The following tag-resource example tags a specified contact with the provided tag key value pair.

```bash
aws ssm-contacts tag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tags '[["Key":"group1","Value":"1"]]'
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a contact

The following untag-resource example removes the group1 tag from the specified contact.

```bash
aws ssm-contacts untag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tag-keys "group1"
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

For API details, see StopEngagement in AWS CLI Command Reference.

For API details, see TagResource in AWS CLI Command Reference.

For API details, see UntagResource in AWS CLI Command Reference.
update-contact-channel

The following code example shows how to use `update-contact-channel`.

AWS CLI

To update a contact channel

The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:1111222333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \
   --name "akuas voice channel" \
   --delivery-address '{"SimpleAddress": "+15005550198"}"
```

This command produces no output.

For more information, see [Contacts](incident-manager-user-guide) in the Incident Manager User Guide.

- For API details, see [UpdateContactChannel](aws-cli-command-reference) in AWS CLI Command Reference.

update-contact

The following code example shows how to use `update-contact`.

AWS CLI

To update the engagement plan of contact

The following `update-contact` example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-2:1111222333:contact/akuam" \
   --plan '{"Stages": [
   {"DurationInMinutes": 5, "Targets": [
   {"ChannelTargetInfo": "arn:aws:ssm-contacts:us-east-2:1111222333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65","RetryIntervalInMinutes": 1 }
   ]}, 
   {"DurationInMinutes": 5, "Targets": [
   {"ChannelTargetInfo": "arn:aws:ssm-contacts:us-east-2:1111222333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1 }
   ],"RetryIntervalInMinutes": 1 }]

```
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see UpdateContact in AWS CLI Command Reference.

**Amazon Inspector examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**add-attributes-to-findings**

The following code example shows how to use add-attributes-to-findings.

**AWS CLI**

**To add attributes to findings**

The following add-attribute-to-finding command assigns an attribute with the key of Example and value of example to the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU:
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example

Output:
{
   "failedItems": {}
}

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.
• For API details, see AddAttributesToFindings in AWS CLI Command Reference.

create-assessment-target

The following code example shows how to use create-assessment-target.

AWS CLI

To create an assessment target

The following create-assessment-target command creates an assessment target named ExampleAssessmentTarget using the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv:

Output:
{
   "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX"
}

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.
• For API details, see CreateAssessmentTarget in AWS CLI Command Reference.
**create-assessment-template**

The following code example shows how to use `create-assessment-template`.

**AWS CLI**

**To create an assessment template**

The following `create-assessment-template` command creates an assessment template called ExampleAssessmentTemplate for the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX:

```
aws inspector create-assessment-template --assessment-target-arn
    ExampleAssessmentTemplate --duration-in-seconds 180 --rules-package-arns
    arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p --user-attributes-for-findings
    key=ExampleTag,value=examplevalue
```

Output:

```
{
    "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see [CreateAssessmentTemplate](#) in AWS CLI Command Reference.

**create-resource-group**

The following code example shows how to use `create-resource-group`.

**AWS CLI**

**To create a resource group**

The following `create-resource-group` command creates a resource group using the tag key of Name and value of example:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```
Output:

```
{
    "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see CreateResourceGroup in AWS CLI Command Reference.

**delete-assessment-run**

The following code example shows how to use delete-assessment-run.

**AWS CLI**

**To delete an assessment run**

The following delete-assessment-run command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DeleteAssessmentRun in AWS CLI Command Reference.

**delete-assessment-target**

The following code example shows how to use delete-assessment-target.

**AWS CLI**

**To delete an assessment target**

The following delete-assessment-target command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:`

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

• For API details, see DeleteAssessmentTarget in AWS CLI Command Reference.

delete-assessment-template

The following code example shows how to use delete-assessment-template.

AWS CLI

To delete an assessment template

The following delete-assessment-template command deletes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T:

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

• For API details, see DeleteAssessmentTemplate in AWS CLI Command Reference.

describe-assessment-runs

The following code example shows how to use describe-assessment-runs.

AWS CLI

To describe assessment runs

The following describe-assessment-run command describes an assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE:

aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
Output:

```json
{
    "assessmentRuns": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "completedAt": 1458680301.4,
            "createdAt": 1458680170.035,
            "dataCollected": true,
            "durationInSeconds": 3600,
            "name": "Run 1 for ExampleAssessmentTemplate",
            "notifications": [],
            "rulesPackageArns": [
            ],
            "startedAt": 1458680170.161,
            "state": "COMPLETED",
            "stateChangedAt": 1458680301.4,
            "stateChanges": [
                {
                    "state": "CREATED",
                    "stateChangedAt": 1458680170.035
                },
                {
                    "state": "START_DATA_COLLECTION_PENDING",
                    "stateChangedAt": 1458680170.065
                },
                {
                    "state": "START_DATA_COLLECTION_IN_PROGRESS",
                    "stateChangedAt": 1458680170.096
                },
                {
                    "state": "COLLECTING_DATA",
                    "stateChangedAt": 1458680170.161
                },
                {
                    "state": "STOP_DATA_COLLECTION_PENDING",
                    "stateChangedAt": 1458680239.883
                },
                {
                    "state": "DATA_COLLECTED",
                    "stateChangedAt": 1458680301.4
                }
            ]
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentRuns in AWS CLI Command Reference.

describe-assessment-targets

The following code example shows how to use describe-assessment-targets.

AWS CLI

To describe assessment targets

The following describe-assessment-targets command describes the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:

```
aws inspector describe-assessment-targets --assessment-target-arns
  arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
  "assessmentTargets": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
```
describe-assessment-templates

The following code example shows how to use describe-assessment-templates.

AWS CLI

To describe assessment templates

The following describe-assessment-templates command describes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw:

```
aws inspector describe-assessment-templates --assessment-template-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```json
{
    "assessmentTemplates": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
            "createdAt": 1458074191.844,
            "durationInSeconds": 3600,
            "name": "ExampleAssessmentTemplate",
            "rulesPackageArns": []
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentTemplates in AWS CLI Command Reference.

describe-cross-account-access-role

The following code example shows how to use describe-cross-account-access-role.

AWS CLI

To describe the cross account access role

The following describe-cross-account-access-role command describes the IAM role that enables Amazon Inspector to access your AWS account:

```bash
aws inspector describe-cross-account-access-role
```

Output:

```json
{
  "registeredAt": 1458069182.826,
  "roleArn": "arn:aws:iam::123456789012:role/inspector",
  "valid": true
}
```

For more information, see Setting up Amazon Inspector in the Amazon Inspector guide.

- For API details, see DescribeCrossAccountAccessRole in AWS CLI Command Reference.

describe-findings

The following code example shows how to use describe-findings.
To describe findings

The following describe-findings command describes the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4`:

```bash
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```json
{
   "failedItems": {},
   "findings": [
      {
         "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
         "assetAttributes": {
            "ipv4Addresses": [],
            "schemaVersion": 1
         },
         "assetType": "ec2-instance",
         "attributes": [],
         "confidence": 10,
         "createdAt": 1458680301.37,
         "description": "Amazon Inspector did not find any potential security issues during this assessment.",
         "indicatorOfCompromise": false,
         "numericSeverity": 0,
         "recommendation": "No remediation needed.",
         "schemaVersion": 1,
         "service": "Inspector",
         "serviceAttributes": {
            "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "schemaVersion": 1
         },
         "severity": "Informational",
         "schemaVersion": 1
      }
   ]
}
```
For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see [DescribeFindings](#) in [AWS CLI Command Reference](#).

**describe-resource-groups**

The following code example shows how to use `describe-resource-groups`.

**AWS CLI**

**To describe resource groups**

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```bash
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI
```

**Output:**

```json
{
   "failedItems": {},
   "resourceGroups": [
   {
      "createdAt": 1458074191.098,
      "tags": [
      {
         "key": "Name",
         "value": "example"
      }
      ]
   }
   ]
}
```
For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DescribeResourceGroups](https://docs.aws.amazon.com/cli/latest/reference/inspector/describe-resource-groups.html) in *AWS CLI Command Reference*.

**describe-rules-packages**

The following code example shows how to use `describe-rules-packages`.

**AWS CLI**

**To describe rules packages**

The following `describe-rules-packages` command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
```

**Output:**

```
{
    "failedItems": {},
    "rulesPackages": [
        {
            "description": "The rules in this package help verify whether the EC2 instances in your application are exposed to Common Vulnerabilities and Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service or data. The CVE system provides a reference for publicly known information security vulnerabilities and exposures. For more information, see [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the end of a completed Inspector assessment, you can search [https://cve.mitre.org/](https://cve.mitre.org/) using the CVE's ID (for example, "CVE-2009-0021") to find detailed information about this CVE, its severity, and how to mitigate it.",
            "name": "Common Vulnerabilities and Exposures",
            "provider": "Amazon Web Services, Inc.",
            "version": "1.1"
        }
    ]
}
```
For more information, see Amazon Inspector Rules Packages and Rules in the Amazon Inspector guide.

- For API details, see `DescribeRulesPackages` in AWS CLI Command Reference.

**get-telemetry-metadata**

The following code example shows how to use `get-telemetry-metadata`.

**AWS CLI**

To get the telemetry metadata

The following `get-telemetry-metadata` command generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```shell
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```json
{
    "telemetryMetadata": [
        {
            "count": 2,  
            "dataSize": 345,
            "messageType": "InspectorDuplicateProcess"
        },
        {
            "count": 3,
            "dataSize": 255, 
            "messageType": "InspectorTimeEventMsg"
        },
        {
            "count": 4,
            "dataSize": 1082, 
            "messageType": "InspectorNetworkInterface"
        }
    ]
}
```
"messageType": "InspectorOperatingSystem"
],
{
  "count": 6,
  "dataSize": 546,
  "messageType": "InspectorStopProcess"
],
{
  "count": 1,
  "dataSize": 1553,
  "messageType": "InspectorInstanceMetaData"
],
{
  "count": 2,
  "dataSize": 434,
  "messageType": "InspectorTcpV4Connection"
],
{
  "count": 474,
  "dataSize": 2960322,
  "messageType": "InspectorPackageInfo"
],
{
  "count": 3,
  "dataSize": 2235,
  "messageType": "InspectorSystemPerformance"
],
{
  "count": 105,
  "dataSize": 46048,
  "messageType": "InspectorCodeModule"
],
{
  "count": 1,
  "dataSize": 182,
  "messageType": "InspectorUdpV6ListeningPort"
],
{
  "count": 2,
  "dataSize": 371,
  "messageType": "InspectorUdpV4ListeningPort"
],
{
  "count": 18,
"dataSize": 8362,
  "messageType": "InspectorKernelModule"
},
{
  "count": 29,
  "dataSize": 48788,
  "messageType": "InspectorConfigurationInfo"
},
{
  "count": 1,
  "dataSize": 79,
  "messageType": "InspectorMonitoringStart"
},
{
  "count": 5,
  "dataSize": 0,
  "messageType": "InspectorSplitMsgBegin"
},
{
  "count": 51,
  "dataSize": 4593,
  "messageType": "InspectorGroup"
},
{
  "count": 1,
  "dataSize": 184,
  "messageType": "InspectorTcpV4ListeningPort"
},
{
  "count": 1159,
  "dataSize": 3146579,
  "messageType": "Total"
},
{
  "count": 5,
  "dataSize": 0,
  "messageType": "InspectorSplitMsgEnd"
},
{
  "count": 1,
  "dataSize": 612,
  "messageType": "InspectorLoadImageInProcess"
}
For API details, see [GetTelemetryMetadata](awscli:GetTelemetryMetadata) in *AWS CLI Command Reference*.

### list-assessment-run-agents

The following code example shows how to use `list-assessment-run-agents`.

#### AWS CLI

**To list assessment run agents**

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```bash
aws inspector list-assessment-run-agents \
  --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

**Output:**

```json
{
  "assessmentRunAgents": [
    {
      "agentHealth": "HEALTHY",
      "agentHealthCode": "HEALTHY",
      "agentId": "i-49113b93",
      "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "telemetryMetadata": [
        {
          "count": 2,
          "dataSize": 345,
          "messageType": "InspectorDuplicateProcess"
        },
        {
          "count": 3,
          "dataSize": 255,
          "messageType": "InspectorTimeEventMsg"
        },
        {
          "count": 4,
          "dataSize": 345,
          "messageType": "InspectorDuplicateProcess"

For more information, see AWS Agents in the Amazon Inspector User Guide.

- For API details, see ListAssessmentRunAgents in AWS CLI Command Reference.

**list-assessment-runs**

The following code example shows how to use `list-assessment-runs`.

**AWS CLI**

**To list assessment runs**

The following `list-assessment-runs` command lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

Output:

```
{
   "assessmentRunArns": [
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v"
   ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector User Guide.

- For API details, see ListAssessmentRuns in AWS CLI Command Reference.

**list-assessment-targets**

The following code example shows how to use `list-assessment-targets`.
AWS CLI

To list assessment targets

The following list-assessment-targets command lists all existing assessment targets:

```bash
aws inspector list-assessment-targets
```

Output:

```json
{
    "assessmentTargetArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see ListAssessmentTargets in AWS CLI Command Reference.

list-assessment-templates

The following code example shows how to use list-assessment-templates.

AWS CLI

To list assessment templates

The following list-assessment-templates command lists all existing assessment templates:

```bash
aws inspector list-assessment-templates
```

Output:

```json
{
    "assessmentTemplateArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-Uza6ihLh"
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `ListAssessmentTemplates` in AWS CLI Command Reference.

**list-event-subscriptions**

The following code example shows how to use `list-event-subscriptions`.

**AWS CLI**

**To list event subscriptions**

The following `list-event-subscriptions` command lists all the event subscriptions for the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```bash
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```json
{
   "subscriptions": [
   {
   "eventSubscriptions": [
   {
   "event": "ASSESSMENT_RUN_COMPLETED",
   "subscribedAt": 1459455440.867
   }
   ],
   "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0",
   "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
   }
   ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.
list-findings

The following code example shows how to use list-findings.

AWS CLI

To list findings

The following list-findings command lists all of the generated findings:

```bash
aws inspector list-findings
```

Output:

```json
{
   "findingArns": [
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
   ]
}
```

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

list-rules-packages

The following code example shows how to use list-rules-packages.

AWS CLI

To list rules packages

The following list-rules-packages command lists all available Inspector rules packages:

```bash
aws inspector list-rules-packages
```
For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see [ListRulesPackages](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-rules-packages.html) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for resource**

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```bash
```

**Output:**

```json
{
    "tags": [
        {
            "key": "Name",
            "value": "Example"
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

preview-agents

The following code example shows how to use `preview-agents`.

AWS CLI

To preview agents

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
```

Output:

```
{
    "agentPreviews": [
        {
            "agentId": "i-49113b93"
        }
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see PreviewAgents in AWS CLI Command Reference.

register-cross-account-access-role

The following code example shows how to use `register-cross-account-access-role`.

AWS CLI

To register the cross account access role
The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the `preview-agents` command:

```bash
aws inspector register-cross-account-access-role --role-arn arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see [RegisterCrossAccountAccessRole](http://awscli.amazonaws.com/AWS婵CLI Command Reference) in *AWS CLI Command Reference*.

### remove-attributes-from-findings

The following code example shows how to use `remove-attributes-from-findings`.

**AWS CLI**

**To remove attributes from findings**

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```bash
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attribute-keys key=Example,value=example
```

**Output:**

```json
{
   "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [RemoveAttributesFromFindings](http://awscli.amazonaws.com/AWS婵CLI Command Reference) in *AWS CLI Command Reference*.
**set-tags-for-resource**

The following code example shows how to use `set-tags-for-resource`.

**AWS CLI**

To set tags for a resource

The following `set-tags-for-resource` command sets the tag with the key of `Example` and value of `example` to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```bash
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [SetTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/inspector/set-tags-for-resource.html) in [AWS CLI Command Reference](https).

**start-assessment-run**

The following code example shows how to use `start-assessment-run`.

**AWS CLI**

To start an assessment run

The following `start-assessment-run` command starts the assessment run named `examplerun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```bash
```

Output:

```json
{
    "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0oroxY"
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StartAssessmentRun in AWS CLI Command Reference.

**stop-assessment-run**

The following code example shows how to use stop-assessment-run.

**AWS CLI**

**To stop an assessment run**

The following stop-assessment-run command stops the assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0oroxY:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StopAssessmentRun in AWS CLI Command Reference.

**subscribe-to-event**

The following code example shows how to use subscribe-to-event.

**AWS CLI**

**To subscribe to an event**

The following example enables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of arn:aws:sns:us-west-2:123456789012:exampletopic

```
aws inspector subscribe-to-event \
   --event ASSESSMENT_RUN_COMPLETED \
```

Actions and scenarios
This command produces no output.

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

• For API details, see SubscribeToEvent in AWS CLI Command Reference.

unsubscribe-from-event

The following code example shows how to use unsubscribe-from-event.

AWS CLI

To unsubscribe from an event

The following unsubscribe-from-event command disables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of arn:aws:sns:us-west-2:123456789012:examletopic:

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

• For API details, see UnsubscribeFromEvent in AWS CLI Command Reference.

update-assessment-target

The following code example shows how to use update-assessment-target.

AWS CLI

To update an assessment target

The following update-assessment-target command updates the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX and
the name of Example, and the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt`:

```bash
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [UpdateAssessmentTarget](https://docs.aws.amazon.com/cli/latest/reference/inspector/update-assessment-target.html) in *AWS CLI Command Reference*.

## AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- [Actions](#)

### Actions

**accept-certificate-transfer**

The following code example shows how to use `accept-certificate-transfer`.

### AWS CLI

**To accept a device certificate transferred from a different AWS account**

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.
This command does not produce any output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see AcceptCertificateTransfer in AWS CLI Command Reference.

add-thing-to-billing-group

The following code example shows how to use add-thing-to-billing-group.

AWS CLI

Example 1: To add a thing by name to a billing group

The following add-thing-to-billing-group example adds the thing named MyLightBulb to the billing group named GroupOne.

```
aws iot add-thing-to-billing-group \\
   --billing-group-name GroupOne \\
   --thing-name MyLightBulb
```

This command produces no output.

Example 2: To add a thing by ARN to a billing group

The following add-thing-to-billing-group example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-thing-group \\
   --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \\
   --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see AddThingToBillingGroup in AWS CLI Command Reference.

add-thing-to-thing-group

The following code example shows how to use add-thing-to-thing-group.

AWS CLI

To add a thing to a group

The following add-thing-to-thing-group example adds the specified thing to the specified thing group.

```
aws iot add-thing-to-thing-group \\
  --thing-name MyLightBulb \\
  --thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see AddThingToThingGroup in AWS CLI Command Reference.

associate-targets-with-job

The following code example shows how to use associate-targets-with-job.

AWS CLI

To associate a thing group with a continuous job

The following associate-targets-with-job example associates the specified thing group with the specified continuous job.

```
aws iot associate-targets-with-job \\
  --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \\
  --job-id "example-job-04"
```

Output:
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see AssociateTargetsWithJob in AWS CLI Command Reference.

attach-policy

The following code example shows how to use attach-policy.

AWS CLI

Example 1: To attach a policy to a thing group

The following attach-policy example attaches the specified policy to a thing group identified by its ARN.

```bash
aws iot attach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

Example 2: To attach a policy to a certificate

The following attach-policy example attaches the policy UpdateDeviceCertPolicy to the principal specified by a certificate.

```bash
aws iot attach-policy \
    --policy-name UpdateDeviceCertPolicy \
    --target "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d672fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.
For more information, see [Attach an AWS IoT Policy to a Device Certificate](https://docs.aws.amazon.com/iot/latest/developerguide/dev-policy-attach.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

### attach-security-profile

The following code example shows how to use `attach-security-profile`.

**AWS CLI**

**To associate a security profile with all unregistered devices**

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named Testprofile with all unregistered devices in the `us-west-2` region for this AWS account.

```bash
aws iot attach-security-profile \
  --security-profile-name Testprofile \
```

This command produces no output.

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-commands.html) in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

### attach-thing-principal

The following code example shows how to use `attach-thing-principal`.

**AWS CLI**

**To attach a certificate to your thing**

The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```bash
aws iot attach-thing-principal \
```

Actions and scenarios
--thing-name MyTemperatureSensor \
--principal arn:aws:iot:us-west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c66923453499506002a35159767055278e8

This command produces no output.

For more information, see How to Manage Things with the Registry in the AWS IoT Developers Guide.

- For API details, see AttachThingPrincipal in AWS CLI Command Reference.

cancel-audit-mitigation-actions-task

The following code example shows how to use cancel-audit-mitigation-actions-task.

AWS CLI

To cancel an audit mitigation actions task

The following cancel-audit-mitigation-actions-task example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

aws iot cancel-audit-mitigation-actions-task 
--task-id "myActionsTaskId"

This command produces no output.

For more information, see CancelAuditMitigationActionsTask (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see CancelAuditMitigationActionsTask in AWS CLI Command Reference.

cancel-audit-task

The following code example shows how to use cancel-audit-task.

AWS CLI

To cancel an audit task

The following cancel-audit-task example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.
aws iot cancel-audit-task \
   --task-id a3aea009955e501a31b764abe1bebd3d

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

• For API details, see CancelAuditTask in AWS CLI Command Reference.

cancel-certificate-transfer

The following code example shows how to use cancel-certificate-transfer.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following cancel-certificate-transfer example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

aws iot cancel-certificate-transfer \
   --certificate-id
   f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8

This command produces no output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

• For API details, see CancelCertificateTransfer in AWS CLI Command Reference.

cancel-job-execution

The following code example shows how to use cancel-job-execution.

AWS CLI

To cancel a job execution on a device

The following cancel-job-execution example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the --force parameter.
aws iot cancel-job-execution \
   --job-id "example-job-03" \
   --thing-name "MyRPi"

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
- For API details, see CancelJobExecution in AWS CLI Command Reference.

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job

The following cancel-job example cancels the specified job.

aws iot cancel-job \
   --job-job "example-job-03"

Output:

{
   "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
   "jobId": "example-job-03",
   "description": "example job test"
}

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
- For API details, see CancelJob in AWS CLI Command Reference.

clear-default-authorizer

The following code example shows how to use clear-default-authorizer.

AWS CLI

To clear the default authorizer
The following clear-default-authorizer example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```bash
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see [ClearDefaultAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-api-reference.html#ClearDefaultAuthorizer) in the *AWS IoT API Reference*.

- For API details, see [ClearDefaultAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/clear-default-authorizer.html) in *AWS CLI Command Reference*.

### confirm-topic-rule-destination

The following code example shows how to use confirm-topic-rule-destination.

**AWS CLI**

**To confirm a topic rule destination**

The following confirm-topic-rule-destination example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```bash
aws iot confirm-topic-rule-destination
  --confirmation-token "AYADeIcmtq-ZkxfpiWIQqHWMSucAXwABABVhd3MtY3J5cHRvLXB1YmpYy1rZxkAREFxY1E0Um1GeDg0V21BZWZ1VjZtZWFRVUJJUtdaywpPqg8YEsalID4B40aJ3s1wEHKMzybiF1RoOZzYisI01vs1zQy5UmCkq3tv-3f7-nKfosoIAAAAAAAEAAAAAAAEAAAAAAAIA9RMgy-V19V9m6Iw2xfbw____wAAAAEAAAAAAAAAAAABw4SokgUcxiJ3gT06n50NLJvpyQR1UmPIj5sShgXEQGc03m6Pu-iufgrzePl8RZYOWr006Aj9DvJx-1iD6Pu-GGPu1ka07KnzG2AD0qf1HUf4YRTvyUgBnMGUCMQC8ZrhmKqntd_c6Kgrow3bMUDbvNq02qZr8Z8jm2rzgseRo1AnPJeTJ303Z4I1I1F8x1cdPGP-PV1d0XFemyL8g"
```

This command produces no output.

For more information, see [Confirming a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-developer-guide.html) in the *AWS IoT Developer Guide*.

- For API details, see [ConfirmTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/confirm-topic-rule-destination.html) in *AWS CLI Command Reference*.

### create-audit-suppression

The following code example shows how to use create-audit-suppression.
AWS CLI

To create an audit finding suppression

The following create-audit-suppression example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```
aws iot create-audit-suppression
   --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK
   --resource-identifier
   policyVersionIdentifier={"policyName"="virtualMachinePolicy","policyVersionId"="1"}
   --no-suppress-indefinitely
   --expiration-date 2020-10-20
```

This command produces no output.

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/howto/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/create-audit-suppression.html) in *AWS CLI Command Reference*.

create-authorizer

The following code example shows how to use create-authorizer.

AWS CLI

To create a custom authorizer

The following create-authorizer example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
aws iot create-authorizer
   --authorizer-name "CustomAuthorizer"
   --token-key-name "MyAuthToken"
   --status ACTIVE
   --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----MIIBIjANBgkqhkiG9w0BAQEFAAOCQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7ENxAio9q6QD4FFqjGZsvjtyWwjo1RKK0U8Eq9xb503kRSmyIwTzwzm/f4Gf0YZUloJ+t3PUwHrmbYTAgTrC UgRBygjggVwGCps5ZAX4Eyt5cr+AIHIIUDbxS7pzwOBKPeic0asNJpqTBpkBbRaKyleJh5oo81NDHHmVtbBm5A5YiJjqYXLaVAowKzZ
```

Actions and scenarios 3675
Output:

```json
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer2"
}
```

For more information, see [CreateAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in the AWS IoT API Reference.

- For API details, see [CreateAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in AWS CLI Command Reference.

**create-billing-group**

The following code example shows how to use `create-billing-group`.

**AWS CLI**

**To create a billing group**

The following `create-billing-group` example creates a simple billing group named GroupOne.

```bash
aws iot create-billing-group \
    --billing-group-name GroupOne
```

Output:

```json
{
    "billingGroupName": "GroupOne",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see [Billing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in the AWS IoT Developers Guide.

- For API details, see [CreateBillingGroup](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in AWS CLI Command Reference.
create-certificate-from-csr

The following code example shows how to use create-certificate-from-csr.

AWS CLI

To create a device certificate from a certificate signing request (CSR)

The following create-certificate-from-csr example creates a device certificate from a CSR. You can use the openssl command to create a CSR.

```
aws iot create-certificate-from-csr \
  --certificate-signing-request=file://certificate.csr
```

Output:

```
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
  "certificateId": "c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
  "certificatePem": "<certificate-text>"
}
```

For more information, see CreateCertificateFromCSR in the AWS IoT API Reference.
- For API details, see CreateCertificateFromCsr in AWS CLI Command Reference.

create-custom-metric

The following code example shows how to use create-custom-metric.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following create-custom-metric example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \
  --metric-name "batteryPercentage" \
  --metric-type "number"
```
--display-name "Remaining battery percentage." \
--region us-east-1 \
--client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/batteryPercentage"
}
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateCustomMetric](#) in *AWS CLI Command Reference*.

**create-dimension**

The following code example shows how to use create-dimension.

**AWS CLI**

**To create a dimension**

The following `create-dimension` creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```
aws iot create-dimension \
    --name TopicFilterForAuthMessages \
    --type TOPIC_FILTER \
    --string-values device/+/*
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDimension](#) in *AWS CLI Command Reference*. 
create-domain-configuration

The following code example shows how to use create-domain-configuration.

AWS CLI

To create a domain configuration

The following create-domain-configuration example creates an AWS-managed domain configuration with a service type of DATA.

```
aws iot create-domain-configuration \
  --domain-configuration-name "additionalDataDomain" \
  --service-type "DATA"
```

Output:

```
{  
  "domainConfigurationName": "additionalDataDomain",  
  "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see CreateDomainConfiguration in AWS CLI Command Reference.

create-dynamic-thing-group

The following code example shows how to use create-dynamic-thing-group.

AWS CLI

To create a dynamic thing group

The following create-dynamic-thing-group example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \
  --thing-group-name "RoomTooWarm" \
  --query-string "attributes.temperature>60"
```
Output:

```
{
    "thingGroupName": "RoomTooWarm",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
    "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
    "indexName": "AWS_Things",
    "queryString": "attributes.temperature>60",
    "queryVersion": "2017-09-30"
}
```

For more information, see [Dynamic Thing Groups](aws-iot-developer-guide) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDynamicThingGroup](aws-cli-command-reference) in *AWS CLI Command Reference*.

### create-job

The following code example shows how to use `create-job`.

**AWS CLI**

**Example 1: To create a job**

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the MyRaspberryPi device.

```
aws iot create-job
    --job-id "example-job-01"
    --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
    --document file://example-job.json
    --description "example job test"
    --target-selection SNAPSHOT
```

Output:

```
{
    "jobId": "example-job-01",
    "description": "example job test"
}
```

**Example 2: To create a continuous job**
The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

```bash
```

Output:

```
{
  "jobId": "example-job-04",
  "description": "example continuous job"
}
```

For more information, see [Creating and Managing Jobs (CLI)] in the *AWS IoT Developer Guide*.

- For API details, see [CreateJob](https://docs.aws.amazon.com/cli/latest/reference/iot/create-job.html) in *AWS CLI Command Reference*.

### create-keys-and-certificate

The following code example shows how to use `create-keys-and-certificate`.

**AWS CLI**

**To create an RSA key pair and issue an X.509 certificate**

The following `create-keys-and-certificate` creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```bash
aws iot create-keys-and-certificate \
    --certificate-pem-outfile "myTest.cert.pem" \
    --public-key-outfile "myTest.public.key" \
    --private-key-outfile "myTest.private.key"
```

Output:

```
{
}
```
For more information, see Create and Register an AWS IoT Device Certificate in the AWS IoT Developer Guide.

- For API details, see CreateKeysAndCertificate in AWS CLI Command Reference.

create-mitigation-action

The following code example shows how to use create-mitigation-action.
AWS CLI

To create a mitigation action

The following create-mitigation-action example defines a mitigation action named AddThingsToQuarantineGroup1Action that, when applied, moves things into the thing group named QuarantineGroup1. This action overrides dynamic thing groups.

```bash
code snippet
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of params.json:

```json

```

Output:

```json

```

For more information, see CreateMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

• For API details, see CreateMitigationAction in AWS CLI Command Reference.

create-ota-update

The following code example shows how to use create-ota-update.
AWS CLI

To create an OTA update for use with Amazon FreeRTOS

The following create-ota-update example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```bash
aws iot create-ota-update \
--cli-input-json file://create-ota-update.json
```

Contents of create-ota-update.json:

```json
{
  "otaUpdateId": "ota12345",
  "description": "A critical update needed right away.",
  "targets": [
    "device1",
    "device2",
    "device3",
    "device4"
  ],
  "targetSelection": "SNAPSHOT",
  "awsJobExecutionsRolloutConfig": {
    "maximumPerMinute": 10
  },
  "files": [
    {
      "fileName": "firmware.bin",
      "fileLocation": {
        "stream": {
          "streamId": "004",
          "fileId":123
        }
      },
      "codeSigning": {
        "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
      }
    }
  ],
  "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
}
```
Output:

```json
{
    "otaUpdateId": "ota12345",
    "awsIotJobId": "job54321",
    "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see [CreateOTAUpdate](#) in the [AWS IoT API Reference](#).

- For API details, see [CreateOtaUpdate](#) in *AWS CLI Command Reference*.

**create-policy-version**

The following code example shows how to use `create-policy-version`.

**AWS CLI**

**To update a policy with a new version**

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```bash
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-document file://policy.json \
    --set-as-default
```

**Contents of policy.json:**

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "iot:UpdateCertificate",
            "Resource": "*"
        }
    ]
}
```
Output:

```json
{
  "policyVersionId": "2",
  "isDefaultVersion": true
}
```

For more information, see [AWS IoT Policies](https://aws.amazon.com/iot/) in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicyVersion](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy-version.html) in *AWS CLI Command Reference*.

### create-policy

The following code example shows how to use `create-policy`.

**AWS CLI**

**To create an AWS IoT policy**

The following `create-policy` example creates an AWS IoT policy named `TemperatureSensorPolicy`. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
  --policy-name TemperatureSensorPolicy \
  --policy-document file://policy.json
```

**Contents of policy.json:**

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["iot:Publish", "iot:Receive"],
      "Resource": [...
```
"arn:aws:iot:us-west-2:123456789012:topic/topic_2"
],
{
"Effect": "Allow",
"Action": [
  "iot:Subscribe"
],
"Resource": [
  "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
]
},
{
"Effect": "Allow",
"Action": [
  "iot:Connect"
],
"Resource": [
]
}
}

Output:

{
  "policyName": "TemperatureSensorPolicy",
  "policyDocument": "{\n    "Version": "2012-10-17",
    "Statement": [
      {\n        "Effect": "Allow",
        "Action": [\n          "iot:Publish",
          "iot:Receive"\n        ],
        "Resource": [\n          "arn:aws:iot:us-west-2:123456789012:topic/topic_1"\n        ]
      }
    ]
  }"}

"arn:aws:iot:us-west-2:123456789012:topic/topic_2"

},

{  "Effect": "Allow",
   "Action": [  "iot:Subscribe"
   ],
                    "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
   ]
},

{  "Effect": "Allow",
   "Action": [  "iot:Connect"
   ],
   ]
 }
"policyVersionId": "1"
"

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

• For API details, see CreatePolicy in AWS CLI Command Reference.

create-provisioning-claim

The following code example shows how to use create-provisioning-claim.

AWS CLI

To create a provisioning claim

The following create-provisioning-claim example creates a provisioning claim from a provisioning template.

aws iot create-provisioning-claim \

Actions and scenarios
Output:

```
{
    "certificateId": "78de02184b2ce80cf8bf709bda59e62b19fb83513590483eb0434589476ab09f",

```
For more information, see Provisioning by trusted user in the AWS IoT Core Developers Guide.
• For API details, see CreateProvisioningClaim in AWS CLI Command Reference.

create-provisioning-template-version

The following code example shows how to use create-provisioning-template-version.

AWS CLI

To create a provisioning template version

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file template.json.

```
aws iot create-provisioning-template-version \
   --template-name widget-template \
   --template-body file://template.json
```

Contents of template.json:

```json

}
create-provisioning-template

The following code example shows how to use create-provisioning-template.

AWS CLI

To create a provisioning template

The following create-provisioning-template example creates a provisioning template as defined by the file template.json.

```
aws iot create-provisioning-template \
    --template-name widget-template \
    --description "A provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
    --template-body file://template.json
```

Contents of template.json:

```
{
    "Parameters" : {
      "DeviceLocation": {
        "Type": "String"
      },
    },
    "Mappings": {
```

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.
- For API details, see CreateProvisioningTemplateVersion in AWS CLI Command Reference.
"LocationTable": {
  "Seattle": {
    "LocationUrl": "https://example.aws"
  }
},
"Resources": {
  "thing": {
    "Type": "AWS::IoT::Thing",
    "Properties": {
      "AttributePayload": {
        "version": "v1",
        "serialNumber": "serialNumber"
      },
      "ThingName": "\"Fn::Join\"[\"",[\"ThingPrefix\", {
      "Ref": "SerialNumber\"]\"]\",
      "ThingTypeName": "\"Fn::Join\"[\"",[\"ThingTypePrefix\", {

        ]
      }
    }
  }
}

Output:

```
{
  "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
  "templateName": "widget-template",
  "defaultVersionId": 1
}
```

For more information, see [AWS IoT Secure Tunneling](https://aws.amazon.com/iot/) in the [AWS IoT Core Developer Guide](https://aws.amazon.com/iot/).

- For API details, see [CreateProvisioningTemplate](https://aws.amazon.com/iot/) in [AWS CLI Command Reference](https://aws.amazon.com/iot/).

### create-role-alias

The following code example shows how to use `create-role-alias`.

**AWS CLI**

**To create a role alias**

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```
aws iot create-role-alias \
  --role-alias LightBulbRole \
  --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:
For more information, see CreateRoleAlias in the AWS IoT API Reference.

- For API details, see CreateRoleAlias in AWS CLI Command Reference.

create-scheduled-audit

The following code example shows how to use create-scheduled-audit.

AWS CLI

To create a scheduled audit

The following create-scheduled-audit example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
   --scheduled-audit-name WednesdayCertCheck \
   --frequency WEEKLY \
   --day-of-week WED \
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK \
   DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
   "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/\n   WednesdayCertCheck"
}
```

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see CreateScheduledAudit in AWS CLI Command Reference.

create-security-profile

The following code example shows how to use create-security-profile.
AWS CLI

To create a security profile

The following create-security-profile example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```bash
aws iot create-security-profile \
  --security-profile-name PossibleIssue \
  --security-profile-description "Check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128" \
  --behaviors "[{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"less-than","value":{"count":10},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}]"
```

Output:

```json
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue"
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see CreateSecurityProfile in AWS CLI Command Reference.

create-stream

The following code example shows how to use create-stream.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following create-stream example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.
aws iot create-stream \
  --cli-input-json file://create-stream.json

Contents of create-stream.json:

```json
{
  "streamId": "stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "files": [
    {
      "fileId": 123,
      "s3Location": {
        "bucket": "codesign-ota-bucket",
        "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
      }
    }
  ],
  "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```json
{
  "streamId": "stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "streamVersion": "1"
}
```

For more information, see [CreateStream](https://docs.aws.amazon.com/iot/latest/apireference/ev-create-stream.html) in the *AWS IoT API Reference*.  
- For API details, see [CreateStream](https://docs.aws.amazon.com/cli/latest/reference/iot/create-stream.html) in *AWS CLI Command Reference*.  

