointInTime (p. 177)
- Scan (p. 184)
- TagResource (p. 197)
- TransactGetItems (p. 199)
- TransactWriteItems (p. 205)
- UntagResource (p. 214)
- UpdateContinuousBackups (p. 216)
- UpdateContributorInsights (p. 218)
- UpdateGlobalTable (p. 221)
- UpdateGlobalTableSettings (p. 224)
- UpdateItem (p. 230)
- UpdateTable (p. 242)
- UpdateTableReplicaAutoScaling (p. 251)
- UpdateTimeToLive (p. 256)

The following actions are supported by DynamoDB Accelerator:

- CreateCluster (p. 259)
- CreateParameterGroup (p. 265)
- CreateSubnetGroup (p. 267)
- DecreaseReplicationFactor (p. 270)
- DeleteCluster (p. 273)
- DeleteParameterGroup (p. 276)
- DeleteSubnetGroup (p. 278)
- DescribeClusters (p. 280)
- DescribeDefaultParameters (p. 283)
- DescribeEvents (p. 286)
- DescribeParameterGroups (p. 289)
- DescribeParameters (p. 292)
- DescribeSubnetGroups (p. 295)
- IncreaseReplicationFactor (p. 298)
- ListTags (p. 302)
- RebootNode (p. 305)
- TagResource (p. 308)
- UntagResource (p. 311)
- UpdateCluster (p. 314)
- UpdateParameterGroup (p. 318)
- UpdateSubnetGroup (p. 320)

The following actions are supported by Amazon DynamoDB Streams:

- DescribeStream (p. 323)
- GetRecords (p. 327)
- GetShardIterator (p. 333)
- ListStreams (p. 337)
The following actions are supported by Amazon DynamoDB:

- BatchExecuteStatement (p. 6)
- BatchGetItem (p. 10)
- BatchWriteItem (p. 18)
- CreateBackup (p. 27)
- CreateGlobalTable (p. 30)
- CreateTable (p. 33)
- DeleteBackup (p. 44)
- DeleteItem (p. 47)
- DeleteTable (p. 56)
- DescribeBackup (p. 61)
- DescribeContinuousBackups (p. 64)
- DescribeContributorInsights (p. 66)
- DescribeEndpoints (p. 69)
- DescribeExport (p. 70)
- DescribeGlobalTable (p. 72)
- DescribeGlobalTableSettings (p. 74)
- DescribeImport (p. 78)
- DescribeKinesisStreamingDestination (p. 81)
- DescribeLimits (p. 83)
- DescribeTable (p. 86)
- DescribeTableReplicaAutoScaling (p. 91)
- DescribeTimeToLive (p. 94)
- DisableKinesisStreamingDestination (p. 96)
- EnableKinesisStreamingDestination (p. 99)
- ExecuteStatement (p. 102)
- ExecuteTransaction (p. 108)
- ExportTableToPointInTime (p. 114)
- GetItem (p. 118)
- ImportTable (p. 124)
- ListBackups (p. 129)
- ListContributorInsights (p. 132)
- ListExports (p. 134)
- ListGlobalTables (p. 137)
- ListImports (p. 140)
- ListTables (p. 143)
- ListTagsOfResource (p. 146)
- PutItem (p. 148)
- Query (p. 158)
- RestoreTableFromBackup (p. 171)
- RestoreTableToPointInTime (p. 177)
- Scan (p. 184)
- TagResource (p. 197)
- TransactGetItems (p. 199)
- TransactWriteItems (p. 205)
- UntagResource (p. 214)
- UpdateContinuousBackups (p. 216)
- UpdateContributorInsights (p. 218)
- UpdateGlobalTable (p. 221)
- UpdateGlobalTableSettings (p. 224)
- UpdateItem (p. 230)
- UpdateTable (p. 242)
- UpdateTableReplicaAutoScaling (p. 251)
- UpdateTimeToLive (p. 256)
BatchExecuteStatement
Service: Amazon DynamoDB

This operation allows you to perform batch reads or writes on data stored in DynamoDB, using PartiQL. Each read statement in a BatchExecuteStatement must specify an equality condition on all key attributes. This enforces that each SELECT statement in a batch returns at most a single item.

**Note**
The entire batch must consist of either read statements or write statements, you cannot mix both in one batch.

**Important**
A HTTP 200 response does not mean that all statements in the BatchExecuteStatement succeeded. Error details for individual statements can be found under the `Error` field of the `BatchStatementResponse` for each statement.

Request Syntax

```json
{
  "ReturnConsumedCapacity": "string",
  "Statements": [ 
    {
      "ConsistentRead": boolean,
      "Parameters": [ 
        {
          "B": blob,
          "BOOL": boolean,
          "BS": [ blob ],
          "L": [ 
            "AttributeValue"
          ],
          "M": { 
            "string": "AttributeValue"
          },
          "N": "string",
          "NS": [ "string" ],
          "NULL": boolean,
          "S": "string",
          "SS": [ "string" ]
        }
      ],
      "Statement": "string"
    }
  ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**Statements (p. 6)**

The list of PartiQL statements representing the batch to run.

Type: Array of `BatchStatementRequest (p. 370)` objects

Array Members: Minimum number of 1 item. Maximum number of 25 items.
Required: Yes

**ReturnConsumedCapacity (p. 6)**

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- **INDEXES** - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- **TOTAL** - The response includes only the aggregate ConsumedCapacity for the operation.

- **NONE** - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

**Response Syntax**

```json
{
  "ConsumedCapacity": [
    {
      "CapacityUnits": number,
      "GlobalSecondaryIndexes": {
        "string": {
          "CapacityUnits": number,
          "ReadCapacityUnits": number,
          "WriteCapacityUnits": number
        }
      },
      "LocalSecondaryIndexes": {
        "string": {
          "CapacityUnits": number,
          "ReadCapacityUnits": number,
          "WriteCapacityUnits": number
        }
      },
      "ReadCapacityUnits": number,
      "Table": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      },
      "TableName": "string",
      "WriteCapacityUnits": number
    }
  ],
  "Responses": [
    {
      "Error": {
        "Code": "string",
        "Message": "string"
      },
      "Item": {
        "string": {
          "B": blob,
          "BOOL": boolean,
          ...
        }
      }
    }
  ]
}
```
### Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

#### ConsumedCapacity (p. 7)

The capacity units consumed by the entire operation. The values of the list are ordered according to the ordering of the statements.

Type: Array of [ConsumedCapacity](#) objects

#### Responses (p. 7)

The response to each PartiQL statement in the batch.

Type: Array of [BatchStatementResponse](#) objects

---

### Errors

For information about the errors that are common to all actions, see [Common Errors](#).

- **InternalServer>Error**

  An error occurred on the server side.

  HTTP Status Code: 500

- **RequestLimitExceeded**

  Throughput exceeds the current throughput quota for your account. Please contact [AWS Support](#) to request a quota increase.

  HTTP Status Code: 400

---

BatchGetItem
Service: Amazon DynamoDB

The BatchGetItem operation returns the attributes of one or more items from one or more tables. You identify requested items by primary key.

A single operation can retrieve up to 16 MB of data, which can contain as many as 100 items. BatchGetItem returns a partial result if the response size limit is exceeded, the table's provisioned throughput is exceeded, or an internal processing failure occurs. If a partial result is returned, the operation returns a value for UnprocessedKeys. You can use this value to retry the operation starting with the next item to get.

**Important**
If you request more than 100 items, BatchGetItem returns a ValidationException with the message "Too many items requested for the BatchGetItem call."

For example, if you ask to retrieve 100 items, but each individual item is 300 KB in size, the system returns 52 items (so as not to exceed the 16 MB limit). It also returns an appropriate UnprocessedKeys value so you can get the next page of results. If desired, your application can include its own logic to assemble the pages of results into one dataset.

If none of the items can be processed due to insufficient provisioned throughput on all of the tables in the request, then BatchGetItem returns a ProvisionedThroughputExceededException. If at least one of the items is successfully processed, then BatchGetItem completes successfully, while returning the keys of the unread items in UnprocessedKeys.

**Important**
If DynamoDB returns any unprocessed items, you should retry the batch operation on those items. However, we strongly recommend that you use an exponential backoff algorithm. If you retry the batch operation immediately, the underlying read or write requests can still fail due to throttling on the individual tables. If you delay the batch operation using exponential backoff, the individual requests in the batch are much more likely to succeed.

For more information, see Batch Operations and Error Handling in the Amazon DynamoDB Developer Guide.

By default, BatchGetItem performs eventually consistent reads on every table in the request. If you want strongly consistent reads instead, you can set ConsistentRead to true for any or all tables.

In order to minimize response latency, BatchGetItem retrieves items in parallel.

When designing your application, keep in mind that DynamoDB does not return items in any particular order. To help parse the response by item, include the primary key values for the items in your request in the ProjectionExpression parameter.

If a requested item does not exist, it is not returned in the result. Requests for nonexistent items consume the minimum read capacity units according to the type of read. For more information, see Working with Tables in the Amazon DynamoDB Developer Guide.

**Request Syntax**

```json
{
  "RequestItems": {
    "string": {
      "AttributesToGet": [ "string" ],
      "ConsistentRead": boolean,
      "ExpressionAttributeNames": {
        "string": "string"
      },
      "Keys": [
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**RequestItems (p. 10)**

A map of one or more table names and, for each table, a map that describes one or more items to retrieve from that table. Each table name can be used only once per BatchGetItem request.

Each element in the map of items to retrieve consists of the following:

- **ConsistentRead** - If true, a strongly consistent read is used; if false (the default), an eventually consistent read is used.

- **ExpressionAttributeNames** - One or more substitution tokens for attribute names in the ProjectionExpression parameter. The following are some use cases for using ExpressionAttributeNames:
  - To access an attribute whose name conflicts with a DynamoDB reserved word.
  - To create a placeholder for repeating occurrences of an attribute name in an expression.
  - To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

- **Percentile**

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify for ExpressionAttributeNames:

- `{"#P":"Percentile"}`

You could then use this substitution in an expression, as in this example:

- `#P = :val`
**Note**
Tokens that begin with the `:` character are *expression attribute values*, which are placeholders for the actual value at runtime.

For more information about expression attribute names, see Accessing Item Attributes in the Amazon DynamoDB Developer Guide.

- **Keys** - An array of primary key attribute values that define specific items in the table. For each primary key, you must provide all of the key attributes. For example, with a simple primary key, you only need to provide the partition key value. For a composite key, you must provide both the partition key value and the sort key value.
- **ProjectionExpression** - A string that identifies one or more attributes to retrieve from the table. These attributes can include scalars, sets, or elements of a JSON document. The attributes in the expression must be separated by commas.

If no attribute names are specified, then all attributes are returned. If any of the requested attributes are not found, they do not appear in the result.

For more information, see Accessing Item Attributes in the Amazon DynamoDB Developer Guide.

- **AttributesToGet** - This is a legacy parameter. Use ProjectionExpression instead. For more information, see AttributesToGet in the Amazon DynamoDB Developer Guide.

Type: String to KeysAndAttributes (p. 430) object map

Map Entries: Maximum number of 100 items.

Key Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**ReturnConsumedCapacity (p. 10)**

Determine the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- **INDEXES** - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

  - **TOTAL** - The response includes only the aggregate ConsumedCapacity for the operation.

  - **NONE** - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

**Response Syntax**

```json
{
  "ConsumedCapacity": [
    {
      "CapacityUnits": number,
      "GlobalSecondaryIndexes": {
```
"string" : {
   "CapacityUnits": number,
   "ReadCapacityUnits": number,
   "WriteCapacityUnits": number
 },
"LocalSecondaryIndexes": {
   "string": {
      "CapacityUnits": number,
      "ReadCapacityUnits": number,
      "WriteCapacityUnits": number
   }
},
"ReadCapacityUnits": number,
"Table": {
   "CapacityUnits": number,
   "ReadCapacityUnits": number,
   "WriteCapacityUnits": number
},
"TableName": "string",
"WriteCapacityUnits": number
},
"Responses": {
   "string": [
   {
   "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [ 
         "AttributeValue"
      ],
      "M": {
         "string": "AttributeValue"
      },
      "Ny": "string",
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
   }
   }
   ],
   "UnprocessedKeys": {
   "string": {
      "AttributesToGet": [ "string" ],
      "ConsistentRead": boolean,
      "ExpressionAttributeNames": {
      "string": "string"
   },
   "Keys": [ 
   {
      "string": {
         "B": blob,
         "BOOL": boolean,
         "BS": [ blob ],
         "L": [ 
            "AttributeValue"
      ],
      "M": {
         "string": "AttributeValue"
      },
      "N": "string",
      "NS": [ "string" ]
   }
   ]
   }
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ConsumedCapacity (p. 12)**

The read capacity units consumed by the entire BatchGetItem operation.

Each element consists of:

- **TableName** - The table that consumed the provisioned throughput.
- **CapacityUnits** - The total number of capacity units consumed.

Type: Array of **ConsumedCapacity (p. 380)** objects

**Responses (p. 12)**

A map of table name to a list of items. Each object in Responses consists of a table name, along with a map of attribute data consisting of the data type and attribute value.

Type: String to array of string to **AttributeValue (p. 349)** object maps map

Key Pattern: [a-zA-Z0-9_.-]+

Key Length Constraints: Maximum length of 65535.

**UnprocessedKeys (p. 12)**

A map of tables and their respective keys that were not processed with the current response. The UnprocessedKeys value is in the same form as RequestItems, so the value can be provided directly to a subsequent BatchGetItem operation. For more information, see RequestItems in the Request Parameters section.

Each element consists of:

- **Keys** - An array of primary key attribute values that define specific items in the table.
- **ProjectionExpression** - One or more attributes to be retrieved from the table or index. By default, all attributes are returned. If a requested attribute is not found, it does not appear in the result.
- **ConsistentRead** - The consistency of a read operation. If set to true, then a strongly consistent read is used; otherwise, an eventually consistent read is used.

If there are no unprocessed keys remaining, the response contains an empty UnprocessedKeys map.

Type: String to **KeysAndAttributes (p. 430)** object map

Map Entries: Maximum number of 100 items.

Key Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ProvisionedThroughputExceededException

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

Retrieve Items from Multiple Tables

The following example requests attributes from two different tables.

Sample Request

```json
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.BatchGetItem

{
  "RequestItems": {
    "Forum": {
      "Keys": [
      
```
Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{

**BatchWriteItem**

Service: Amazon DynamoDB

The BatchWriteItem operation puts or deletes multiple items in one or more tables. A single call to BatchWriteItem can transmit up to 16MB of data over the network, consisting of up to 25 item put or delete operations. While individual items can be up to 400 KB once stored, it's important to note that an item's representation might be greater than 400KB while being sent in DynamoDB's JSON format for the API call. For more details on this distinction, see Naming Rules and Data Types.

**Note**

BatchWriteItem cannot update items. To update items, use the UpdateItem action.

The individual PutItem and DeleteItem operations specified in BatchWriteItem are atomic; however BatchWriteItem as a whole is not. If any requested operations fail because the table's provisioned throughput is exceeded or an internal processing failure occurs, the failed operations are returned in the UnprocessedItems response parameter. You can investigate and optionally resend the requests. Typically, you would call BatchWriteItem in a loop. Each iteration would check for unprocessed items and submit a new BatchWriteItem request with those unprocessed items until all items have been processed.

If none of the items can be processed due to insufficient provisioned throughput on all of the tables in the request, then BatchWriteItem returns a ProvisionedThroughputExceededException.

**Important**

If DynamoDB returns any unprocessed items, you should retry the batch operation on those items. However, we strongly recommend that you use an exponential backoff algorithm. If you retry the batch operation immediately, the underlying read or write requests can still fail due to throttling on the individual tables. If you delay the batch operation using exponential backoff, the individual requests in the batch are much more likely to succeed.

For more information, see Batch Operations and Error Handling in the Amazon DynamoDB Developer Guide.

With BatchWriteItem, you can efficiently write or delete large amounts of data, such as from Amazon EMR, or copy data from another database into DynamoDB. In order to improve performance with these large-scale operations, BatchWriteItem does not behave in the same way as individual PutItem and DeleteItem calls would. For example, you cannot specify conditions on individual put and delete requests, and BatchWriteItem does not return deleted items in the response.

If you use a programming language that supports concurrency, you can use threads to write items in parallel. Your application must include the necessary logic to manage the threads. With languages that don't support threading, you must update or delete the specified items one at a time. In both situations, BatchWriteItem performs the specified put and delete operations in parallel, giving you the power of the thread pool approach without having to introduce complexity into your application.

Parallel processing reduces latency, but each specified put and delete request consumes the same number of write capacity units whether it is processed in parallel or not. Delete operations on nonexistent items consume one write capacity unit.

If one or more of the following is true, DynamoDB rejects the entire batch write operation:

- One or more tables specified in the BatchWriteItem request does not exist.
- Primary key attributes specified on an item in the request do not match those in the corresponding table's primary key schema.
- You try to perform multiple operations on the same item in the same BatchWriteItem request. For example, you cannot put and delete the same item in the same BatchWriteItem request.
- Your request contains at least two items with identical hash and range keys (which essentially is two put operations).
- There are more than 25 requests in the batch.
• Any individual item in a batch exceeds 400 KB.
• The total request size exceeds 16 MB.

**Request Syntax**

```json
{
    "RequestItems": {
        "string": [
            {
                "DeleteRequest": {
                    "Key": {
                        "string": {
                            "B": "blob",
                            "BOOL": "boolean",
                            "BS": [ "blob" ],
                            "L": [
                                "AttributeValue"
                            ],
                            "M": {
                                "string": "AttributeValue"
                            },
                            "N": "string",
                            "NS": [ "string" ],
                            "NULL": boolean,
                            "S": "string",
                            "SS": [ "string" ]
                        }
                    }
                },
                "PutRequest": {
                    "Item": {
                        "string": {
                            "B": "blob",
                            "BOOL": "boolean",
                            "BS": [ "blob" ],
                            "L": [
                                "AttributeValue"
                            ],
                            "M": {
                                "string": "AttributeValue"
                            },
                            "N": "string",
                            "NS": [ "string" ],
                            "NULL": boolean,
                            "S": "string",
                            "SS": [ "string" ]
                        }
                    }
                }
            }
        ],
        "ReturnConsumedCapacity": "string",
        "ReturnItemCollectionMetrics": "string"
    }
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.
RequestItems (p. 19)

A map of one or more table names and, for each table, a list of operations to be performed (DeleteRequest or PutRequest). Each element in the map consists of the following:

- **DeleteRequest** - Perform a DeleteItem operation on the specified item. The item to be deleted is identified by a Key subelement:
  - **Key** - A map of primary key attribute values that uniquely identify the item. Each entry in this map consists of an attribute name and an attribute value. For each primary key, you must provide all of the key attributes. For example, with a simple primary key, you only need to provide a value for the partition key. For a composite primary key, you must provide values for both the partition key and the sort key.

- **PutRequest** - Perform a PutItem operation on the specified item. The item to be put is identified by an Item subelement:
  - **Item** - A map of attributes and their values. Each entry in this map consists of an attribute name and an attribute value. Attribute values must not be null; string and binary type attributes must have lengths greater than zero; and set type attributes must not be empty. Requests that contain empty values are rejected with a ValidationException exception.

  If you specify any attributes that are part of an index key, then the data types for those attributes must match those of the schema in the table's attribute definition.

Type: String to array of WriteRequest (p. 502) objects map

Map Entries: Maximum number of 25 items.

Key Pattern: \[a-zA-Z0-9_.-]+\]

Array Members: Minimum number of 1 item. Maximum number of 25 items.

Required: Yes

ReturnConsumedCapacity (p. 19)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- **INDEXES** - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- **TOTAL** - The response includes only the aggregate ConsumedCapacity for the operation.

- **NONE** - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

ReturnItemCollectionMetrics (p. 19)

Determines whether item collection metrics are returned. If set to SIZE, the response includes statistics about item collections, if any, that were modified during the operation are returned in the response. If set to NONE (the default), no statistics are returned.
Type: String

Valid Values: SIZE | NONE

Required: No

**Response Syntax**

```json
{
    "ConsumedCapacity": [
        {
            "CapacityUnits": number,
            "GlobalSecondaryIndexes": {
                "string": {
                    "CapacityUnits": number,
                    "ReadCapacityUnits": number,
                    "WriteCapacityUnits": number
                }
            },
            "LocalSecondaryIndexes": {
                "string": {
                    "CapacityUnits": number,
                    "ReadCapacityUnits": number,
                    "WriteCapacityUnits": number
                }
            },
            "ReadCapacityUnits": number,
            "Table": {
                "CapacityUnits": number,
                "ReadCapacityUnits": number,
                "WriteCapacityUnits": number
            },
            "TableName": "string",
            "WriteCapacityUnits": number
        }
    ],
    "ItemCollectionMetrics": {
        "string": {
            "ItemCount": {
                "B": blob,
                "BOOL": boolean,
                "BS": [ blob ],
                "L": [ "AttributeValue"
            },
            "M": {
                "string": "AttributeValue"
            },
            "N": "string",
            "NS": [ "string" ],
            "NULL": boolean,
            "$": "string",
            "SS": [ "string" ]
        }
    },
    "SizeEstimateRangeGB": [ number ]
}

"UnprocessedItems": {
    "string": [
    ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ConsumedCapacity (p. 21)

The capacity units consumed by the entire BatchWriteItem operation.

Each element consists of:

- TableName - The table that consumed the provisioned throughput.
- CapacityUnits - The total number of capacity units consumed.

Type: Array of ConsumedCapacity (p. 380) objects
**ItemCollectionMetrics (p. 21)**

A list of tables that were processed by `BatchWriteItem` and, for each table, information about any item collections that were affected by individual `DeleteItem` or `PutItem` operations.

Each entry consists of the following subelements:

- **ItemCollectionKey** - The partition key value of the item collection. This is the same as the partition key value of the item.

- **SizeEstimateRangeGB** - An estimate of item collection size, expressed in GB. This is a two-element array containing a lower bound and an upper bound for the estimate. The estimate includes the size of all the items in the table, plus the size of all attributes projected into all of the local secondary indexes on the table. Use this estimate to measure whether a local secondary index is approaching its size limit.

  The estimate is subject to change over time; therefore, do not rely on the precision or accuracy of the estimate.

Type: String to array of `ItemCollectionMetrics (p. 428)` objects map

Key Pattern: `[a-zA-Z0-9_.-]+`

**UnprocessedItems (p. 21)**

A map of tables and requests against those tables that were not processed. The `UnprocessedItems` value is in the same form as `RequestItems`, so you can provide this value directly to a subsequent `BatchGetItem` operation. For more information, see `RequestItems` in the Request Parameters section.

Each `UnprocessedItems` entry consists of a table name and, for that table, a list of operations to perform (`DeleteRequest` or `PutRequest`).

- **DeleteRequest** - Perform a `DeleteItem` operation on the specified item. The item to be deleted is identified by a **Key** subelement:
  - **Key** - A map of primary key attribute values that uniquely identify the item. Each entry in this map consists of an attribute name and an attribute value.

- **PutRequest** - Perform a `PutItem` operation on the specified item. The item to be put is identified by an **Item** subelement:
  - **Item** - A map of attributes and their values. Each entry in this map consists of an attribute name and an attribute value. Attribute values must not be null; string and binary type attributes must have lengths greater than zero; and set type attributes must not be empty. Requests that contain empty values will be rejected with a `ValidationException` exception.

  If you specify any attributes that are part of an index key, then the data types for those attributes must match those of the schema in the table's attribute definition.

If there are no unprocessed items remaining, the response contains an empty `UnprocessedItems` map.

Type: String to array of `WriteRequest (p. 502)` objects map

Map Entries: Maximum number of 25 items.

Key Pattern: `[a-zA-Z0-9_.-]+`

Array Members: Minimum number of 1 item. Maximum number of 25 items.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ItemCollectionSizeLimitExceededException

An item collection is too large. This exception is only returned for tables that have one or more local secondary indexes.

HTTP Status Code: 400

ProvisionedThroughputExceededException

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

Multiple Operations on One Table

This example writes several items to the Forum table. The response shows that the final put operation failed, possibly because the application exceeded the provisioned throughput on the table. The UnprocessedItems object shows the unsuccessful put request. The application can call BatchWriteItem again to address such unprocessed requests.

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
               Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.BatchWriteItem
```
{  "RequestItems": {  "Forum": [  {  "PutRequest": {  "Item": {  "Name": {  "S": "Amazon DynamoDB"  },  "Category": {  "S": "Amazon Web Services"  }  }  }  },  {  "PutRequest": {  "Item": {  "Name": {  "S": "Amazon RDS"  },  "Category": {  "S": "Amazon Web Services"  }  }  }  },  {  "PutRequest": {  "Item": {  "Name": {  "S": "Amazon Redshift"  },  "Category": {  "S": "Amazon Web Services"  }  }  }  },  {  "PutRequest": {  "Item": {  "Name": {  "S": "Amazon ElastiCache"  },  "Category": {  "S": "Amazon Web Services"  }  }  }  }  ]  },  "ReturnConsumedCapacity": "TOTAL"  }

Sample Response

HTTP/1.1 200 OK

CreateBackup
Service: Amazon DynamoDB

Creates a backup for an existing table.

Each time you create an on-demand backup, the entire table data is backed up. There is no limit to the number of on-demand backups that can be taken.

When you create an on-demand backup, a time marker of the request is cataloged, and the backup is created asynchronously, by applying all changes until the time of the request to the last full table snapshot. Backup requests are processed instantaneously and become available for restore within minutes.

You can call CreateBackup at a maximum rate of 50 times per second.

All backups in DynamoDB work without consuming any provisioned throughput on the table.

If you submit a backup request on 2018-12-14 at 14:25:00, the backup is guaranteed to contain all data committed to the table up to 14:24:00, and data committed after 14:26:00 will not be. The backup might contain data modifications made between 14:24:00 and 14:26:00. On-demand backup does not support causal consistency.

Along with data, the following are also included on the backups:

- Global secondary indexes (GSIs)
- Local secondary indexes (LSIs)
- Streams
- Provisioned read and write capacity

Request Syntax

```json
{
    "BackupName": "string",
    "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**BackupName (p. 27)**

Specified name for the backup.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**TableName (p. 27)**

The name of the table.
Type: String
Pattern: [a-zA-Z0-9_.-]+ 
Required: Yes

Response Syntax

```
{
  "BackupDetails": {
    "BackupArn": "string",
    "BackupCreationDateTime": number,
    "BackupExpiryDateTime": number,
    "BackupName": "string",
    "BackupSizeBytes": number,
    "BackupStatus": "string",
    "BackupType": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**BackupDetails (p. 28)**

Contains the details of the backup created for the table.

Type: BackupDetails (p. 365) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**BackupInUseException**

There is another ongoing conflicting backup control plane operation on the table. The backup is either being created, deleted or restored to a table.

HTTP Status Code: 400

**ContinuousBackupsUnavailableException**

Backups have not yet been enabled for this table.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.
Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400
TableInUseException
A target table with the specified name is either being created or deleted.

HTTP Status Code: 400
TableNotFoundException
A source table with the name TableName does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

CreateGlobalTable

Service: Amazon DynamoDB

Creates a global table from an existing table. A global table creates a replication relationship between two or more DynamoDB tables with the same table name in the provided Regions.

**Note**
This operation only applies to Version 2017.11.29 of global tables.

If you want to add a new replica table to a global table, each of the following conditions must be true:

- The table must have the same primary key as all of the other replicas.
- The table must have the same name as all of the other replicas.
- The table must have DynamoDB Streams enabled, with the stream containing both the new and the old images of the item.
- None of the replica tables in the global table can contain any data.

If global secondary indexes are specified, then the following conditions must also be met:

- The global secondary indexes must have the same name.
- The global secondary indexes must have the same hash key and sort key (if present).

If local secondary indexes are specified, then the following conditions must also be met:

- The local secondary indexes must have the same name.
- The local secondary indexes must have the same hash key and sort key (if present).

**Important**
Write capacity settings should be set consistently across your replica tables and secondary indexes. DynamoDB strongly recommends enabling auto scaling to manage the write capacity settings for all of your global tables replicas and indexes.

If you prefer to manage write capacity settings manually, you should provision equal replicated write capacity units to your replica tables. You should also provision equal replicated write capacity units to matching secondary indexes across your global table.

**Request Syntax**

```
{
    "GlobalTableName": "string",
    "ReplicationGroup": [
    {
        "RegionName": "string"
    }
    ]
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**GlobalTableName (p. 30)**

The global table name.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: Yes

**ReplicationGroup (p. 30)**
The Regions where the global table needs to be created.
Type: Array of Replica (p. 452) objects
Required: Yes

### Response Syntax

```
{
  "GlobalTableDescription": {
    "CreationDateTime": number,
    "GlobalTableArn": "string",
    "GlobalTableName": "string",
    "GlobalTableStatus": "string",
    "ReplicationGroup": [ 
      {
        "GlobalSecondaryIndexes": [ 
          {
            "IndexName": "string",
            "ProvisionedThroughputOverride": {
              "ReadCapacityUnits": number
            }
          }
        ],
        "KMSMasterKeyId": "string",
        "ProvisionedThroughputOverride": {
          "ReadCapacityUnits": number
        },
        "RegionName": "string",
        "ReplicaInaccessibleDateTime": number,
        "ReplicaStatus": "string",
        "ReplicaStatusDescription": "string",
        "ReplicaStatusPercentProgress": "string",
        "ReplicaTableClassSummary": {
          "LastUpdateDateTime": number,
          "TableClass": "string"
        }
      }
    ]
  }
}
```

### Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**GlobalTableDescription (p. 31)**
Contains the details of the global table.
Type: `GlobalTableDescription (p. 419)` object

Errors

For information about the errors that are common to all actions, see `Common Errors (p. 541)`.

**GlobalTableAlreadyExistsException**

The specified global table already exists.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable`, `UpdateTable`, `DeleteTable`, `UpdateTimeToLive`, `RestoreTableFromBackup`, and `RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

**TableNotFoundException**

A source table with the name `TableName` does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

CreateTable

Service: Amazon DynamoDB

The CreateTable operation adds a new table to your account. In an AWS account, table names must be unique within each Region. That is, you can have two tables with same name if you create the tables in different Regions.

CreateTable is an asynchronous operation. Upon receiving a CreateTable request, DynamoDB immediately returns a response with a TableStatus of CREATING. After the table is created, DynamoDB sets the TableStatus to ACTIVE. You can perform read and write operations only on an ACTIVE table.

You can optionally define secondary indexes on the new table, as part of the CreateTable operation. If you want to create multiple tables with secondary indexes on them, you must create the tables sequentially. Only one table with secondary indexes can be in the CREATING state at any given time.

You can use the DescribeTable action to check the table status.

Request Syntax

```json
{
   "AttributeDefinitions": [
      {
         "AttributeName": "string",
         "AttributeType": "string"
      }
   ],
   "BillingMode": "string",
   "GlobalSecondaryIndexes": [
      {
         "IndexName": "string",
         "KeySchema": [
            {
               "AttributeName": "string",
               "KeyType": "string"
            }
         ],
         "Projection": {
            "NonKeyAttributes": [ "string" ],
            "ProjectionType": "string"
         },
         "ProvisionedThroughput": {
            "ReadCapacityUnits": number,
            "WriteCapacityUnits": number
         }
      }
   ],
   "KeySchema": [
      {
         "AttributeName": "string",
         "KeyType": "string"
      }
   ],
   "LocalSecondaryIndexes": [
      {
         "IndexName": "string",
         "KeySchema": [
            {
               "AttributeName": "string",
               "KeyType": "string"
            }
         ]
      }
   ]
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**AttributeDefinitions (p. 33)**
An array of attributes that describe the key schema for the table and indexes.

Type: Array of AttributeDefinition (p. 348) objects

Required: Yes

**KeySchema (p. 33)**
Specifies the attributes that make up the primary key for a table or an index. The attributes in KeySchema must also be defined in the AttributeDefinitions array. For more information, see Data Model in the Amazon DynamoDB Developer Guide.

Each KeySchemaElement in the array is composed of:
- AttributeName - The name of this key attribute.
- KeyType - The role that the key attribute will assume:
  - HASH - partition key
  - RANGE - sort key

**Note**
The partition key of an item is also known as its hash attribute. The term "hash attribute" derives from the DynamoDB usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its \textit{range attribute}. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

For a simple primary key (partition key), you must provide exactly one element with a \texttt{KeyType} of \texttt{HASH}.

For a composite primary key (partition key and sort key), you must provide exactly two elements, in this order: The first element must have a \texttt{KeyType} of \texttt{HASH}, and the second element must have a \texttt{KeyType} of \texttt{RANGE}.

For more information, see \textit{Working with Tables} in the \textit{Amazon DynamoDB Developer Guide}.

Type: Array of \texttt{KeySchemaElement} objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: Yes

\textbf{TableName (p. 33)}

The name of the table to create.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

\textbf{BillingMode (p. 33)}

Controls how you are charged for read and write throughput and how you manage capacity. This setting can be changed later.

- \texttt{PROVISIONED} - We recommend using \texttt{PROVISIONED} for predictable workloads. \texttt{PROVISIONED} sets the billing mode to \textit{Provisioned Mode}.

- \texttt{PAY_PER_REQUEST} - We recommend using \texttt{PAY_PER_REQUEST} for unpredictable workloads. \texttt{PAY_PER_REQUEST} sets the billing mode to \textit{On-Demand Mode}.

Type: String

Valid Values: \texttt{PROVISIONED} | \texttt{PAY_PER_REQUEST}

Required: No

\textbf{GlobalSecondaryIndexes (p. 33)}

One or more global secondary indexes (the maximum is 20) to be created on the table. Each global secondary index in the array includes the following:

- \texttt{IndexName} - The name of the global secondary index. Must be unique only for this table.

- \texttt{KeySchema} - Specifies the key schema for the global secondary index.

- \texttt{Projection} - Specifies attributes that are copied (projected) from the table into the index. These are in addition to the primary key attributes and index key attributes, which are automatically projected. Each attribute specification is composed of:

  - \texttt{ProjectionType} - One of the following:
    - \texttt{KEYS_ONLY} - Only the index and primary keys are projected into the index.
    - \texttt{INCLUDE} - Only the specified table attributes are projected into the index. The list of projected attributes is in \texttt{NonKeyAttributes}. 

• **ALL** - All of the table attributes are projected into the index.

• **NonKeyAttributes** - A list of one or more non-key attribute names that are projected into the secondary index. The total count of attributes provided in **NonKeyAttributes**, summed across all of the secondary indexes, must not exceed 100. If you project the same attribute into two different indexes, this counts as two distinct attributes when determining the total.

• **ProvisionedThroughput** - The provisioned throughput settings for the global secondary index, consisting of read and write capacity units.

Type: Array of `GlobalSecondaryIndex (p. 409)` objects

Required: No

**LocalSecondaryIndexes (p. 33)**

One or more local secondary indexes (the maximum is 5) to be created on the table. Each index is scoped to a given partition key value. There is a 10 GB size limit per partition key value; otherwise, the size of a local secondary index is unconstrained.

Each local secondary index in the array includes the following:

• **IndexName** - The name of the local secondary index. Must be unique only for this table.

• **KeySchema** - Specifies the key schema for the local secondary index. The key schema must begin with the same partition key as the table.

• **Projection** - Specifies attributes that are copied (projected) from the table into the index. These are in addition to the primary key attributes and index key attributes, which are automatically projected. Each attribute specification is composed of:

  • **ProjectionType** - One of the following:
    • **KEYS_ONLY** - Only the index and primary keys are projected into the index.
    • **INCLUDE** - Only the specified table attributes are projected into the index. The list of projected attributes is in **NonKeyAttributes**.
    • **ALL** - All of the table attributes are projected into the index.

• **NonKeyAttributes** - A list of one or more non-key attribute names that are projected into the secondary index. The total count of attributes provided in **NonKeyAttributes**, summed across all of the secondary indexes, must not exceed 100. If you project the same attribute into two different indexes, this counts as two distinct attributes when determining the total.

Type: Array of `LocalSecondaryIndex (p. 435)` objects

Required: No

**ProvisionedThroughput (p. 33)**

Represents the provisioned throughput settings for a specified table or index. The settings can be modified using the `UpdateTable` operation.

If you set `BillingMode` as `PROVISIONED`, you must specify this property. If you set `BillingMode` as `PAY_PER_REQUEST`, you cannot specify this property.

For current minimum and maximum provisioned throughput values, see [Service, Account, and Table Quotas](https://docs.aws.amazon.com/dynamodb/latest/developerguide/service-quotas-consumed.html) in the *Amazon DynamoDB Developer Guide*.

Type: `ProvisionedThroughput (p. 445)` object

Required: No

**SSESpecification (p. 33)**

Represents the settings used to enable server-side encryption.
Type: **SSESpecification** (p. 480) object

Required: No

**StreamSpecification (p. 33)**

The settings for DynamoDB Streams on the table. These settings consist of:

- **StreamEnabled** - Indicates whether DynamoDB Streams is to be enabled (true) or disabled (false).
- **StreamViewType** - When an item in the table is modified, StreamViewType determines what information is written to the table's stream. Valid values for StreamViewType are:
  - **KEYS_ONLY** - Only the key attributes of the modified item are written to the stream.
  - **NEW_IMAGE** - The entire item, as it appears after it was modified, is written to the stream.
  - **OLD_IMAGE** - The entire item, as it appeared before it was modified, is written to the stream.
  - **NEW_AND_OLD_IMAGES** - Both the new and the old item images of the item are written to the stream.

Type: **StreamSpecification** (p. 481) object

Required: No

**TableClass (p. 33)**

The table class of the new table. Valid values are **STANDARD** and **STANDARD_INFREQUENT_ACCESS**.

Type: **String**

Valid Values: **STANDARD | STANDARD_INFREQUENT_ACCESS**

Required: No

**Tags (p. 33)**

A list of key-value pairs to label the table. For more information, see Tagging for DynamoDB.

Type: Array of **Tag** (p. 492) objects

Required: No

**Response Syntax**

```json
{
  "TableDescription": {

}
}

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TableDescription (p. 37)**

Represents the properties of the table.

Type: `TableDescription (p. 486)` object

**Errors**

For information about the errors that are common to all actions, see `Common Errors (p. 541)`.
InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

Examples

Create a Table

This example creates a table named Thread. The table primary key consists of ForumName (partition key) and Subject (sort key). A local secondary index is also created; its key consists of ForumName (partition key) and LastPostDateTime (sort key).

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0

DeleteBackup
Service: Amazon DynamoDB

Deletes an existing backup of a table.
You can call DeleteBackup at a maximum rate of 10 times per second.

Request Syntax

```
{
    "BackupArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**BackupArn (p. 44)**

The ARN associated with the backup.

Type: String

Required: Yes

Response Syntax

```
[
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "string",
            "BackupCreationDateTime": number,
            "BackupExpirationDateTime": number,
            "BackupName": "string",
            "BackupSizeBytes": number,
            "BackupStatus": "string",
            "BackupType": "string"
        },
        "SourceTableDetails": {
            "BillingMode": "string",
            "ItemCount": number,
            "KeySchema": [
                {
                    "AttributeName": "string",

}
},
"TimeToLiveDescription": {
"AttributeName": "string",
"TimeToLiveStatus": "string"
}
}]

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

BackupDescription (p. 44)

Contains the description of the backup created for the table.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

BackupInUseException

There is another ongoing conflicting backup control plane operation on the table. The backup is either being created, deleted or restored to a table.

HTTP Status Code: 400

BackupNotFoundException

Backup not found for the given BackupARN.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

DeleteItem
Service: Amazon DynamoDB

Deletes a single item in a table by primary key. You can perform a conditional delete operation that deletes the item if it exists, or if it has an expected attribute value.

In addition to deleting an item, you can also return the item's attribute values in the same operation, using the ReturnValues parameter.

Unless you specify conditions, the DeleteItem is an idempotent operation; running it multiple times on the same item or attribute does not result in an error response.

Conditional deletes are useful for deleting items only if specific conditions are met. If those conditions are met, DynamoDB performs the delete. Otherwise, the item is not deleted.

Request Syntax

```json
{
  "ConditionalOperator": "string",
  "ConditionExpression": "string",
  "Expected": {
    "string": {
      "AttributeValueList": [
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [
          "AttributeValue"
        ],
        "N": {
          "string": "AttributeValue"
        },
        "M": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
      ]
    },
    "ComparisonOperator": "string",
    "Exists": boolean,
    "Value": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [
        "AttributeValue"
      ],
      "N": {
        "string": "AttributeValue"
      },
      "M": "string",
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
    }
  },
  "ExpressionAttributeNames": {
    "string": "string"
  }
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**Key (p. 47)**

A map of attribute names to `AttributeValue` objects, representing the primary key of the item to delete.

For the primary key, you must provide all of the attributes. For example, with a simple primary key, you only need to provide a value for the partition key. For a composite primary key, you must provide values for both the partition key and the sort key.

Type: String to `AttributeValue (p. 349)` object map

Key Length Constraints: Maximum length of 65535.

Required: Yes
**TableName (p. 47)**

The name of the table from which to delete the item.

Type: String

Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**ConditionalOperator (p. 47)**

This is a legacy parameter. Use `ConditionExpression` instead. For more information, see `ConditionalOperator` in the *Amazon DynamoDB Developer Guide*.

Type: String

Valid Values: AND | OR

Required: No

**ConditionExpression (p. 47)**

A condition that must be satisfied in order for a conditional `DeleteItem` to succeed.

An expression can contain any of the following:

- Functions: `attribute_exists` | `attribute_not_exists` | `attribute_type` | `contains` | `begins_with` | `size`

  These function names are case-sensitive.

- Comparison operators: `=` | `<>` | `<` | `>` | `<=` | `>=` | `BETWEEN` | `IN`

- Logical operators: `AND` | `OR` | `NOT`

For more information about condition expressions, see `Condition Expressions` in the *Amazon DynamoDB Developer Guide*.

Type: String

Required: No

**Expected (p. 47)**

This is a legacy parameter. Use `ConditionExpression` instead. For more information, see `Expected` in the *Amazon DynamoDB Developer Guide*.

Type: String to `ExpectedAttributeValue (p. 397)` object map

Key Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeNames (p. 47)**

One or more substitution tokens for attribute names in an expression. The following are some use cases for using `ExpressionAttributeNames`:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
- To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the `#` character in an expression to dereference an attribute name. For example, consider the following attribute name:
• Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify the following for ExpressionAttributeNames:

• {"#P":"Percentile"}

You could then use this substitution in an expression, as in this example:

• #P : = :val

Note

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.

For more information on expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

ExpressionAttributeValues (p. 47)

One or more values that can be substituted in an expression.

Use the : (colon) character in an expression to dereference an attribute value. For example, suppose that you wanted to check whether the value of the ProductStatus attribute was one of the following:

Available | Backordered | Discontinued

You would first need to specify ExpressionAttributeValues as follows:

{ ":avail":{"S":"Available"}, ":back":{"S":"Backordered"}, ":disc": {"S":"Discontinued"} }

You could then use these values in an expression, such as this:

ProductStatus IN (:avail, :back, :disc)

For more information on expression attribute values, see Condition Expressions in the Amazon DynamoDB Developer Guide.

Type: String to AttributeValue (p. 349) object map

Required: No

ReturnConsumedCapacity (p. 47)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

• INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

• TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.
- **NONE** - No ConsumedCapacity details are included in the response.

  Type: String

  Valid Values: INDEXES | TOTAL | NONE

  Required: No

**ReturnItemCollectionMetrics (p. 47)**

Determines whether item collection metrics are returned. If set to SIZE, the response includes statistics about item collections, if any, that were modified during the operation are returned in the response. If set to NONE (the default), no statistics are returned.

  Type: String

  Valid Values: SIZE | NONE

  Required: No

**ReturnValues (p. 47)**

Use ReturnValues if you want to get the item attributes as they appeared before they were deleted. For DeleteItem, the valid values are:

- **NONE** - If ReturnValues is not specified, or if its value is NONE, then nothing is returned. (This setting is the default for ReturnValues.)
- **ALL_OLD** - The content of the old item is returned.

There is no additional cost associated with requesting a return value aside from the small network and processing overhead of receiving a larger response. No read capacity units are consumed.

  **Note**

  The ReturnValues parameter is used by several DynamoDB operations; however, DeleteItem does not recognize any values other than NONE or ALL_OLD.

  Type: String

  Valid Values: NONE | ALL_OLD | UPDATED_OLD | ALL_NEW | UPDATED_NEW

  Required: No

**Response Syntax**

```json
{
    "Attributes": {
        "string": {
            "B": blob,
            "BOOL": boolean,
            "BS": [ blob ],
            "L": [
                "AttributeValue"
            ],
            "M": {
                "string": "AttributeValue"
            },
            "N": "string",
            "NS": [ "string" ],
            "NULL": boolean,
            "S": "string",
            "SS": [ "string" ]
        }
    },
    ...
}
```
"ConsumedCapacity": { "CapacityUnits": number, "GlobalSecondaryIndexes": { "string": { "CapacityUnits": number, "ReadCapacityUnits": number, "WriteCapacityUnits": number } }, "LocalSecondaryIndexes": { "string": { "CapacityUnits": number, "ReadCapacityUnits": number, "WriteCapacityUnits": number } }, "ReadCapacityUnits": number, "Table": { "CapacityUnits": number, "ReadCapacityUnits": number, "WriteCapacityUnits": number }, "TableName": "string", "WriteCapacityUnits": number }, "ItemCollectionMetrics": { "ItemCollectionKey": { "string": { "B": blob, "BOOL": boolean, "BS": [ blob ], "L": [ "AttributeValue" ], "M": { "string": "AttributeValue" }, "N": "string", "NS": [ "string" ], "NULL": boolean, "S": "string", "SS": [ "string" ] } }, "SizeEstimateRangeGB": [ number ] }

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Attributes (p. 51)

A map of attribute names to AttributeValue objects, representing the item as it appeared before the DeleteItem operation. This map appears in the response only if ReturnValues was specified as ALL_OLD in the request.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.
**ConsumedCapacity (p. 51)**

The capacity units consumed by the DeleteItem operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Provisioned Mode in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object

**ItemCollectionMetrics (p. 51)**

Information about item collections, if any, that were affected by the DeleteItem operation. ItemCollectionMetrics is only returned if the ReturnItemCollectionMetrics parameter was specified. If the table does not have any local secondary indexes, this information is not returned in the response.

Each ItemCollectionMetrics element consists of:

- ItemCollectionKey - The partition key value of the item collection. This is the same as the partition key value of the item itself.
- SizeEstimateRangeGB - An estimate of item collection size, in gigabytes. This value is a two-element array containing a lower bound and an upper bound for the estimate. The estimate includes the size of all the items in the table, plus the size of all attributes projected into all of the local secondary indexes on that table. Use this estimate to measure whether a local secondary index is approaching its size limit.

The estimate is subject to change over time; therefore, do not rely on the precision or accuracy of the estimate.

Type: ItemCollectionMetrics (p. 428) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**ConditionalCheckFailedException**

A condition specified in the operation could not be evaluated.

HTTP Status Code: 400

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

**ItemCollectionSizeLimitExceededException**

An item collection is too large. This exception is only returned for tables that have one or more local secondary indexes.

HTTP Status Code: 400

**ProvisionedThroughputExceededException**

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400
RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

TransactionConflictException

Operation was rejected because there is an ongoing transaction for the item.

HTTP Status Code: 400

Examples

Delete an Item

The following example deletes an item from the Thread table, but only if that item does not already have an attribute named Replies. Because ReturnValue is set to ALL_OLD, the response contains the item as it appeared before the delete.

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
                Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.DeleteItem

{
  "TableName": "Thread",
  "Key": {
    "ForumName": {
      "S": "Amazon DynamoDB"
    },
    "Subject": {
      "S": "How do I update multiple items?"
    }
  },
  "ConditionExpression": "attribute_not_exists(Replies)",
  "ReturnValue": "ALL_OLD"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
```
DeleteItem

{  
  "Attributes": { 
    "LastPostedBy": { 
      "S": "fred@example.com"
    }, 
    "ForumName": { 
      "S": "Amazon DynamoDB"
    }, 
    "LastPostDateTime": { 
      "S": "201303201023"
    }, 
    "Tags": { 
      "SS": ["Update","Multiple Items","HelpMe"]
    }, 
    "Subject": { 
      "S": "How do I update multiple items?"
    }, 
    "Message": { 
      "S": "I want to update multiple items in a single call. What's the best way to do that?"
    }
  }  
}

DeleteTable
Service: Amazon DynamoDB

The `DeleteTable` operation deletes a table and all of its items. After a `DeleteTable` request, the specified table is in the DELETING state until DynamoDB completes the deletion. If the table is in the ACTIVE state, you can delete it. If a table is in CREATING or UPDATING states, then DynamoDB returns a ResourceInUseException. If the specified table does not exist, DynamoDB returns a ResourceNotFoundException. If table is already in the DELETING state, no error is returned.