**create-thing-group**

The following code example shows how to use create-thing-group.

**AWS CLI**

**Example 1: To create a thing group**
The following create-thing-group example creates a thing group named LightBulbs with a description and two attributes.

```bash
aws iot create-thing-group \
   --thing-group-name LightBulbs \
   --thing-group-properties "thingGroupDescription="Generic bulb group",
   attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```json
{
   "thingGroupName": "LightBulbs",
   "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
   "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"
}
```

**Example 2: To create a thing group that's part of a parent group**

The following create-thing-group creates a thing group named HalogenBulbs that has a parent thing group named LightBulbs.

```bash
aws iot create-thing-group \
   --thing-group-name HalogenBulbs \
   --parent-group-name LightBulbs
```

Output:

```json
{
   "thingGroupName": "HalogenBulbs",
   "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-group.html) in *AWS CLI Command Reference*.

**create-thing-type**

The following code example shows how to use create-thing-type.
AWS CLI

To define a thing type

The following create-thing-type example defines a thing type and associated attributes.

```bash
aws iot create-thing-type \
   --thing-type-name "LightBulb" \
   --thing-type-properties "thingTypeDescription=light bulb type, searchableAttributes=wattage,model"
```

Output:

```
{
   "thingTypeName": "LightBulb",
   "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
   "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"
}
```

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thingtypes.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingType](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-type.html) in *AWS CLI Command Reference*.

create-thing

The following code example shows how to use create-thing.

**Example 1: To create a thing record in the registry**

The following create-thing example creates an entry for a device in the AWS IoT thing registry.

```bash
aws iot create-thing \
   --thing-name SampleIoTThing
```

Output:

```
{
   "thingName": "SampleIoTThing",
   ...
}
```
Example 2: To define a thing that is associated with a thing type

The following `create-thing` example create a thing that has the specified thing type and its attributes.

```bash
aws iot create-thing \
   --thing-name "MyLightBulb" \
   --thing-type-name "LightBulb" \
   --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

Output:

```json
{
   "thingName": "MyLightBulb",
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
   "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/how-to-manage-things.html) and [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-type.html) in the *AWS IoT Developers Guide*.

- For API details, see CreateThing in *AWS CLI Command Reference*.

### create-topic-rule-destination

The following code example shows how to use `create-topic-rule-destination`.

**AWS CLI**

**To create a topic rule destination**

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```bash
aws iot create-topic-rule-destination \
   --destination-configuration httpUrlConfiguration={confirmationUrl=https://example.com}
```
Output:

```json
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see Creating a topic rule destination in the AWS IoT Developer Guide.

- For API details, see CreateTopicRuleDestination in AWS CLI Command Reference.

**create-topic-rule**

The following code example shows how to use `create-topic-rule`.

**AWS CLI**

**To create a rule that sends an Amazon SNS alert**

The following create-topic-rule example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule
   --rule-name "LowMoistureRule"
   --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```json
{
    "sql": "SELECT * FROM '${aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'\n",
    "description": "Sends an alert whenever soil moisture level readings are too low.",
    "ruleDisabled": false,
}```
This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developers Guide.

- For API details, see CreateTopicRule in AWS CLI Command Reference.

**delete-account-audit-configuration**

The following code example shows how to use delete-account-audit-configuration.

**AWS CLI**

**To disable all audit checks for your AWS account**

The following delete-account-audit-configuration example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. Use this command with caution.

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteAccountAuditConfiguration in AWS CLI Command Reference.

**delete-audit-suppression**

The following code example shows how to use delete-audit-suppression.
To delete an audit finding suppression

The following delete-audit-suppression example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```bash
aws iot delete-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.

- For API details, see DeleteAuditSuppression in AWS CLI Command Reference.

delete-authorizer

The following code example shows how to use delete-authorizer.

AWS CLI

To delete a custom authorizer

The following delete-authorizer example deletes the authorizer named CustomAuthorizer. A custom authorizer must be in the INACTIVE state before you can delete it.

```bash
aws iot delete-authorizer \
    --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see DeleteAuthorizer in the AWS IoT Developer Guide.

- For API details, see DeleteAuthorizer in AWS CLI Command Reference.

delete-billing-group

The following code example shows how to use delete-billing-group.
AWS CLI

To delete a billing group

The following delete-billing-group example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \\
   --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see Billing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteBillingGroup in AWS CLI Command Reference.

delete-ca-certificate

The following code example shows how to use delete-ca-certificate.

AWS CLI

To delete a CA certificate

The following delete-ca-certificate example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \\
   --certificate-id \\
   f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the AWS IoT API Reference.
- For API details, see DeleteCaCertificate in AWS CLI Command Reference.

delete-certificate

The following code example shows how to use delete-certificate.
AWS CLI

To delete a device certificate

The following delete-certificate example deletes the device certificate with the specified ID.

```bash
aws iot delete-certificate \
  --certificate-id \
  c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9
```

This command produces no output.

For more information, see `DeleteCertificate` in the *AWS IoT API Reference*.

- For API details, see `DeleteCertificate` in *AWS CLI Command Reference*.

delete-custom-metric

The following code example shows how to use delete-custom-metric.

AWS CLI

To delete a custom metric

The following delete-custom-metric example deletes a custom metric.

```bash
aws iot delete-custom-metric \
  --metric-name batteryPercentage \
  --region us-east-1
```

Output:

```
HTTP 200
```

For more information, see `Custom metrics` in the *AWS IoT Core Developer Guide*.

- For API details, see `DeleteCustomMetric` in *AWS CLI Command Reference*.

delete-dimension

The following code example shows how to use delete-dimension.
AWS CLI

To delete a dimension

The following delete-dimension example deletes a dimension called TopicFilterForAuthMessages.

```
aws iot delete-dimension \
   --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DeleteDimension in AWS CLI Command Reference.

delete-domain-configuration

The following code example shows how to use delete-domain-configuration.

AWS CLI

To delete a domain configuration

The following delete-domain-configuration example deletes a domain configuration named additionalDataDomain from your AWS account.

```
aws iot delete-domain-configuration \
   --domain-configuration-name "additionalDataDomain" \
   --domain-configuration-status "OK"
```

This command produces no output.

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see DeleteDomainConfiguration in AWS CLI Command Reference.

delete-dynamic-thing-group

The following code example shows how to use delete-dynamic-thing-group.
AWS CLI

To delete a dynamic thing group

The following `delete-dynamic-thing-group` example deletes the specified dynamic thing group.

```
aws iot delete-dynamic-thing-group \\
    --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteDynamicThingGroup in AWS CLI Command Reference.

delete-job-execution

The following code example shows how to use `delete-job-execution`.

AWS CLI

To delete a job execution

The following `delete-job-execution` example deletes the job execution of the specified job on a device. Use `describe-job-execution` to get the execution number.

```
aws iot delete-job-execution \\
    --job-id "example-job-02" \\
    --thing-name "MyRaspberryPi" \\
    --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
- For API details, see DeleteJobExecution in AWS CLI Command Reference.

delete-job

The following code example shows how to use `delete-job`.
AWS CLI

To delete a job

The following delete-job example deletes the specified job. By specifying the --force option, the job is deleted even if the status is IN_PROGRESS.

```bash
aws iot delete-job \
  --job-id "example-job-04" \
  --force
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DeleteJob in AWS CLI Command Reference.

delete-mitigation-action

The following code example shows how to use delete-mitigation-action.

AWS CLI

To delete a mitigation action

The following delete-mitigation-action example deletes the specified mitigation action.

```bash
aws iot delete-mitigation-action \
  --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see DeleteMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see DeleteMitigationAction in AWS CLI Command Reference.

delete-ota-update

The following code example shows how to use delete-ota-update.
AWS CLI

To delete an OTA update

The following delete-ota-update example deletes the specified OTA update.

```bash
aws iot delete-ota-update \\  --ota-update-id ota12345 \\  --delete-stream \\  --force-delete-aws-job
```

This command produces no output.

For more information, see [DeleteOTAUpdate](https://docs.aws.amazon.com/iot/latest/developerguide/ota-update.html) in the *AWS IoT API Reference*.

- For API details, see [DeleteOtaUpdate](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-ota-update.html) in *AWS CLI Command Reference*.

**delete-policy-version**

The following code example shows how to use delete-policy-version.

AWS CLI

To delete a version of policy

The following delete-policy-version example deletes version 2 of the specified policy from your AWS account.

```bash
aws iot delete-policy-version \\  --policy-name UpdateDeviceCertPolicy \\  --policy-version-id 2
```

This command produces no output.

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/iot-policies.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeletePolicyVersion](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-policy-version.html) in *AWS CLI Command Reference*.

**delete-policy**

The following code example shows how to use delete-policy.
AWS CLI

To delete a policy

The following delete-policy example deletes the specified policy from your AWS account.

```bash
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.
- For API details, see DeletePolicy in AWS CLI Command Reference.

delete-provisioning-template-version

The following code example shows how to use delete-provisioning-template-version.

AWS CLI

To delete a provisioning template version

The following delete-provisioning-template-version example deletes version 2 of the specified provisioning template.

```bash
aws iot delete-provisioning-template-version \
  --version-id 2 \
  --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.
- For API details, see DeleteProvisioningTemplateVersion in AWS CLI Command Reference.

delete-provisioning-template

The following code example shows how to use delete-provisioning-template.

AWS CLI

To delete a provisioning template

Actions and scenarios
The following delete-provisioning-template example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
   --template-name widget-template
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/core/latest/developerguide/secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplate](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-provisioning-template.html) in *AWS CLI Command Reference*.

### delete-registration-code

The following code example shows how to use delete-registration-code.

**AWS CLI**

**To delete your registration cod**

The following delete-registration-code example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see [Use Your Own Certificate](https://docs.aws.amazon.com/iot/core/latest/developerguide/secure-certificates.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteRegistrationCode](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-registration-code.html) in *AWS CLI Command Reference*.

### delete-role-alias

The following code example shows how to use delete-role-alias.

**AWS CLI**

**To delete an AWS IoT role alias**

The following delete-role-alias example deletes an AWS IoT role alias named LightBulbRole.

```
aws iot delete-role-alias \
```

--role-alias LightBulbRole

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the AWS IoT Developer Guide.

- For API details, see DeleteRoleAlias in AWS CLI Command Reference.

delete-scheduled-audit

The following code example shows how to use delete-scheduled-audit.

AWS CLI

To delete a scheduled audit

The following delete-scheduled-audit example deletes the AWS IoT Device Defender scheduled audit named AWSIoTDeviceDefenderDailyAudit.

```sh
aws iot delete-scheduled-audit \
   --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteScheduledAudit in AWS CLI Command Reference.

delete-security-profile

The following code example shows how to use delete-security-profile.

AWS CLI

To delete a security profile

The following delete-security-profile example deletes a security profile named PossibleIssue.

```sh
aws iot delete-security-profile \
   --security-profile-name PossibleIssue
```
This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DeleteSecurityProfile in AWS CLI Command Reference.

**delete-stream**

The following code example shows how to use delete-stream.

**AWS CLI**

**To delete a stream**

The following delete-stream example deletes the specified stream.

```
aws iot delete-stream
    --stream-id stream12345
```

This command produces no output.

For more information, see DeleteStream in the AWS IoT API Reference.

- For API details, see DeleteStream in AWS CLI Command Reference.

**delete-thing-group**

The following code example shows how to use delete-thing-group.

**AWS CLI**

**To delete a thing group**

The following delete-thing-group example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group
    --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see DeleteThingGroup in AWS CLI Command Reference.
delete-thing-type

The following code example shows how to use delete-thing-type.

AWS CLI

Example 1: To delete a thing type

The following delete-thing-type example deletes a deprecated thing type.

```bash
aws iot delete-thing-type \
  --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingType](#) in *AWS CLI Command Reference*.

delete-thing

The following code example shows how to use delete-thing.

AWS CLI

To display detailed information about a thing

The following delete-thing example deletes a thing from the AWS IoT registry for your AWS account.

```bash
aws iot delete-thing --thing-name "FourthBulb"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThing](#) in *AWS CLI Command Reference*.

delete-topic-rule-destination

The following code example shows how to use delete-topic-rule-destination.
AWS CLI

To delete a topic rule destination

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```bash
aws iot delete-topic-rule-destination \
--arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see [Deleting a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/deleting-topic-rule-destination) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule-destination.html) in *AWS CLI Command Reference*.

**delete-topic-rule**

The following code example shows how to use `delete-topic-rule`.

AWS CLI

To delete a rule

The following `delete-topic-rule` example deletes the specified rule.

```bash
aws iot delete-topic-rule \
--rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see [Deleting a Rule](https://docs.aws.amazon.com/iot/latest/developerguide/deleting-rule.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteTopicRule](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule.html) in *AWS CLI Command Reference*.

**delete-v2-logging-level**

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

To delete the logging level for a thing group
The following delete-v2-logging-level example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
    --target-type THING_GROUP \
    --target-name LightBulbs
```

This command produces no output.

- For API details, see `DeleteV2LoggingLevel` in *AWS CLI Command Reference*.

**deprecate-thing-type**

The following code example shows how to use deprecate-thing-type.

**AWS CLI**

**Example 1: To deprecate a thing type**

The following deprecate-thing-type example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

**Example 2: To reverse the deprecation of a thing type**

The following deprecate-thing-type example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType" \
    --undo-deprecate
```

This command produces no output.

For more information, see `Thing Types` in the *AWS IoT Developers Guide*.

- For API details, see `DeprecateThingType` in *AWS CLI Command Reference*.
describe-account-audit-configuration

The following code example shows how to use `describe-account-audit-configuration`.

**AWS CLI**

**To view current audit configuration settings**

The following `describe-account-audit-configuration` example lists the current settings for your AWS IoT Device Defender audit configuration.

```bash/aws iot describe-account-audit-configuration
```

**Output:**

```json
{
   "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit_1551201085996",
   "auditNotificationTargetConfigurations": {
      "SNS": {
         "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit",
         "enabled": true
      }
   },
   "auditCheckConfigurations": {
      "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
         "enabled": true
      },
      "CA_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "CONFLICTING_CLIENT_IDS_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_SHARED_CHECK": {
         "enabled": true
      },
      "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```

Actions and scenarios 3718
The following code example shows how to use `describe-audit-finding`.

**AWS CLI**

**To list details for an audit finding**

The following `describe-audit-finding` example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the `list-audit-findings` command to get a list of the findings from an audit to get the `findingId`.

```
aws iot describe-audit-finding \
   --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

**Output:**

```
{
   "finding": {
      "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
   }
}
```
For more information, see Check Audit Results (Audit Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeAuditFinding in AWS CLI Command Reference.

describe-audit-mitigation-actions-task

The following code example shows how to use describe-audit-mitigation-actions-task.

AWS CLI

To show the details of an audit mitigation actions task

The following describe-audit-mitigation-actions-task example shows the details for the specified task, where the ResetPolicyVersionAction was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```
aws iot describe-audit-mitigation-actions-task \
   --task-id ResetPolicyTask01
```
For more information, see [DescribeAuditMitigationActionsTask (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/audit-action-commands.html) in the [AWS IoT Developer Guide](https).

- For API details, see [DescribeAuditMitigationActionsTask](https://docs.aws.amazon.com/cli/latest/reference/iot/audit-mitigation-actionstask.html) in [AWS CLI Command Reference](https).
describe-audit-suppression

The following code example shows how to use describe-audit-suppression.

AWS CLI

To get details about an audit finding suppression

The following describe-audit-suppression example lists details about an audit finding suppression.

```bash
aws iot describe-audit-task \
    --task-id "787ed873b69cb4d6c6d9ae6ddd06996c5"
```

Output:

```json
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see [Audit finding suppressions](https://aws.amazon.com/iot-developer-guide) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeAuditSuppression](https://aws.amazon.com/cli-command-reference) in *AWS CLI Command Reference*. 
describe-audit-task

The following code example shows how to use describe-audit-task.

AWS CLI

To get information about an audit instance

The following describe-audit-task example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```bash
aws iot describe-audit-task \
   --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```json
{
   "taskStatus": "COMPLETED",
   "taskType": "ON_DEMAND_AUDIT_TASK",
   "taskStartTime": 1560356923.434,
   "taskStatistics": {
      "totalChecks": 3,
      "inProgressChecks": 0,
      "waitingForDataCollectionChecks": 0,
      "compliantChecks": 3,
      "nonCompliantChecks": 0,
      "failedChecks": 0,
      "canceledChecks": 0
   },
   "auditDetails": {
      "CA_CERTIFICATE_EXPIRING_CHECK": {
         "checkRunStatus": "COMPLETED_COMPLIANT",
         "checkCompliant": true,
         "totalResourcesCount": 0,
         "nonCompliantResourcesCount": 0
      },
      "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
         "checkRunStatus": "COMPLETED_COMPLIANT",
         "checkCompliant": true,
         "totalResourcesCount": 6,
         "nonCompliantResourcesCount": 0
      }
   }
}
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAuditTask in AWS CLI Command Reference.

**describe-authorizer**

The following code example shows how to use describe-authorizer.

**AWS CLI**

To get information about a custom authorizer

The following describe-authorizer example displays details for the specified custom authorizer.

```bash
aws iot describe-authorizer
  --authorizer-name CustomAuthorizer
```

Output:

```json
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "tokenKeyName": "MyAuthToken",
        "tokenSigningPublicKeys": {
            "FIRST_KEY": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZjIwoZ+7ENxAo9q6QD4FFqjGZsvjtYwjoe1RKK0U8Eq9xb503kRSmyIwTzwzm/f4Gf0Y
\n```

Actions and scenarios 3724
For more information, see [DescribeAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/CreateAuthorizer.html) in the AWS IoT API Reference.

- For API details, see [DescribeAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/CreateAuthorizer.html) in AWS CLI Command Reference.

**describe-billing-group**

The following code example shows how to use `describe-billing-group`.

**AWS CLI**

To get information about a billing group

The following `describe-billing-group` example gets information for the specified billing group.

```bash
aws iot describe-billing-group --billing-group-name GroupOne
```

Output:

```json
{
    "billingGroupName": "GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "version": 1,
    "billingGroupProperties": {},
    "billingGroupMetadata": {
        "creationDate": 1560199355.378
    }
}
```
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeBillingGroup in AWS CLI Command Reference.

describe-ca-certificate

The following code example shows how to use describe-ca-certificate.

AWS CLI

To get details about a CA certificate

The following describe-ca-certificate example displays the details for the specified CA certificate.

```aws
aws iot describe-ca-certificate
   --certificate-id
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```json
{
   "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
   "status": "INACTIVE",
   "certificatePem": "-----BEGIN CERTIFICATE-----

-----END CERTIFICATE-----
```

Actions and scenarios
The following code example shows how to use `describe-certificate`.

**AWS CLI**

To get information about a certificate

The following `describe-certificate` example displays the details for the specified certificate.

```
aws iot describe-certificate \
 --certificate-id \
 "4f0ba725787a94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

Output:

```
{
   "certificateDescription": {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787a94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",

For more information, see DescribeCertificate in the AWS IoT API Reference.

- For API details, see DescribeCertificate in AWS CLI Command Reference.

describe-custom-metric

The following code example shows how to use describe-custom-metric.

AWS CLI

To get information about a Device Defender custom metric

The following describe-custom-metric example gets information about a custom metric named myCustomMetric.
aws iot describe-custom-metric \
   --metric-name myCustomMetric

Output:

```
{
   "metricName": "myCustomMetric",
   "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
   "metricType": "number",
   "displayName": "My custom metric",
   "creationDate": 2020-11-17T23:02:12.879000-09:00,
   "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.  
For API details, see DescribeCustomMetric in AWS CLI Command Reference.

describe-default-authorizer

The following code example shows how to use describe-default-authorizer.

AWS CLI

**To get information about the default custom authorizer**

The following describe-default-authorizer example displays details for the default custom authorizer.

aws iot describe-default-authorizer

Output:

```
{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the AWS IoT API Reference.  
For API details, see DescribeDefaultAuthorizer in AWS CLI Command Reference.
describe-dimension

The following code example shows how to use describe-dimension.

AWS CLI

To get information about a dimension

The following describe-dimension example gets information about a dimension named TopicFilterForAuthMessages.

```
aws iot describe-dimension \
   --name TopicFilterForAuthMessages
```

Output:

```
{
   "name": "TopicFilterForAuthMessages",
   "type": "TOPIC_FILTER",
   "stringValues": [
      "device/+/auth"
   ],
   "creationDate": 1578620223.255,
   "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeDimension in AWS CLI Command Reference.

describe-domain-configuration

The following code example shows how to use describe-domain-configuration.

AWS CLI

To describe a domain configuration

The following describe-domain-configuration example displays details about the specified domain configuration.
aws iot describe-domain-configuration \\
   --domain-configuration-name "additionalDataDomain"

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see DescribeDomainConfiguration in AWS CLI Command Reference.

describe-endpoint

The following code example shows how to use describe-endpoint.

AWS CLI

Example 1: To get your current AWS endpoint

The following describe-endpoint example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{
    "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the AWS IoT Developer Guide.
Example 2: To get your ATS endpoint

The following describe-endpoint example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \
    --endpoint-type iot:Data-ATS
```

Output:

```
{
    "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see X.509 Certificates and AWS IoT in the AWS IoT Developer Guide.

For API details, see DescribeEndpoint in AWS CLI Command Reference.

describe-event-configurations

The following code example shows how to use describe-event-configurations.

AWS CLI

To show which event types are published

The following describe-event-configurations example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```
aws iot describe-event-configurations
```

Output:

```
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
            "Enabled": false
        }
    }
}
```
"JOB": {
    "Enabled": false
},
"JOB_EXECUTION": {
    "Enabled": false
},
"POLICY": {
    "Enabled": false
},
"THING": {
    "Enabled": false
},
"THING_GROUP": {
    "Enabled": false
},
"THING_GROUP_HIERARCHY": {
    "Enabled": false
},
"THING_GROUP_MEMBERSHIP": {
    "Enabled": false
},
"THING_TYPE": {
    "Enabled": false
},
"THING_TYPE_ASSOCIATION": {
    "Enabled": false
}
}

For more information, see [Event Messages](#) in the [AWS IoT Developer Guide](#).

- For API details, see [DescribeEventConfigurations](#) in [AWS CLI Command Reference](#).

describe-index

The following code example shows how to use describe-index.

**AWS CLI**

To retrieve the current status of the thing index

The following describe-index example retrieves the current status of the thing index.
aws iot describe-index \
   --index-name "AWS_Things"

Output:

{
   "indexName": "AWS_Things",
   "indexStatus": "ACTIVE",
   "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}

For more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

- For API details, see DescribeIndex in AWS CLI Command Reference.

**describe-job-execution**

The following code example shows how to use describe-job-execution.

**AWS CLI**

**To get execution details for a job on a device**

The following describe-job-execution example gets execution details for the specified job.

aws iot describe-job-execution \
   --job-id "example-job-01" \
   --thing-name "MyRaspberryPi"

Output:

{
   "execution": {
      "jobId": "example-job-01",
      "status": "QUEUED",
      "statusDetails": {},
      "queuedAt": 1560787023.636,
      "lastUpdatedAt": 1560787023.636,
      "executionNumber": 1,
      "versionNumber": 1
   }
}
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJobExecution in AWS CLI Command Reference.

**describe-job**

The following code example shows how to use describe-job.

**AWS CLI**

**To get detailed status for a job**

The following describe-job example gets detailed status for the job whose ID is example-job-01.

```bash
aws iot describe-job \
   --job-id "example-job-01"
```

**Output:**

```json
{
   "job": {
      "jobId": "example-job-01",
      "targetSelection": "SNAPSHOT",
      "status": "IN_PROGRESS",
      "targets": [
      ],
      "description": "example job test",
      "presignedUrlConfig": {},
      "jobExecutionsRolloutConfig": {},
      "createdAt": 1560787022.733,
      "lastUpdatedAt": 1560787026.294,
      "jobProcessDetails": {
         "numberOfCanceledThings": 0,
         "numberOfSucceededThings": 0,
         "numberOfFailedThings": 0,
         "numberOfRejectedThings": 0,
         "numberOfQueuedThings": 1,
```

```json
```
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

• For API details, see DescribeJob in AWS CLI Command Reference.

describe-mitigation-action

The following code example shows how to use describe-mitigation-action.

AWS CLI

To view the details for a defined mitigation action

The following describe-mitigation-action example displays details for the specified mitigation action.

```bash
aws iot describe-mitigation-action \
    --action-name AddThingsToQuarantineGroupAction
```

Output:

```
{
    "actionName": "AddThingsToQuarantineGroupAction",
    "actionType": "ADD_THINGS_TO_THING_GROUP",
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    }
}
```
For more information, see DescribeMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeMitigationAction in AWS CLI Command Reference.

**describe-provisioning-template-version**

The following code example shows how to use describe-provisioning-template-version.

**AWS CLI**

**To describe a provisioning template version**

The following describe-provisioning-template-version example describes a provisioning template version.

```bash
aws iot describe-provisioning-template-version \
  --template-name MyTestProvisioningTemplate \
  --version-id 1
```

**Output:**

```json
{
  "versionId": 1,
  "creationDate": 1589308310.574,
  "templateBody": {
    "Parameters": {
      "SerialNumber": {
        "Type": "String"
      },
      "AWS::IoT::Certificate::Id": {
        "Type": "String"
      }
    },
    "Resources": {
      "certificate": {
        "Properties": {
```
For more information, see Provisioning devices that don’t have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplateVersion in AWS CLI Command Reference.
describe-provisioning-template

The following code example shows how to use describe-provisioning-template.

AWS CLI

To describe a provisioning template

The following describe-provisioning-template example describes a provisioning template.

```
aws iot describe-provisioning-template \
    --template-name MyTestProvisioningTemplate
```

Output:

```json
{
    "templateName": "MyTestProvisioningTemplate",
    "creationDate": 1589308310.574,
    "lastModifiedDate": 1589308345.539,
    "defaultVersionId": 1,
    "templateBody": "{
        "Parameters": {
            "SerialNumber": {
                "Type": "String"
            },
            "AWS::IoT::Certificate::Id": {
                "Type": "String"
            }
        },
        "Resources": {
            "certificate": {
                "Properties": {
                    "CertificateId": {
                        "Ref": "AWS::IoT::Certificate::Id"
                    },
                    "Status": "Active"
                },
                "Type": "AWS::IoT::Certificate"
            },
            "policy": {
```

Actions and scenarios 3739
For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplate in AWS CLI Command Reference.

describe-role-alias

The following code example shows how to use describe-role-alias.
AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```bash
aws iot describe-role-alias \
    --role-alias LightBulbRole
```

Output:

```
{
    "roleAliasDescription": {
        "roleAlias": "LightBulbRole",
        "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole",
        "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
        "owner": "123456789012",
        "credentialDurationSeconds": 3600,
        "creationDate": 1570558643.221,
        "lastModifiedDate": 1570558643.221
    }
}
```

For more information, see [DescribeRoleAlias](https://docs.aws.amazon.com/iot/latest/developerguide/iot-api-reference-iot-service.html) in the *AWS IoT API Reference*.

- For API details, see [DescribeRoleAlias](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-role-alias.html) in *AWS CLI Command Reference*.

**describe-scheduled-audit**

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```bash
aws iot describe-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeScheduledAudit in AWS CLI Command Reference.

describe-security-profile

The following code example shows how to use describe-security-profile.

AWS CLI

To get information about a security profile

The following describe-security-profile example gets information about the AWS IoT Device Defender security profile named PossibleIssue.

```
aws iot describe-security-profile
  --security-profile-name PossibleIssue
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
```
```json
{
    "name": "CellularBandwidth",
    "metric": "aws:message-byte-size",
    "criteria": {
        "comparisonOperator": "greater-than",
        "value": {
            "count": 128
        },
        "consecutiveDatapointsToAlarm": 1,
        "consecutiveDatapointsToClear": 1
    }
},
{
    "name": "Authorization",
    "metric": "aws:num-authorization-failures",
    "criteria": {
        "comparisonOperator": "greater-than",
        "value": {
            "count": 10
        },
        "durationSeconds": 300,
        "consecutiveDatapointsToAlarm": 1,
        "consecutiveDatapointsToClear": 1
    }
}
]
"version": 1,
"creationDate": 1560278102.528,
"lastModifiedDate": 1560278102.528
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeSecurityProfile in AWS CLI Command Reference.

describe-stream

The following code example shows how to use describe-stream.

**AWS CLI**

To get information about a stream

The following describe-stream example displays the details about the specified stream.
aws iot describe-stream \
   --stream-id stream12345

Output:

```
{
   "streamInfo": {
      "streamId": "stream12345",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
      "files": [
         {
            "fileId": "123",
            "s3Location": {
               "bucket": "codesign-ota-bucket",
               "key": "48c67f5c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
         }
      ],
      "createdAt": 1557863215.995,
      "lastUpdatedAt": 1557863215.995,
      "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
   }
}
```

For more information, see `DescribeStream` in the `AWS IoT API Reference`.

- For API details, see `DescribeStream` in `AWS CLI Command Reference`.

### describe-thing-group

The following code example shows how to use `describe-thing-group`.

#### AWS CLI

**To get information about a thing group**

The following `describe-thing-group` example gets information about the thing group named HalogenBulbs.

```
aws iot describe-thing-group \
```
--thing-group-name HalogenBulbs

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
    "version": 1,
    "thingGroupProperties": {},
    "thingGroupMetadata": {
        "parentGroupName": "LightBulbs",
        "rootToParentThingGroups": [
            {
                "groupName": "LightBulbs",
                "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
            }
        ],
        "creationDate": 1559927609.897
    }
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeThingGroup in AWS CLI Command Reference.

**describe-thing-type**

The following code example shows how to use describe-thing-type.

**AWS CLI**

To get information about a thing type

The following describe-thing-type example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
    --thing-type-name "LightBulb"
```

Output:
For more information, see Thing Types in the AWS IoT Developers Guide.

- For API details, see DescribeThingType in AWS CLI Command Reference.

describe-thing

The following code example shows how to use describe-thing.

AWS CLI

To display detailed information about a thing

The following describe-thing example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```json
{
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
```

\"model\": \"123\",
    \"wattage\": \"75\"
},
\"version\": 1
}

For more information, see How to Manage Things with the Registry in the AWS IoT Developers Guide.

- For API details, see DescribeThing in AWS CLI Command Reference.

**detach-policy**

The following code example shows how to use detach-policy.

**AWS CLI**

**Example 1: To detach an AWS IoT policy from a thing group**

The following detach-policy example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

/aws/iot detach-policy \
    --target \"arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs\" \
    --policy-name \"MyFirstGroup_Core-policy\""

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

**Example 2: To detach an AWS IoT policy from a device certificate**

The following detach-policy example detaches the TemperatureSensorPolicy policy from a device certificate identified by ARN.

/aws/iot detach-policy \
    --policy-name TemperatureSensorPolicy \
    --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142

This command produces no output.

- For API details, see DetachPolicy in AWS CLI Command Reference.
**detach-security-profile**

The following code example shows how to use `detach-security-profile`.

**AWS CLI**

*To disassociate a security profile from a target*

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named Testprofile and the all registered things target.

```bash
aws iot detach-security-profile \
    --security-profile-name Testprofile \
```

This command produces no output.

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [DetachSecurityProfile](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-security-profile.html) in *AWS CLI Command Reference*.

**detach-thing-principal**

The following code example shows how to use `detach-thing-principal`.

**AWS CLI**

*To detach a certificate/principal from a thing*

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```bash
aws iot detach-thing-principal \
    --thing-name "MyLightBulb" \
    --principal "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/thing-registry.html) in the *AWS IoT Developers Guide*.
For API details, see `DetachThingPrincipal` in *AWS CLI Command Reference*.

**disable-topic-rule**

The following code example shows how to use `disable-topic-rule`.

**AWS CLI**

**To disable a topic rule**

The following `disable-topic-rule` example disables the specified topic rule.

```bash
aws iot disable-topic-rule \
   --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see `Viewing Your Rules` in the *AWS IoT Developer Guide*.

• For API details, see `DisableTopicRule` in *AWS CLI Command Reference*.

**enable-topic-rule**

The following code example shows how to use `enable-topic-rule`.

**AWS CLI**

**To enable a topic rule**

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```bash
aws iot enable-topic-rule \
   --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see `Viewing Your Rules` in the *AWS IoT Developer Guide*.

• For API details, see `EnableTopicRule` in *AWS CLI Command Reference*.

**get-behavior-model-training-summaries**

The following code example shows how to use `get-behavior-model-training-summaries`.

Actions and scenarios
AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```bash
aws iot get-behavior-model-training-summaries \
    --security-profile-name MySecuirtyProfileName
```

Output:

```json
{
    "summaries": [
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_sent_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_received_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Authorization_failures_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Message_size_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Connection_attempts_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        }
    ]
}
```
get-cardinality

The following code example shows how to use get-cardinality.

AWS CLI

To return the approximate count of unique values that match the query

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload attributes="{"temperature":${Temperatures[i]},rackId=${Racks[i]},stateNormal=${IsNormal[i]}"")
    aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
```
The following get-cardinality example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```bash
aws iot get-cardinality \
   --aggregation-field "attributes.rackId" \
   --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
   "cardinality": 2
}
```

For more information, see Querying for Aggregate Data<https://docs.aws.amazon.com/iot/latest/developerguide/index Aggregate.html> in the AWS IoT Developer Guide.

- For API details, see GetCardinality in AWS CLI Command Reference.

**get-effective-policies**

The following code example shows how to use get-effective-policies.

**AWS CLI**

**To list the policies that effect a thing**

The following get-effective-policies example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.
```bash
aws iot get-effective-policies 
--thing-name TemperatureSensor-001 
--principal arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b1b3caaae57b7272ba44c45e3448142
```

Output:

```json
{
    "effectivePolicies": [
        {
            "policyName": "TemperatureSensorPolicy",
```
For more information, see Get Effective Policies for a Thing in the AWS IoT Developers Guide.

- For API details, see GetEffectivePolicies in AWS CLI Command Reference.

**get-indexing-configuration**

The following code example shows how to use get-indexing-configuration.