**Note**
DynamoDB might continue to accept data read and write operations, such as GetItem and PutItem, on a table in the DELETING state until the table deletion is complete.

When you delete a table, any indexes on that table are also deleted.

If you have DynamoDB Streams enabled on the table, then the corresponding stream on that table goes into the DISABLED state, and the stream is automatically deleted after 24 hours.

Use the `DescribeTable` action to check the status of the table.

**Request Syntax**

```json
{
   "TableName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 56)**

The name of the table to delete.

Type: String

Pattern: [a-zA-Z0-9_.-]*

Required: Yes

**Response Syntax**

```json
{
   "TableDescription": {
      "ArchivalSummary": {
         "ArchivalBackupArn": "string",
         "ArchivalDateTime": number,
         "ArchivalReason": "string"
      },
      "AttributeDefinitions": [
         {
            "AttributeName": "string",
            "AttributeType": "string"

"TableClass": "string"
},
"TableId": "string",
"TableName": "string",
"TableSizeBytes": number,
"TableStatus": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

TableDescription (p. 56)

Represents the properties of a table.
Type: `TableDescription` (p. 486) object

Errors

For information about the errors that are common to all actions, see `Common Errors` (p. 541).

`InternalServerException`

An error occurred on the server side.

HTTP Status Code: 500

`LimitExceededException`

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable`, `UpdateTable`, `DeleteTable`, `UpdateTimeToLive`, `RestoreTableFromBackup`, and `RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

`ResourceInUseException`

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the `CREATING` state.

HTTP Status Code: 400

`ResourceNotFoundException`

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be `ACTIVE`.

HTTP Status Code: 400

Examples

Delete a Table

This example deletes the Reply table.

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
                Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.DeleteTable
```
DeleteTable

```json
{
    "TableName": "Reply"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "TableDescription": {
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/Reply",
        "ItemCount": 0,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableName": "Reply",
        "TableSizeBytes": 0,
        "TableStatus": "DELETING"
    }
}
```

DescribeBackup
Service: Amazon DynamoDB

Describes an existing backup of a table.

You can call DescribeBackup at a maximum rate of 10 times per second.

Request Syntax

```json
{
  "BackupArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**  
In the following list, the required parameters are described first.

**BackupArn (p. 61)**

The Amazon Resource Name (ARN) associated with the backup.

Type: String

Required: Yes

Response Syntax

```json
{
  "BackupDescription": {
    "BackupDetails": {
      "BackupArn": "string",
      "BackupCreationDateTime": number,
      "BackupExpiryDateTime": number,
      "BackupName": "string",
      "BackupSizeBytes": number,
      "BackupStatus": "string",
      "BackupType": "string"
    },
    "SourceTableDetails": {
      "BillingMode": "string",
      "ItemCount": number,
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      },
      "TableArn": "string",
      "TableCreationDateTime": number,
      "TableId": "string",
      "TableName": "string"
    }
  }
}
```
"TableSizeBytes": number,
"SourceTableFeatureDetails": {
  "GlobalSecondaryIndexes": [
    {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      },
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  ],
  "LocalSecondaryIndexes": [
    {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      }
    }
  ],
  "SSEDescription": {
    "InaccessibleEncryptionDateTime": number,
    "KMSMasterKeyArn": "string",
    "SSEType": "string",
    "Status": "string"
  },
  "StreamDescription": {
    "StreamEnabled": boolean,
    "StreamViewType": "string"
  },
  "TimeToLiveDescription": {
    "AttributeName": "string",
    "TimeToLiveStatus": "string"
  }
}
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

BackupDescription (p. 61)

Contains the description of the backup created for the table.
Type: `BackupDescription` (p. 364) object

**Errors**

For information about the errors that are common to all actions, see `Common Errors` (p. 541).

**BackupNotFoundException**

Backup not found for the given BackupARN.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

DescribeContinuousBackups

Service: Amazon DynamoDB

Checks the status of continuous backups and point in time recovery on the specified table. Continuous backups are ENABLED on all tables at table creation. If point in time recovery is enabled, PointInTimeRecoveryStatus will be set to ENABLED.

After continuous backups and point in time recovery are enabled, you can restore to any point in time within EarliestRestorableDateTime and LatestRestorableDateTime.

LatestRestorableDateTime is typically 5 minutes before the current time. You can restore your table to any point in time during the last 35 days.

You can call DescribeContinuousBackups at a maximum rate of 10 times per second.

Request Syntax

```
{
   "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 64)**

Name of the table for which the customer wants to check the continuous backups and point in time recovery settings.

Type: String

Pattern: \[a-zA-Z0-9_.-]+\]

Required: Yes

Response Syntax

```
{
   "ContinuousBackupsDescription": {
      "ContinuousBackupsStatus": "string",
      "PointInTimeRecoveryDescription": {
         "EarliestRestorableDateTime": number,
         "LatestRestorableDateTime": number,
         "PointInTimeRecoveryStatus": "string"
      }
   }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**ContinuousBackupsDescription (p. 64)**

Represents the continuous backups and point in time recovery settings on the table.

Type: ContinuousBackupsDescription (p. 382) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**TableNotFoundException**

A source table with the name TableName does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

**See Also**

DescribeContributorInsights
Service: Amazon DynamoDB

Returns information about contributor insights, for a given table or global secondary index.

Request Syntax

```json
{
  "IndexName": "string",
  "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 66)**

The name of the table to describe.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**IndexName (p. 66)**

The name of the global secondary index to describe, if applicable.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

Response Syntax

```json
{
  "ContributorInsightsRuleList": [ "string" ],
  "ContributorInsightsStatus": "string",
  "FailureException": {
    "ExceptionDescription": "string",
    "ExceptionName": "string"
  },
  "IndexName": "string",
  "LastUpdateDateTime": number,
  "TableName": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ContributorInsightsRuleList (p. 66)**

List of names of the associated contributor insights rules.

Type: Array of strings

Pattern: [A-Za-z0-9][A-Za-z0-9\-_\.]{0,126}[A-Za-z0-9]

**ContributorInsightsStatus (p. 66)**

Current status of contributor insights.

Type: String

Valid Values: ENABLING | ENABLED | DISABLING | DISABLED | FAILED

**FailureException (p. 66)**

Returns information about the last failure that was encountered.

The most common exceptions for a FAILED status are:

- LimitExceededException - Per-account Amazon CloudWatch Contributor Insights rule limit reached. Please disable Contributor Insights for other tables/indexes OR disable Contributor Insights rules before retrying.
- AccessDeniedException - Amazon CloudWatch Contributor Insights rules cannot be modified due to insufficient permissions.
- AccessDeniedException - Failed to create service-linked role for Contributor Insights due to insufficient permissions.
- InternalServerError - Failed to create Amazon CloudWatch Contributor Insights rules. Please retry request.

Type: FailureException (p. 406) object

**IndexName (p. 66)**

The name of the global secondary index being described.

Type: String

Pattern: [a-zA-Z0-9_\-_\.]+

**LastUpdateDateTime (p. 66)**

Timestamp of the last time the status was changed.

Type: Timestamp

**TableName (p. 66)**

The name of the table being described.

Type: String

Pattern: [a-zA-Z0-9_.-]+

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServer>Error**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

**See Also**

- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
DescribeEndpoints

Service: Amazon DynamoDB

Returns the regional endpoint information.

Response Syntax

```json
{
   "Endpoints": [
      {
         "Address": "string",
         "CachePeriodInMinutes": number
      }
   ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Endpoints (p. 69)

List of endpoints.

Type: Array of Endpoint (p. 396) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3
DescribeExport

Service: Amazon DynamoDB

Describes an existing table export.

Request Syntax

```
{
  "ExportArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

Note

In the following list, the required parameters are described first.

ExportArn (p. 70)

The Amazon Resource Name (ARN) associated with the export.

Type: String

Required: Yes

Response Syntax

```
{
  "ExportDescription": { 
    "BilledSizeBytes": number, 
    "ClientToken": "string", 
    "EndTime": number, 
    "ExportArn": "string", 
    "ExportFormat": "string", 
    "ExportManifest": "string", 
    "ExportStatus": "string", 
    "ExportTime": number, 
    "FailureCode": "string", 
    "FailureMessage": "string", 
    "ItemCount": number, 
    "S3Bucket": "string", 
    "S3BucketOwner": "string", 
    "S3Prefix": "string", 
    "S3SseAlgorithm": "string", 
    "S3SseKmsKeyId": "string", 
    "StartTime": number, 
    "TableArn": "string", 
    "TableId": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**ExportDescription (p. 70)**

Represents the properties of the export.

Type: `ExportDescription (p. 401)` object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**ExportNotFoundException**

The specified export was not found.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable`, `UpdateTable`, `DeleteTable`, `UpdateTimeToLive`, `RestoreTableFromBackup`, and `RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

DescribeGlobalTable
Service: Amazon DynamoDB

Returns information about the specified global table.

**Note**
This operation only applies to Version 2017.11.29 of global tables. If you are using global tables Version 2019.11.21 you can use DescribeTable instead.

**Request Syntax**

```json
{
   "GlobalTableName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**GlobalTableName (p. 72)**
The name of the global table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**Response Syntax**

```json
{
   "GlobalTableDescription": {
      "CreationDateTime": number,
      "GlobalTableArn": "string",
      "GlobalTableName": "string",
      "GlobalTableStatus": "string",
      "ReplicationGroup": [
         {
            "GlobalSecondaryIndexes": [
               {
                  "IndexName": "string",
                  "ProvisionedThroughputOverride": {
                     "ReadCapacityUnits": number
                  }
               }
            ],
            "KMSMasterKeyId": "string",
            "ProvisionedThroughputOverride": {
               "ReadCapacityUnits": number
            },
            "RegionName": "string",
            "ReplicaInaccessibleDateTime": number,
            "ReplicaStatus": "string",
```
"ReplicaStatusDescription": "string",
"ReplicaStatusPercentProgress": "string",
"ReplicaTableClassSummary": {
   "LastUpdateDateTime": number,
   "TableClass": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**GlobalTableDescription (p. 72)**

Contains the details of the global table.

Type: GlobalTableDescription (p. 419) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**GlobalTableNotFoundException**

The specified global table does not exist.

HTTP Status Code: 400

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

DescribeGlobalTableSettings

Service: Amazon DynamoDB

Describes Region-specific settings for a global table.

**Note**
This operation only applies to Version 2017.11.29 of global tables.

**Request Syntax**

```
{
  "GlobalTableName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**GlobalTableName (p. 74)**

The name of the global table to describe.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**Response Syntax**

```
{
  "GlobalTableName": "string",
  "ReplicaSettings": [
    {
      "RegionName": "string",
      "ReplicaBillingModeSummary": {
        "BillingMode": "string",
        "LastUpdateToPayPerRequestDateTime": number
      },
      "ReplicaGlobalSecondaryIndexSettings": [
        {
          "IndexName": "string",
          "IndexStatus": "string",
          "ProvisionedReadCapacityAutoScalingSettings": {
            "AutoScalingDisabled": boolean,
            "AutoScalingRoleArn": "string",
            "MaximumUnits": number,
            "MinimumUnits": number,
            "ScalingPolicies": [
              {
                "PolicyName": "string",
                "TargetTrackingScalingPolicyConfiguration": {
                  "DisableScaleIn": boolean,
                  "ScaleInCooldown": number
                }
              }
            ]
          }
        }

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**GlobalTableName (p. 74)**

The name of the global table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

**ReplicaSettings (p. 74)**

The Region-specific settings for the global table.

Type: Array of [ReplicaSettingsDescription (p. 466)] objects

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 541)].

**GlobalTableNotFoundException**

The specified global table does not exist.

HTTP Status Code: 400

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

DescribeImport
Service: Amazon DynamoDB

Represents the properties of the import.

Request Syntax

```
{
    "ImportArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ImportArn (p. 78)**

The Amazon Resource Name (ARN) associated with the table you're importing to.

Type: String

Required: Yes

Response Syntax

```
{
    "ImportTableDescription": {
        "ClientToken": "string",
        "CloudWatchLogGroupArn": "string",
        "EndTime": number,
        "ErrorCount": number,
        "FailureCode": "string",
        "FailureMessage": "string",
        "ImportArn": "string",
        "ImportedItemCount": number,
        "ImportStatus": "string",
        "InputCompressionType": "string",
        "InputFormat": "string",
        "InputFormatOptions": {
            "Csv": {
                "Delimiter": "string",
                "HeaderList": [ "string" ]
            }
        },
        "ProcessedItemCount": number,
        "ProcessedSizeBytes": number,

    "ReadCapacityUnits": number,
    "WriteCapacityUnits": number
  },
  "SSESpecification": {
    "Enabled": boolean,
    "KMSMasterKeyId": "string",
    "SSEType": "string"
  },
  "TableName": "string"
},
"TableId": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ImportTableDescription (p. 78)

Represents the properties of the table created for the import, and parameters of the import. The import parameters include import status, how many items were processed, and how many errors were encountered.

Type: ImportTableDescription (p. 424) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ImportNotFoundException

The specified import was not found.

HTTP Status Code: 400

DescribeKinesisStreamingDestination

Service: Amazon DynamoDB

Returns information about the status of Kinesis streaming.

Request Syntax

```json
{
   "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 81)**

The name of the table being described.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

Response Syntax

```json
{
   "KinesisDataStreamDestinations": [
      {
         "DestinationStatus": "string",
         "DestinationStatusDescription": "string",
         "StreamArn": "string"
      }
   ],
   "TableName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**KinesisDataStreamDestinations (p. 81)**

The list of replica structures for the table being described.

Type: Array of KinesisDataStreamDestination (p. 434) objects

**TableName (p. 81)**

The name of the table being described.
DescribeKinesisStreamingDestination

Type: String
Pattern: [a-zA-Z0-9_.-]+

Errors
For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError
An error occurred on the server side.
HTTP Status Code: 500

ResourceNotFoundException
The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.
HTTP Status Code: 400

DescribeLimits

Service: Amazon DynamoDB

Returns the current provisioned-capacity quotas for your AWS account in a Region, both for the Region as a whole and for any one DynamoDB table that you create there.

When you establish an AWS account, the account has initial quotas on the maximum read capacity units and write capacity units that you can provision across all of your DynamoDB tables in a given Region. Also, there are per-table quotas that apply when you create a table there. For more information, see Service, Account, and Table Quotas page in the Amazon DynamoDB Developer Guide.

Although you can increase these quotas by filing a case at AWS Support Center, obtaining the increase is not instantaneous. The DescribeLimits action lets you write code to compare the capacity you are currently using to those quotas imposed by your account so that you have enough time to apply for an increase before you hit a quota.

For example, you could use one of the AWS SDKs to do the following:

1. Call DescribeLimits for a particular Region to obtain your current account quotas on provisioned capacity there.
2. Create a variable to hold the aggregate read capacity units provisioned for all your tables in that Region, and one to hold the aggregate write capacity units. Zero them both.
3. Call ListTables to obtain a list of all your DynamoDB tables.
4. For each table name listed by ListTables, do the following:
   • Call DescribeTable with the table name.
   • Use the data returned by DescribeTable to add the read capacity units and write capacity units provisioned for the table itself to your variables.
   • If the table has one or more global secondary indexes (GSIs), loop over these GSIs and add their provisioned capacity values to your variables as well.
5. Report the account quotas for that Region returned by DescribeLimits, along with the total current provisioned capacity levels you have calculated.

This will let you see whether you are getting close to your account-level quotas.

The per-table quotas apply only when you are creating a new table. They restrict the sum of the provisioned capacity of the new table itself and all its global secondary indexes.

For existing tables and their GSIs, DynamoDB doesn't let you increase provisioned capacity extremely rapidly, but the only quota that applies is that the aggregate provisioned capacity over all your tables and GSIs cannot exceed either of the per-account quotas.

**Note**

DescribeLimits should only be called periodically. You can expect throttling errors if you call it more than once in a minute.

The DescribeLimits Request element has no content.

**Response Syntax**

```json
{
    "AccountMaxReadCapacityUnits": number,
    "AccountMaxWriteCapacityUnits": number,
    "TableMaxReadCapacityUnits": number,
    "TableMaxWriteCapacityUnits": number
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**AccountMaxReadCapacityUnits (p. 83)**

The maximum total read capacity units that your account allows you to provision across all of your tables in this Region.

Type: Long

Valid Range: Minimum value of 1.

**AccountMaxWriteCapacityUnits (p. 83)**

The maximum total write capacity units that your account allows you to provision across all of your tables in this Region.

Type: Long

Valid Range: Minimum value of 1.

**TableMaxReadCapacityUnits (p. 83)**

The maximum read capacity units that your account allows you to provision for a new table that you are creating in this Region, including the read capacity units provisioned for its global secondary indexes (GSIs).

Type: Long

Valid Range: Minimum value of 1.

**TableMaxWriteCapacityUnits (p. 83)**

The maximum write capacity units that your account allows you to provision for a new table that you are creating in this Region, including the write capacity units provisioned for its global secondary indexes (GSIs).

Type: Long

Valid Range: Minimum value of 1.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerErro**

An error occurred on the server side.

HTTP Status Code: 500

Examples

**DescribeLimits**

This example illustrates one usage of DescribeLimits.
Sample Request

```plaintext
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.DescribeLimits
{}
```

Sample Response

```plaintext
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "AccountMaxReadCapacityUnits": 20000,
    "AccountMaxWriteCapacityUnits": 20000,
    "TableMaxReadCapacityUnits": 10000,
    "TableMaxWriteCapacityUnits": 10000
}
```

### DescribeTable

**Service:** Amazon DynamoDB

Returns information about the table, including the current status of the table, when it was created, the primary key schema, and any indexes on the table.

**Note**
If you issue a DescribeTable request immediately after a CreateTable request, DynamoDB might return a ResourceNotFoundException. This is because DescribeTable uses an eventually consistent query, and the metadata for your table might not be available at that moment. Wait for a few seconds, and then try the DescribeTable request again.

### Request Syntax

```
{
  "TableName": "string"
}
```

### Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 86)**

The name of the table to describe.

- **Type:** String
- **Length Constraints:** Minimum length of 3. Maximum length of 255.
- **Pattern:** [a-zA-Z0-9_.-]+
- **Required:** Yes

### Response Syntax

```
{
  "Table": {
    "ArchivalSummary": {
      "ArchivalBackupArn": "string",
      "ArchivalDateTime": number,
      "ArchivalReason": "string"
    },
    "AttributeDefinitions": [
      {
        "AttributeName": "string",
        "AttributeType": "string"
      }
    ],
    "BillingModeSummary": {
      "BillingMode": "string",
      "LastUpdateToPayPerRequestDateTime": number
    },
    "CreationDateTime": number,
    "GlobalSecondaryIndexes": [
    ]
  }
}

},

"TableId": "string",
"TableName": "string",
"TableSizeBytes": number,
"TableStatus": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Table (p. 86)

The properties of the table.

Type: TableDescription (p. 486) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).
InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

Describe a Table

This example describes the Thread table.

Sample Request

POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.DescribeTable
{
  "TableName":"Thread"
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

}
DescribeTableReplicaAutoScaling

Service: Amazon DynamoDB

Describes auto scaling settings across replicas of the global table at once.

**Note**
This operation only applies to Version 2019.11.21 of global tables.

Request Syntax

```
{
  "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

### TableName (p. 91)

The name of the table.

- **Type:** String
- **Length Constraints:** Minimum length of 3. Maximum length of 255.
- **Pattern:** [a-zA-Z0-9_.-]+
- **Required:** Yes

Response Syntax

```
{
  "TableAutoScalingDescription": {
    "Replicas": [ {
      "GlobalSecondaryIndexes": [ {
        "IndexName": "string",
        "IndexStatus": "string",
        "ProvisionedReadCapacityAutoScalingSettings": { 
          "AutoScalingDisabled": boolean,
          "AutoScalingRoleArn": "string",
          "MaximumUnits": number,
          "MinimumUnits": number,
          "ScalingPolicies": [ { 
            "PolicyName": "string",
            "TargetTrackingScalingPolicyConfiguration": { 
              "DisableScaleIn": boolean,
              "ScaleInCooldown": number,
              "ScaleOutCooldown": number,
              "TargetValue": number
            }
          } ]
        }
      } ]
    },
    "ProvisionedWriteCapacityAutoScalingSettings": {
```

`91`

      {
        "PolicyName": "string",
        "TargetTrackingScalingPolicyConfiguration": {
          "DisableScaleIn": boolean,
          "ScaleInCooldown": number,
          "ScaleOutCooldown": number,
          "TargetValue": number
        }
      }
    ],
    "ReplicaStatus": "string"
  }
],
"TableName": "string",
"TableStatus": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**TableAutoScalingDescription** (p. 91)

Represents the auto scaling properties of the table.

Type: `TableAutoScalingDescription` (p. 482) object

**Errors**

For information about the errors that are common to all actions, see `Common Errors` (p. 541).

**InternalServer>Error**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be **ACTIVE**.

HTTP Status Code: 400

DescribeTimeToLive
Service: Amazon DynamoDB

Gives a description of the Time to Live (TTL) status on the specified table.

Request Syntax

```json
{
    "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 94)**

The name of the table to be described.

- Type: String
- Pattern: [a-zA-Z0-9_.-]+
- Required: Yes

Response Syntax

```json
{
    "TimeToLiveDescription": {
        "AttributeName": "string",
        "TimeToLiveStatus": "string"
    }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TimeToLiveDescription (p. 94)**

- Type: TimeToLiveDescription (p. 493) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).
InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

DisableKinesisStreamingDestination

Service: Amazon DynamoDB

Stops replication from the DynamoDB table to the Kinesis data stream. This is done without deleting either of the resources.

Request Syntax

```json
{
    "StreamArn": "string",
    "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**StreamArn (p. 96)**

The ARN for a Kinesis data stream.

Type: String

Required: Yes

**TableName (p. 96)**

The name of the DynamoDB table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

Response Syntax

```json
{
    "DestinationStatus": "string",
    "StreamArn": "string",
    "TableName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
**DestinationStatus (p. 96)**

The current status of the replication.

Type: String

Valid Values: ENABLING | ACTIVE | DISABLING | DISABLED | ENABLE_FAILED

**StreamArn (p. 96)**

The ARN for the specific Kinesis data stream.

Type: String

**TableName (p. 96)**

The name of the table being modified.

Type: String

Pattern: [a-zA-Z0-9_.-]+

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceededexception**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

**ResourceInUseException**

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.
HTTP Status Code: 400

EnableKinesisStreamingDestination
Service: Amazon DynamoDB

Starts table data replication to the specified Kinesis data stream at a timestamp chosen during the enable workflow. If this operation doesn't return results immediately, use DescribeKinesisStreamingDestination to check if streaming to the Kinesis data stream is ACTIVE.

Request Syntax

```json
{
  "StreamArn": "string",
  "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**StreamArn (p. 99)**

The ARN for a Kinesis data stream.

Type: String

Required: Yes

**TableName (p. 99)**

The name of the DynamoDB table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

Response Syntax

```json
{
  "DestinationStatus": "string",
  "StreamArn": "string",
  "TableName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
DestinationStatus (p. 99)

The current status of the replication.

Type: String

Valid Values: ENABLING | ACTIVE | DISABLING | DISABLED | ENABLE_FAILED

StreamArn (p. 99)

The ARN for the specific Kinesis data stream.

Type: String

TableName (p. 99)

The name of the table being modified.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerErro

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededExce

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.
HTTP Status Code: 400

ExecuteStatement

Service: Amazon DynamoDB

This operation allows you to perform reads and singleton writes on data stored in DynamoDB, using PartiQL.

For PartiQL reads (SELECT statement), if the total number of processed items exceeds the maximum dataset size limit of 1 MB, the read stops and results are returned to the user as a LastEvaluatedKey value to continue the read in a subsequent operation. If the filter criteria in WHERE clause does not match any data, the read will return an empty result set.

A single SELECT statement response can return up to the maximum number of items (if using the Limit parameter) or a maximum of 1 MB of data (and then apply any filtering to the results using WHERE clause). If LastEvaluatedKey is present in the response, you need to paginate the result set.

Request Syntax

```
{
  "ConsistentRead": boolean,
  "Limit": number,
  "NextToken": "string",
  "Parameters": [
    {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [
        "AttributeValue"
      ],
      "M": {
        "string": "AttributeValue"
      },
      "N": "string",
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
    }
  ],
  "ReturnConsumedCapacity": "string",
  "Statement": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**Statement (p. 102)**

The PartiQL statement representing the operation to run.

- **Type:** String
- **Length Constraints:** Minimum length of 1. Maximum length of 8192.
- **Required:** Yes
ConsistentRead (p. 102)

The consistency of a read operation. If set to true, then a strongly consistent read is used; otherwise, an eventually consistent read is used.

Type: Boolean

Required: No

Limit (p. 102)

The maximum number of items to evaluate (not necessarily the number of matching items). If DynamoDB processes the number of items up to the limit while processing the results, it stops the operation and returns the matching values up to that point, along with a key in LastEvaluatedKey to apply in a subsequent operation so you can pick up where you left off. Also, if the processed dataset size exceeds 1 MB before DynamoDB reaches this limit, it stops the operation and returns the matching values up to the limit, and a key in LastEvaluatedKey to apply in a subsequent operation to continue the operation.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

NextToken (p. 102)

Set this value to get remaining results, if NextToken was returned in the statement response.

Type: String

Required: No

Parameters (p. 102)

The parameters for the PartiQL statement, if any.

Type: Array of AttributeValue (p. 349) objects

Array Members: Minimum number of 1 item.

Required: No

ReturnConsumedCapacity (p. 102)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.

- NONE - No ConsumedCapacity details are included in the response.

Type: String
Valid Values: INDEXES | TOTAL | NONE

Required: No

Response Syntax

```json
{
  "ConsumedCapacity": {
    "CapacityUnits": number,
    "GlobalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "LocalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "ReadCapacityUnits": number,
    "Table": {
      "CapacityUnits": number,
      "ReadCapacityUnits": number,
      "WriteCapacityUnits": number
    },
    "TableName": "string",
    "WriteCapacityUnits": number
  },
  "Items": [
    {
      "string": {
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [
          "AttributeValue"
        ],
        "M": {
          "string": "AttributeValue"
        },
        "N": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
      }
    }
  ],
  "LastEvaluatedKey": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [
        "AttributeValue"
      ],
      "M": {
        "string": "AttributeValue"
      }
    }
  }
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ConsumedCapacity (p. 104)**

The capacity units consumed by an operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the request asked for it. For more information, see Provisioned Throughput in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object

**Items (p. 104)**

If a read operation was used, this property will contain the result of the read operation; a map of attribute names and their values. For the write operations this value will be empty.

Type: Array of string to AttributeValue (p. 349) object maps

Key Length Constraints: Maximum length of 65535.

**LastEvaluatedKey (p. 104)**

The primary key of the item where the operation stopped, inclusive of the previous result set. Use this value to start a new operation, excluding this value in the new request. If LastEvaluatedKey is empty, then the "last page" of results has been processed and there is no more data to be retrieved. If LastEvaluatedKey is not empty, it does not necessarily mean that there is more data in the result set. The only way to know when you have reached the end of the result set is when LastEvaluatedKey is empty.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

**NextToken (p. 104)**

If the response of a read request exceeds the response payload limit DynamoDB will set this value in the response. If set, you can use that this value in the subsequent request to get the remaining results.

Type: String

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).
ConditionalCheckFailedException

A condition specified in the operation could not be evaluated.

HTTP Status Code: 400

DuplicateItemException

There was an attempt to insert an item with the same primary key as an item that already exists in the DynamoDB table.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ItemCollectionSizeLimitExceededException

An item collection is too large. This exception is only returned for tables that have one or more local secondary indexes.

HTTP Status Code: 400

ProvisionedThroughputExceededException

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

TransactionConflictException

Operation was rejected because there is an ongoing transaction for the item.

HTTP Status Code: 400

See Also

- AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for JavaScript
• AWS SDK for PHP V3
• AWS SDK for Python
• AWS SDK for Ruby V3
ExecuteTransaction

Service: Amazon DynamoDB

This operation allows you to perform transactional reads or writes on data stored in DynamoDB, using PartiQL.

**Note**
The entire transaction must consist of either read statements or write statements, you cannot mix both in one transaction. The EXISTS function is an exception and can be used to check the condition of specific attributes of the item in a similar manner to ConditionCheck in the TransactWriteItems API.

**Request Syntax**

```
{
  "ClientRequestToken": "string",
  "ReturnConsumedCapacity": "string",
  "TransactStatements": [
    {
      "Parameters": [
        {
          "B": blob,
          "BOOL": boolean,
          "BS": [ blob ],
          "L": [
            "AttributeValue"
          ],
          "M": {
            "string": "AttributeValue"
          },
          "N": "string",
          "NS": [ "string" ],
          "NULL": boolean,
          "S": "string",
          "SS": [ "string" ]
        }
      ],
      "Statement": "string"
    }
  ]
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TransactStatements (p. 108)**

The list of PartiQL statements representing the transaction to run.

Type: Array of ParameterizedStatement (p. 441) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

**ClientRequestToken (p. 108)**

Set this value to get remaining results, if NextToken was returned in the statement response.
ReturnConsumedCapacity (p. 108)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response. For more information, see TransactGetItems and TransactWriteItems.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

Response Syntax

```json
{
   "ConsumedCapacity": [
      {
         "CapacityUnits": number,
         "GlobalSecondaryIndexes": {
            "string": {
               "CapacityUnits": number,
               "ReadCapacityUnits": number,
               "WriteCapacityUnits": number
            }
         },
         "LocalSecondaryIndexes": {
            "string": {
               "CapacityUnits": number,
               "ReadCapacityUnits": number,
               "WriteCapacityUnits": number
            }
         },
         "ReadCapacityUnits": number,
         "Table": {
            "CapacityUnits": number,
            "ReadCapacityUnits": number,
            "WriteCapacityUnits": number
         },
         "TableName": "string",
         "WriteCapacityUnits": number
      }
   ],
   "Responses": [
      {
         "Item": {
            "string": {
               "B": blob,
               "BOOL": boolean,
               "BS": [ blob ],
               "L": [ "AttributeValue"
            ],
            "N": {
               "string": "AttributeValue"
            },
            "NS": [ "string" ],
            "NULL": boolean,
            "string": "AttributeValue"
         }
      }
   ]
}
```
"S": "string",
"SS": [ "string" ]
}
}
]

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ConsumedCapacity (p. 109)

The capacity units consumed by the entire operation. The values of the list are ordered according to the ordering of the statements.

Type: Array of ConsumedCapacity (p. 380) objects

Responses (p. 109)

The response to a PartiQL transaction.

Type: Array of ItemResponse (p. 429) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

IdempotentParameterMismatchException

DynamoDB rejected the request because you retried a request with a different payload but with an idempotent token that was already used.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ProvisionedThroughputExceededException

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400
ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

TransactionCanceledException

The entire transaction request was canceled.

DynamoDB cancels a TransactWriteItems request under the following circumstances:

- A condition in one of the condition expressions is not met.
- A table in the TransactWriteItems request is in a different account or region.
- More than one action in the TransactWriteItems operation targets the same item.
- There is insufficient provisioned capacity for the transaction to be completed.
- An item size becomes too large (larger than 400 KB), or a local secondary index (LSI) becomes too large, or a similar validation error occurs because of changes made by the transaction.
- There is a user error, such as an invalid data format.

DynamoDB cancels a TransactGetItems request under the following circumstances:

- There is an ongoing TransactGetItems operation that conflicts with a concurrent PutItem, UpdateItem, DeleteItem or TransactWriteItems request. In this case the TransactGetItems operation fails with a TransactionCanceledException.
- A table in the TransactGetItems request is in a different account or region.
- There is insufficient provisioned capacity for the transaction to be completed.
- There is a user error, such as an invalid data format.

Note
If using Java, DynamoDB lists the cancellation reasons on the CancellationReasons property. This property is not set for other languages. Transaction cancellation reasons are ordered in the order of requested items, if an item has no error it will have None code and Null message.

Cancellation reason codes and possible error messages:

- No Errors:
  - Code: None
  - Message: null
- Conditional Check Failed:
  - Code: ConditionalCheckFailed
  - Message: The conditional request failed.
- Item Collection Size Limit Exceeded:
  - Code: ItemCollectionSizeLimitExceeded
  - Message: Collection size exceeded.
- Transaction Conflict:
  - Code: TransactionConflict
  - Message: Transaction is ongoing for the item.
- Provisioned Throughput Exceeded:
  - Code: ProvisionedThroughputExceeded
  - Messages:
    - The level of configured provisioned throughput for the table was exceeded. Consider increasing your provisioning level with the UpdateTable API.
Note
This message is received when provisioned throughput is exceeded is on a provisioned DynamoDB table.

• The level of configured provisioned throughput for one or more global secondary indexes of the table was exceeded. Consider increasing your provisioning level for the under-provisioned global secondary indexes with the UpdateTable API.

Note
This message is returned when provisioned throughput is exceeded is on a provisioned GSI.

• Throttling Error:
  • Code: ThrottlingError
  • Messages:
    • Throughput exceeds the current capacity of your table or index. DynamoDB is automatically scaling your table or index so please try again shortly. If exceptions persist, check if you have a hot key: https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/bp-partition-key-design.html.

Note
This message is returned when writes get throttled on an On-Demand table as DynamoDB is automatically scaling the table.

• Throughput exceeds the current capacity for one or more global secondary indexes. DynamoDB is automatically scaling your index so please try again shortly.

Note
This message is returned when writes get throttled on an On-Demand GSI as DynamoDB is automatically scaling the GSI.

• Validation Error:
  • Code: ValidationException
  • Messages:
    • One or more parameter values were invalid.
    • The update expression attempted to update the secondary index key beyond allowed size limits.
    • The update expression attempted to update the secondary index key to unsupported type.
    • An operand in the update expression has an incorrect data type.
    • Item size to update has exceeded the maximum allowed size.
    • Number overflow. Attempting to store a number with magnitude larger than supported range.
    • Type mismatch for attribute to update.
    • Nesting Levels have exceeded supported limits.
    • The document path provided in the update expression is invalid for update.
    • The provided expression refers to an attribute that does not exist in the item.

HTTP Status Code: 400
TransactionInProgressException
The transaction with the given request token is already in progress.

HTTP Status Code: 400

ExportTableToPointInTime
Service: Amazon DynamoDB

Exports table data to an S3 bucket. The table must have point in time recovery enabled, and you can export data from any time within the point in time recovery window.

Request Syntax

```json
{
    "ClientToken": "string",
    "ExportFormat": "string",
    "ExportTime": number,
    "S3Bucket": "string",
    "S3BucketOwner": "string",
    "S3Prefix": "string",
    "S3SseAlgorithm": "string",
    "S3SseKmsKeyId": "string",
    "TableArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

**S3Bucket (p. 114)**

The name of the Amazon S3 bucket to export the snapshot to.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-z0-9A-Z]+[\.-\w]*[a-z0-9A-Z]+$

Required: Yes

**TableArn (p. 114)**

The Amazon Resource Name (ARN) associated with the table to export.

Type: String

Required: Yes

**ClientToken (p. 114)**

Providing a ClientToken makes the call to ExportTableToPointInTimeInput idempotent, meaning that multiple identical calls have the same effect as one single call.

A client token is valid for 8 hours after the first request that uses it is completed. After 8 hours, any request with the same client token is treated as a new request. Do not resubmit the same request with the same client token for more than 8 hours, or the result might not be idempotent.

If you submit a request with the same client token but a change in other parameters within the 8-hour idempotency window, DynamoDB returns an ImportConflictException.

Type: String
Pattern: ^\[^\\$]+$  
Required: No  

**ExportFormat (p. 114)**  
The format for the exported data. Valid values for ExportFormat are DYNAMODB_JSON or ION.  
Type: String  
Valid Values: DYNAMODB_JSON | ION  
Required: No  

**ExportTime (p. 114)**  
Time in the past from which to export table data, counted in seconds from the start of the Unix epoch. The table export will be a snapshot of the table's state at this point in time.  
Type: Timestamp  
Required: No  

**S3BucketOwner (p. 114)**  
The ID of the AWS account that owns the bucket the export will be stored in.  
Type: String  
Pattern: [0-9]{12}  
Required: No  

**S3Prefix (p. 114)**  
The Amazon S3 bucket prefix to use as the file name and path of the exported snapshot.  
Type: String  
Length Constraints: Maximum length of 1024.  
Required: No  

**S3SseAlgorithm (p. 114)**  
The type of encryption used on the bucket where export data will be stored. Valid values for S3SseAlgorithm are:  
- AES256 - server-side encryption with Amazon S3 managed keys  
- KMS - server-side encryption with AWS KMS managed keys  
Type: String  
Valid Values: AES256 | KMS  
Required: No  

**S3SseKmsKeyId (p. 114)**  
The ID of the AWS KMS managed key used to encrypt the S3 bucket where export data will be stored (if applicable).  
Type: String  
Length Constraints: Minimum length of 1. Maximum length of 2048.
Response Syntax

```json
{
  "ExportDescription": {
    "BilledSizeBytes": "number",
    "ClientToken": "string",
    "EndTime": "number",
    "ExportArn": "string",
    "ExportFormat": "string",
    "ExportManifest": "string",
    "ExportStatus": "string",
    "ExportTime": "number",
    "FailureCode": "string",
    "FailureMessage": "string",
    "ItemCount": "number",
    "S3Bucket": "string",
    "S3BucketOwner": "string",
    "S3Prefix": "string",
    "S3SseAlgorithm": "string",
    "S3SseKmsKeyId": "string",
    "StartTime": "number",
    "TableArn": "string",
    "TableId": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ExportDescription (p. 116)**

Contains a description of the table export.

Type: ExportDescription (p. 401) object

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 541)](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/common-errors.html).

ExportConflictException

There was a conflict when writing to the specified S3 bucket.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

InvalidExportTimeException

The specified ExportTime is outside of the point in time recovery window.
HTTP Status Code: 400

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

**PointInTimeRecoveryUnavailableException**

Point in time recovery has not yet been enabled for this source table.

HTTP Status Code: 400

**TableNotFoundException**

A source table with the name TableName does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
**GetItem**

Service: Amazon DynamoDB

The GetItem operation returns a set of attributes for the item with the given primary key. If there is no matching item, GetItem does not return any data and there will be no Item element in the response.

GetItem provides an eventually consistent read by default. If your application requires a strongly consistent read, set ConsistentRead to true. Although a strongly consistent read might take more time than an eventually consistent read, it always returns the last updated value.

**Request Syntax**

```
{
    "AttributesToGet": [ "string" ],
    "ConsistentRead": boolean,
    "ExpressionAttributeNames": {
        "string": "string"
    },
    "Key": {
        "string": {
            "B": blob,
            "BOOL": boolean,
            "BS": [ blob ],
            "L": [ "AttributeValue"
        ],
        "M": {
            "string": "AttributeValue"
        },
        "N": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
    },
    "ProjectionExpression": "string",
    "ReturnConsumedCapacity": "string",
    "TableName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**Key** (p. 118)

A map of attribute names to AttributeValue objects, representing the primary key of the item to retrieve.

For the primary key, you must provide all of the attributes. For example, with a simple primary key, you only need to provide a value for the partition key. For a composite primary key, you must provide values for both the partition key and the sort key.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.
**Required:** Yes

**TableName (p. 118)**

The name of the table containing the requested item.

**Type:** String

**Length Constraints:** Minimum length of 3. Maximum length of 255.

**Pattern:** [a-zA-Z0-9_.-]+

**Required:** Yes

**AttributesToGet (p. 118)**

This is a legacy parameter. Use ProjectionExpression instead. For more information, see AttributesToGet in the Amazon DynamoDB Developer Guide.

**Type:** Array of strings

**Array Members:** Minimum number of 1 item.

**Length Constraints:** Maximum length of 65535.

**Required:** No

**ConsistentRead (p. 118)**

Determines the read consistency model: If set to true, then the operation uses strongly consistent reads; otherwise, the operation uses eventually consistent reads.

**Type:** Boolean

**Required:** No

**ExpressionAttributeNames (p. 118)**

One or more substitution tokens for attribute names in an expression. The following are some use cases for using ExpressionAttributeNames:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
- To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

- Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify the following for ExpressionAttributeNames:

- {"#P":"Percentile"}

You could then use this substitution in an expression, as in this example:

- #P = :val

**Note**

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.
For more information on expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

ProjectionExpression (p. 118)

A string that identifies one or more attributes to retrieve from the table. These attributes can include scalars, sets, or elements of a JSON document. The attributes in the expression must be separated by commas.

If no attribute names are specified, then all attributes are returned. If any of the requested attributes are not found, they do not appear in the result.

For more information, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

ReturnConsumedCapacity (p. 118)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.

- NONE - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

Response Syntax

```json
{
  "ConsumedCapacity": {
    "CapacityUnits": number,
    "GlobalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "LocalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  }
}```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ConsumedCapacity (p. 120)**

The capacity units consumed by the GetItem operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Read/Write Capacity Mode in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object

**Item (p. 120)**

A map of attribute names to AttributeValue objects, as specified by ProjectionExpression.

Type: String to AttributeValue (p. 349) object map

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerError**

An error occurred on the server side.
HTTP Status Code: 500
**ProvisionedThroughputExceededException**

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400
**RequestLimitExceeded**

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400
**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

**Examples**

**Retrieve Item Attributes**

The following example retrieves three attributes from the Thread table. In the response, the ConsumedCapacityUnits value is 1, because ConsistentRead is set to true. If ConsistentRead had been set to false (or not specified) for the same request, an eventually consistent read would have been used and ConsumedCapacityUnits would have been 0.5.

**Sample Request**

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.GetItem

{

"TableName": "Thread",
"Key": {

"ForumName": {

"S": "Amazon DynamoDB"

},

"Subject": {

"S": "How do I update multiple items?"

}

},

"ProjectionExpression":"LastPostDateTime, Message, Tags",
"ConsistentRead": true,
"ReturnConsumedCapacity": "TOTAL"

}`
```
Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "ConsumedCapacity": {
        "CapacityUnits": 1,
        "TableName": "Thread"
    },
    "Item": {
        "Tags": {
            "SS": ["Update","Multiple Items","HelpMe"]
        },
        "LastPostDateTime": {
            "S": "201303190436"
        },
        "Message": {
            "S": "I want to update multiple items in a single call. What's the best way to do that?"
        }
    }
}

ImportTable
Service: Amazon DynamoDB

Imports table data from an S3 bucket.

Request Syntax

```json
{
    "ClientToken": "string",
    "InputCompressionType": "string",
    "InputFormat": "string",
    "InputFormatOptions": {
        "Csv": {
            "Delimiter": "string",
            "HeaderList": [ "string" ]
        }
    },
    "S3BucketSource": {
        "S3Bucket": "string",
        "S3BucketOwner": "string",
        "S3KeyPrefix": "string"
    },
    "TableCreationParameters": {
        "AttributeDefinitions": [
            { "AttributeName": "string", "AttributeType": "string" }
        ],
        "BillingMode": "string",
        "GlobalSecondaryIndexes": [
            { "IndexName": "string",
              "KeySchema": [
                { "AttributeName": "string", "KeyType": "string" }
              ],
              "Projection": {
                "NonKeyAttributes": [ "string" ],
                "ProjectionType": "string"
              },
              "ProvisionedThroughput": {
                "ReadCapacityUnits": number,
                "WriteCapacityUnits": number
              }
            }
        ],
        "KeySchema": [
            { "AttributeName": "string", "KeyType": "string" }
        ],
        "ProvisionedThroughput": {
            "ReadCapacityUnits": number,
            "WriteCapacityUnits": number
        },
        "SSESpecification": {
            "Enabled": boolean,
            "KMSMasterKeyId": "string",
            "SSEType": "string"
        }
    }
}
```
Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

**InputFormat (p. 124)**

The format of the source data. Valid values for `InputFormat` are CSV, DYNAMODB_JSON or ION.

Type: String

Valid Values: DYNAMODB_JSON | ION | CSV

Required: Yes

**S3BucketSource (p. 124)**

The S3 bucket that provides the source for the import.

Type: `S3BucketSource (p. 473)` object

Required: Yes

**TableCreationParameters (p. 124)**

Parameters for the table to import the data into.

Type: `TableCreationParameters (p. 484)` object

Required: Yes

**ClientToken (p. 124)**

Providing a `ClientToken` makes the call to `ImportTableInput` idempotent, meaning that multiple identical calls have the same effect as one single call.

A client token is valid for 8 hours after the first request that uses it is completed. After 8 hours, any request with the same client token is treated as a new request. Do not resubmit the same request with the same client token for more than 8 hours, or the result might not be idempotent.

If you submit a request with the same client token but a change in other parameters within the 8-hour idempotency window, DynamoDB returns an `IdempotentParameterMismatch` exception.

Type: String

Pattern: `^[^\$]+$`

Required: No

**InputCompressionType (p. 124)**

Type of compression to be used on the input coming from the imported table.

Type: String

Valid Values: GZIP | ZSTD | NONE

Required: No
InputFormatOptions (p. 124)

Additional properties that specify how the input is formatted,

Type: InputFormatOptions (p. 427) object

Required: No

Response Syntax

```
{
    "ImportTableDescription": {
        "ClientToken": "string",
        "CloudWatchLogGroupArn": "string",
        "EndTime": number,
        "ErrorCount": number,
        "FailureCode": "string",
        "FailureMessage": "string",
        "ImportArn": "string",
        "ImportedItemCount": number,
        "ImportStatus": "string",
        "InputCompressionType": "string",
        "InputFormat": "string",
        "InputFormatOptions": {
            "Csv": {
                "Delimiter": "string",
                "HeaderList": [ "string" ]
            }
        },
        "ProcessedItemCount": number,
        "ProcessedSizeBytes": number,
        "S3BucketSource": {
            "S3Bucket": "string",
            "S3BucketOwner": "string",
            "S3KeyPrefix": "string"
        },
        "StartTime": number,
        "TableArn": "string",
        "TableCreationParameters": {
            "AttributeName": "string",
            "AttributeType": "string"
        },
        "BillingMode": "string",
        "GlobalSecondaryIndexes": {
            "IndexName": "string",
            "KeySchema": {
                "AttributeName": "string",
                "KeyType": "string"
            },
            "Projection": {
                "NonKeyAttributes": [ "string" ],
                "ProjectionType": "string"
            },
            "ProvisionedThroughput": {
                "ReadCapacityUnits": number,
                "WriteCapacityUnits": number
            }
        }
    }
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ImportTableDescription (p. 126)**

Represents the properties of the table created for the import, and parameters of the import. The import parameters include import status, how many items were processed, and how many errors were encountered.

Type: `ImportTableDescription (p. 424)` object

**Errors**

For information about the errors that are common to all actions, see `Common Errors (p. 541)`.