**AWS CLI**

To get the thing indexing configuration

The following get-indexing-configuration example gets the current configuration data for AWS IoT fleet indexing.

```bash
aws iot get-indexing-configuration
```

Output:

```json
{
   "thingIndexingConfiguration": {
      "thingIndexingMode": "OFF",
      "thingConnectivityIndexingMode": "OFF"
   },
   "thingGroupIndexingConfiguration": {
      "thingGroupIndexingMode": "OFF"
   }
}
```

For more information, see Managing Thing Indexing in the AWS IoT Developers Guide.
get-job-document

The following code example shows how to use get-job-document.

AWS CLI

To retrieve the document for a job

The following get-job-document example displays details about the document for the job whose ID is example-job-01.

```
aws iot get-job-document \
   --job-id "example-job-01"
```

Output:

```
{
   "document": "\n   \"operation\":\"customJob\",\n   \"otherInfo\":\n   \"someValue\"\n}\n```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

get-logging-options

The following code example shows how to use get-logging-options.

AWS CLI

To get the logging options

The following get-logging-options example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```
For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see [GetLoggingOptions](#) in *AWS CLI Command Reference*.

### get-ota-update

The following code example shows how to use `get-ota-update`.

**AWS CLI**

**To retrieve information about an OTA Update**

The following `get-ota-update` example displays details about the specified OTA Update.

```bash
aws iot get-ota-update \
   --ota-update-id ota12345
```

Output:

```json
{
   "otaUpdateInfo": {
      "otaUpdateId": "ota12345",
      "creationDate": 1557863215.995,
      "lastModifiedDate": 1557863215.995,
      "description": "A critical update needed right away.",
      "targets": ["device1",
                  "device2",
                  "device3",
                  "device4"
                 ],
      "targetSelection": "SNAPSHOT",
      "protocols": ["HTTP"],
      "awsJobExecutionsRolloutConfig": {
```
"maximumPerMinute": 10
},
"otaUpdateFiles": [
{
  "fileName": "firmware.bin",
  "fileLocation": {
    "stream": {
      "streamId": "004",
      "fileId": 123
    }
  },
  "codeSigning": {
    "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
  }
},
"roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
"otaUpdateStatus": "CREATE_COMPLETE",
"awsIotJobId": "job54321",
"errorInfo": {
}
}]

For more information, see [GetOTAUpdate](https://docs.aws.amazon.com/iot/latest/developerguide/getotaupdate.html) in the AWS IoT API Reference.

**get-percentiles**

The following code example shows how to use get-percentiles.

**AWS CLI**

To group the aggregated values that match the query into percentile groupings

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
```
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload attributes="{temperature=${Temperatures[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done

Example output of the setup script:

```json
{
  "version": 1,
  "thingName": "TempSensor0",
  "defaultClientId": "TempSensor0",
  "attributes": {
    "temperature": "70"
  },
  "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
  "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```bash
aws iot get-percentiles \
  --aggregation-field "attributes.temperature" \
  --query-string "thingName:TempSensor*" \
  --percents 10 25 50 75 90
```

Output:

```json
{
  "percentiles": [
    {
      "percent": 10.0,
      "value": 67.7
    },
    {
      "percent": 25.0,
      "value": 71.25
    }
  ]
}
```
For more information, see Querying for Aggregate Data in the AWS IoT Developer Guide.

- For API details, see GetPercentiles in AWS CLI Command Reference.

get-policy-version

The following code example shows how to use get-policy-version.

**AWS CLI**

**To get information about a specific version of a policy**

The following get-policy-version example gets information about the first version of the specified policy.

```bash
aws iot get-policy
   --policy-name UpdateDeviceCertPolicy
   --policy-version-id "1"
```

Output:

```json
{
   "policyName": "UpdateDeviceCertPolicy",
```
"policyVersionId": "1",
"isDefaultVersion": false,
"creationDate": 1559925941.924,
"lastModifiedDate": 1559926175.458,
"generationId":
"5066f1b6712ce9d2a1e56399771649a272d6a921762fecd080e24fe52f24e042"
}

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-policies.html) in the *AWS IoT Developers Guide*.

---

**get-policy**

The following code example shows how to use `get-policy`.

**AWS CLI**

To get information about the default version of a policy

The following `get-policy` example retrieves information about the default version of the specified policy.

```bash
aws iot get-policy \
   --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
   "policyName": "UpdateDeviceCertPolicy",
   "defaultVersionId": "2",
   "creationDate": 1559925941.924,
   "lastModifiedDate": 1559925941.924,
   "generationId":
   "5066f1b6712ce9d2a1e56399771649a272d6a921762fecd080e24fe52f24e042"
}
```

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-policies.html) in the *AWS IoT Developers Guide*. 
For API details, see GetPolicy in AWS CLI Command Reference.

get-registration-code

The following code example shows how to use get-registration-code.

AWS CLI

To get your AWS account-specific registration code

The following get-registration-code example retrieves your AWS account-specific registration code.

```
aws iot get-registration-code
```

Output:

```
{
   "registrationCode":
   "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide.

For API details, see GetRegistrationCode in AWS CLI Command Reference.

get-statistics

The following code example shows how to use get-statistics.

AWS CLI

To search the device index for aggregate data

The following get-statistics example returns the number of things that have a property called connectivity.connected set to false (that is, the number of devices that are not connected) in their device shadow.

```
aws iot get-statistics \
   --index-name AWS_Things \
   --query-string "connectivity.connected:false"
```
For more information, see Getting Statistics About Your Device Fleet in the AWS IoT Developer Guide.

- For API details, see GetStatistics in AWS CLI Command Reference.

get-topic-rule-destination

The following code example shows how to use get-topic-rule-destination.

AWS CLI

To get a topic rule destination

The following get-topic-rule-destination example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "DISABLED",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see Working with topic rule destinations in the AWS IoT Developer Guide.
For API details, see `GetTopicRuleDestination` in *AWS CLI Command Reference*.

### get-topic-rule

The following code example shows how to use `get-topic-rule`.

#### AWS CLI

**To get information about a rule**

The following `get-topic-rule` example gets information about the specified rule.

```bash
aws iot get-topic-rule \
--rule-name MyRPiLowMoistureAlertRule
```

**Output:**

```json
{
  "rule": {
    "ruleName": "MyRPiLowMoistureAlertRule",
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'"
          
  },
  "description": "Sends an alert whenever soil moisture level readings are too low.",
  "createdAt": 1558624363.0,
  "actions": [ 
    { 
      "sns": { 
        "roleArn": "arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole",
        "messageFormat": "RAW"
      } 
    }
  ],
  "ruleDisabled": false,
  "awsIotSqlVersion": "2016-03-23"
}
```
For more information, see Viewing Your Rules in the AWS IoT Developers Guide.

- For API details, see GetTopicRule in AWS CLI Command Reference.

get-v2-logging-options

The following code example shows how to use get-v2-logging-options.

AWS CLI

To list the current logging options

The following get-v2-logging-options example lists the current logging options for AWS IoT.

aws iot get-v2-logging-options

Output:

```json
{
   "roleArn": "arn:aws:iam::094249569039:role/service-role/iotLoggingRole",
   "defaultLogLevel": "WARN",
   "disableAllLogs": false
}
```

For more information, see title in the AWS IoT Developer Guide.

- For API details, see GetV2LoggingOptions in AWS CLI Command Reference.

list-active-violations

The following code example shows how to use list-active-violations.

AWS CLI

To list the active violations

The following list-active-violations example lists all violations for the specified security profile.

aws iot list-active-violations \
    --security-profile-name Testprofile
Output:

```json
{
   "activeViolations": [
      {
         "violationId": "174db59167fa474c80a652ad1583fd44",
         "thingName": "iotconsole-1560269126751-1",
         "securityProfileName": "Testprofile",
         "behavior": {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
               "comparisonOperator": "greater-than",
               "value": {
                  "count": 10
               },
               "durationSeconds": 300,
               "consecutiveDatapointsToAlarm": 1,
               "consecutiveDatapointsToClear": 1
            }
         },
         "lastViolationValue": {
            "count": 0
         },
         "lastViolationTime": 1560293700.0,
         "violationStartTime": 1560279000.0
      },
      {

        }
    },
    "lastViolationValue": {
        "count": 0
    },
    "lastViolationTime": 1560276600.0,
    "violationStartTime": 1560276600.0
}
For API details, see [ListActiveViolations](#) in *AWS CLI Command Reference*.

### list-attached-policies

The following code example shows how to use list-attached-policies.

**AWS CLI**

**Example 1: To list the policies attached to a group**

The following list-attached-policies example lists the policies that are attached to the specified group.

```bash
aws iot list-attached-policies \
  --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

**Output:**

```json
{
   "policies": [
      {
         "policyName": "UpdateDeviceCertPolicy",
      }
   ]
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

**Example 2: To list the policies attached to a device certificate**
The following list-attached-policies example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```bash
aws iot list-attached-policies \
    --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```json
{
    "policies": [
        {
            "policyName": "TemperatureSensorPolicy",
        }
    ]
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListAttachedPolicies](https://docs.aws.amazon.com/cli/latest/reference/iot/list-attached-policies.html) in *AWS CLI Command Reference*.

### list-audit-findings

The following code example shows how to use list-audit-findings.

#### AWS CLI

**Example 1: To list all findings from an audit**

The following list-audit-findings example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```bash
aws iot list-audit-findings \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```json
{
    "findings": []
}
```
Example 2: To list findings for an audit check type

The following list-audit-findings example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```bash
aws iot list-audit-findings \
   --check-name DEVICE_CERTIFICATE_SHARED_CHECK \
   --start-time 1559747125 \
   --end-time 1560962028
```

Output:

```
{
   "findings": [
       {
           "taskId": "eeef61068b0eb03c456d746c5a26ee04",
           "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",
           "taskStartTime": 1560161017.172,
           "findingTime": 1560161017.592,
           "severity": "CRITICAL",
           "nonCompliantResource": {
               "resourceType": "DEVICE_CERTIFICATE",
               "resourceIdentifier": {
                   "deviceCertificateId": "b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b"
               }
           },
           "relatedResources": [
               {
                   "resourceType": "CLIENT_ID",
                   "resourceIdentifier": {
                       "clientId": "ZipxgAIl"
                   },
                   "additionalInfo": {
                       "CONNECTION_TIME": "1560086374068"

            },
            "additionalInfo": {
                "CONNECTION_TIME": "1559972350825"
            }
        }
    ]
}
Actions and scenarios 3771
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see ListAuditFindings in AWS CLI Command Reference.

list-audit-mitigation-actions-executions

The following code example shows how to use list-audit-mitigation-actions-executions.

AWS CLI

To list the details of an audit mitigation action execution

An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit. The following list-audit-mitigation-actions-executions example lists the details for the mitigation action task with the specified taskId and for the specified finding.

aws iot list-audit-mitigation-actions-executions \
   --task-id myActionsTaskId \
   --finding-id 0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464

Output:

```json
{
   "actionsExecutions": [
   {
      "taskId": "myActionsTaskId",
      "findingId": "0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464",
      "actionName": "ResetPolicyVersionAction",
      "actionId": "1ea0b415-bef1-4a01-bd13-72fb63c59af6",
      "DISCONNECTION_TIME": "1559826728402"
   }
   ]
}
```
The following code example shows how to use `list-audit-mitigation-actions-tasks`.

**AWS CLI**

To list audit mitigation action tasks

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```bash
aws iot list-audit-mitigation-actions-tasks \
    --start-time 1594157400 \
    --end-time 1594157430
```

Output:

```json
{
    "tasks": [
        {
            "taskId": "0062f2d6-3999-488f-88c7-bef005414103",
            "startTime": "2020-07-07T14:30:15.172000-07:00",
            "taskStatus": "COMPLETED"
        }
    ]
}
```

For more information, see [ListAuditMitigationActionsExecutions (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/list-audit-mitigation-actions-executions.html) in the *AWS IoT Developer Guide*.  

- For API details, see [ListAuditMitigationActionsExecutions](https://docs.aws.amazon.com/cli/latest/reference/iot/list-audit-mitigation-actions-executions.html) in *AWS CLI Command Reference*.  

For more information, see [ListAuditMitigationActionsTasks (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/list-audit-mitigation-actions-tasks.html) in the *AWS IoT Developer Guide*.  

Actions and scenarios
list-audit-suppressions

The following code example shows how to use list-audit-suppressions.

AWS CLI

To list all audit finding suppressions

The following list-audit-suppressions example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
  "suppressions": [
    {
      "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
      "resourceIdentifier": {
        "deviceCertificateId": "c7691e<shortened>"
      },
      "expirationDate": 1597881600.0,
      "suppressIndefinitely": false
    }
  ]
}
```

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.

- For API details, see ListAuditSuppressions in AWS CLI Command Reference.

list-audit-tasks

The following code example shows how to use list-audit-tasks.

AWS CLI

To list all findings from an audit
The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```
aws iot list-audit-tasks \
   --start-time 1559747125 \
   --end-time 1560357228
```

Output:

```
{
   "tasks": [
   {
      "taskId": "a3aea009955e501a31b764abe1bebd3d",
      "taskStatus": "COMPLETED",
      "taskType": "ON_DEMAND_AUDIT_TASK"
   },
   {
      "taskId": "f76b4b5102b632cd9ae38a279c266da1",
      "taskStatus": "COMPLETED",
      "taskType": "SCHEDULED_AUDIT_TASK"
   },
   {
      "taskId": "51d9967d9f9ff4d26529505f6d2c444a",
      "taskStatus": "COMPLETED",
      "taskType": "SCHEDULED_AUDIT_TASK"
   },
   {
      "taskId": "eeef61068b0eb03c456d746c5a26ee04",
      "taskStatus": "COMPLETED",
      "taskType": "SCHEDULED_AUDIT_TASK"
   },
   {
      "taskId": "041c49557b7c04c079a49514b55589",
      "taskStatus": "COMPLETED",
      "taskType": "SCHEDULED_AUDIT_TASK"
   },
   {
      "taskId": "82c7f2afac1562d18a4560be73998acc",
      "taskStatus": "COMPLETED",
      "taskType": "SCHEDULED_AUDIT_TASK"
   },
   {
      "taskId": "bade6b5efde21b1569822f6021b39cf5",
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see ListAuditTasks in AWS CLI Command Reference.

list-authorizers

The following code example shows how to use list-authorizers.

AWS CLI

To list your custom authorizer

The following list-authorizers example lists the custom authorizers in your AWS account.

aws iot list-authorizers

Output:

```json
{
  "authorizers": [
    {
      "authorizerName": "CustomAuthorizer",
      "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
    },
    {
```
For more information, see [ListAuthorizers](https://docs.aws.amazon.com/iot/latest/developerguide/list-authorizers.html) in the *AWS IoT API Reference*.

- For API details, see [ListAuthorizers](https://docs.aws.amazon.com/iot/latest/developerguide/list-authorizers.html) in *AWS CLI Command Reference*.

### list-billing-groups

The following code example shows how to use `list-billing-groups`.

**AWS CLI**

To list the billing groups for your AWS account and region

The following `list-billing-groups` example lists all billing groups that are defined for your AWS account and AWS Region.

```bash
aws iot list-billing-groups
```

Output:

```json
{
   "billingGroups": [
      {
         "groupName": "GroupOne",
         "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
      }
   ]
}
```

For more information, see [Billing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in the *AWS IoT Developers Guide*.
list-ca-certificates

The following code example shows how to use list-ca-certificates.

**AWS CLI**

To list the CA certificates registered in your AWS account

The following list-ca-certificates example lists the CA certificates registered in your AWS account.

```
aws iot list-ca-certificates
```

Output:

```
{
   "certificates": [
      {
         "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
         "status": "INACTIVE",
         "creationDate": 1569365372.053
      }
   ]
}
```

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

For API details, see [ListCaCertificates](#) in *AWS CLI Command Reference*.

list-certificates-by-ca

The following code example shows how to use list-certificates-by-ca.

**AWS CLI**

To list all device certificates signed with a CA certificate
The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
   --ca-certificate-id
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
   "certificates": [
      {
         "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
         "certificateId": "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
         "status": "ACTIVE",
         "creationDate": 1569363250.557
      }
   ]
}
```

For more information, see `ListCertificatesByCA` in the AWS IoT API Reference.

- For API details, see `ListCertificatesByCa` in AWS CLI Command Reference.

### list-certificates

The following code example shows how to use `list-certificates`.

**AWS CLI**

**Example 1: To list the certificates registered in your AWS account**

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```
Output:

```json
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "certificateId": "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "status": "ACTIVE",
            "creationDate": 1556810537.617
        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/262a1ac8a7d8a72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",
            "certificateId": "262a1ac8a7d8a72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",
            "status": "ACTIVE",
            "creationDate": 1546447050.885
        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b",
            "certificateId": "b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b",
            "status": "ACTIVE",
            "creationDate": 1546292258.322
        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/7aebeea3845d14a44ec80b06b8b78a89f3f8a706974b8b34d18f5adf0741db42",
            "certificateId": "7aebeea3845d14a44ec80b06b8b78a89f3f8a706974b8b34d18f5adf0741db42",
            "status": "ACTIVE",
            "creationDate": 1541457693.453
        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/54458aa39ebb3eb39c91ffbbdcc3a6ca1c7c094d1644b889f735a6fc2cd9a7e3",
            "certificateId": "54458aa39ebb3eb39c91ffbbdcc3a6ca1c7c094d1644b889f735a6fc2cd9a7e3",
            "status": "ACTIVE",
            "creationDate": 1541113568.611
        }
    ]
}
```
For API details, see **ListCertificates** in *AWS CLI Command Reference*.

**list-custom-metrics**

The following code example shows how to use `list-custom-metrics`.

**AWS CLI**

To list your custom metrics

The following `list-custom-metrics` example lists all of your custom metrics.

```
aws iot list-custom-metrics \
  --region us-east-1
```

Output:

```
{
   "metricNames": [
      "batteryPercentage"
   ]
}
```

For more information, see **Custom metrics** in the *AWS IoT Core Developer Guide*.

For API details, see **ListCustomMetrics** in *AWS CLI Command Reference*.

**list-dimensions**

The following code example shows how to use `list-dimensions`.
AWS CLI

To list the dimensions for your AWS account

The following list-dimensions example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```bash
aws iot list-dimensions
```

Output:

```json
{
   "dimensionNames": [
      "TopicFilterForAuthMessages",
      "TopicFilterForActivityMessages"
   ]
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ListDimensions in AWS CLI Command Reference.

list-domain-configurations

The following code example shows how to use list-domain-configurations.

AWS CLI

To list domain configurations

The following list-domain-configurations example lists the domain configurations in your AWS account that have the specified service type.

```bash
aws iot list-domain-configurations \
   --service-type "DATA"
```

Output:

```json
{
   "domainConfigurations":
```

Actions and scenarios
For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see ListDomainConfigurations in AWS CLI Command Reference.

```json
[
  {
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh",
    "serviceType": "DATA"
  },
  {
    "domainConfigurationName": "iot:Jobs",
    "serviceType": "JOBS"
  },
  {
    "domainConfigurationName": "iot:Data-ATS",
    "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/iot:Data-ATS",
    "serviceType": "DATA"
  },
  {
    "domainConfigurationName": "iot:CredentialProvider",
    "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/iot:CredentialProvider",
    "serviceType": "CREDENTIAL_PROVIDER"
  }
]
```

list-indices

The following code example shows how to use list-indices.

**AWS CLI**

To list the configured search indices

The following list-indices example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.
aws iot list-indices

Output:

{
   "indexNames": [
      "AWS_Things"
   ]
}

For more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

- For API details, see ListIndices in AWS CLI Command Reference.

list-job-executions-for-job

The following code example shows how to use list-job-executions-for-job.

AWS CLI

To list the jobs in your AWS account

The following list-job-executions-for-job example lists all job executions for a job in your AWS account, specified by the jobId.

aws iot list-job-executions-for-job \
--job-id my-ota-job

Output:

{
   "executionSummaries": [
      {
         "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/my_thing",
         "jobExecutionSummary": {
            "status": "QUEUED",
            "queuedAt": "2022-03-07T15:58:42.195000-08:00",
            "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
            "executionNumber": 1,
            "retryAttempt": 0
         }
      }
   ]
}
list-job-executions-for-thing

The following code example shows how to use list-job-executions-for-thing.

AWS CLI

To list the jobs that were executed for a thing

The following list-job-executions-for-thing example lists all jobs that were executed for the thing named MyRaspberryPi.

    aws iot list-job-executions-for-thing \
        --thing-name "MyRaspberryPi"

Output:

    {
        "executionSummaries": [
            {
                "jobId": "example-job-01",
                "jobExecutionSummary": {
                    "status": "QUEUED",
                    "queuedAt": 1560787023.636,
                    "lastUpdatedAt": 1560787023.636,
                    "executionNumber": 1
                }
            }
        ]
    }

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see ListJobExecutionsForJob in AWS CLI Command Reference.
### list-jobs

The following code example shows how to use list-jobs.

**AWS CLI**

**To list the jobs in your AWS account**

The following list-jobs example lists all jobs in your AWS account, sorted by the job status.

```bash
aws iot list-jobs
```

Output:

```json
{
   "jobs": [
      {
         "jobId": "example-job-01",
         "targetSelection": "SNAPSHOT",
         "status": "IN_PROGRESS",
         "createdAt": 1560787022.733,
         "lastUpdatedAt": 1560787026.294
      }
   ]
}
```

For more information, see [Creating and Managing Jobs (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/creating-managing-jobs-cli.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobs](https://docs.aws.amazon.com/cli/latest/reference/iot/list-jobs.html) in *AWS CLI Command Reference*.

### list-mitigation-actions

The following code example shows how to use list-mitigation-actions.

**AWS CLI**

**To list all defined mitigation actions**

The following list-mitigation-actions example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.
aws iot list-mitigation-actions

Output:

```json
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCAcertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```
For more information, see ListMitigationActions (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see ListMitigationActions in AWS CLI Command Reference.

list-mitigations-actions

The following code example shows how to use list-mitigations-actions.

AWS CLI

To list all defined mitigation actions

The following list-mitigations-actions example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

aws iot list-mitigation-actions

Output:

```json
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        }
    ]
}
```
For more information, see [ListMitigationActions](https://aws.amazon.com) in the *AWS IoT Developer Guide*.

- For API details, see [ListMitigationActions](https://aws.amazon.com) in *AWS CLI Command Reference*.

### list-ota-updates

The following code example shows how to use `list-ota-updates`.

#### AWS CLI

**To list OTA Updates for the account**

The following `list-ota-updates` example lists the available OTA updates.

```bash
aws iot list-ota-updates
```

**Output:**

```json
{
    "otaUpdates": [
        {
            "otaUpdateId": "itsaupdate",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "otaUpdateId": "itsaupdate",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "otaUpdateId": "itsaupdate",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```
"creationDate": 1557863215.995
}
]
}

For more information, see [ListOTAUpdates](#) in the *AWS IoT API Reference*.

- For API details, see [ListOtaUpdates](#) in *AWS CLI Command Reference*.

### list-outgoing-certificates

The following code example shows how to use list-outgoing-certificates.

#### AWS CLI

**To list certificates being transferred to a different AWS account**

The following `list-outgoing-certificates` example lists all device certificates that are in the process of being transferred to a different AWS account using the `transfer-certificate` command.

```bash
aws iot list-outgoing-certificates
```

**Output:**

```json
{
   "outgoingCertificates": [
   {
   "certificateArn": "arn:aws:iot:us-west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
   "certificateId": "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
   "transferredTo": "030714055129",
   "transferDate": 1569427780.441,
   "creationDate": 1569363250.557
   }
   ]
}
```

For more information, see [ListOutgoingCertificates](#) in the *AWS IoT API Reference*.
- For API details, see ListOutgoingCertificates in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use list-policies.

**AWS CLI**

**To list the policies defined in your AWS account**

The following list-policies example lists all policies defined in your AWS account.

```
aws iot list-policies
```

**Output:**

```
{
   "policies": [
   {
    "policyName": "UpdateDeviceCertPolicy",
   },
   {
    "policyName": "PlantIoTPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
   },
   {
    "policyName": "MyPiGroup_Core-policy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-policy"
   }
]
}
```

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

**list-policy-versions**

The following code example shows how to use list-policy-versions.
Example 1: To see all versions of a policy

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions  
   --policy-name LightBulbPolicy
```

Output:

```
{
   "policyVersions": [
      {
         "versionId": "2",
         "isDefaultVersion": true,
         "createDate": 1559925941.924
      },
      {
         "versionId": "1",
         "isDefaultVersion": false,
         "createDate": 1559925941.924
      }
   ]
}
```

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/iot-policies.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListPolicyVersions](https://docs.aws.amazon.com/cli/latest/reference/iot/list-policy-versions.html) in *AWS CLI Command Reference*.

**list-principal-things**

The following code example shows how to use `list-principal-things`.

AWS CLI

**To list the things attached with a principal**

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.
aws iot list-principal-things \
   --principal arn:aws:iot:us-west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8

Output:

```json
{
   "things": [
      "DeskLamp",
      "TableLamp"
   ]
}
```

For more information, see `ListPrincipalThings` in the `AWS IoT API Reference`.

- For API details, see `ListPrincipalThings` in `AWS CLI Command Reference`.

---

**list-provisioning-template-versions**

The following code example shows how to use `list-provisioning-template-versions`.

**AWS CLI**

To list provisioning template versions

The following `list-provisioning-template-versions` example lists the available versions of the specified provisioning template.

```bash
aws iot list-provisioning-template-versions \
   --template-name "widget-template"
```

Output:

```json
{
   "versions": [
      {
         "versionId": 1,
         "creationDate": 1574800471.339,
         "isDefaultVersion": true
      },
      {
```
For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplateVersions](https://docs.aws.amazon.com/cli/latest/reference/iot/list-provisioning-template-versions.html) in *AWS CLI Command Reference*.

### list-provisioning-templates

The following code example shows how to use `list-provisioning-templates`.

**AWS CLI**

#### To list provisioning templates

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```bash
aws iot list-provisioning-templates
```

**Output:**

```json
{
  "templates": [
    {
      "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
      "templateName": "widget-template",
      "description": "A provisioning template for widgets",
      "creationDate": 1574800471.367,
      "lastModifiedDate": 1574801192.324,
      "enabled": false
    }
  ]
}
```

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplates](https://docs.aws.amazon.com/cli/latest/reference/iot/list-provisioning-template-versions.html) in *AWS CLI Command Reference*. 
list-role-aliases

The following code example shows how to use list-role-aliases.

AWS CLI

To list the AWS IoT role aliases in your AWS account

The following list-role-aliases example lists the AWS IoT role aliases in your AWS account.

```bash
aws iot list-role-aliases
```

Output:

```json
{
   "roleAliases": [
      "ResidentAlias",
      "ElectricianAlias"
   ]
}
```

For more information, see ListRoleAliases in the AWS IoT API Reference.
- For API details, see ListRoleAliases in AWS CLI Command Reference.

list-scheduled-audits

The following code example shows how to use list-scheduled-audits.

AWS CLI

To list the scheduled audits for your AWS account

The following list-scheduled-audits example lists any audits scheduled for your AWS account.

```bash
aws iot list-scheduled-audits
```

Output:
For more information, see [Audit Commands](#) in the [AWS IoT Developer Guide](#).

- For API details, see [ListScheduledAudits](#) in [AWS CLI Command Reference](#).

### list-security-profiles-for-target

The following code example shows how to use `list-security-profiles-for-target`.

**AWS CLI**

**To list the security profiles attached to a target**

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```
aws iot list-security-profiles-for-target  \
```

**Output:**

```json
{
   "securityProfileTargetMappings": [
   {
   
```
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ListSecurityProfilesForTarget in AWS CLI Command Reference.

**list-security-profiles**

The following code example shows how to use list-security-profiles.

**AWS CLI**

**To list the security profiles for your AWS account**

The following list-security-profiles example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```shell
aws iot list-security-profiles
```

**Output:**

```json
{
    "securityProfileIdentifiers": [
        {
            "name": "Testprofile",
            "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
        }
    ]
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.
For API details, see `ListSecurityProfiles` in *AWS CLI Command Reference*.

**list-streams**

The following code example shows how to use `list-streams`.

**AWS CLI**

**To list the streams in the account**

The following `list-streams` example lists all of the streams in your AWS account.

```
aws iot list-streams
```

Output:

```json
{
  "streams": [
    {
      "streamId": "stream12345",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update 12345."
    },
    {
      "streamId": "stream54321",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update 54321."
    }
  ]
}
```

For more information, see `ListStreams` in the *AWS IoT API Reference*.

For API details, see `ListStreams` in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

```
```
To display the tags and their values associated with a resource

The following `list-tags-for-resource` example displays the tags and values associated with the thing group LightBulbs.

```bash
aws iot list-tags-for-resource \
```

Output:

```
{
   "tags": [
   {
      "Key": "Assembly",
      "Value": "Fact1NW"
   },
   {
      "Key": "MyTag",
      "Value": "777"
   }
   ]
}
```

For more information, see [Tagging Your AWS IoT Resources](https://docs.aws.amazon.com/iot/latest/developerguide/tag-resource.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/iot/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**list-targets-for-policy**

The following code example shows how to use `list-targets-for-policy`.

**AWS CLI**

To list the principals associated with an AWS IoT policy

The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```bash
aws iot list-targets-for-policy \
```
Output:

```json
{
    "targets": [
        "arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
        "arn:aws:iot:us-west-2:123456789012:cert/d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
    ]
}
```

For more information, see [Thing Groups](#) in the [AWS IoT Developers Guide](#).

- For API details, see [ListTargetsForPolicy](#) in [AWS CLI Command Reference](#).

### list-targets-for-security-profile

The following code example shows how to use `list-targets-for-security-profile`.

**AWS CLI**

**To list the targets to which a security profile is applied**

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```bash
aws iot list-targets-for-security-profile \
    --security-profile-name Testprofile
```

Output:

```json
{
    "securityProfileTargets": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
        },
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
        }
    ]
}
```
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ListTargetsForSecurityProfile in AWS CLI Command Reference.

**list-thing-groups-for-thing**

The following code example shows how to use list-thing-groups-for-thing.

**AWS CLI**

**To list the groups that a thing belongs to**

The following list-thing-groups-for-thing example lists the groups to which the specified thing belongs.

```bash
aws iot list-thing-groups-for-thing \
  --thing-name MyLightBulb
```

Output:

```json
{
    "thingGroups": [
        {
            "groupName": "DeadBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see ListThingGroupsForThing in AWS CLI Command Reference.

**list-thing-groups**

The following code example shows how to use list-thing-groups.
AWS CLI

To list the thing groups defined in your AWS account

The following describe-thing-group example lists all thing groups defined in your AWS account.

```bash
aws iot list-thing-groups
```

Output:

```
{
   "thingGroups": [
   {
      "groupName": "HalogenBulbs",
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
   },
   {
      "groupName": "LightBulbs",
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
   }
  ]
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot-developer-guide) in the *AWS IoT Developers Guide*.

- For API details, see ([ListThingGroups](https://docs.aws.amazon.com/cli/latest/reference/iot/list-thing-groups.html)) in *AWS CLI Command Reference*.

---

list-thing-principals

The following code example shows how to use list-thing-principals.

AWS CLI

To list the principals associated with a thing

The following list-thing-principals example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```bash
aws iot list-thing-principals \
   --thing-name MyRaspberryPi
```
Output:

```
{
    "principals": [
        "arn:aws:iot:us-west-2:123456789012:cert/33475ac865079a5ffdf5ecd44240640349293facc760642d7d8d5fbb6b4c86893"
    ]
}
```

For more information, see ListThingPrincipals in the AWS IoT API Reference.

- For API details, see ListThingPrincipals in AWS CLI Command Reference.

**list-thing-types**

The following code example shows how to use list-thing-types.

**AWS CLI**

**To list the defined thing types**

The following list-thing-types example displays a list of thing types defined in your AWS account.

```
aws iot list-thing-types
```

Output:

```
{
    "thingTypes": [
        {
            "thingTypeName": "LightBulb",
            "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
            "thingTypeProperties": {
                "thingTypeDescription": "light bulb type",
                "searchableAttributes": [
                    "model",
                    "wattage"
                ]
            },
            "thingTypeMetadata": {

```
For more information, see [Thing Types](https://aws.amazon.com/iot-developer-guide) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingTypes](https://aws.amazon.com/iot-cli-command-reference) in *AWS CLI Command Reference*.

**list-things-in-billing-group**

The following code example shows how to use `list-things-in-billing-group`.

**AWS CLI**

To list the things in a billing group

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```bash
aws iot list-things-in-billing-group \
   --billing-group-name GroupOne
```

Output:

```json
{
   "things": [ 
      "MyOtherLightBulb",
      "MyLightBulb"
   ]
}
```

For more information, see [Billing Groups](https://aws.amazon.com/iot-developer-guide) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingsInBillingGroup](https://aws.amazon.com/iot-cli-command-reference) in *AWS CLI Command Reference*.

**list-things-in-thing-group**

The following code example shows how to use `list-things-in-thing-group`.

...
AWS CLI

To list the things that belong to a group

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```
aws iot list-things-in-thing-group \
   --thing-group-name LightBulbs
```

Output:

```
{
   "things": [
      "MyLightBulb"
   ]
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see ListThingsInThingGroup in AWS CLI Command Reference.

**list-things**

The following code example shows how to use `list-things`.

**AWS CLI**

**Example 1: To list all things in the registry**

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{
   "things": [
     {
       "thingName": "ThirdBulb",
       "thingTypeName": "LightBulb",
     },
     
```
Example 2: To list the defined things that have a specific attribute

The following list-things example displays a list of things that have an attribute named wattage.

```bash
aws iot list-things \
   --attribute-name wattage
```
Output:

```json
{
  "things": [
    {
      "thingName": "MyLightBulb",
      "thingTypeName": "LightBulb",
      "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "version": 1
    },
    {
      "thingName": "MyOtherLightBulb",
      "thingTypeName": "LightBulb",
      "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "version": 3
    }
  ]
}
```

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot-developer-guide/register-things.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListThings](https://docs.aws.amazon.com/cli/latest/reference/iot/list-things.html) in *AWS CLI Command Reference*.

**list-topic-rule-destinations**

The following code example shows how to use list-topic-rule-destinations.

**AWS CLI**

**To list your topic rule destinations**

The following list-topic-rule-destinations example lists all topic rule destinations that you have defined in the current AWS Region.
aws iot list-topic-rule-destinations

Output:

```json
{
    "destinationSummaries": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "status": "ENABLED",
            "httpUrlSummary": {
                "confirmationUrl": "https://example.com"
            }
        }
    ]
}
```

For more information, see [Working with topic rule destinations](https://docs.aws.amazon.com/iot/latest/developerguide/working-topic-rule-destinations.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListTopicRuleDestinations](https://docs.aws.amazon.com/cli/latest/reference/iot/list-topic-rule-destinations.html) in *AWS CLI Command Reference*.

**list-topic-rules**

The following code example shows how to use `list-topic-rules`.

**AWS CLI**

**To list your rules**

The following `list-topic-rules` example lists all rules that you have defined.

`aws iot list-topic-rules`

Output:

```json
{
    "rules": [
        {
            "ruleName": "MyRPiLowMoistureAlertRule",
            "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",
```
For more information, see [Viewing Your Rules](#) in the [AWS IoT Developers Guide](#).

- For API details, see [ListTopicRules](#) in [AWS CLI Command Reference](#).

### list-v2-logging-levels

The following code example shows how to use `list-v2-logging-levels`.

**AWS CLI**

**To list logging levels**

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

**Output:**

```
{
    "logTargetConfigurations": [
        {
            "logTarget": {
                "targetType": "DEFAULT"
            },
            "logLevel": "ERROR"
        }
    ]
}
```
For API details, see [ListV2LoggingLevels](https://aws.amazon.com/cli/v2/docs/list-violation-events) in *AWS CLI Command Reference*.

### list-violation-events

The following code example shows how to use `list-violation-events`.