**ImportConflictException**

There was a conflict when importing from the specified S3 source. This can occur when the current import conflicts with a previous import request that had the same client token.

HTTP Status Code: 400

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.
HTTP Status Code: 400

ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

ListBackups

Service: Amazon DynamoDB

List backups associated with an AWS account. To list backups for a given table, specify TableName. ListBackups returns a paginated list of results with at most 1 MB worth of items in a page. You can also specify a maximum number of entries to be returned in a page.

In the request, start time is inclusive, but end time is exclusive. Note that these boundaries are for the time at which the original backup was requested.

You can call ListBackups a maximum of five times per second.

Request Syntax

```
{
   "BackupType": "string",
   "ExclusiveStartBackupArn": "string",
   "Limit": number,
   "TableName": "string",
   "TimeRangeLowerBound": number,
   "TimeRangeUpperBound": number
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**BackupType (p. 129)**

The backups from the table specified by BackupType are listed.

Where BackupType can be:

- USER - On-demand backup created by you. (The default setting if no other backup types are specified.)
- SYSTEM - On-demand backup automatically created by DynamoDB.
- ALL - All types of on-demand backups (USER and SYSTEM).

Type: String

Valid Values: USER | SYSTEM | AWS_BACKUP | ALL

Required: No

**ExclusiveStartBackupArn (p. 129)**

LastEvaluatedBackupArn is the Amazon Resource Name (ARN) of the backup last evaluated when the current page of results was returned, inclusive of the current page of results. This value may be specified as the ExclusiveStartBackupArn of a new ListBackups operation in order to fetch the next page of results.

Type: String

Required: No
Limit (p. 129)

Maximum number of backups to return at once.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

TableName (p. 129)

The backups from the table specified by TableName are listed.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

TimeRangeLowerBound (p. 129)

Only backups created after this time are listed. TimeRangeLowerBound is inclusive.

Type: Timestamp

Required: No

TimeRangeUpperBound (p. 129)

Only backups created before this time are listed. TimeRangeUpperBound is exclusive.

Type: Timestamp

Required: No

Response Syntax

```json
{
  "BackupSummaries": [
    {
      "BackupArn": "string",
      "BackupCreationDateTime": number,
      "BackupExpirationDateTime": number,
      "BackupName": "string",
      "BackupSizeBytes": number,
      "BackupStatus": "string",
      "BackupType": "string",
      "TableArn": "string",
      "TableId": "string",
      "TableName": "string"
    }
  ],
  "LastEvaluatedBackupArn": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**BackupSummaries (p. 130)**

List of BackupSummary objects.

Type: Array of BackupSummary (p. 367) objects

**LastEvaluatedBackupArn (p. 130)**

The ARN of the backup last evaluated when the current page of results was returned, inclusive of the current page of results. This value may be specified as the ExclusiveStartBackupArn of a new ListBackups operation in order to fetch the next page of results.

If LastEvaluatedBackupArn is empty, then the last page of results has been processed and there are no more results to be retrieved.

If LastEvaluatedBackupArn is not empty, this may or may not indicate that there is more data to be returned. All results are guaranteed to have been returned if and only if no value for LastEvaluatedBackupArn is returned.

Type: String

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerErro**

An error occurred on the server side.

HTTP Status Code: 500

**See Also**

ListContributorInsights
Service: Amazon DynamoDB

Returns a list of ContributorInsightsSummary for a table and all its global secondary indexes.

Request Syntax

```
{
  "MaxResults": number,
  "NextToken": "string",
  "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

**MaxResults (p. 132)**

Maximum number of results to return per page.
Type: Integer
Valid Range: Maximum value of 100.
Required: No

**NextToken (p. 132)**

A token to for the desired page, if there is one.
Type: String
Required: No

**TableName (p. 132)**

The name of the table.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

Response Syntax

```
{
  "ContributorInsightsSummaries": [
    {
      "ContributorInsightsStatus": "string",
      "IndexName": "string",
      "TableName": "string"
    }
  ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ContributorInsightsSummaries (p. 132)**

A list of ContributorInsightsSummary.

Type: Array of ContributorInsightsSummary (p. 383) objects

**NextToken (p. 132)**

A token to go to the next page if there is one.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

ListExports

Service: Amazon DynamoDB

Lists completed exports within the past 90 days.

Request Syntax

```
{
   "MaxResults": number,
   "NextToken": "string",
   "TableArn": "string"
}```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**MaxResults (p. 134)**

Maximum number of results to return per page.

Type: Integer

Required: No

**NextToken (p. 134)**

An optional string that, if supplied, must be copied from the output of a previous call to ListExports. When provided in this manner, the API fetches the next page of results.

Type: String

Required: No

**TableArn (p. 134)**

The Amazon Resource Name (ARN) associated with the exported table.

Type: String

Required: No

Response Syntax

```
{
   "ExportSummaries": [
      {
         "ExportArn": "string",
         "ExportStatus": "string"
      }
   ],
   "NextToken": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ExportSummaries (p. 134)

A list of ExportSummary objects.

Type: Array of ExportSummary (p. 405) objects

NextToken (p. 134)

If this value is returned, there are additional results to be displayed. To retrieve them, call ListExports again, with NextToken set to this value.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerException

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ListGlobalTables
Service: Amazon DynamoDB

Lists all global tables that have a replica in the specified Region.

Note
This operation only applies to Version 2017.11.29 of global tables.

Request Syntax

```
{
  "ExclusiveStartGlobalTableName": "string",
  "Limit": number,
  "RegionName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

ExclusiveStartGlobalTableName (p. 137)

The first global table name that this operation will evaluate.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

Limit (p. 137)

The maximum number of table names to return, if the parameter is not specified DynamoDB defaults to 100.

If the number of global tables DynamoDB finds reaches this limit, it stops the operation and returns the table names collected up to that point, with a table name in the LastEvaluatedGlobalTableName to apply in a subsequent operation to the ExclusiveStartGlobalTableName parameter.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

RegionName (p. 137)

Lists the global tables in a specific Region.

Type: String

Required: No
Response Syntax

```json
{
  "GlobalTables": [
    {
      "GlobalTableName": "string",
      "ReplicationGroup": [
        {
          "RegionName": "string"
        }
      ]
    }
  ],
  "LastEvaluatedGlobalTableName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**GlobalTables (p. 138)**

List of global table names.

Type: Array of GlobalTable (p. 418) objects

**LastEvaluatedGlobalTableName (p. 138)**

Last evaluated global table name.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

ListImports

Service: Amazon DynamoDB

Lists completed imports within the past 90 days.

Request Syntax

```
{
    "NextToken": "string",
    "PageSize": number,
    "TableArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**NextToken (p. 140)**

An optional string that, if supplied, must be copied from the output of a previous call to ListImports. When provided in this manner, the API fetches the next page of results.

Type: String

Pattern: ([0-9a-f]{16})+

Required: No

**PageSize (p. 140)**

The number of ImportSummary objects returned in a single page.

Type: Integer

Required: No

**TableArn (p. 140)**

The Amazon Resource Name (ARN) associated with the table that was imported to.

Type: String

Required: No

Response Syntax

```
[
    "ImportSummaryList": [ 
        {
            "CloudWatchLogGroupArn": "string",
            "EndTime": number,
            "ImportArn": "string",
            "ImportStatus": "string",
```
"InputFormat": "string",
"S3BucketSource": {
  "S3Bucket": "string",
  "S3BucketOwner": "string",
  "S3KeyPrefix": "string"
},
"StartTime": "string",
"TableArn": "string"
},
"NextToken": "string"

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ImportSummaryList (p. 140)

A list of ImportSummary objects.

Type: Array of ImportSummary (p. 422) objects

NextToken (p. 140)

If this value is returned, there are additional results to be displayed. To retrieve them, call ListImports again, with NextToken set to this value.

Type: String

Pattern: ([0-9a-f]{16})+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ListTables
Service: Amazon DynamoDB

Returns an array of table names associated with the current account and endpoint. The output from ListTables is paginated, with each page returning a maximum of 100 table names.

Request Syntax

```
{
    "ExclusiveStartTableName": "string",
    "Limit": number
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ExclusiveStartTableName (p. 143)**

The first table name that this operation will evaluate. Use the value that was returned for LastEvaluatedTableName in a previous operation, so that you can obtain the next page of results.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

**Limit (p. 143)**

A maximum number of table names to return. If this parameter is not specified, the limit is 100.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

Response Syntax

```
{
    "LastEvaluatedTableName": "string",
    "TableNames": [ "string" ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
LastEvaluatedTableName (p. 143)

The name of the last table in the current page of results. Use this value as the ExclusiveStartTableName in a new request to obtain the next page of results, until all the table names are returned.

If you do not receive a LastEvaluatedTableName value in the response, this means that there are no more table names to be retrieved.

Type: String

Pattern: [a-zA-Z0-9_.-]+

TableNames (p. 143)

The names of the tables associated with the current account at the current endpoint. The maximum size of this array is 100.

If LastEvaluatedTableName also appears in the output, you can use this value as the ExclusiveStartTableName parameter in a subsequent ListTables request and obtain the next page of results.

Type: Array of strings

Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerException

An error occurred on the server side.

HTTP Status Code: 500

Examples

List Tables

This example requests a list of tables, starting with a table named Forum and ending after three table names have been returned.

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.ListTables
```
```json
{
    "ExclusiveStartTableName": "Forum",
    "Limit": 3
}
```

## Sample Response

HTTP/1.1 200 OK  
x-amzn-RequestId: <RequestId>  
Content-Type: application/x-amz-json-1.0  
Content-Length: <PayloadSizeBytes>  
Date: <Date>  
{
    "LastEvaluatedTableName": "Thread",
    "TableNames": ["Forum","Reply","Thread"]
}

ListTagsOfResource
Service: Amazon DynamoDB

List all tags on an Amazon DynamoDB resource. You can call ListTagsOfResource up to 10 times per second, per account.

For an overview on tagging DynamoDB resources, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

Request Syntax

```json
{
   "NextToken": "string",
   "ResourceArn": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ResourceArn (p. 146)**

The Amazon DynamoDB resource with tags to be listed. This value is an Amazon Resource Name (ARN).

Type: String

Required: Yes

**NextToken (p. 146)**

An optional string that, if supplied, must be copied from the output of a previous call to ListTagOfResource. When provided in this manner, this API fetches the next page of results.

Type: String

Required: No

Response Syntax

```json
{
   "NextToken": "string",
   "Tags": [
      {
         "Key": "string",
         "Value": "string"
      }
   ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**NextToken (p. 146)**

If this value is returned, there are additional results to be displayed. To retrieve them, call ListTagsOfResource again, with NextToken set to this value.

Type: String

**Tags (p. 146)**

The tags currently associated with the Amazon DynamoDB resource.

Type: Array of Tag (p. 492) objects

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

PutItem

Service: Amazon DynamoDB

Creates a new item, or replaces an old item with a new item. If an item that has the same primary key as the new item already exists in the specified table, the new item completely replaces the existing item. You can perform a conditional put operation (add a new item if one with the specified primary key doesn’t exist), or replace an existing item if it has certain attribute values. You can return the item’s attribute values in the same operation, using the ReturnValues parameter.

When you add an item, the primary key attributes are the only required attributes. Attribute values cannot be null.

Empty String and Binary attribute values are allowed. Attribute values of type String and Binary must have a length greater than zero if the attribute is used as a key attribute for a table or index. Set type attributes cannot be empty.

Invalid Requests with empty values will be rejected with a ValidationException exception.

**Note**

To prevent a new item from replacing an existing item, use a conditional expression that contains the attribute_not_exists function with the name of the attribute being used as the partition key for the table. Since every record must contain that attribute, the attribute_not_exists function will only succeed if no matching item exists.

For more information about PutItem, see Working with Items in the Amazon DynamoDB Developer Guide.

**Request Syntax**

```json
{
    "ConditionalOperator": "string",
    "ConditionExpression": "string",
    "Expected": {
        "string": {
            "AttributeValueList": [
            {
                "B": blob,
                "BOOL": boolean,
                "BS": [ blob ],
                "L": [
                    "AttributeValue"
                ],
                "M": {
                    "string": "AttributeValue"
                },
                "N": "string",
                "NS": [ "string" ],
                "NULL": boolean,
                "S": "string",
                "SS": [ "string" ]
            }
            }
        },
        "ComparisonOperator": "string",
        "Exists": boolean,
        "Value": {
            "B": blob,
            "BOOL": boolean,
            "BS": [ blob ],
            "L": [
                "AttributeValue"
            ]
        }
    }
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.
**Item (p. 148)**

A map of attribute name/value pairs, one for each attribute. Only the primary key attributes are required; you can optionally provide other attribute name-value pairs for the item.

You must provide all of the attributes for the primary key. For example, with a simple primary key, you only need to provide a value for the partition key. For a composite primary key, you must provide both values for both the partition key and the sort key.

If you specify any attributes that are part of an index key, then the data types for those attributes must match those of the schema in the table's attribute definition.

Empty String and Binary attribute values are allowed. Attribute values of type String and Binary must have a length greater than zero if the attribute is used as a key attribute for a table or index.

For more information about primary keys, see Primary Key in the Amazon DynamoDB Developer Guide.

Each element in the Item map is an AttributeValue object.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

**TableName (p. 148)**

The name of the table to contain the item.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**ConditionalOperator (p. 148)**

This is a legacy parameter. Use ConditionExpression instead. For more information, see ConditionalOperator in the Amazon DynamoDB Developer Guide.

Type: String

Valid Values: AND | OR

Required: No

**ConditionExpression (p. 148)**

A condition that must be satisfied in order for a conditional PutItem operation to succeed.

An expression can contain any of the following:

- Functions: `attribute_exists` | `attribute_not_exists` | `attribute_type` | `contains` | `begins_with` | `size`

  These function names are case-sensitive.

- Comparison operators: `=` | `<>` | `<` | `>` | `<=` | `>=` | `BETWEEN` | `IN`

- Logical operators: `AND` | `OR` | `NOT`
For more information on condition expressions, see Condition Expressions in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**Expected (p. 148)**

This is a legacy parameter. Use ConditionExpression instead. For more information, see Expected in the Amazon DynamoDB Developer Guide.

Type: String to ExpectedAttributeValue (p. 397) object map

Key Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeNames (p. 148)**

One or more substitution tokens for attribute names in an expression. The following are some use cases for using ExpressionAttributeNames:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
- To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

- Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify the following for ExpressionAttributeNames:

- {"#P": "Percentile"}

You could then use this substitution in an expression, as in this example:

- #P = :val

**Note**

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.

For more information on expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeValues (p. 148)**

One or more values that can be substituted in an expression.

Use the : (colon) character in an expression to dereference an attribute value. For example, suppose that you wanted to check whether the value of the ProductStatus attribute was one of the following:

Available | Backordered | Discontinued
You would first need to specify ExpressionAttributeValues as follows:

{ ":avail":{"S":"Available"}, ":back":{"S":"Backordered"}, ":disc":
{"S":"Discontinued"} }

You could then use these values in an expression, such as this:

ProductStatus IN (:avail, :back, :disc)

For more information on expression attribute values, see Condition Expressions in the Amazon DynamoDB Developer Guide.

Type: String to AttributeValue (p. 349) object map

Required: No

ReturnConsumedCapacity (p. 148)

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.

- NONE - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

ReturnItemCollectionMetrics (p. 148)

Determines whether item collection metrics are returned. If set to SIZE, the response includes statistics about item collections, if any, that were modified during the operation are returned in the response. If set to NONE (the default), no statistics are returned.

Type: String

Valid Values: SIZE | NONE

Required: No

ReturnValues (p. 148)

Use ReturnValues if you want to get the item attributes as they appeared before they were updated with the PutItem request. For PutItem, the valid values are:

- NONE - If ReturnValues is not specified, or if its value is NONE, then nothing is returned. (This setting is the default for ReturnValues.)

- ALL_OLD - If PutItem overwrote an attribute name-value pair, then the content of the old item is returned.

The values returned are strongly consistent.

There is no additional cost associated with requesting a return value aside from the small network and processing overhead of receiving a larger response. No read capacity units are consumed.
Note
The ReturnValues parameter is used by several DynamoDB operations; however, PutItem does not recognize any values other than NONE or ALL_OLD.

Type: String

Valid Values: NONE | ALL_OLD | UPDATED_OLD | ALL_NEW | UPDATED_NEW

Required: No

Response Syntax

```json
{
  "Attributes": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [
        "AttributeValue"
      ],
      "M": {
        "string": "AttributeValue"
      },
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
    }
  },
  "ConsumedCapacity": {
    "CapacityUnits": number,
    "GlobalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "LocalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "ReadCapacityUnits": number,
    "Table": {
      "CapacityUnits": number,
      "ReadCapacityUnits": number,
      "WriteCapacityUnits": number
    },
    "TableName": "string",
    "WriteCapacityUnits": number
  },
  "ItemCollectionMetrics": {
    "ItemCollectionKey": {
      "string": {
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [  
      
```

153
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Attributes (p. 153)

The attribute values as they appeared before the PutItem operation, but only if ReturnValues is specified as ALL_OLD in the request. Each element consists of an attribute name and an attribute value.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

ConsumedCapacity (p. 153)

The capacity units consumed by the PutItem operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Read/Write Capacity Mode in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object

ItemCollectionMetrics (p. 153)

Information about item collections, if any, that were affected by the PutItem operation. ItemCollectionMetrics is only returned if the ReturnItemCollectionMetrics parameter was specified. If the table does not have any local secondary indexes, this information is not returned in the response.

Each ItemCollectionMetrics element consists of:

- ItemCollectionKey - The partition key value of the item collection. This is the same as the partition key value of the item itself.
- SizeEstimateRangeGB - An estimate of item collection size, in gigabytes. This value is a two-element array containing a lower bound and an upper bound for the estimate. The estimate includes the size of all the items in the table, plus the size of all attributes projected into all of the local secondary indexes on that table. Use this estimate to measure whether a local secondary index is approaching its size limit.

The estimate is subject to change over time; therefore, do not rely on the precision or accuracy of the estimate.

Type: ItemCollectionMetrics (p. 428) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**ConditionalCheckFailedException**

A condition specified in the operation could not be evaluated.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**ItemCollectionSizeLimitExceededException**

An item collection is too large. This exception is only returned for tables that have one or more local secondary indexes.

HTTP Status Code: 400

**ProvisionedThroughputExceededException**

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

**RequestLimitExceeded**

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

**TransactionConflictException**

Operation was rejected because there is an ongoing transaction for the item.

HTTP Status Code: 400

Examples

Put an Item

The following example puts a new item into the Thread table, but only if there is not already an item in the table with the same key.

**Sample Request**

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>.
Accept-Encoding: identity
```
PutItem

```json
{
  "TableName": "Thread",
  "Item": {
    "LastPostDateTime": {
      "S": "201303190422"
    },
    "Tags": {
      "SS": ["Update","Multiple Items","HelpMe"]
    },
    "ForumName": {
      "S": "Amazon DynamoDB"
    },
    "Message": {
      "S": "I want to update multiple items in a single call. What\'s the best way to do that?"
    },
    "Subject": {
      "S": "How do I update multiple items?"
    },
    "LastPostedBy": {
      "S": "fred@example.com"
    }
  },
  "ConditionExpression": "ForumName <> :f and Subject <> :s",
  "ExpressionAttributeValues": {
    ":f": {"S": "Amazon DynamoDB"},
    ":s": {"S": "How do I update multiple items?"}
  }
}
```

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

```
{}
```

Query
Service: Amazon DynamoDB

You must provide the name of the partition key attribute and a single value for that attribute. Query returns all items with that partition key value. Optionally, you can provide a sort key attribute and use a comparison operator to refine the search results.

Use the KeyConditionExpression parameter to provide a specific value for the partition key. The Query operation will return all of the items from the table or index with that partition key value. You can optionally narrow the scope of the Query operation by specifying a sort key value and a comparison operator in KeyConditionExpression. To further refine the Query results, you can optionally provide a FilterExpression. A FilterExpression determines which items within the results should be returned to you. All of the other results are discarded.

A Query operation always returns a result set. If no matching items are found, the result set will be empty. Queries that do not return results consume the minimum number of read capacity units for that type of read operation.

Note
DynamoDB calculates the number of read capacity units consumed based on item size, not on the amount of data that is returned to an application. The number of capacity units consumed will be the same whether you request all of the attributes (the default behavior) or just some of them (using a projection expression). The number will also be the same whether or not you use a FilterExpression.

Query results are always sorted by the sort key value. If the data type of the sort key is Number, the results are returned in numeric order; otherwise, the results are returned in order of UTF-8 bytes. By default, the sort order is ascending. To reverse the order, set the ScanIndexForward parameter to false.

A single Query operation will read up to the maximum number of items set (if using the Limit parameter) or a maximum of 1 MB of data and then apply any filtering to the results using FilterExpression. If LastEvaluatedKey is present in the response, you will need to paginate the result set. For more information, see Paginating the Results in the Amazon DynamoDB Developer Guide.

FilterExpression is applied after a Query finishes, but before the results are returned. A FilterExpression cannot contain partition key or sort key attributes. You need to specify those attributes in the KeyConditionExpression.

Note
A Query operation can return an empty result set and a LastEvaluatedKey if all the items read for the page of results are filtered out.

You can query a table, a local secondary index, or a global secondary index. For a query on a table or on a local secondary index, you can set the ConsistentRead parameter to true and obtain a strongly consistent result. Global secondary indexes support eventually consistent reads only, so do not specify ConsistentRead when querying a global secondary index.

Request Syntax

```json
{
  "AttributesToGet": [ "string" ],
  "ConditionalOperator": "string",
  "ConsistentRead": boolean,
  "ExclusiveStartKey": {
    "string": {
      "B": blob,
      "BOOL": boolean,
```
"BS": [ "blob" ],
"L": [ 
  "AttributeValue"
],
"M": { 
  "string" : "AttributeValue"
},
"N": "string",
"NS": [ "string" ],
"NULL": boolean,
"S": "string",
"SS": [ "string" ]
}
],
"ExpressionAttributeNames": { 
  "string" : "string"
},
"ExpressionAttributeValues": { 
  "string" : { 
    "B": blob,
    "BOOL": boolean,
    "BS": [ "blob" ],
    "L": [ 
      "AttributeValue"
    ],
    "M": { 
      "string" : "AttributeValue"
    },
    "N": "string",
    "NS": [ "string" ],
    "NULL": boolean,
    "S": "string",
    "SS": [ "string" ]
  }
},
"FilterExpression": "string",
"IndexName": "string",
"KeyConditionExpression": "string",
"KeyConditions": { 
  "string" : { 
    "AttributeValueList": [ 
    { 
      "B": blob,
      "BOOL": boolean,
      "BS": [ "blob" ],
      "L": [ 
        "AttributeValue"
      ],
      "M": { 
        "string" : "AttributeValue"
      },
      "N": "string",
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
    }
  },
  "ComparisonOperator": "string"
} },
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 158)**

The name of the table containing the requested items.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**AttributesToGet (p. 158)**

This is a legacy parameter. Use ProjectionExpression instead. For more information, see AttributesToGet in the Amazon DynamoDB Developer Guide.

Type: Array of strings

Array Members: Minimum number of 1 item.

Length Constraints: Maximum length of 65535.

Required: No

**ConditionalOperator (p. 158)**

This is a legacy parameter. Use FilterExpression instead. For more information, see ConditionalOperator in the Amazon DynamoDB Developer Guide.
Type: String
Valid Values: AND | OR
Required: No

**ConsistentRead (p. 158)**
Determines the read consistency model: If set to true, then the operation uses strongly consistent reads; otherwise, the operation uses eventually consistent reads.

Strongly consistent reads are not supported on global secondary indexes. If you query a global secondary index with ConsistentRead set to true, you will receive a ValidationException.

Type: Boolean
Required: No

**ExclusiveStartKey (p. 158)**
The primary key of the first item that this operation will evaluate. Use the value that was returned for LastEvaluatedKey in the previous operation.

The data type for ExclusiveStartKey must be String, Number, or Binary. No set data types are allowed.

Type: String to AttributeValue (p. 349) object map
Key Length Constraints: Maximum length of 65535.
Required: No

**ExpressionAttributeNames (p. 158)**
One or more substitution tokens for attribute names in an expression. The following are some use cases for using ExpressionAttributeNames:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
- To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

- Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify the following for ExpressionAttributeNames:

- {"#P":"Percentile"}

You could then use this substitution in an expression, as in this example:

- #P = :val

**Note**
Tokens that begin with the : character are *expression attribute values*, which are placeholders for the actual value at runtime.

For more information on expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.
Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

ExpressionAttributeValues (p. 158)

One or more values that can be substituted in an expression.

Use the : (colon) character in an expression to dereference an attribute value. For example, suppose that you wanted to check whether the value of the ProductStatus attribute was one of the following:

Available | Backordered | Discontinued

You would first need to specify ExpressionAttributeValues as follows:

```
{:avail:{"S":"Available"}, :back:{"S":"Backordered"}, :disc:{"S":"Discontinued"}
```

You could then use these values in an expression, such as this:

`ProductStatus IN (:avail, :back, :disc)`

For more information on expression attribute values, see Specifying Conditions in the Amazon DynamoDB Developer Guide.

Type: String to AttributeValue (p. 349) object map

Required: No

FilterExpression (p. 158)

A string that contains conditions that DynamoDB applies after the Query operation, but before the data is returned to you. Items that do not satisfy the FilterExpression criteria are not returned.

A FilterExpression does not allow key attributes. You cannot define a filter expression based on a partition key or a sort key.

Note

A FilterExpression is applied after the items have already been read; the process of filtering does not consume any additional read capacity units.

For more information, see Filter Expressions in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

IndexName (p. 158)

The name of an index to query. This index can be any local secondary index or global secondary index on the table. Note that if you use the IndexName parameter, you must also provide TableName.

Type: String

Pattern: [a-zA-Z0-9_]++

Required: No
**KeyConditionExpression (p. 158)**

The condition that specifies the key values for items to be retrieved by the Query action.

The condition must perform an equality test on a single partition key value.

The condition can optionally perform one of several comparison tests on a single sort key value. This allows Query to retrieve one item with a given partition key value and sort key value, or several items that have the same partition key value but different sort key values.

The partition key equality test is required, and must be specified in the following format:

```
partitionKeyName = :partitionkeyval
```

If you also want to provide a condition for the sort key, it must be combined using AND with the condition for the sort key. Following is an example, using the = comparison operator for the sort key:

```
partitionKeyName = :partitionkeyval AND sortKeyName = :sortkeyval
```

Valid comparisons for the sort key condition are as follows:

- `sortKeyName = :sortkeyval` - true if the sort key value is equal to :sortkeyval.
- `sortKeyName < :sortkeyval` - true if the sort key value is less than :sortkeyval.
- `sortKeyName <= :sortkeyval` - true if the sort key value is less than or equal to :sortkeyval.
- `sortKeyName > :sortkeyval` - true if the sort key value is greater than :sortkeyval.
- `sortKeyName >= :sortkeyval` - true if the sort key value is greater than or equal to :sortkeyval.
- `sortKeyName BETWEEN :sortkeyval1 AND :sortkeyval2` - true if the sort key value is greater than or equal to :sortkeyval1, and less than or equal to :sortkeyval2.
- `begins_with ( sortKeyName, :sortkeyval )` - true if the sort key value begins with a particular operand. (You cannot use this function with a sort key that is of type Number.) Note that the function name `begins_with` is case-sensitive.

Use the ExpressionAttributeValues parameter to replace tokens such as :partitionkeyval and :sortkeyval with actual values at runtime.

You can optionally use the ExpressionAttributeNames parameter to replace the names of the partition key and sort key with placeholder tokens. This option might be necessary if an attribute name conflicts with a DynamoDB reserved word. For example, the following KeyConditionExpression parameter causes an error because Size is a reserved word:

```
Size = :myval
```

To work around this, define a placeholder (such a #S) to represent the attribute name Size. KeyConditionExpression then is as follows:

```
#S = :myval
```

For a list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide.

For more information on ExpressionAttributeNames and ExpressionAttributeValues, see Using Placeholders for Attribute Names and Values in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**KeyConditions (p. 158)**

This is a legacy parameter. Use KeyConditionExpression instead. For more information, see KeyConditions in the Amazon DynamoDB Developer Guide.
Type: String to Condition (p. 375) object map

Key Length Constraints: Maximum length of 65535.

Required: No

**Limit (p. 158)**

The maximum number of items to evaluate (not necessarily the number of matching items). If DynamoDB processes the number of items up to the limit while processing the results, it stops the operation and returns the matching values up to that point, and a key in LastEvaluatedKey to apply in a subsequent operation, so that you can pick up where you left off. Also, if the processed dataset size exceeds 1 MB before DynamoDB reaches this limit, it stops the operation and returns the matching values up to the limit, and a key in LastEvaluatedKey to apply in a subsequent operation to continue the operation. For more information, see Query and Scan in the Amazon DynamoDB Developer Guide.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

**ProjectionExpression (p. 158)**

A string that identifies one or more attributes to retrieve from the table. These attributes can include scalars, sets, or elements of a JSON document. The attributes in the expression must be separated by commas.

If no attribute names are specified, then all attributes will be returned. If any of the requested attributes are not found, they will not appear in the result.

For more information, see Accessing Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**QueryFilter (p. 158)**

This is a legacy parameter. Use FilterExpression instead. For more information, see QueryFilter in the Amazon DynamoDB Developer Guide.

Type: String to Condition (p. 375) object map

Key Length Constraints: Maximum length of 65535.

Required: No

**ReturnConsumedCapacity (p. 158)**

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.
• NONE - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

**ScanIndexForward (p. 158)**

Specifies the order for index traversal: If true (default), the traversal is performed in ascending order; if false, the traversal is performed in descending order.

Items with the same partition key value are stored in sorted order by sort key. If the sort key data type is Number, the results are stored in numeric order. For type String, the results are stored in order of UTF-8 bytes. For type Binary, DynamoDB treats each byte of the binary data as unsigned.

If ScanIndexForward is true, DynamoDB returns the results in the order in which they are stored (by sort key value). This is the default behavior. If ScanIndexForward is false, DynamoDB reads the results in reverse order by sort key value, and then returns the results to the client.

Type: Boolean

Required: No

**Select (p. 158)**

The attributes to be returned in the result. You can retrieve all item attributes, specific item attributes, the count of matching items, or in the case of an index, some or all of the attributes projected into the index.

• ALL_ATTRIBUTES - Returns all of the item attributes from the specified table or index. If you query a local secondary index, then for each matching item in the index, DynamoDB fetches the entire item from the parent table. If the index is configured to project all item attributes, then all of the data can be obtained from the local secondary index, and no fetching is required.

• ALL_PROJECTED_ATTRIBUTES - Allowed only when querying an index. Retrieves all attributes that have been projected into the index. If the index is configured to project all attributes, this return value is equivalent to specifying ALL_ATTRIBUTES.

• COUNT - Returns the number of matching items, rather than the matching items themselves.

• SPECIFIC_ATTRIBUTES - Returns only the attributes listed in ProjectionExpression. This return value is equivalent to specifying ProjectionExpression without specifying any value for Select.

If you query or scan a local secondary index and request only attributes that are projected into that index, the operation will read only the index and not the table. If any of the requested attributes are not projected into the local secondary index, DynamoDB fetches each of these attributes from the parent table. This extra fetching incurs additional throughput cost and latency.

If you query or scan a global secondary index, you can only request attributes that are projected into the index. Global secondary index queries cannot fetch attributes from the parent table.

If neither Select nor ProjectionExpression are specified, DynamoDB defaults to ALL_ATTRIBUTES when accessing a table, and ALL_PROJECTED_ATTRIBUTES when accessing an index. You cannot use both Select and ProjectionExpression together in a single request, unless the value for Select is SPECIFIC_ATTRIBUTES. (This usage is equivalent to specifying ProjectionExpression without any value for Select.)

**Note**

If you use the ProjectionExpression parameter, then the value for Select can only be SPECIFIC_ATTRIBUTES. Any other value for Select will return an error.
Type: String

Valid Values: ALL_ATTRIBUTES | ALL_PROJECTED_ATTRIBUTES | SPECIFIC_ATTRIBUTES | COUNT

Required: No

Response Syntax

```json
{
  "ConsumedCapacity": {
    "CapacityUnits": number,
    "GlobalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "LocalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "ReadCapacityUnits": number,
    "Table": {
      "CapacityUnits": number,
      "ReadCapacityUnits": number,
      "WriteCapacityUnits": number
    },
    "TableName": "string",
    "WriteCapacityUnits": number
  },
  "Count": number,
  "Items": [
    {
      "string": {
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [
          "AttributeValue"
        ],
        "M": {
          "string": "AttributeValue"
        },
        "N": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
      }
    }
  ],
  "LastEvaluatedKey": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [ "AttributeValue"
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ConsumedCapacity (p. 166)**

The capacity units consumed by the Query operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Provisioned Throughput in the *Amazon DynamoDB Developer Guide*.

Type: ConsumedCapacity (p. 380) object

**Count (p. 166)**

The number of items in the response.

If you used a QueryFilter in the request, then Count is the number of items returned after the filter was applied, and ScannedCount is the number of matching items before the filter was applied.

If you did not use a filter in the request, then Count and ScannedCount are the same.

Type: Integer

**Items (p. 166)**

An array of item attributes that match the query criteria. Each element in this array consists of an attribute name and the value for that attribute.

Type: Array of string to AttributeValue (p. 349) object maps

Key Length Constraints: Maximum length of 65535.

**LastEvaluatedKey (p. 166)**

The primary key of the item where the operation stopped, inclusive of the previous result set. Use this value to start a new operation, excluding this value in the new request.

If LastEvaluatedKey is empty, then the "last page" of results has been processed and there is no more data to be retrieved.

If LastEvaluatedKey is not empty, it does not necessarily mean that there is more data in the result set. The only way to know when you have reached the end of the result set is when LastEvaluatedKey is empty.
Type: String to `AttributeValue (p. 349)` object map

Key Length Constraints: Maximum length of 65535.

**ScannedCount (p. 166)**

The number of items evaluated, before any `QueryFilter` is applied. A high `ScannedCount` value with few, or no, `Count` results indicates an inefficient `Query` operation. For more information, see `Count` and `ScannedCount` in the *Amazon DynamoDB Developer Guide*.

If you did not use a filter in the request, then `ScannedCount` is the same as `Count`.

Type: Integer

**Errors**

For information about the errors that are common to all actions, see `Common Errors (p. 541)`.

**InternalServer**

An error occurred on the server side.

HTTP Status Code: 500

**ProvisionedThroughputExceeded**

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to `Error Retries and Exponential Backoff` in the *Amazon DynamoDB Developer Guide*.

HTTP Status Code: 400

**RequestLimitExceeded**

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be `ACTIVE`.

HTTP Status Code: 400

**Examples**

**Retrieve a Range of Items**

The following example queries the `Reply` table for replies in a forum that were posted by particular users. There is a local secondary index on the `Reply` table, `PostedBy-Index`, to facilitate fast lookups on these attributes.

The `ProjectionExpression` parameter determines which attributes are returned.

**Sample Request**

```
POST / HTTP/1.1
```
Query

Sample Request

POST / HTTP/1.1
Host: dynamodb.<region>.<domain>
Accept-Encoding: identity
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>, Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.Query

{
  "TableName": "Reply",
  "IndexName": "PostedBy-Index",
  "Limit": 3,
  "ConsistentRead": true,
  "ProjectionExpression": "Id, PostedBy, ReplyDateTime",
  "KeyConditionExpression": "Id = :v1 AND PostedBy BETWEEN :v2a AND :v2b",
  "ExpressionAttributeValues": {
    ":v1": {"S": "Amazon DynamoDB#DynamoDB Thread 1"},
    ":v2a": {"S": "User A"},
    ":v2b": {"S": "User C"}
  },
  "ReturnConsumedCapacity": "TOTAL"
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

{
  "ConsumedCapacity": {
    "CapacityUnits": 1,
    "TableName": "Reply"
  },
  "Count": 2,
  "Items": [
    {
      "ReplyDateTime": {"S": "2015-02-18T20:27:36.165Z"},
      "PostedBy": {"S": "User A"},
      "Id": {"S": "Amazon DynamoDB#DynamoDB Thread 1"}
    },
    {
      "ReplyDateTime": {"S": "2015-02-25T20:27:36.165Z"},
      "PostedBy": {"S": "User B"},
      "Id": {"S": "Amazon DynamoDB#DynamoDB Thread 1"}
    }
  ],
  "ScannedCount": 2
}

Count Items

The following example returns the number of items in the Thread table for a particular forum.

Sample Request

POST / HTTP/1.1
Host: dynamodb.<region>.<domain>
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>, Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.Query

{
    "TableName": "Thread",
    "ConsistentRead": true,
    "KeyConditionExpression": "ForumName = :val",
    "ExpressionAttributeValues": {
        ":val": {"S": "Amazon DynamoDB"}
    }
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Date: <Date>

{
    "Count":2,
    "ScannedCount":2
}

RestoreTableFromBackup
Service: Amazon DynamoDB

Creates a new table from an existing backup. Any number of users can execute up to 4 concurrent restores (any type of restore) in a given account.

You can call RestoreTableFromBackup at a maximum rate of 10 times per second.

You must manually set up the following on the restored table:

- Auto scaling policies
- IAM policies
- Amazon CloudWatch metrics and alarms
- Tags
- Stream settings
- Time to Live (TTL) settings

Request Syntax

```json
{
  "BackupArn": "string",
  "BillingModeOverride": "string",
  "GlobalSecondaryIndexOverride": [
    {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      },

  "ProvisionedThroughputOverride": {
    "ReadCapacityUnits": number,
    "WriteCapacityUnits": number
  }
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**BackupArn (p. 171)**

The Amazon Resource Name (ARN) associated with the backup.

Type: String

Required: Yes

**TargetTableName (p. 171)**

The name of the new table to which the backup must be restored.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**BillingModeOverride (p. 171)**

The billing mode of the restored table.

Type: String

Valid Values: PROVISIONED | PAY_PER_REQUEST

Required: No

**GlobalSecondaryIndexOverride (p. 171)**

List of global secondary indexes for the restored table. The indexes provided should match existing secondary indexes. You can choose to exclude some or all of the indexes at the time of restore.

Type: Array of GlobalSecondaryIndex (p. 409) objects

Required: No

**LocalSecondaryIndexOverride (p. 171)**

List of local secondary indexes for the restored table. The indexes provided should match existing secondary indexes. You can choose to exclude some or all of the indexes at the time of restore.

Type: Array of LocalSecondaryIndex (p. 435) objects

Required: No
**ProvisionedThroughputOverride (p. 171)**

Provisioned throughput settings for the restored table.

Type: `ProvisionedThroughput (p. 445)` object

Required: No

**SSESpecificationOverride (p. 171)**

The new server-side encryption settings for the restored table.

Type: `SSESpecification (p. 480)` object

Required: No

**Response Syntax**

```json
{
    "TableDescription": {
        "ArchivalSummary": {
            "ArchivalBackupArn": "string",
            "ArchivalDateTime": number,
            "ArchivalReason": "string"
        },
        "AttributeDefinitions": [
            {
                "AttributeName": "string",
                "AttributeType": "string"
            }
        ],
        "BillingModeSummary": {
            "BillingMode": "string",
            "LastUpdateToPayPerRequestDateTime": number
        },
        "CreationDateTime": number,
        "GlobalSecondaryIndexes": [
            {
                "Backfilling": boolean,
                "IndexArn": "string",
                "IndexName": "string",
                "IndexSizeBytes": number,
                "IndexStatus": "string",
                "ItemCount": number,
                "KeySchema": [
                    {
                        "AttributeName": "string",
                        "KeyType": "string"
                    }
                ],
                "Projection": {
                    "NonKeyAttributes": [ "string" ],
                    "ProjectionType": "string"
                },
                "ProvisionedThroughput": {
                    "LastDecreaseDateTime": number,
                    "LastIncreaseDateTime": number,
                    "NumberOfDecreasesToday": number,
                    "ReadCapacityUnits": number,
                    "WriteCapacityUnits": number
                }
            }
        ],
        "GlobalTableVersion": "string"
    }
}
```
"ItemCount": number,

  "LastUpdateDateTime": number,
  "TableClass": string
},
"TableId": string,
"TableName": string,
"TableSizeBytes": number,
"TableStatus": string
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

TableDescription (p. 173)

The description of the table created from an existing backup.

Type: TableDescription (p. 486) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

BackupInUseException

There is another ongoing conflicting backup control plane operation on the table. The backup is either being created, deleted or restored to a table.

HTTP Status Code: 400

BackupNotFoundException

Backup not found for the given BackupARN.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

LimitExceeded Exception

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.
The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400
**TableAlreadyExistsException**

A target table with the specified name already exists.

HTTP Status Code: 400
**TableInUseException**

A target table with the specified name is either being created or deleted.

HTTP Status Code: 400

RestoreTableToPointInTime

Service: Amazon DynamoDB

Restores the specified table to the specified point in time within EarliestRestorableDateTime and LatestRestorableDateTime. You can restore your table to any point in time during the last 35 days. Any number of users can execute up to 4 concurrent restores (any type of restore) in a given account.

When you restore using point in time recovery, DynamoDB restores your table data to the state based on the selected date and time (day:hour:minute:second) to a new table.

Along with data, the following are also included on the new restored table using point in time recovery:

- Global secondary indexes (GSIs)
- Local secondary indexes (LSIs)
- Provisioned read and write capacity
- Encryption settings

**Important**

All these settings come from the current settings of the source table at the time of restore.

You must manually set up the following on the restored table:

- Auto scaling policies
- IAM policies
- Amazon CloudWatch metrics and alarms
- Tags
- Stream settings
- Time to Live (TTL) settings
- Point in time recovery settings

**Request Syntax**

```json
{
  "BillingModeOverride": "string",
  "GlobalSecondaryIndexOverride": [
    {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      },
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  ],
  "LocalSecondaryIndexOverride": [
    {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      },
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  ]
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**TargetTableName (p. 177)**

The name of the new table to which it must be restored to.

Type: String

Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**BillingModeOverride (p. 177)**

The billing mode of the restored table.

Type: String

Valid Values: `PROVISIONED` | `PAY_PER_REQUEST`

Required: No

**GlobalSecondaryIndexOverride (p. 177)**

List of global secondary indexes for the restored table. The indexes provided should match existing secondary indexes. You can choose to exclude some or all of the indexes at the time of restore.

Type: Array of `GlobalSecondaryIndex (p. 409)` objects

Required: No
LocalSecondaryIndexOverride (p. 177)
List of local secondary indexes for the restored table. The indexes provided should match existing secondary indexes. You can choose to exclude some or all of the indexes at the time of restore.

Type: Array of LocalSecondaryIndex (p. 435) objects
Required: No

ProvisionedThroughputOverride (p. 177)
Provisioned throughput settings for the restored table.

Type: ProvisionedThroughput (p. 445) object
Required: No

RestoreDateTime (p. 177)
Time in the past to restore the table to.

Type: Timestamp
Required: No

SourceTableArn (p. 177)
The DynamoDB table that will be restored. This value is an Amazon Resource Name (ARN).

Type: String
Required: No

Pattern: [a-zA-Z0-9_.-]+
Required: No

SourceTableName (p. 177)
Name of the source table that is being restored.

Type: String

Pattern: [a-zA-Z0-9_.-]+
Required: No

SSESpecificationOverride (p. 177)
The new server-side encryption settings for the restored table.

Type: SSESpecification (p. 480) object
Required: No

UseLatestRestorableTime (p. 177)
Restore the table to the latest possible time. LatestRestorableDateTime is typically 5 minutes before the current time.

Type: Boolean
Required: No

Response Syntax

```

  "LastUpdateDateTime": number,
  "TableClass": "string"
},
"TableId": "string",
"TableName": "string",
"TableSizeBytes": number,
"TableStatus": "string"}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TableDescription (p. 179)**

- Represents the properties of a table.
- Type: TableDescription (p. 486) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerError**

- An error occurred on the server side.
- HTTP Status Code: 500

**InvalidRestoreTimeException**

- An invalid restore time was specified. RestoreDateTime must be between EarliestRestorableDateTime and LatestRestorableDateTime.
- HTTP Status Code: 400

**LimitExceedededException**

- There is no limit to the number of daily on-demand backups that can be taken.
- Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.
- The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.
- There is a soft account quota of 2,500 tables.
- HTTP Status Code: 400

**PointInTimeRecoveryUnavailableException**

- Point in time recovery has not yet been enabled for this source table.
- HTTP Status Code: 400

**TableAlreadyExistsException**

- A target table with the specified name already exists.
- HTTP Status Code: 400

**TableInUseException**

- A target table with the specified name is either being created or deleted.
- HTTP Status Code: 400
TableNotFoundException

A source table with the name TableName does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

Scan
Service: Amazon DynamoDB

The Scan operation returns one or more items and item attributes by accessing every item in a table or a secondary index. To have DynamoDB return fewer items, you can provide a FilterExpression operation.

If the total number of scanned items exceeds the maximum dataset size limit of 1 MB, the scan stops and results are returned to the user as a LastEvaluatedKey value to continue the scan in a subsequent operation. The results also include the number of items exceeding the limit. A scan can result in no table data meeting the filter criteria.

A single Scan operation reads up to the maximum number of items set (if using the Limit parameter) or a maximum of 1 MB of data and then apply any filtering to the results using FilterExpression. If LastEvaluatedKey is present in the response, you need to paginate the result set. For more information, see Paginating the Results in the Amazon DynamoDB Developer Guide.

Scan operations proceed sequentially; however, for faster performance on a large table or secondary index, applications can request a parallel Scan operation by providing the Segment and TotalSegments parameters. For more information, see Parallel Scan in the Amazon DynamoDB Developer Guide.

Scan uses eventually consistent reads when accessing the data in a table; therefore, the result set might not include the changes to data in the table immediately before the operation began. If you need a consistent copy of the data, as of the time that the Scan begins, you can set the ConsistentRead parameter to true.

Request Syntax

```json
{
  "AttributesToGet": [ "string" ],
  "ConditionalOperator": "string",
  "ConsistentRead": boolean,
  "ExclusiveStartKey": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [ "AttributeValue"
    },
    "M": {
      "string": "AttributeValue"
    },
    "N": "string",
    "NS": [ "string" ],
    "NULL": boolean,
    "S": "string",
    "SS": [ "string" ]
  },
  "ExpressionAttributeNames": {
    "string": "string"
  },
  "ExpressionAttributeValues": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [ "AttributeValue"
    }
}
```
The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 184)**

The name of the table containing the requested items; or, if you provide IndexName, the name of the table to which that index belongs.

Type: String

Pattern: [a-zA-Z0-9_-]*

Required: Yes
AttributesToGet (p. 184)

This is a legacy parameter. Use ProjectionExpression instead. For more information, see AttributesToGet in the Amazon DynamoDB Developer Guide.

Type: Array of strings

Array Members: Minimum number of 1 item.

Length Constraints: Maximum length of 65535.

Required: No

ConditionalOperator (p. 184)

This is a legacy parameter. Use FilterExpression instead. For more information, see ConditionalOperator in the Amazon DynamoDB Developer Guide.

Type: String

Valid Values: AND | OR

Required: No

ConsistentRead (p. 184)

A Boolean value that determines the read consistency model during the scan:

- If ConsistentRead is false, then the data returned from Scan might not contain the results from other recently completed write operations (PutItem, UpdateItem, or DeleteItem).
- If ConsistentRead is true, then all of the write operations that completed before the Scan began are guaranteed to be contained in the Scan response.

The default setting for ConsistentRead is false.

The ConsistentRead parameter is not supported on global secondary indexes. If you scan a global secondary index with ConsistentRead set to true, you will receive a ValidationException.

Type: Boolean

Required: No

ExclusiveStartKey (p. 184)

The primary key of the first item that this operation will evaluate. Use the value that was returned for LastEvaluatedKey in the previous operation.