**AWS CLI**

**To list the security profile violations during a time period**

The following `list-violation-events` example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```bash
aws iot list-violation-events \
    --start-time 1559747125 \
    --end-time 1560351925
```

**Output:**

```json
{
    "violationEvents": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
```
"count": 0
},
"violationEventType": "in-alarm",
"violationEventTime": 1560279000.0
},
{
"violationId": "c8a9466a093d3b7b35cd44ca58bdbeab",
"thingName": "TvnQoEoU",
"securityProfileName": "Testprofile",
"behavior": {
"name": "CellularBandwidth",
"metric": "aws:message-byte-size",
"criteria": {
"comparisonOperator": "greater-than",
"value": {
"count": 128
},
"consecutiveDatapointsToAlarm": 1,
"consecutiveDatapointsToClear": 1
}
}
"metricValue": {
"count": 110
},
"violationEventType": "in-alarm",
"violationEventTime": 1560276600.0
},
{
"violationId": "74aa393adea02e6648f3ac362beed55e",
"thingName": "iotconsole-1560269232412-2",
"securityProfileName": "Testprofile",
"behavior": {
"name": "Authorization",
"metric": "aws:num_authorization-failures",
"criteria": {
"comparisonOperator": "greater-than",
"value": {
"count": 10
},
"durationSeconds": 300,
"consecutiveDatapointsToAlarm": 1,
"consecutiveDatapointsToClear": 1
}

},

Actions and scenarios
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ListViolationEvents in AWS CLI Command Reference.

**register-ca-certificate**

The following code example shows how to use register-ca-certificate.

**AWS CLI**

To register a certificate authority (CA) certificate
The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \
  --ca-certificate file://rootCA.pem \
  --verification-cert file://verificationCert.pem
```

Output:

```
{
  "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467"
}
```

For more information, see [RegisterCACertificate](https://docs.aws.amazon.com/iot/latest/developerguide/register-ca-certificate.html) in the *AWS IoT API Reference*.

- For API details, see [RegisterCaCertificate](https://docs.aws.amazon.com/cli/latest/reference/iot/register-ca-certificate.html) in *AWS CLI Command Reference*.

**register-certificate**

The following code example shows how to use `register-certificate`.

**AWS CLI**

**To register a self signed device certificate**

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \
  --certificate-pem file://deviceCert.pem \
  --ca-certificate-pem file://rootCA.pem
```

Output:

```
{

```
For more information, see RegisterCertificate in the AWS IoT API Reference.

- For API details, see RegisterCertificate in AWS CLI Command Reference.

**register-thing**

The following code example shows how to use register-thing.

**AWS CLI**

**To register a thing**

The following register-thing example registers a thing using a provisioning template.

```
aws iot register-thing
   --template-body '{"Parameters":{"ThingName":
{"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"}},"Resources":
{"certificate":{"Properties":{"CertificateId":
{"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"policy":
{"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
{"OverrideSettings":
{"AttributePayload":"MERGE","ThingGroups":"DO NOTHING","ThingTypeName":"REPLACE"},"Properties":
{"AttributePayload":{},"ThingGroups":[]},"ThingName":
{"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}' \n   --parameters '"ThingName":"Register-thing-trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e30404b9233c"'
```

**Output:**

```
{
   "certificatePem": "-----BEGIN CERTIFICATE-----
   MIIDWTCCAkGgAwIBAgIUYLk81I35cIppobpw
   HiOJ2jnboIwDQYJKoZIhvcNAQEL
   
   nMIIDWTCCAkGgAwIBAgIUYLk81I35cIppobpw
   HiOJ2jnboIwDQYJKoZIhvcNAQEL
   
   n8QAwTTFLMEkGA1UECwxCQW1hem9uIFd1YiBTZXJ2aWNlcyBPPUFtYXpvbi
   5jb29g\n   5Sw5jL1BMPVNLXyXR0bGUgU1Q9V2FzaGlzZ3RvbiBDPVVTMB4XDTIwMDcyMzE2NDUw
   
   n0VoXDTQ5MTIzMT
```

Actions and scenarios 3814
For more information, see Provisioning by trusted user in the AWS IoT Core Developers Guide.

- For API details, see RegisterThing in AWS CLI Command Reference.

reject-certificate-transfer

The following code example shows how to use reject-certificate-transfer.

AWS CLI

To reject a certificate transfer

The following reject-certificate-transfer example rejects the transfer of the specified device certificate from another AWS account.
aws iot reject-certificate-transfer \
   --certificate-id
f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8

This command produces no output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see RejectCertificateTransfer in AWS CLI Command Reference.

remove-thing-from-billing-group

The following code example shows how to use remove-thing-from-billing-group.

AWS CLI

To remove a thing from a billing group

The following remove-thing-from-billing-group example removes the specified thing from a billing group.

aws iot remove-thing-from-billing-group \
   --billing-group-name GroupOne \
   --thing-name MyOtherLightBulb

This command produces no output.

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see RemoveThingFromBillingGroup in AWS CLI Command Reference.

remove-thing-from-thing-group

The following code example shows how to use remove-thing-from-thing-group.

AWS CLI

To remove a thing from a thing group

The following remove-thing-from-thing-group example removes the specified thing from a thing group.
aws iot remove-thing-from-thing-group \
   --thing-name bulb7 \
   --thing-group-name DeadBulbs

This command produces no output.

For more information, see Thing Groups <https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html > in the AWS IoT Developer Guide.
• For API details, see RemoveThingFromThingGroup in AWS CLI Command Reference.

replace-topic-rule

The following code example shows how to use replace-topic-rule.

AWS CLI

To update a topic's rule definition

The following replace-topic-rule example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

aws iot replace-topic-rule \
   --rule-name MyRPiLowMoistureAlertRule \

This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developer Guide.
• For API details, see ReplaceTopicRule in AWS CLI Command Reference.

search-index

The following code example shows how to use search-index.
To query the thing index

The following search-index example queries the AWS_Things index for things that have a type of LightBulb.

```bash
aws iot search-index \
   --index-name "AWS_Things" \
   --query-string "thingTypeName:LightBulb"
```

Output:

```json
{
   "things": [
      {
         "thingName": "MyLightBulb",
         "thingId": "40da2e73-c6af-406e-b415-15acae538797",
         "thingTypeName": "LightBulb",
         "thingGroupNames": [
            "LightBulbs",
            "DeadBulbs"
         ],
         "attributes": {
            "model": "123",
            "wattage": "75"
         },
         "connectivity": {
            "connected": false
         }
      },
      {
         "thingName": "ThirdBulb",
         "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",
         "thingTypeName": "LightBulb",
         "attributes": {
            "model": "123",
            "wattage": "75"
         },
         "connectivity": {
            "connected": false
         }
      }
   ]
}
```
for more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

• For API details, see SearchIndex in AWS CLI Command Reference.

set-default-authorizer

The following code example shows how to use set-default-authorizer.

AWS CLI

To set a default authorizer

The following set-default-authorizer example sets the custom authorizer named CustomAuthorizer as the default authorizer.

aws iot set-default-authorizer \
   --authorizer-name CustomAuthorizer

Output:

{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}

For more information, see CreateDefaultAuthorizer in the AWS IoT API Reference.
For API details, see SetDefaultAuthorizer in AWS CLI Command Reference.

**set-default-policy-version**

The following code example shows how to use `set-default-policy-version`.

**AWS CLI**

**To set the default version for a policy**

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```bash
aws iot set-default-policy-version \
  --policy-name UpdateDeviceCertPolicy \
  --policy-version-id 2
```

This command produces no output.

For API details, see SetDefaultPolicyVersion in AWS CLI Command Reference.

**set-v2-logging-level**

The following code example shows how to use `set-v2-logging-level`.

**AWS CLI**

**To set the logging level for a thing group**

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```bash
aws iot set-v2-logging-level \
  --log-target "{"targetType":"THING_GROUP","targetName":"LightBulbs"}" \
  --log-level WARN
```

This command produces no output.

For API details, see SetV2LoggingLevel in AWS CLI Command Reference.
set-v2-logging-options

The following code example shows how to use set-v2-logging-options.

AWS CLI

To set the logging options

The following set-v2-logging-options example sets the default logging verbosity level to ERROR and specifies the ARN to use for logging.

```bash
aws iot set-v2-logging-options \
   --default-log-level ERROR \
   --role-arn "arn:aws:iam::094249569039:role/service-role/iotLoggingRole"
```

This command produces no output.

- For API details, see SetV2LoggingOptions in AWS CLI Command Reference.

start-audit-mitigation-actions-task

The following code example shows how to use start-audit-mitigation-actions-task.

AWS CLI

To apply a mitigation action to the findings from an audit

The following start-audit-mitigation-actions-task example applies the ResetPolicyVersionAction action (which clears the policy) to the specified single finding.

```bash
aws iot start-audit-mitigation-actions-task \
   --task-id "myActionsTaskId" \
   --target "findingIds=["0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464"]" \
   --audit-check-to-actions-mapping "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=["ResetPolicyVersionAction"]" \
   --client-request-token "adhadhahda"
```

Output:

```json
{
    "taskId": "myActionsTaskId"
}
```
For more information, see [StartAuditMitigationActionsTask (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/APIReference/API_StartAuditMitigationActionsTask.html) in the *AWS IoT Developer Guide*.

- For API details, see [StartAuditMitigationActionsTask](https://docs.aws.amazon.com/cli/latest/reference/iot/start-audit-mitigation-actions-task.html) in *AWS CLI Command Reference*.

### `start-on-demand-audit-task`

The following code example shows how to use `start-on-demand-audit-task`.

**AWS CLI**

**To start an audit right away**

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```bash
aws iot start-on-demand-audit-task \
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK \ 
   DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

**Output:**

```json
{
   "taskId": "a3aea009955e501a31b764abe1bebd3d"
}
```

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [StartOnDemandAuditTask](https://docs.aws.amazon.com/cli/latest/reference/iot/start-on-demand-audit-task.html) in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To specify a tag key and value for a resource**

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.
aws iot tag-resource
   --tags Key=Assembly,Value="Fact1NW" \

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the AWS IoT Developer Guide.

• For API details, see TagResource in AWS CLI Command Reference.

**test-authorization**

The following code example shows how to use test-authorization.

**AWS CLI**

**To test your AWS IoT policies**

The following test-authorization example tests the AWS IoT policies associated with the specified principal.

```
aws iot test-authorization \
   --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-east-1:123456789012:client/client1 \
   --principal arn:aws:iot:us-west-2:123456789012:cert/aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775
```

Output:

```json
{
   "authResults": [
   {
      "authInfo": {
         "actionType": "CONNECT",
         "resources": [
            "arn:aws:iot:us-east-1:123456789012:client/client1"
         ]
      },
      "allowed": {
         "policies": [
            {
               "policyName": "TestPolicyAllowed",
            }
```
For more information, see **TestAuthorization** in the *AWS IoT API Reference*.

- For API details, see **TestAuthorization** in *AWS CLI Command Reference*.

### test-invoke-authorizer

The following code example shows how to use `test-invoke-authorizer`.

**AWS CLI**

**To test your custom authorizer**

The following `test-invoke-authorizer` example tests your custom authorizer.
aws iot test-invoke-authorizer \
  --authorizer-name IoTAuthorizer \
  --token allow \
  --token-signature "mE0GvaHqy9nER/FdgtJX5lXEJE3b3vE7t1gEszc0TKGgLKWXTnPkb2AbKn0AZ8lGyoN5dVtWDWVmr25m7+
  +zjbYIMk2TBvyGXh0mvKFBPkdgyA43KL6SiZY0cTq1PMcQ0sP7VX2rXr7CTowCxnSNKphGXdQe0/
  ISdQ+J06KUaHwCmupt0/MejKtaNwiia064j6wpr0AUwG55I1YFruD0X
  +wfo8pb0DubAIX1Ua705kuhRUCTx4SxUShEYKmN4IDEvLB6Fsi0B2wvB7y4iPmcajxzG102ExvyCUNctCV9dY1RRGj

Output:

```json
{
  "isAuthenticated": true,
  "principalId": "principalId",
  "policyDocuments": ["{
    "Version": "2012-10-17",
    "Statement": [
  },
  "refreshAfterInSeconds": 600,
  "disconnectAfterInSeconds": 3600
}
```

For more information, see `TestInvokeAuthorizer` in the AWS IoT API Reference.

- For API details, see `TestInvokeAuthorizer` in AWS CLI Command Reference.

---

**transfer-certificate**

The following code example shows how to use `transfer-certificate`.

**AWS CLI**

To transfer a device certificate to a different AWS account

The following `transfer-certificate` example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

```bash
aws iot transfer-certificate \
  --certificate-id 488b6a7f2acde0b0a77384e63c4e40b18b1b3caaae57b727ba44c45e3448142 \
  --target-aws-account 030714055129
```
Output:

```
{
   "transferredCertificateArn": "arn:aws:iot:us-west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see TransferCertificate in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove a tag key from a resource**

The following untag-resource example removes the tag MyTag and its value from the thing group LightBulbs.

```
command
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the AWS IoT Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-account-audit-configuration**

The following code example shows how to use update-account-audit-configuration.

**AWS CLI**

**Example 1: To enable Amazon SNS notifications for audit notifications**

The following update-account-audit-configuration example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.
aws iot update-account-audit-configuration \

This command produces no output.

**Example 2: To enable an audit check**

The following `update-account-audit-configuration` example enables the AWS IoT Device Defender audit check named `AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK`. You cannot disable an audit check if it is part of the `targetCheckNames` for one or more scheduled audits for the AWS account.

aws iot update-account-audit-configuration \
   --audit-check-configurations \
   "{"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK":{"enabled":true}}"

This command produces no output.

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateAccountAuditConfiguration](https://docs.aws.amazon.com/cli/latest/reference/iot/update-account-audit-configuration.html) in *AWS CLI Command Reference*.

**update-audit-suppression**

The following code example shows how to use `update-audit-suppression`.

**AWS CLI**

**To update an audit finding suppression**

The following `update-audit-suppression` example updates an audit finding suppression's expiration date to 2020-09-21.

aws iot update-audit-suppression \
   --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
   --resource-identifier deviceCertificateId=c7691e<shortened> \
   --no-suppress-indefinitely \
   --expiration-date 2020-09-21
This command produces no output.

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.

- For API details, see UpdateAuditSuppression in AWS CLI Command Reference.

update-authorizer

The following code example shows how to use update-authorizer.

AWS CLI

To update a custom authorizer

The following update-authorizer example he state of CustomAuthorizer2 to INACTIVE.

```
aws iot update-authorizer \
    --authorizer-name CustomAuthorizer2 \
    --status INACTIVE
```

Output:

```
{
   "authorizerName": "CustomAuthorizer2",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer2"
}
```

For more information, see UpdateAuthorizer in the AWS IoT API Reference.

- For API details, see UpdateAuthorizer in AWS CLI Command Reference.

update-billing-group

The following code example shows how to use update-billing-group.

AWS CLI

To update information about a billing group

The following update-billing-group example updates the description for the specified billing group.
aws iot update-billing-group
   --billing-group-name GroupOne
   --billing-group-properties "billingGroupDescription="Primary bulb billing group"
"
Output:

```
{
   "version": 2
}
```

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see UpdateBillingGroup in AWS CLI Command Reference.

**update-ca-certificate**

The following code example shows how to use update-ca-certificate.

**AWS CLI**

**To update a certificate authority (CA) certificate**

The following update-ca-certificate example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate 
   --certificate-id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467 
   --new-status ACTIVE
```

This command produces no output.

For more information, see UpdateCACertificate in the AWS IoT API Reference.

- For API details, see UpdateCaCertificate in AWS CLI Command Reference.

**update-certificate**

The following code example shows how to use update-certificate.
AWS CLI

To update a device certificate

The following update-certificate example sets the specified device certificate to INACTIVE status.

```
aws iot update-certificate \
   --certificate-id d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \
   --new-status INACTIVE
```

This command produces no output.

For more information, see UpdateCertificate in the AWS IoT API Reference.
- For API details, see UpdateCertificate in AWS CLI Command Reference.

update-custom-metric

The following code example shows how to use update-custom-metric.

AWS CLI

To update a custom metric

The following update-custom-metric example updates a custom metric to have a new display-name.

```
aws iot update-custom-metric \
   --metric-name batteryPercentage \
   --display-name 'remaining battery percentage on device' \
   --region us-east-1
```

Output:

```json
{
   "metricName": "batteryPercentage",
   "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/batteryPercentage",
   "metricType": "number",
}
```
For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [UpdateCustomMetric](#) in *AWS CLI Command Reference*.

**update-dimension**

The following code example shows how to use update-dimension.

**AWS CLI**

**To update a dimension**

The following update-dimension example updates a dimension.

```bash
aws iot update-dimension \
   --name TopicFilterForAuthMessages \
   --string-values device/${iot:ClientId}/auth
```

Output:

```json
{
   "name": "TopicFilterForAuthMessages",
   "lastModifiedDate": 1585866222.317,
   "stringValues": [
      "device/${iot:ClientId}/auth"
   ],
   "creationDate": 1585854500.474,
   "type": "TOPIC_FILTER",
   "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see [Scoping metrics in security profiles using dimensions](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [UpdateDimension](#) in *AWS CLI Command Reference*. 

Actions and scenarios
update-domain-configuration

The following code example shows how to use update-domain-configuration.

AWS CLI

To update a domain configuration

The following update-domain-configuration example disables the specified domain configuration.

```bash
aws iot update-domain-configuration \
   --domain-configuration-name "additionalDataDomain" \
   --domain-configuration-status "DISABLED"
```

Output:

```json
{
   "domainConfigurationName": "additionalDataDomain",
   "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see UpdateDomainConfiguration in AWS CLI Command Reference.

update-dynamic-thing-group

The following code example shows how to use update-dynamic-thing-group.

AWS CLI

To update a dynamic thing group

The following update-dynamic-thing-group example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```bash
aws iot update-dynamic-thing-group \
   --thing-group-name "RoomTooWarm"
```
--thing-group-properties "thingGroupDescription="This thing group contains rooms warmer than 65F."" \
--query-string "attributes.temperature>65"

Output:

```json
{
  "version": 2
}
```

For more information, see [Dynamic Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/dynamic-things.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateDynamicThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/update-dynamic-thing-group.html) in *AWS CLI Command Reference*.

### update-event-configurations

The following code example shows how to use `update-event-configurations`.

**AWS CLI**

**To show which event types are published**

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```bash
aws iot update-event-configurations \  
--event-configurations "{"CA_CERTIFICATE":{"Enabled":true}}"
```

This command produces no output.

For more information, see [Event Messages](https://docs.aws.amazon.com/iot/latest/developerguide/iot-events.html) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateEventConfigurations](https://docs.aws.amazon.com/cli/latest/reference/iot/update-event-configurations.html) in *AWS CLI Command Reference*.

### update-indexing-configuration

The following code example shows how to use `update-indexing-configuration`.

**AWS CLI**

**To enable thing indexing**
The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the `AWS_Things` index.

```
aws iot update-indexing-configuration
   --thing-indexing-configuration
   thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see [Managing Thing Indexing](https://docs.aws.amazon.com/iot/latest/developerguide/thing-index.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateIndexingConfiguration](https://docs.aws.amazon.com/cli/latest/reference/iot/update-indexing-configuration.html) in *AWS CLI Command Reference*.

### update-job

The following code example shows how to use `update-job`.

**AWS CLI**

**To get detailed status for a job**

The following `update-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job 
   --job-id "example-job-01"
```

Output:

```
{
   "job": {
      "jobId": "example-job-01",
      "targetSelection": "SNAPSHOT",
      "status": "IN_PROGRESS",
      "targets": [
      ],
      "description": "example job test",
      "presignedUrlConfig": {}
   },
   "jobStatus": {
      "status": "IN_PROGRESS",
      "jobId": "example-job-01",
      "jobStatus": "IN_PROGRESS",
      "targetSelection": "SNAPSHOT",
      "status": "IN_PROGRESS",
      "targets": [
      ],
      "description": "example job test",
      "presignedUrlConfig": {},
      "jobStatus": "IN_PROGRESS"
   }
}
```
"jobExecutionsRolloutConfig": {},
"createdAt": 1560787022.733,
"lastUpdatedAt": 1560787026.294,
"jobProcessDetails": {
    "numberOfCanceledThings": 0,
    "numberOfSucceededThings": 0,
    "numberOfFailedThings": 0,
    "numberOfRejectedThings": 0,
    "numberOfQueuedThings": 1,
    "numberOfInProgressThings": 0,
    "numberOfRemovedThings": 0,
    "numberOfTimedOutThings": 0
},
"timeoutConfig": {}
}

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see UpdateJob in AWS CLI Command Reference.

update-mitigation-action

The following code example shows how to use update-mitigation-action.

AWS CLI

To update a mitigation action

The following update-mitigation-action example updates the specified mitigation action named AddThingsToQuarantineGroupAction, changes the thing group name, and sets overrideDynamicGroups to false. You can verify your changes by using the describe-mitigation-action command.

```bash
aws iot update-mitigation-action \
    --cli-input-json "{ "actionName": "AddThingsToQuarantineGroupAction", 
    "actionParams": { "addThingsToThingGroupParams": {"thingGroupNames": ["QuarantineGroup2"],"overrideDynamicGroups": false}}"
```

Output:

```json
{
```
"actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
"actionId": "2fd2726d-98e1-4abf-b10f-09465cc66bfa"
}

For more information, see UpdateMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see UpdateMitigationAction in AWS CLI Command Reference.

update-provisioning-template

The following code example shows how to use update-provisioning-template.

AWS CLI

To update a provisioning template

The following update-provisioning-template example modifies the description and role arn for the specified provisioning template and enables the template.

```
aws iot update-provisioning-template \\
    --template-name widget-template \\
    --enabled \\
    --description "An updated provisioning template for widgets" \\
    --provisioning-role-arn arn:aws:iam::504350838278:role/Provision_role
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.

- For API details, see UpdateProvisioningTemplate in AWS CLI Command Reference.

update-role-alias

The following code example shows how to use update-role-alias.

AWS CLI

To update a role alias

The following update-role-alias example updates the LightBulbRole role alias.
aws iot update-role-alias
   --role-alias LightBulbRole
   --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001

Output:

{
   "roleAlias": "LightBulbRole",
   "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}

For more information, see UpdateRoleAlias in the AWS IoT API Reference.

• For API details, see UpdateRoleAlias in AWS CLI Command Reference.

update-scheduled-audit

The following code example shows how to use update-scheduled-audit.

AWS CLI

To update a scheduled audit definition

The following update-scheduled-audit example changes the target check names for an AWS IoT Device Defender scheduled audit.

aws iot update-scheduled-audit
   --scheduled-audit-name WednesdayCertCheck
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
   DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKE_CA_CERTIFICATE_STILL_ACTIVE_CHECK

Output:

{
   "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/WednesdayCertCheck"
}

For more information, see Audit Commands in the AWS IoT Developer Guide.

• For API details, see UpdateScheduledAudit in AWS CLI Command Reference.
update-security-profile

The following code example shows how to use update-security-profile.

AWS CLI

To change a security profile

The following update-security-profile example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```
aws iot update-security-profile \
  --security-profile-name PossibleIssue \
  --security-profile-description "Check to see if authorization fails 12 times in 5 minutes or if cellular bandwidth exceeds 128" \
  --behaviors "[{{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"less-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}}]"
```

Output:

```
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue",
  "securityProfileDescription": "check to see if authorization fails 12 times in 5 minutes or if cellular bandwidth exceeds 128",
  "behaviors": [ 
    { 
      "name": "CellularBandwidth",
      "metric": "aws:message-byte-size",
      "criteria": { 
        "comparisonOperator": "greater-than",
        "value": { 
          "count": 128 
        },
        "consecutiveDatapointsToAlarm": 1,
        "consecutiveDatapointsToClear": 1 
      } 
    },
    { 
      "name": "Authorization",
      "metric": "aws:num-authorization-failures",
      "criteria": { 
        "comparisonOperator": "less-than",
        "value": { 
          "count": 12,
          "durationSeconds": 300,
          "consecutiveDatapointsToAlarm": 1,
          "consecutiveDatapointsToClear": 1 
        } 
      } 
    }
  ]
}
```
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see UpdateSecurityProfile in AWS CLI Command Reference.

**update-stream**

The following code example shows how to use `update-stream`.

**AWS CLI**

**To update a stream**

The following `update-stream` example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \
--cli-input-json file://update-stream.json
```

Contents of `update-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
Output:

```
{
   "streamId": "stream12345",
   "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
   "streamVersion": 2
}
```

For more information, see [UpdateStream](https://docs.aws.amazon.com/iot/latest/api_reference/API_UpdateStream.html) in the *AWS IoT API Reference*.

- For API details, see [UpdateStream](https://docs.aws.amazon.com/cli/latest/reference/iot/update-thing-group.html) in *AWS CLI Command Reference*.

### update-thing-group

The following code example shows how to use `update-thing-group`.

**AWS CLI**

**To update the definition for a thing group**

The following `update-thing-group` example updates the definition for the specified thing group, changing the description and two attributes.

```
aws iot update-thing-group \  
   --thing-group-name HalogenBulbs \  
   --thing-group-properties "thingGroupDescription="Halogen bulb group"",  
   attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:
For more information, see Thing Groups in the AWS IoT Developers Guide.

For API details, see UpdateThingGroup in AWS CLI Command Reference.

update-thing-groups-for-thing

The following code example shows how to use update-thing-groups-for-thing.

AWS CLI

To change the groups to which a thing belongs

The following update-thing-groups-for-thing example removes the thing named MyLightBulb from the group named DeadBulbs and adds it to the group named replaceableItems at the same time.

```
aws iot update-thing-groups-for-thing \
   --thing-name MyLightBulb \
   --thing-groups-to-add "replaceableItems" \
   --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developer Guide.

For API details, see UpdateThingGroupsForThing in AWS CLI Command Reference.

update-thing

The following code example shows how to use update-thing.

AWS CLI

To associate a thing with a thing type

The following update-thing example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.
This command does not produce output. Use the `describe-thing` command to see the result.

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-types.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThing](https://docs.aws.amazon.com/cli/latest/reference/iot/update-thing.html) in *AWS CLI Command Reference*.

**update-topic-rule-destination**

The following code example shows how to use `update-topic-rule-destination`.

**AWS CLI**

**Example 1: To enable a topic rule destination**

The following `update-topic-rule-destination` example enables traffic to a topic rule destination.

```bash
aws iot update-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
   --status ENABLED
```

This command produces no output.

For more information, see [Enabling a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/enable-topic-rule-destination.html) in the *AWS IoT Developer Guide*.

**Example 2: To disable a topic rule destination**

The following `update-topic-rule-destination` example disables traffic to a topic rule destination.

```bash
aws iot update-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
   --status DISABLED
```

This command produces no output.
Example 3: To send a new confirmation message

The following `update-topic-rule-destination` example sends a new confirmation message for a topic rule destination.

```
aws iot update-topic-rule-destination \\
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \\
    --status IN_PROGRESS
```

This command produces no output.

For more information, see Sending a new confirmation message in the AWS IoT Developer Guide.

- For API details, see UpdateTopicRuleDestination in AWS CLI Command Reference.

validate-security-profile-behaviors

The following code example shows how to use validate-security-profile-behaviors.

AWS CLI

Example 1: To validate the behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \\
    --behaviors "[{{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"greater-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}}]"
```

Output:

```
{
    "valid": true,
}
Example 2: To validate incorrect behaviors parameters for a security profile

The following validate-security-profile-behaviors example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors 
   --behaviors "[{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"greater-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":100000,"consecutiveDatapointsToClear":1}]]"
```

Output:

```
{
   "valid": false,
   "validationErrors": [
      {
        "errorMessage": "Behavior Authorization is malformed. consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
      }
   ]
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ValidateSecurityProfileBehaviors in AWS CLI Command Reference.

AWS IoT 1-Click Devices examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Devices.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

claim-devices-by-claim-code

The following code example shows how to use claim-devices-by-claim-code.

AWS CLI

To claim one or more AWS IoT 1-Click devices using a claim code

The following claim-devices-by-claim-code example claims the specified AWS IoT 1-Click device using a claim code (instead of a device ID).

```
aws iot1click-devices claim-devices-by-claim-code \
--claim-code C-123EXAMPLE
```

Output:

```
{
  "Total": 9
  "ClaimCode": "C-123EXAMPLE"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ClaimDevicesByClaimCode in AWS CLI Command Reference.

describe-device

The following code example shows how to use describe-device.
AWS CLI

To describe a device

The following describe-device example describes the specified device.

```
aws iot1click-devices describe-device \
   --device-id G030PM0123456789
```

Output:

```
{
   "DeviceDescription": {
      "Attributes": {
         "projectRegion": "us-west-2",
         "projectName": "AnytownDumpsters",
         "placementName": "customer217",
         "deviceTemplateName": "empty-dumpster-request"
      },
      "DeviceId": "G030PM0123456789",
      "Enabled": false,
      "RemainingLife": 99.9,
      "Type": "button",
      "Tags": {}  
   }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see DescribeDevice in AWS CLI Command Reference.

finalize-device-claim

The following code example shows how to use finalize-device-claim.

AWS CLI

To finalize a claim request for an AWS IoT 1-Click device using a device ID

The following finalize-device-claim example finalizes a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).
aws iot1click-devices finalize-device-claim \
   --device-id G030PM0123456789

Output:

```
{
   "State": "CLAIMED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see FinalizeDeviceClaim in AWS CLI Command Reference.

get-device-methods

The following code example shows how to use get-device-methods.

AWS CLI

To list the available methods for a device

The following get-device-methods example lists the available methods for a device.

aws iot1click-devices get-device-methods \
   --device-id G030PM0123456789

Output:

```
{
   "DeviceMethods": [
      {
         "MethodName": "getDeviceHealthParameters"
      },
      {
         "MethodName": "setDeviceHealthMonitorCallback"
      },
      {
         "MethodName": "getDeviceHealthMonitorCallback"
      },
      {
      }
```
"MethodName": "setOnClickCallback"
],
{
  "MethodName": "getOnClickCallback"
}
]
}

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see GetDeviceMethods in AWS CLI Command Reference.

initiate-device-claim

The following code example shows how to use initiate-device-claim.

AWS CLI

**To initiate a claim request for an AWS IoT 1-Click device using a device ID**

The following initiate-device-claim example initiates a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices initiate-device-claim \\
  --device-id G030PM0123456789
```

Output:

```
{
  "State": "CLAIM_INITIATED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see InitiateDeviceClaim in AWS CLI Command Reference.

invoke-device-method

The following code example shows how to use invoke-device-method.

Actions and scenarios

3848
AWS CLI

To invoke a device method on a device

The following `invoke-device-method` example invokes the specified method on a device.

```
aws iot1click-devices invoke-device-method \
   --cli-input-json file://invoke-device-method.json
```

Contents of `invoke-device-method.json`:

```json
{
  "DeviceId": "G030PM0123456789",
  "DeviceMethod": {
    "DeviceType": "device",
    "MethodName": "getDeviceHealthParameters"
  }
}
```

Output:

```json
{
  "DeviceMethodResponse": "{"remainingLife": 99.8}"
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the [AWS IoT 1-Click Developer Guide](#).

- For API details, see [InvokeDeviceMethod](#) in [AWS CLI Command Reference](#).

list-device-events

The following code example shows how to use `list-device-events`.

AWS CLI

To list a device's events for a specified time range

The following `list-device-events` example lists the specified device's events for the specified time range.
aws iot1click-devices list-device-events \
   --device-id G030PM0123456789 \

Output:

```json
{
    "Events": [
        {
            "Device": {
                "Attributes": {},
                "DeviceId": "G030PM0123456789",
                "Type": "button"
            },
            "StdEvent": "{"clickType": \"SINGLE\", "reportedTime": \"2019-07-18T23:47:55.015Z\", \"certificateId\": \"fe8798a6c97c62ef8756b80eefdcf2280f3352f82faa8080c74cc4f4a4d1811\", \"remainingLife\": 99.85000000000001, \"testMode\": false}"
        },
        {
            "Device": {
                "Attributes": {},
                "DeviceId": "G030PM0123456789",
                "Type": "button"
            },
            "StdEvent": "{"clickType": \"DOUBLE\", "reportedTime": \"2019-07-19T00:14:41.353Z\", \"certificateId\": \"fe8798a6c97c62ef8756b80eefdcf2280f3352f82faa8080c74cc4f4a4d1811\", \"remainingLife\": 99.8, \"testMode\": false}"
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListDeviceEvents in AWS CLI Command Reference.

**list-devices**

The following code example shows how to use list-devices.
AWS CLI

To list the devices of a specified type

The following list-devices example lists the devices of a specified type.

```bash
aws iot1click-devices list-devices \
   --device-type button
```

This command produces no output.

Output:

```json
{
   "Devices": [
      {
         "remainingLife": 99.9,
         "attributes": {
            "type": "button",
            "deviceId": "G030PM0123456789",
            "enabled": false
         }
      }
   ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListDevices in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a device

The following list-tags-for-resource example list the tags for the specified device.
aws iot1click-devices list-tags-for-resource \\

Output:

```
{
   "Tags": {
       "Driver Phone": "123-555-0199",
       "Driver": "Jorge Souza"
   }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the [AWS IoT 1-Click Developer Guide](#).

- For API details, see [ListTagsForResource](#) in [AWS CLI Command Reference](#).

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

**To add tags to a device AWS resource**

The following `tag-resource` example adds two tags to the specified resource.

```
aws iot1click-devices tag-resource \\
   --cli-input-json file://devices-tag-resource.json
```

Contents of `devices-tag-resource.json`:

```
{
   "Tags": {
       "Driver": "Jorge Souza",
       "Driver Phone": "123-555-0199"
   }
}
```
This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

### unclaim-device

The following code example shows how to use unclaim-device.

**AWS CLI**

**To unclaim (deregister) a device from your AWS account**

The following unclaim-device example unclaims (deregisters) the specified device from your AWS account.

```bash
aws iot1click-devices unclaim-device \
   --device-id G030PM0123456789
```

Output:

```json
{
   "State": "UNCLAIMED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UnclaimDevice in AWS CLI Command Reference.

### untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a device AWS resource**
The following `untag-resource` example removes the tags with the names `Driver Phone` and `Driver` from the specified device resource.

```bash
aws iot1click-devices untag-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters" \
    --tag-keys "Driver Phone" "Driver"
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/using-aws-iot-1-click-with-aws-cli.html) in the [AWS IoT 1-Click Developer Guide](https://docs.aws.amazon.com/iot1click/latest/developerguide/).

### update-device-state

The following code example shows how to use `update-device-state`.

**AWS CLI**

To update the `enabled` state for a device

The following `update-device-state` sets the state of the specified device to enabled.

```bash
aws iot1click-devices update-device-state \
    --device-id G030PM0123456789 \
    --enabled
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/using-aws-iot-1-click-with-aws-cli.html) in the [AWS IoT 1-Click Developer Guide](https://docs.aws.amazon.com/iot1click/latest/developerguide/).

### AWS IoT 1-Click Projects examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Projects.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

associate-device-with-placement

The following code example shows how to use associate-device-with-placement.

AWS CLI

To associate an AWS IoT 1-Click device with an existing placement

The following associate-device-with-placement example associates the specified AWS IoT 1-Click device with an existing placement.

```bash
aws iot1click-projects associate-device-with-placement \
   --project-name AnytownDumpsters \ 
   --placement-name customer217 \ 
   --device-template-name empty-dumpster-request \ 
   --device-id G030PM0123456789
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see AssociateDeviceWithPlacement in AWS CLI Command Reference.

create-placement

The following code example shows how to use create-placement.
AWS CLI

To create an AWS IoT 1-Click placement for a project

The following `create-placement` example creates an AWS IoT 1-Click placement for the specified project.

```bash
aws iot1click-projects create-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217 \
    --attributes "{"location": "123 Any Street Anytown, USA 10001", "phone": "123-456-7890"}"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see `CreatePlacement` in AWS CLI Command Reference.

create-project

The following code example shows how to use `create-project`.

AWS CLI

To create an AWS IoT 1-Click project for zero or more placements

The following `create-project` example creates an AWS IoT 1-Click project for a placement.