The data type for ExclusiveStartKey must be String, Number or Binary. No set data types are allowed.

In a parallel scan, a Scan request that includes ExclusiveStartKey must specify the same segment whose previous Scan returned the corresponding value of LastEvaluatedKey.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: No

ExpressionAttributeNames (p. 184)

One or more substitution tokens for attribute names in an expression. The following are some use cases for using ExpressionAttributeNames:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

- Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide). To work around this, you could specify the following for ExpressionAttributeNames:

- {"#P":"Percentile"}

You could then use this substitution in an expression, as in this example:

- #P = :val

**Note**

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.

For more information on expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeValues (p. 184)**

One or more values that can be substituted in an expression.

Use the : (colon) character in an expression to dereference an attribute value. For example, suppose that you wanted to check whether the value of the ProductStatus attribute was one of the following:

Available | Backordered | Discontinued

You would first need to specify ExpressionAttributeValues as follows:

{ "avail":{"S":"Available"}, "back":{"S":"Backordered"}, "disc":
{"S":"Discontinued"} }

You could then use these values in an expression, as such:

ProductStatus IN (:avail, :back, :disc)

For more information on expression attribute values, see Condition Expressions in the Amazon DynamoDB Developer Guide.

Type: String to AttributeValue (p. 349) object map

Required: No

**FilterExpression (p. 184)**

A string that contains conditions that DynamoDB applies after the Scan operation, but before the data is returned to you. Items that do not satisfy the FilterExpression criteria are not returned.

**Note**

A FilterExpression is applied after the items have already been read; the process of filtering does not consume any additional read capacity units.
For more information, see Filter Expressions in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**IndexName (p. 184)**

The name of a secondary index to scan. This index can be any local secondary index or global secondary index. Note that if you use the IndexName parameter, you must also provide TableName.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

**Limit (p. 184)**

The maximum number of items to evaluate (not necessarily the number of matching items). If DynamoDB processes the number of items up to the limit while processing the results, it stops the operation and returns the matching values up to that point, and a key in LastEvaluatedKey to apply in a subsequent operation, so that you can pick up where you left off. Also, if the processed dataset size exceeds 1 MB before DynamoDB reaches this limit, it stops the operation and returns the matching values up to the limit, and a key in LastEvaluatedKey to apply in a subsequent operation to continue the operation. For more information, see Working with Queries in the Amazon DynamoDB Developer Guide.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

**ProjectionExpression (p. 184)**

A string that identifies one or more attributes to retrieve from the specified table or index. These attributes can include scalars, sets, or elements of a JSON document. The attributes in the expression must be separated by commas.

If no attribute names are specified, then all attributes will be returned. If any of the requested attributes are not found, they will not appear in the result.

For more information, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**ReturnConsumedCapacity (p. 184)**

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- INDEXES - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- TOTAL - The response includes only the aggregate ConsumedCapacity for the operation.

- NONE - No ConsumedCapacity details are included in the response.
Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

**ScanFilter (p. 184)**

This is a legacy parameter. Use FilterExpression instead. For more information, see ScanFilter in the Amazon DynamoDB Developer Guide.

Type: String to Condition (p. 375) object map

Key Length Constraints: Maximum length of 65535.

Required: No

**Segment (p. 184)**

For a parallel Scan request, Segment identifies an individual segment to be scanned by an application worker.

Segment IDs are zero-based, so the first segment is always 0. For example, if you want to use four application threads to scan a table or an index, then the first thread specifies a Segment value of 0, the second thread specifies 1, and so on.

The value of LastEvaluatedKey returned from a parallel Scan request must be used as ExclusiveStartKey with the same segment ID in a subsequent Scan operation.

The value for Segment must be greater than or equal to 0, and less than the value provided for TotalSegments.

If you provide Segment, you must also provide TotalSegments.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 999999.

Required: No

**Select (p. 184)**

The attributes to be returned in the result. You can retrieve all item attributes, specific item attributes, the count of matching items, or in the case of an index, some or all of the attributes projected into the index.

- ALL_ATTRIBUTES - Returns all of the item attributes from the specified table or index. If you query a local secondary index, then for each matching item in the index, DynamoDB fetches the entire item from the parent table. If the index is configured to project all item attributes, then all of the data can be obtained from the local secondary index, and no fetching is required.
- ALL_PROJECTED_ATTRIBUTES - Allowed only when querying an index. Retrieves all attributes that have been projected into the index. If the index is configured to project all attributes, this return value is equivalent to specifying ALL_ATTRIBUTES.
- COUNT - Returns the number of matching items, rather than the matching items themselves.
- SPECIFIC_ATTRIBUTES - Returns only the attributes listed in ProjectionExpression. This return value is equivalent to specifying ProjectionExpression without specifying any value for Select.

If you query or scan a local secondary index and request only attributes that are projected into that index, the operation reads only the index and not the table. If any of the requested attributes are not projected into the local secondary index, DynamoDB fetches each of these attributes from the parent table. This extra fetching incurs additional throughput cost and latency.
If you query or scan a global secondary index, you can only request attributes that are projected into the index. Global secondary index queries cannot fetch attributes from the parent table.

If neither Select nor ProjectionExpression are specified, DynamoDB defaults to ALL_ATTRIBUTES when accessing a table, and ALL_PROJECTED_ATTRIBUTES when accessing an index. You cannot use both Select and ProjectionExpression together in a single request, unless the value for Select is SPECIFIC_ATTRIBUTES. (This usage is equivalent to specifying ProjectionExpression without any value for Select.)

**Note**

If you use the ProjectionExpression parameter, then the value for Select can only be SPECIFIC_ATTRIBUTES. Any other value for Select will return an error.

**Type:** String  
**Valid Values:** ALL_ATTRIBUTES | ALL_PROJECTED_ATTRIBUTES | SPECIFIC_ATTRIBUTES | COUNT  
**Required:** No

**TotalSegments (p. 184)**

For a parallel Scan request, TotalSegments represents the total number of segments into which the Scan operation will be divided. The value of TotalSegments corresponds to the number of application workers that will perform the parallel scan. For example, if you want to use four application threads to scan a table or an index, specify a TotalSegments value of 4.

The value for TotalSegments must be greater than or equal to 1, and less than or equal to 1000000. If you specify a TotalSegments value of 1, the Scan operation will be sequential rather than parallel.

If you specify TotalSegments, you must also specify Segment.

**Type:** Integer  
**Valid Range:** Minimum value of 1. Maximum value of 1000000.  
**Required:** No

**Response Syntax**

```
{
    "ConsumedCapacity": {
        "CapacityUnits": number,
        "GlobalSecondaryIndexes": {
            "string": {
                "CapacityUnits": number,
                "ReadCapacityUnits": number,
                "WriteCapacityUnits": number
            }
        },
        "LocalSecondaryIndexes": {
            "string": {
                "CapacityUnits": number,
                "ReadCapacityUnits": number,
                "WriteCapacityUnits": number
            }
        },
        "ReadCapacityUnits": number,
        "Table": {
            "CapacityUnits": number,
```
"ReadCapacityUnits": number,

    "SS": [ "string" ]
  }
},
"LastEvaluatedKey": {
  "string": {
    "B": blob,
    "BOOL": boolean,
    "BS": [ blob ],
    "L": [
      "AttributeValue"
    ],
    "M": {
      "string": "AttributeValue"
    },
    "N": "string",
    "NS": [ "string" ],
    "NULL": boolean,
    "S": "string",
    "SS": [ "string" ]
  }
},
"ScannedCount": number
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ConsumedCapacity (p. 190)

The capacity units consumed by the Scan operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Provisioned Throughput in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object
Count (p. 190)

The number of items in the response.

If you set ScanFilter in the request, then Count is the number of items returned after the filter was applied, and ScannedCount is the number of matching items before the filter was applied.

If you did not use a filter in the request, then Count is the same as ScannedCount.

Type: Integer

Items (p. 190)

An array of item attributes that match the scan criteria. Each element in this array consists of an attribute name and the value for that attribute.

Type: Array of string to AttributeValue (p. 349) object maps

Key Length Constraints: Maximum length of 65535.

LastEvaluatedKey (p. 190)

The primary key of the item where the operation stopped, inclusive of the previous result set. Use this value to start a new operation, excluding this value in the new request.

If LastEvaluatedKey is empty, then the "last page" of results has been processed and there is no more data to be retrieved.

If LastEvaluatedKey is not empty, it does not necessarily mean that there is more data in the result set. The only way to know when you have reached the end of the result set is when LastEvaluatedKey is empty.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

ScannedCount (p. 190)

The number of items evaluated, before any ScanFilter is applied. A high ScannedCount value with few, or no, Count results indicates an inefficient Scan operation. For more information, see Count and ScannedCount in the Amazon DynamoDB Developer Guide.

If you did not use a filter in the request, then ScannedCount is the same as Count.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServer>Error

An error occurred on the server side.

HTTP Status Code: 500

ProvisionedThroughputExceededException

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.
HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

Return All Items

The following example returns all of the items in a table. No scan filter is applied.

Sample Request

POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
    Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.Scan

{  
    "TableName": "Reply",
    "ReturnConsumedCapacity": "TOTAL"
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

{  
    "ConsumedCapacity": {
        "CapacityUnits": 0.5,
        "TableName": "Reply"
    },
    "Count": 4,
    "Items": [
        {
            "PostedBy": {
                "S": "joe@example.com"
            },
            "ReplyDateTime": {
                "S": "20130320115336"
            }
        }
    ]
}
Use a Filter Expression

The following example returns only those items matching specific criteria.

Sample Request

```
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
```
Sample Response

HTTP/1.1 200 OK
x-amzn-Request-Id: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "ConsumedCapacity": {
    "CapacityUnits": 0.5,
    "TableName": "Reply"
  },
  "Count": 2,
  "Items": [
    {
      "PostedBy": {
        "S": "joe@example.com"
      },
      "ReplyDateTime": {
        "S": "20130520115336"
      },
      "Id": {
        "S": "Amazon DynamoDB#How do I update multiple items?"
      },
      "Message": {
        "S": "Have you looked at BatchWriteItem?"
      }
    },
    {
      "PostedBy": {
        "S": "joe@example.com"
      },
      "ReplyDateTime": {
        "S": "20130520115347"
      },
      "Id": {
        "S": "Amazon DynamoDB#How do I update multiple items?"
      },
      "Message": {
        "S": "BatchWriteItem is documented in the Amazon DynamoDB API Reference."
      }
    }
  ],
  "ScannedCount": 4
}

TagResource

Service: Amazon DynamoDB

Associate a set of tags with an Amazon DynamoDB resource. You can then activate these user-defined tags so that they appear on the Billing and Cost Management console for cost allocation tracking. You can call TagResource up to five times per second, per account.

For an overview on tagging DynamoDB resources, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

Request Syntax

```
{
  "ResourceArn": "string",
  "Tags": [
    {
      "Key": "string",
      "Value": "string"
    }
  ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ResourceArn (p. 197)**

Identifies the Amazon DynamoDB resource to which tags should be added. This value is an Amazon Resource Name (ARN).

Type: String

Required: Yes

**Tags (p. 197)**

The tags to be assigned to the Amazon DynamoDB resource.

Type: Array of Tag (p. 492) objects

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServerError**

An error occurred on the server side.
HTTP Status Code: 500
**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable`, `UpdateTable`, `DeleteTable`, `UpdateTimeToLive`, `RestoreTableFromBackup`, and `RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400
**ResourceInUseException**

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the **CREATING** state.

HTTP Status Code: 400
**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be **ACTIVE**.

HTTP Status Code: 400

TransactGetItems
Service: Amazon DynamoDB

TransactGetItems is a synchronous operation that atomically retrieves multiple items from one or more tables (but not from indexes) in a single account and Region. A TransactGetItems call can contain up to 100 TransactGetItem objects, each of which contains a Get structure that specifies an item to retrieve from a table in the account and Region. A call to TransactGetItems cannot retrieve items from tables in more than one AWS account or Region. The aggregate size of the items in the transaction cannot exceed 4 MB.

DynamoDB rejects the entire TransactGetItems request if any of the following is true:

- A conflicting operation is in the process of updating an item to be read.
- There is insufficient provisioned capacity for the transaction to be completed.
- There is a user error, such as an invalid data format.
- The aggregate size of the items in the transaction cannot exceed 4 MB.

Request Syntax

```
{
    "ReturnConsumedCapacity": "string",
    "TransactItems": [
        {
            "Get": {
                "ExpressionAttributeNames": {
                    "string": "string"
                },
                "Key": {
                    "string": {
                        "B": blob,
                        "BOOL": boolean,
                        "BS": [ blob ],
                        "L": [ "AttributeValue"
                    },
                    "M": {
                        "string": "AttributeValue"
                    },
                    "N": "string",
                    "NS": [ "string" ],
                    "NULL": boolean,
                    "S": "string",
                    "SS": [ "string" ]
                }
            },
            "ProjectionExpression": "string",
            "TableName": "string"
        }
    ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.
TransactItems (p. 199)

An ordered array of up to 100 TransactGetItem objects, each of which contains a Get structure.

Type: Array of TransactGetItem (p. 495) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

ReturnConsumedCapacity (p. 199)

A value of TOTAL causes consumed capacity information to be returned, and a value of NONE prevents that information from being returned. No other value is valid.

Type: String

Valid Values: INDEXES  |  TOTAL  |  NONE

Required: No

Response Syntax

```json
{
   "ConsumedCapacity": [
      {
         "CapacityUnits": number,
         "GlobalSecondaryIndexes": {
            "string": {
               "CapacityUnits": number,
               "ReadCapacityUnits": number,
               "WriteCapacityUnits": number
            }
         },
         "LocalSecondaryIndexes": {
            "string": {
               "CapacityUnits": number,
               "ReadCapacityUnits": number,
               "WriteCapacityUnits": number
            }
         },
         "ReadCapacityUnits": number,
         "Table": {
            "CapacityUnits": number,
            "ReadCapacityUnits": number,
            "WriteCapacityUnits": number
         },
         "TableName": "string",
         "WriteCapacityUnits": number
      }
   ],
   "Responses": [
      {
         "Item": {
            "string": {
               "B": blob,
               "BOOL": boolean,
               "BS": [ blob ],
               "L": [
                  "AttributeValue"
               ],
               "M": {
                  "string": "AttributeValue"
               }
            }
         }
      }
   ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

ConsumedCapacity (p. 200)

If the ReturnConsumedCapacity value was TOTAL, this is an array of ConsumedCapacity objects, one for each table addressed by TransactGetItem objects in the TransactItems parameter. These ConsumedCapacity objects report the read-capacity units consumed by the TransactGetItems call in that table.

Type: Array of ConsumedCapacity (p. 380) objects

Responses (p. 200)

An ordered array of up to 100 ItemResponse objects, each of which corresponds to the TransactGetItem object in the same position in the TransactItems array. Each ItemResponse object contains a Map of the name-value pairs that are the projected attributes of the requested item.

If a requested item could not be retrieved, the corresponding ItemResponse object is Null, or if the requested item has no projected attributes, the corresponding ItemResponse object is an empty Map.

Type: Array of ItemResponse (p. 429) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ProvisionedThroughputExceeded

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400
RequestLimitExceeded
Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException
The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

TransactionCanceledException
The entire transaction request was canceled.

DynamoDB cancels a TransactWriteItems request under the following circumstances:
• A condition in one of the condition expressions is not met.
• A table in the TransactWriteItems request is in a different account or region.
• More than one action in the TransactWriteItems operation targets the same item.
• There is insufficient provisioned capacity for the transaction to be completed.
• An item size becomes too large (larger than 400 KB), or a local secondary index (LSI) becomes too large, or a similar validation error occurs because of changes made by the transaction.
• There is a user error, such as an invalid data format.

DynamoDB cancels a TransactGetItems request under the following circumstances:
• There is an ongoing TransactGetItems operation that conflicts with a concurrent PutItem, UpdateItem, DeleteItem or TransactWriteItems request. In this case the TransactGetItems operation fails with a TransactionCanceledException.
• A table in the TransactGetItems request is in a different account or region.
• There is insufficient provisioned capacity for the transaction to be completed.
• There is a user error, such as an invalid data format.

Note
If using Java, DynamoDB lists the cancellation reasons on the CancellationReasons property. This property is not set for other languages. Transaction cancellation reasons are ordered in the order of requested items, if an item has no error it will have None code and Null message.

Cancellation reason codes and possible error messages:
• No Errors:
  • Code: None
  • Message: null
• Conditional Check Failed:
  • Code: ConditionalCheckFailed
  • Message: The conditional request failed.
• Item Collection Size Limit Exceeded:
  • Code: ItemCollectionSizeLimitExceeded
  • Message: Collection size exceeded.
• Transaction Conflict:
  • Code: TransactionConflict
  • Message: Transaction is ongoing for the item.
• Provisioned Throughput Exceeded:
• Code: ProvisionedThroughputExceeded
  • Messages:
    • The level of configured provisioned throughput for the table was exceeded. Consider increasing your provisioning level with the UpdateTable API.
      
      **Note**
      This Message is received when provisioned throughput is exceeded is on a provisioned DynamoDB table.
    • The level of configured provisioned throughput for one or more global secondary indexes of the table was exceeded. Consider increasing your provisioning level for the under-provisioned global secondary indexes with the UpdateTable API.
      
      **Note**
      This message is returned when provisioned throughput is exceeded is on a provisioned GSI.
  
• Throttling Error:
  • Code: ThrottlingError
  • Messages:
    • Throughput exceeds the current capacity of your table or index. DynamoDB is automatically scaling your table or index so please try again shortly. If exceptions persist, check if you have a hot key: https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/bp-partition-key-design.html.
      
      **Note**
      This message is returned when writes get throttled on an On-Demand table as DynamoDB is automatically scaling the table.
    • Throughput exceeds the current capacity for one or more global secondary indexes. DynamoDB is automatically scaling your index so please try again shortly.
      
      **Note**
      This message is returned when when writes get throttled on an On-Demand GSI as DynamoDB is automatically scaling the GSI.
  
• Validation Error:
  • Code: ValidationException
  • Messages:
    • One or more parameter values were invalid.
    • The update expression attempted to update the secondary index key beyond allowed size limits.
    • The update expression attempted to update the secondary index key to unsupported type.
    • An operand in the update expression has an incorrect data type.
    • Item size to update has exceeded the maximum allowed size.
    • Number overflow. Attempting to store a number with magnitude larger than supported range.
    • Type mismatch for attribute to update.
    • Nesting Levels have exceeded supported limits.
    • The document path provided in the update expression is invalid for update.
    • The provided expression refers to an attribute that does not exist in the item.

HTTP Status Code: 400

TransactWriteItems

Service: Amazon DynamoDB

TransactWriteItems is a synchronous write operation that groups up to 100 action requests. These actions can target items in different tables, but not in different AWS accounts or Regions, and no two actions can target the same item. For example, you cannot both ConditionCheck and Update the same item. The aggregate size of the items in the transaction cannot exceed 4 MB.

The actions are completed atomically so that either all of them succeed, or all of them fail. They are defined by the following objects:

- **Put** — Initiates a PutItem operation to write a new item. This structure specifies the primary key of the item to be written, the name of the table to write it in, an optional condition expression that must be satisfied for the write to succeed, a list of the item’s attributes, and a field indicating whether to retrieve the item’s attributes if the condition is not met.

- **Update** — Initiates an UpdateItem operation to update an existing item. This structure specifies the primary key of the item to be updated, the name of the table where it resides, an optional condition expression that must be satisfied for the update to succeed, an expression that defines one or more attributes to be updated, and a field indicating whether to retrieve the item’s attributes if the condition is not met.

- **Delete** — Initiates a DeleteItem operation to delete an existing item. This structure specifies the primary key of the item to be deleted, the name of the table where it resides, an optional condition expression that must be satisfied for the deletion to succeed, and a field indicating whether to retrieve the item’s attributes if the condition is not met.

- **ConditionCheck** — Applies a condition to an item that is not being modified by the transaction. This structure specifies the primary key of the item to be checked, the name of the table where it resides, a condition expression that must be satisfied for the transaction to succeed, and a field indicating whether to retrieve the item’s attributes if the condition is not met.

DynamoDB rejects the entire TransactWriteItems request if any of the following is true:

- A condition in one of the condition expressions is not met.
- An ongoing operation is in the process of updating the same item.
- There is insufficient provisioned capacity for the transaction to be completed.
- An item size becomes too large (bigger than 400 KB), a local secondary index (LSI) becomes too large, or a similar validation error occurs because of changes made by the transaction.
- The aggregate size of the items in the transaction exceeds 4 MB.
- There is a user error, such as an invalid data format.

Request Syntax

```json
{
  "ClientRequestToken": "string",
  "ReturnConsumedCapacity": "string",
  "ReturnItemCollectionMetrics": "string",
  "TransactItems": [
    {

"TableName": "string"
}
Request Parameters

The request accepts the following data in JSON format.

Note

In the following list, the required parameters are described first.

TransactItems (p. 205)

An ordered array of up to 100 TransactWriteItem objects, each of which contains a ConditionCheck, Put, Update, or Delete object. These can operate on items in different tables, but the tables must reside in the same AWS account and Region, and no two of them can operate on the same item.

Type: Array of TransactWriteItem (p. 496) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

ClientRequestToken (p. 205)

Providing a ClientRequestToken makes the call to TransactWriteItems idempotent, meaning that multiple identical calls have the same effect as a single call.
Although multiple identical calls using the same client request token produce the same result on the server (no side effects), the responses to the calls might not be the same. If the ReturnConsumedCapacity parameter is set, then the initial TransactWriteItems call returns the amount of write capacity units consumed in making the changes. Subsequent TransactWriteItems calls with the same client token return the number of read capacity units consumed in reading the item.

A client request token is valid for 10 minutes after the first request that uses it is completed. After 10 minutes, any request with the same client token is treated as a new request. Do not resubmit the same request with the same client token for more than 10 minutes, or the result might not be idempotent.

If you submit a request with the same client token but a change in other parameters within the 10-minute idempotency window, DynamoDB returns an IdempotentParameterMismatch exception.

Type: String
Required: No

**ReturnConsumedCapacity**

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- **INDEXES** - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- **TOTAL** - The response includes only the aggregate ConsumedCapacity for the operation.

- **NONE** - No ConsumedCapacity details are included in the response.

Type: String
Valid Values: INDEXES | TOTAL | NONE
Required: No

**ReturnItemCollectionMetrics**

Determines whether item collection metrics are returned. If set to SIZE, the response includes statistics about item collections (if any), that were modified during the operation and are returned in the response. If set to NONE (the default), no statistics are returned.

Type: String
Valid Values: SIZE | NONE
Required: No

**Response Syntax**

```json
{
    "ConsumedCapacity": [
        
    ]
}```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

ConsumedCapacity (p. 209)

The capacity units consumed by the entire TransactWriteItems operation. The values of the list are ordered according to the ordering of the TransactItems request parameter.

Type: Array of ConsumedCapacity (p. 380) objects
ItemCollectionMetrics (p. 209)

A list of tables that were processed by TransactWriteItems and, for each table, information about any item collections that were affected by individual UpdateItem, PutItem, or DeleteItem operations.

Type: String to array of ItemCollectionMetrics (p. 428) objects map

Key Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

IdempotentParameterMismatchException

DynamoDB rejected the request because you retried a request with a different payload but with an idempotent token that was already used.

HTTP Status Code: 400

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ProvisionedThroughputExceeded Exception

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

RequestLimitExceeded

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

TransactionCanceledException

The entire transaction request was canceled.

DynamoDB cancels a TransactWriteItems request under the following circumstances:

- A condition in one of the condition expressions is not met.
- A table in the TransactWriteItems request is in a different account or region.
- More than one action in the TransactWriteItems operation targets the same item.
- There is insufficient provisioned capacity for the transaction to be completed.
• An item size becomes too large (larger than 400 KB), or a local secondary index (LSI) becomes too large, or a similar validation error occurs because of changes made by the transaction.
• There is a user error, such as an invalid data format.

DynamoDB cancels a TransactGetItems request under the following circumstances:
• There is an ongoing TransactGetItems operation that conflicts with a concurrent PutItem, UpdateItem, DeleteItem or TransactWriteItems request. In this case the TransactGetItems operation fails with a TransactionCanceledException.
• A table in the TransactGetItems request is in a different account or region.
• There is insufficient provisioned capacity for the transaction to be completed.
• There is a user error, such as an invalid data format.

Note
If using Java, DynamoDB lists the cancellation reasons on the CancellationReasons property. This property is not set for other languages. Transaction cancellation reasons are ordered in the order of requested items, if an item has no error it will have None code and Null message.

Cancellation reason codes and possible error messages:
• No Errors:
  • Code: None
  • Message: null
• Conditional Check Failed:
  • Code: ConditionalCheckFailed
  • Message: The conditional request failed.
• Item Collection Size Limit Exceeded:
  • Code: ItemCollectionSizeLimitExceeded
  • Message: Collection size exceeded.
• Transaction Conflict:
  • Code: TransactionConflict
  • Message: Transaction is ongoing for the item.
• Provisioned Throughput Exceeded:
  • Code: ProvisionedThroughputExceeded
  • Messages:
    • The level of configured provisioned throughput for the table was exceeded. Consider increasing your provisioning level with the UpdateTable API.

  Note
  This Message is received when provisioned throughput is exceeded is on a provisioned DynamoDB table.
  • The level of configured provisioned throughput for one or more global secondary indexes of the table was exceeded. Consider increasing your provisioning level for the under-provisioned global secondary indexes with the UpdateTable API.

  Note
  This message is returned when provisioned throughput is exceeded is on a provisioned GSI.
• Throttling Error:
  • Code: ThrottlingError
  • Messages:
    • Throughput exceeds the current capacity of your table or index. DynamoDB is automatically scaling your table or index so please try again shortly. If exceptions persist, check if you have
a hot key: https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/bp-partition-key-design.html.

**Note**
This message is returned when writes get throttled on an On-Demand table as DynamoDB is automatically scaling the table.

- Throughput exceeds the current capacity for one or more global secondary indexes. DynamoDB is automatically scaling your index so please try again shortly.

**Note**
This message is returned when writes get throttled on an On-Demand GSI as DynamoDB is automatically scaling the GSI.

- Validation Error:
  - Code: ValidationError
  - Messages:
    - One or more parameter values were invalid.
    - The update expression attempted to update the secondary index key beyond allowed size limits.
    - The update expression attempted to update the secondary index key to unsupported type.
    - An operand in the update expression has an incorrect data type.
    - Item size to update has exceeded the maximum allowed size.
    - Number overflow. Attempting to store a number with magnitude larger than supported range.
    - Type mismatch for attribute to update.
    - Nesting Levels have exceeded supported limits.
    - The document path provided in the update expression is invalid for update.
    - The provided expression refers to an attribute that does not exist in the item.

HTTP Status Code: 400
**TransactionInProgressException**

The transaction with the given request token is already in progress.

HTTP Status Code: 400

UntagResource
Service: Amazon DynamoDB

Removes the association of tags from an Amazon DynamoDB resource. You can call UntagResource up to five times per second, per account.

For an overview on tagging DynamoDB resources, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

Request Syntax

```json
{
   "ResourceArn": "string",
   "TagKeys": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ResourceArn (p. 214)**

The DynamoDB resource that the tags will be removed from. This value is an Amazon Resource Name (ARN).

Type: String

Required: Yes

**TagKeys (p. 214)**

A list of tag keys. Existing tags of the resource whose keys are members of this list will be removed from the DynamoDB resource.

Type: Array of strings

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServer**

An error occurred on the server side.

HTTP Status Code: 500
LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

UpdateContinuousBackups
Service: Amazon DynamoDB

UpdateContinuousBackups enables or disables point in time recovery for the specified table. A successful UpdateContinuousBackups call returns the current ContinuousBackupsDescription. If point in time recovery is enabled, PointInTimeRecoveryStatus will be set to ENABLED.

Once continuous backups and point in time recovery are enabled, you can restore to any point in time within EarliestRestorableDateTime and LatestRestorableDateTime.

LatestRestorableDateTime is typically 5 minutes before the current time. You can restore your table to any point in time during the last 35 days.

Request Syntax

```
{
  "PointInTimeRecoverySpecification": {
    "PointInTimeRecoveryEnabled": boolean
  },
  "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**PointInTimeRecoverySpecification (p. 216)**

Represents the settings used to enable point in time recovery.

Type: **PointInTimeRecoverySpecification (p. 443)** object

Required: Yes

**TableName (p. 216)**

The name of the table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

Response Syntax

```
{
  "ContinuousBackupsDescription": {
    "ContinuousBackupsStatus": "string",
    "PointInTimeRecoveryDescription": {
      "EarliestRestorableDateTime": number,
      "LatestRestorableDateTime": number,
      "PointInTimeRecoveryStatus": "string"
    }
  }
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ContinuousBackupsDescription (p. 216)**

Represents the continuous backups and point in time recovery settings on the table.

Type: *ContinuousBackupsDescription (p. 382)* object

Errors

For information about the errors that are common to all actions, see *Common Errors (p. 541)*.

**ContinuousBackupsUnavailableException**

Backups have not yet been enabled for this table.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**TableNotFoundException**

A source table with the name *TableName* does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

UpdateContributorInsights

Service: Amazon DynamoDB

Updates the status for contributor insights for a specific table or index. CloudWatch Contributor Insights for DynamoDB graphs display the partition key and (if applicable) sort key of frequently accessed items and frequently throttled items in plaintext. If you require the use of AWS Key Management Service (KMS) to encrypt this table's partition key and sort key data with an AWS managed key or customer managed key, you should not enable CloudWatch Contributor Insights for DynamoDB for this table.

Request Syntax

```json
{
    "ContributorInsightsAction": "string",
    "IndexName": "string",
    "TableName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**ContributorInsightsAction (p. 218)**

Represents the contributor insights action.

Type: String

Valid Values: ENABLE | DISABLE

Required: Yes

**TableName (p. 218)**

The name of the table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**IndexName (p. 218)**

The global secondary index name, if applicable.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

Response Syntax

```json
{
}
```
"ContributorInsightsStatus": "string",
"IndexName": "string",
"TableName": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ContributorInsightsStatus (p. 218)**

The status of contributor insights

Type: String

Valid Values: ENABLING | ENABLED | DISABLING | DISABLED | FAILED

**IndexName (p. 218)**

The name of the global secondary index, if applicable.

Type: String

Pattern: [a-zA-Z0-9_.-]+

**TableName (p. 218)**

The name of the table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServer>Error**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

See Also

• AWS SDK for PHP V3
• AWS SDK for Python
• AWS SDK for Ruby V3
UpdateGlobalTable
Service: Amazon DynamoDB

Add or remove replicas in the specified global table. The global table must already exist to be able to use this operation. Any replica to be added must be empty, have the same name as the global table, have the same key schema, have DynamoDB Streams enabled, and have the same provisioned and maximum write capacity units.

**Note**

Although you can use UpdateGlobalTable to add replicas and remove replicas in a single request, for simplicity we recommend that you issue separate requests for adding or removing replicas.

If global secondary indexes are specified, then the following conditions must also be met:

- The global secondary indexes must have the same name.
- The global secondary indexes must have the same hash key and sort key (if present).
- The global secondary indexes must have the same provisioned and maximum write capacity units.

**Request Syntax**

```json
{
  "GlobalTableName": "string",
  "ReplicaUpdates": [
    {
      "Create": {
        "RegionName": "string"
      },
      "Delete": {
        "RegionName": "string"
      }
    }
  ]
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**GlobalTableName (p. 221)**

The global table name.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**ReplicaUpdates (p. 221)**

A list of Regions that should be added or removed from the global table.

Type: Array of ReplicaUpdate (p. 471) objects
Response Syntax

```
{
  "GlobalTableDescription": {
    "CreationDateTime": number,
    "GlobalTableArn": "string",
    "GlobalTableName": "string",
    "GlobalTableStatus": "string",
    "ReplicationGroup": [
      {
        "GlobalSecondaryIndexes": [
          {
            "IndexName": "string",
            "ProvisionedThroughputOverride": {
              "ReadCapacityUnits": number
            }
          }
        ],
        "KMSMasterKeyId": "string",
        "ProvisionedThroughputOverride": {
          "ReadCapacityUnits": number
        },
        "RegionName": "string",
        "ReplicaInaccessibleDateTime": number,
        "ReplicaStatus": "string",
        "ReplicaStatusDescription": "string",
        "ReplicaStatusPercentProgress": "string",
        "ReplicaTableClassSummary": {
          "LastUpdateDateTime": number,
          "TableClass": "string"
        }
      }
    ]
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

GlobalTableDescription (p. 222)

Contains the details of the global table.

Type: GlobalTableDescription (p. 419) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

GlobalTableNotFoundException

The specified global table does not exist.

HTTP Status Code: 400
InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ReplicaAlreadyExistsException

The specified replica is already part of the global table.

HTTP Status Code: 400

ReplicaNotFoundException

The specified replica is no longer part of the global table.

HTTP Status Code: 400

TableNotFoundException

A source table with the name TableName does not currently exist within the subscriber's account or the subscriber is operating in the wrong AWS Region.

HTTP Status Code: 400

UpdateGlobalTableSettings
Service: Amazon DynamoDB

Updates settings for a global table.

Request Syntax

```json
{
    "GlobalTableBillingMode": "string",
    "GlobalTableGlobalSecondaryIndexSettingsUpdate": [
        {
            "IndexName": "string",
            "ProvisionedWriteCapacityAutoScalingSettingsUpdate": {
                "AutoScalingDisabled": boolean,
                "AutoScalingRoleArn": "string",
                "MaximumUnits": number,
                "MinimumUnits": number,
                "ScalingPolicyUpdate": {
                    "PolicyName": "string",
                    "TargetTrackingScalingPolicyConfiguration": {
                        "DisableScaleIn": boolean,
                        "ScaleInCool-down": number,
                        "ScaleOutCool-down": number,
                        "TargetValue": number
                    }
                }
            },
            "ProvisionedWriteCapacityUnits": number
        }
    ],
    "GlobalTableName": "string",
    "GlobalTableProvisionedWriteCapacityAutoScalingSettingsUpdate": {

                    }
                }
            ],
            "ReplicaProvisionedWriteCapacityUnits": number
        }
    ]
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**GlobalTableName (p. 224)**

The name of the global table

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**GlobalTableBillingMode (p. 224)**

The billing mode of the global table. If GlobalTableBillingMode is not specified, the global table defaults to PROVISIONED capacity billing mode.

- **PROVISIONED** - We recommend using PROVISIONED for predictable workloads. PROVISIONED sets the billing mode to **Provisioned Mode**.
- **PAY_PER_REQUEST** - We recommend using PAY_PER_REQUEST for unpredictable workloads. PAY_PER_REQUEST sets the billing mode to **On-Demand Mode**.

Type: String

Valid Values: PROVISIONED | PAY_PER_REQUEST

Required: No
GlobalTableGlobalSecondaryIndexSettingsUpdate (p. 224)

Represents the settings of a global secondary index for a global table that will be modified.

Type: Array of GlobalTableGlobalSecondaryIndexSettingsUpdate (p. 421) objects

Array Members: Minimum number of 1 item. Maximum number of 20 items.

Required: No

GlobalTableProvisionedWriteCapacityAutoScalingSettingsUpdate (p. 224)

Auto scaling settings for managing provisioned write capacity for the global table.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

GlobalTableProvisionedWriteCapacityUnits (p. 224)

The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException.

Type: Long

Valid Range: Minimum value of 1.

Required: No

ReplicaSettingsUpdate (p. 224)

Represents the settings for a global table in a Region that will be modified.

Type: Array of ReplicaSettingsUpdate (p. 468) objects

Array Members: Minimum number of 1 item. Maximum number of 50 items.

Required: No

Response Syntax

```json
{
  "GlobalTableName": "string",
  "ReplicaSettings": [
    {
      "RegionName": "string",
      "ReplicaBillingModeSummary": {
        "BillingMode": "string",

        "ScaleOutCooldown": number,
        "TargetValue": number
      }
    }
  ]
},

"ReplicaProvisionedWriteCapacityUnits": number,
"ReplicaStatus": "string",
"ReplicaTableClassSummary": {
"LastUpdateDateTime": number,
"TableClass": "string"
}]

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

GlobalTableName (p. 226)

The name of the global table.
Type: String
Pattern: [a-zA-Z0-9._-]+

ReplicaSettings (p. 226)

The Region-specific settings for the global table.
Type: Array of ReplicaSettingsDescription (p. 466) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

GlobalTableNotFoundException

The specified global table does not exist.
HTTP Status Code: 400

IndexNotFoundException

The operation tried to access a nonexistent index.
HTTP Status Code: 400

InternalServerError

An error occurred on the server side.
HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.
There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

ReplicaNotFoundException

The specified replica is no longer part of the global table.

HTTP Status Code: 400

ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400

UpdateItem

Service: Amazon DynamoDB

Edits an existing item's attributes, or adds a new item to the table if it does not already exist. You can put, delete, or add attribute values. You can also perform a conditional update on an existing item (insert a new attribute name-value pair if it doesn't exist, or replace an existing name-value pair if it has certain expected attribute values).

You can also return the item's attribute values in the same UpdateItem operation using the ReturnValues parameter.

Request Syntax

```json
{
    "AttributeUpdates": {
        "string": {
            "Action": "string",
            "Value": {
                "B": blob,
                "BOOL": boolean,
                "BS": [ blob ],
                "L": [ 
                    "AttributeValue"
                ],

"UpdateExpression": "string"
}

Request Parameters

The request accepts the following data in JSON format.
**Note**

In the following list, the required parameters are described first.

**Key (p. 230)**

The primary key of the item to be updated. Each element consists of an attribute name and a value for that attribute.

For the primary key, you must provide all of the attributes. For example, with a simple primary key, you only need to provide a value for the partition key. For a composite primary key, you must provide values for both the partition key and the sort key.

Type: String to `AttributeValue (p. 349)` object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

**TableName (p. 230)**

The name of the table containing the item to update.

Type: String

Pattern: \[a-zA-Z0-9_.-]+\]

Required: Yes

**AttributeUpdates (p. 230)**

This is a legacy parameter. Use `UpdateExpression` instead. For more information, see `AttributeUpdates` in the *Amazon DynamoDB Developer Guide*.

Type: String to `AttributeValueUpdate (p. 352)` object map

Key Length Constraints: Maximum length of 65535.

Required: No

**ConditionalOperator (p. 230)**

This is a legacy parameter. Use `ConditionExpression` instead. For more information, see `ConditionalOperator` in the *Amazon DynamoDB Developer Guide*.

Type: String

Valid Values: AND | OR

Required: No

**ConditionExpression (p. 230)**

A condition that must be satisfied in order for a conditional update to succeed.

An expression can contain any of the following:

- Functions: `attribute_exists | attribute_not_exists | attribute_type | contains | begins_with | size`

  These function names are case-sensitive.
- Comparison operators: `= | < > | <= | >= | BETWEEN | IN`
• Logical operators: AND | OR | NOT

For more information about condition expressions, see Specifying Conditions in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

**Expected (p. 230)**

This is a legacy parameter. Use ConditionExpression instead. For more information, see Expected in the Amazon DynamoDB Developer Guide.

Type: String to ExpectedAttributeValue (p. 397) object map

Key Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeNames (p. 230)**

One or more substitution tokens for attribute names in an expression. The following are some use cases for using ExpressionAttributeNames:

• To access an attribute whose name conflicts with a DynamoDB reserved word.
• To create a placeholder for repeating occurrences of an attribute name in an expression.
• To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the # character in an expression to dereference an attribute name. For example, consider the following attribute name:

• Percentile

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon DynamoDB Developer Guide.) To work around this, you could specify the following for ExpressionAttributeNames:

• {"#P":"Percentile"}

You could then use this substitution in an expression, as in this example:

• #P = :val

**Note**

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.

For more information about expression attribute names, see Specifying Item Attributes in the Amazon DynamoDB Developer Guide.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeValues (p. 230)**

One or more values that can be substituted in an expression.

Use the : (colon) character in an expression to dereference an attribute value. For example, suppose that you wanted to check whether the value of the ProductStatus attribute was one of the following:
Available | Backordered | Discontinued

You would first need to specify ExpressionAttributeValues as follows:

```json
{ "avail":{"S":"Available"}, "back":{"S":"Backordered"}, "disc":
{"S":"Discontinued"} }
```

You could then use these values in an expression, such as this:

`ProductStatus IN (:avail, :back, :disc)`

For more information on expression attribute values, see *Condition Expressions* in the *Amazon DynamoDB Developer Guide*.

Type: String to `AttributeValue (p. 349)` object map

Required: No

**ReturnConsumedCapacity (p. 230)**

Determines the level of detail about either provisioned or on-demand throughput consumption that is returned in the response:

- **INDEXES** - The response includes the aggregate ConsumedCapacity for the operation, together with ConsumedCapacity for each table and secondary index that was accessed.

  Note that some operations, such as GetItem and BatchGetItem, do not access any indexes at all. In these cases, specifying INDEXES will only return ConsumedCapacity information for table(s).

- **TOTAL** - The response includes only the aggregate ConsumedCapacity for the operation.

- **NONE** - No ConsumedCapacity details are included in the response.

Type: String

Valid Values: INDEXES | TOTAL | NONE

Required: No

**ReturnItemCollectionMetrics (p. 230)**

Determines whether item collection metrics are returned. If set to SIZE, the response includes statistics about item collections, if any, that were modified during the operation are returned in the response. If set to NONE (the default), no statistics are returned.

Type: String

Valid Values: SIZE | NONE

Required: No

**ReturnValues (p. 230)**

Use ReturnValues if you want to get the item attributes as they appear before or after they are updated. For UpdateItem, the valid values are:

- **NONE** - If ReturnValues is not specified, or if its value is NONE, then nothing is returned. (This setting is the default for ReturnValues.)

- **ALL_OLD** - Returns all of the attributes of the item, as they appeared before the UpdateItem operation.

- **UPDATED_OLD** - Returns only the updated attributes, as they appeared before the UpdateItem operation.
• **ALL_NEW** - Returns all of the attributes of the item, as they appear after the UpdateItem operation.

• **UPDATED_NEW** - Returns only the updated attributes, as they appear after the UpdateItem operation.

There is no additional cost associated with requesting a return value aside from the small network and processing overhead of receiving a larger response. No read capacity units are consumed.

The values returned are strongly consistent.

Type: String

Valid Values: NONE | ALL_OLD | UPDATED_OLD | ALL_NEW | UPDATED_NEW

Required: No

**UpdateExpression (p. 230)**

An expression that defines one or more attributes to be updated, the action to be performed on them, and new values for them.

The following action values are available for UpdateExpression:

• **SET** - Adds one or more attributes and values to an item. If any of these attributes already exist, they are replaced by the new values. You can also use SET to add or subtract from an attribute that is of type Number. For example: SET myNum = myNum + :val

  SET supports the following functions:

  • **if_not_exists**(path, operand) - if the item does not contain an attribute at the specified path, then if_not_exists evaluates to operand; otherwise, it evaluates to path. You can use this function to avoid overwriting an attribute that may already be present in the item.

  • **list_append**(operand, operand) - evaluates to a list with a new element added to it. You can append the new element to the start or the end of the list by reversing the order of the operands.

  These function names are case-sensitive.

• **REMOVE** - Removes one or more attributes from an item.

• **ADD** - Adds the specified value to the item, if the attribute does not already exist. If the attribute does exist, then the behavior of ADD depends on the data type of the attribute:

  • If the existing attribute is a number, and if Value is also a number, then Value is mathematically added to the existing attribute. If Value is a negative number, then it is subtracted from the existing attribute.

  **Note**

  If you use ADD to increment or decrement a number value for an item that doesn't exist before the update, DynamoDB uses 0 as the initial value. Similarly, if you use ADD for an existing item to increment or decrement an attribute value that doesn't exist before the update, DynamoDB uses 0 as the initial value. For example, suppose that the item you want to update doesn't have an attribute named itemcount, but you decide to ADD the number 3 to this attribute anyway. DynamoDB will create the itemcount attribute, set its initial value to 0, and finally add 3 to it. The result will be a new itemcount attribute in the item, with a value of 3.

  • If the existing data type is a set and if Value is also a set, then Value is added to the existing set. For example, if the attribute value is the set [1, 2], and the ADD action specified [3], then the final attribute value is [1, 2, 3]. An error occurs if an ADD action is specified for a set attribute and the attribute type specified does not match the existing set type.

  Both sets must have the same primitive data type. For example, if the existing data type is a set of strings, the Value must also be a set of strings.
The ADD action only supports Number and set data types. In addition, ADD can only be used on top-level attributes, not nested attributes.

- **DELETEn** - Deletes an element from a set.

If a set of values is specified, then those values are subtracted from the old set. For example, if the attribute value was the set \([a, b, c]\) and the DELETE action specifies \([a, c]\), then the final attribute value is \([b]\). Specifying an empty set is an error.

The DELETE action only supports set data types. In addition, DELETE can only be used on top-level attributes, not nested attributes.

You can have many actions in a single expression, such as the following:

```
SET a=:value1,
b=:value2  DELETE :value3, :value4, :value5
```

For more information on update expressions, see Modifying Items and Attributes in the Amazon DynamoDB Developer Guide.

Type: String

Required: No

Response Syntax

```json
{
  "Attributes": {
    "string": {
      "B": blob,
      "BOOL": boolean,
      "BS": [ blob ],
      "L": [
        "AttributeValue"
      ],
      "M": {
        "string" : "AttributeValue"
      },
      "M": "string",
      "NS": [ "string" ],
      "NULL": boolean,
      "S": "string",
      "SS": [ "string" ]
    }
  },
  "ConsumedCapacity": {
    "CapacityUnits": number,
    "GlobalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "LocalSecondaryIndexes": {
      "string": {
        "CapacityUnits": number,
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  },
  "ReadCapacityUnits": number
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Attributes (p. 236)

A map of attribute values as they appear before or after the UpdateItem operation, as determined by the ReturnValues parameter.

The Attributes map is only present if ReturnValues was specified as something other than NONE in the request. Each element represents one attribute.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

ConsumedCapacity (p. 236)

The capacity units consumed by the UpdateItem operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the ReturnConsumedCapacity parameter was specified. For more information, see Provisioned Throughput in the Amazon DynamoDB Developer Guide.

Type: ConsumedCapacity (p. 380) object

ItemCollectionMetrics (p. 236)

Information about item collections, if any, that were affected by the UpdateItem operation. ItemCollectionMetrics is only returned if the ReturnItemCollectionMetrics parameter
was specified. If the table does not have any local secondary indexes, this information is not returned in the response.

Each ItemCollectionMetrics element consists of:

- **ItemCollectionKey** - The partition key value of the item collection. This is the same as the partition key value of the item itself.
- **SizeEstimateRangeGB** - An estimate of item collection size, in gigabytes. This value is a two-element array containing a lower bound and an upper bound for the estimate. The estimate includes the size of all the items in the table, plus the size of all attributes projected into all of the local secondary indexes on that table. Use this estimate to measure whether a local secondary index is approaching its size limit.

The estimate is subject to change over time; therefore, do not rely on the precision or accuracy of the estimate.

Type: ItemCollectionMetrics (p. 428) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**ConditionalCheckFailedException**

A condition specified in the operation could not be evaluated.

HTTP Status Code: 400

**InternalServerError**

An error occurred on the server side.

HTTP Status Code: 500

**ItemCollectionSizeLimitExceededException**

An item collection is too large. This exception is only returned for tables that have one or more local secondary indexes.

HTTP Status Code: 400

**ProvisionedThroughputExceededException**

Your request rate is too high. The AWS SDKs for DynamoDB automatically retry requests that receive this exception. Your request is eventually successful, unless your retry queue is too large to finish. Reduce the frequency of requests and use exponential backoff. For more information, go to Error Retries and Exponential Backoff in the Amazon DynamoDB Developer Guide.

HTTP Status Code: 400

**RequestLimitExceeded**

Throughput exceeds the current throughput quota for your account. Please contact AWS Support to request a quota increase.

HTTP Status Code: 400

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400
TransactionConflictException

Operation was rejected because there is an ongoing transaction for the item.

HTTP Status Code: 400

Examples

Conditional Update

This example updates the Thread table, changing the LastPostedBy attribute, but only if LastPostedBy is currently "fred@example.com". All of the item's attributes, as they appear after the update, are returned in the response.

Sample Request

```plaintext
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
                Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.UpdateItem

{
    "TableName": "Thread",
    "Key": {
        "ForumName": {
            "S": "Amazon DynamoDB"
        },
        "Subject": {
            "S": "Maximum number of items?"
        }
    },
    "UpdateExpression": "set LastPostedBy = :val1",
    "ConditionExpression": "LastPostedBy = :val2",
    "ExpressionAttributeValues": {
        ":val1": {"S": "alice@example.com"},
        ":val2": {"S": "fred@example.com"}
    },
    "ReturnValues": "ALL_NEW"
}
```

Sample Response

```plaintext
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

{
    "Attributes": {
        "LastPostedBy": {
            "S": "alice@example.com"
        },
        "ForumName": {
            "S": "Amazon DynamoDB"
        }
    }
}
```
UpdateItem

The following example increments the Replies attribute in the Thread table whenever someone posts a reply. Because ReturnValues is set to NONE, no output appears in the response payload.

Sample Request

POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>, Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.UpdateItem

{
   "TableName": "Thread",
   "Key": {
      "ForumName": {
         "S": "Amazon DynamoDB"
      },
      "Subject": {
         "S": "A question about updates"
      }
   },
   "UpdateExpression": "set Replies = Replies + :num,",
   "ExpressionAttributeValues": {
      ":num": {"N": "1"}
   },
   "ReturnValues": "NONE"
}

Sample Response

HTTP/1.1 200 OK
x-amzn-Request-Id: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
UpdateItem

UpdateTable
Service: Amazon DynamoDB

Modifies the provisioned throughput settings, global secondary indexes, or DynamoDB Streams settings for a given table.

You can only perform one of the following operations at once:

- Modify the provisioned throughput settings of the table.
- Remove a global secondary index from the table.
- Create a new global secondary index on the table. After the index begins backfilling, you can use UpdateTable to perform other operations.

UpdateTable is an asynchronous operation; while it is executing, the table status changes from ACTIVE to UPDATING. While it is UPDATING, you cannot issue another UpdateTable request. When the table returns to the ACTIVE state, the UpdateTable operation is complete.

Request Syntax

```json
{
  "AttributeDefinitions": [
    {
      "AttributeName": "string",
      "AttributeType": "string"
    }
  ],
  "BillingMode": "string",
  "GlobalSecondaryIndexUpdates": [
    "Create": {
      "IndexName": "string",
      "KeySchema": [
        {
          "AttributeName": "string",
          "KeyType": "string"
        }
      ],
      "Projection": {
        "NonKeyAttributes": [ "string" ],
        "ProjectionType": "string"
      },
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    },
    "Delete": {
      "IndexName": "string"
    },
    "Update": {
      "IndexName": "string",
      "ProvisionedThroughput": {
        "ReadCapacityUnits": number,
        "WriteCapacityUnits": number
      }
    }
  ],
  "ProvisionedThroughput": {
    "ReadCapacityUnits": number,
    "WriteCapacityUnits": number
  }
}
```
Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 242)**

The name of the table to be updated.

Type: String

Pattern: [a-zA-Z0-9_.-]+  

Required: Yes

**AttributeDefinitions (p. 242)**

An array of attributes that describe the key schema for the table and indexes. If you are adding a new global secondary index to the table, AttributeDefinitions must include the key element(s) of the new index.

Type: Array of `AttributeDefinition (p. 348)` objects

Required: No

**BillingMode (p. 242)**

Controls how you are charged for read and write throughput and how you manage capacity. When switching from pay-per-request to provisioned capacity, initial provisioned capacity values must be set. The initial provisioned capacity values are estimated based on the consumed read and write capacity of your table and global secondary indexes over the past 30 minutes.

- **PROVISIONED** - We recommend using PROVISIONED for predictable workloads. PROVISIONED sets the billing mode to **Provisioned Mode**.
- **PAY_PER_REQUEST** - We recommend using PAY_PER_REQUEST for unpredictable workloads. PAY_PER_REQUEST sets the billing mode to **On-Demand Mode**.

Type: String

Valid Values: PROVISIONED | PAY_PER_REQUEST

Required: No

**GlobalSecondaryIndexUpdates (p. 242)**

An array of one or more global secondary indexes for the table. For each index in the array, you can request one action:

- **Create** - add a new global secondary index to the table.
- **Update** - modify the provisioned throughput settings of an existing global secondary index.
- **Delete** - remove a global secondary index from the table.

You can create or delete only one global secondary index per `UpdateTable` operation.

For more information, see Managing Global Secondary Indexes in the `Amazon DynamoDB Developer Guide`.

Type: Array of `GlobalSecondaryIndexUpdate (p. 417)` objects

Required: No

**ProvisionedThroughput (p. 242)**

The new provisioned throughput settings for the specified table or index.

Type: `ProvisionedThroughput (p. 445)` object

Required: No

**ReplicaUpdates (p. 242)**

A list of replica update actions (create, delete, or update) for the table.

**Note**

This property only applies to Version 2019.11.21 of global tables.

Type: Array of `ReplicationGroupUpdate (p. 470)` objects
Array Members: Minimum number of 1 item.

Required: No

**SSESpecification (p. 242)**

The new server-side encryption settings for the specified table.

Type: **SSESpecification (p. 480)** object

Required: No

**StreamSpecification (p. 242)**

Represents the DynamoDB Streams configuration for the table.

**Note**

You receive a ResourceInUseException if you try to enable a stream on a table that already has a stream, or if you try to disable a stream on a table that doesn't have a stream.

Type: **StreamSpecification (p. 481)** object

Required: No

**TableClass (p. 242)**

The table class of the table to be updated. Valid values are STANDARD and STANDARD_INFREQUENT_ACCESS.

Type: String

Valid Values: STANDARD | STANDARD_INFREQUENT_ACCESS

Required: No

**Response Syntax**

```
{
  "TableDescription": {
    "ArchivalSummary": {
      "ArchivalBackupArn": "string",
      "ArchivalDateTime": number,
      "ArchivalReason": "string"

"TableStatus": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

TableDescription (p. 245)

Represents the properties of the table.

Type: TableDescription (p. 486) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerException

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.
Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400
ResourceInUseException
The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400
ResourceNotFoundException
The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

Modify Provisioned Write Throughput
This example changes both the provisioned read and write throughput of the Thread table to 10 capacity units.

Sample Request

```plaintext
POST / HTTP/1.1
Host: dynamodb.<region>.<domain>;
Accept-Encoding: identity
Content-Length: <PayloadSizeBytes>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.0
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>, SignedHeaders=<Headers>,
Signature=<Signature>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDB_20120810.UpdateTable

{
    "TableName": "Thread",
    "ProvisionedThroughput": {
        "ReadCapacityUnits": 10,
        "WriteCapacityUnits": 10
    }
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
```
{ "TableDescription": { "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/Thread", "AttributeDefinitions": [ { "AttributeName": "ForumName", "AttributeType": "S" }, { "AttributeName": "LastPostDateTime", "AttributeType": "S" }, { "AttributeName": "Subject", "AttributeType": "S" } ], "CreationDateTime": 1.363801528686E9, "ItemCount": 0, "KeySchema": [ { "AttributeName": "ForumName", "KeyType": "HASH" }, { "AttributeName": "Subject", "KeyType": "RANGE" } ], "LocalSecondaryIndexes": [ { "IndexName": "LastPostIndex", "IndexSizeBytes": 0, "ItemCount": 0, "KeySchema": [ { "AttributeName": "ForumName", "KeyType": "HASH" }, { "AttributeName": "LastPostDateTime", "KeyType": "RANGE" } ], "Projection": { "ProjectionType": "KEYS_ONLY" } } ], "ProvisionedThroughput": { "LastIncreaseDateTime": 1.363801701282E9, "NumberOfDecreasesToday": 0, "ReadCapacityUnits": 5, "WriteCapacityUnits": 5 }, "TableName": "Thread", "TableSizeBytes": 0, "TableStatus": "UPDATING" } }

UpdateTableReplicaAutoScaling

Service: Amazon DynamoDB

Updates auto scaling settings on your global tables at once.

**Note**
This operation only applies to Version 2019.11.21 of global tables.

**Request Syntax**

```json
{
    "GlobalSecondaryIndexUpdates": [
        {
            "IndexName": "string",
            "ProvisionedWriteCapacityAutoScalingUpdate": {
                "AutoScalingDisabled": boolean,
                "AutoScalingRoleArn": "string",
                "MaximumUnits": number,
                "MinimumUnits": number,
                "ScalingPolicyUpdate": {
                    "PolicyName": "string",
                    "TargetTrackingScalingPolicyConfiguration": {
                        "DisableScaleIn": boolean,
                        "ScaleInCoolDown": number,
                        "ScaleOutCoolDown": number,
                        "TargetValue": number
                    }
                }
            }
        },
        "ProvisionedWriteCapacityAutoScalingUpdate": {
            "AutoScalingDisabled": boolean,

      "ScaleOutCooldown": number,
      "TargetValue": number
    }
  }
}
]
"TableName": "string"
}

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**TableName (p. 251)**

The name of the global table to be updated.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**GlobalSecondaryIndexUpdates (p. 251)**

Represents the auto scaling settings of the global secondary indexes of the replica to be updated.

Type: Array of GlobalSecondaryIndexAutoScalingUpdate (p. 411) objects

Array Members: Minimum number of 1 item.

Required: No

**ProvisionedWriteCapacityAutoScalingUpdate (p. 251)**

Represents the auto scaling settings to be modified for a global table or global secondary index.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

**ReplicaUpdates (p. 251)**

Represents the auto scaling settings of replicas of the table that will be modified.
Type: Array of `ReplicaAutoScalingUpdate` objects

Array Members: Minimum number of 1 item.

Required: No

Response Syntax

```json
{
  "TableAutoScalingDescription": {
    "Replicas": [
      {
        "GlobalSecondaryIndexes": [
          {
            "IndexName": "string",
            "IndexStatus": "string",
            "ProvisionedReadCapacityAutoScalingSettings": {
              "AutoScalingDisabled": boolean,
              "AutoScalingRoleArn": "string",
              "MaximumUnits": number,
              "MinimumUnits": number,
              "ScalingPolicies": [
                {
                  "PolicyName": "string",
                  "TargetTrackingScalingPolicyConfiguration": {
                    "DisableScaleIn": boolean,
                    "ScaleInCooldown": number,
                    "ScaleOutCooldown": number,
                    "TargetValue": number
                  }
                }
              ]
            }
          }
        ],
        "ProvisionedWriteCapacityAutoScalingSettings": {
          "AutoScalingDisabled": boolean,
          "AutoScalingRoleArn": "string",
          "MaximumUnits": number,
          "MinimumUnits": number,
          "ScalingPolicies": [
            {
              "PolicyName": "string",

 "TargetValue": number
 }
 }
]
},
"ReplicaStatus": "string"
}
],
"TableName": "string",
"TableStatus": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

TableAutoScalingDescription (p. 253)

Returns information about the auto scaling settings of a table with replicas.

Type: TableAutoScalingDescription (p. 482) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

LimitExceededException

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.
The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400
ResourceInUseException

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400
ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

**UpdateTimeToLive**

Service: Amazon DynamoDB

The `UpdateTimeToLive` method enables or disables Time to Live (TTL) for the specified table. A successful `UpdateTimeToLive` call returns the current `TimeToLiveSpecification`. It can take up to one hour for the change to fully process. Any additional `UpdateTimeToLive` calls for the same table during this one hour duration result in a `ValidationException`.

TTL compares the current time in epoch time format to the time stored in the TTL attribute of an item. If the epoch time value stored in the attribute is less than the current time, the item is marked as expired and subsequently deleted.

**Note**

The epoch time format is the number of seconds elapsed since 12:00:00 AM January 1, 1970 UTC.

DynamoDB deletes expired items on a best-effort basis to ensure availability of throughput for other data operations.

**Important**

DynamoDB typically deletes expired items within two days of expiration. The exact duration within which an item gets deleted after expiration is specific to the nature of the workload. Items that have expired and not been deleted will still show up in reads, queries, and scans.

As items are deleted, they are removed from any local secondary index and global secondary index immediately in the same eventually consistent way as a standard delete operation.

For more information, see Time To Live in the Amazon DynamoDB Developer Guide.

**Request Syntax**

```
{
  "TableName": "string",
  "TimeToLiveSpecification": {
    "AttributeName": "string",
    "Enabled": boolean
  }
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**TableName** (p. 256)

The name of the table to be configured.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**TimeToLiveSpecification** (p. 256)

Represents the settings used to enable or disable Time to Live for the specified table.
Type: TimeToLiveSpecification (p. 494) object

Required: Yes

**Response Syntax**

```json
{
  "TimeToLiveSpecification": {
    "AttributeName": "string",
    "Enabled": boolean
  }
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TimeToLiveSpecification (p. 257)**

Represents the output of a `UpdateTimeToLive` operation.

Type: TimeToLiveSpecification (p. 494) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InternalServer>Error**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceededException**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 500 simultaneous table operations are allowed per account. These operations include `CreateTable`, `UpdateTable`, `DeleteTable`, `UpdateTimeToLive`, `RestoreTableFromBackup`, and `RestoreTableToPointInTime`.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 250 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 2,500 tables.

HTTP Status Code: 400

**ResourceInUseException**

The operation conflicts with the resource's availability. For example, you attempted to recreate an existing table, or tried to delete a table currently in the CREATING state.

HTTP Status Code: 400
ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

DynamoDB Accelerator

The following actions are supported by DynamoDB Accelerator:

- CreateCluster (p. 259)
- CreateParameterGroup (p. 265)
- CreateSubnetGroup (p. 267)
- DecreaseReplicationFactor (p. 270)
- DeleteCluster (p. 273)
- DeleteParameterGroup (p. 276)
- DeleteSubnetGroup (p. 278)
- DescribeClusters (p. 280)
- DescribeDefaultParameters (p. 283)
- DescribeEvents (p. 286)
- DescribeParameterGroups (p. 289)
- DescribeParameters (p. 292)
- DescribeSubnetGroups (p. 295)
- IncreaseReplicationFactor (p. 298)
- ListTags (p. 302)
- RebootNode (p. 305)
- TagResource (p. 308)
- UntagResource (p. 311)
- UpdateCluster (p. 314)
- UpdateParameterGroup (p. 318)
- UpdateSubnetGroup (p. 320)
CreateCluster
Service: DynamoDB Accelerator

Creates a DAX cluster. All nodes in the cluster run the same DAX caching software.

Request Syntax

```
{
   "AvailabilityZones": [ "string" ],
   "ClusterEndpointEncryptionType": "string",
   "ClusterName": "string",
   "Description": "string",
   "IamRoleArn": "string",
   "NodeType": "string",
   "NotificationTopicArn": "string",
   "ParameterGroupName": "string",
   "PreferredMaintenanceWindow": "string",
   "ReplicationFactor": number,
   "SecurityGroupIds": [ "string" ],
   "SSESpecification": {
      "Enabled": boolean
   },
   "SubnetGroupName": "string",
   "Tags": [ {
      "Key": "string",
      "Value": "string"
   } ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 259)**

The cluster identifier. This parameter is stored as a lowercase string.

**Constraints:**

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Type: String

Required: Yes

**IamRoleArn (p. 259)**

A valid Amazon Resource Name (ARN) that identifies an IAM role. At runtime, DAX will assume this role and use the role's permissions to access DynamoDB on your behalf.

Type: String

Required: Yes
**NodeType (p. 259)**

The compute and memory capacity of the nodes in the cluster.

Type: String

Required: Yes

**ReplicationFactor (p. 259)**

The number of nodes in the DAX cluster. A replication factor of 1 will create a single-node cluster, without any read replicas. For additional fault tolerance, you can create a multiple node cluster with one or more read replicas. To do this, set `ReplicationFactor` to a number between 3 (one primary and two read replicas) and 10 (one primary and nine read replicas). If the `AvailabilityZones` parameter is provided, its length must equal the `ReplicationFactor`.

**Note**

AWS recommends that you have at least two read replicas per cluster.

Type: Integer

Required: Yes

**AvailabilityZones (p. 259)**

The Availability Zones (AZs) in which the cluster nodes will reside after the cluster has been created or updated. If provided, the length of this list must equal the `ReplicationFactor` parameter. If you omit this parameter, DAX will spread the nodes across Availability Zones for the highest availability.

Type: Array of strings

Required: No

**ClusterEndpointEncryptionType (p. 259)**

The type of encryption the cluster's endpoint should support. Values are:

- NONE for no encryption
- TLS for Transport Layer Security

Type: String

Valid Values: NONE | TLS

Required: No

**Description (p. 259)**

A description of the cluster.

Type: String

Required: No

**NotificationTopicArn (p. 259)**

The Amazon Resource Name (ARN) of the Amazon SNS topic to which notifications will be sent.

**Note**

The Amazon SNS topic owner must be same as the DAX cluster owner.

Type: String

Required: No
**ParameterGroupName (p. 259)**

The parameter group to be associated with the DAX cluster.

Type: String

Required: No

**PreferredMaintenanceWindow (p. 259)**

Specifies the weekly time range during which maintenance on the DAX cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are:

- sun
- mon
- tue
- wed
- thu
- fri
- sat

Example: sun:05:00-sun:09:00

**Note**

If you don't specify a preferred maintenance window when you create or modify a cache cluster, DAX assigns a 60-minute maintenance window on a randomly selected day of the week.

Type: String

Required: No

**SecurityGroupIds (p. 259)**

A list of security group IDs to be assigned to each node in the DAX cluster. (Each of the security group ID is system-generated.)

If this parameter is not specified, DAX assigns the default VPC security group to each node.

Type: Array of strings

Required: No

**SSESpecification (p. 259)**

Represents the settings used to enable server-side encryption on the cluster.

Type: **SSESpecification (p. 520)** object

Required: No

**SubnetGroupName (p. 259)**

The name of the subnet group to be used for the replication group.

**Important**

DAX clusters can only run in an Amazon VPC environment. All of the subnets that you specify in a subnet group must exist in the same VPC.

Type: String
Tags (p. 259)
A set of tags to associate with the DAX cluster.
Type: Array of Tag (p. 523) objects
Required: No

Response Syntax

```json
{
"Cluster": {
  "ActiveNodes": number,
  "ClusterArn": "string",
  "ClusterDiscoveryEndpoint": {
    "Address": "string",
    "Port": number,
    "URL": "string"
  },
  "ClusterEndpointEncryptionType": "string",
  "ClusterName": "string",
  "Description": "string",
  "IamRoleArn": "string",
  "NodeIdsToRemove": [ "string" ],
  "Nodes": [ {
    "AvailabilityZone": "string",
    "Endpoint": {
      "Address": "string",
      "Port": number,
      "URL": "string"
    },
    "NodeCreateTime": number,
    "NodeId": "string",
    "NodeStatus": "string",
    "ParameterGroupStatus": "string"
  } ],
  "NodeType": "string",
  "NotificationConfiguration": {
    "TopicArn": "string",
    "TopicStatus": "string"
  },
  "ParameterGroup": {
    "NodeIdsToReboot": [ "string" ],
    "ParameterApplyStatus": "string",
    "ParameterGroupName": "string"
  },
  "PreferredMaintenanceWindow": "string",
  "SecurityGroups": [ {
    "SecurityGroupIdentifier": "string",
    "Status": "string"
  } ],
  "SSEDescription": {
    "Status": "string"
  },
  "Status": "string",
  "SubnetGroup": "string",
  "TotalNodes": number
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Cluster (p. 262)

A description of the DAX cluster that you have created.

Type: Cluster (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterAlreadyExistsFault

You already have a DAX cluster with the given identifier.

HTTP Status Code: 400

ClusterQuotaForCustomerExceededFault

You have attempted to exceed the maximum number of DAX clusters for your AWS account.

HTTP Status Code: 400

InsufficientClusterCapacityFault

There are not enough system resources to create the cluster you requested (or to resize an already-existing cluster).

HTTP Status Code: 400

InvalidClusterStateFault

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterGroupStateFault

One or more parameters in a parameter group are in an invalid state.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

InvalidVPCNetworkStateFault

The VPC network is in an invalid state.
HTTP Status Code: 400

NodeQuotaForClusterExceededFault

You have attempted to exceed the maximum number of nodes for a DAX cluster.

HTTP Status Code: 400

NodeQuotaForCustomerExceededFault

You have attempted to exceed the maximum number of nodes for your AWS account.

HTTP Status Code: 400

ParameterGroupNotFoundFault

The specified parameter group does not exist.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

ServiceQuotaExceededException

You have reached the maximum number of x509 certificates that can be created for encrypted clusters in a 30 day period. Contact AWS customer support to discuss options for continuing to create encrypted clusters.

HTTP Status Code: 400

SubnetGroupNotFoundFault

The requested subnet group name does not refer to an existing subnet group.

HTTP Status Code: 400

TagQuotaPerResourceExceeded

You have exceeded the maximum number of tags for this DAX cluster.

HTTP Status Code: 400

CreateParameterGroup
Service: DynamoDB Accelerator

Creates a new parameter group. A parameter group is a collection of parameters that you apply to all of the nodes in a DAX cluster.

Request Syntax

```
{
  "Description": "string",
  "ParameterGroupName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ParameterGroupName (p. 265)**

The name of the parameter group to apply to all of the clusters in this replication group.

- Type: String
- Required: Yes

**Description (p. 265)**

A description of the parameter group.

- Type: String
- Required: No

Response Syntax

```
{
  "ParameterGroup": {
    "Description": "string",
    "ParameterGroupName": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**ParameterGroup (p. 265)**

Represents the output of a CreateParameterGroup action.

- Type: ParameterGroup (p. 515) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InvalidArgumentException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterGroupStateFault

One or more parameters in a parameter group are in an invalid state.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ParameterGroupAlreadyExistsFault

The specified parameter group already exists.

HTTP Status Code: 400

ParameterGroupQuotaExceededFault

You have attempted to exceed the maximum number of parameter groups.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

CreateSubnetGroup
Service: DynamoDB Accelerator

Creates a new subnet group.

Request Syntax

```json
{
   "Description": "string",
   "SubnetGroupName": "string",
   "SubnetIds": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**SubnetGroupName (p. 267)**

A name for the subnet group. This value is stored as a lowercase string.

*Type:* String  
*Required:* Yes

**SubnetIds (p. 267)**

A list of VPC subnet IDs for the subnet group.

*Type:* Array of strings  
*Required:* Yes

**Description (p. 267)**

A description for the subnet group

*Type:* String  
*Required:* No

Response Syntax

```json
{
   "SubnetGroup": { 
      "Description": "string",
      "SubnetGroupName": "string",
      "Subnets": [
         { 
            "SubnetAvailabilityZone": "string",
            "SubnetIdentifier": "string"
         }
      ],
      "VpcId": "string"
   }
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

SubnetGroup (p. 267)

Represents the output of a CreateSubnetGroup operation.

Type: SubnetGroup (p. 522) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InvalidSubnet

An invalid subnet identifier was specified.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

SubnetGroupAlreadyExistsFault

The specified subnet group already exists.

HTTP Status Code: 400

SubnetGroupQuotaExceededFault

The request cannot be processed because it would exceed the allowed number of subnets in a subnet group.

HTTP Status Code: 400

SubnetQuotaExceededFault

The request cannot be processed because it would exceed the allowed number of subnets in a subnet group.

HTTP Status Code: 400

DecreaseReplicationFactor
Service: DynamoDB Accelerator

Removes one or more nodes from a DAX cluster.

**Note**
You cannot use DecreaseReplicationFactor to remove the last node in a DAX cluster. If you need to do this, use DeleteCluster instead.

**Request Syntax**

```json
{
   "AvailabilityZones": [ "string" ],
   "ClusterName": "string",
   "NewReplicationFactor": number,
   "NodeIdsToRemove": [ "string" ]
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 270)**

The name of the DAX cluster from which you want to remove nodes.

Type: String

Required: Yes

**NewReplicationFactor (p. 270)**

The new number of nodes for the DAX cluster.

Type: Integer

Required: Yes

**AvailabilityZones (p. 270)**

The Availability Zone(s) from which to remove nodes.

Type: Array of strings

Required: No

**NodeIdsToRemove (p. 270)**

The unique identifiers of the nodes to be removed from the cluster.

Type: Array of strings

Required: No

**Response Syntax**

```json
{
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Cluster (p. 270)

A description of the DAX cluster, after you have decreased its replication factor.

Type: Cluster (p. 504) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidClusterStateFault

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

NodeNotFoundFault

None of the nodes in the cluster have the given node ID.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DeleteCluster
Service: DynamoDB Accelerator

Deletes a previously provisioned DAX cluster. DeleteCluster deletes all associated nodes, node endpoints and the DAX cluster itself. When you receive a successful response from this action, DAX immediately begins deleting the cluster; you cannot cancel or revert this action.

Request Syntax

```json
{
   "ClusterName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 273)**

The name of the cluster to be deleted.

Type: String

Required: Yes

Response Syntax

```json
{
   "Cluster": {
      "ActiveNodes": number,
      "ClusterArn": "string",
      "ClusterDiscoveryEndpoint": {
         "Address": "string",
         "Port": number,
         "URL": "string"
      },
      "ClusterEndpointEncryptionType": "string",
      "ClusterName": "string",
      "Description": "string",
      "IamRoleArn": "string",
      "NodeIdsToRemove": [ "string" ],
      "Nodes": [ 
         {
            "AvailabilityZone": "string",
            "Endpoint": {
               "Address": "string",
               "Port": number,
               "URL": "string"
            },
            "NodeCreateTime": number,
            "NodeId": "string",
            "NodeStatus": "string",
            "ParameterGroupStatus": "string"
         }
      ],
      "NodeType": "string"
   }
}
```
"NotificationConfiguration": { 
   "TopicArn": "string",
   "TopicStatus": "string"
 },
"ParameterGroup": { 
   "NodeIdsToReboot": [ "string" ],
   "ParameterApplyStatus": "string",
   "ParameterGroupName": "string"
 },
"PreferredMaintenanceWindow": "string",
"SecurityGroups": [ 
   { 
      "SecurityGroupIdentifier": "string",
      "Status": "string"
   } 
 ],
"SSEDescription": { 
   "Status": "string"
 },
"Status": "string",
"SubnetGroup": "string",
"TotalNodes": number
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Cluster (p. 273)

A description of the DAX cluster that is being deleted.

Type: Cluster (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidClusterStateException

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.
HTTP Status Code: 400

_ServiceLinkedRoleNotFoundFault_

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DeleteParameterGroup
Service: DynamoDB Accelerator

Deletes the specified parameter group. You cannot delete a parameter group if it is associated with any DAX clusters.

Request Syntax

```
{
    "ParameterGroupName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

**ParameterGroupName (p. 276)**

The name of the parameter group to delete.

Type: String

Required: Yes

Response Syntax

```
{
    "DeletionMessage": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DeletionMessage (p. 276)**

A user-specified message for this action (i.e., a reason for deleting the parameter group).

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InvalidParameterCombinationException**

Two or more incompatible parameters were specified.

HTTP Status Code: 400
InvalidParameterGroupStateFault

One or more parameters in a parameter group are in an invalid state.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ParameterGroupNotFoundFault

The specified parameter group does not exist.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DeleteSubnetGroup
Service: DynamoDB Accelerator

Deletes a subnet group.

**Note**
You cannot delete a subnet group if it is associated with any DAX clusters.

**Request Syntax**

```
{
  "SubnetGroupName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**SubnetGroupName** *(p. 278)*

The name of the subnet group to delete.

- Type: String
- Required: Yes

**Response Syntax**

```
{
  "DeletionMessage": "string"
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DeletionMessage** *(p. 278)*

A user-specified message for this action (i.e., a reason for deleting the subnet group).

- Type: String

**Errors**

For information about the errors that are common to all actions, see Common Errors *(p. 541).*

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.
HTTP Status Code: 400

**SubnetGroupInUseFault**

The specified subnet group is currently in use.

HTTP Status Code: 400

**SubnetGroupNotFoundFault**

The requested subnet group name does not refer to an existing subnet group.

HTTP Status Code: 400

DescribeClusters
Service: DynamoDB Accelerator

Returns information about all provisioned DAX clusters if no cluster identifier is specified, or about a specific DAX cluster if a cluster identifier is supplied.

If the cluster is in the CREATING state, only cluster level information will be displayed until all of the nodes are successfully provisioned.

If the cluster is in the DELETING state, only cluster level information will be displayed.

If nodes are currently being added to the DAX cluster, node endpoint information and creation time for the additional nodes will not be displayed until they are completely provisioned. When the DAX cluster state is available, the cluster is ready for use.

If nodes are currently being removed from the DAX cluster, no endpoint information for the removed nodes is displayed.

Request Syntax

```
{
    "ClusterNames": [ "string" ],
    "MaxResults": number,
    "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**ClusterNames (p. 280)**

The names of the DAX clusters being described.

Type: Array of strings

Required: No

**MaxResults (p. 280)**

The maximum number of results to include in the response. If more results exist than the specified MaxResults value, a token is included in the response so that the remaining results can be retrieved.

The value for MaxResults must be between 20 and 100.

Type: Integer

Required: No

**NextToken (p. 280)**

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by MaxResults.

Type: String

Required: No
Response Syntax

```
{
  "Clusters": [
    {
      "ActiveNodes": number,
      "ClusterArn": "string",
      "ClusterDiscoveryEndpoint": {
        "Address": "string",
        "Port": number,
        "URL": "string"
      },
      "ClusterEndpointEncryptionType": "string",
      "ClusterName": "string",
      "Description": "string",
      "IamRoleArn": "string",
      "NodeIdsToRemove": [ "string" ],
      "Nodes": [
        {
          "AvailabilityZone": "string",
          "Endpoint": {
            "Address": "string",
            "Port": number,
            "URL": "string"
          },
          "NodeCreateTime": number,
          "NodeId": "string",
          "NodeStatus": "string",
          "ParameterGroupStatus": "string"
        }
      ],
      "NodeType": "string",
      "NotificationConfiguration": {
        "TopicArn": "string",
        "TopicStatus": "string"
      },
      "ParameterGroup": {
        "NodeIdsToReboot": [ "string" ],
        "ParameterApplyStatus": "string",
        "ParameterGroupName": "string"
      },
      "PreferredMaintenanceWindow": "string",
      "SecurityGroups": [
        {
          "SecurityGroupIdentifier": "string",
          "Status": "string"
        }
      ],
      "SSEDescription": {
        "Status": "string"
      },
      "Status": "string",
      "SubnetGroup": "string",
      "TotalNodes": number
    }
  ],
  "NextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

Clusters (p. 281)

The descriptions of your DAX clusters, in response to a DescribeClusters request.

Type: Array of Cluster (p. 504) objects

NextToken (p. 281)

Provides an identifier to allow retrieval of paginated results.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundException

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundException

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DescribeDefaultParameters

Service: DynamoDB Accelerator

Returns the default system parameter information for the DAX caching software.

Request Syntax

{  "MaxResults": number,  "NextToken": "string"}

Request Parameters

The request accepts the following data in JSON format.

Note
In the following list, the required parameters are described first.

MaxResults (p. 283)

The maximum number of results to include in the response. If more results exist than the specified MaxResults value, a token is included in the response so that the remaining results can be retrieved.

The value for MaxResults must be between 20 and 100.

Type: Integer

Required: No

NextToken (p. 283)

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by MaxResults.

Type: String

Required: No

Response Syntax

[  "NextToken": "string",  "Parameters": [   {    "AllowedValues": "string",    "ChangeType": "string",    "DataType": "string",    "Description": "string",    "IsModifiable": "string",    "NodeTypeSpecificValues": [     {      "NodeType": "string",      "Value": "string"     }   ]  },]
"ParameterName": "string",
"ParameterType": "string",
"ParameterValue": "string",
"Source": "string"
]
}

Response Elements
If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 283)**
Provides an identifier to allow retrieval of paginated results.

Type: String

**Parameters (p. 283)**
A list of parameters. Each element in the list represents one parameter.

Type: Array of Parameter (p. 513) objects

Errors
For information about the errors that are common to all actions, see Common Errors (p. 541).

**InvalidParameterCombinationException**
Two or more incompatible parameters were specified.

HTTP Status Code: 400

**InvalidParameterValueException**
The value for a parameter is invalid.

HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**
The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DescribeEvents

Service: DynamoDB Accelerator

Returns events related to DAX clusters and parameter groups. You can obtain events specific to a particular DAX cluster or parameter group by providing the name as a parameter.

By default, only the events occurring within the last 24 hours are returned; however, you can retrieve up to 14 days’ worth of events if necessary.

Request Syntax

```json
{
    "Duration": number,
    "EndTime": number,
    "MaxResults": number,
    "NextToken": string,
    "SourceName": string,
    "SourceType": string,
    "StartTime": number
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**Duration (p. 286)**

The number of minutes' worth of events to retrieve.

Type: Integer

Required: No

**EndTime (p. 286)**

The end of the time interval for which to retrieve events, specified in ISO 8601 format.

Type: Timestamp

Required: No

**MaxResults (p. 286)**

The maximum number of results to include in the response. If more results exist than the specified `MaxResults` value, a token is included in the response so that the remaining results can be retrieved.

The value for `MaxResults` must be between 20 and 100.

Type: Integer

Required: No

**NextToken (p. 286)**

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by `MaxResults`. 
Type: String
Required: No

**SourceName (p. 286)**

The identifier of the event source for which events will be returned. If not specified, then all sources are included in the response.

Type: String
Required: No

**SourceType (p. 286)**

The event source to retrieve events for. If no value is specified, all events are returned.

Type: String
Valid Values: CLUSTER | PARAMETER_GROUP | SUBNET_GROUP
Required: No

**StartTime (p. 286)**

The beginning of the time interval to retrieve events for, specified in ISO 8601 format.

Type: Timestamp
Required: No

### Response Syntax

```json
{
    "Events": [
        {
            "Date": number,
            "Message": "string",
            "SourceName": "string",
            "SourceType": "string"
        },
        ...
    ],
    "NextToken": "string"
}
```

### Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Events (p. 287)**

An array of events. Each element in the array represents one event.

Type: Array of **Event (p. 508)** objects

**NextToken (p. 287)**

Provides an identifier to allow retrieval of paginated results.

Type: String
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DescribeParameterGroups

Service: DynamoDB Accelerator

Returns a list of parameter group descriptions. If a parameter group name is specified, the list will contain only the descriptions for that group.

Request Syntax

```json
{
   "MaxResults": number,
   "NextToken": "string",
   "ParameterGroupNames": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**

In the following list, the required parameters are described first.

**MaxResults (p. 289)**

The maximum number of results to include in the response. If more results exist than the specified `MaxResults` value, a token is included in the response so that the remaining results can be retrieved.

The value for `MaxResults` must be between 20 and 100.

Type: Integer  
Required: No

**NextToken (p. 289)**

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by `MaxResults`.

Type: String  
Required: No

**ParameterGroupNames (p. 289)**

The names of the parameter groups.

Type: Array of strings  
Required: No

Response Syntax

```json
{
   "NextToken": "string",
   "ParameterGroups": [
      {
         "Description": "string",
         "ParameterGroupName": "string"
      }
   ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

NextToken (p. 289)

Provides an identifier to allow retrieval of paginated results.

Type: String

ParameterGroups (p. 289)

An array of parameter groups. Each element in the array represents one parameter group.

Type: Array of ParameterGroup (p. 515) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ParameterGroupNotFoundFault

The specified parameter group does not exist.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

See Also

DescribeParameters
Service: DynamoDB Accelerator

Returns the detailed parameter list for a particular parameter group.

Request Syntax

```
{
  "MaxResults": number,
  "NextToken": "string",
  "ParameterGroupName": "string",
  "Source": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ParameterGroupName (p. 292)**

The name of the parameter group.

Type: String

Required: Yes

**MaxResults (p. 292)**

The maximum number of results to include in the response. If more results exist than the specified MaxResults value, a token is included in the response so that the remaining results can be retrieved.

The value for MaxResults must be between 20 and 100.

Type: Integer

Required: No

**NextToken (p. 292)**

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by MaxResults.

Type: String

Required: No

**Source (p. 292)**

How the parameter is defined. For example, system denotes a system-defined parameter.

Type: String

Required: No
Response Syntax

```json
{
  "NextToken": "string",
  "Parameters": [
    {
      "AllowedValues": "string",
      "ChangeType": "string",
      "DataType": "string",
      "Description": "string",
      "IsModifiable": "string",
      "NodeTypeSpecificValues": [
        {
          "NodeType": "string",
          "Value": "string"
        }
      ],
      "ParameterName": "string",
      "ParameterType": "string",
      "ParameterValue": "string",
      "Source": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 293)**

Provides an identifier to allow retrieval of paginated results.

Type: String

**Parameters (p. 293)**

A list of parameters within a parameter group. Each element in the list represents one parameter.

Type: Array of Parameter (p. 513) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InvalidParameterCombinationException**

Two or more incompatible parameters were specified.

HTTP Status Code: 400

**InvalidParameterValueException**

The value for a parameter is invalid.

HTTP Status Code: 400

**ParameterGroupNotFoundFault**

The specified parameter group does not exist.
HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

DescribeSubnetGroups
Service: DynamoDB Accelerator

Returns a list of subnet group descriptions. If a subnet group name is specified, the list will contain only the description of that group.

Request Syntax

```
{
  "MaxResults": number,
  "NextToken": "string",
  "SubnetGroupNames": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**MaxResults** (p. 295)

The maximum number of results to include in the response. If more results exist than the specified MaxResults value, a token is included in the response so that the remaining results can be retrieved.

The value for MaxResults must be between 20 and 100.

Type: Integer
Required: No

**NextToken** (p. 295)

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token, up to the value specified by MaxResults.

Type: String
Required: No

**SubnetGroupNames** (p. 295)

The name of the subnet group.

Type: Array of strings
Required: No

Response Syntax

```
{
  "NextToken": "string",
  "SubnetGroups": [
    {
      "Description": "string",
      "SubnetGroupName": "string",
    }
  ]
}
```
"Subnets": [  
  {  
    "SubnetAvailabilityZone": "string",  
    "SubnetIdentifier": "string"  
  },  
  {  
    "VpcId": "string"  
  }  
],  
"VpcId": "string"}  
}  
}  

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

NextToken (p. 295)

Provides an identifier to allow retrieval of paginated results.

Type: String

SubnetGroups (p. 295)

An array of subnet groups. Each element in the array represents a single subnet group.

Type: Array of SubnetGroup (p. 522) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

SubnetGroupNotFoundFault

The requested subnet group name does not refer to an existing subnet group.

HTTP Status Code: 400

IncreaseReplicationFactor
Service: DynamoDB Accelerator

Adds one or more nodes to a DAX cluster.

Request Syntax

```
{
   "AvailabilityZones": [ "string" ],
   "ClusterName": "string",
   "NewReplicationFactor": number
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 298)**

The name of the DAX cluster that will receive additional nodes.

Type: String

Required: Yes

**NewReplicationFactor (p. 298)**

The new number of nodes for the DAX cluster.

Type: Integer

Required: Yes

**AvailabilityZones (p. 298)**

The Availability Zones (AZs) in which the cluster nodes will be created. All nodes belonging to the cluster are placed in these Availability Zones. Use this parameter if you want to distribute the nodes across multiple AZs.

Type: Array of strings

Required: No

Response Syntax

```
{
   "Cluster": {
      "ActiveNodes": number,
      "ClusterArn": "string",
      "ClusterDiscoveryEndpoint": {
         "Address": "string",
         "Port": number,
         "URL": "string"
      },
      "ClusterEndpointEncryptionType": "string",
      "ClusterName": "string",
```
"Description": "string",
"IamRoleArn": "string",
"NodeIdToRemove": [ "string" ],
"Nodes": [
  {
    "AvailabilityZone": "string",
    "Endpoint": {
      "Address": "string",
      "Port": number,
      "URL": "string"
    },
    "NodeCreateTime": number,
    "NodeId": "string",
    "NodeStatus": "string",
    "ParameterGroupStatus": "string"
  }
],
"NodeType": "string",
"NotificationConfiguration": {
  "TopicArn": "string",
  "TopicStatus": "string"
},
"ParameterGroup": {
  "NodeIdsToReboot": [ "string" ],
  "ParameterApplyStatus": "string",
  "ParameterGroupName": "string"
},
"PreferredMaintenanceWindow": "string",
"SecurityGroups": [
  {
    "SecurityGroupIdentifier": "string",
    "Status": "string"
  }
],
"SSEDescription": {
  "Status": "string"
},
"Status": "string",
"SubnetGroup": "string",
"TotalNodes": number
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

Cluster (p. 298)

A description of the DAX cluster, with its new replication factor. Type: Cluster (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.
HTTP Status Code: 400

**InsufficientClusterCapacityFault**

There are not enough system resources to create the cluster you requested (or to resize an already-existing cluster).

HTTP Status Code: 400

**InvalidClusterStateFault**

The requested DAX cluster is not in the *available* state.

HTTP Status Code: 400

**InvalidParameterCombinationException**

Two or more incompatible parameters were specified.

HTTP Status Code: 400

**InvalidParameterValueException**

The value for a parameter is invalid.

HTTP Status Code: 400

**InvalidVPCNetworkStateFault**

The VPC network is in an invalid state.

HTTP Status Code: 400

**NodeQuotaForClusterExceededFault**

You have attempted to exceed the maximum number of nodes for a DAX cluster.

HTTP Status Code: 400

**NodeQuotaForCustomerExceededFault**

You have attempted to exceed the maximum number of nodes for your AWS account.

HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

ListTags
Service: DynamoDB Accelerator
List all of the tags for a DAX cluster. You can call ListTags up to 10 times per second, per account.

Request Syntax

```json
{
   "NextToken": "string",
   "ResourceName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

### ResourceName (p. 302)

The name of the DAX resource to which the tags belong.

Type: String

Required: Yes

### NextToken (p. 302)

An optional token returned from a prior request. Use this token for pagination of results from this action. If this parameter is specified, the response includes only results beyond the token.

Type: String

Required: No

Response Syntax

```json
{
   "NextToken": "string",
   "Tags": [
      {
         "Key": "string",
         "Value": "string"
      }
   ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

### NextToken (p. 302)

If this value is present, there are additional results to be displayed. To retrieve them, call ListTags again, with NextToken set to this value.
Type: String

**Tags (p. 302)**

A list of tags currently associated with the DAX cluster.

Type: Array of **Tag (p. 523)** objects

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 541)](#).

**ClusterNotFoundFault**

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

**InvalidARNFault**

The Amazon Resource Name (ARN) supplied in the request is not valid.

HTTP Status Code: 400

**InvalidClusterStateFault**

The requested DAX cluster is not in the `available` state.

HTTP Status Code: 400

**InvalidParameterCombinationException**

Two or more incompatible parameters were specified.

HTTP Status Code: 400

**InvalidParameterValueException**

The value for a parameter is invalid.

HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

RebootNode
Service: DynamoDB Accelerator

Reboots a single node of a DAX cluster. The reboot action takes place as soon as possible. During the reboot, the node status is set to REBOOTING.

**Note**
RebootNode restarts the DAX engine process and does not remove the contents of the cache.

**Request Syntax**

```json
{
    "ClusterName": "string",
    "NodeId": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 305)**

The name of the DAX cluster containing the node to be rebooted.

Type: String
Required: Yes

**NodeId (p. 305)**

The system-assigned ID of the node to be rebooted.

Type: String
Required: Yes

**Response Syntax**

```json
{
    "Cluster": {
        "ActiveNodes": number,
        "ClusterArn": "string",
        "ClusterDiscoveryEndpoint": {
            "Address": "string",
            "Port": number,
            "URL": "string"
        },
        "ClusterEndpointEncryptionType": "string",
        "ClusterName": "string",
        "Description": "string",
        "IamRoleArn": "string",
        "NodeIdsToRemove": [ "string" ],
        "Nodes": [
            {
                "AvailabilityZone": "string",
                "Endpoint": {
                    "Address": "string",
                    
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Cluster (p. 305)**

A description of the DAX cluster after a node has been rebooted.

Type: Cluster (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

**ClusterNotFoundFault**

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

**InvalidClusterStateFault**

The requested DAX cluster is not in the available state.

HTTP Status Code: 400
InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

NodeNotFoundException

None of the nodes in the cluster have the given node ID.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

TagResource
Service: DynamoDB Accelerator

Associates a set of tags with a DAX resource. You can call TagResource up to 5 times per second, per account.

Request Syntax

```
{
  "ResourceName": "string",
  "Tags": [
    {
      "Key": "string",
      "Value": "string"
    }
  ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ResourceName (p. 308)**

The name of the DAX resource to which tags should be added.

Type: String

Required: Yes

**Tags (p. 308)**

The tags to be assigned to the DAX resource.

Type: Array of Tag (p. 523) objects

Required: Yes

Response Syntax

```
{
  "Tags": [
    {
      "Key": "string",
      "Value": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
Tags (p. 308)

The list of tags that are associated with the DAX resource.

Type: Array of Tag (p. 523) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidARNFault

The Amazon Resource Name (ARN) supplied in the request is not valid.

HTTP Status Code: 400

InvalidClusterStateFault

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

TagQuotaPerResourceExceeded

You have exceeded the maximum number of tags for this DAX cluster.

HTTP Status Code: 400

UntagResource
Service: DynamoDB Accelerator

Removes the association of tags from a DAX resource. You can call UntagResource up to 5 times per second, per account.

Request Syntax

```
{
    "ResourceName": "string",
    "TagKeys": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ResourceName (p. 311)**

The name of the DAX resource from which the tags should be removed.

Type: String
Required: Yes

**TagKeys (p. 311)**

A list of tag keys. If the DAX cluster has any tags with these keys, then the tags are removed from the cluster.

Type: Array of strings
Required: Yes

Response Syntax

```
{
    "Tags": [
        {
            "Key": "string",
            "Value": "string"
        }
    ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Tags (p. 311)**

The tag keys that have been removed from the cluster.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidARNFault

The Amazon Resource Name (ARN) supplied in the request is not valid.

HTTP Status Code: 400

InvalidClusterStateFault

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

TagNotFoundFault

The tag does not exist.

HTTP Status Code: 400

UpdateCluster
Service: DynamoDB Accelerator

Modifies the settings for a DAX cluster. You can use this action to change one or more cluster configuration parameters by specifying the parameters and the new values.