```bash
aws iot1click-projects create-project --cli-input-json file://create-project.json
```

Contents of `create-project.json`:

```json
{
    "projectName": "AnytownDumpsters",
    "description": "All dumpsters in the Anytown region.",
    "placementTemplate": {
        "defaultAttributes": {
            "City": "Anytown"
        },
        "deviceTemplates": {
            "empty-dumpster-request": {
```
This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [CreateProject](https://docs.aws.amazon.com/cli/latest/reference/iot1click/creatoproject.html) in *AWS CLI Command Reference*.

### delete-placement

The following code example shows how to use `delete-placement`.

**AWS CLI**

**To delete a placement from a project**

The following `delete-placement` example deletes the specified placement from a project.

```bash
aws iot1click-projects delete-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DeletePlacement](https://docs.aws.amazon.com/cli/latest/reference/iot1click/deletemessage.html) in *AWS CLI Command Reference*.

### delete-project

The following code example shows how to use `delete-project`.

**AWS CLI**

**To delete a project from your AWS account**

The following `delete-project` example deletes the specified project from your AWS account.
aws iot1click-projects delete-project \
   --project-name AnytownDumpsters

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

• For API details, see DeleteProject in AWS CLI Command Reference.

describe-placement

The following code example shows how to use describe-placement.

AWS CLI

To describe a placement for a project

The following describe-placement example describes a placement for the specified project.

aws iot1click-projects describe-placement \
   --project-name AnytownDumpsters \
   --placement-name customer217

Output:

```json
{
   "placement": {
      "projectName": "AnytownDumpsters",
      "placementName": "customer217",
      "attributes": {
         "phone": "123-555-0110",
         "location": "123 Any Street Anytown, USA 10001"
      },
      "createdDate": 1563488454,
      "updatedDate": 1563488454
   }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.
• For API details, see `DescribePlacement` in *AWS CLI Command Reference*.

**describe-project**

The following code example shows how to use `describe-project`.

**AWS CLI**

**To describe an AWS IoT 1-Click project**

The following `describe-project` example describes the specified AWS IoT 1-Click project.

```bash
aws iot1click-projects describe-project \
   --project-name AnytownDumpsters
```

**Output:**

```json
{
   "project": {
      "projectName": "AnytownDumpsters",
      "description": "All dumpsters in the Anytown region.",

         "defaultAttributes": {
            "City": "Anytown"
         },
         "deviceTemplates": {
            "empty-dumpster-request": {
               "deviceType": "button",
               "callbackOverrides": {}
            }
         }
      },
      "tags": {}
   }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/userguide/using-aws-iot-1-click-with-aws-cli.html) in the *AWS IoT 1-Click Developer Guide*. 
• For API details, see DescribeProject in AWS CLI Command Reference.

**disassociate-device-from-placement**

The following code example shows how to use disassociate-device-from-placement.

**AWS CLI**

**To disassociate a device from a placement**

The following disassociate-device-from-placement example disassociates the specified device from a placement.

```bash
aws iot1click-projects disassociate-device-from-placement \
   --project-name AnytownDumpsters \
   --placement-name customer217 \
   --device-template-name empty-dumpster-request
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

• For API details, see DisassociateDeviceFromPlacement in AWS CLI Command Reference.

**get-devices-in-placement**

The following code example shows how to use get-devices-in-placement.

**AWS CLI**

**To list all devices in a placement contained in a project**

The following get-devices-in-placement example lists all devices in a the specified placement contained in the specified project.

```bash
aws iot1click-projects get-devices-in-placement \
   --project-name AnytownDumpsters \
   --placement-name customer217
```

Output:
For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1-click/latest/developerguide/) in the *AWS IoT 1-Click Developer Guide*.

### list-placements

The following code example shows how to use `list-placements`.

**AWS CLI**

**To list all AWS IoT 1-Click placements for a project**

The following `list-placements` example lists all AWS IoT 1-Click placements for the specified project.

```bash
aws iot1click-projects list-placements \
  --project-name AnytownDumpsters
```

**Output:**

```json
{
  "placements": [
    {
      "projectName": "AnytownDumpsters",
      "placementName": "customer217",
      "createdDate": 1563488454,
      "updatedDate": 1563488454
    }
  ]
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1-click/latest/developerguide/) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListPlacements](https://docs.aws.amazon.com/cli/latest/reference/iot1-click/list-placements.html) in *AWS CLI Command Reference*. 
list-projects

The following code example shows how to use list-projects.

AWS CLI

To list all AWS IoT 1-Click projects

The following list-projects example list all AWS IoT 1-Click projects in your account.

```bash
aws iot1click-projects list-projects
```

Output:

```json
{
    "projects": [
        {
            "projectName": "AnytownDumpsters",
            "createdDate": 1563483100,
            "updatedDate": 1563483100,
            "tags": {}
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListProjects in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a project resource

The following list-tags-for-resource example list the tags for the specified project resource.
aws iot1click-projects list-tags-for-resource \

Output:

```
{
   "tags": {
       "Manager": "Li Juan",
       "Account": "45215"
   }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a project resource

The following tag-resource example adds two tags to the specified project resource.

```
aws iot1click-projects tag-resource \
   --cli-input-json file://devices-tag-resource.json
```

Contents of devices-tag-resource.json:

```
{
   "resourceArn": "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters",
   "tags": {
      "Account": "45215",
      "Manager": "Li Juan"
   }
}
```
This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

### untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a project resource**

The following untag-resource example removes the tag with the key name Manager from the specified project.

```
aws iot1click-projects untag-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters" \
    --tag-keys "Manager"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

### update-placement

The following code example shows how to use update-placement.

**AWS CLI**

**To update the "attributes" key-value pairs of a placement**

The following update-placement example update the "attributes" key-value pairs of a placement.

```
aws iot1click-projects update-placement \
    --project-arn "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters"
```
AWS Command Line Interface

--cli-input-json file://update-placement.json

Contents of update-placement.json:

```json
{
    "projectName": "AnytownDumpsters",
    "placementName": "customer217",
    "attributes": {
        "phone": "123-456-7890",
        "location": "123 Any Street Anytown, USA 10001"
    }
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UpdatePlacement in AWS CLI Command Reference.

update-project

The following code example shows how to use update-project.

**AWS CLI**

**To update settings for a project**

The following update-project example updates the description for a project.

```
aws iot1click-projects update-project \
    --project-name AnytownDumpsters \
    --description "All dumpsters (yard waste, recycling, garbage) in the Anytown region."
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UpdateProject in AWS CLI Command Reference.
AWS IoT Analytics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Analytics.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-put-message**

The following code example shows how to use `batch-put-message`.

**AWS CLI**

To send a message to a channel

The following `batch-put-message` example sends a message to the specified channel.

```
aws iotanalytics batch-put-message \
   --cli-binary-format raw-in-base64-out \
   --cli-input-json file://batch-put-message.json
```

Contents of `batch-put-message.json`:

```
{
   "channelName": "mychannel",
   "messages": [
      {
         "messageId": "0001",
         "payload": "eyAidGVtcGVyYXR1cmUiOiAyMCB9"
      }
   ]
}
```
Output:

```json
{
    "batchPutMessageErrorEntries": []
}
```

For more information, see [BatchPutMessage](#) in the [AWS IoT Analytics API Reference](#).
- For API details, see [BatchPutMessage](#) in [AWS CLI Command Reference](#).

### cancel-pipeline-reprocessing

The following code example shows how to use `cancel-pipeline-reprocessing`.

**AWS CLI**

To cancel the reprocessing of data through a pipeline

The following `cancel-pipeline-reprocessing` example cancels the reprocessing of data through the specified pipeline.

```bash
aws iotanalytics cancel-pipeline-reprocessing \
    --pipeline-name mypipeline \
    --reprocessing-id "6ad2764f-fb13-4de3-b101-4e74af03b043"
```

This command produces no output.

For more information, see [CancelPipelineReprocessing](#) in the [AWS IoT Analytics API Reference](#).
- For API details, see [CancelPipelineReprocessing](#) in [AWS CLI Command Reference](#).

### create-channel

The following code example shows how to use `create-channel`.

**AWS CLI**

To create a channel
The following `create-channel` example creates a channel with the specified configuration. A channel collects data from an MQTT topic and archives the raw, unprocessed messages before publishing the data to a pipeline.

```
aws iotanalytics create-channel \
   --cli-input-json file://create-channel.json
```

**Contents of `create-channel.json`:**

```json
{
   "channelName": "mychannel",
   "retentionPeriod": {
      "unlimited": true
   },
   "tags": [
      {
         "key": "Environment",
         "value": "Production"
      }
   ]
}
```

**Output:**

```json
{
   "channelArn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel",
   "channelName": "mychannel",
   "retentionPeriod": {
      "unlimited": true
   }
}
```

For more information, see [CreateChannel](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_CreateChannel.html) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateChannel](https://docs.aws.amazon.com/cli/latest/reference/iotanalytics/create-channel.html) in *AWS CLI Command Reference*.

---

**create-dataset-content**

The following code example shows how to use `create-dataset-content`.

---

**Actions and scenarios**

3868
AWS CLI

To create the content of a dataset

The following create-dataset-content example creates the content of the specified dataset by applying a queryAction (an SQL query) or a containerAction (executing a containerized application).

```bash
aws iotanalytics create-dataset-content \
--dataset-name mydataset
```

Output:

```json
{
   "versionId": "d494b416-9850-4670-b885-ca22f1e89d62"
}
```

For more information, see [CreateDatasetContent](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_CreateDatasetContent.html) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateDatasetContent](https://docs.aws.amazon.com/cli/latest/reference/iot-analytics/create-dataset-content.html) in *AWS CLI Command Reference*.

create-dataset

The following code example shows how to use create-dataset.

AWS CLI

To create a dataset

The following create-dataset example creates a dataset. A dataset stores data retrieved from a data store by applying a queryAction (a SQL query) or a containerAction (executing a containerized application). This operation creates the skeleton of a dataset. You can populate the dataset manually by calling CreateDatasetContent or automatically according to a trigger you specify.

```bash
aws iotanalytics create-dataset \
--cli-input-json file://create-dataset.json
```

Contents of create-dataset.json:

```json
Actions and scenarios
```
The following code example shows how to use `create-datastore`.

**AWS CLI**

To create a data store
The following `create-datastore` example creates a data store, which is a repository for messages.

```bash
aws iotanalytics create-datastore \
  --cli-input-json file://create-datastore.json
```

**Contents of `create-datastore.json`**:

```json
{
  "datastoreName": "mydatastore",
  "retentionPeriod": {
    "numberOfDays": 90
  },
  "tags": [
    {
      "key": "Environment",
      "value": "Production"
    }
  ]
}
```

**Output**:

```json
{
  "datastoreName": "mydatastore",
  "retentionPeriod": {
    "numberOfDays": 90,
    "unlimited": false
  }
}
```

For more information, see [CreateDatastore](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateDatastore](#) in *AWS CLI Command Reference*.

**create-pipeline**

The following code example shows how to use `create-pipeline`.
Create an IoT Analytics Pipeline

The following `create-pipeline` example creates a pipeline. A pipeline consumes messages from a channel and allows you to process the messages before storing them in a data store. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities in the `pipelineActivities` array.

```
aws iotanalytics create-pipeline \
    --cli-input-json file://create-pipeline.json
```

Contents of `create-pipeline.json`:

```json
{
    "pipelineName": "mypipeline",
    "pipelineActivities": [
        {
            "channel": {
                "name": "myChannelActivity",
                "channelName": "mychannel",
                "next": "myMathActivity"
            }
        },
        {
            "datastore": {
                "name": "myDatastoreActivity",
                "datastoreName": "mydatastore"
            }
        },
        {
            "math": {
                "name": "myMathActivity",
                "math": "((temp - 32) * 5.0) / 9.0",
                "attribute": "tempC",
                "next": "myDatastoreActivity"
            }
        }
    ],
    "tags": [
        {
            "key": "Environment",
            "value": "Beta"
        }
    ]
}
```
Output:

```json
{
    "pipelineName": "mypipeline"
}
```

For more information, see CreatePipeline in the AWS IoT Analytics API Reference.

- For API details, see CreatePipeline in AWS CLI Command Reference.

**delete-channel**

The following code example shows how to use delete-channel.

**AWS CLI**

Delete an IoT Analytics Channel

The following delete-channel example deletes the specified channel.

```bash
aws iotanalytics delete-channel \
  --channel-name mychannel
```

This command produces no output.

For more information, see DeleteChannel in the AWS IoT Analytics API Reference.

- For API details, see DeleteChannel in AWS CLI Command Reference.

**delete-dataset-content**

The following code example shows how to use delete-dataset-content.

**AWS CLI**

To delete dataset content
The following `delete-dataset-content` example deletes the content of the specified dataset.

```
aws iotanalytics delete-dataset-content \
   --dataset-name mydataset
```

This command produces no output.

For more information, see `DeleteDatasetContent` in the *AWS IoT Analytics API Reference*.

- For API details, see `DeleteDatasetContent` in *AWS CLI Command Reference*.

### delete-dataset

The following code example shows how to use `delete-dataset`.

**AWS CLI**

**To delete a dataset**

The following `delete-dataset` example deletes the specified dataset. You don't have to delete the content of the dataset before you perform this operation.

```
aws iotanalytics delete-dataset \
   --dataset-name mydataset
```

This command produces no output.

For more information, see `DeleteDataset` in the *AWS IoT Analytics API Reference*.

- For API details, see `DeleteDataset` in *AWS CLI Command Reference*.

### delete-datastore

The following code example shows how to use `delete-datastore`.

**AWS CLI**

**To delete a data store**

The following `delete-datastore` example deletes the specified data store.
aws iotanalytics delete-datastore \
   --datastore-name mydatastore

This command produces no output.

For more information, see DeleteDatastore in the AWS IoT Analytics API Reference.
• For API details, see DeleteDatastore in AWS CLI Command Reference.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete a pipeline

The following delete-pipeline example deletes the specified pipeline.

aws iotanalytics delete-pipeline \
   --pipeline-name mypipeline

This command produces no output.

For more information, see DeletePipeline in the AWS IoT Analytics API Reference.
• For API details, see DeletePipeline in AWS CLI Command Reference.

describe-channel

The following code example shows how to use describe-channel.

AWS CLI

To retrieve information about a channel

The following describe-channel example displays details, including statistics, for the specified channel.

aws iotanalytics describe-channel \
   --channel-name mychannel \
   --include-statistics
describe-dataset

The following code example shows how to use describe-dataset.

**AWS CLI**

To retrieve information about a dataset

The following describe-dataset example displays details for the specified dataset.

```
aws iotanalytics describe-dataset \
  --dataset-name mydataset
```

Output:

```
{
  "dataset": {
    "statistics": {
      "size": {
        "estimatedSizeInBytes": 402.0,
        "estimatedOn": 1561504380.0
      }
    },
    "channel": {
      "status": "ACTIVE",
      "name": "mychannel",
      "lastUpdateTime": 1557860351.001,
      "creationTime": 1557860351.001,
      "retentionPeriod": {
        "unlimited": true
      },
      "arn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
    }
  }
}
```

For more information, see [DescribeChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeChannel](#) in *AWS CLI Command Reference*.
For more information, see `DescribeDataset` in the *AWS IoT Analytics API Reference*.

- For API details, see `DescribeDataset` in *AWS CLI Command Reference*.

### describe-datastore

The following code example shows how to use `describe-datastore`.

**AWS CLI**

**To retrieve information about a data store**

The following `describe-datastore` example displays details, including statistics, for the specified data store.

```bash
aws iotanalytics describe-datastore \
  --datastore-name mydatastore \
  --include-statistics
```

Output:
For more information, see [DescribeDatastore](https://docs.aws.amazon.com/iotanalytics/APIReference/API_DescribeDatastore.html) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeDatastore](https://docs.aws.amazon.com/cli/latest/reference/iotanalytics/describe-datastore.html) in *AWS CLI Command Reference*.

**describe-logging-options**

The following code example shows how to use `describe-logging-options`.

**AWS CLI**

**To retrieve the current logging options**

The following `describe-logging-options` example displays the current AWS IoT Analytics logging options.

```bash
aws iotanalytics describe-logging-options
```

This command produces no output. Output:

```json
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
        "enabled": true,
    }
}
```
describe-pipeline

The following code example shows how to use describe-pipeline.

AWS CLI

To retrieve information about a pipeline

The following describe-pipeline example displays details for the specified pipeline.

```bash
aws iotanalytics describe-pipeline \
    --pipeline-name mypipeline
```

Output:

```json
{
    "pipeline": {
        "activities": [
            {
                "channel": {
                    "channelName": "mychannel",
                    "name": "mychannel_28",
                    "next": "mydatastore_29"
                }
            },
            {
                "datastore": {
                    "datastoreName": "mydatastore",
                    "name": "mydatastore_29"
                }
            }
        ],
        "name": "mypipeline",
        "lastUpdateTime": 1561676362.515,
        "creationTime": 1557859124.432,
    
```
For more information, see DescribePipeline in the AWS IoT Analytics API Reference.

- For API details, see DescribePipeline in AWS CLI Command Reference.

get-dataset-content

The following code example shows how to use get-dataset-content.

AWS CLI

To retrieve the contents of a dataset

The following get-dataset-content example retrieves the contents of a dataset as presigned URIs.

```
aws iotanalytics get-dataset-content --dataset-name mydataset
```

Output:

```
{
    "status": { 
        "state": "SUCCEEDED"
    },
    "timestamp": 1557863215.995,
    "entries": [
        { 
        }
    ]
}
```
For more information, see GetDatasetContent in the guide.

- For API details, see GetDatasetContent in AWS CLI Command Reference.

**list-channels**

The following code example shows how to use list-channels.

**AWS CLI**

**To retrieve a list of channels**

The following list-channels example displays summary information for the available channels.

```bash
aws iotanalytics list-channels
```

**Output:**

```json
{
  "channelSummaries": [
    {
      "status": "ACTIVE",
      "channelName": "mychannel",
      "creationTime": 1557860351.001,
      "lastUpdateTime": 1557860351.001
    }
  ]
}
```

For more information, see ListChannels in the AWS IoT Analytics API Reference.

- For API details, see ListChannels in AWS CLI Command Reference.

**list-dataset-contents**

The following code example shows how to use list-dataset-contents.
AWS CLI

To list information about dataset contents

The following `list-dataset-contents` example lists information about dataset contents that have been created.

```bash
aws iotanalytics list-dataset-contents
    --dataset-name mydataset
```

Output:

```json
{
    "datasetContentSummaries": [
        {
            "status": {
                "state": "SUCCEEDED"
            },
            "scheduleTime": 1557863215.995,
            "version": "b10ea2a9-66c1-4d99-8d1f-518113b738d0",
            "creationTime": 1557863215.995
        }
    ]
}
```

For more information, see `ListDatasetContents` in the `AWS IoT Analytics API Reference`.

- For API details, see `ListDatasetContents` in `AWS CLI Command Reference`.

list-datasets

The following code example shows how to use `list-datasets`.

AWS CLI

To retrieve information about datasets

The following `list-datasets` example lists summary information about available datasets.

```bash
aws iotanalytics list-datasets
```

Output:
For more information, see [ListDatasets](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListDatasets](#) in *AWS CLI Command Reference*.

**list-datastores**

The following code example shows how to use `list-datastores`.

**AWS CLI**

**To retrieve a list of data stores**

The following `list-datastores` example displays summary information about the available data stores.

```bash
aws iotanalytics list-datastores
```

**Output:**

```json
{
    "datastoreSummaries": [
        {
            "status": "ACTIVE",
            "datastoreName": "mydatastore",
            "actions": [
                {
                    "actionName": "query_32",
                    "actionType": "QUERY"
                }
            ]
        }
    ]
}
```
list-pipelines

The following code example shows how to use list-pipelines.

AWS CLI

To retrieve a list of pipelines

The following list-pipelines example displays a list of available pipelines.

```
aws iotanalytics list-pipelines
```

Output:

```
{
    "pipelineSummaries": [
        {
            "pipelineName": "mypipeline",
            "creationTime": 1557859124.432,
            "lastUpdateTime": 1557859124.432,
            "reprocessingSummaries": []
        }
    ]
}
```

For more information, see ListPipelines in the AWS IoT Analytics API Reference.

- For API details, see ListPipelines in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

For more information, see ListDatastores in the AWS IoT Analytics API Reference.

- For API details, see ListDatastores in AWS CLI Command Reference.
AWS CLI

To list tags for a resource

The following list-tags-for-resource example Lists the tags that you have attached to the specified resource.

```bash
aws iotanalytics list-tags-for-resource --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
```

Output:

```json
{
  "tags": [
    {
      "value": "bar",
      "key": "foo"
    }
  ]
}
```

For more information, see ListTagsForResource in the AWS IoT Analytics API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-logging-options

The following code example shows how to use put-logging-options.

AWS CLI

To set or update logging options

The following put-logging-options example sets or updates the AWS IoT Analytics logging options. If you update the value of any loggingOptions field, it can take up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the "roleArn" field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```bash
aws iotanalytics put-logging-options \
```
Contents of put-logging-options.json:

```json
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
        "level": "ERROR",
        "enabled": true
    }
}
```

This command produces no output.

For more information, see [PutLoggingOptions](#) in the AWS IoT Analytics API Reference.

- For API details, see [PutLoggingOptions](#) in AWS CLI Command Reference.

**run-pipeline-activity**

The following code example shows how to use `run-pipeline-activity`.

**AWS CLI**

**To simulate a pipeline activity**

The following `run-pipeline-activity` example simulates the results of running a pipeline activity on a message payload.

```
aws iotanalytics run-pipeline-activity \
    --pipeline-activity file://maths.json \
    --payloads file://payloads.json
```

Contents of `maths.json`:

```json
{
    "math": {
        "name": "MyMathActivity",
        "math": "((temp - 32) * 5.0) / 9.0",
        "attribute": "tempC"
    }
}
```
Contents of payloads.json:

```
[
  "{"humidity": 52, "temp": 68 }",
  "{"humidity": 52, "temp": 32 }"
]
```

Output:

```
{
  "logResult": "",
  "payloads": [
    "eyJodW1pZGl0eSI6NTIsInRlbXAiOjY4LCJ0ZW1wQyI6MjB9",
    "eyJodW1pZGl0eSI6NTIsInRlbXAiOjMyLCJ0ZW1wQyI6MH0="
  ]
}
```

For more information, see [RunPipelineActivity](https://docs.aws.amazon.com/iotanalytics/latest/developerguide/iot-analytics-api-reference.html#iot-analytics-api-reference-runpipelineactivity) in the *AWS IoT Analytics API Reference*.

- For API details, see [RunPipelineActivity](https://docs.aws.amazon.com/cli/latest/reference/iotanalytics/runpipelineactivity.html) in *AWS CLI Command Reference*.

**sample-channel-data**

The following code example shows how to use sample-channel-data.

**AWS CLI**

**To retrieve sample messages from a channel**

The following sample-channel-data example retrieves a sample of messages from the specified channel ingested during the specified timeframe. You can retrieve up to 10 messages.

```
aws iotanalytics sample-channel-data \
  --channel-name mychannel
```

Output:

```
{
```
For more information, see [SampleChannelData](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [SampleChannelData](#) in *AWS CLI Command Reference*.

**start-pipeline-reprocessing**

The following code example shows how to use `start-pipeline-reprocessing`.

**AWS CLI**

**To start pipeline reprocessing**

The following `start-pipeline-reprocessing` example starts the reprocessing of raw message data through the specified pipeline.

```bash
aws iotanalytics start-pipeline-reprocessing
  --pipeline-name mypipeline
```

**Output:**

```json
{
  "reprocessingId": "6ad2764f-fb13-4de3-b101-4e74af03b043"
}
```

For more information, see [StartPipelineReprocessing](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [StartPipelineReprocessing](#) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or modify tags for a resource**
The following `tag-resource` example adds to or modifies the tags attached to the specified resource.

```bash
aws iotanalytics tag-resource \
  --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \
  --tags "[{"key": "Environment", "value": "Production"}]"
```

This command produces no output.

For more information, see `TagResource` in the *AWS IoT Analytics API Reference*.
- For API details, see `TagResource` in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove tags from a resource

The following `untag-resource` example removes the tags with the specified key names from the specified resource.

```bash
aws iotanalytics untag-resource \
  --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \
  --tag-keys "["Environment"]"
```

This command produces no output.

For more information, see `UntagResource <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UntagResource.html>` in the *AWS IoT Analytics API Reference*.
- For API details, see `UntagResource` in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

**AWS CLI**

To modify a channel
The following `update-channel` example modifies the settings for the specified channel.

```
aws iotanalytics update-channel \
   --cli-input-json file://update-channel.json
```

Contents of `update-channel.json`:

```
{
   "channelName": "mychannel",
   "retentionPeriod": {
      "numberOfDays": 92
   }
}
```

This command produces no output.

For more information, see [UpdateChannel](#) in the AWS IoT Analytics API Reference.

- For API details, see [UpdateChannel](#) in AWS CLI Command Reference.

**update-dataset**

The following code example shows how to use `update-dataset`.

**AWS CLI**

**To update a dataset**

The following `update-dataset` example modifies the settings of the specified dataset.

```
aws iotanalytics update-dataset \
   --cli-input-json file://update-dataset.json
```

Contents of `update-dataset.json`:

```
{
   "datasetName": "mydataset",
   "actions": [
   {
      "actionName": "myDatasetUpdateAction",
      "queryAction": {
         "sqlQuery": "SELECT * FROM mydatastore"
      }
   }
   
```
This command produces no output.

For more information, see UpdateDataset <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UpdateDataset.html> in the AWS IoT Analytics API Reference.

- For API details, see UpdateDataset in AWS CLI Command Reference.

**update-datastore**

The following code example shows how to use update-datastore.

**AWS CLI**

**To update a data store**

The following update-datastore example modifies the settings of the specified data store.

```
aws iotanalytics update-datastore \
  --cli-input-json file://update-datastore.json
```

Contents of update-datastore.json:

```json
{
  "datastoreName": "mydatastore",
  "retentionPeriod": {
    "numberOfDays": 93
  }
}
```

This command produces no output.

For more information, see UpdateDatastore in the AWS IoT Analytics API Reference.

- For API details, see UpdateDatastore in AWS CLI Command Reference.
update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update a pipeline

The following update-pipeline example modifies the settings of the specified pipeline. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities, in the pipelineActivities array.

```
aws iotanalytics update-pipeline \
   --cli-input-json file://update-pipeline.json
```

Contents of update-pipeline.json:

```json
{
   "pipelineName": "mypipeline",
   "pipelineActivities": [
      {
         "channel": {
            "name": "myChannelActivity",
            "channelName": "mychannel",
            "next": "myMathActivity"
         }
      },
      {
         "datastore": {
            "name": "myDatastoreActivity",
            "datastoreName": "mydatastore"
         }
      },
      {
         "math": {
            "name": "myMathActivity",
            "math": "(((temp - 32) * 5.0) / 9.0) + 273.15",
            "attribute": "tempK",
            "next": "myDatastoreActivity"
         }
      }
   ]
}
```
This command produces no output.

For more information, see UpdatePipeline in the AWS IoT Analytics API Reference.
• For API details, see UpdatePipeline in AWS CLI Command Reference.

Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

create-suite-definition

The following code example shows how to use create-suite-definition.

AWS CLI

Example 1: To create an IoT Device Advisor test suite

The following create-suite-definition example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```bash
aws iotdeviceadvisor create-suite-definition
   --suite-definition-configuration '{
```
"suiteDefinitionName": "TestSuiteName", \\
"devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIoTThing"}], \\
"intendedForQualification": false, \\
"rootGroup": "{"configuration":{},"tests": [{"name": "MQTT_Connect", "configuration": "{"EXECUTION_TIMEOUT":120}, "tests": [{"name": "MQTT_Connect", "configuration": "", "test": [{"id": "MQTT_Connect", "testCase": null, "version": "0.0.0"}]}, ]}, ]}
"devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"'}

Output:

```
{
    "suiteDefinitionId": "0jtsgio7yenu",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/0jtsgio7yenu",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see [Create a test suite definition](#) in the AWS IoT Core Developer Guide.

**Example 2: To create an IoT Device Advisor Latest Qualification test suite**

The following create-suite-definition example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \\
   --suite-definition-configuration '{ \\
        "suiteDefinitionName": "TestSuiteName", \\
        "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIoTThing"}], \\
        "intendedForQualification": true, \\
        "rootGroup": "", \\
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"'}
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/txgsuolk2myj",
```
For more information, see Create a test suite definition in the AWS IoT Core Developer Guide.

- For API details, see CreateSuiteDefinition in AWS CLI Command Reference.

**delete-suite-definition**

The following code example shows how to use delete-suite-definition.

**AWS CLI**

To delete the IoT Device Advisor test suite

The following delete-suite-definition example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition \
    --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see DeleteSuiteDefinition in the AWS IoT API Reference.

- For API details, see DeleteSuiteDefinition in AWS CLI Command Reference.

**get-endpoint**

The following code example shows how to use get-endpoint.

**AWS CLI**

**Example 1: To get the information about an IoT Device Advisor Account-level endpoint**

The following get-endpoint example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:
Example 2: To get the information about an IoT Device Advisor Device-level endpoint

The following get-endpoint example gets the information about a device advisor device-level test endpoint with the specified thing-arn or certificate-arn.

```
aws iotdeviceadvisor get-endpoint \
   --thing-arn arn:aws:iot:us-east-1:123456789012:thing/MyIotThing
```

Output:

```
{
   "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

For more information, see Get a test endpoint in the AWS IoT Core Developer Guide.

- For API details, see GetEndpoint in AWS CLI Command Reference.

get-suite-definition

The following code example shows how to use get-suite-definition.

AWS CLI

To get the information about an IoT Device Advisor test suite

The following get-suite-definition example get the information about a device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor get-suite-definition \
   --suite-definition-id qqcsmtyyjabl
```

Output:

```
{
   "suiteDefinitionId": "qqcsmtyyjabl",
}
```
"suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/qqcsmtyyjabl",
"suiteDefinitionVersion": "v1",
"latestVersion": "v1",
"suiteDefinitionConfiguration": {
    "suiteDefinitionName": "MQTT connection",
    "devices": [],
    "intendedForQualification": false,
    "isLongDurationTest": false,
    "rootGroup": "{"configuration":{},"tests": [{"id":"uta5d9j1kwc","name":"Test group 1","configuration":{},"tests": [{"id":"awr8pq5vc9yp","name":"MQTT Connect","configuration":{},"test": {"id":"MQTT_Connect","testCase":null,"version":"0.0.0"}}]}"]}
"devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole",
"protocol": "MqttV3_1_1"
},
"createdAt": "2022-11-11T22:28:52.389000-05:00",
"lastModifiedAt": "2022-11-11T22:28:52.389000-05:00",
"tags": {}
}

For more information, see [Get a test suite definition](https://docs.aws.amazon.com/iotdeviceadvisor/latest/developer-guide/get-test-suite-definition.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [GetSuiteDefinition](https://docs.aws.amazon.com/cli/latest/reference/iotdeviceadvisor/get-suite-definition.html) in *AWS CLI Command Reference*.

### get-suite-run-report

The following code example shows how to use `get-suite-run-report`.

#### AWS CLI

**To get the information about an IoT Device Advisor qualifying test suite run report**

The following `get-suite-run-report` example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run-report \
    --suite-definition-id ztvb5aek4w4x \
    --suite-run-id p6awv83nre6v
```

**Output:**

```json
{
}
For more information, see Get a qualification report for a successful qualification test suite run in the AWS IoT Core Developer Guide.

- For API details, see GetSuiteRunReport in AWS CLI Command Reference.

get-suite-run

The following code example shows how to use get-suite-run.

AWS CLI

To get the information about an IoT Device Advisor test suite run status

The following get-suite-run example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```bash
aws iotdeviceadvisor get-suite-run \
   --suite-definition-id qqcsmtyyjabl \
   --suite-run-id nzlfyhaa18oa
```

Output:

```json
{
   "suiteDefinitionId": "qqcsmtyyjabl",
   "suiteDefinitionVersion": "v1",
   "suiteRunId": "nzlfyhaa18oa",
   "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/qqcsmtyyjabl/nzlfyhaa18oa",
   "suiteRunConfiguration": {
      "primaryDevice": {
         "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing",
         "certificateArn": "arn:aws:iot:us-east-1:123456789012:cert/certFile"
      },
      "parallelRun": false
   },
   "testResult": {
      "groups": [
         {
            "groupId": "uta5d9j1kvwc",
```
For more information, see [Get a test suite run](https://docs.aws.amazon.com/iot-deviceadvisor/latest/developerguide/get-suites.html) in the *AWS IoT Core Developer Guide*.

### list-suite-definitions

The following code example shows how to use `list-suite-definitions`.

**AWS CLI**

**Example 1: To list the IoT Device Advisor test suites you created**

The following `list-suite-definitions` example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

```
aws iotdeviceadvisor list-suite-definitions
```
Example 2: To list the IoT Device Advisor test suites you created with the specified settings

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified max-result number. If you have more test suites than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
  --max-result 1 \
  --next-token "nextTokenValue"
```

Output:

```
{
  "suiteDefinitionInformationList": [
  {
    "suiteDefinitionId": "ztvb5aew4w4x",
    "intendedForQualification": false,
    "isLongDurationTest": false,
    "protocol": "MqttV3_1_1",
    "createdAt": "2022-11-17T14:15:56.830000-05:00"
  },
  {
    ...  
  }],
  "nextToken": "nextTokenValue"
}
```
For more information, see ListSuiteDefinitions in the AWS IoT API Reference.

- For API details, see ListSuiteDefinitions in AWS CLI Command Reference.

list-suite-runs

The following code example shows how to use list-suite-runs.

AWS CLI

Example 1: To list all information about the specified IoT Device Advisor test suite runs status

The following list-suite-runs example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

aws iotdeviceadvisor list-suite-runs \\
   --suite-definition-id ztvb5aew4w4x

Output:

```json
{
   "suiteRunsList": [
      {
         "suiteDefinitionId": "ztvb5aew4w4x",
         "suiteDefinitionVersion": "v1",
         "suiteDefinitionName": "TestSuite",
         "suiteRunId": "p6awv89nre6v",
```
Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id qqcsmtyyjaml \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteRunsList": [ 
        

            
        
    ],
    "nextToken": "nextTokenValue"
}
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags attached to an IoT Device Advisor resource

The following `list-tags-for-resource` example lists the tags attached to a device advisor resource. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor list-tags-for-resource \
  --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjpg38ny
```

Output:

```
{
  "tags": {
    "TestTagKey": "TestTagValue"
  }
}
```

For more information, see `ListTagsForResource` in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see `ListTagsForResource` in *AWS CLI Command Reference*.

**start-suite-run**

The following code example shows how to use `start-suite-run`.

**AWS CLI**

To start an IoT Device Advisor test suite run
The following `start-suite-run` example lists the available widgets in your AWS account.

```bash
aws iotdeviceadvisor start-suite-run \
   --suite-definition-id qqcsmttyyjabl \
   --suite-definition-version v1 \
```

Output:

```json
{
   "suiteRunId": "pwmucgw7lt9s",
   "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/qqcsmttyyjabl/pwmucgw7lk9s",
   "createdAt": "2022-12-02T15:43:05.581000-05:00"
}
```

For more information, see [Start a test suite run](https://docs.aws.amazon.com/iot-deviceadvisor/latest/developer-guide/start_test.html) in the AWS IoT Core Developer Guide.

---

**stop-suite-run**

The following code example shows how to use `stop-suite-run`.