Request Syntax

```
{
    "ClusterName": "string",
    "Description": "string",
    "NotificationTopicArn": "string",
    "NotificationTopicStatus": "string",
    "ParameterGroupName": "string",
    "PreferredMaintenanceWindow": "string",
    "SecurityGroupIds": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ClusterName (p. 314)**

The name of the DAX cluster to be modified.

Type: String

Required: Yes

**Description (p. 314)**

A description of the changes being made to the cluster.

Type: String

Required: No

**NotificationTopicArn (p. 314)**

The Amazon Resource Name (ARN) that identifies the topic.

Type: String

Required: No

**NotificationTopicStatus (p. 314)**

The current state of the topic. A value of “active” means that notifications will be sent to the topic. A value of “inactive” means that notifications will not be sent to the topic.

Type: String

Required: No

**ParameterGroupName (p. 314)**

The name of a parameter group for this cluster.

Type: String
**PreferredMaintenanceWindow (p. 314)**

A range of time when maintenance of DAX cluster software will be performed. For example: sun: 01:00-sun:09:00. Cluster maintenance normally takes less than 30 minutes, and is performed automatically within the maintenance window.

Type: String

Required: No

**SecurityGroupIds (p. 314)**

A list of user-specified security group IDs to be assigned to each node in the DAX cluster. If this parameter is not specified, DAX assigns the default VPC security group to each node.

Type: Array of strings

Required: No

## Response Syntax

```
{
   "Cluster": {
      "ActiveNodes": number,
      "ClusterArn": "string",
      "ClusterDiscoveryEndpoint": {
         "Address": "string",
         "Port": number,
         "URL": "string"
      },
      "ClusterEndpointEncryptionType": "string",
      "ClusterName": "string",
      "Description": "string",
      "IamRoleArn": "string",
      "NodeIdsToRemove": [ "string" ],
      "Nodes": [ {
         "AvailabilityZone": "string",
         "Endpoint": { 
            "Address": "string",
            "Port": number,
            "URL": "string"
         },
         "CreateTime": number,
         "Id": "string",
         "NodeStatus": "string",
         "ParameterGroupStatus": "string"
      } ],
      "NodeType": "string",
      "NotificationConfiguration": { 
         "TopicArn": "string",
         "TopicStatus": "string"
      },
      "ParameterGroup": { 
         "NodeIdToReboot": [ "string" ],
         "ParameterApplyStatus": "string",
         "ParameterGroupName": "string"
      },
      "PreferredMaintenanceWindow": "string",
      "SecurityGroups": [ 
```
UpdateCluster

{  
  "SecurityGroupIdentifier": "string",
  "Status": "string"
},  
"SSEDescription": {  
  "Status": "string",
  "SubnetGroup": "string",
  "TotalNodes": number
}  
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

Cluster (p. 315)

A description of the DAX cluster, after it has been modified.

Type: Cluster (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

ClusterNotFoundFault

The requested cluster ID does not refer to an existing DAX cluster.

HTTP Status Code: 400

InvalidClusterStateFault

The requested DAX cluster is not in the available state.

HTTP Status Code: 400

InvalidParameterCombinationException

Two or more incompatible parameters were specified.

HTTP Status Code: 400

InvalidParameterGroupStateFault

One or more parameters in a parameter group are in an invalid state.

HTTP Status Code: 400

InvalidParameterValueException

The value for a parameter is invalid.

HTTP Status Code: 400

ParameterGroupNotFoundFault

The specified parameter group does not exist.
HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

**See Also**

UpdateParameterGroup

Service: DynamoDB Accelerator

Modifies the parameters of a parameter group. You can modify up to 20 parameters in a single request by submitting a list parameter name and value pairs.

Request Syntax

```json
{
  "ParameterGroupName": "string",
  "ParameterNameValues": [
    {
      "ParameterName": "string",
      "ParameterValue": "string"
    }
  ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ParameterGroupName (p. 318)**

The name of the parameter group.

Type: String

Required: Yes

**ParameterNameValues (p. 318)**

An array of name-value pairs for the parameters in the group. Each element in the array represents a single parameter.

**Note**
record-ttl-millis and query-ttl-millis are the only supported parameter names. For more details, see Configuring TTL Settings.

Type: Array of ParameterNameValue (p. 517) objects

Required: Yes

Response Syntax

```json
{
  "ParameterGroup": {
    "Description": "string",
    "ParameterGroupName": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**ParameterGroup (p. 318)**

The parameter group that has been modified.

Type: ParameterGroup (p. 515) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 541).

**InvalidParameterCombinationException**

Two or more incompatible parameters were specified.

HTTP Status Code: 400

**InvalidParameterGroupStateFault**

One or more parameters in a parameter group are in an invalid state.

HTTP Status Code: 400

**InvalidParameterValueException**

The value for a parameter is invalid.

HTTP Status Code: 400

**ParameterGroupNotFoundFault**

The specified parameter group does not exist.

HTTP Status Code: 400

**ServiceLinkedRoleNotFoundFault**

The specified service linked role (SLR) was not found.

HTTP Status Code: 400

**See Also**

UpdateSubnetGroup
Service: DynamoDB Accelerator
Modifies an existing subnet group.

Request Syntax

```
{
  "Description": "string",
  "SubnetGroupName": "string",
  "SubnetIds": [ "string" ]
}
```

Request Parameters
The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**SubnetGroupName (p. 320)**
The name of the subnet group.
Type: String
Required: Yes

**Description (p. 320)**
A description of the subnet group.
Type: String
Required: No

**SubnetIds (p. 320)**
A list of subnet IDs in the subnet group.
Type: Array of strings
Required: No

Response Syntax

```
{
  "SubnetGroup": {
    "Description": "string",
    "SubnetGroupName": "string",
    "Subnets": [ {
      "SubnetAvailabilityZone": "string",
      "SubnetIdentifier": "string"
    } ],
    "VpcId": "string"
  }
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

SubnetGroup (p. 320)
  The subnet group that has been modified.
  Type: SubnetGroup (p. 522) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InvalidSubnet
  An invalid subnet identifier was specified.
  HTTP Status Code: 400

ServiceLinkedRoleNotFoundFault
  The specified service linked role (SLR) was not found.
  HTTP Status Code: 400

SubnetGroupNotFoundFault
  The requested subnet group name does not refer to an existing subnet group.
  HTTP Status Code: 400

SubnetInUse
  The requested subnet is being used by another subnet group.
  HTTP Status Code: 400

SubnetQuotaExceededFault
  The request cannot be processed because it would exceed the allowed number of subnets in a subnet group.
  HTTP Status Code: 400

Amazon DynamoDB Streams

The following actions are supported by Amazon DynamoDB Streams:

- DescribeStream (p. 323)
- GetRecords (p. 327)
- GetShardIterator (p. 333)
- ListStreams (p. 337)
DescribeStream
Service: Amazon DynamoDB Streams

Returns information about a stream, including the current status of the stream, its Amazon Resource Name (ARN), the composition of its shards, and its corresponding DynamoDB table.

**Note**
You can call DescribeStream at a maximum rate of 10 times per second.

Each shard in the stream has a SequenceNumberRange associated with it. If the SequenceNumberRange has a StartingSequenceNumber but no EndingSequenceNumber, then the shard is still open (able to receive more stream records). If both StartingSequenceNumber and EndingSequenceNumber are present, then that shard is closed and can no longer receive more data.

**Request Syntax**

```json
{
    "ExclusiveStartShardId": "string",
    "Limit": number,
    "StreamArn": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**StreamArn (p. 323)**

The Amazon Resource Name (ARN) for the stream.

Type: String

Required: Yes

**ExclusiveStartShardId (p. 323)**

The shard ID of the first item that this operation will evaluate. Use the value that was returned for LastEvaluatedShardId in the previous operation.

Type: String

Required: No

**Limit (p. 323)**

The maximum number of shard objects to return. The upper limit is 100.

Type: Integer

Valid Range: Minimum value of 1.

Required: No
Response Syntax

```json
{
  "StreamDescription": {
    "CreationRequestDateTime": number,
    "KeySchema": [
      {
        "AttributeName": "string",
        "KeyType": "string"
      }
    ],
    "LastEvaluatedShardId": "string",
    "Shards": [
      {
        "ParentShardId": "string",
        "SequenceNumberRange": {
          "EndingSequenceNumber": "string",
          "StartingSequenceNumber": "string"
        },
        "ShardId": "string"
      }
    ],
    "StreamArn": "string",
    "StreamLabel": "string",
    "StreamStatus": "string",
    "StreamViewType": "string",
    "TableName": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

StreamDescription (p. 324)

A complete description of the stream, including its creation date and time, the DynamoDB table associated with the stream, the shard IDs within the stream, and the beginning and ending sequence numbers of stream records within the shards.

Type: StreamDescription (p. 536) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError

An error occurred on the server side.

HTTP Status Code: 500

ResourceNotFoundException

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400
Examples

Describe A Stream

The following sample returns a description of a stream with a given stream ARN. All of the shards in the stream are listed in the response, along with the beginning and ending sequence numbers of stream records within the shards. Note that one of the shards is still open, because it does not have an EndingSequenceNumber.

Sample Request

```
POST / HTTP/1.1
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <CRC32>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDBStreams_20120810.DescribeStream
{
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
x-amzn-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "StreamDescription": {
    "StreamStatus": "ENABLED",
    "StreamViewType": "NEW_AND_OLD_IMAGES",
    "CreationRequestDateTime": "Wed May 20 13:51:10 PDT 2015",
    "TableName": "Forum",
    "KeySchema": [
      {"AttributeName": "ForumName","KeyType": "HASH"},
      {"AttributeName": "Subject","KeyType": "RANGE"}
    ],
    "Shards": [
      {
        "SequenceNumberRange": {

GetRecords
Service: Amazon DynamoDB Streams

Retrieves the stream records from a given shard.

Specify a shard iterator using the ShardIterator parameter. The shard iterator specifies the position in the shard from which you want to start reading stream records sequentially. If there are no stream records available in the portion of the shard that the iterator points to, GetRecords returns an empty list. Note that it might take multiple calls to get to a portion of the shard that contains stream records.

**Note**
GetRecords can retrieve a maximum of 1 MB of data or 1000 stream records, whichever comes first.

**Request Syntax**

```json
{
  "Limit": number,
  "ShardIterator": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ShardIterator (p. 327)**

A shard iterator that was retrieved from a previous GetShardIterator operation. This iterator can be used to access the stream records in this shard.

Type: String
Length Constraints: Minimum length of 1. Maximum length of 2048.
Required: Yes

**Limit (p. 327)**

The maximum number of records to return from the shard. The upper limit is 1000.

Type: Integer
Valid Range: Minimum value of 1.
Required: No

**Response Syntax**

```json
{
  "NextShardIterator": "string",
  "Records": [
    {
      "awsRegion": "string",
      "dynamodb": {
        "ApproximateCreationDateTime": number,
        "Keys": {
          "string": "value""
```
"string" : {
    "B": blob,
    "BOOL": boolean,
    "BS": [ blob ],
    "L": [ "AttributeValue"
        ],
    "M": {
        "string": "AttributeValue"
        },
    "N": "string",
    "NS": [ "string" ],
    "NULL": boolean,
    "S": "string",
    "SS": [ "string" ]
    }
},
"NewImage": {
    "string" : {
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [ "AttributeValue"
            ],
        "M": {
            "string": "AttributeValue"
            },
        "N": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
        }
    },
"OldImage": {
    "string" : {
        "B": blob,
        "BOOL": boolean,
        "BS": [ blob ],
        "L": [ "AttributeValue"
            ],
        "M": {
            "string": "AttributeValue"
            },
        "N": "string",
        "NS": [ "string" ],
        "NULL": boolean,
        "S": "string",
        "SS": [ "string" ]
        }
    },
"SequenceNumber": "string",
"SizeBytes": number,
"StreamViewType": "string"
},
"eventID": "string",
"eventName": "string",
"eventSource": "string",
"eventVersion": "string",
"userIdentity": {
    "PrincipalId": "string",
    "Type": "string"
    }
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextShardIterator (p. 327)**

The next position in the shard from which to start sequentially reading stream records. If set to `null`, the shard has been closed and the requested iterator will not return any more data.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

**Records (p. 327)**

The stream records from the shard, which were retrieved using the shard iterator.

Type: Array of [Record](p. 531) objects

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 541)].

**ExpiredIteratorException**

The shard iterator has expired and can no longer be used to retrieve stream records. A shard iterator expires 15 minutes after it is retrieved using the GetShardIterator action.

HTTP Status Code: 400

**InternalServerException**

An error occurred on the server side.

HTTP Status Code: 500

**LimitExceeded Exception**

There is no limit to the number of daily on-demand backups that can be taken.

Up to 50 simultaneous table operations are allowed per account. These operations include CreateTable, UpdateTable, DeleteTable, UpdateTimeToLive, RestoreTableFromBackup, and RestoreTableToPointInTime.

The only exception is when you are creating a table with one or more secondary indexes. You can have up to 25 such requests running at a time; however, if the table or index specifications are complex, DynamoDB might temporarily reduce the number of concurrent operations.

There is a soft account quota of 256 tables.

HTTP Status Code: 400

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400
TrimmedDataAccessException

The operation attempted to read past the oldest stream record in a shard.

In DynamoDB Streams, there is a 24 hour limit on data retention. Stream records whose age exceeds this limit are subject to removal (trimming) from the stream. You might receive a TrimmedDataAccessException if:

- You request a shard iterator with a sequence number older than the trim point (24 hours).
- You obtain a shard iterator, but before you use the iterator in a GetRecords request, a stream record in the shard exceeds the 24 hour period and is trimmed. This causes the iterator to access a record that no longer exists.

HTTP Status Code: 400

Examples

Retrieve stream records from a shard

The following sample retrieves all the stream records from a shard. To do this, it uses a ShardIterator that was obtained from a previous GetShardIterator call.

Sample Request

```
POST / HTTP/1.1
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <CRC32>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDBStreams_20120810.GetRecords
{
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "Records": [
        {
            "awsRegion": "us-west-2",
            "dynamodb": {
                "ApproximateCreationDateTime": 1.46480431E9,
                "Keys":
```
GetRecords

GetShardIterator

Service: Amazon DynamoDB Streams

Returns a shard iterator. A shard iterator provides information about how to retrieve the stream records from within a shard. Use the shard iterator in a subsequent GetRecords request to read the stream records from the shard.

**Note**
A shard iterator expires 15 minutes after it is returned to the requester.

**Request Syntax**

```json
{
    "SequenceNumber": "string",
    "ShardId": "string",
    "ShardIteratorType": "string",
    "StreamArn": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ShardId (p. 333)**

The identifier of the shard. The iterator will be returned for this shard ID.

- **Type:** String
- **Length Constraints:** Minimum length of 28. Maximum length of 65.
- **Required:** Yes

**ShardIteratorType (p. 333)**

Determines how the shard iterator is used to start reading stream records from the shard:

- **AT_SEQUENCE_NUMBER** - Start reading exactly from the position denoted by a specific sequence number.
- **AFTER_SEQUENCE_NUMBER** - Start reading right after the position denoted by a specific sequence number.
- **TRIM_HORIZON** - Start reading at the last (untrimmed) stream record, which is the oldest record in the shard. In DynamoDB Streams, there is a 24 hour limit on data retention. Stream records whose age exceeds this limit are subject to removal (trimming) from the stream.
- **LATEST** - Start reading just after the most recent stream record in the shard, so that you always read the most recent data in the shard.

- **Type:** String
- **Valid Values:** TRIM_HORIZON | LATEST | AT_SEQUENCE_NUMBER | AFTER_SEQUENCE_NUMBER
- **Required:** Yes

**StreamArn (p. 333)**

The Amazon Resource Name (ARN) for the stream.
GetShardIterator

Type: String
Required: Yes

SequenceNumber (p. 333)
The sequence number of a stream record in the shard from which to start reading.
Type: String
Required: No

Response Syntax

```json
{
  "ShardIterator": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

ShardIterator (p. 334)
The position in the shard from which to start reading stream records sequentially. A shard iterator specifies this position using the sequence number of a stream record in a shard.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 2048.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 541).

InternalServerError
An error occurred on the server side.
HTTP Status Code: 500

ResourceNotFoundException
The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.
HTTP Status Code: 400

TrimmedDataAccessException
The operation attempted to read past the oldest stream record in a shard.

In DynamoDB Streams, there is a 24 hour limit on data retention. Stream records whose age exceeds this limit are subject to removal (trimming) from the stream. You might receive a TrimmedDataAccessException if:
• You request a shard iterator with a sequence number older than the trim point (24 hours).
• You obtain a shard iterator, but before you use the iterator in a GetRecords request, a stream record in the shard exceeds the 24 hour period and is trimmed. This causes the iterator to access a record that no longer exists.

HTTP Status Code: 400

Examples

Retrieve a Shard Iterator For a Stream

The following sample returns a shard iterator for the provided stream ARN and shard ID. The shard iterator will allow access to stream records beginning with the given sequence number.

Sample Request

POST / HTTP/1.1
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <CRC32>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDBStreams_20120810.GetShardIterator

{
  "ShardId": "00000001414576573621-f55eea83",
  "ShardIteratorType": "TRIM_HORIZON"
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>

{
}

ListStreams
Service: Amazon DynamoDB Streams

Returns an array of stream ARNs associated with the current account and endpoint. If the TableName parameter is present, then ListStreams will return only the streams ARNs for that table.

**Note**
You can call ListStreams at a maximum rate of 5 times per second.

**Request Syntax**

```
{
   "ExclusiveStartStreamArn": "string",
   "Limit": number,
   "TableName": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Note**
In the following list, the required parameters are described first.

**ExclusiveStartStreamArn (p. 337)**

The ARN (Amazon Resource Name) of the first item that this operation will evaluate. Use the value that was returned for LastEvaluatedStreamArn in the previous operation.

Type: String

Required: No

**Limit (p. 337)**

The maximum number of streams to return. The upper limit is 100.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

**TableName (p. 337)**

If this parameter is provided, then only the streams associated with this table name are returned.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

**Response Syntax**

```
{
}
```
"LastEvaluatedStreamArn": "string",
"Streams": [
  {
    "StreamArn": "string",
    "StreamLabel": "string",
    "TableName": "string"
  }
]

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**LastEvaluatedStreamArn (p. 337)**

The stream ARN of the item where the operation stopped, inclusive of the previous result set. Use this value to start a new operation, excluding this value in the new request.

If `LastEvaluatedStreamArn` is empty, then the "last page" of results has been processed and there is no more data to be retrieved.

If `LastEvaluatedStreamArn` is not empty, it does not necessarily mean that there is more data in the result set. The only way to know when you have reached the end of the result set is when `LastEvaluatedStreamArn` is empty.

Type: String

**Streams (p. 337)**

A list of stream descriptors associated with the current account and endpoint.

Type: Array of [Stream (p. 535)] objects

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 541)].

**InternalServer>Error**

An error occurred on the server side.

HTTP Status Code: 500

**ResourceNotFoundException**

The operation tried to access a nonexistent table or index. The resource might not be specified correctly, or its status might not be ACTIVE.

HTTP Status Code: 400

Examples

**Retrieve All Stream ARNs**

The following sample returns all of the stream ARNs.
Sample Request

POST / HTTP/1.1
x-amzn-RequestId: <RequestID>
x-amzn-crc32: <CRC32>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
X-Amz-Date: <Date>
X-Amz-Target: DynamoDBStreams_20120810.ListStreams
{}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestID>
x-amz-crc32: <Checksum>
Content-Type: application/x-amz-json-1.0
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "Streams": [
    {
      stream/2015-05-20T20:51:10.252",
      "TableName": "Forum",
      "StreamLabel": "2015-05-20T20:51:10.252"
    },
    {
      stream/2015-05-20T20:50:02.714",
      "TableName": "Forum",
      "StreamLabel": "2015-05-20T20:50:02.714"
    },
    {
      stream/2015-05-19T23:03:50.641",
      "TableName": "Forum",
      "StreamLabel": "2015-05-19T23:03:50.641"
    },
    ...
    remaining output omitted...
  ]
}

ArchivalSummary

Service: Amazon DynamoDB

Contains details of a table archival operation.

Contents

Note

In the following list, the required parameters are described first.

ArchivalBackupArn

The Amazon Resource Name (ARN) of the backup the table was archived to, when applicable in the archival reason. If you wish to restore this backup to the same table name, you will need to delete the original table.

Type: String

Required: No

ArchivalDateTime

The date and time when table archival was initiated by DynamoDB, in UNIX epoch time format.

Type: Timestamp

Required: No

ArchivalReason

The reason DynamoDB archived the table. Currently, the only possible value is:

- INACCESSIBLE_ENCRYPTION_CREDENTIALS - The table was archived due to the table's AWS KMS key being inaccessible for more than seven days. An On-Demand backup was created at the archival time.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**AttributeDefinition**

Service: Amazon DynamoDB

Represents an attribute for describing the key schema for the table and indexes.

**Contents**

**Note**

In the following list, the required parameters are described first.

**AttributeName**

A name for the attribute.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 255.

Required: Yes

**AttributeType**

The data type for the attribute, where:

- **S** - the attribute is of type String
- **N** - the attribute is of type Number
- **B** - the attribute is of type Binary

Type: String

Valid Values: S | N | B

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AttributeValue

Service: Amazon DynamoDB

Represents the data for an attribute.

Each attribute value is described as a name-value pair. The name is the data type, and the value is the data itself.

For more information, see Data Types in the Amazon DynamoDB Developer Guide.

Contents

**Note**

In the following list, the required parameters are described first.

**B**

An attribute of type Binary. For example:

```
"B": "dGhpcyB0ZXh0IGlzIGJhc2U2NC1lbmNvZGVk"
```

Type: Base64-encoded binary data object

Required: No

**BOOL**

An attribute of type Boolean. For example:

```
"BOOL": true
```

Type: Boolean

Required: No

**BS**

An attribute of type Binary Set. For example:

```
"BS": ["U3Vubnk=", "UmFpbnk=", "U25vd3k="]
```

Type: Array of Base64-encoded binary data objects

Required: No

**L**

An attribute of type List. For example:

```
"L": [ {"S": "Cookies"}, {"S": "Coffee"}, {"N": "3.14159"}]
```

Type: Array of AttributeValue (p. 349) objects

Required: No

**M**

An attribute of type Map. For example:

```
"M": {"Name": {"S": "Joe"}, "Age": {"N": "35"}}
```

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.
Required: No

**N**
An attribute of type Number. For example:

"N": "123.45"

Numbers are sent across the network to DynamoDB as strings, to maximize compatibility across languages and libraries. However, DynamoDB treats them as number type attributes for mathematical operations.

Type: String

Required: No

**NS**
An attribute of type Number Set. For example:

"NS": ["42.2", "-19", "7.5", "3.14"]

Numbers are sent across the network to DynamoDB as strings, to maximize compatibility across languages and libraries. However, DynamoDB treats them as number type attributes for mathematical operations.

Type: Array of strings

Required: No

**NULL**
An attribute of type Null. For example:

"NULL": true

Type: Boolean

Required: No

**S**
An attribute of type String. For example:

"S": "Hello"

Type: String

Required: No

**SS**
An attribute of type String Set. For example:

"SS": ["Giraffe", "Hippo", "Zebra"]

Type: Array of strings

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AttributeValueUpdate

Service: Amazon DynamoDB

For the UpdateItem operation, represents the attributes to be modified, the action to perform on each, and the new value for each.

Note
You cannot use UpdateItem to update any primary key attributes. Instead, you will need to delete the item, and then use PutItem to create a new item with new attributes.

Attribute values cannot be null; string and binary type attributes must have lengths greater than zero; and set type attributes must not be empty. Requests with empty values will be rejected with a ValidationException exception.

Contents

Note
In the following list, the required parameters are described first.

Action
Specifies how to perform the update. Valid values are PUT (default), DELETE, and ADD. The behavior depends on whether the specified primary key already exists in the table.

If an item with the specified Key is found in the table:

• PUT - Adds the specified attribute to the item. If the attribute already exists, it is replaced by the new value.

• DELETE - If no value is specified, the attribute and its value are removed from the item. The data type of the specified value must match the existing value's data type.

If a set of values is specified, then those values are subtracted from the old set. For example, if the attribute value was the set \[a, b, c\] and the DELETE action specified \[a, c\], then the final attribute value would be \[b\]. Specifying an empty set is an error.

• ADD - If the attribute does not already exist, then the attribute and its values are added to the item. If the attribute does exist, then the behavior of ADD depends on the data type of the attribute:

  • If the existing attribute is a number, and if Value is also a number, then the Value is mathematically added to the existing attribute. If Value is a negative number, then it is subtracted from the existing attribute.

    Note
    If you use ADD to increment or decrement a number value for an item that doesn't exist before the update, DynamoDB uses 0 as the initial value. In addition, if you use ADD to update an existing item, and intend to increment or decrement an attribute value which does not yet exist, DynamoDB uses 0 as the initial value. For example, suppose that the item you want to update does not yet have an attribute named itemcount, but you decide to ADD the number 3 to this attribute anyway, even though it currently does not exist. DynamoDB will create the itemcount attribute, set its initial value to 0, and finally add 3 to it. The result will be a new itemcount attribute in the item, with a value of 3.

  • If the existing data type is a set, and if the Value is also a set, then the Value is added to the existing set. (This is a set operation, not mathematical addition.) For example, if the attribute value was the set \[1, 2\], and the ADD action specified \[3\], then the final attribute value would be \[1, 2, 3\]. An error occurs if an Add action is specified for a set attribute and the attribute type specified does not match the existing set type.
Both sets must have the same primitive data type. For example, if the existing data type is a set of strings, the Value must also be a set of strings. The same holds true for number sets and binary sets.

This action is only valid for an existing attribute whose data type is number or is a set. Do not use ADD for any other data types.

If no item with the specified Key is found:
- PUT - DynamoDB creates a new item with the specified primary key, and then adds the attribute.
- DELETE - Nothing happens; there is no attribute to delete.
- ADD - DynamoDB creates a new item with the supplied primary key and number (or set) for the attribute value. The only data types allowed are number, number set, string set or binary set.

Type: String

Valid Values: ADD | PUT | DELETE

Required: No

Value

Represents the data for an attribute.

Each attribute value is described as a name-value pair. The name is the data type, and the value is the data itself.

For more information, see Data Types in the Amazon DynamoDB Developer Guide.

Type: AttributeValue (p. 349) object

Required: No

See Also

AutoScalingPolicyDescription
Service: Amazon DynamoDB

Represents the properties of the scaling policy.

Contents

**Note**
In the following list, the required parameters are described first.

PolicyName

The name of the scaling policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: \p{Print}+

Required: No

TargetTrackingScalingPolicyConfiguration

Represents a target tracking scaling policy configuration.

Type: AutoScalingTargetTrackingScalingPolicyConfigurationDescription (p. 360) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AutoScalingPolicyUpdate
Service: Amazon DynamoDB

Represents the auto scaling policy to be modified.

Contents

Note
In the following list, the required parameters are described first.

TargetTrackingScalingPolicyConfiguration

Represents a target tracking scaling policy configuration.

Type: AutoScalingTargetTrackingScalingPolicyConfigurationUpdate (p. 362) object

Required: Yes

PolicyName

The name of the scaling policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: \p{Print}+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AutoScalingSettingsDescription
Service: Amazon DynamoDB

Represents the auto scaling settings for a global table or global secondary index.

Contents

Note
In the following list, the required parameters are described first.

AutoScalingDisabled
Disabled auto scaling for this global table or global secondary index.
Type: Boolean
Required: No

AutoScalingRoleArn
Role ARN used for configuring the auto scaling policy.
Type: String
Required: No

MaximumUnits
The maximum capacity units that a global table or global secondary index should be scaled up to.
Type: Long
Valid Range: Minimum value of 1.
Required: No

MinimumUnits
The minimum capacity units that a global table or global secondary index should be scaled down to.
Type: Long
Valid Range: Minimum value of 1.
Required: No

ScalingPolicies
Information about the scaling policies.
Type: Array of AutoScalingPolicyDescription (p. 354) objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
AutoScalingSettingsUpdate

Service: Amazon DynamoDB

Represents the auto scaling settings to be modified for a global table or global secondary index.

Contents

Note
In the following list, the required parameters are described first.

AutoScalingDisabled

Disabled auto scaling for this global table or global secondary index.

Type: Boolean
Required: No

AutoScalingRoleArn

Role ARN used for configuring auto scaling policy.

Type: String
Pattern: [\u0020-\uD7FF\uE000-\uEFFF\uD800-\uDC00-\uDFFF\r\n\t]*
Required: No

MaximumUnits

The maximum capacity units that a global table or global secondary index should be scaled up to.

Type: Long
Valid Range: Minimum value of 1.
Required: No

MinimumUnits

The minimum capacity units that a global table or global secondary index should be scaled down to.

Type: Long
Valid Range: Minimum value of 1.
Required: No

ScalingPolicyUpdate

The scaling policy to apply for scaling target global table or global secondary index capacity units.

Type: AutoScalingPolicyUpdate (p. 355) object
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
AutoScalingTargetTrackingScalingPolicyConfigurationDescription

Service: Amazon DynamoDB

Represents the properties of a target tracking scaling policy.

Contents

Note

In the following list, the required parameters are described first.

TargetValue

The target value for the metric. The range is 8.515920e-109 to 1.174271e+108 (Base 10) or 2e-360 to 2e360 (Base 2).

Type: Double

Required: Yes

DisableScaleIn

Indicates whether scale in by the target tracking policy is disabled. If the value is true, scale in is disabled and the target tracking policy won't remove capacity from the scalable resource. Otherwise, scale in is enabled and the target tracking policy can remove capacity from the scalable resource. The default value is false.

Type: Boolean

Required: No

ScaleInCooldown

The amount of time, in seconds, after a scale in activity completes before another scale in activity can start. The cooldown period is used to block subsequent scale in requests until it has expired. You should scale in conservatively to protect your application's availability. However, if another alarm triggers a scale out policy during the cooldown period after a scale-in, application auto scaling scales out your scalable target immediately.

Type: Integer

Required: No

ScaleOutCooldown

The amount of time, in seconds, after a scale out activity completes before another scale out activity can start. While the cooldown period is in effect, the capacity that has been added by the previous scale out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. You should continuously (but not excessively) scale out.

Type: Integer

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
AutoScalingTargetTrackingScalingPolicyConfigurationUpdate

Service: Amazon DynamoDB

Represents the settings of a target tracking scaling policy that will be modified.

Contents

**Note**
In the following list, the required parameters are described first.

**TargetValue**

The target value for the metric. The range is 8.515920e-109 to 1.174271e+108 (Base 10) or 2e-360 to 2e360 (Base 2).

Type: Double

Required: Yes

**DisableScaleIn**

Indicates whether scale in by the target tracking policy is disabled. If the value is true, scale in is disabled and the target tracking policy won't remove capacity from the scalable resource. Otherwise, scale in is enabled and the target tracking policy can remove capacity from the scalable resource. The default value is false.

Type: Boolean

Required: No

**ScaleInCooldown**

The amount of time, in seconds, after a scale in activity completes before another scale in activity can start. The cooldown period is used to block subsequent scale in requests until it has expired. You should scale in conservatively to protect your application's availability. However, if another alarm triggers a scale out policy during the cooldown period after a scale-in, application auto scaling scales out your scalable target immediately.

Type: Integer

Required: No

**ScaleOutCooldown**

The amount of time, in seconds, after a scale out activity completes before another scale out activity can start. While the cooldown period is in effect, the capacity that has been added by the previous scale out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. You should continuously (but not excessively) scale out.

Type: Integer

Required: No

• AWS SDK for Ruby V3
BackupDescription
Service: Amazon DynamoDB

Contains the description of the backup created for the table.

Contents

Note
In the following list, the required parameters are described first.

BackupDetails

Contains the details of the backup created for the table.

Type: BackupDetails (p. 365) object

Required: No

SourceTableDetails

Contains the details of the table when the backup was created.

Type: SourceTableDetails (p. 474) object

Required: No

SourceTableFeatureDetails

Contains the details of the features enabled on the table when the backup was created. For example, LSIs, GSIs, streams, TTL.

Type: SourceTableFeatureDetails (p. 476) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BackupDetails
Service: Amazon DynamoDB

Contains the details of the backup created for the table.

Contents

**Note**
In the following list, the required parameters are described first.

**BackupArn**

ARN associated with the backup.

Type: String

Required: Yes

**BackupCreationDateTime**

Time at which the backup was created. This is the request time of the backup.

Type: Timestamp

Required: Yes

**BackupName**

Name of the requested backup.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**BackupStatus**

Backup can be in one of the following states: CREATING, ACTIVE, DELETED.

Type: String

Valid Values: CREATING | DELETED | AVAILABLE

Required: Yes

**BackupType**

BackupType:

- **USER** - You create and manage these using the on-demand backup feature.
- **SYSTEM** - If you delete a table with point-in-time recovery enabled, a SYSTEM backup is automatically created and is retained for 35 days (at no additional cost). System backups allow you to restore the deleted table to the state it was in just before the point of deletion.
- **AWS_BACKUP** - On-demand backup created by you from AWS Backup service.

Type: String

Valid Values: USER | SYSTEM | AWS_BACKUP
BackupDetails

Required: Yes

**BackupExpiryDateTime**

Time at which the automatic on-demand backup created by DynamoDB will expire. This on-demand backup expires automatically 35 days after its creation.

Type: Timestamp

Required: No

**BackupSizeBytes**

Size of the backup in bytes. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

Type: Long

Valid Range: Minimum value of 0.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BackupSummary
Service: Amazon DynamoDB
Contains details for the backup.

Contents

Note
In the following list, the required parameters are described first.

BackupArn
ARN associated with the backup.
Type: String
Required: No

BackupCreationDateTime
Time at which the backup was created.
Type: Timestamp
Required: No

BackupExpiryDateTime
Time at which the automatic on-demand backup created by DynamoDB will expire. This on-demand backup expires automatically 35 days after its creation.
Type: Timestamp
Required: No

BackupName
Name of the specified backup.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

BackupSizeBytes
Size of the backup in bytes.
Type: Long
Valid Range: Minimum value of 0.
Required: No

BackupStatus
Backup can be in one of the following states: CREATING, ACTIVE, DELETED.
Type: String
Valid Values: CREATING | DELETED | AVAILABLE

Required: No

**BackupType**

BackupType:
- **USER** - You create and manage these using the on-demand backup feature.
- **SYSTEM** - If you delete a table with point-in-time recovery enabled, a SYSTEM backup is automatically created and is retained for 35 days (at no additional cost). System backups allow you to restore the deleted table to the state it was in just before the point of deletion.
- **AWS_BACKUP** - On-demand backup created by you from AWS Backup service.

Type: String

Valid Values: USER | SYSTEM | AWS_BACKUP

Required: No

**TableArn**

ARN associated with the table.

Type: String

Required: No

**TableId**

Unique identifier for the table.

Type: String

Pattern: [0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{12}

Required: No

**TableName**

Name of the table.

Type: String

Pattern: [a-zA-Z0-9-.\_\-]+

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BatchStatementError

Service: Amazon DynamoDB

An error associated with a statement in a PartiQL batch that was run.

Contents

Note
In the following list, the required parameters are described first.

Code

The error code associated with the failed PartiQL batch statement.

Type: String

Valid Values: ConditionalCheckFailed | ItemCollectionSizeLimitExceeded | RequestLimitExceeded | ValidationError | ProvisionedThroughputExceeded | TransactionConflict | ThrottlingError | InternalServerError | ResourceNotFound | AccessDenied | DuplicateItem

Required: No

Message

The error message associated with the PartiQL batch response.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BatchStatementRequest

Service: Amazon DynamoDB

A PartiQL batch statement request.

Contents

**Note**
In the following list, the required parameters are described first.

**Statement**

A valid PartiQL statement.

Type: String

Required: Yes

**ConsistentRead**

The read consistency of the PartiQL batch request.

Type: Boolean

Required: No

**Parameters**

The parameters associated with a PartiQL statement in the batch request.

Type: Array of AttributeValue (p. 349) objects

Array Members: Minimum number of 1 item.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BatchStatementResponse
Service: Amazon DynamoDB
A PartiQL batch statement response.

Contents

Note
In the following list, the required parameters are described first.

Error
The error associated with a failed PartiQL batch statement.
Type: BatchStatementError (p. 369) object
Required: No

Item
A DynamoDB item associated with a BatchStatementResponse
Type: String to AttributeValue (p. 349) object map
Key Length Constraints: Maximum length of 65535.
Required: No

TableName
The table name associated with a failed PartiQL batch statement.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
BillingModeSummary

Service: Amazon DynamoDB

Contains the details for the read/write capacity mode.

Contents

Note

In the following list, the required parameters are described first.

BillingMode

Controls how you are charged for read and write throughput and how you manage capacity. This setting can be changed later.

- **PROVISIONED** - Sets the read/write capacity mode to PROVISIONED. We recommend using PROVISIONED for predictable workloads.
- **PAY_PER_REQUEST** - Sets the read/write capacity mode to PAY_PER_REQUEST. We recommend using PAY_PER_REQUEST for unpredictable workloads.

Type: String

Valid Values: PROVISIONED | PAY_PER_REQUEST

Required: No

LastUpdateTimeToPayPerRequestDateTime

Represents the time when PAY_PER_REQUEST was last set as the read/write capacity mode.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CancellationReason
Service: Amazon DynamoDB

An ordered list of errors for each item in the request which caused the transaction to get cancelled. The values of the list are ordered according to the ordering of the TransactWriteItems request parameter. If no error occurred for the associated item an error with a Null code and Null message will be present.

Contents

Note
In the following list, the required parameters are described first.

Code
Status code for the result of the cancelled transaction.
Type: String
Required: No

Item
Item in the request which caused the transaction to get cancelled.
Type: String to AttributeValue (p. 349) object map
Key Length Constraints: Maximum length of 65535.
Required: No

Message
Cancellation reason message description.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Capacity
Service: Amazon DynamoDB

Represents the amount of provisioned throughput capacity consumed on a table or an index.

Contents

Note
In the following list, the required parameters are described first.

CapacityUnits
The total number of capacity units consumed on a table or an index.

Type: Double
Required: No

ReadCapacityUnits
The total number of read capacity units consumed on a table or an index.

Type: Double
Required: No

WriteCapacityUnits
The total number of write capacity units consumed on a table or an index.

Type: Double
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Condition

Service: Amazon DynamoDB

Represents the selection criteria for a Query or Scan operation:

- For a Query operation, Condition is used for specifying the KeyConditions to use when querying a table or an index. For KeyConditions, only the following comparison operators are supported:

  EQ | LE | LT | GE | GT | BEGINS_WITH | BETWEEN

Condition is also used in a QueryFilter, which evaluates the query results and returns only the desired values.

- For a Scan operation, Condition is used in a ScanFilter, which evaluates the scan results and returns only the desired values.

Contents

Note

In the following list, the required parameters are described first.

ComparisonOperator

A comparator for evaluating attributes. For example, equals, greater than, less than, etc.

The following comparison operators are available:

EQ | NE | LE | LT | GE | GT | NOT_NULL | NULL | CONTAINS | NOT_CONTAINS | BEGINS_WITH | IN | BETWEEN

The following are descriptions of each comparison operator.

- EQ: Equal. EQ is supported for all data types, including lists and maps.

  AttributeValueList can contain only one AttributeValue element of type String, Number, Binary, String Set, Number Set, or Binary Set. If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  
  `{"S":"6"}` does not equal `{"N":"6"}`. Also, `{"N":"6"}` does not equal `{"NS": ["6", "2", "1"]}`.

- NE: Not equal. NE is supported for all data types, including lists and maps.

  AttributeValueList can contain only one AttributeValue of type String, Number, Binary, String Set, Number Set, or Binary Set. If an item contains an AttributeValue of a different type than the one provided in the request, the value does not match. For example, 
  
  `{"S":"6"}` does not equal `{"N":"6"}`. Also, `{"N":"6"}` does not equal `{"NS": ["6", "2", "1"]}`.

- LE: Less than or equal.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  
  `{"S":"6"}` does not equal `{"N":"6"}`. Also, `{"N":"6"}` does not compare to `{"NS": ["6", "2", "1"]}`.

- LT: Less than.

  AttributeValueList can contain only one AttributeValue of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the
one provided in the request, the value does not match. For example, \{"S":"6"\} does not equal \{"N":"6"\}. Also, \{"N":"6"\} does not compare to \{"NS":\["6", "2", "1"\]\}.

- **GE**: Greater than or equal.

AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, \{"S":"6"\} does not equal \{"N":"6"\}. Also, \{"N":"6"\} does not compare to \{"NS":\["6", "2", "1"\]\}.

- **GT**: Greater than.

AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, \{"S":"6"\} does not equal \{"N":"6"\}. Also, \{"N":"6"\} does not compare to \{"NS":\["6", "2", "1"\]\}.

- **NOT_NULL**: The attribute exists. NOT_NULL is supported for all data types, including lists and maps.

  **Note**
  This operator tests for the existence of an attribute, not its data type. If the data type of attribute "a" is null, and you evaluate it using NOT_NULL, the result is a Boolean true. This result is because the attribute "a" exists; its data type is not relevant to the NOT_NULL comparison operator.

- **NULL**: The attribute does not exist. NULL is supported for all data types, including lists and maps.

  **Note**
  This operator tests for the nonexistence of an attribute, not its data type. If the data type of attribute "a" is null, and you evaluate it using NULL, the result is a Boolean false. This is because the attribute "a" exists; its data type is not relevant to the NULL comparison operator.

- **CONTAINS**: Checks for a subsequence, or value in a set.

AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If the target attribute of the comparison is of type String, then the operator checks for a substring match. If the target attribute of the comparison is of type Binary, then the operator looks for a subsequence of the target that matches the input. If the target attribute of the comparison is a set ("SS", "NS", or "BS"), then the operator evaluates to true if it finds an exact match with any member of the set.

CONTAINS is supported for lists: When evaluating "a CONTAINS b", "a" can be a list; however, "b" cannot be a set, a map, or a list.

- **NOT_CONTAINS**: Checks for absence of a subsequence, or absence of a value in a set.

AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If the target attribute of the comparison is of type String, then the operator checks for the absence of a substring match. If the target attribute of the comparison is Binary, then the operator checks for the absence of a subsequence of the target that matches the input. If the target attribute of the comparison is a set ("SS", "NS", or "BS"), then the operator evaluates to true if it does not find an exact match with any member of the set.

NOT_CONTAINS is supported for lists: When evaluating "a NOT CONTAINS b", "a" can be a list; however, "b" cannot be a set, a map, or a list.

- **BEGINS_WITH**: Checks for a prefix.
AttributeValueList can contain only one AttributeValue of type String or Binary (not a Number or a set type). The target attribute of the comparison must be of type String or Binary (not a Number or a set type).

- **IN**: Checks for matching elements in a list.

  AttributeValueList can contain one or more AttributeValue elements of type String, Number, or Binary. These attributes are compared against an existing attribute of an item. If any elements of the input are equal to the item attribute, the expression evaluates to true.

- **BETWEEN**: Greater than or equal to the first value, and less than or equal to the second value.

  AttributeValueList must contain two AttributeValue elements of the same type, either String, Number, or Binary (not a set type). A target attribute matches if the target value is greater than, or equal to, the first element and less than, or equal to, the second element. If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, {"S":"6"} does not compare to {"N":"6"}. Also, {"N":"6"} does not compare to {"NS":["6", "2", "1"]}

For usage examples of AttributeValueList and ComparisonOperator, see Legacy Conditional Parameters in the Amazon DynamoDB Developer Guide.

**Type**: String  
**Valid Values**: EQ | NE | IN | LE | LT | GE | GT | BETWEEN | NOT_NULL | NULL | CONTAINS | NOT_CONTAINS | BEGINS_WITH  
**Required**: Yes

**AttributeValueList**

One or more values to evaluate against the supplied attribute. The number of values in the list depends on the ComparisonOperator being used.

For type Number, value comparisons are numeric.

String value comparisons for greater than, equals, or less than are based on ASCII character code values. For example, a is greater than A, and a is greater than B. For a list of code values, see http://en.wikipedia.org/wiki/ASCII#ASCII_printable_characters.

For Binary, DynamoDB treats each byte of the binary data as unsigned when it compares binary values.

**Type**: Array of AttributeValue (p. 349) objects  
**Required**: No

- AWS SDK for Ruby V3
ConditionCheck
Service: Amazon DynamoDB

Represents a request to perform a check that an item exists or to check the condition of specific attributes of the item.

Contents

Note
In the following list, the required parameters are described first.

ConditionExpression
A condition that must be satisfied in order for a conditional update to succeed.
Type: String
Required: Yes

Key
The primary key of the item to be checked. Each element consists of an attribute name and a value for that attribute.
Type: String to AttributeValue (p. 349) object map
Key Length Constraints: Maximum length of 65535.
Required: Yes

TableName
Name of the table for the check item request.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: Yes

ExpressionAttributeNames
One or more substitution tokens for attribute names in an expression.
Type: String to string map
Value Length Constraints: Maximum length of 65535.
Required: No

ExpressionAttributeValue
One or more values that can be substituted in an expression.
Type: String to AttributeValue (p. 349) object map
Required: No

ReturnValuesOnConditionCheckFailure
Use ReturnValuesOnConditionCheckFailure to get the item attributes if the ConditionCheck condition fails. For ReturnValuesOnConditionCheckFailure, the valid values are: NONE and ALL_OLD.
ConditionCheck

Type: String

Valid Values: ALL_OLD | NONE

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ConsumedCapacity
Service: Amazon DynamoDB

The capacity units consumed by an operation. The data returned includes the total provisioned throughput consumed, along with statistics for the table and any indexes involved in the operation. ConsumedCapacity is only returned if the request asked for it. For more information, see Provisioned Throughput in the Amazon DynamoDB Developer Guide.

Contents

Note
In the following list, the required parameters are described first.

CapacityUnits
The total number of capacity units consumed by the operation.
Type: Double
Required: No

GlobalSecondaryIndexes
The amount of throughput consumed on each global index affected by the operation.
Type: String to Capacity (p. 374) object map
Key Pattern: [a-zA-Z0-9_.-]+
Required: No

LocalSecondaryIndexes
The amount of throughput consumed on each local index affected by the operation.
Type: String to Capacity (p. 374) object map
Key Pattern: [a-zA-Z0-9_.-]+
Required: No

ReadCapacityUnits
The total number of read capacity units consumed by the operation.
Type: Double
Required: No

Table
The amount of throughput consumed on the table affected by the operation.
Type: Capacity (p. 374) object
Required: No

TableName
The name of the table that was affected by the operation.
Type: String

Pattern: [a-zA-Z0-9_.-]+  

Required: No

**WriteCapacityUnits**

The total number of write capacity units consumed by the operation.

Type: Double

Required: No

**See Also**

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ContinuousBackupsDescription

Service: Amazon DynamoDB

Represents the continuous backups and point in time recovery settings on the table.

Contents

**Note**
In the following list, the required parameters are described first.

**ContinuousBackupsStatus**

ContinuousBackupsStatus can be one of the following states: ENABLED, DISABLED

Type: String

Valid Values:  ENABLED  |  DISABLED

Required: Yes

**PointInTimeRecoveryDescription**

The description of the point in time recovery settings applied to the table.

Type: PointInTimeRecoveryDescription (p. 442) object

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ContributorInsightsSummary
Service: Amazon DynamoDB

Represents a Contributor Insights summary entry.

Contents

Note
In the following list, the required parameters are described first.

ContributorInsightsStatus
Describes the current status for contributor insights for the given table and index, if applicable.
Type: String
Valid Values: ENABLING | ENABLED | DISABLING | DISABLED | FAILED
Required: No

IndexName
Name of the index associated with the summary, if any.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

TableName
Name of the table associated with the summary.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateGlobalSecondaryIndexAction
Service: Amazon DynamoDB

Represents a new global secondary index to be added to an existing table.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**
The name of the global secondary index to be created.

Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: Yes

**KeySchema**
The key schema for the global secondary index.

Type: Array of KeySchemaElement (p. 432) objects
Array Members: Minimum number of 1 item. Maximum number of 2 items.
Required: Yes

**Projection**
Represents attributes that are copied (projected) from the table into an index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: Projection (p. 444) object
Required: Yes

**ProvisionedThroughput**
Represents the provisioned throughput settings for the specified global secondary index.

For current minimum and maximum provisioned throughput values, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.

Type: ProvisionedThroughput (p. 445) object
Required: No

**See Also**
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateReplicaAction

Service: Amazon DynamoDB

Represents a replica to be added.

Contents

Note
In the following list, the required parameters are described first.

RegionName

The Region of the replica to be added.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateReplicationGroupMemberAction
Service: Amazon DynamoDB

Represents a replica to be created.

Contents

Note
In the following list, the required parameters are described first.

RegionName

The Region where the new replica will be created.

Type: String

Required: Yes

GlobalSecondaryIndexes

Replica-specific global secondary index settings.

Type: Array of ReplicaGlobalSecondaryIndex (p. 458) objects

Array Members: Minimum number of 1 item.

Required: No

KMSMasterKeyId

The AWS KMS key that should be used for AWS KMS encryption in the new replica. To specify a key, use its key ID, Amazon Resource Name (ARN), alias name, or alias ARN. Note that you should only provide this parameter if the key is different from the default DynamoDB KMS key alias/aws/dynamodb.

Type: String

Required: No

ProvisionedThroughputOverride

Replica-specific provisioned throughput. If not specified, uses the source table's provisioned throughput settings.

Type: ProvisionedThroughputOverride (p. 448) object

Required: No

TableClassOverride

Replica-specific table class. If not specified, uses the source table's table class.

Type: String

Valid Values: STANDARD | STANDARD_INFREQUENT_ACCESS

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CsvOptions
Service: Amazon DynamoDB
Processing options for the CSV file being imported.

Contents

Note
In the following list, the required parameters are described first.

Delimiter
The delimiter used for separating items in the CSV file being imported.
Type: String
Length Constraints: Fixed length of 1.
Pattern: [, ; : |\t ]
Required: No

HeaderList
List of the headers used to specify a common header for all source CSV files being imported. If this field is specified then the first line of each CSV file is treated as data instead of the header. If this field is not specified the the first line of each CSV file is treated as the header.
Type: Array of strings
Array Members: Minimum number of 1 item. Maximum number of 255 items.
Pattern: [\x20-\x21\x23-\x2B\x2D-\x7E]*
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Delete

Service: Amazon DynamoDB

Represents a request to perform a DeleteItem operation.

Contents

Note

In the following list, the required parameters are described first.

Key

The primary key of the item to be deleted. Each element consists of an attribute name and a value for that attribute.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

TableName

Name of the table in which the item to be deleted resides.

Type: String

Pattern: [a-zA-Z0-9_.-]+ 

Required: Yes

ConditionExpression

A condition that must be satisfied in order for a conditional delete to succeed.

Type: String

Required: No

ExpressionAttributeNames

One or more substitution tokens for attribute names in an expression.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

ExpressionAttributeValues

One or more values that can be substituted in an expression.

Type: String to AttributeValue (p. 349) object map

Required: No

ReturnValuesOnConditionCheckFailure

Use ReturnValuesOnConditionCheckFailure to get the item attributes if the Delete condition fails. For ReturnValuesOnConditionCheckFailure, the valid values are: NONE and ALL_OLD.
Type: String

Valid Values: ALL_OLD | NONE

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteGlobalSecondaryIndexAction
Service: Amazon DynamoDB
Represents a global secondary index to be deleted from an existing table.

Contents

Note
In the following list, the required parameters are described first.

IndexName
The name of the global secondary index to be deleted.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteReplicaAction
Service: Amazon DynamoDB

Represents a replica to be removed.

Contents

Note
In the following list, the required parameters are described first.

RegionName
The Region of the replica to be removed.
Type: String
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteReplicationGroupMemberAction
Service: Amazon DynamoDB

Represents a replica to be deleted.

Contents

Note
In the following list, the required parameters are described first.

RegionName
The Region where the replica exists.
Type: String
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteRequest

Service: Amazon DynamoDB

Represents a request to perform a DeleteItem operation on an item.

Contents

*Note*
In the following list, the required parameters are described first.

**Key**

A map of attribute name to attribute values, representing the primary key of the item to delete. All of the table's primary key attributes must be specified, and their data types must match those of the table's key schema.

Type: String to `AttributeValue (p. 349)` object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Endpoint
Service: Amazon DynamoDB
An endpoint information details.

Contents

Note
In the following list, the required parameters are described first.

Address
IP address of the endpoint.
Type: String
Required: Yes

CachePeriodInMinutes
Endpoint cache time to live (TTL) value.
Type: Long
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**ExpectedAttributeValue**

Service: Amazon DynamoDB

Represents a condition to be compared with an attribute value. This condition can be used with `DeleteItem`, `PutItem`, or `UpdateItem` operations; if the comparison evaluates to true, the operation succeeds; if not, the operation fails. You can use `ExpectedAttributeValue` in one of two different ways:

- Use `AttributeValueList` to specify one or more values to compare against an attribute. Use `ComparisonOperator` to specify how you want to perform the comparison. If the comparison evaluates to true, then the conditional operation succeeds.
- Use `Value` to specify a value that DynamoDB will compare against an attribute. If the values match, then `ExpectedAttributeValue` evaluates to true and the conditional operation succeeds. Optionally, you can also set `Exists` to false, indicating that you do not expect to find the attribute value in the table. In this case, the conditional operation succeeds only if the comparison evaluates to false.

`Value` and `Exists` are incompatible with `AttributeValueList` and `ComparisonOperator`. Note that if you use both sets of parameters at once, DynamoDB will return a `ValidationException` exception.

**Contents**

**Note**

In the following list, the required parameters are described first.

**AttributeValueList**

One or more values to evaluate against the supplied attribute. The number of values in the list depends on the `ComparisonOperator` being used.

For type `Number`, value comparisons are numeric.

String value comparisons for greater than, equals, or less than are based on ASCII character code values. For example, `a` is greater than `A`, and `a` is greater than `B`. For a list of code values, see [http://en.wikipedia.org/wiki/ASCII#ASCII_printable_characters](http://en.wikipedia.org/wiki/ASCII#ASCII_printable_characters).

For Binary, DynamoDB treats each byte of the binary data as unsigned when it compares binary values.

For information on specifying data types in JSON, see [JSON Data Format](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/JSON.html) in the *Amazon DynamoDB Developer Guide*.

Type: Array of `AttributeValue` (p. 349) objects

Required: No

**ComparisonOperator**

A comparator for evaluating attributes in the `AttributeValueList`. For example, equals, greater than, less than, etc.

The following comparison operators are available:

- `EQ` | `NE` | `LE` | `LT` | `GE` | `GT` | `NOT_NULL` | `NULL` | `CONTAINS` | `NOT_CONTAINS` | `BEGINS_WITH` | `IN` | `BETWEEN`

The following are descriptions of each comparison operator.
• **EQ**: Equal. EQ is supported for all data types, including lists and maps.

  AttributeValueList can contain only one AttributeValue element of type String, Number, Binary, String Set, Number Set, or Binary Set. If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not equal 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **NE**: Not equal. NE is supported for all data types, including lists and maps.

  AttributeValueList can contain only one AttributeValue of type String, Number, Binary, String Set, Number Set, or Binary Set. If an item contains an AttributeValue of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not equal 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **LE**: Less than or equal.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not compare to 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **LT**: Less than.

  AttributeValueList can contain only one AttributeValue of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not compare to 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **GE**: Greater than or equal.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not compare to 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **GT**: Greater than.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, 
  ```
  {"S":"6"}
  ```
  does not equal 
  ```
  {"N":"6"}
  ```
  Also, 
  ```
  {"N":"6"}
  ```
  does not compare to 
  ```
  {"NS":["6", "2", "1"]}
  ```
  
  • **NOT_NULL**: The attribute exists. NOT_NULL is supported for all data types, including lists and maps.

  **Note**

  This operator tests for the existence of an attribute, not its data type. If the data type of attribute "a" is null, and you evaluate it using NOT_NULL, the result is a Boolean true. This result is because the attribute "a" exists; its data type is not relevant to the NOT_NULL comparison operator.

  • **NULL**: The attribute does not exist. NULL is supported for all data types, including lists and maps.

  **Note**

  This operator tests for the nonexistence of an attribute, not its data type. If the data type of attribute "a" is null, and you evaluate it using NULL, the result is a Boolean false. This is because the attribute "a" exists; its data type is not relevant to the NULL comparison operator.
- **CONTAINS**: Checks for a subsequence, or value in a set.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If the target attribute of the comparison is of type String, then the operator checks for a substring match. If the target attribute of the comparison is of type Binary, then the operator looks for a subsequence of the target that matches the input. If the target attribute of the comparison is a set ("SS", "NS", or "BS"), then the operator evaluates to true if it finds an exact match with any member of the set.

  CONTAINS is supported for lists: When evaluating "a CONTAINS b", "a" can be a list; however, "b" cannot be a set, a map, or a list.

- **NOT_CONTAINS**: Checks for absence of a subsequence, or absence of a value in a set.

  AttributeValueList can contain only one AttributeValue element of type String, Number, or Binary (not a set type). If the target attribute of the comparison is a String, then the operator checks for the absence of a substring match. If the target attribute of the comparison is Binary, then the operator checks for the absence of a subsequence of the target that matches the input. If the target attribute of the comparison is a set ("SS", "NS", or "BS"), then the operator evaluates to true if it does not find an exact match with any member of the set.

  NOT_CONTAINS is supported for lists: When evaluating "a NOT CONTAINS b", "a" can be a list; however, "b" cannot be a set, a map, or a list.

- **BEGINS_WITH**: Checks for a prefix.

  AttributeValueList can contain only one AttributeValue of type String or Binary (not a Number or a set type). The target attribute of the comparison must be of type String or Binary (not a Number or a set type).

- **IN**: Checks for matching elements in a list.

  AttributeValueList can contain one or more AttributeValue elements of type String, Number, or Binary. These attributes are compared against an existing attribute of an item. If any elements of the input are equal to the item attribute, the expression evaluates to true.

- **BETWEEN**: Greater than or equal to the first value, and less than or equal to the second value.

  AttributeValueList must contain two AttributeValue elements of the same type, either String, Number, or Binary (not a set type). A target attribute matches if the target value is greater than, or equal to, the first element and less than, or equal to, the second element. If an item contains an AttributeValue element of a different type than the one provided in the request, the value does not match. For example, {"S":"6"} does not compare to {"N":"6"}. Also, {"N":"6"} does not compare to {"NS": ["6", "2", "1"]}.

Type: String

Valid Values: EQ | NE | IN | LE | LT | GE | GT | BETWEEN | NOT_NULL | NULL | CONTAINS | NOT_CONTAINS | BEGINS_WITH

Required: No

**Exists**

Causes DynamoDB to evaluate the value before attempting a conditional operation:

- If **Exists** is true, DynamoDB will check to see if that attribute value already exists in the table. If it is found, then the operation succeeds. If it is not found, the operation fails with a ConditionCheckFailedException.

- If **Exists** is false, DynamoDB assumes that the attribute value does not exist in the table. If in fact the value does not exist, then the assumption is valid and the operation succeeds.
If the value is found, despite the assumption that it does not exist, the operation fails with a ConditionCheckFailedException.

The default setting for Exists is true. If you supply a Value all by itself, DynamoDB assumes the attribute exists: You don’t have to set Exists to true, because it is implied.

DynamoDB returns a ValidationException if:

- Exists is true but there is no Value to check. (You expect a value to exist, but don’t specify what that value is.)
- Exists is false but you also provide a Value. (You cannot expect an attribute to have a value, while also expecting it not to exist.)

Type: Boolean
Required: No

Value

Represents the data for the expected attribute.

Each attribute value is described as a name-value pair. The name is the data type, and the value is the data itself.

For more information, see Data Types in the Amazon DynamoDB Developer Guide.

Type: AttributeValue (p. 349) object
Required: No

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ExportDescription
Service: Amazon DynamoDB

Represents the properties of the exported table.

Contents

Note
In the following list, the required parameters are described first.

BilledSizeBytes
The billable size of the table export.
Type: Long
Valid Range: Minimum value of 0.
Required: No

ClientToken
The client token that was provided for the export task. A client token makes calls to ExportTableToPointInTimeInput idempotent, meaning that multiple identical calls have the same effect as one single call.
Type: String
Pattern: ^[^\$]+$
Required: No

EndTime
The time at which the export task completed.
Type: Timestamp
Required: No

ExportArn
The Amazon Resource Name (ARN) of the table export.
Type: String
Required: No

ExportFormat
The format of the exported data. Valid values for ExportFormat are DYNAMODB_JSON or ION.
Type: String
Valid Values: DYNAMODB_JSON | ION
Required: No

ExportManifest
The name of the manifest file for the export task.
Type: String
ExportDescription

Required: No

ExportStatus

Export can be in one of the following states: IN_PROGRESS, COMPLETED, or FAILED.
Type: String
Valid Values: IN_PROGRESS | COMPLETED | FAILED
Required: No

ExportTime

Point in time from which table data was exported.
Type: Timestamp
Required: No

FailureCode

Status code for the result of the failed export.
Type: String
Required: No

FailureMessage

Export failure reason description.
Type: String
Required: No

ItemCount

The number of items exported.
Type: Long
Valid Range: Minimum value of 0.
Required: No

S3Bucket

The name of the Amazon S3 bucket containing the export.
Type: String
Length Constraints: Maximum length of 255.
Pattern: ^[a-zA-Z0-9-]+[\._\-\w]*[a-zA-Z0-9-]+$
Required: No

S3BucketOwner

The ID of the AWS account that owns the bucket containing the export.
Type: String
Pattern: [0-9]{12}
Required: No
S3Prefix

The Amazon S3 bucket prefix used as the file name and path of the exported snapshot.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

S3SseAlgorithm

Type of encryption used on the bucket where export data is stored. Valid values for S3SseAlgorithm are:

- AES256 - server-side encryption with Amazon S3 managed keys
- KMS - server-side encryption with AWS KMS managed keys

Type: String

Valid Values: AES256 | KMS

Required: No

S3SseKmsKeyId

The ID of the AWS KMS managed key used to encrypt the S3 bucket where export data is stored (if applicable).

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Required: No

StartTime

The time at which the export task began.

Type: Timestamp

Required: No

TableArn

The Amazon Resource Name (ARN) of the table that was exported.

Type: String

Required: No

TableId

Unique ID of the table that was exported.

Type: String

Pattern: [0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{12}

Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ExportSummary
Service: Amazon DynamoDB

Summary information about an export task.

Contents

Note
In the following list, the required parameters are described first.

ExportArn
The Amazon Resource Name (ARN) of the export.
Type: String
Required: No

ExportStatus
Export can be in one of the following states: IN_PROGRESS, COMPLETED, or FAILED.
Type: String
Valid Values: IN_PROGRESS | COMPLETED | FAILED
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
FailureException
Service: Amazon DynamoDB

Represents a failure a contributor insights operation.

Contents

Note
In the following list, the required parameters are described first.

ExceptionDescription
Description of the failure.
Type: String
Required: No

ExceptionName
Exception name.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Get
Service: Amazon DynamoDB

Specifies an item and related attribute values to retrieve in a TransactGetItem object.

Contents

Note
In the following list, the required parameters are described first.

Key
A map of attribute names to AttributeValue objects that specifies the primary key of the item to retrieve.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

TableName
The name of the table from which to retrieve the specified item.

Type: String

Pattern: [a-zA-Z0-9_.-]+ 

Required: Yes

ExpressionAttributeNames

One or more substitution tokens for attribute names in the ProjectionExpression parameter.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

ProjectionExpression

A string that identifies one or more attributes of the specified item to retrieve from the table. The attributes in the expression must be separated by commas. If no attribute names are specified, then all attributes of the specified item are returned. If any of the requested attributes are not found, they do not appear in the result.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
GlobalSecondaryIndex
Service: Amazon DynamoDB

Represents the properties of a global secondary index.

Contents

Note
In the following list, the required parameters are described first.

IndexName
The name of the global secondary index. The name must be unique among all other indexes on this table.

Type: String
Pattern: [a-zA-Z0-9_.-]+

Required: Yes

KeySchema
The complete key schema for a global secondary index, which consists of one or more pairs of attribute names and key types:

- HASH - partition key
- RANGE - sort key

Note
The partition key of an item is also known as its hash attribute. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.

The sort key of an item is also known as its range attribute. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: Array of KeySchemaElement (p. 432) objects
Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: Yes

Projection
Represents attributes that are copied (projected) from the table into the global secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: Projection (p. 444) object

Required: Yes

ProvisionedThroughput
Represents the provisioned throughput settings for the specified global secondary index.

For current minimum and maximum provisioned throughput values, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.

Type: ProvisionedThroughput (p. 445) object
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalSecondaryIndexAutoScalingUpdate

Service: Amazon DynamoDB

Represents the auto scaling settings of a global secondary index for a global table that will be modified.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**

The name of the global secondary index.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

ProvisionedWriteCapacityAutoScalingUpdate

Represents the auto scaling settings to be modified for a global table or global secondary index.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalSecondaryIndexDescription

Service: Amazon DynamoDB

Represents the properties of a global secondary index.

Contents

Note
In the following list, the required parameters are described first.

Backfilling

Indicates whether the index is currently backfilling. Backfilling is the process of reading items from the table and determining whether they can be added to the index. (Not all items will qualify: For example, a partition key cannot have any duplicate values.) If an item can be added to the index, DynamoDB will do so. After all items have been processed, the backfilling operation is complete and Backfilling is false.

You can delete an index that is being created during the Backfilling phase when IndexStatus is set to CREATING and Backfilling is true. You can't delete the index that is being created when IndexStatus is set to CREATING and Backfilling is false.

Note
For indexes that were created during a CreateTable operation, the Backfilling attribute does not appear in the DescribeTable output.

Type: Boolean

Required: No

IndexArn

The Amazon Resource Name (ARN) that uniquely identifies the index.

Type: String

Required: No

IndexName

The name of the global secondary index.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

IndexSizeBytes

The total size of the specified index, in bytes. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

Type: Long

Required: No

IndexStatus

The current state of the global secondary index:
• CREATING - The index is being created.
• UPDATING - The index is being updated.
• DELETING - The index is being deleted.
• ACTIVE - The index is ready for use.

Type: String
Valid Values: CREATING | UPDATING | DELETING | ACTIVE
Required: No

**ItemCount**

The number of items in the specified index. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

Type: Long
Required: No

**KeySchema**

The complete key schema for a global secondary index, which consists of one or more pairs of attribute names and key types:
• HASH - partition key
• RANGE - sort key

**Note**
The partition key of an item is also known as its *hash attribute*. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its *range attribute*. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: Array of *KeySchemaElement* objects
Array Members: Minimum number of 1 item. Maximum number of 2 items.
Required: No

**Projection**

Represents attributes that are copied (projected) from the table into the global secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: *Projection* object
Required: No

**ProvisionedThroughput**

Represents the provisioned throughput settings for the specified global secondary index.

For current minimum and maximum provisioned throughput values, see *Service, Account, and Table Quotas* in the *Amazon DynamoDB Developer Guide*.

Type: *ProvisionedThroughputDescription* object
Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalSecondaryIndexInfo

Service: Amazon DynamoDB

Represents the properties of a global secondary index for the table when the backup was created.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**

The name of the global secondary index.

Type: String

Pattern: 

Required: No

**KeySchema**

The complete key schema for a global secondary index, which consists of one or more pairs of attribute names and key types:

- HASH - partition key
- RANGE - sort key

**Note**
The partition key of an item is also known as its hash attribute. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values. The sort key of an item is also known as its range attribute. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: Array of KeySchemaElement (p. 432) objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: No

**Projection**

Represents attributes that are copied (projected) from the table into the global secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: Projection (p. 444) object

Required: No

**ProvisionedThroughput**

Represents the provisioned throughput settings for the specified global secondary index.

Type: ProvisionedThroughput (p. 445) object

Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalSecondaryIndexUpdate
Service: Amazon DynamoDB

Represents one of the following:

- A new global secondary index to be added to an existing table.
- New provisioned throughput parameters for an existing global secondary index.
- An existing global secondary index to be removed from an existing table.

Contents

Note
In the following list, the required parameters are described first.

Create
The parameters required for creating a global secondary index on an existing table:

- IndexName
- KeySchema
- AttributeDefinitions
- Projection
- ProvisionedThroughput

Type: CreateGlobalSecondaryIndexAction (p. 384) object

Required: No

Delete
The name of an existing global secondary index to be removed.

Type: DeleteGlobalSecondaryIndexAction (p. 392) object

Required: No

Update
The name of an existing global secondary index, along with new provisioned throughput settings to be applied to that index.

Type: UpdateGlobalSecondaryIndexAction (p. 499) object

Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalTable
Service: Amazon DynamoDB

Represents the properties of a global table.

Contents

Note
In the following list, the required parameters are described first.

GlobalTableName
The global table name.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

ReplicationGroup
The Regions where the global table has replicas.
Type: Array of Replica (p. 452) objects
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalTableDescription
Service: Amazon DynamoDB

Contains details about the global table.

Contents

Note
In the following list, the required parameters are described first.

CreationDateTime
The creation time of the global table.
Type: Timestamp
Required: No

GlobalTableArn
The unique identifier of the global table.
Type: String
Required: No

GlobalTableName
The global table name.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

GlobalTableStatus
The current state of the global table:
• CREATING - The global table is being created.
• UPDATING - The global table is being updated.
• DELETING - The global table is being deleted.
• ACTIVE - The global table is ready for use.
Type: String
Valid Values: CREATING | ACTIVE | DELETING | UPDATING
Required: No

ReplicationGroup
The Regions where the global table has replicas.
Type: Array of ReplicaDescription (p. 456) objects
Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
GlobalTableGlobalSecondaryIndexSettingsUpdate

Service: Amazon DynamoDB

Represents the settings of a global secondary index for a global table that will be modified.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**

The name of the global secondary index. The name must be unique among all other indexes on this table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**ProvisionedWriteCapacityAutoScalingSettingsUpdate**

Auto scaling settings for managing a global secondary index's write capacity units.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

**ProvisionedWriteCapacityUnits**

The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException.

Type: Long

Valid Range: Minimum value of 1.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportSummary
Service: Amazon DynamoDB
Summary information about the source file for the import.

Contents

Note
In the following list, the required parameters are described first.

CloudWatchLogGroupArn
The Amazon Resource Number (ARN) of the Cloudwatch Log Group associated with this import task.
Type: String
Required: No

EndTime
The time at which this import task ended. (Does this include the successful complete creation of the table it was imported to?)
Type: Timestamp
Required: No

ImportArn
The Amazon Resource Number (ARN) corresponding to the import request.
Type: String
Required: No

ImportStatus
The status of the import operation.
Type: String
Valid Values: IN_PROGRESS | COMPLETED | CANCELLING | CANCELLED | FAILED
Required: No

InputFormat
The format of the source data. Valid values are CSV, DYNAMODB_JSON or ION.
Type: String
Valid Values: DYNAMODB_JSON | ION | CSV
Required: No

S3BucketSource
The path and S3 bucket of the source file that is being imported. This includes the S3Bucket (required), S3KeyPrefix (optional) and S3BucketOwner (optional if the bucket is owned by the requester).
ImportSummary

Type: \texttt{S3BucketSource (p. 473)} object

Required: No

\textbf{StartTime}

The time at which this import task began.

Type: Timestamp

Required: No

\textbf{TableArn}

The Amazon Resource Number (ARN) of the table being imported into.

Type: String

Required: No

\textbf{See Also}

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportTableDescription
Service: Amazon DynamoDB

Represents the properties of the table being imported into.

Contents

**Note**
In the following list, the required parameters are described first.

**ClientToken**

The client token that was provided for the import task. Reusing the client token on retry makes a call to `ImportTable` idempotent.

Type: String
Pattern: `^[^\$]+$`
Required: No

**CloudWatchLogGroupArn**

The Amazon Resource Number (ARN) of the Cloudwatch Log Group associated with the target table.

Type: String
Required: No

**EndTime**

The time at which the creation of the table associated with this import task completed.

Type: Timestamp
Required: No

**ErrorCount**

The number of errors occurred on importing the source file into the target table.

Type: Long
Valid Range: Minimum value of 0.
Required: No

**FailureCode**

The error code corresponding to the failure that the import job ran into during execution.

Type: String
Required: No

**FailureMessage**

The error message corresponding to the failure that the import job ran into during execution.

Type: String
Required: No
ImportArn

The Amazon Resource Number (ARN) corresponding to the import request.

Type: String

Required: No

ImportedItemCount

The number of items successfully imported into the new table.

Type: Long

Valid Range: Minimum value of 0.

Required: No

ImportStatus

The status of the import.

Type: String

Valid Values: IN_PROGRESS | COMPLETED | CANCELLING | CANCELLED | FAILED

Required: No

InputCompressionType

The compression options for the data that has been imported into the target table. The values are NONE, GZIP, or ZSTD.

Type: String

Valid Values: GZIP | ZSTD | NONE

Required: No

InputFormat

The format of the source data going into the target table.

Type: String

Valid Values: DYNAMODB_JSON | ION | CSV

Required: No

InputFormatOptions

The format options for the data that was imported into the target table. There is one value, CsvOption.

Type: InputFormatOptions (p. 427) object

Required: No

ProcessedItemCount

The total number of items processed from the source file.

Type: Long

Valid Range: Minimum value of 0.
Required: No

**ProcessedSizeBytes**

The total size of data processed from the source file, in Bytes.

Type: Long

Required: No

**S3BucketSource**

Values for the S3 bucket the source file is imported from. Includes bucket name (required), key prefix (optional) and bucket account owner ID (optional).

Type: `S3BucketSource (p. 473)` object

Required: No

**StartTime**

The time when this import task started.

Type: Timestamp

Required: No

**TableArn**

The Amazon Resource Number (ARN) of the table being imported into.

Type: String

Required: No

**TableCreationParameters**

The parameters for the new table that is being imported into.

Type: `TableCreationParameters (p. 484)` object

Required: No

**TableId**

The table id corresponding to the table created by import table process.

Type: String

Pattern: `[0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{12}

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InputFormatOptions

Service: Amazon DynamoDB

The format options for the data that was imported into the target table. There is one value, CsvOption.

Contents

Note
In the following list, the required parameters are described first.

Csv
The options for imported source files in CSV format. The values are Delimiter and HeaderList.

Type: CsvOptions (p. 389) object
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**ItemCollectionMetrics**

Service: Amazon DynamoDB

Information about item collections, if any, that were affected by the operation. ItemCollectionMetrics is only returned if the request asked for it. If the table does not have any local secondary indexes, this information is not returned in the response.

**Contents**

**Note**

In the following list, the required parameters are described first.

**ItemCollectionKey**

The partition key value of the item collection. This value is the same as the partition key value of the item.

Type: String to `AttributeValue (p. 349)` object map

Key Length Constraints: Maximum length of 65535.

Required: No

**SizeEstimateRangeGB**

An estimate of item collection size, in gigabytes. This value is a two-element array containing a lower bound and an upper bound for the estimate. The estimate includes the size of all the items in the table, plus the size of all attributes projected into all of the local secondary indexes on that table. Use this estimate to measure whether a local secondary index is approaching its size limit.

The estimate is subject to change over time; therefore, do not rely on the precision or accuracy of the estimate.

Type: Array of doubles

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ItemResponse

Service: Amazon DynamoDB

Details for the requested item.

Contents

Note
In the following list, the required parameters are described first.

Item

Map of attribute data consisting of the data type and attribute value.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**KeysAndAttributes**

Service: Amazon DynamoDB

Represents a set of primary keys and, for each key, the attributes to retrieve from the table.

For each primary key, you must provide **all** of the key attributes. For example, with a simple primary key, you only need to provide the partition key. For a composite primary key, you must provide **both** the partition key and the sort key.

**Contents**

**Note**
In the following list, the required parameters are described first.

**Keys**

The primary key attribute values that define the items and the attributes associated with the items.

Type: Array of string to `AttributeValue (p. 349)` object maps

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Key Length Constraints: Maximum length of 65535.

Required: Yes

**AttributesToGet**

This is a legacy parameter. Use `ProjectionExpression` instead. For more information, see Legacy Conditional Parameters in the Amazon DynamoDB Developer Guide.

Type: Array of strings

Array Members: Minimum number of 1 item.

Length Constraints: Maximum length of 65535.

Required: No

**ConsistentRead**

The consistency of a read operation. If set to `true`, then a strongly consistent read is used; otherwise, an eventually consistent read is used.

Type: Boolean

Required: No

**ExpressionAttributeNames**

One or more substitution tokens for attribute names in an expression. The following are some use cases for using `ExpressionAttributeNames`:

- To access an attribute whose name conflicts with a DynamoDB reserved word.
- To create a placeholder for repeating occurrences of an attribute name in an expression.
- To prevent special characters in an attribute name from being misinterpreted in an expression.

Use the `#` character in an expression to dereference an attribute name. For example, consider the following attribute name:

- `Percentile`

The name of this attribute conflicts with a reserved word, so it cannot be used directly in an expression. (For the complete list of reserved words, see Reserved Words in the Amazon...
To work around this, you could specify the following for ExpressionAttributeNames:

- \{"#P":"Percentile}\}

You could then use this substitution in an expression, as in this example:

- \#P = :val

**Note**

Tokens that begin with the : character are expression attribute values, which are placeholders for the actual value at runtime.

For more information on expression attribute names, see Accessing Item Attributes in the Amazon DynamoDB Developer Guide.

**ProjectionExpression**

A string that identifies one or more attributes to retrieve from the table. These attributes can include scalars, sets, or elements of a JSON document. The attributes in the ProjectionExpression must be separated by commas.

If no attribute names are specified, then all attributes will be returned. If any of the requested attributes are not found, they will not appear in the result.

For more information, see Accessing Item Attributes in the Amazon DynamoDB Developer Guide.

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
KeySchemaElement

Service: Amazon DynamoDB

Represents a single element of a key schema. A key schema specifies the attributes that make up the primary key of a table, or the key attributes of an index.

A KeySchemaElement represents exactly one attribute of the primary key. For example, a simple primary key would be represented by one KeySchemaElement (for the partition key). A composite primary key would require one KeySchemaElement for the partition key, and another KeySchemaElement for the sort key.

A KeySchemaElement must be a scalar, top-level attribute (not a nested attribute). The data type must be one of String, Number, or Binary. The attribute cannot be nested within a List or a Map.

Contents

Note
In the following list, the required parameters are described first.

AttributeName
The name of a key attribute.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 255.
Required: Yes

KeyType
The role that this key attribute will assume:
- HASH - partition key
- RANGE - sort key

Note
The partition key of an item is also known as its hash attribute. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its range attribute. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: String
Valid Values: HASH | RANGE
Required: Yes

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
KinesisDataStreamDestination

Service: Amazon DynamoDB

Describes a Kinesis data stream destination.

Contents

Note
In the following list, the required parameters are described first.

DestinationStatus
The current status of replication.
Type: String
Valid Values: ENABLING | ACTIVE | DISABLING | DISABLED | ENABLE_FAILED
Required: No

DestinationStatusDescription
The human-readable string that corresponds to the replica status.
Type: String
Required: No

StreamArn
The ARN for a specific Kinesis data stream.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LocalSecondaryIndex

Service: Amazon DynamoDB

Represents the properties of a local secondary index.

Contents

**Note**

In the following list, the required parameters are described first.

**IndexName**

The name of the local secondary index. The name must be unique among all other indexes on this table.

Type: String

Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**KeySchema**

The complete key schema for the local secondary index, consisting of one or more pairs of attribute names and key types:

- HASH - partition key
- RANGE - sort key

**Note**

The partition key of an item is also known as its *hash attribute*. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.

The sort key of an item is also known as its *range attribute*. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: Array of `KeySchemaElement (p. 432)` objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: Yes

**Projection**

Represents attributes that are copied (projected) from the table into the local secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: `Projection (p. 444)` object

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
LocalSecondaryIndexDescription
Service: Amazon DynamoDB

Represents the properties of a local secondary index.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexArn**

The Amazon Resource Name (ARN) that uniquely identifies the index.

*Type: String*

*Required: No*

**IndexName**

Represents the name of the local secondary index.

*Type: String*

*Pattern: \[^a-zA-Z0-9_.-]+*

*Required: No*

**IndexSizeBytes**

The total size of the specified index, in bytes. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

*Type: Long*

*Required: No*

**ItemCount**

The number of items in the specified index. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

*Type: Long*

*Required: No*

**KeySchema**

The complete key schema for the local secondary index, consisting of one or more pairs of attribute names and key types:

- **HASH** - partition key
- **RANGE** - sort key

**Note**

The partition key of an item is also known as its **hash attribute**. The term “hash attribute” derives from DynamoDB’s usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.

The sort key of an item is also known as its **range attribute**. The term “range attribute” derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.
LocalSecondaryIndexDescription

Type: Array of `KeySchemaElement (p. 432)` objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: No

Projection

Represents attributes that are copied (projected) from the table into the global secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: `Projection (p. 444)` object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LocalSecondaryIndexInfo

Service: Amazon DynamoDB

Represents the properties of a local secondary index for the table when the backup was created.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**

Represents the name of the local secondary index.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

**KeySchema**

The complete key schema for a local secondary index, which consists of one or more pairs of attribute names and key types:

- HASH - partition key
- RANGE - sort key

**Note**
The partition key of an item is also known as its *hash attribute*. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its *range attribute*. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: Array of **KeySchemaElement** (p. 432) objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: No

**Projection**

Represents attributes that are copied (projected) from the table into the global secondary index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Type: **Projection** (p. 444) object

Required: No

**See Also**

- AWS SDK for C++
- AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ParameterizedStatement
Service: Amazon DynamoDB

Represents a PartiQL statement that uses parameters.

Contents

Note
In the following list, the required parameters are described first.