**AWS CLI**

**To stop an IoT Device Advisor test suite that is currently running**

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```bash
aws iotdeviceadvisor stop-suite-run \
   --suite-definition-id qqcsmttyyjabl \
   --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see [Stop a test suite run](https://docs.aws.amazon.com/iot-deviceadvisor/latest/developer-guide/stop_test.html) in the AWS IoT Core Developer Guide.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

*To add to and modify the existing tags of an IoT Device Advisor resource*

The following `tag-resource` example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor tag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjyg38ny \
    --tags '{"TagKey": "TagValue"}"
```

This command produces no output.

For more information, see [TagResource](#) in the AWS IoT API Reference and [Resource types defined by AWS IoT Core Device Advisor](#) in the Service Authorization Reference.

- For API details, see [TagResource](#) in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

*To remove the existing tags from an IoT Device Advisor resource*

The following `untag-resource` example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor untag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjyg38ny \
    --tag-keys "TagKey"
```
This command produces no output.

For more information, see `UntagResource` in the AWS IoT API Reference and `Resource types defined by AWS IoT Core Device Advisor` in the Service Authorization Reference.

- For API details, see `UntagResource` in AWS CLI Command Reference.

**update-suite-definition**

The following code example shows how to use `update-suite-definition`.

**AWS CLI**

**Example 1: To update an IoT Device Advisor test suite**

The following update-suite-definition example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```bash
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id 3hsn88h4p2g5 \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": ["thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIoTThing"], \
        "intendedForQualification": false, \
        "rootGroup": "{\"configuration\":{},\"tests\":{{\"name\":\"MQTT Connect\", \"configuration\":{{\"EXECUTION_TIMEOUT\":120},\"tests\":{{\"name\":\"MQTT_Connect\", \"configuration\":{},\"test\":{{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version \":\"0.0.0\"}}}]]}}", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```json
{
    "suiteDefinitionId": "3hsn88h4p2g5",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

**Example 2: To update an IoT Device Advisor Qualification test suite**
The following update-suite-definition example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```bash
aws iotdeviceadvisor update-suite-definition
   --suite-definition-id txgsuolk2myj
   --suite-definition-configuration '{
   "suiteDefinitionName": "TestSuiteName",
   "devices": ["thingArn":"arn:aws:iot:us-east-1:123456789012:thing/MyIotThing"],
   "intendedForQualification": true,
   "rootGroup": ",",
   "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"]'
```

Output:

```json
{
   "suiteDefinitionId": "txgsuolk2myj",
   "suiteDefinitionName": "TestSuiteName",
   "suiteDefinitionVersion": "v3",
   "createdAt": "2022-11-17T14:15:56.830000-05:00",
   "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

For more information, see [UpdateSuiteDefinition](https://docs.aws.amazon.com/iot/latest/developerguide/api-update-suite-definition.html) in the [AWS IoT API Reference](https://docs.aws.amazon.com/iot/latest/developerguide/api-update-suite-definition.html).

- For API details, see [UpdateSuiteDefinition](https://docs.aws.amazon.com/iot/latest/developerguide/api-update-suite-definition.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/iot/latest/developerguide/cli-actions.html).

### AWS IoT data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT data.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

**delete-thing-shadow**

The following code example shows how to use `delete-thing-shadow`.

**AWS CLI**

**To delete a device's shadow document**

The following `delete-thing-shadow` example deletes the entire shadow document for the device named MyRPi.

```
aws iot-data delete-thing-shadow \
    --thing-name MyRPi \
    "output.txt"
```

The command produces no output on the display, but `output.txt` contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see [Using Shadows](https://aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingShadow](https://docs.aws.amazon.com/cli/latest/reference/iot-data/delete-thing-shadow.html) in *AWS CLI Command Reference*.

**get-thing-shadow**

The following code example shows how to use `get-thing-shadow`.

**AWS CLI**

**To get a thing shadow document**

The following `get-thing-shadow` example gets the thing shadow document for the specified IoT thing.

```
aws iot-data get-thing-shadow \
```

The command produces no output on the display, but the following shows the contents of output.txt:

```
{
    "state":{
        "reported":{
            "moisture":"low"
        }
    },
    "metadata":{
        "reported":{
            "moisture":{
                "timestamp":1560269319
            }
        }
    },
    "version":1,"timestamp":1560269405
}
```

For more information, see [Device Shadow Service Data Flow](https://aws.amazon.com/iot-developers-guide/) in the *AWS IoT Developers Guide*.

- For API details, see [GetThingShadow](https://docs.aws.amazon.com/cli/latest/reference/iot-data/get-thing-shadow.html) in *AWS CLI Command Reference*.

### update-thing-shadow

The following code example shows how to use `update-thing-shadow`.

**AWS CLI**

**To update a thing shadow**

The following `update-thing-shadow` example modifies the current state of the device shadow for the specified thing and saves it to the file `output.txt`.

```
aws iot-data update-thing-shadow
    --thing-name MyRPi \
    --payload "{"state":{"reported":{"moisture":"okay"}}}" \
    "output.txt"
```
The command produces no output on the display, but the following shows the contents of output.txt:

```json
{
  "state": {
    "reported": {
      "moisture": "okay"
    }
  },
  "metadata": {
    "reported": {
      "moisture": {
        "timestamp": 1560270036
      }
    }
  },
  "version": 2,
  "timestamp": 1560270036
}
```

For more information, see [Device Shadow Service Data Flow](https://aws.amazon.com) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingShadow](https://aws.amazon.com) in *AWS CLI Command Reference*.

**AWS IoT Events examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
Actions

batch-put-message

The following code example shows how to use batch-put-message.

AWS CLI

To send messages (inputs) to AWS IoT Events

The following batch-put-message example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (inputName) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
   --cli-input-json file://highPressureMessage.json
```

Contents of highPressureMessage.json:

```
{
   "messages": [
   {
      "messageId": "00001",
      "inputName": "PressureInput",
      "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\": 80, \"temperature\": 39} }"
   }
  ]
}
```

Output:

```
{
   "BatchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the AWS IoT Events API Reference.

- For API details, see BatchPutMessage in AWS CLI Command Reference.
**batch-update-detector**

The following code example shows how to use `batch-update-detector`.

**AWS CLI**

**To update a detector (instance)**

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```bash
aws iotevents-data batch-update-detector \
   --cli-input-json file://budFulton-A32.json
```

Contents of `budFulton-A32.json`:

```json
{
   "detectors": [
   {
      "messageId": "00001",
      "detectorModelName": "motorDetectorModel",
      "keyValue": "Fulton-A32",
      "state": {
         "stateName": "Normal",
         "variables": [
            {
               "name": "pressureThresholdBreached",
               "value": "0"
            }
         ],
         "timers": [
         
         ]
      }
   }
   ]
}
```

Output:

```json
{
   "batchUpdateDetectorErrorEntries": []
}
```
create-detector-model

The following code example shows how to use create-detector-model.

AWS CLI

To create a detector model

The following create-detector-model example creates a detector model with its configuration specified by a parameter file.

```
aws iotevents create-detector-model  
   --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
   "detectorModelName": "motorDetectorModel",
   "detectorModelDefinition": {
      "states": [
         {
            "stateName": "Normal",
            "onEnter": {
               "events": [
                  {
                     "eventName": "init",
                     "condition": "true",
                     "actions": [
                        {
                           "setVariable": {
                              "variableName": "pressureThresholdBreached",
                              "value": "0"
                           }
                        }
                     ],
                  }
               ]
            }
         }
      ]
   },
   "onInput": {
```

For more information, see [BatchUpdateDetector](#) in the *AWS IoT Events API Reference*. For API details, see [BatchUpdateDetector](#) in *AWS CLI Command Reference*.

```

For more information, see [CreateDetectorModel](#) in the *AWS IoT Events API Reference*.

- For API details, see [CreateDetectorModel](#) in *AWS CLI Command Reference*.

**create-input**

The following code example shows how to use `create-input`.

**AWS CLI**

**To create an input**

The following `create-input` example creates an input.
aws iotevents create-input \
    --cli-input-json file://pressureInput.json

Contents of pressureInput.json:

```json
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```json
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795312.542,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see CreateInput in the AWS IoT Events API Reference.

- For API details, see CreateInput in AWS CLI Command Reference.

**delete-detector-model**

The following code example shows how to use delete-detector-model.

**AWS CLI**

To delete a detector model
The following delete-detector-model example deletes the specified detector model. Any active instances of the detector model are also deleted.

```bash
aws iotevents delete-detector-model \\    --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see `DeleteDetectorModel` in the *AWS IoT Events API Reference*.

- For API details, see `DeleteDetectorModel` in *AWS CLI Command Reference*.

delete-input

The following code example shows how to use delete-input.

**AWS CLI**

**To delete an input**

The following delete-input example deletes the specified input.

```bash
aws iotevents delete-input \\    --input-name PressureInput
```

This command produces no output.

For more information, see `DeleteInput` in the *AWS IoT Events API Reference*.

- For API details, see `DeleteInput` in *AWS CLI Command Reference*.

describe-detector-model

The following code example shows how to use describe-detector-model.

**AWS CLI**

**To get information about a detector model**

The following describe-detector-model example displays details for the specified detector model. Because the version parameter is not specified, information about the latest version is returned.
aws iotevents describe-detector-model \
   --detector-model-name motorDetectorModel

Output:

```json
{
   "detectorModel": {
      "detectorModelConfiguration": {
         "status": "ACTIVE",
         "lastUpdateTime": 1560796816.077,
         "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
         "creationTime": 1560796816.077,
         "key": "motorid",
         "detectorModelName": "motorDetectorModel",
         "detectorModelVersion": "1"
      },
      "detectorModelDefinition": {
         "states": [
            {
               "onInput": {
                  "transitionEvents": [
                     {
                        "eventName": "Overpressurized",
                        "actions": [
                           {
                              "setVariable": {
                                 "variableName": "pressureThresholdBreached",
                                 "value": "$variable.pressureThresholdBreached + 3"
                              }
                           }
                        ],
                        "condition": "$input.PressureInput.sensorData.pressure > 70",
                        "nextState": "Dangerous"
                     }
               ],
               "events": []
            }
         ],
         "stateName": "Normal",
```
"onEnter": {  
"events": [ 
{  
  "eventName": "init",  
  "actions": [ 
  
"setVariable": {  
"variableName": "pressureThresholdBreached",

{  
  "eventName": "BackToNormal",  
  "actions": [],  
  "condition": "$input.PressureInput.sensorData.pressure <= 70 && $variable.pressureThresholdBreached <= 1",  
  "nextState": "Normal"  
}  
],  
"events": [ 
{  
  "eventName": "Overpressurized",  
  "actions": [ 
  
"setVariable": {  
"variableName": "pressureThresholdBreached",  
"value": "3"  
}  
]  
}  
]
Actions and scenarios
For more information, see `DescribeDetectorModel` in the AWS IoT Events API Reference.

- For API details, see `DescribeDetectorModel` in AWS CLI Command Reference.

**describe-detector**

The following code example shows how to use `describe-detector`.

**AWS CLI**

To get information about a detector (instance).

The following `describe-detector` example displays details for the specified detector (instance).

```
aws iotevents-data describe-detector \
  --detector-model-name motorDetectorModel \
  --key-value "Fulton-A32"
```

**Output:**

```
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
    }
}
```
"state": {
    "variables": [
        {
            "name": "pressureThresholdBreached",
            "value": "3"
        }
    ],
    "stateName": "Dangerous",
    "timers": []
},
"keyValue": "Fulton-A32",
"detectorModelName": "motorDetectorModel",
"detectorModelVersion": "1"
}

For more information, see DescribeDetector in the AWS IoT Events API Reference.

- For API details, see DescribeDetector in AWS CLI Command Reference.

describe-input

The following code example shows how to use describe-input.

AWS CLI

To get information about an input

The following describe-input example displays details for the specified input.

```bash
aws iotevents describe-input \
    --input-name PressureInput
```

Output:

```
{
    "input": {
        "inputConfiguration": {
            "status": "ACTIVE",
            "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
            "lastUpdateTime": 1560795312.542,
            "creationTime": 1560795312.542,
```
"inputName": "PressureInput",
   "inputDescription": "Pressure readings from a motor"
 },
 "inputDefinition": {
   "attributes": [
     {
       "jsonPath": "sensorData.pressure"
     },
     {
       "jsonPath": "motorid"
     }
   ]
 }
}

For more information, see DescribeInput in the AWS IoT Events API Reference.

- For API details, see DescribeInput in AWS CLI Command Reference.

describe-logging-options

The following code example shows how to use describe-logging-options.

AWS CLI

To get information about logging settings

The following describe-logging-options example retrieves the current settings of the AWS IoT Events logging options.

aws iotevents describe-logging-options

Output:

{
   "loggingOptions": {
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "enabled": false,
      "level": "ERROR"
   }
}
For more information, see `DescribeLoggingOptions` in the *AWS IoT Events API Reference*.

- For API details, see `DescribeLoggingOptions` in *AWS CLI Command Reference*.

**list-detector-model-versions**

The following code example shows how to use `list-detector-model-versions`.

**AWS CLI**

**To get information about versions of a detector model**

The following `list-detector-model-versions` example Lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \
  --detector-model-name motorDetectorModel
```

**Output:**

```json
{
   "detectorModelVersionSummaries": [
      {
         "status": "ACTIVE",
         "lastUpdateTime": 1560796816.077,
         "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
         "creationTime": 1560796816.077,
         "detectorModelName": "motorDetectorModel",
         "detectorModelVersion": "1"
      }
   ]
}
```

For more information, see `ListDetectorModelVersions` in the *AWS IoT Events API Reference*.

- For API details, see `ListDetectorModelVersions` in *AWS CLI Command Reference*.

**list-detector-models**

The following code example shows how to use `list-detector-models`.
**AWS CLI**

**To get a list of your detector models**

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```bash/aws iotevents list-detector-models```

Output:

```json
{
   "detectorModelSummaries": [
      {
         "detectorModelName": "motorDetectorModel",
         "creationTime": 1552072424.212,
         "detectorModelDescription": "Detect overpressure in a motor."
      }
   ]
}
```

For more information, see [ListDetectorModels](https://docs.aws.amazon.com/iotevents/latest/APIReference/API_ListDetectorModels.html) in the *AWS IoT Events API Reference*.

- For API details, see [ListDetectorModels](https://docs.aws.amazon.com/cli/latest/reference/iotevents-data/list-detectors.html) in *AWS CLI Command Reference*.

**list-detectors**

The following code example shows how to use `list-detectors`.

**AWS CLI**

**To get a list of detectors for a detector model**

The following `list-detectors` example lists the detectors (the instances of a detector model) in your account.

```bash/aws iotevents-data list-detectors \
   --detector-model-name motorDetectorModel```

Output:

```json
{
```

"detectorSummaries": [
  {
    "lastUpdateTime": 1558129925.2,
    "creationTime": 1552073155.527,
    "state": {
      "stateName": "Normal"
    },
    "keyValue": "Fulton-A32",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "1"
  }
]

For more information, see ListDetectors in the AWS IoT Events API Reference.

- For API details, see ListDetectors in AWS CLI Command Reference.

list-inputs

The following code example shows how to use list-inputs.

AWS CLI

To list inputs

The following list-inputs example lists the inputs you have created in your account.

aws iotevents list-inputs

This command produces no output. Output:

```json
{
  {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}
```
For more information, see ListInputs in the AWS IoT Events API Reference.

- For API details, see ListInputs in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags assigned to a resource.

The following list-tags-for-resource example lists the tag key names and values you have assigned to the resource.

```bash
aws iotevents list-tags-for-resource \
  --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```json
{
  "tags": [
    {
      "value": "motor",
      "key": "deviceType"
    }
  ]
}
```

For more information, see ListTagsForResource in the AWS IoT Events API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-logging-options

The following code example shows how to use put-logging-options.

AWS CLI

To set logging options

The following put-logging-options example sets or updates the AWS IoT Events logging options. If you update the value of any loggingOptions field, it can take up to
one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \\n   --cli-input-json file://logging-options.json
```

**Contents of logging-options.json:**

```json
{
   "loggingOptions": {
   "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
   "level": "DEBUG",
   "enabled": true,
   "detectorDebugOptions": [
   {
      "detectorModelName": "motorDetectorModel",
      "keyValue": "Fulton-A32"
   }
   ]
}
}
```

This command produces no output.

For more information, see [PutLoggingOptions](#) in the AWS IoT Events API Reference.

- For API details, see [PutLoggingOptions](#) in [AWS CLI Command Reference](#).

### tag-resource

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a resource**

The following `tag-resource` example adds or modifies (if key `deviceType` already exists) the tag attached the specified resource.

```
aws iotevents tag-resource \\
   --cli-input-json file://pressureInput.tag.json
```
Contents of `pressureInput.tag.json`:

```json
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tags": [
        {
            "key": "deviceType",
            "value": "motor"
        }
    ]
}
```

This command produces no output.

For more information, see `TagResource` in the *AWS IoT Events API Reference*.
- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a resource**

The following `untag-resource` example removes the tag with the specified key name from the specified resource.

```
aws iotevents untag-resource \
    --resource-arn arn:aws:iotevents:us-west-2:123456789012:input/PressureInput \
    --tagkeys deviceType
```

This command produces no output.

For more information, see `UntagResource` in the *AWS IoT Events API Reference*.
- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**update-detector-model**

The following code example shows how to use `update-detector-model`.

---

*Actions and scenarios* 3930
To update a detector model

The following `update-detector-model` example updates the specified detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
  --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```json
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        }
      }
    ],
    "onInput": {
      "transitionEvents": [
        {
          "eventName": "Overpressurized",
          "condition": "${input.PressureInput.sensorData.pressure > 70}"
        }
      ]
    }
  }
}
```
"setVariable": {
    "variableName": "pressureThresholdBreached",
    "value": "$variable.pressureThresholdBreached + 3"
  },
  "nextState": "Dangerous"
}]
},
{ "stateName": "Dangerous",
  "onEnter": {
    "events": [
      {
        "eventName": "Pressure Threshold Breached",
        "condition": "$variable.pressureThresholdBreached > 1",
        "actions": [
          {
            "sns": {
              "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"            
            }
          }
        ]
      }
    ]
  },
  "onInput": {
    "events": [
      {
        "eventName": "Overpressurized",
        "condition": "$input.PressureInput.sensorData.pressure > 70",
        "actions": [
          {
            "setVariable": {
              "variableName": "pressureThresholdBreached",
              "value": "3"
            }
          }
        ]
      }
    ]
  },
{ "eventName": "Pressure Okay", "condition": "$input.PressureInput.sensorData.pressure <= 70", "actions": [ { "setVariable": { "variableName": "pressureThresholdBreached", "value": "$variable.pressureThresholdBreached - 1" } } ] }, "transitionEvents": [ { "eventName": "BackToNormal", "condition": "$input.PressureInput.sensorData.pressure <= 70 && $variable.pressureThresholdBreached <= 1", "nextState": "Normal" } ], "onExit": { "events": [ { "eventName": "Normal Pressure Restored", "condition": "true", "actions": [ { "sns": { "targetArn": "arn:aws:sns:us-east-1:123456789012:pressureClearedAction" } } ] } ] }, "initialStateName": "Normal"
Output:

```
{
  "detectorModelConfiguration": {
    "status": "ACTIVATING",
    "lastUpdateTime": 1560799387.719,
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "creationTime": 1560799387.719,
    "key": "motorid",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "2"
  }
}
```

For more information, see [UpdateDetectorModel](https://docs.aws.amazon.com/iot-events/latest/developerguide/iot-events-update-detector-model-cli.html) in the *AWS IoT Events API Reference*.

- For API details, see [UpdateDetectorModel](https://docs.aws.amazon.com/cli/latest/reference/iotevents/update-detector-model.html) in *AWS CLI Command Reference*.

**update-input**

The following code example shows how to use update-input.

**AWS CLI**

**To update an input**

The following update-input example updates the specified input with a new description and definition.

```
aws iotevents update-input \
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
  "inputName": "PressureInput",
```
"inputDescription": "Pressure readings from a motor",
"inputDefinition": {
  "attributes": [
    { "jsonPath": "sensorData.pressure" },
    { "jsonPath": "motorid" }
  ]
}
}

Output:

{
  "inputConfiguration": {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1560795976.458,
    "creationTime": 1560795312.542,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}

For more information, see UpdateInput in the AWS IoT Events API Reference.
• For API details, see UpdateInput in AWS CLI Command Reference.

AWS IoT Events-Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events-Data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions and scenarios
**Actions**

**batch-put-message**

The following code example shows how to use `batch-put-message`.

**AWS CLI**

**To send messages (inputs) to AWS IoT Events**

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \\
    --cli-binary-format raw-in-base64-out \\
    --cli-input-json file://highPressureMessage.json
```

**Contents of `highPressureMessage.json`:**

```json
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{"motorId": "Fulton-A32", "sensorData": {"pressure": 80, "temperature": 39} }"
        }
    ]
}
```

**Output:**

```json
{
    "BatchPutMessageErrorEntries": []
}
```
For more information, see `BatchPutMessage` in the *AWS IoT Events Developer Guide*.

- For API details, see `BatchPutMessage` in *AWS CLI Command Reference*.

**batch-update-detector**

The following code example shows how to use `batch-update-detector`.

**AWS CLI**

**To update a detector (instance)**

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```bash
aws iotevents-data batch-update-detector \ 
   --cli-input-json file://budFulton-A32.json
```

Contents of `budFulton-A32.json`:

```json
{
   "detectors": [
   {
      "messageId": "00001",
      "detectorModelName": "motorDetectorModel",
      "keyValue": "Fulton-A32",
      "state": {
         "stateName": "Normal",
         "variables": [
            {
               "name": "pressureThresholdBreached",
               "value": "0"
            }
         ],
         "timers": [
            ]
      }
   }
]
}
```

Output:
create-detector-model

The following code example shows how to use create-detector-model.

AWS CLI

To create a detector model

The following create-detector-model example creates a detector model.

```
aws iotevents create-detector-model \\
--cli-input-json file://motorDetectorModel.json
```

Contents of motorDetectorModel.json:

```json
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "init",
                            "condition": "true",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value": "0"
                                    }
                                ]
                            ]
                        ]
                    ]
                }
            }
        ]
    }
}
```
"transitionEvents": [
    {
      "eventName": "Overpressurized",
      "condition": "\$input.PressureInput.sensorData.pressure > 70",
      "actions": [
        {
          "setVariable": {
            "variableName": "pressureThresholdBreached",
            "value": "$variable.pressureThresholdBreached + 3"
          }
        }
      ],
      "nextState": "Dangerous"
    }
  ],
  "onInput": {
    "events": [
      {
        "eventName": "Pressure Threshold Breached",
        "condition": "$variable.pressureThresholdBreached &gt; 1",
        "actions": [
          {
            "sns": {
              "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"
            }
          }
        ]
      }
    ]
  }
]
"eventName": "Overpressurized",
"condition": "${input.PressureInput.sensorData.pressure} > 70",

]
]
"initialStateName": "Normal"
},
"key": "motorid",
"roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
}

Output:

{
   "detectorModelConfiguration": {
      "status": "ACTIVATING",
      "lastUpdateTime": 1560796816.077,
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "creationTime": 1560796816.077,
      "key": "motorid",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "1"
   }
}

For more information, see [CreateDetectorModel](#) in the AWS IoT Events Developer Guide*. For API details, see [CreateDetectorModel](#) in AWS CLI Command Reference.

**create-input**

The following code example shows how to use create-input.

**AWS CLI**

To create an input
The following create-input example creates an input.

```bash
aws iotevents create-input \
   --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```json
{
   "inputName": "PressureInput",
   "inputDescription": "Pressure readings from a motor",
   "inputDefinition": {
      "attributes": [
         { "jsonPath": "sensorData.pressure" },
         { "jsonPath": "motorid" }
      ]
   }
}
```

Output:

```json
{
   "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,
      "inputName": "PressureInput",
      "inputDescription": "Pressure readings from a motor"
   }
}
```

For more information, see CreateInput in the AWS IoT Events Developer Guide*.

- For API details, see CreateInput in AWS CLI Command Reference.

**delete-detector-model**

The following code example shows how to use delete-detector-model.

**AWS CLI**

To delete a detector model
The following delete-detector-model example deletes a detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \
   --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see DeleteDetectorModel in the AWS IoT Events Developer Guide*. For API details, see DeleteDetectorModel in AWS CLI Command Reference.

delete-input

The following code example shows how to use delete-input.

AWS CLI

To delete an input

The following delete-input example deletes an input.

```
aws iotevents delete-input \
   --input-name PressureInput
```

This command produces no output.

For more information, see DeleteInput in the AWS IoT Events Developer Guide*. For API details, see DeleteInput in AWS CLI Command Reference.

describe-detector-model

The following code example shows how to use describe-detector-model.

AWS CLI

To get information about a detector model

The following describe-detector-model example describes a detector model. If the version parameter is not specified, the command returns information about the latest version.
aws iotevents describe-detector-model \
--detector-model-name motorDetectorModel

Output:

{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "key": "motorid",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        },
        "detectorModelDefinition": {
            "states": [
                {
                    "onInput": {
                        "transitionEvents": [
                            {
                                "eventName": "Overpressurized",
                                "actions": [
                                    {
                                        "setVariable": {

For more information, see \texttt{DescribeDetectorModel} in the \textit{AWS IoT Events Developer Guide}*. 

- For API details, see \texttt{DescribeDetectorModel} in \textit{AWS CLI Command Reference}.

\texttt{describe-detector}

The following code example shows how to use \texttt{describe-detector}.

\textbf{AWS CLI}

**To get information about a detector (instance)**

The following \texttt{describe-detector} example returns information about the specified detector (instance).

\begin{verbatim}
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
\end{verbatim}

Output:

\begin{verbatim}
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
    }
}
\end{verbatim}
{
  "state": {
    "variables": [
      {
        "name": "pressureThresholdBreached",
        "value": "3"
      }
    ],
    "stateName": "Dangerous",
    "timers": []
  },
  "keyValue": "Fulton-A32",
  "detectorModelName": "motorDetectorModel",
  "detectorModelVersion": "1"
}
}

For more information, see DescribeDetector in the AWS IoT Events Developer Guide*.

- For API details, see DescribeDetector in AWS CLI Command Reference.

describe-input

The following code example shows how to use describe-input.

AWS CLI

**To get information about an input**

The following describe-input example retrieves the details of an input.

```bash
aws iotevents describe-input \
  --input-name PressureInput
```

**Output:**

```json
{
  "input": {
    "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,
```
For more information, see `DescribeInput` in the *AWS IoT Events Developer Guide*.

- For API details, see `DescribeInput` in *AWS CLI Command Reference*.

**describe-logging-options**

The following code example shows how to use `describe-logging-options`.

**AWS CLI**

To get information about logging settings

The following `describe-logging-options` example retrieves the current AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "enabled": false,
        "level": "ERROR"
    }
}
```
For more information, see `DescribeLoggingOptions` in the *AWS IoT Events Developer Guide*.

- For API details, see `DescribeLoggingOptions` in *AWS CLI Command Reference*.

**list-detector-model-versions**

The following code example shows how to use `list-detector-model-versions`.

**AWS CLI**

**To get information about versions of a detector model**

The following `list-detector-model-versions` example lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```bash
aws iotevents list-detector-model-versions \
   --detector-model-name motorDetectorModel
```

Output:

```json
{
   "detectorModelVersionSummaries": [
      {
         "status": "ACTIVE",
         "lastUpdateTime": 1560796816.077,
         "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
         "creationTime": 1560796816.077,
         "detectorModelName": "motorDetectorModel",
         "detectorModelVersion": "1"
      }
   ]
}
```

For more information, see `ListDetectorModelVersions` in the *AWS IoT Events Developer Guide*.

- For API details, see `ListDetectorModelVersions` in *AWS CLI Command Reference*.

**list-detector-models**

The following code example shows how to use `list-detector-models`.

```bash
aws iotevents list-detector-models \
   --detector-model-name motorDetectorModel
```

Output:

```json
{
   "detectorModelSummaries": [
      {
         "status": "ACTIVE",
         "lastUpdateTime": 1560796816.077,
         "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
         "creationTime": 1560796816.077,
         "detectorModelName": "motorDetectorModel",
         "detectorModelVersion": "1"
      }
   ]
}
```

For more information, see `ListDetectorModels` in the *AWS IoT Events Developer Guide*.

- For API details, see `ListDetectorModels` in *AWS CLI Command Reference*.
AWS CLI

To get a list of your detector models

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```bash
aws iotevents list-detector-models
```

Output:

```json
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212,
            "detectorModelDescription": "Detect overpressure in a motor."
        }
    ]
}
```

For more information, see [ListDetectorModels](https://docs.aws.amazon.com/iotevents/latest/developerguide/list-detector-models.html) in the *AWS IoT Events Developer Guide*.

- For API details, see [ListDetectorModels](https://docs.aws.amazon.com/cli/latest/reference/iotevents-data/list-detectors.html) in *AWS CLI Command Reference*.

**list-detectors**

The following code example shows how to use `list-detectors`.

AWS CLI

To get a list of detectors for a detector model

The following `list-detectors` example lists detectors (the instances of a detector model).

```bash
aws iotevents-data list-detectors " --detector-model-name motorDetectorModel"
```

Output:

```json
{
    "detectorSummaries": [
```
For more information, see ListDetectors in the AWS IoT Events Developer Guide*. 

- For API details, see ListDetectors in AWS CLI Command Reference.

list-inputs

The following code example shows how to use list-inputs.

AWS CLI

To list inputs

The following list-inputs example lists the inputs that you've created.

```
aws iotevents list-inputs
```

Output:

```json
{
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
}
```

For more information, see ListInputs in the AWS IoT Events Developer Guide*. 

- For API details, see ListInputs in AWS CLI Command Reference.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags assigned to a resource

The following list-tags-for-resource example lists the tags (metadata) you have assigned to the resource.

```bash
aws iotevents list-tags-for-resource \
   --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
   "tags": [
      {
        "value": "motor",
        "key": "deviceType"
      }
   ]
}
```

For more information, see ListTagsForResource in the AWS IoT Events Developer Guide*. For API details, see ListTagsForResource in AWS CLI Command Reference.

put-logging-options

The following code example shows how to use put-logging-options.

AWS CLI

To set logging options

The following list-tags-for-resource example sets or updates the AWS IoT Events logging options. If you update the value of any loggingOptions field, it takes up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the roleArn field (for example, to correct an invalid policy) it takes up to five minutes for that change to take effect.
aws iotevents put-logging-options
   --cli-input-json file://logging-options.json

Contents of logging-options.json:

```
{
   "loggingOptions": {
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "level": "DEBUG",
      "enabled": true,
      "detectorDebugOptions": [
         {
            "detectorModelName": "motorDetectorModel",
            "keyValue": "Fulton-A32"
         }
      ]
   }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the AWS IoT Events Developer Guide*.

- For API details, see PutLoggingOptions in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a resource**

The following tag-resource example adds to or modifies the tags of the given resource. Tags are metadata that can be used to manage a resource.

```
aws iotevents tag-resource
   --cli-input-json file://pressureInput.tag.json
```

Contents of pressureInput.tag.json:

```
{
```

This command produces no output.

For more information, see TagResource in the AWS IoT Events Developer Guide*.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a resource

The following untag-resource example removes the specified tags from the resource.

```bash
aws iotevents untag-resource \
--cli-input-json file://pressureInput.untag.json
```

Contents of pressureInput.untag.json:

```json
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tagKeys": [
        "deviceType"
    ]
}
```

This command produces no output.

For more information, see UntagResource in the AWS IoT Events Developer Guide*.

- For API details, see UntagResource in AWS CLI Command Reference.
**update-detector-model**

The following code example shows how to use `update-detector-model`.

**AWS CLI**

**To update a detector model**

The following `update-detector-model` example updates a detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
  --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```json
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        },
        "onInput": {
          "transitionEvents": [
            {
              "eventName": "Overpressurized",
            }
          ]
        }
      }
    ]
  }
}
```
"condition": "$input.PressureInput.sensorData.pressure > 70",
"actions": [
  {
    "setVariable": {
      "variableName": "pressureThresholdBreached",
      "value": "$variable.pressureThresholdBreached + 3"
    }
  }
],
"nextState": "Dangerous"
}
]
},
{
  "stateName": "Dangerous",
  "onEnter": {
    "events": [
    {
      "eventName": "Pressure Threshold Breached",
      "condition": "$variable.pressureThresholdBreached > 1",
      "actions": [
      {

"targetArn": "arn:aws:sns:us-east-1:123456789012:pressureClearedAction"
}
}
]
}
],
"initialStateName": "Normal"}
Output:

```
{
  "detectorModelConfiguration": {
    "status": "ACTIVATING",
    "lastUpdateTime": 1560799387.719,
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "creationTime": 1560799387.719,
    "key": "motorid",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "2"
  }
}
```

For more information, see [UpdateDetectorModel](https://docs.aws.amazon.com/IoTEvents/latest/APIReference/API_UpdateDetectorModel.html) in the [AWS IoT Events Developer Guide](https://docs.aws.amazon.com/IoTEvents/latest/APIReference/)

- For API details, see [UpdateDetectorModel](https://docs.aws.amazon.com/IoTEvents/latest/APIReference/API_UpdateDetectorModel.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iotevents/update-input.html).

**update-input**

The following code example shows how to use update-input.

**AWS CLI**

**To update an input**

The following update-input example updates an input.

```
aws iotevents update-input \
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
  "inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor",
```
"inputDefinition": {
  "attributes": [
    { "jsonPath": "sensorData.pressure" },
    { "jsonPath": "motorid" }
  ]
}

Output:

{ "inputConfiguration": {
  "status": "ACTIVE",
  "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
  "lastUpdateTime": 1560795976.458,
  "creationTime": 1560795312.542,
  "inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor"
}

For more information, see UpdateInput in the AWS IoT Events Developer Guide.

- For API details, see UpdateInput in AWS CLI Command Reference.

**AWS IoT Greengrass examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
• Actions

**Actions**

**associate-role-to-group**

The following code example shows how to use `associate-role-to-group`.

**AWS CLI**

**To associate a role with a Greengrass group**

The following `associate-role-to-group` example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```bash
aws greengrass associate-role-to-group \
   --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b \
   --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```json
{
   "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see [Configure the Group Role](#) in the *AWS IoT Greengrass Developer Guide*.

• For API details, see [AssociateRoleToGroup](#) in *AWS CLI Command Reference*.

**associate-service-role-to-account**

The following code example shows how to use `associate-service-role-to-account`.

**AWS CLI**

**To associate a service role with your AWS account**

The following `associate-service-role-to-account` example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have
previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

```bash
aws greengrass associate-service-role-to-account
   --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
```

Output:

```
{
   "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see [Greengrass Service Role](#) in the *AWS IoT Greengrass Developer Guide*.  
- For API details, see [AssociateServiceRoleToAccount](#) in *AWS CLI Command Reference*.

### create-connector-definition-version

The following code example shows how to use `create-connector-definition-version`.

**AWS CLI**

**To create a connector definition version**

The following `create-connector-definition-version` example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

```bash
aws greengrass create-connector-definition-version
   --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118"
   --connectors "[
   {
      "Id": "MyTwilioNotificationsConnector",
      "Parameters": {
         "TWILIO_ACCOUNT_SID": "AC1a8d4204890840d7fc482a3b090d57",
         "TwilioAuthTokenSecretArn-ResourceId": "TwilioAuthToken",
         "DefaultFromPhoneNumber": "4254492999"
      }
   }]
```

Output:

```
{
}
```
For API details, see [CreateConnectorDefinitionVersion](awscli/reference/greengrass/create-connector-definition) in AWS CLI Command Reference.

**create-connector-definition**

The following code example shows how to use `create-connector-definition`.

**AWS CLI**

**To create a connector definition**

The following `create-connector-definition` example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```bash
aws greengrass create-connector-definition \
  --name MySNSConnector \
```

Output:

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
    "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
    "Name": "MySNSConnector"
}
```
create-core-definition-version

The following code example shows how to use create-core-definition-version.

**AWS CLI**

**To create a core definition version**

The following create-core-definition-version example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the create-core-definition-version command.

Create the AWS IoT thing that corresponds to the core device:

```bash
aws iot create-thing \
   --thing-name "MyCoreDevice"
```

Output:

```json
{
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
   "thingName": "MyCoreDevice",
   "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```bash
aws iot create-keys-and-certificate \
   --set-as-active \
   --certificate-pem-outfile "myCore.cert.pem" \
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```bash
aws iot create-policy \
   --policy-name "Core_Devices" \
```

Output:

```json
{
   "policyName": "Core_Devices",
}
```
Attach the policy to the certificate:

```bash
aws iot attach-policy 
   --policy-name "Core_Devices" 
   --target "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```bash
aws iot attach-thing-principal 
   --thing-name "MyCoreDevice" 
   --principal "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition version:

```bash
aws greengrass create-core-definition-version 
   --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" 
   --cores "{"Id":"MyCoreDevice","ThingArn":"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice","CertificateArn":"arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz","SyncShadow":true}"
```

Output:

```json
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/3fdc1190-2ce5-44de-b98b-eec8f9571014",
   "Version": "3fdc1190-2ce5-44de-b98b-eec8f9571014",
   "CreationTimestamp": "2019-09-18T00:15:09.838Z",
}
The following code example shows how to use `create-core-definition`.

**Example 1: To create an empty core definition**

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```
aws greengrass create-core-definition \
   --name cliGroup_Core
```

**Output:**

```
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/b5c08008-54cb-44bd-9ee-c121b04283b5",
   "Id": "b5c08008-54cb-44bd-9ee-c121b04283b5",
   "Name": "cliGroup_Core"
}
```

**Example 2: To create a core definition with an initial version**

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.
Create the AWS IoT thing that corresponds to the core device:

```bash
aws iot create-thing \
  --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```bash
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myCore.cert.pem" \
  --public-key-outfile "myCore.public.key" \
  --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndxQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END CERTIFICATE-----",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----\nMIIBIjANBzrqhkiG9w0BAQFmAOCQ8AMIIBCgKCAQEaQuyukFjbMXDcNOK4zMCxDR...fvY4+te\n-----END PUBLIC KEY-----",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----\nMIIEowIABAICQaKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4zMCxDR...fvY4+te\n-----END RSA PRIVATE KEY-----",
    },
    "certificateId": "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```
Create an AWS IoT policy that allows iot and greengrass actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```bash
aws iot create-policy
   --policy-name "Core_Devices"
```

Output:

```json
{
   "policyName": "Core_Devices",
   "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```bash
aws iot attach-policy
   --policy-name "Core_Devices"
   --target "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```bash
aws iot attach-thing-principal
   --thing-name "MyCoreDevice"
```
This command produces no output.

Create the core definition:

```
aws greengrass create-core-definition \
  --name "MyCores" \
  --initial-version "{"Cores":[{"Id":"MyCoreDevice","ThingArn":"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice","CertificateArn":"arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz","SyncShadow":true}]]"
```

Output:

```
{
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/cc87b5b3-8f4b-465d-944c-1d6de5dbfcd1",  
  "Name": "MyCores",  
  "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",  
  "LatestVersion": "cc87b5b3-8f4b-465d-944c-1d6de5dbfcd1",  
  "CreationTimestamp": "2019-09-18T00:11:06.197Z",  
  "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12",  
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see Configure the AWS IoT Greengrass Core in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateCoreDefinition in AWS CLI Command Reference.

**create-deployment**

The following code example shows how to use create-deployment.

**AWS CLI**

To create a deployment for a version of a Greengrass group
The following `create-deployment` example deploys the specified version of a Greengrass group.

```bash
aws greengrass create-deployment \
   --deployment-type NewDeployment \
   --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
   --group-version-id "dc40c1e9-e8c8-4d28-a84d-a9cad5f599c9"
```

Output:

```json
{
  "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/deployments/bfceb608-4e97-45bc-af5c-460144270308",
  "DeploymentId": "bfceb608-4e97-45bc-af5c-460144270308"
}
```

For more information, see [Getting Started with Connectors (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/greengrass-getting-started-with-connectors-cli.html) in the [AWS IoT Greengrass Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

- For API details, see [CreateDeployment](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-deployment.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-deployment.html).

### create-device-definition-version

The following code example shows how to use `create-device-definition-version`.

**AWS CLI**

**To create a device definition version**

The following `create-device-definition-version` example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```bash
awsiot create-thing \
   --thing-name "InteriorTherm"
```
Output:

```json
{
    "thingName": "InteriorTherm",
    "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the create-keys-and-certificate command and requires write permissions to the current directory. Alternatively, you can use the create-certificate-from-csr command:

```bash
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```json
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS
-----END CERTIFICATE-----
",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
MIIBIjANBzrqhkiG9w0BAQF AAAQCAQ8AMIIBCgKCAQE AQKpRgnn6yq26U3y...wIDAQAB
-----END PUBLIC KEY-----
",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
MIIEowIABAKCAQE ArKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...f vY4+te
-----END RSA PRIVATE KEY-----
",
        "certificateId": "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
    }
}
```

Create an AWS IoT policy that allows iot and greengrass actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```bash
aws iot create-policy \
```

Actions and scenarios
--policy-name "GG_Devices" \
--policy-document "{"Version":\"2012-10-17\",\"Statement\":[[\"Effect \\n:\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect \\
,\"iot:Receive\"],\"Resource\":\"*\"]],\"Effect\":\"Allow\",\"Action\": \\
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"], \\
\"Resource\":\"*\"]},\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\",\"Resource \\
:\"*\"]]}}"

Output:

{
   "policyName": "GG_Devices",
   "policyDocument": "{"Version":\"2012-10-17\",\"Statement\":[[\"Effect \\n:\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect \\
,\"iot:Receive\"],\"Resource\":\"*\"]],\"Effect\":\"Allow\",\"Action\": \\
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"], \\
\"Resource\":\"*\"]},\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\",\"Resource \\
:\"*\"]]}}",
   "policyVersionId": "1"
}

Attach the policy to the certificate:

aws iot attach-policy \
   --policy-name "GG_Devices" \
   --target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd68eb92"

Attach the thing to the certificate

aws iot attach-thing-principal \
   --thing-name "InteriorTherm" \
   --principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd68eb92"

After you create and configure the IoT thing as shown above, use the ThingArn and CertificateArn from the first two commands in the following example.

aws greengrass create-device-definition-version \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
The following code example shows how to use `create-device-definition`.

**AWS CLI**

To create a device definition

The following `create-device-definition` example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```bash
aws iot create-thing 
--thing-name "InteriorTherm"
```

Output:

```

```

For API details, see [CreateDeviceDefinitionVersion](#) in AWS CLI Command Reference.
Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```bash
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myDevice.cert.pem" \
  --public-key-outfile "myDevice.public.key" \
  --private-key-outfile "myDevice.private.key"
```

Output:

```json
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18b7568eb92",
  "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS
-----END CERTIFICATE-----
",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
MIIBIjANBzrqhkiG9w0BAQEFAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB
-----END PUBLIC KEY-----
",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
MIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4zMCxDR...fvY4+te
-----END RSA PRIVATE KEY-----
",
    "certificateId": "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18b7568eb92"
  }
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```bash
aws iot create-policy \

Actions and scenarios
```
--policy-name "GG_Devices" \

Output:

{
    "policyName": "GG_Devices",
    "policyVersionId": "1"
}

Attach the policy to the certificate:

aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"

Attach the thing to the certificate

aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"

After you create and configure the IoT thing as shown above, use the ThingArn and CertificateArn from the first two commands in the following example.

aws greengrass create-device-definition \

--name "Sensors" \

Output:

```
{
  "Name": "Sensors",
  "LastUpdatedTimestamp": "2019-09-11T00:11:06.197Z",
  "LatestVersion": "3b5cc510-58c1-44b5-9d98-4ad858ffa795",
  "CreationTimestamp": "2019-09-11T00:11:06.197Z",
  "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

• For API details, see [CreateDeviceDefinition](https://docs.aws.amazon.com/Amazon greengrass/latest/developerguide/gg-cli-create-device-definition.html) in *AWS CLI Command Reference*.

### create-function-definition-version

The following code example shows how to use `create-function-definition-version`.

**AWS CLI**

To create a version of the function definition

The following `create-function-definition-version` example creates a new version of the specified function definition. This version specifies a single function whose ID is `Hello-World-function`, allows access to the file system, and specifies a maximum memory size and timeout period.

```
aws greengrass create-function-definition-version
```
### create-function-definition

The following code example shows how to use `create-function-definition`.

**AWS CLI**

**To create a Lambda function definition**

The following create-function-definition example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named `TempMonitorFunction`) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's create-function and publish-version commands. Lambda's create-function command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM create-role command to create an empty role to get an ARN to use with Lambda's create-function or you can use an existing execution role.

```
aws greengrass create-function-definition
```

---

For API details, see [CreateFunctionDefinitionVersion](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-function-definition-version.html) in *AWS CLI Command Reference.*
--name MyGreengrassFunctions \
--initial-version "{"Functions": [{"Id": "TempMonitorFunction", 
"Timeout": 5}]}
"

Output:

{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b",
   "CreationTimestamp": "2019-06-19T22:24:44.585Z",
   "Id": "3b0d0080-87e7-48c6-b182-503ec743a08b",
   "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
   "LatestVersion": "67f918b9-efb4-40b0-b87c-de8c9faf085b",
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-efb4-40b0-b87c-de8c9faf085b",
   "Name": "MyGreengrassFunctions"
}

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateFunctionDefinition in AWS CLI Command Reference.

create-group-certificate-authority

The following code example shows how to use create-group-certificate-authority.

**AWS CLI**

To create a certificate authority (CA) for a group

The following create-group-certificate-authority example creates or rotates a CA for the specified group.

aws greengrass create-group-certificate-authority \
   --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"

Output:
For more information, see [AWS IoT Greengrass Security](https://docs.aws.amazon.com/greengrass/latest/developerguide/aws-iot-greengrass-security.html) in the [AWS IoT Greengrass Developer Guide](https://docs.aws.amazon.com/greengrass/latest/developerguide/).

### create-group-version

The following code example shows how to use create-group-version.

**AWS CLI**

#### To create a version of a Greengrass group

The following create-group-version example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the `create-resource-definition` command. To create a connector definition with an initial version, use the `create-connector-definition` command. To create a function definition with an initial version, use the `create-function-definition` command. To create a subscription definition with an initial version, use the `create-subscription-definition` command. To retrieve the ARN of the latest core definition version, use the `get-group-version` command and specify the ID of the latest group version.

```bash
aws greengrass create-group-version \
  --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
  --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
  --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1"
```
--connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/78a331b-895d-489b-8823-17b4f418a0" \
--function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-efb4-40b0-b87c-de8c9f085b" \
--subscription-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7f9a4f103f"

Output:

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
  "CreationTimestamp": "2019-06-20T18:42:47.020Z",
  "Id": "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca",
  "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}
```

For more information, see [Overview of the AWS IoT Greengrass Group Object Model](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/gg-group-object-model.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateGroupVersion](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-group-version.html) in *AWS CLI Command Reference*.

**create-group**

The following code example shows how to use `create-group`.

**AWS CLI**

To create a Greengrass group

The following `create-group` example creates a group named `cli-created-group`.

```bash
aws greengrass create-group \
   --name cli-created-group
```

Output:

```json
{
```
"Id": "4e22bd92-898c-436b-ade5-434d883ff749",
"LastUpdatedTimestamp": "2019-06-25T18:07:17.688Z",
"Name": "cli-created-group"
}

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.

create-logger-definition-version

The following code example shows how to use create-logger-definition-version.

AWS CLI

To create a logger definition version

The following create-logger-definition-version example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```bash
aws greengrass create-logger-definition-version \\
   --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \\
   --loggers "[{{"Id":"1","Component":"GreengrassSystem","Level":"ERROR","Space":10240,"Type":"FileSystem"},{"Id":"2","Component":"Lambda","Level":"INFO","Space":10240,"Type":"FileSystem"},{"Id":"3","Component":"GreengrassSystem","Level":"WARN","Type":"AWSCloudWatch"},{"Id":"4","Component":"Lambda","Level":"INFO","Type":"AWSCloudWatch"}]"
```

Output:

```
{
```
For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateLoggerDefinitionVersion in AWS CLI Command Reference.

**create-logger-definition**

The following code example shows how to use create-logger-definition.

**AWS CLI**

To create a logger definition

The following create-logger-definition example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition \
  --name "LoggingConfigs" \
  --initial-version "{"Loggers": [{"Id":"1","Component":"GreengrassSystem", "Level":"ERROR","Space":10240,"Type":"FileSystem"}, {"Id":"2","Component":"Lambda","Level":"INFO","Space":10240,"Type":"FileSystem"}, {"Id":"3","Component":"Lambda","Level":"INFO","Type":"AWSCloudWatch"}]"
```

Output:

```
{
}
For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateLoggerDefinition in AWS CLI Command Reference.

create-resource-definition-version

The following code example shows how to use create-resource-definition-version.

AWS CLI

To create a version of a resource definition

The following create-resource-definition-version example creates a new version of a TwilioAuthToken.

```bash
aws greengrass create-resource-definition-version \
  --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
```

Output:

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/b3bcada0-5fb6-42df-bf0b-1ee4f15e769e",
  "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
  "Version": "b3bcada0-5fb6-42df-bf0b-1ee4f15e769e"
}
```
create-resource-definition

The following code example shows how to use create-resource-definition.

AWS CLI

**To create a resource definition**

The following create-resource-definition example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \
   --name MyGreengrassResources \
```

Output:

```
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
   "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
   "LatestVersion": "a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
   "Name": "MyGreengrassResources"
}
```

For more information, see [How to Configure Local Resource Access Using the AWS Command Line Interface](https://docs.aws.amazon.com/greengrass/latest/ug/local-resource-access.html) in the *AWS IoT Greengrass Developer Guide*. 
create-software-update-job

The following code example shows how to use create-software-update-job.

AWS CLI

To create a software update job for a core

The following create-software-update-job example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is MyFirstGroup_Core. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes iot.amazonaws.com as a trusted entity.

```
aws greengrass create-software-update-job 
  --update-targets-architecture armv7l 
  --update-targets ["arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core"] 
  --update-targets-operating-system raspbian 
  --software-to-update core 
  --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role 
  --update-agent-log-level WARN
```

Output:

```
{
  "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
  "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
  "PlatformSoftwareVersion": "1.9.3"
}
```

For more information, see OTA Updates of AWS IoT Greengrass Core Software in the AWS IoT Greengrass Developer Guide.

• For API details, see CreateSoftwareUpdateJob in AWS CLI Command Reference.

create-subscription-definition-version

The following code example shows how to use create-subscription-definition-version.

Actions and scenarios
**AWS CLI**

**To create a new version of a subscription definition**

The following `create-subscription-definition-version` example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```
aws greengrass create-subscription-definition-version \
   --subscription-definition-id "9d611d57-5d5d-44bd-a3b4-feccbdd69112" \
```

Output:

```
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/7b65dfae-50b6-4d0f-b3e0-27728bfb0620",
   "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
   "Version": "7b65dfae-50b6-4d0f-b3e0-27728bfb0620"
}
```

- For API details, see [CreateSubscriptionDefinitionVersion](#) in **AWS CLI Command Reference**.

**create-subscription-definition**

The following code example shows how to use `create-subscription-definition`.

**AWS CLI**

**To create a subscription definition**

The following `create-subscription-definition` example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the
MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's create-alias command.

```bash
aws greengrass create-subscription-definition \
```

Output:

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
    "LatestVersion": "aa645c47-ac90-420d-9091-8c7ffa4f103f",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"
}
```

For more information, see Getting Started with Connectors (CLI) in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateSubscriptionDefinition in AWS CLI Command Reference.

### delete-connector-definition

The following code example shows how to use delete-connector-definition.

**AWS CLI**

To delete a connector definition
The following delete-connector-definition example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \
   --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

This command produces no output.
- For API details, see [DeleteConnectorDefinition](https://docs.aws.amazon.com/cli/latest/reference/greengrass/delete-connector-definition.html) in *AWS CLI Command Reference*.

### delete-core-definition

The following code example shows how to use delete-core-definition.

**AWS CLI**

**To delete a core definition**

The following delete-core-definition example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \
   --core-definition-id "ff36cc5f-9f98-4994-b468-9d9b6dc52abd"
```

This command produces no output.
- For API details, see [DeleteCoreDefinition](https://docs.aws.amazon.com/cli/latest/reference/greengrass/delete-core-definition.html) in *AWS CLI Command Reference*.

### delete-device-definition

The following code example shows how to use delete-device-definition.

**AWS CLI**

**To delete a device definition**

The following delete-device-definition example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.
aws greengrass delete-device-definition \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"

This command produces no output.

- For API details, see `DeleteDeviceDefinition` in *AWS CLI Command Reference*.

**delete-function-definition**

The following code example shows how to use `delete-function-definition`.

**AWS CLI**

**To delete a function definition**

The following `delete-function-definition` example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

aws greengrass delete-function-definition \
   --function-definition-id "fd4b906a-dff3-4c1b-96eb-52ebfcfac06a"

This command produces no output.

- For API details, see `DeleteFunctionDefinition` in *AWS CLI Command Reference*.

**delete-group**

The following code example shows how to use `delete-group`.

**AWS CLI**

**To delete a group**

The following `delete-group` example deletes the specified Greengrass group.

aws greengrass delete-group \
   --group-id "4e22bd92-898c-436b-ade5-434d883ff749"

This command produces no output.
For API details, see DeleteGroup in AWS CLI Command Reference.

delete-logger-definition

The following code example shows how to use delete-logger-definition.

AWS CLI

To delete a logger definition

The following delete-logger-definition example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```bash
aws greengrass delete-logger-definition \\
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

For API details, see DeleteLoggerDefinition in AWS CLI Command Reference.

delete-resource-definition

The following code example shows how to use delete-resource-definition.

AWS CLI

To delete a resource definition

The following delete-resource-definition example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```bash
aws greengrass delete-resource-definition \\
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

This command produces no output.
For API details, see DeleteResourceDefinition in AWS CLI Command Reference.

**delete-subscription-definition**

The following code example shows how to use delete-subscription-definition.

**AWS CLI**

**To delete a subscription definition**

The following delete-subscription-definition example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can’t be deployed successfully.

```bash
aws greengrass delete-subscription-definition \
    --subscription-definition-id "cd6f1c37-d9a4-4e90-be94-01a7404f5967"
```

This command produces no output.

- For API details, see DeleteSubscriptionDefinition in AWS CLI Command Reference.

**disassociate-role-from-group**

The following code example shows how to use disassociate-role-from-group.

**AWS CLI**

**To disassociate the role from a Greengrass group**

The following disassociate-role-from-group example disassociates the IAM role from the specified Greengrass group.

```bash
aws greengrass disassociate-role-from-group \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```json
{
    "DisassociatedAt": "2019-09-10T20:05:49Z"
}
```
disassociate-service-role-from-account

The following code example shows how to use disassociate-service-role-from-account.

**AWS CLI**

To disassociate a service role from your AWS account

The following disassociate-service-role-from-account example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the delete-role-policy command to detach the AWSGreengrassResourceAccessRolePolicy managed policy from the role, and then use the delete-role command to delete the role.

```
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
   "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see [Greengrass Service Role](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/greengrass-service-role.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [DisassociateServiceRoleFromAccount](https://docs.aws.amazon.com/cli/latest/reference/greengrass/disassociate-service-role-from-account.html) in *AWS CLI Command Reference*.

get-associated-role

The following code example shows how to use get-associated-role.

**AWS CLI**

To get the role associated with a Greengrass group
The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role \
   --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

**Output:**

```
{
   "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",
   "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see [Configure the Group Role](https://docs.aws.amazon.com/greengrass/latest/developer-guide/configure-group-role.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [GetAssociatedRole](https://docs.aws.amazon.com/cli/latest/reference/greengrass/get-associated-role.html) in *AWS CLI Command Reference*.

---

**get-bulk-deployment-status**

The following code example shows how to use `get-bulk-deployment-status`.

**AWS CLI**

**To check the status of your bulk deployment**

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status \
   --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

**Output:**

```
{
   "BulkDeploymentMetrics": {
      "InvalidInputRecords": 1,
      "RecordsProcessed": 1,
      "RetryAttempts": 0
   }
}
```
For more information, see Create Bulk Deployments for Groups in the AWS IoT Greengrass Developer Guide.

- For API details, see GetBulkDeploymentStatus in AWS CLI Command Reference.

get-connectivity-info

The following code example shows how to use get-connectivity-info.

AWS CLI

To get the connectivity information for a Greengrass core

The following get-connectivity-info example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

aws greengrass get-connectivity-info \
--thing-name "MyGroup_Core"

Output:

```json
{
   "ConnectivityInfo": [
   {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "127.0.0.1",
      "Id": "AUTOIP_127.0.0.1_0"
   },
   {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "192.168.1.3",
      "Id": "AUTOIP_192.168.1.3_1"
   },
   {
```
get-connector-definition-version

The following code example shows how to use get-connector-definition-version.

AWS CLI

To retrieve information about a specific version of a connector definition

The following get-connector-definition-version example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the list-connector-definition-versions command. To retrieve the ID of the last version added to the connector definition, use the get-connector-definition command and check the LatestVersion property.

```bash
aws greengrass get-connector-definition-version \
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8" \
  --connector-definition-version-id "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
```

Output:

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
  "CreationTimestamp": "2019-06-19T19:30:01.300Z",
}
```
"Definition": {
  "Connectors": [
  {
    "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/versions/1",
    "Id": "MySNSConnector",
    "Parameters": {
      "DefaultSNSArn": "arn:aws:sns:us-west-2:123456789012:GGConnectorTopic"
    }
  }
  ],
  "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
  "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
}

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/integrate-service-protocols.html) in the [AWS IoT Greengrass Developer Guide](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/).

### get-connector-definition

The following code example shows how to use `get-connector-definition`.

**AWS CLI**

To retrieve information about a connector definition

The following `get-connector-definition` example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the `list-connector-definitions` command.

```bash
aws greengrass get-connector-definition \  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
```
For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the AWS IoT Greengrass Developer Guide.

- For API details, see GetConnectorDefinition in AWS CLI Command Reference.

**get-core-definition-version**

The following code example shows how to use get-core-definition-version.

**AWS CLI**

**To retrieve details about a specific version of the Greengrass core definition**

The following get-core-definition-version example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the list-core-definition-versions command. To retrieve the ID of the last version added to the core definition, use the get-core-definition command and check the LatestVersion property.

```
aws greengrass get-core-definition-version "

**get-core-definition**

The following code example shows how to use get-core-definition.

**AWS CLI**

**To retrieve details for a Greengrass core definition**

The following get-core-definition example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the list-core-definitions command.

```
aws greengrass get-core-definition
  --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"
```

**Output:**

```
{
  "CreationTimestamp": "2018-10-18T04:47:06.721Z",
  "Id": "237d6916-27cf-457f-ba0c-e86cfb5d25cd",

**get-deployment-status**

The following code example shows how to use `get-deployment-status`.

**AWS CLI**

**To retrieve the status of a deployment**

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```bash
aws greengrass get-deployment-status \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
   --deployment-id "1065b8a0-812b-4f21-9d5d-e89b232a530f"
```

Output:

```json
{
    "DeploymentStatus": "Success",
    "DeploymentType": "NewDeployment",
    "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

• For API details, see [GetDeploymentStatus](#) in *AWS CLI Command Reference*.

**get-device-definition-version**

The following code example shows how to use `get-device-definition-version`.

**AWS CLI**

**To get a device definition version**
The following `get-device-definition-version` example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the `list-device-definition-versions` command. To retrieve the ID of the last version added to the device definition, use the `get-device-definition` command and check the `LatestVersion` property.

```
aws greengrass get-device-definition-version \\
--device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \\
--device-definition-version-id "83c13984-6fed-447e-84d5-5b8aa45d5f71"
```

Output:

    "tags": {}
}
```

For API details, see **GetFunctionDefinitionVersion** in *AWS CLI Command Reference*.
get-group-certificate-authority

The following code example shows how to use `get-group-certificate-authority`.

**AWS CLI**

**To retrieve the CA associated with a Greengrass group**

The following `get-group-certificate-authority` example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the `list-group-certificate-authorities` command and specify the group ID.

```bash
aws greengrass get-group-certificate-authority \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
  --certificate-authority-id "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

**Output:**

```json
{

Actions and scenarios 4005
get-group-certificate-configuration

The following code example shows how to use get-group-certificate-configuration.

AWS CLI

To retrieve the configuration for the certificate authority used by the Greengrass group

The following get-group-certificate-configuration example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```bash
aws greengrass get-group-certificate-configuration \
--group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```json
{
  "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
  "CertificateExpiryInMilliseconds": 604800000,
  "GroupId": "1013db12-8b58-45ff-acc7-704248f66731"
}
```

For API details, see GetGroupCertificateConfiguration in AWS CLI Command Reference.

get-group-version

The following code example shows how to use get-group-version.

AWS CLI

To retrieve information about a version of a Greengrass group

The following get-group-version example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the list-group-versions command. To retrieve the ID of the last version added to the group, use the get-group command and check the LatestVersion property.
aws greengrass get-group-version \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
   --group-version-id "115136b3-cfd7-4462-b77f-8741a4b00e5e"

Output:

}
```

- For API details, see [GetGroupVersion](aws CLI Command Reference).  

**get-group**

The following code example shows how to use get-group.

**AWS CLI**

**To retrieve information about a Greengrass group**

The following get-group example retrieves information about the specified Greengrass group. To retrieve the IDs of your groups, use the list-groups command.

```bash
aws greengrass get-group \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```
Output:

```json
{
    "Id": "1013db12-8b58-45ff-acc7-704248f66731",

    "Name": "GGGroup4Pi3",
    "tags": {}
}
```

- For API details, see [GetGroup](#) in [AWS CLI Command Reference](#).

**get-logger-definition-version**

The following code example shows how to use `get-logger-definition-version`.

### AWS CLI

**To retrieve information about a version of a logger definition**

The following `get-logger-definition-version` example retrieves information about the specified version of the specified logger definition. To retrieve the IDs of all versions of the logger definition, use the `list-logger-definition-versions` command. To retrieve the ID of the last version added to the logger definition, use the `get-logger-definition` command and check the `LatestVersion` property.

```bash
aws greengrass get-logger-definition-version \
   --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23" \
   --logger-definition-version-id "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
```

**Output:**

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/5e3f6f64-a565-491e-8de0-3c0d8e0f2073",
}
```
get-logger-definition

The following code example shows how to use `get-logger-definition`.

**AWS CLI**

To retrieve information about a logger definition

The following `get-logger-definition` example retrieves information about the specified logger definition. To retrieve the IDs of your logger definitions, use the `list-logger-definitions` command.

```bash
aws greengrass get-logger-definition --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

Output:

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23",
    "CreationTimestamp": "2019-05-08T16:10:13.809Z",

               },
               "SourcePath": "/dev/bus/usb"
            }
         }
      ],
      "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
```

get-resource-definition

The following code example shows how to use get-resource-definition.

AWS CLI

To retrieve information about a resource definition

The following get-resource-definition example retrieves information about the specified resource definition. To retrieve the IDs of your resource definitions, use the list-resource-definitions command.

```
aws greengrass get-resource-definition \
   --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658",
   "CreationTimestamp": "2019-06-19T16:40:59.261Z",
   "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
   "LastUpdatedTimestamp": "2019-06-19T16:40:59.261Z",
   "LatestVersion": "26e8829a-491a-464d-9c87-664bf6f6f2be",
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/26e8829a-491a-464d-9c87-664bf6f6f2be",
   "tags": {}
}
```

For API details, see GetResourceDefinition in AWS CLI Command Reference.

get-service-role-for-account

The following code example shows how to use get-service-role-for-account.
AWS CLI

To retrieve the details for the service role that is attached to your account

The following get-service-role-for-account example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
  "AssociatedAt": "2018-10-18T15:59:20Z",
  "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass Service Role in the AWS IoT Greengrass Developer Guide.

- For API details, see GetServiceRoleForAccount in AWS CLI Command Reference.

get-subscription-definition-version

The following code example shows how to use get-subscription-definition-version.

AWS CLI

To retrieve information about a specific version of a subscription definition

The following get-subscription-definition-version example retrieves retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the list-subscription-definition-versions command. To retrieve the ID of the last version added to the subscription definition, use the get-subscription-definition command and check the LatestVersion property.

```
aws greengrass get-subscription-definition-version \
  --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152" \
  --subscription-definition-version-id "88ae8699-12ac-4663-ba3f-4d7f0519140b"
```
Output:

```json
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
   "CreationTimestamp": "2019-06-18T17:03:52.499Z",
   "Definition": {
      "Subscriptions": [
         {
            "Id": "692c4484-d89f-4f64-8edd-1a041a65e5b6",
            "Subject": "hello/world",
            "Target": "cloud"
         }
      ],
      "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
      "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
   }
}
```

- For API details, see [GetSubscriptionDefinitionVersion](https://docs.aws.amazon.com/cli/latest/reference/greengrass/get-subscription-definition.html) in *AWS CLI Command Reference*.

**get-subscription-definition**

The following code example shows how to use `get-subscription-definition`.

**AWS CLI**

To retrieve information about a subscription definition

The following `get-subscription-definition` example retrieves information about the specified subscription definition. To retrieve the IDs of your subscription definitions, use the `list-subscription-definitions` command.

```
aws greengrass get-subscription-definition \
   --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```json
{
```

Actions and scenarios 4013
For API details, see [GetSubscriptionDefinition](https://docs.aws.amazon.com/cli/latest/reference/greengrass/get-subscription-definition) in *AWS CLI Command Reference*.

### get-thing-runtime-configuration

The following code example shows how to use `get-thing-runtime-configuration`.

**AWS CLI**

**To retrieve the runtime configuration of a Greengrass core**

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```
aws greengrass get-thing-runtime-configuration \
  --thing-name SampleGreengrassCore
```

**Output:**

```
{
  "RuntimeConfiguration": {
    "TelemetryConfiguration": {
      "ConfigurationSyncStatus": "OutOfSync",
      "Telemetry": "On"
    }
  }
}
```
For more information, see Configuring telemetry settings in the AWS IoT Greengrass Developer Guide.

- For API details, see GetThingRuntimeConfiguration in AWS CLI Command Reference.

list-bulk-deployment-detailed-reports

The following code example shows how to use list-bulk-deployment-detailed-reports.

AWS CLI

To list information about individual deployments in a bulk deployment

The following list-bulk-deployment-detailed-reports example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
   --bulk-deployment-id 42ce9c42-489b-4ed4-b905-8996aa50ef9d
```

Output:

```
{
   "Deployments": [
   {
       "DeploymentType": "NewDeployment",
       "DeploymentStatus": "Success",
       "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
       "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
       "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/versions/123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
       "CreatedAt": "2020-01-21T21:34:16.501Z"
   },
   {
       "DeploymentType": "NewDeployment",
       "DeploymentStatus": "InProgress",
       "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
       "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
   }
]
```
For more information, see Create Bulk Deployments for Groups in the AWS IoT Greengrass Developer Guide.

- For API details, see ListBulkDeploymentDetailedReports in AWS CLI Command Reference.

list-bulk-deployments

The following code example shows how to use list-bulk-deployments.

AWS CLI

To list bulk deployments

The following list-bulk-deployments example lists all bulk deployments.

aws greengrass list-bulk-deployments

Output:

```
{
   "BulkDeployments": [
   {
      "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "CreatedAt": "2019-06-25T16:33:26Z"
   }
   ]
}
```

For more information, see Create Bulk Deployments for Groups in the AWS IoT Greengrass Developer Guide.

- For API details, see ListBulkDeployments in AWS CLI Command Reference.
list-connector-definition-versions

The following code example shows how to use list-connector-definition-versions.

AWS CLI

To list the versions that are available for a connector definition

The following list-connector-definition-versions example lists the versions that are available for the specified connector definition. Use the list-connector-definitions command to get the connector definition ID.

```
aws greengrass list-connector-definition-versions \
   --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
   "Versions": [
       {
           "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
           "CreationTimestamp": "2019-06-19T19:30:01.300Z",
           "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
           "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
       }
   ]
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the AWS IoT Greengrass Developer Guide.

- For API details, see ListConnectorDefinitionVersions in AWS CLI Command Reference.

list-connector-definitions

The following code example shows how to use list-connector-definitions.

AWS CLI

To list the Greengrass connectors that are defined
The following list-connector-definitions example lists all of the Greengrass connectors that are defined for your AWS account.

```bash
aws greengrass list-connector-definitions
```

Output:

```json
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
            "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
            "Name": "MySNSConnector"
        }
    ]
}
```

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/integrate-connector-defined.html) in the [AWS IoT Greengrass Developer Guide](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/integrate-connector-defined.html).

- For API details, see [ListConnectorDefinitions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-connector-definitions.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-connector-definitions.html).

### list-core-definition-versions

The following code example shows how to use list-core-definition-versions.

**AWS CLI**

**To list the versions of a Greengrass core definition**

The following list-core-definitions example lists all versions of the specified Greengrass core definition. You can use the list-core-definitions command to get the version ID.

```bash
aws greengrass list-core-definition-versions
```
Output:

```
{
   "Versions": [
   {
      "Id": "eaf280cb-138c-4d15-af36-6f681a1348f7",
      "Version": "467c36e4-c5da-440c-a97b-084e62593b4c"
   }
   ]
}
```

- For API details, see [ListCoreDefinitionVersions](https://awscli.amazonaws.com/v2/documentation/api/reference/greengrass/acs.html#aws-cli:greengrass:acs:ListCoreDefinitionVersions) in *AWS CLI Command Reference*.

### list-core-definitions

The following code example shows how to use `list-core-definitions`.

**AWS CLI**

**To list Greengrass core definitions**

The following `list-core-definitions` example lists all of the Greengrass core definitions for your AWS account.

```
aws greengrass list-core-definitions
```

Output:

```
{
   "Definitions": [
   {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/0507843c-c1ef-4f06-b051-817030df7e7d",
      "CreationTimestamp": "2018-10-17T04:30:32.786Z",
```
For API details, see ListCoreDefinitions in AWS CLI Command Reference.
list-deployments

The following code example shows how to use list-deployments.

AWS CLI

To list the deployments for a Greengrass group

The following list-deployments example lists the deployments for the specified Greengrass group. You can use the list-groups command to look up your group ID.

```
aws greengrass list-deployments \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
   "Deployments": [
      {
         "CreatedAt": "2019-06-18T17:04:32.702Z",
         "DeploymentId": "1065b8a0-812b-4f21-9d5d-e89b232a530f",
         "DeploymentType": "NewDeployment",
         "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e"
      }
   ]
}
```

- For API details, see [ListDeployments](#) in AWS CLI Command Reference.

list-device-definition-versions

The following code example shows how to use list-device-definition-versions.

AWS CLI

To list the versions of a device definition

The following list-device-definition-versions example displays the device definition versions associated with the specified device definition.
aws greengrass list-device-definition-versions \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"

Output:

```json
{
   "Versions": [
   {
      "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
      "CreationTimestamp": "2019-09-11T00:15:09.838Z",
      "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71"
   },
   {
      "Version": "3b5cc510-58c1-44b5-9d98-4ad858ffa795",
      "CreationTimestamp": "2019-09-11T00:11:06.197Z",
      "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795"
   }
   ]
}
```

- For API details, see [ListDeviceDefinitionVersions](#) in [AWS CLI Command Reference](#).