Statement
A PartiQL statement that uses parameters.

Type: String

Required: Yes

Parameters
The parameter values.

Type: Array of AttributeValue (p. 349) objects

Array Members: Minimum number of 1 item.

Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PointInTimeRecoveryDescription
Service: Amazon DynamoDB

The description of the point in time settings applied to the table.

Contents

Note
In the following list, the required parameters are described first.

EarliestRestorableDateTime
Specifies the earliest point in time you can restore your table to. You can restore your table to any point in time during the last 35 days.

Type: Timestamp
Required: No

LatestRestorableDateTime
LatestRestorableDateTime is typically 5 minutes before the current time.

Type: Timestamp
Required: No

PointInTimeRecoveryStatus

The current state of point in time recovery:
• ENABLED - Point in time recovery is enabled.
• DISABLED - Point in time recovery is disabled.

Type: String

Valid Values: ENABLED | DISABLED
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
PointInTimeRecoverySpecification

Service: Amazon DynamoDB

Represents the settings used to enable point in time recovery.

Contents

**Note**
In the following list, the required parameters are described first.

**PointInTimeRecoveryEnabled**
Indicates whether point in time recovery is enabled (true) or disabled (false) on the table.

Type: Boolean
Required: Yes

**See Also**
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Projection
Service: Amazon DynamoDB

Represents attributes that are copied (projected) from the table into an index. These are in addition to the primary key attributes and index key attributes, which are automatically projected.

Contents

Note
In the following list, the required parameters are described first.

NonKeyAttributes

Represents the non-key attribute names which will be projected into the index.

For local secondary indexes, the total count of NonKeyAttributes summed across all of the local secondary indexes, must not exceed 100. If you project the same attribute into two different indexes, this counts as two distinct attributes when determining the total.

Type: Array of strings
Array Members: Minimum number of 1 item. Maximum number of 20 items.
Length Constraints: Minimum length of 1. Maximum length of 255.
Required: No

ProjectionType

The set of attributes that are projected into the index:
- KEYS_ONLY - Only the index and primary keys are projected into the index.
- INCLUDE - In addition to the attributes described in KEYS_ONLY, the secondary index will include other non-key attributes that you specify.
- ALL - All of the table attributes are projected into the index.

Type: String
Valid Values: ALL | KEYS_ONLY | INCLUDE
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ProvisionedThroughput

Service: Amazon DynamoDB

Represents the provisioned throughput settings for a specified table or index. The settings can be modified using the UpdateTable operation.

For current minimum and maximum provisioned throughput values, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.

Contents

Note

In the following list, the required parameters are described first.

ReadCapacityUnits

The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException. For more information, see Specifying Read and Write Requirements in the Amazon DynamoDB Developer Guide.

If read/write capacity mode is PAY_PER_REQUEST the value is set to 0.

Type: Long

Valid Range: Minimum value of 1.

Required: Yes

WriteCapacityUnits

The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException. For more information, see Specifying Read and Write Requirements in the Amazon DynamoDB Developer Guide.

If read/write capacity mode is PAY_PER_REQUEST the value is set to 0.

Type: Long

Valid Range: Minimum value of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ProvisionedThroughputDescription

Service: Amazon DynamoDB

Represents the provisioned throughput settings for the table, consisting of read and write capacity units, along with data about increases and decreases.

Contents

Note
In the following list, the required parameters are described first.

LastDecreaseDateTime
The date and time of the last provisioned throughput decrease for this table.
Type: Timestamp
Required: No

LastIncreaseDateTime
The date and time of the last provisioned throughput increase for this table.
Type: Timestamp
Required: No

NumberOfDecreasesToday
The number of provisioned throughput decreases for this table during this UTC calendar day. For current maximums on provisioned throughput decreases, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.
Type: Long
Valid Range: Minimum value of 1.
Required: No

ReadCapacityUnits
The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException. Eventually consistent reads require less effort than strongly consistent reads, so a setting of 50 ReadCapacityUnits per second provides 100 eventually consistent ReadCapacityUnits per second.
Type: Long
Valid Range: Minimum value of 0.
Required: No

WriteCapacityUnits
The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException.
Type: Long
Valid Range: Minimum value of 0.
Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ProvisionedThroughputOverride
Service: Amazon DynamoDB

Replica-specific provisioned throughput settings. If not specified, uses the source table's provisioned throughput settings.

Contents

Note
In the following list, the required parameters are described first.

ReadCapacityUnits
Replica-specific read capacity units. If not specified, uses the source table's read capacity settings.

Type: Long

Valid Range: Minimum value of 1.

Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Put
Service: Amazon DynamoDB

Represents a request to perform a PutItem operation.

Contents

**Note**
In the following list, the required parameters are described first.

**Item**
A map of attribute name to attribute values, representing the primary key of the item to be written by PutItem. All of the table's primary key attributes must be specified, and their data types must match those of the table's key schema. If any attributes are present in the item that are part of an index key schema for the table, their types must match the index key schema.

Type: String to `AttributeValue (p. 349)`

Key Length Constraints: Maximum length of 65535.

Required: Yes

**TableName**
Name of the table in which to write the item.

Type: String

Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**ConditionExpression**
A condition that must be satisfied in order for a conditional update to succeed.

Type: String

Required: No

**ExpressionAttributeNames**
One or more substitution tokens for attribute names in an expression.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeValues**
One or more values that can be substituted in an expression.

Type: String to `AttributeValue (p. 349)`

Required: No

**ReturnValuesOnConditionCheckFailure**
Use `ReturnValuesOnConditionCheckFailure` to get the item attributes if the Put condition fails. For `ReturnValuesOnConditionCheckFailure`, the valid values are: NONE and ALL_OLD.
Type: String
Valid Values: ALL_OLD | NONE
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PutRequest
Service: Amazon DynamoDB
Represents a request to perform a PutItem operation on an item.

Contents

Note
In the following list, the required parameters are described first.

Item
A map of attribute name to attribute values, representing the primary key of an item to be processed by PutItem. All of the table's primary key attributes must be specified, and their data types must match those of the table's key schema. If any attributes are present in the item that are part of an index key schema for the table, their types must match the index key schema.

Type: String to AttributeValue (p. 349) object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Replica
Service: Amazon DynamoDB

Represents the properties of a replica.

Contents

Note
In the following list, the required parameters are described first.

RegionName
The Region where the replica needs to be created.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaAutoScalingDescription
Service: Amazon DynamoDB

Represents the auto scaling settings of the replica.

Contents

**Note**
In the following list, the required parameters are described first.

**GlobalSecondaryIndexes**
Replica-specific global secondary index auto scaling settings.

Type: Array of ReplicaGlobalSecondaryIndexAutoScalingDescription (p. 459) objects

Required: No

**RegionName**
The Region where the replica exists.

Type: String

Required: No

**ReplicaProvisionedReadCapacityAutoScalingSettings**
Represents the auto scaling settings for a global table or global secondary index.

Type: AutoScalingSettingsDescription (p. 356) object

Required: No

**ReplicaProvisionedWriteCapacityAutoScalingSettings**
Represents the auto scaling settings for a global table or global secondary index.

Type: AutoScalingSettingsDescription (p. 356) object

Required: No

**ReplicaStatus**
The current state of the replica:

- CREATING - The replica is being created.
- UPDATING - The replica is being updated.
- DELETING - The replica is being deleted.
- ACTIVE - The replica is ready for use.

Type: String

Valid Values: CREATING | CREATION_FAILED | UPDATING | DELETING | ACTIVE | REGION_DISABLED | INACCESSIBLE_ENCRYPTION_CREDENTIALS

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ReplicaAutoScalingUpdate

Service: Amazon DynamoDB

Represents the auto scaling settings of a replica that will be modified.

Contents

Note

In the following list, the required parameters are described first.

RegionName

The Region where the replica exists.

Type: String

Required: Yes

ReplicaGlobalSecondaryIndexUpdates

Represents the auto scaling settings of global secondary indexes that will be modified.

Type: Array of ReplicaGlobalSecondaryIndexAutoScalingUpdate (p. 461) objects

Required: No

ReplicaProvisionedReadCapacityAutoScalingUpdate

Represents the auto scaling settings to be modified for a global table or global secondary index.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaDescription
Service: Amazon DynamoDB
Contains the details of the replica.

Contents

**Note**
In the following list, the required parameters are described first.

**GlobalSecondaryIndexes**
Replica-specific global secondary index settings.
Type: Array of ReplicaGlobalSecondaryIndexDescription (p. 462) objects
Required: No

**KMSMasterKeyId**
The AWS KMS key of the replica that will be used for AWS KMS encryption.
Type: String
Required: No

**ProvisionedThroughputOverride**
Replica-specific provisioned throughput. If not described, uses the source table's provisioned throughput settings.
Type: ProvisionedThroughputOverride (p. 448) object
Required: No

**RegionName**
The name of the Region.
Type: String
Required: No

**ReplicaInaccessibleDateTime**
The time at which the replica was first detected as inaccessible. To determine cause of inaccessibility check the ReplicaStatus property.
Type: Timestamp
Required: No

**ReplicaStatus**
The current state of the replica:
- CREATING - The replica is being created.
- UPDATING - The replica is being updated.
- DELETING - The replica is being deleted.
- ACTIVE - The replica is ready for use.
- REGION_DISABLED - The replica is inaccessible because the AWS Region has been disabled.
**Note**
If the AWS Region remains inaccessible for more than 20 hours, DynamoDB will remove this replica from the replication group. The replica will not be deleted and replication will stop from and to this region.

- **INACCESSIBLE_ENCRYPTION_CREDENTIALS** - The AWS KMS key used to encrypt the table is inaccessible.

**Note**
If the AWS KMS key remains inaccessible for more than 20 hours, DynamoDB will remove this replica from the replication group. The replica will not be deleted and replication will stop from and to this region.

Type: String
Valid Values: CREATING | CREATION_FAILED | UPDATING | DELETING | ACTIVE | REGION_DISABLED | INACCESSIBLE_ENCRYPTION_CREDENTIALS
Required: No

**ReplicaStatusDescription**
Detailed information about the replica status.
Type: String
Required: No

**ReplicaStatusPercentProgress**
Specifies the progress of a Create, Update, or Delete action on the replica as a percentage.
Type: String
Required: No

**ReplicaTableClassSummary**
Contains details of the table class.
Type: `TableClassSummary` (p. 483) object
Required: No

**See Also**
For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndex
Service: Amazon DynamoDB

Represents the properties of a replica global secondary index.

Contents

Note
In the following list, the required parameters are described first.

IndexName
The name of the global secondary index.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

ProvisionedThroughputOverride
Replica table GSI-specific provisioned throughput. If not specified, uses the source table GSI's read capacity settings.

Type: ProvisionedThroughputOverride (p. 448) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndexAutoScalingDescription

Service: Amazon DynamoDB

Represents the auto scaling configuration for a replica global secondary index.

Contents

**Note**
In the following list, the required parameters are described first.

**IndexName**

The name of the global secondary index.

Type: String

Pattern: \[a-zA-Z0-9_.-]+\]

Required: No

**IndexStatus**

The current state of the replica global secondary index:

- **CREATING** - The index is being created.
- **UPDATING** - The index is being updated.
- **DELETING** - The index is being deleted.
- **ACTIVE** - The index is ready for use.

Type: String

Valid Values: **CREATING** | **UPDATING** | **DELETING** | **ACTIVE**

Required: No

**ProvisionedReadCapacityAutoScalingSettings**

Represents the auto scaling settings for a global table or global secondary index.

Type: AutoScalingSettingsDescription (p. 356) object

Required: No

**ProvisionedWriteCapacityAutoScalingSettings**

Represents the auto scaling settings for a global table or global secondary index.

Type: AutoScalingSettingsDescription (p. 356) object

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
• AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndexAutoScalingUpdate

Service: Amazon DynamoDB

Represents the auto scaling settings of a global secondary index for a replica that will be modified.

Contents

Note
In the following list, the required parameters are described first.

IndexName

The name of the global secondary index.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

ProvisionedReadCapacityAutoScalingUpdate

Represents the auto scaling settings to be modified for a global table or global secondary index.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndexDescription
Service: Amazon DynamoDB
Represents the properties of a replica global secondary index.

Contents

Note
In the following list, the required parameters are described first.

IndexName
The name of the global secondary index.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

ProvisionedThroughputOverride
If not described, uses the source table GSI's read capacity settings.
Type: ProvisionedThroughputOverride (p. 448) object
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndexSettingsDescription

Service: Amazon DynamoDB

Represents the properties of a global secondary index.

Contents

Note
In the following list, the required parameters are described first.

IndexName

The name of the global secondary index. The name must be unique among all other indexes on this table.

Type: String
Pattern: [a-zA-Z0-9_.-]+

Required: Yes

IndexStatus

The current status of the global secondary index:
• CREATING - The global secondary index is being created.
• UPDATING - The global secondary index is being updated.
• DELETING - The global secondary index is being deleted.
• ACTIVE - The global secondary index is ready for use.

Type: String
Valid Values: CREATING | UPDATING | DELETING | ACTIVE

Required: No

ProvisionedReadCapacityAutoScalingSettings

Auto scaling settings for a global secondary index replica's read capacity units.

Type: AutoScalingSettingsDescription (p. 356) object

Required: No

ProvisionedReadCapacityUnits

The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException.

Type: Long
Valid Range: Minimum value of 1.

Required: No

ProvisionedWriteCapacityAutoScalingSettings

Auto scaling settings for a global secondary index replica's write capacity units.

Type: AutoScalingSettingsDescription (p. 356) object
Required: No

**ProvisionedWriteCapacityUnits**

The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException.

Type: Long

Valid Range: Minimum value of 1.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaGlobalSecondaryIndexSettingsUpdate

Service: Amazon DynamoDB

Represents the settings of a global secondary index for a global table that will be modified.

Contents

**Note**

In the following list, the required parameters are described first.

**IndexName**

The name of the global secondary index. The name must be unique among all other indexes on this table.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

**ProvisionedReadCapacityAutoScalingSettingsUpdate**

Auto scaling settings for managing a global secondary index replica's read capacity units.

Type: AutoScalingSettingsUpdate (p. 358) object

Required: No

**ProvisionedReadCapacityUnits**

The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException.

Type: Long

Valid Range: Minimum value of 1.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaSettingsDescription
Service: Amazon DynamoDB

Represents the properties of a replica.

Contents

Note
In the following list, the required parameters are described first.

RegionName
The Region name of the replica.
Type: String
Required: Yes

ReplicaBillingModeSummary
The read/write capacity mode of the replica.
Type: BillingModeSummary (p. 372) object
Required: No

ReplicaGlobalSecondaryIndexSettings
Replica global secondary index settings for the global table.
Type: Array of ReplicaGlobalSecondaryIndexSettingsDescription (p. 463) objects
Required: No

ReplicaProvisionedReadCapacityAutoScalingSettings
Auto scaling settings for a global table replica's read capacity units.
Type: AutoScalingSettingsDescription (p. 356) object
Required: No

ReplicaProvisionedReadCapacityUnits
The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException. For more information, see Specifying Read and Write Requirements in the Amazon DynamoDB Developer Guide.
Type: Long
Valid Range: Minimum value of 0.
Required: No

ReplicaProvisionedWriteCapacityAutoScalingSettings
Auto scaling settings for a global table replica's write capacity units.
Type: AutoScalingSettingsDescription (p. 356) object
Required: No

ReplicaProvisionedWriteCapacityUnits
**ReplicaProvisionedWriteCapacityUnits**

The maximum number of writes consumed per second before DynamoDB returns a ThrottlingException. For more information, see Specifying Read and Write Requirements in the Amazon DynamoDB Developer Guide.

Type: Long

Valid Range: Minimum value of 0.

Required: No

**ReplicaStatus**

The current state of the Region:

- CREATING - The Region is being created.
- UPDATING - The Region is being updated.
- DELETING - The Region is being deleted.
- ACTIVE - The Region is ready for use.

Type: String

Valid Values: CREATING | CREATION_FAILED | UPDATING | DELETING | ACTIVE | REGION_DISABLED | INACCESSIBLE_ENCRYPTION_CREDENTIALS

Required: No

**ReplicaTableClassSummary**

Contains details of the table class.

Type: TableClassSummary (p. 483) object

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaSettingsUpdate
Service: Amazon DynamoDB

Represents the settings for a global table in a Region that will be modified.

Contents

Note
In the following list, the required parameters are described first.

RegionName
The Region of the replica to be added.
Type: String
Required: Yes

ReplicaGlobalSecondaryIndexSettingsUpdate
Represents the settings of a global secondary index for a global table that will be modified.
Type: Array of ReplicaGlobalSecondaryIndexSettingsUpdate (p. 465) objects
Array Members: Minimum number of 1 item. Maximum number of 20 items.
Required: No

ReplicaProvisionedReadCapacityAutoScalingSettingsUpdate
Auto scaling settings for managing a global table replica's read capacity units.
Type: AutoScalingSettingsUpdate (p. 358) object
Required: No

ReplicaProvisionedReadCapacityUnits
The maximum number of strongly consistent reads consumed per second before DynamoDB returns a ThrottlingException. For more information, see Specifying Read and Write Requirements in the Amazon DynamoDB Developer Guide.
Type: Long
Valid Range: Minimum value of 1.
Required: No

ReplicaTableClass
Replica-specific table class. If not specified, uses the source table's table class.
Type: String
Valid Values: STANDARD | STANDARD_INFREQUENT_ACCESS
Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ReplicationGroupUpdate
Service: Amazon DynamoDB

Represents one of the following:

- A new replica to be added to an existing regional table or global table. This request invokes the CreateTableReplica action in the destination Region.
- New parameters for an existing replica. This request invokes the UpdateTable action in the destination Region.
- An existing replica to be deleted. The request invokes the DeleteTableReplica action in the destination Region, deleting the replica and all if its items in the destination Region.

**Note**
When you manually remove a table or global table replica, you do not automatically remove any associated scalable targets, scaling policies, or CloudWatch alarms.

**Contents**

**Note**
In the following list, the required parameters are described first.

**Create**

The parameters required for creating a replica for the table.

Type: CreateReplicationGroupMemberAction (p. 387) object

Required: No

**Delete**

The parameters required for deleting a replica for the table.

Type: DeleteReplicationGroupMemberAction (p. 394) object

Required: No

**Update**

The parameters required for updating a replica for the table.

Type: UpdateReplicationGroupMemberAction (p. 500) object

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReplicaUpdate
Service: Amazon DynamoDB

Represents one of the following:

- A new replica to be added to an existing global table.
- New parameters for an existing replica.
- An existing replica to be removed from an existing global table.

Contents

Note
In the following list, the required parameters are described first.

Create

The parameters required for creating a replica on an existing global table.

Type: CreateReplicaAction (p. 386) object

Required: No

Delete

The name of the existing replica to be removed.

Type: DeleteReplicaAction (p. 393) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RestoreSummary
Service: Amazon DynamoDB
Contains details for the restore.

Contents

Note
In the following list, the required parameters are described first.

RestoreDateTime
Point in time or source backup time.
Type: Timestamp
Required: Yes

RestoreInProgress
Indicates if a restore is in progress or not.
Type: Boolean
Required: Yes

SourceBackupArn
The Amazon Resource Name (ARN) of the backup from which the table was restored.
Type: String
Required: No

SourceTableArn
The ARN of the source table of the backup that is being restored.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3BucketSource

Service: Amazon DynamoDB

The S3 bucket that is being imported from.

Contents

Note
In the following list, the required parameters are described first.

S3Bucket

The S3 bucket that is being imported from.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-z0-9A-Z]+[\-\w]*[a-z0-9A-Z]+$

Required: Yes

S3BucketOwner

The account number of the S3 bucket that is being imported from. If the bucket is owned by the requester this is optional.

Type: String

Pattern: [0-9]{12}

Required: No

S3KeyPrefix

The key prefix shared by all S3 Objects that are being imported.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SourceTableDetails
Service: Amazon DynamoDB

Contains the details of the table when the backup was created.

Contents

Note
In the following list, the required parameters are described first.

KeySchema

Schema of the table.

Type: Array of KeySchemaElement (p. 432) objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: Yes

ProvisionedThroughput

Read IOPs and Write IOPS on the table when the backup was created.

Type: ProvisionedThroughput (p. 445) object

Required: Yes

TableCreationDateTime

Time when the source table was created.

Type: Timestamp

Required: Yes

TableId

Unique identifier for the table for which the backup was created.

Type: String

Pattern: [0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{12}

Required: Yes

TableName

The name of the table for which the backup was created.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

BillingMode

Controls how you are charged for read and write throughput and how you manage capacity. This setting can be changed later.

- PROVISIONED - Sets the read/write capacity mode to PROVISIONED. We recommend using PROVISIONED for predictable workloads.
• PAY_PER_REQUEST - Sets the read/write capacity mode to PAY_PER_REQUEST. We recommend using PAY_PER_REQUEST for unpredictable workloads.

  Type: String
  Valid Values: PROVISIONED | PAY_PER_REQUEST
  Required: No

**ItemCount**

  Number of items in the table. Note that this is an approximate value.

  Type: Long
  Valid Range: Minimum value of 0.
  Required: No

**TableArn**

  ARN of the table for which backup was created.

  Type: String
  Required: No

**TableSizeBytes**

  Size of the table in bytes. Note that this is an approximate value.

  Type: Long
  Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
SourceTableFeatureDetails
Service: Amazon DynamoDB

Contains the details of the features enabled on the table when the backup was created. For example, LSIs, GSIs, streams, TTL.

Contents

Note
In the following list, the required parameters are described first.

GlobalSecondaryIndexes

Represents the GSI properties for the table when the backup was created. It includes the IndexName, KeySchema, Projection, and ProvisionedThroughput for the GSIs on the table at the time of backup.

Type: Array of GlobalSecondaryIndexInfo (p. 415) objects

Required: No

LocalSecondaryIndexes

Represents the LSI properties for the table when the backup was created. It includes the IndexName, KeySchema and Projection for the LSIs on the table at the time of backup.

Type: Array of LocalSecondaryIndexInfo (p. 439) objects

Required: No

SSEDescription

The description of the server-side encryption status on the table when the backup was created.

Type: SSEDescription (p. 478) object

Required: No

StreamDescription

Stream settings on the table when the backup was created.

Type: StreamSpecification (p. 481) object

Required: No

TimeToLiveDescription

Time to Live settings on the table when the backup was created.

Type: TimeToLiveDescription (p. 493) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**SSEDescription**
Service: Amazon DynamoDB

The description of the server-side encryption status on the specified table.

**Contents**

**Note**
In the following list, the required parameters are described first.

**InaccessibleEncryptionDateTime**

Indicates the time, in UNIX epoch date format, when DynamoDB detected that the table's AWS KMS key was inaccessible. This attribute will automatically be cleared when DynamoDB detects that the table's AWS KMS key is accessible again. DynamoDB will initiate the table archival process when table's AWS KMS key remains inaccessible for more than seven days from this date.

Type: Timestamp

Required: No

**KMSMasterKeyArn**

The AWS KMS key ARN used for the AWS KMS encryption.

Type: String

Required: No

**SSEType**

Server-side encryption type. The only supported value is:

- **KMS** - Server-side encryption that uses AWS Key Management Service. The key is stored in your account and is managed by AWS KMS (AWS KMS charges apply).

Type: String

Valid Values: AES256 | KMS

Required: No

**Status**

Represents the current state of server-side encryption. The only supported values are:

- **ENABLED** - Server-side encryption is enabled.
- **UPDATING** - Server-side encryption is being updated.

Type: String

Valid Values: ENABLING | ENABLED | DISABLING | DISABLED | UPDATING

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- **AWS SDK for C++**
- **AWS SDK for Go**
• AWS SDK for Java V2
• AWS SDK for Ruby V3
SSESpecification

Service: Amazon DynamoDB

Represents the settings used to enable server-side encryption.

Contents

Note
In the following list, the required parameters are described first.

Enabled
Indicates whether server-side encryption is done using an AWS managed key or an AWS owned key. If enabled (true), server-side encryption type is set to KMS and an AWS managed key is used (AWS KMS charges apply). If disabled (false) or not specified, server-side encryption is set to AWS owned key.

Type: Boolean
Required: No

KMSMasterKeyId
The AWS KMS key that should be used for the AWS KMS encryption. To specify a key, use its key ID, Amazon Resource Name (ARN), alias name, or alias ARN. Note that you should only provide this parameter if the key is different from the default DynamoDB key alias/aws/dynamodb.

Type: String
Required: No

SSEType
Server-side encryption type. The only supported value is:

- KMS - Server-side encryption that uses AWS Key Management Service. The key is stored in your account and is managed by AWS KMS (AWS KMS charges apply).

Type: String
Valid Values: AES256 | KMS
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
StreamSpecification

Service: Amazon DynamoDB

Represents the DynamoDB Streams configuration for a table in DynamoDB.

Contents

Note
In the following list, the required parameters are described first.

StreamEnabled

Indicates whether DynamoDB Streams is enabled (true) or disabled (false) on the table.

Type: Boolean

Required: Yes

StreamViewType

When an item in the table is modified, StreamViewType determines what information is written to the stream for this table. Valid values for StreamViewType are:

• KEYS_ONLY - Only the key attributes of the modified item are written to the stream.
• NEW_IMAGE - The entire item, as it appears after it was modified, is written to the stream.
• OLD_IMAGE - The entire item, as it appeared before it was modified, is written to the stream.
• NEW_AND_OLD_IMAGES - Both the new and the old item images of the item are written to the stream.

Type: String

Valid Values: NEW_IMAGE | OLD_IMAGE | NEW_AND_OLD_IMAGES | KEYS_ONLY

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
TableAutoScalingDescription
Service: Amazon DynamoDB

Represents the auto scaling configuration for a global table.

Contents

Note
In the following list, the required parameters are described first.

Replicas
Represents replicas of the global table.
Type: Array of ReplicaAutoScalingDescription (p. 453) objects
Required: No

TableName
The name of the table.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

TableStatus
The current state of the table:
- CREATING - The table is being created.
- UPDATING - The table is being updated.
- DELETING - The table is being deleted.
- ACTIVE - The table is ready for use.
Type: String
Valid Values: CREATING | UPDATING | DELETING | ACTIVE | INACCESSIBLE_ENCRYPTION_CREDENTIALS | ARCHIVING | ARCHIVED
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TableClassSummary
Service: Amazon DynamoDB
Contains details of the table class.

Contents

Note
In the following list, the required parameters are described first.

LastUpdateDateTime
The date and time at which the table class was last updated.
Type: Timestamp
Required: No

TableClass
The table class of the specified table. Valid values are STANDARD and
STANDARD_INFREQUENT_ACCESS.
Type: String
Valid Values: STANDARD | STANDARD_INFREQUENT_ACCESS
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TableCreationParameters
Service: Amazon DynamoDB
The parameters for the table created as part of the import operation.

Contents

Note
In the following list, the required parameters are described first.

AttributeDefinitions
The attributes of the table created as part of the import operation.
Type: Array of AttributeDefinition (p. 348) objects
Required: Yes

KeySchema
The primary key and option sort key of the table created as part of the import operation.
Type: Array of KeySchemaElement (p. 432) objects
Array Members: Minimum number of 1 item. Maximum number of 2 items.
Required: Yes

TableName
The name of the table created as part of the import operation.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: Yes

BillingMode
The billing mode for provisioning the table created as part of the import operation.
Type: String
Valid Values:  PROVISIONED  |  PAY_PER_REQUEST
Required: No

GlobalSecondaryIndexes
The Global Secondary Indexes (GSI) of the table to be created as part of the import operation.
Type: Array of GlobalSecondaryIndex (p. 409) objects
Required: No

ProvisionedThroughput
Represents the provisioned throughput settings for a specified table or index. The settings can be modified using the UpdateTable operation.
For current minimum and maximum provisioned throughput values, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.
TableCreationParameters

Type: ProvisionedThroughput (p. 445) object

Required: No

SSESpecification

Represents the settings used to enable server-side encryption.

Type: SSESpecification (p. 480) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TableDescription

Service: Amazon DynamoDB

Represents the properties of a table.

Contents

Note
In the following list, the required parameters are described first.

ArchivalSummary
Contains information about the table archive.
Type: ArchivalSummary (p. 347) object
Required: No

AttributeDefinitions
An array of AttributeDefinition objects. Each of these objects describes one attribute in the table and index key schema.
Each AttributeDefinition object in this array is composed of:
• AttributeName - The name of the attribute.
• AttributeType - The data type for the attribute.
Type: Array of AttributeDefinition (p. 348) objects
Required: No

BillingModeSummary
Contains the details for the read/write capacity mode.
Type: BillingModeSummary (p. 372) object
Required: No

CreationDateTime
The date and time when the table was created, in UNIX epoch time format.
Type: Timestamp
Required: No

GlobalSecondaryIndexes
The global secondary indexes, if any, on the table. Each index is scoped to a given partition key value. Each element is composed of:
• Backfilling - If true, then the index is currently in the backfilling phase. Backfilling occurs only when a new global secondary index is added to the table. It is the process by which DynamoDB populates the new index with data from the table. (This attribute does not appear for indexes that were created during a CreateTable operation.)
• IndexName - The name of the global secondary index.
You can delete an index that is being created during the Backfilling phase when IndexStatus is set to CREATING and Backfilling is true. You can't delete the index that is being created when IndexStatus is set to CREATING and Backfilling is false. (This attribute does not appear for indexes that were created during a CreateTable operation.)
• **IndexSizeBytes** - The total size of the global secondary index, in bytes. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

• **IndexStatus** - The current status of the global secondary index:
  • **CREATING** - The index is being created.
  • **UPDATING** - The index is being updated.
  • **DELETING** - The index is being deleted.
  • **ACTIVE** - The index is ready for use.

• **ItemCount** - The number of items in the global secondary index. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

• **KeySchema** - Specifies the complete index key schema. The attribute names in the key schema must be between 1 and 255 characters (inclusive). The key schema must begin with the same partition key as the table.

• **Projection** - Specifies attributes that are copied (projected) from the table into the index. These are in addition to the primary key attributes and index key attributes, which are automatically projected. Each attribute specification is composed of:
  • **ProjectionType** - One of the following:
    • **KEYS_ONLY** - Only the index and primary keys are projected into the index.
    • **INCLUDE** - In addition to the attributes described in **KEYS_ONLY**, the secondary index will include other non-key attributes that you specify.
    • **ALL** - All of the table attributes are projected into the index.
  • **NonKeyAttributes** - A list of one or more non-key attribute names that are projected into the secondary index. The total count of attributes provided in **NonKeyAttributes**, summed across all of the secondary indexes, must not exceed 100. If you project the same attribute into two different indexes, this counts as two distinct attributes when determining the total.

• **ProvisionedThroughput** - The provisioned throughput settings for the global secondary index, consisting of read and write capacity units, along with data about increases and decreases.

If the table is in the **DELETING** state, no information about indexes will be returned.

Type: Array of **GlobalSecondaryIndexDescription** (p. 412) objects

Required: No

**GlobalTableVersion**

Represents the version of global tables in use, if the table is replicated across AWS Regions.

Type: String

Required: No

**ItemCount**

The number of items in the specified table. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

Type: Long

Required: No

**KeySchema**

The primary key structure for the table. Each KeySchemaElement consists of:

• **AttributeName** - The name of the attribute.

• **KeyType** - The role of the attribute:
  • **HASH** - partition key
• RANGE - sort key

**Note**
The partition key of an item is also known as its *hash attribute*. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its *range attribute*. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

For more information about primary keys, see Primary Key in the Amazon DynamoDB Developer Guide.

Type: Array of KeySchemaElement (p. 432) objects

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Required: No

**LatestStreamArn**

The Amazon Resource Name (ARN) that uniquely identifies the latest stream for this table.

Type: String

Required: No

**LatestStreamLabel**

A timestamp, in ISO 8601 format, for this stream.

Note that LatestStreamLabel is not a unique identifier for the stream, because it is possible that a stream from another table might have the same timestamp. However, the combination of the following three elements is guaranteed to be unique:

• AWS customer ID
• Table name
• StreamLabel

Type: String

Required: No

**LocalSecondaryIndexes**

Represents one or more local secondary indexes on the table. Each index is scoped to a given partition key value. Tables with one or more local secondary indexes are subject to an item collection size limit, where the amount of data within a given item collection cannot exceed 10 GB. Each element is composed of:

• IndexName - The name of the local secondary index.
• KeySchema - Specifies the complete index key schema. The attribute names in the key schema must be between 1 and 255 characters (inclusive). The key schema must begin with the same partition key as the table.
• Projection - Specifies attributes that are copied (projected) from the table into the index. These are in addition to the primary key attributes and index key attributes, which are automatically projected. Each attribute specification is composed of:
  • ProjectionType - One of the following:
    • KEYS_ONLY - Only the index and primary keys are projected into the index.
- **INCLUDE** - Only the specified table attributes are projected into the index. The list of projected attributes is in `NonKeyAttributes`.
- **ALL** - All of the table attributes are projected into the index.
- **NonKeyAttributes** - A list of one or more non-key attribute names that are projected into the secondary index. The total count of attributes provided in `NonKeyAttributes`, summed across all of the secondary indexes, must not exceed 100. If you project the same attribute into two different indexes, this counts as two distinct attributes when determining the total.
- **IndexSizeBytes** - Represents the total size of the index, in bytes. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.
- **ItemCount** - Represents the number of items in the index. DynamoDB updates this value approximately every six hours. Recent changes might not be reflected in this value.

If the table is in the `DELETING` state, no information about indexes will be returned.

Type: Array of `LocalSecondaryIndexDescription (p. 437)` objects

Required: No

**ProvisionedThroughput**

The provisioned throughput settings for the table, consisting of read and write capacity units, along with data about increases and decreases.

Type: `ProvisionedThroughputDescription (p. 446)` object

Required: No

**Replicas**

Represents replicas of the table.

Type: Array of `ReplicaDescription (p. 456)` objects

Required: No

**RestoreSummary**

Contains details for the restore.

Type: `RestoreSummary (p. 472)` object

Required: No

**SSEDescription**

The description of the server-side encryption status on the specified table.

Type: `SSEDescription (p. 478)` object

Required: No

**StreamSpecification**

The current DynamoDB Streams configuration for the table.

Type: `StreamSpecification (p. 481)` object

Required: No

**TableArn**

The Amazon Resource Name (ARN) that uniquely identifies the table.

Type: String

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Tag
Service: Amazon DynamoDB

Describes a tag. A tag is a key-value pair. You can add up to 50 tags to a single DynamoDB table.

AWS-assigned tag names and values are automatically assigned the `aws:` prefix, which the user cannot assign. AWS-assigned tag names do not count towards the tag limit of 50. User-assigned tag names have the prefix `user:` in the Cost Allocation Report. You cannot backdate the application of a tag.

For an overview on tagging DynamoDB resources, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

Contents

Note
In the following list, the required parameters are described first.

Key
The key of the tag. Tag keys are case sensitive. Each DynamoDB table can only have up to one tag with the same key. If you try to add an existing tag (same key), the existing tag value will be updated to the new value.

Type: String

Required: Yes

Value
The value of the tag. Tag values are case-sensitive and can be null.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TimeToLiveDescription
Service: Amazon DynamoDB

The description of the Time to Live (TTL) status on the specified table.

Contents

Note
In the following list, the required parameters are described first.

AttributeName
The name of the TTL attribute for items in the table.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 255.
Required: No

TimeToLiveStatus
The TTL status for the table.
Type: String
Valid Values: ENABLING | DISABLING | ENABLED | DISABLED
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TimeToLiveSpecification
Service: Amazon DynamoDB

Represents the settings used to enable or disable Time to Live (TTL) for the specified table.

Contents

Note
In the following list, the required parameters are described first.

AttributeName
The name of the TTL attribute used to store the expiration time for items in the table.

Type: String
Length Constraints: Minimum length of 1. Maximum length of 255.
Required: Yes

Enabled
Indicates whether TTL is to be enabled (true) or disabled (false) on the table.

Type: Boolean
Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TransactGetItem

Service: Amazon DynamoDB

Specifies an item to be retrieved as part of the transaction.

Contents

Note
In the following list, the required parameters are described first.

Get

Contains the primary key that identifies the item to get, together with the name of the table that contains the item, and optionally the specific attributes of the item to retrieve.

Type: Get (p. 407) object

Required: Yes

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
TransactWriteItem
Service: Amazon DynamoDB

A list of requests that can perform update, put, delete, or check operations on multiple items in one or more tables atomically.

Contents

Note
In the following list, the required parameters are described first.

ConditionCheck

A request to perform a check item operation.

Type: ConditionCheck (p. 378) object

Required: No

Delete

A request to perform a DeleteItem operation.

Type: Delete (p. 390) object

Required: No

Put

A request to perform a PutItem operation.

Type: Put (p. 449) object

Required: No

Update

A request to perform an UpdateItem operation.

Type: Update (p. 497) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Update
Service: Amazon DynamoDB

Represents a request to perform an UpdateItem operation.

Contents

*Note*
In the following list, the required parameters are described first.

**Key**
The primary key of the item to be updated. Each element consists of an attribute name and a value for that attribute.

Type: String to **AttributeValue** *(p. 349)* object map

Key Length Constraints: Maximum length of 65535.

Required: Yes

**TableName**
Name of the table for the UpdateItem request.

Type: String

Pattern: `[a-zA-Z0-9_.-]+`

Required: Yes

**UpdateExpression**
An expression that defines one or more attributes to be updated, the action to be performed on them, and new value(s) for them.

Type: String

Required: Yes

**ConditionExpression**
A condition that must be satisfied in order for a conditional update to succeed.

Type: String

Required: No

**ExpressionAttributeNames**
One or more substitution tokens for attribute names in an expression.

Type: String to string map

Value Length Constraints: Maximum length of 65535.

Required: No

**ExpressionAttributeValues**
One or more values that can be substituted in an expression.
Type: String to `AttributeValue (p. 349)` object map

Required: No

**ReturnValuesOnConditionCheckFailure**

Use `ReturnValuesOnConditionCheckFailure` to get the item attributes if the `Update` condition fails. For `ReturnValuesOnConditionCheckFailure`, the valid values are: `NONE`, `ALL_OLD`, `UPDATED_OLD`, `ALL_NEW`, `UPDATED_NEW`.

Type: String

Valid Values: `ALL_OLD` | `NONE`

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
UpdateGlobalSecondaryIndexAction

Service: Amazon DynamoDB

Represents the new provisioned throughput settings to be applied to a global secondary index.

Contents

Note
In the following list, the required parameters are described first.

IndexName
The name of the global secondary index to be updated.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: Yes

ProvisionedThroughput

Represents the provisioned throughput settings for the specified global secondary index.

For current minimum and maximum provisioned throughput values, see Service, Account, and Table Quotas in the Amazon DynamoDB Developer Guide.

Type: ProvisionedThroughput (p. 445) object

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
UpdateReplicationGroupMemberAction
Service: Amazon DynamoDB

Represents a replica to be modified.

Contents

Note
In the following list, the required parameters are described first.

RegionName

The Region where the replica exists.

Type: String
Required: Yes

GlobalSecondaryIndexes

Replica-specific global secondary index settings.

Type: Array of ReplicaGlobalSecondaryIndex (p. 458) objects
Array Members: Minimum number of 1 item.
Required: No

KMSMasterKeyId

The AWS KMS key of the replica that should be used for AWS KMS encryption. To specify a key, use its key ID, Amazon Resource Name (ARN), alias name, or alias ARN. Note that you should only provide this parameter if the key is different from the default DynamoDB KMS key alias/aws/dynamodb.

Type: String
Required: No

ProvisionedThroughputOverride

Replica-specific provisioned throughput. If not specified, uses the source table's provisioned throughput settings.

Type: ProvisionedThroughputOverride (p. 448) object
Required: No

TableClassOverride

Replica-specific table class. If not specified, uses the source table's table class.

Type: String
Valid Values: STANDARD | STANDARD_INFREQUENT_ACCESS
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
WriteRequest

Service: Amazon DynamoDB

Represents an operation to perform - either DeleteItem or PutItem. You can only request one of these operations, not both, in a single WriteRequest. If you do need to perform both of these operations, you need to provide two separate WriteRequest objects.

Contents

Note
In the following list, the required parameters are described first.

DeleteRequest

A request to perform a DeleteItem operation.

Type: DeleteRequest (p. 395) object

Required: No

PutRequest

A request to perform a PutItem operation.

Type: PutRequest (p. 451) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

DynamoDB Accelerator

The following data types are supported by DynamoDB Accelerator:

- Cluster (p. 504)
- Endpoint (p. 507)
- Event (p. 508)
- Node (p. 509)
- NodeTypeSpecificValue (p. 511)
- NotificationConfiguration (p. 512)
- Parameter (p. 513)
- ParameterGroup (p. 515)
- ParameterGroupStatus (p. 516)
- ParameterNameValue (p. 517)
- SecurityGroupMembership (p. 518)
• SSEDescription (p. 519)
• SSESpecificaton (p. 520)
• Subnet (p. 521)
• SubnetGroup (p. 522)
• Tag (p. 523)
Cluster
Service: DynamoDB Accelerator
Contains all of the attributes of a specific DAX cluster.

Contents

Note
In the following list, the required parameters are described first.

ActiveNodes
The number of nodes in the cluster that are active (i.e., capable of serving requests).
Type: Integer
Required: No

ClusterArn
The Amazon Resource Name (ARN) that uniquely identifies the cluster.
Type: String
Required: No

ClusterDiscoveryEndpoint
The endpoint for this DAX cluster, consisting of a DNS name, a port number, and a URL. Applications should use the URL to configure the DAX client to find their cluster.
Type: Endpoint (p. 507) object
Required: No

ClusterEndpointEncryptionType
The type of encryption supported by the cluster's endpoint. Values are:
• NONE for no encryption
  • TLS for Transport Layer Security
Type: String
Valid Values: NONE | TLS
Required: No

ClusterName
The name of the DAX cluster.
Type: String
Required: No

Description
The description of the cluster.
Type: String
Required: No
IamRoleArn

A valid Amazon Resource Name (ARN) that identifies an IAM role. At runtime, DAX will assume this role and use the role's permissions to access DynamoDB on your behalf.

Type: String

Required: No

NodeIdsToRemove

A list of nodes to be removed from the cluster.

Type: Array of strings

Required: No

Nodes

A list of nodes that are currently in the cluster.

Type: Array of Node (p. 509) objects

Required: No

NodeType

The node type for the nodes in the cluster. (All nodes in a DAX cluster are of the same type.)

Type: String

Required: No

NotificationConfiguration

Describes a notification topic and its status. Notification topics are used for publishing DAX events to subscribers using Amazon Simple Notification Service (SNS).

Type: NotificationConfiguration (p. 512) object

Required: No

ParameterGroup

The parameter group being used by nodes in the cluster.

Type: ParameterGroupStatus (p. 516) object

Required: No

PreferredMaintenanceWindow

A range of time when maintenance of DAX cluster software will be performed. For example: sun:01:00-sun:09:00. Cluster maintenance normally takes less than 30 minutes, and is performed automatically within the maintenance window.

Type: String

Required: No

SecurityGroups

A list of security groups, and the status of each, for the nodes in the cluster.

Type: Array of SecurityGroupMembership (p. 518) objects

Required: No
**SSEDescription**

The description of the server-side encryption status on the specified DAX cluster.

Type: `SSEDescription` (p. 519) object

Required: No

**Status**

The current status of the cluster.

Type: String

Required: No

**SubnetGroup**

The subnet group where the DAX cluster is running.

Type: String

Required: No

**TotalNodes**

The total number of nodes in the cluster.

Type: Integer

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Endpoint
Service: DynamoDB Accelerator

Represents the information required for client programs to connect to the endpoint for a DAX cluster.

Contents

Note
In the following list, the required parameters are described first.

Address
The DNS hostname of the endpoint.
Type: String
Required: No

Port
The port number that applications should use to connect to the endpoint.
Type: Integer
Required: No

URL
The URL that applications should use to connect to the endpoint. The default ports are 8111 for the "dax" protocol and 9111 for the "daxs" protocol.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Event
Service: DynamoDB Accelerator

Represents a single occurrence of something interesting within the system. Some examples of events are creating a DAX cluster, adding or removing a node, or rebooting a node.

Contents

Note
In the following list, the required parameters are described first.

Date
The date and time when the event occurred.
Type: Timestamp
Required: No

Message
A user-defined message associated with the event.
Type: String
Required: No

SourceName
The source of the event. For example, if the event occurred at the node level, the source would be the node ID.
Type: String
Required: No

SourceType
Specifies the origin of this event - a cluster, a parameter group, a node ID, etc.
Type: String
Valid Values: CLUSTER | PARAMETER_GROUP | SUBNET_GROUP
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Node
Service: DynamoDB Accelerator

Represents an individual node within a DAX cluster.

Contents

**Note**
In the following list, the required parameters are described first.

**AvailabilityZone**
The Availability Zone (AZ) in which the node has been deployed.

Type: String
Required: No

**Endpoint**
The endpoint for the node, consisting of a DNS name and a port number. Client applications can connect directly to a node endpoint, if desired (as an alternative to allowing DAX client software to intelligently route requests and responses to nodes in the DAX cluster.

Type: *Endpoint* (p. 507) object
Required: No

**NodeCreateTime**
The date and time (in UNIX epoch format) when the node was launched.

Type: Timestamp
Required: No

**NodeId**
A system-generated identifier for the node.

Type: String
Required: No

**NodeStatus**
The current status of the node. For example: available.

Type: String
Required: No

**ParameterGroupStatus**
The status of the parameter group associated with this node. For example, in-sync.

Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
**NodeTypeSpecificValue**

Service: DynamoDB Accelerator

Represents a parameter value that is applicable to a particular node type.

**Contents**

**Note**

In the following list, the required parameters are described first.

**NodeType**

A node type to which the parameter value applies.

Type: String

Required: No

**Value**

The parameter value for this node type.

Type: String

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NotificationConfiguration

Service: DynamoDB Accelerator

Describes a notification topic and its status. Notification topics are used for publishing DAX events to subscribers using Amazon Simple Notification Service (SNS).

Contents

Note
In the following list, the required parameters are described first.

TopicArn
The Amazon Resource Name (ARN) that identifies the topic.
Type: String
Required: No

TopicStatus
The current state of the topic. A value of “active” means that notifications will be sent to the topic. A value of “inactive” means that notifications will not be sent to the topic.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Parameter
Service: DynamoDB Accelerator

Describes an individual setting that controls some aspect of DAX behavior.

Contents

Note
In the following list, the required parameters are described first.

AllowedValues
A range of values within which the parameter can be set.
Type: String
Required: No

ChangeType
The conditions under which changes to this parameter can be applied. For example, requires-reboot indicates that a new value for this parameter will only take effect if a node is rebooted.
Type: String
Valid Values: IMMEDIATE | REQUIRES_REBOOT
Required: No

DataType
The data type of the parameter. For example, integer:
Type: String
Required: No

Description
A description of the parameter
Type: String
Required: No

IsModifiable
Whether the customer is allowed to modify the parameter.
Type: String
Valid Values: TRUE | FALSE | CONDITIONAL
Required: No

NodeTypeSpecificValues
A list of node types, and specific parameter values for each node.
Type: Array of NodeTypeSpecificValue (p. 511) objects
Required: No

ParameterName
The name of the parameter.
Parameter

ParameterType

Determines whether the parameter can be applied to any nodes, or only nodes of a particular type.

Type: String

Valid Values: DEFAULT | NODE_TYPE_SPECIFIC

Required: No

ParameterValue

The value for the parameter.

Type: String

Required: No

Source

How the parameter is defined. For example, system denotes a system-defined parameter.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ParameterGroup
Service: DynamoDB Accelerator

A named set of parameters that are applied to all of the nodes in a DAX cluster.

Contents

Note
In the following list, the required parameters are described first.

Description
A description of the parameter group.
Type: String
Required: No

ParameterGroupName
The name of the parameter group.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ParameterGroupStatus
Service: DynamoDB Accelerator
The status of a parameter group.

Contents

Note
In the following list, the required parameters are described first.

NodeIdsToReboot
The node IDs of one or more nodes to be rebooted.
Type: Array of strings
Required: No

ParameterApplyStatus
The status of parameter updates.
Type: String
Required: No

ParameterGroupName
The name of the parameter group.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ParameterNameValue
Service: DynamoDB Accelerator
An individual DAX parameter.

Contents

Note
In the following list, the required parameters are described first.

ParameterName
The name of the parameter.
Type: String
Required: No

ParameterValue
The value of the parameter.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SecurityGroupMembership
Service: DynamoDB Accelerator

An individual VPC security group and its status.

Contents

Note
In the following list, the required parameters are described first.

SecurityGroupIdentifier
  The unique ID for this security group.
  Type: String
  Required: No

Status
  The status of this security group.
  Type: String
  Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SSEDescription
Service: DynamoDB Accelerator

The description of the server-side encryption status on the specified DAX cluster.

Contents

Note
In the following list, the required parameters are described first.

Status

The current state of server-side encryption:
- ENABLING - Server-side encryption is being enabled.
- ENABLED - Server-side encryption is enabled.
- DISABLING - Server-side encryption is being disabled.
- DISABLED - Server-side encryption is disabled.

Type: String

Valid Values: ENABLING | ENABLED | DISABLING | DISABLED

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**SSESpecification**

Service: DynamoDB Accelerator

Represents the settings used to enable server-side encryption.

**Contents**

**Note**

In the following list, the required parameters are described first.

**Enabled**

Indicates whether server-side encryption is enabled (true) or disabled (false) on the cluster.

Type: Boolean

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Subnet
Service: DynamoDB Accelerator

Represents the subnet associated with a DAX cluster. This parameter refers to subnets defined in Amazon Virtual Private Cloud (Amazon VPC) and used with DAX.

Contents

Note
In the following list, the required parameters are described first.

SubnetAvailabilityZone
The Availability Zone (AZ) for the subnet.
Type: String
Required: No

SubnetIdentifier
The system-assigned identifier for the subnet.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SubnetGroup
Service: DynamoDB Accelerator
Represents the output of one of the following actions:

- *CreateSubnetGroup*
- *ModifySubnetGroup*

Contents

Note
In the following list, the required parameters are described first.

Description
The description of the subnet group.
Type: String
Required: No

SubnetGroupName
The name of the subnet group.
Type: String
Required: No

Subnets
A list of subnets associated with the subnet group.
Type: Array of Subnet (p. 521) objects
Required: No

VpcId
The Amazon Virtual Private Cloud identifier (VPC ID) of the subnet group.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Tag
Service: DynamoDB Accelerator

A description of a tag. Every tag is a key-value pair. You can add up to 50 tags to a single DAX cluster.

AWS-assigned tag names and values are automatically assigned the aws: prefix, which the user cannot assign. AWS-assigned tag names do not count towards the tag limit of 50. User-assigned tag names have the prefix user:.

You cannot backdate the application of a tag.

Contents

Note
In the following list, the required parameters are described first.

Key

The key for the tag. Tag keys are case sensitive. Every DAX cluster can only have one tag with the same key. If you try to add an existing tag (same key), the existing tag value will be updated to the new value.

Type: String
Required: No

Value

The value of the tag. Tag values are case-sensitive and can be null.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3

Amazon DynamoDB Streams

The following data types are supported by Amazon DynamoDB Streams:

- AttributeValue (p. 525)
- Identity (p. 528)
- KeySchemaElement (p. 529)
- Record (p. 531)
- SequenceNumberRange (p. 533)
- Shard (p. 534)
- Stream (p. 535)
- StreamDescription (p. 536)
- StreamRecord (p. 539)
AttributeValue

Represents the data for an attribute.

Each attribute value is described as a name-value pair. The name is the data type, and the value is the data itself.

For more information, see Data Types in the Amazon DynamoDB Developer Guide.

Contents

Note
In the following list, the required parameters are described first.

B
An attribute of type Binary. For example:
"B": "dGhpcyB0ZXh0IGlzIGJhc2U2NC1lbmNvZGVk"
Type: Base64-encoded binary data object
Required: No

BOOL
An attribute of type Boolean. For example:
"BOOL": true
Type: Boolean
Required: No

BS
An attribute of type Binary Set. For example:
"BS": ["U3Vubnk=", "UmFpbnk=", "U25vd3k="]
Type: Array of Base64-encoded binary data objects
Required: No

L
An attribute of type List. For example:
"L": [ {"S": "Cookies"}, {"S": "Coffee"}, {"N": "3.14159"}]
Type: Array of AttributeValue (p. 525) objects
Required: No

M
An attribute of type Map. For example:
"M": {"Name": {"S": "Joe"}, "Age": {"N": "35"}}
Type: String to AttributeValue (p. 525) object map
Key Length Constraints: Maximum length of 65535.
Required: No

**N**

An attribute of type Number. For example:

"N": "123.45"

Numbers are sent across the network to DynamoDB as strings, to maximize compatibility across languages and libraries. However, DynamoDB treats them as number type attributes for mathematical operations.

Type: String

Required: No

**NS**

An attribute of type Number Set. For example:

"NS": ["42.2", "-19", "7.5", "3.14"]

Numbers are sent across the network to DynamoDB as strings, to maximize compatibility across languages and libraries. However, DynamoDB treats them as number type attributes for mathematical operations.

Type: Array of strings

Required: No

**NULL**

An attribute of type Null. For example:

"NULL": true

Type: Boolean

Required: No

**S**

An attribute of type String. For example:

"S": "Hello"

Type: String

Required: No

**SS**

An attribute of type String Set. For example:

"SS": ["Giraffe", "Hippo", "Zebra"]

Type: Array of strings

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
Identity
Service: Amazon DynamoDB Streams
Contains details about the type of identity that made the request.

Contents

**Note**
In the following list, the required parameters are described first.

**PrincipalId**
A unique identifier for the entity that made the call. For Time To Live, the principalId is "dynamodb.amazonaws.com".

Type: String
Required: No

**Type**
The type of the identity. For Time To Live, the type is "Service".

Type: String
Required: No

**See Also**
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
KeySchemaElement

Service: Amazon DynamoDB Streams

Represents a single element of a key schema. A key schema specifies the attributes that make up the primary key of a table, or the key attributes of an index.

A KeySchemaElement represents exactly one attribute of the primary key. For example, a simple primary key would be represented by one KeySchemaElement (for the partition key). A composite primary key would require one KeySchemaElement for the partition key, and another KeySchemaElement for the sort key.

A KeySchemaElement must be a scalar, top-level attribute (not a nested attribute). The data type must be one of String, Number, or Binary. The attribute cannot be nested within a List or a Map.

Contents

Note
In the following list, the required parameters are described first.

AttributeName
The name of a key attribute.
Type: String
Length Constraints: Minimum length of 1. Maximum length of 255.
Required: Yes

KeyType
The role that this key attribute will assume:
- HASH - partition key
- RANGE - sort key

Note
The partition key of an item is also known as its hash attribute. The term "hash attribute" derives from DynamoDB's usage of an internal hash function to evenly distribute data items across partitions, based on their partition key values.
The sort key of an item is also known as its range attribute. The term "range attribute" derives from the way DynamoDB stores items with the same partition key physically close together, in sorted order by the sort key value.

Type: String
Valid Values: HASH | RANGE
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Record
Service: Amazon DynamoDB Streams
A description of a unique event within a stream.

Contents

Note
In the following list, the required parameters are described first.

awsRegion
The region in which the GetRecords request was received.
Type: String
Required: No
dynamodb
The main body of the stream record, containing all of the DynamoDB-specific fields.
Type: StreamRecord (p. 539) object
Required: No
eventID
A globally unique identifier for the event that was recorded in this stream record.
Type: String
Required: No
eventName
The type of data modification that was performed on the DynamoDB table:
- INSERT - a new item was added to the table.
- MODIFY - one or more of an existing item's attributes were modified.
- REMOVE - the item was deleted from the table
Type: String
Valid Values: INSERT | MODIFY | REMOVE
Required: No
eventSource
The AWS service from which the stream record originated. For DynamoDB Streams, this is aws:dynamodb.
Type: String
Required: No
eventVersion
The version number of the stream record format. This number is updated whenever the structure of Record is modified.
Client applications must not assume that eventVersion will remain at a particular value, as this number is subject to change at any time. In general, eventVersion will only increase as the low-level DynamoDB Streams API evolves.
Record

userIdentity

Items that are deleted by the Time to Live process after expiration have the following fields:

- Records[].userIdentity.type
  "Service"
- Records[].userIdentity.principalId
  "dynamodb.amazonaws.com"

Type: Identity (p. 528) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SequenceNumberRange
Service: Amazon DynamoDB Streams

The beginning and ending sequence numbers for the stream records contained within a shard.

Contents

Note
In the following list, the required parameters are described first.

EndingSequenceNumber
The last sequence number for the stream records contained within a shard. String contains numeric characters only.

Type: String

Required: No

StartingSequenceNumber
The first sequence number for the stream records contained within a shard. String contains numeric characters only.

Type: String

Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Shard
Service: Amazon DynamoDB Streams
A uniquely identified group of stream records within a stream.

Contents

Note
In the following list, the required parameters are described first.

ParentShardId
The shard ID of the current shard's parent.
Type: String
Required: No

SequenceNumberRange
The range of possible sequence numbers for the shard.
Type: SequenceNumberRange (p. 533) object
Required: No

ShardId
The system-generated identifier for this shard.
Type: String
Required: No

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Stream
Service: Amazon DynamoDB Streams

Represents all of the data describing a particular stream.

Contents

Note
In the following list, the required parameters are described first.

StreamArn
The Amazon Resource Name (ARN) for the stream.
Type: String
Required: No

StreamLabel
A timestamp, in ISO 8601 format, for this stream.
Note that LatestStreamLabel is not a unique identifier for the stream, because it is possible that a stream from another table might have the same timestamp. However, the combination of the following three elements is guaranteed to be unique:
- the AWS customer ID.
- the table name
- the StreamLabel
Type: String
Required: No

TableName
The DynamoDB table with which the stream is associated.
Type: String
Pattern: [a-zA-Z0-9_.-]+
Required: No

StreamDescription
Service: Amazon DynamoDB Streams

Represents all of the data describing a particular stream.

Contents

Note
In the following list, the required parameters are described first.

CreationRequestDateTime
The date and time when the request to create this stream was issued.
Type: Timestamp
Required: No

KeySchema
The key attribute(s) of the stream's DynamoDB table.
Type: Array of KeySchemaElement (p. 529) objects
Array Members: Minimum number of 1 item. Maximum number of 2 items.
Required: No

LastEvaluatedShardId
The shard ID of the item where the operation stopped, inclusive of the previous result set. Use this value to start a new operation, excluding this value in the new request.

If LastEvaluatedShardId is empty, then the "last page" of results has been processed and there is currently no more data to be retrieved.

If LastEvaluatedShardId is not empty, it does not necessarily mean that there is more data in the result set. The only way to know when you have reached the end of the result set is when LastEvaluatedShardId is empty.

Type: String
Required: No

Shards
The shards that comprise the stream.
Type: Array of Shard (p. 534) objects
Required: No

StreamArn
The Amazon Resource Name (ARN) for the stream.
Type: String
Required: No
StreamLabel

A timestamp, in ISO 8601 format, for this stream.

Note that LatestStreamLabel is not a unique identifier for the stream, because it is possible that a stream from another table might have the same timestamp. However, the combination of the following three elements is guaranteed to be unique:

- the AWS customer ID.
- the table name
- the StreamLabel

Type: String

Required: No

StreamStatus

Indicates the current status of the stream:

- ENABLING - Streams is currently being enabled on the DynamoDB table.
- DISABLED - the stream is enabled.
- DISABLING - Streams is currently being disabled on the DynamoDB table.
- DISABLED - the stream is disabled.

Type: String

Valid Values: ENABLING | ENABLED | DISABLING | DISABLED

Required: No

StreamViewType

Indicates the format of the records within this stream:

- KEYS_ONLY - only the key attributes of items that were modified in the DynamoDB table.
- NEW_IMAGE - entire items from the table, as they appeared after they were modified.
- OLD_IMAGE - entire items from the table, as they appeared before they were modified.
- NEW_AND_OLD_IMAGES - both the new and the old images of the items from the table.

Type: String

Valid Values: NEW_IMAGE | OLD_IMAGE | NEW_AND_OLD_IMAGES | KEYS_ONLY

Required: No

TableName

The DynamoDB table with which the stream is associated.

Type: String

Pattern: [a-zA-Z0-9_.-]+

Required: No

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
StreamRecord
Service: Amazon DynamoDB Streams

A description of a single data modification that was performed on an item in a DynamoDB table.

Contents

Note
In the following list, the required parameters are described first.

ApproximateCreationDateTime
The approximate date and time when the stream record was created, in UNIX epoch time format and rounded down to the closest second.
Type: Timestamp
Required: No

Keys
The primary key attribute(s) for the DynamoDB item that was modified.
Type: String to AttributeValue (p. 525) object map
Key Length Constraints: Maximum length of 65535.
Required: No

NewImage
The item in the DynamoDB table as it appeared after it was modified.
Type: String to AttributeValue (p. 525) object map
Key Length Constraints: Maximum length of 65535.
Required: No

OldImage
The item in the DynamoDB table as it appeared before it was modified.
Type: String to AttributeValue (p. 525) object map
Key Length Constraints: Maximum length of 65535.
Required: No

SequenceNumber
The sequence number of the stream record.
Type: String
Required: No

SizeBytes
The size of the stream record, in bytes.
Type: Long
Valid Range: Minimum value of 1.

Required: No

**StreamViewType**

The type of data from the modified DynamoDB item that was captured in this stream record:

- **KEYS_ONLY** - only the key attributes of the modified item.
- **NEW_IMAGE** - the entire item, as it appeared after it was modified.
- **OLD_IMAGE** - the entire item, as it appeared before it was modified.
- **NEW_AND_OLD_IMAGES** - both the new and the old item images of the item.

Type: String

Valid Values: NEW_IMAGE | OLD_IMAGE | NEW_AND_OLD_IMAGES | KEYS_ONLY

Required: No

Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**

You do not have sufficient access to perform this action.

HTTP Status Code: 400

**IncompleteSignature**

The request signature does not conform to AWS standards.

HTTP Status Code: 400

**InternalFailure**

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

**InvalidAction**

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

**InvalidClientTokenId**

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

**InvalidParameterCombination**

Parameters that must not be used together were used together.

HTTP Status Code: 400

**InvalidParameterValue**

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

**InvalidQueryParameter**

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

**MalformedQueryString**

The query string contains a syntax error.

HTTP Status Code: 404

**MissingAction**

The request is missing an action or a required parameter.

HTTP Status Code: 400
MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

NotAuthorized

You do not have permission to perform this action.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationError

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