**list-device-definitions**

The following code example shows how to use list-device-definitions.

**AWS CLI**

**To list your device definitions**

The following list-device-definitions example displays details about the device definitions in your AWS account in the specified AWS Region.

```bash
aws greengrass list-device-definitions \
   --region us-west-2
```
Output:

```json
{
  "Definitions": [
    {
      "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/devices/50f3274c-3f0a-4f57-b114-6f46085281ab/versions/c777b0f5-1059-449b-beae-f003ebc56c34",
      "LastUpdatedTimestamp": "2019-06-14T15:42:09.059Z",

    }
  ]
}
```

- For API details, see [ListDeviceDefinitions](#) in [AWS CLI Command Reference](#).
list-function-definition-versions

The following code example shows how to use list-function-definition-versions.

AWS CLI

To list the versions of a Lambda function

The following list-function-definition-versions example lists all of the versions of the specified Lambda function. You can use the list-function-definitions command to get the ID.

```bash
aws greengrass list-function-definition-versions \
  --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"
```

Output:

```json
{
  "Versions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
      greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/
      versions/9748fda7-1589-4fcc-ac94-f5559e88678b",
      "CreationTimestamp": "2019-06-18T17:04:30.776Z",
      "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
      "Version": "9748fda7-1589-4fcc-ac94-f5559e88678b"
    },
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
      greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/

      "Version": "4236239f-94f7-4b90-a2f8-2a24c829d21e"
    }
  ]
}
```
For API details, see [ListFunctionDefinitionVersions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-function-definitions.html) in AWS CLI Command Reference.

**list-function-definitions**

The following code example shows how to use `list-function-definitions`.

**AWS CLI**

To list Lambda functions

The following list-function-definitions example lists all of the Lambda functions defined for your AWS account.

```
aws greengrass list-function-definitions
```

Output:

```
{
   "Definitions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/017970a5-8952-46dd-b1c1-020b3ae8e960",
         "CreationTimestamp": "2018-10-17T04:30:32.884Z",

         "LatestVersion": "4380b302-790d-4ed8-92bf-02e88afecb15",
      }
   ]
}
```
For API details, see `ListFunctionDefinitions` in *AWS CLI Command Reference*.

**list-group-certificate-authorities**

The following code example shows how to use `list-group-certificate-authorities`. 
AWS CLI

**To list the current CAs for a group**

The following `list-group-certificate-authorities` example lists the current certificate authorities (CAs) for the specified Greengrass group.

```bash
aws greengrass list-group-certificate-authorities \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
   "GroupCertificateAuthorities": [ 
      {
         "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/certificateauthorities/f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",
         "GroupCertificateAuthorityId": "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
      }
   ]
}
```

- For API details, see [ListGroupCertificateAuthorities](#) in *AWS CLI Command Reference*.

**list-group-versions**

The following code example shows how to use `list-group-versions`.

AWS CLI

**To list the versions of a Greengrass group**

The following `list-group-versions` example lists the versions of the specified Greengrass group.

```bash
aws greengrass list-group-versions \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```
Output:

```json
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",

        }
    ]
}
```
For API details, see ListGroupVersions in AWS CLI Command Reference.

list-groups

The following code example shows how to use list-groups.

AWS CLI

To list the Greengrass groups

The following list-groups example lists all Greengrass groups that are defined in your AWS account.

aws greengrass list-groups

Output:

```json
{
   "Groups": [
      {
         "Id": "1013db12-8b58-45ff-acc7-704248f66731",
         "LatestVersion": "115136b3-cfd7-4462-b77f-8741a4b00e5e",
         "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",
         "Name": "GGGroup4Pi3"
      },
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8",

         "LatestVersion": "749af901-60ab-456f-a096-91b12d983c29",
```
For API details, see [ListGroups](#) in [AWS CLI Command Reference](#).

### list-logger-definition-versions

The following code example shows how to use `list-logger-definition-versions`.

**AWS CLI**

#### To get a list of versions of a logger definition

The following list-logger-definition-versions example gets a list of all versions of the specified logger definition.

```bash
aws greengrass list-logger-definition-versions  
--logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

**Output:**

```json
{
   "Versions": [
      
   
   ]
}
```
For API details, see `ListLoggerDefinitionVersions` in *AWS CLI Command Reference*.  

**list-logger-definitions**

The following code example shows how to use `list-logger-definitions`.

**AWS CLI**

To get a list of logger definitions

The following `list-logger-definitions` example lists all of the logger definitions for your AWS account.

```bash
aws greengrass list-logger-definitions
```

Output:

```json
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/5e3f6f64-a565-491e-8de0-3c0d8e0f2073",
            "CreationTimestamp": "2019-05-08T16:10:13.866Z",
            "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
            "Version": "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/3ec6d3af-eb85-48f9-a16d-1c795fe696d7",
            "CreationTimestamp": "2019-05-08T16:10:13.809Z",
            "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
            "Version": "3ec6d3af-eb85-48f9-a16d-1c795fe696d7"
        }
    ]
}
```
For API details, see [ListLoggerDefinitions](#) in AWS CLI Command Reference.

**list-resource-definition-versions**

The following code example shows how to use list-resource-definition-versions.

**AWS CLI**

To list the versions of a resource definition

The following list-resource-definition-versions example lists the versions for the specified Greengrass resource.

```
aws greengrass list-resource-definition-versions \
  --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
  "Versions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/26e8829a-491a-464d-9c87-664bf6f6f2be",
      "CreationTimestamp": "2019-06-19T16:40:59.392Z",
      "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
      "Version": "26e8829a-491a-464d-9c87-664bf6f6f2be"
    },
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/432d92f6-12de-4ec9-a704-619a942a62aa",
```
list-resource-definitions

The following code example shows how to use list-resource-definitions.

AWS CLI

**To list the resources that are defined**

The following list-resource-definitions example lists the resources that are defined for AWS IoT Greengrass to use.

```bash
aws greengrass list-resource-definitions
```

**Output:**

```json
{
   "Definitions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658",
         "CreationTimestamp": "2019-06-19T16:40:59.261Z",
         "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
         "LastUpdatedTimestamp": "2019-06-19T16:40:59.261Z",
         "LatestVersion": "26e8829a-491a-464d-9c87-664bf6f6f2be",
         "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/26e8829a-491a-464d-9c87-664bf6f6f2be"
      },
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
         "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
         "LatestVersion": "432d92f6-12de-4ec9-a704-619a942a62aa",
         "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/432d92f6-12de-4ec9-a704-619a942a62aa"
      }
   ]
}
```

For API details, see ListResourceDefinitions in AWS CLI Command Reference.

```
list-subscription-definition-versions

The following code example shows how to use list-subscription-definition-versions.

**AWS CLI**

**To list the versions of a subscription definition**

The following list-subscription-definition-versions example lists all versions of the specified subscription. You can use the list-subscription-definitions command to look up the subscription ID.

```
aws greengrass list-subscription-definition-versions \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
            "CreationTimestamp": "2019-06-18T17:03:52.499Z",
            "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
            "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
        }
    ]
}
```
For API details, see [ListSubscriptionDefinitionVersions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-subscription-definitions.html) in *AWS CLI Command Reference*.

### list-subscription-definitions

The following code example shows how to use `list-subscription-definitions`.

#### AWS CLI

**To get a list subscription definitions**

The following `list-subscription-definitions` example lists all of the AWS IoT Greengrass subscriptions that are defined in your AWS account.

```
aws greengrass list-subscription-definitions
```

**Output:**

```json
{
    "Definitions": [  
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/7e320ba3-c369-4069-a2f0-90acb7f219d6",
            "CreationTimestamp": "2019-06-18T17:03:52.392Z",
            "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
            "Version": "7e320ba3-c369-4069-a2f0-90acb7f219d6"
        }
    ]
}
```
For API details, see ListSubscriptionDefinitions in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags attached to a resource

The following list-tags-for-resource example lists the tags and their values that are attached to the specified resource.

```
aws greengrass list-tags-for-resource \
   --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:
For more information, see Tagging Your Greengrass Resources in the AWS IoT Greengrass Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

reset-deployments

The following code example shows how to use reset-deployments.

AWS CLI

To clean up deployment information for a Greengrass group

The following reset-deployments example cleans up deployment information for the specified Greengrass group. When you add the --force option, the deployment information is reset without waiting for the core device to respond.

```bash
aws greengrass reset-deployments \
    --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
    --force
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/deployments/7dd4e356-9882-46a3-9e28-6d21900c011a",
    "DeploymentId": "7dd4e356-9882-46a3-9e28-6d21900c011a"
}
```

For more information, see Reset Deployments in the AWS IoT Greengrass Developer Guide.

- For API details, see ResetDeployments in AWS CLI Command Reference.
**start-bulk-deployment**

The following code example shows how to use `start-bulk-deployment`.

**AWS CLI**

**To start a bulk deployment operation**

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment \
   --cli-input-json "{"InputFileUri":"https://gg-group-deployment1.s3-us-west-2.amazonaws.com/MyBulkDeploymentInputFile.txt","ExecutionRoleArn":"arn:aws:iam::123456789012:role/ggCreateDeploymentRole","AmznClientToken":"yourAmazonClientToken"}"
```

Output:

```
{
   "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
   "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
}
```

For more information, see [Create Bulk Deployments for Groups](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/bulk-deployment.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [StartBulkDeployment](https://docs.aws.amazon.com/cli/latest/reference/greengrass/start-bulk-deployment.html) in *AWS CLI Command Reference*.

**stop-bulk-deployment**

The following code example shows how to use `stop-bulk-deployment`.

**AWS CLI**

**To stop a bulk deployment**

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive an error: `InvalidInputException: Cannot change state of finished execution.`
aws greengrass stop-bulk-deployment \
   --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"

This command produces no output.

For more information, see Create Bulk Deployments for Groups in the AWS IoT Greengrass Developer Guide.

• For API details, see StopBulkDeployment in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To apply tags to a resource

The following tag-resource example applies two tags, ResourceType and ResourceSubType, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the untag-resource command to remove a tag.

aws greengrass tag-resource \
   --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
   --tags "ResourceType=Device,ResourceSubType=USB"

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the AWS IoT Greengrass Developer Guide.

• For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag and its value from a resource
The following untag-resource example removes the tag whose key is Category from the specified Greengrass group. If the key Category does not exist for the specified resource, no error is returned.

```bash
aws greengrass untag-resource \
   --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731" \
   --tag-keys "Category"
```

This command produces no output.

For more information, see [Tagging Your Greengrass Resources](#) in the AWS IoT Greengrass Developer Guide.

- For API details, see [UntagResource](#) in AWS CLI Command Reference.

**update-connectivity-info**

The following code example shows how to use update-connectivity-info.

**AWS CLI**

**To update the connectivity information for a Greengrass core**

The following update-connectivity-info example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```bash
aws greengrass update-connectivity-info \
   --thing-name "MyGroup_Core" \
   --connectivity-info "[{"Metadata":"","PortNumber":8883,"HostAddress":"127.0.0.1","Id":"localhost_127.0.0.1"},{"Metadata":"","PortNumber":8883,"HostAddress":"192.168.1.3","Id":"localIP_192.168.1.3"}]
```

**Output:**

```json
{
   "Version": "312de337-59af-4cf9-a278-2a23bd39c300"
}
```
For API details, see UpdateConnectivityInfo in AWS CLI Command Reference.

update-connector-definition

The following code example shows how to use update-connector-definition.

AWS CLI

To update the name for a connector definition

The following update-connector-definition example updates the name for the specified connector definition. If you want to update the details for the connector, use the create-connector-definition-version command to create a new version.

```bash
aws greengrass update-connector-definition \
    --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
    --name "GreengrassConnectors2019"
```

For more information, see Integrate with Services and Protocols Using Connectors in the AWS IoT Greengrass Developer Guide.

For API details, see UpdateConnectorDefinition in AWS CLI Command Reference.

update-core-definition

The following code example shows how to use update-core-definition.

AWS CLI

To update a core definition

The following update-core-definition example changes the name of the specified core definition. You can update only the name property of a core definition.

```bash
aws greengrass update-core-definition \
    --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
    --name "MyCoreDevices"
```

This command produces no output.

For more information, see Configure the AWS IoT Greengrass Core in the AWS IoT Greengrass Developer Guide.
For API details, see UpdateCoreDefinition in AWS CLI Command Reference.

update-device-definition

The following code example shows how to use update-device-definition.

AWS CLI

To update a device definition

The following update-device-definition example changes the name of the specified device definition. You can only update the name property of a device definition.

```
aws greengrass update-device-definition \\
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \\
    --name "TemperatureSensors"
```

This command produces no output.

For API details, see UpdateDeviceDefinition in AWS CLI Command Reference.

update-function-definition

The following code example shows how to use update-function-definition.

AWS CLI

To update the name for a function definition

The following update-function-definition example updates the name for the specified function definition. If you want to update the details for the function, use the create-function-definition-version command to create a new version.

```
aws greengrass update-function-definition \\
    --function-definition-id "e47952bd-dea9-4e2c-a7e1-37bbe8807f46" \\
    --name ObsoleteFunction
```

This command produces no output.

For more information, see Run Local Lambda Functions in the AWS IoT Greengrass Developer Guide.
update-group-certificate-configuration

The following code example shows how to use `update-group-certificate-configuration`.

**AWS CLI**

**To update the expiry of a group's certificates**

The following `update-group-certificate-configuration` example sets a 10-day expiry for the certificates generated for the specified group.

```bash
aws greengrass update-group-certificate-configuration \
   --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1" \
   --certificate-expiry-in-milliseconds 864000000
```

Output:

```json
{
   "CertificateExpiryInMilliseconds": 864000000,
   "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
   "GroupId": "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
}
```

For more information, see [AWS IoT Greengrass Security](https://aws.amazon.com/greengrass/guides/security/) in the *AWS IoT Greengrass Developer Guide*.

**update-group**

The following code example shows how to use `update-group`.

**AWS CLI**

**To update the group name**

The following `update-group` example updates the name of the specified Greengrass group. If you want to update the details for the group, use the `create-group-version` command to create a new version.
aws greengrass update-group \
   --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
   --name TestGroup4of6

For more information, see Configure AWS IoT Greengrass on AWS IoT in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateGroup in AWS CLI Command Reference.

update-logger-definition

The following code example shows how to use update-logger-definition.

AWS CLI

To update a logger definition

The following update-logger-definition example changes the name of the specified logger definition. You can only update the name property of a logger definition.

aws greengrass update-logger-definition \
   --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
   --name "LoggingConfigsForSensors"

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateLoggerDefinition in AWS CLI Command Reference.

update-resource-definition

The following code example shows how to use update-resource-definition.

AWS CLI

To update the name for a resource definition

The following update-resource-definition example updates the name for the specified resource definition. If you want to change the details for the resource, use the create-resource-definition-version command to create a new version.
aws greengrass update-resource-definition \
  --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
  --name GreengrassConnectorResources

This command produces no output.

For more information, see Access Local Resources with Lambda Functions and Connectors in the AWS IoT Greengrass Developer Guide.

• For API details, see UpdateResourceDefinition in AWS CLI Command Reference.

update-subscription-definition

The following code example shows how to use update-subscription-definition.

AWS CLI

To update the name for a subscription definition

The following update-subscription-definition example updates the name for the specified subscription definition. If you want to change details for the subscription, use the create-subscription-definition-version command to create a new version.

aws greengrass update-subscription-definition \
  --subscription-definition-id "fa81bc84-3f59-4377-a84b-5d0134da359b" \
  --name "ObsoleteSubscription"

This command produces no output.

For more information, see title in the guide.

• For API details, see UpdateSubscriptionDefinition in AWS CLI Command Reference.

update-thing-runtime-configuration

The following code example shows how to use update-thing-runtime-configuration.

AWS CLI

To turn on telemetry in the runtime configuration of a Greengrass core
The following update-thing-runtime-configuration example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \
    --thing-name SampleGreengrassCore \
    --telemetry-configuration {"Telemetry":"On"}
```

This command produces no output.

For more information, see Configuring telemetry settings in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateThingRuntimeConfiguration in AWS CLI Command Reference.

**AWS IoT Greengrass V2 examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

associate-service-role-to-account

The following code example shows how to use associate-service-role-to-account.

**AWS CLI**

To associate the Greengrass service role to your AWS account
The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```bash
aws greengrassv2 associate-service-role-to-account
   --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```json
{
   "associatedAt": "2022-01-19T19:53Z"
}
```

For more information, see [Greengrass service role](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/greengrass-service-role.html) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [AssociateServiceRoleToAccount](https://docs.aws.amazon.com/cli/latest/reference/greengrassv2/associate-service-role-to-account.html) in *AWS CLI Command Reference*.

### `batch-associate-client-device-with-core-device`

The following code example shows how to use `batch-associate-client-device-with-core-device`.

**AWS CLI**

**To associate client devices with a core device**

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```bash
aws greengrassv2 batch-associate-client-device-with-core-device
   --core-device-thing-name MyGreengrassCore
   --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```json
{
   "errorEntries": []
}
```

For more information, see [Interact with local IoT devices](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/interact-with-local-iot-devices.html) in the *AWS IoT Greengrass V2 Developer Guide*. 

---
For API details, see BatchAssociateClientDeviceWithCoreDevice in AWS CLI Command Reference.

**batch-disassociate-client-device-from-core-device**

The following code example shows how to use `batch-disassociate-client-device-from-core-device`.

**AWS CLI**

To disassociate client devices from a core device

The following `batch-disassociate-client-device-from-core-device` example disassociates two client devices from a core device.

```bash
aws greengrassv2 batch-disassociate-client-device-from-core-device \
  --core-device-thing-name MyGreengrassCore \
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```json
{
  "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the AWS IoT Greengrass V2 Developer Guide.

For API details, see BatchDisassociateClientDeviceFromCoreDevice in AWS CLI Command Reference.

**cancel-deployment**

The following code example shows how to use `cancel-deployment`.

**AWS CLI**

To cancel a deployment

The following `cancel-deployment` example stops a continuous deployment to a thing group.
aws greengrassv2 cancel-deployment \
   --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

{
   "message": "SUCCESS"
}

For more information, see Cancel deployments in the AWS IoT Greengrass V2 Developer Guide.
- For API details, see CancelDeployment in AWS CLI Command Reference.

create-component-version

The following code example shows how to use create-component-version.

AWS CLI

Example 1: To create a component version from a recipe

The following create-component-version example creates a version of a Hello World component from a recipe file.

aws greengrassv2 create-component-version \
   --inline-recipe fileb://com.example.HelloWorld-1.0.0.json

Contents of com.example.HelloWorld-1.0.0.json:

```json
{
   "RecipeFormatVersion": "2020-01-25",
   "ComponentName": "com.example.HelloWorld",
   "ComponentVersion": "1.0.0",
   "ComponentDescription": "My first AWS IoT Greengrass component.",
   "ComponentPublisher": "Amazon",
   "ComponentConfiguration": {
      "DefaultConfiguration": {
         "Message": "world"
      }
   },
   "Manifests": [
```
Example 2: To create a component version from an AWS Lambda function

The following `create-component-version` example creates a version of a Hello World component from an AWS Lambda function.

```
aws greengrassv2 create-component-version
   --cli-input-json file://lambda-function-component.json
```

Contents of `lambda-function-component.json`:

```
{
   "lambdaFunction": {
   
   }
   
}
```
"componentName": "com.example.HelloWorld",
"componentVersion": "1.0.0",
"componentLambdaParameters": {
  "eventSources": [
    {
      "topic": "hello/world/+",
      "type": "IOT_CORE"
    }
  ]
}
}

Output:
{
  "componentName": "com.example.HelloWorld",
  "componentVersion": "1.0.0",
  "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",
  "status": {
    "componentState": "REQUESTED",
    "message": "NONE",
    "errors": {}
  }
}

For more information, see Run AWS Lambda functions in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see CreateComponentVersion in AWS CLI Command Reference.

create-deployment

The following code example shows how to use create-deployment.

AWS CLI

Example 1: To create a deployment
The following create-deployment example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```bash
aws greengrassv2 create-deployment \
   --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```json
{
   "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
   "deploymentName": "Deployment for MyGreengrassCore",
   "components": {
      "aws.greengrass.Cli": {
         "componentVersion": "2.0.3"
      }
   },
   "deploymentPolicies": {
      "failureHandlingPolicy": "DO NOTHING",
      "componentUpdatePolicy": {
         "timeoutInSeconds": 60,
         "action": "NOTIFY_COMPONENTS"
      },
      "configurationValidationPolicy": {
         "timeoutInSeconds": 60
      }
   },
   "iotJobConfiguration": {}  
}
```

Output:

```json
{
   "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Create deployments](https://docs.aws.amazon.com/iot-greengrass/latest/developer-guide/create-deployment.html) in the *AWS IoT Greengrass V2 Developer Guide*.

**Example 2: To create a deployment that updates component configurations**

The following create-deployment example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:
Reset the target devices' proxy settings to their default no proxy settings. Reset the target devices' MQTT settings to their defaults. Sets the JVM options for the nucleus' JVM. Sets the logging level for the nucleus.

```
aws greengrassv2 create-deployment \
  --cli-input-json file://nucleus-deployment.json
```

Contents of `nucleus-deployment.json`:

```json
{
   "deploymentName": "Deployment for MyGreengrassCoreGroup",
   "components": {
      "aws.greengrass.Nucleus": {
         "componentVersion": "2.0.3",
         "configurationUpdate": {
            "reset": ["/networkProxy", "/mqtt"],
            "merge": "{"jvmOptions":\"-Xmx64m\",\"logging\":{"level\":\"WARN\"}}"
         }
      }
   },
   "deploymentPolicies": {
      "failureHandlingPolicy": "ROLLBACK",
      "componentUpdatePolicy": {
         "timeoutInSeconds": 60,
         "action": "NOTIFY_COMPONENTS"
      },
      "configurationValidationPolicy": {
         "timeoutInSeconds": 60
      }
   },
   "iotJobConfiguration": {}
}
```

Output:

```json
{
}
```
For more information, see Create deployments and Update component configurations in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see CreateDeployment in AWS CLI Command Reference.

**delete-component**

The following code example shows how to use delete-component.

**AWS CLI**

**To delete a component version**

The following delete-component example deletes a Hello World component.

```
aws greengrassv2 delete-component \
```

This command produces no output.

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

**delete-core-device**

The following code example shows how to use delete-core-device.

**AWS CLI**

**To delete a core device**

The following delete-core-device example deletes an AWS IoT Greengrass core device.

```
aws greengrassv2 delete-core-device \
  --core-device-thing-name MyGreengrassCore
```
This command produces no output.

For more information, see Uninstall the AWS IoT Greengrass Core software in the AWS IoT Greengrass V2 Developer Guide.

• For API details, see DeleteCoreDevice in AWS CLI Command Reference.

describe-component

The following code example shows how to use describe-component.

AWS CLI

To describe a component version

The following describe-component example describes a Hello World component.

```bash
aws greengrassv2 describe-component \
```

Output:

```json
{
   "componentName": "com.example.HelloWorld",
   "componentVersion": "1.0.0",
   "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",
   "publisher": "Amazon",
   "description": "My first AWS IoT Greengrass component.",
   "status": {
      "componentState": "DEPLOYABLE",
      "message": "NONE",
      "errors": {}
   },
   "platforms": [
      {"attributes": {
         "os": "linux"
      }},
   ]
}
```
For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide. For API details, see DescribeComponent in AWS CLI Command Reference.

**disassociate-service-role-from-account**

The following code example shows how to use disassociate-service-role-from-account.

**AWS CLI**

To disassociate the Greengrass service role from your AWS account

The following disassociate-service-role-from-account example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```bash
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```json
{
   "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see Greengrass service role in the AWS IoT Greengrass V2 Developer Guide. For API details, see DisassociateServiceRoleFromAccount in AWS CLI Command Reference.

**get-component-version-artifact**

The following code example shows how to use get-component-version-artifact.

**AWS CLI**

To get a URL to download a component artifact

The following get-component-version-artifact example gets a URL to download the local debug console component's JAR file.

```bash
aws greengrassv2 get-component-version-artifact
```
Output:

```json
{
}
```

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetComponentVersionArtifact in AWS CLI Command Reference.

get-component

The following code example shows how to use get-component.

AWS CLI

**Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)**

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

Uses the --output and --query parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see Controlling Command Output in the AWS Command Line Interface User Guide. Uses the base64 utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful get-component command is base64-encoded text. You must decode this blob to obtain the original text. Saves the decoded text to a file. The final section of the command (> com.example.HelloWorld-1.0.0.json) saves the decoded text to a file.

```bash
aws greengrassv2 get-component \
```
For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

Example 2: To download a component's recipe in YAML format (Windows CMD)

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command uses the certutil utility.

```
aws greengrassv2 get-component ^
   --recipe-output-format YAML ^
   --query recipe ^
   --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

Example 3: To download a component's recipe in YAML format (Windows PowerShell)

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command uses the certutil utility.

```
aws greengrassv2 get-component `^`
   --recipe-output-format YAML `^`
   --query recipe `^`
   --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetComponent in AWS CLI Command Reference.
get-connectivity-info

The following code example shows how to use get-connectivity-info.

AWS CLI

To get the connectivity information for a Greengrass core device

The following get-connectivity-info example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```bash
aws greengrassv2 get-connectivity-info \
  --thing-name MyGreengrassCore
```

Output:

```json
{
  "connectivityInfo": [
    {
      "id": "localIP_192.0.2.0",
      "hostAddress": "192.0.2.0",
      "portNumber": 8883
    }
  ]
}
```

For more information, see Manage core device endpoints in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetConnectivityInfo in AWS CLI Command Reference.

get-core-device

The following code example shows how to use get-core-device.

AWS CLI

To get a core device

The following get-core-device example gets information about an AWS IoT Greengrass core device.
aws greengrassv2 get-core-device
   --core-device-thing-name MyGreengrassCore

Output:

{
   "coreDeviceThingName": "MyGreengrassCore",
   "coreVersion": "2.0.3",
   "platform": "linux",
   "architecture": "amd64",
   "status": "HEALTHY",
   "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",
   "tags": {}
}

For more information, see Check core device status in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetCoreDevice in AWS CLI Command Reference.

get-deployment

The following code example shows how to use get-deployment.

AWS CLI

To get a deployment

The following get-deployment example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

aws greengrassv2 get-deployment \
   --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

{
   "revisionId": "14",
}
For more information, see Deploy components to devices in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetDeployment in AWS CLI Command Reference.

get-service-role-for-account

The following code example shows how to use get-service-role-for-account.
**AWS CLI**

**To get the Greengrass service role for your AWS account**

The following `get-service-role-for-account` example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```bash/aws greengrassv2 get-service-role-for-account
```

**Output:**

```json
{
   "associatedAt": "2022-01-19T19:21:53Z",
   "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see [Greengrass service role](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/greengrass-service-role.html) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetServiceRoleForAccount](https://docs.aws.amazon.com/cli/latest/reference/greengrassv2/get-service-role-for-account.html) in *AWS CLI Command Reference*.

**list-client-devices-associated-with-core-device**

The following code example shows how to use `list-client-devices-associated-with-core-device`.

**AWS CLI**

**To list the client devices associated with a core device**

The following `list-client-devices-associated-with-core-device` example lists all client devices associated with a core device.

```bash
/aws greengrassv2 list-client-devices-associated-with-core-device \
   --core-device-thing-name MyTestGreengrassCore
```

**Output:**

```json
{
   "associatedClientDevices": [
```
For more information, see [Interact with local IoT devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListClientDevicesAssociatedWithCoreDevice](#) in *AWS CLI Command Reference*.

### list-component-versions

The following code example shows how to use `list-component-versions`.

**AWS CLI**

**To list the versions of a component**

The following `list-component-versions` example lists all versions of a Hello World component.

```bash
aws greengrassv2 list-component-versions \
```

**Output:**

```json
{
    "componentVersions": [
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.1",
        }
    ]
}
```
For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, seeListComponentVersions in AWS CLI Command Reference.

list-components

The following code example shows how to use list-components.

AWS CLI

To list components

The following list-components example lists each component and its latest version defined in your AWS account in the current Region.

aws greengrassv2 list-components

Output:

```json
{
  "components": [
    {
      "componentName": "com.example.HelloWorld",
      "latestVersion": {
        "componentVersion": "1.0.1",
        "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
        "description": "My first AWS IoT Greengrass component."
      }
    }
  ]
}
```
For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListComponents in AWS CLI Command Reference.

list-core-devices

The following code example shows how to use list-core-devices.

AWS CLI

To list core devices

The following list-core-devices example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

aws greengrassv2 list-core-devices

Output:

```json
{
   "coreDevices": [
      {
         "coreDeviceThingName": "MyGreengrassCore",
         "status": "HEALTHY",
         "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
      }
   ]
}
```

For more information, see Check core device status in the AWS IoT Greengrass V2 Developer Guide.
- For API details, see ListCoreDevices in AWS CLI Command Reference.

**list-deployments**

The following code example shows how to use list-deployments.

**AWS CLI**

**To list deployments**

The following list-deployments example lists the latest revision of each deployment defined in your AWS account in the current Region.

```bash
aws greengrassv2 list-deployments
```

Output:

```json
{
   "deployments": [
       {
           "revisionId": "14",
           "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
           "deploymentName": "Deployment for MyGreengrassCoreGroup",
           "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
           "deploymentStatus": "ACTIVE",
           "isLatestForTarget": false
       },
       {
           "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
           "revisionId": "1",
           "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
           "deploymentName": "Deployment for MyGreengrassCore",
           "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
           "deploymentStatus": "COMPLETED",
           "isLatestForTarget": false
       }
   ]
}
```
For more information, see [Deploy components to devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListDeployments](#) in *AWS CLI Command Reference*.

### list-effective-deployments

The following code example shows how to use `list-effective-deployments`.

**AWS CLI**

**To list deployment jobs**

The following `list-effective-deployments` example lists the deployments that apply to an AWS IoT Greengrass core device.

```bash
aws greengrassv2 list-effective-deployments \
  --core-device-thing-name MyGreengrassCore
```

**Output:**

```json
{
  "effectiveDeployments": [
    {
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "deploymentName": "Deployment for MyGreengrassCore",
      "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
      "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
      "coreDeviceExecutionStatus": "COMPLETED",
      "reason": "SUCCESSFUL",
      "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",
      "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"
    },
    {
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "deploymentName": "Deployment for MyGreengrassCoreGroup",
      "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
      "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
      "coreDeviceExecutionStatus": "SUCCEEDED",
```

```json
```
For more information, see [Check core device status](#) in the [AWS IoT Greengrass V2 Developer Guide](#).

• For API details, see [ListEffectiveDeployments](#) in [AWS CLI Command Reference](#).

list-installed-components

The following code example shows how to use list-installed-components.

**AWS CLI**

To list components installed on a core device

The following list-installed-components example lists the components that are installed on an AWS IoT Greengrass core device.

```bash
aws greengrassv2 list-installed-components \
   --core-device-thing-name MyGreengrassCore
```

Output:

```json
{
   "installedComponents": [
      {
         "componentName": "aws.greengrass.Cli",
         "componentVersion": "2.0.3",
         "lifecycleState": "RUNNING",
         "isRoot": true
      },
      {
         "componentName": "aws.greengrass.Nucleus",
         "componentVersion": "2.0.3",
         "lifecycleState": "FINISHED",
         "isRoot": true
      }
   ]
}
```
For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListInstalledComponents](#) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a resource**

The following `list-tags-for-resource` example lists all tags for an AWS IoT Greengrass core device.

```bash
aws greengrassv2 list-tags-for-resource \\
```

Output:

```json
{
    "tags": {
        "Owner": "richard-roe"
    }
}
```

For more information, see [Tag your resources](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to a resource**
The following `tag-resource` example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```bash
aws greengrassv2 tag-resource \
  --tags Owner=richard-roen
```

This command produces no output.

For more information, see [Tag your resources](https://docs.aws.amazon.com/iot-greengrass/v2/developerguide/tagging-resources.html) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/greengrassv2/tag-resource.html) in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resource` example removes an owner tag from an AWS IoT Greengrass core device.

```bash
aws iotsitewise untag-resource \
  --tag-keys Owner
```

This command produces no output.

For more information, see [Tag your resources](https://docs.aws.amazon.com/iot-greengrass/v2/developerguide/tagging-resources.html) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/untag-resource.html) in *AWS CLI Command Reference*.

### update-connectivity-info

The following code example shows how to use `update-connectivity-info`.

**AWS CLI**

**To update connectivity information for a Greengrass core device**
The following `update-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```bash
aws greengrassv2 update-connectivity-info \
    --thing-name MyGreengrassCore \
    --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```json
{
    "connectivityInfo": [
        {
            "hostAddress": "192.0.2.0",
            "portNumber": 8883,
            "id": "localIP_192.0.2.0"
        }
    ]
}
```

Output:

```json
{
    "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Manage core device endpoints](#) in the [AWS IoT Greengrass V2 Developer Guide](#).

- For API details, see [UpdateConnectivityInfo](#) in [AWS CLI Command Reference](#).

### AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

describe-job-execution

The following code example shows how to use describe-job-execution.

AWS CLI

To get the details of a job execution

The following describe-job-execution example retrieves the details of the latest execution of the specified job and thing.

```
aws iot-jobs-data describe-job-execution
  --job-id SampleJob
  --thing-name MotionSensor1
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
  "execution": {
    "approximateSecondsBeforeTimedOut": 88,
    "executionNumber": 2939653338,
    "jobId": "SampleJob",
    "lastUpdatedAt": 1567701875.743,
    "queuedAt": 1567701902.444,
    "status": "QUEUED",
    "thingName": "MotionSensor1",
    "versionNumber": 3
  }
}
```
For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeJobExecution](#) in *AWS CLI Command Reference*.

### get-pending-job-executions

The following code example shows how to use `get-pending-job-executions`.

**AWS CLI**

**To get a list of all jobs that are not in a terminal status for a thing**

The following `get-pending-job-executions` example displays a list of all jobs that aren't in a terminal state for the specified thing.

```bash
aws iot-jobs-data get-pending-job-executions \
  --thing-name MotionSensor1 \
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

**Output:**

```json
{
  "inProgressJobs": [],
  "queuedJobs": [
    {
      "executionNumber": 2939653338,
      "jobId": "SampleJob",
      "lastUpdatedAt": 1567701875.743,
      "queuedAt": 1567701902.444,
      "versionNumber": 3
    }
  ]
}
```

For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetPendingJobExecutions](#) in *AWS CLI Command Reference*.

### start-next-pending-job-execution

The following code example shows how to use `start-next-pending-job-execution`.

Actions and scenarios
AWS CLI

To get and start the next pending job execution for a thing

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is IN_PROGRESS or QUEUED for the specified thing.

```shell
aws iot-jobs-data start-next-pending-job-execution \
  --thing-name MotionSensor1 \
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```json
{
  "execution": {
    "approximateSecondsBeforeTimedOut": 88,
    "executionNumber": 2939653338,
    "jobId": "SampleJob",
    "lastUpdatedAt": 1567714853.743,
    "queuedAt": 1567701902.444,
    "startedAt": 1567714871.690,
    "status": "IN_PROGRESS",
    "thingName": "MotionSensor1",
    "versionNumber": 3
  }
}
```

For more information, see [Devices and Jobs](http://aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developer Guide*.

- For API details, see [StartNextPendingJobExecution](http://aws.amazon.com/cli-command-reference/) in *AWS CLI Command Reference*.

update-job-execution

The following code example shows how to use `update-job-execution`.

AWS CLI

To update the status of a job execution

The following `update-job-execution` example updates the status of the specified job and thing.

```shell
aws iot-jobs-data update-job-execution \
```
--job-id SampleJob \
--thing-name MotionSensor1 \
--status REMOVED \
--endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com

Output:

```
{
   "executionState": {
      "status": "REMOVED",
      "versionNumber": 3
   }},
```

For more information, see Devices and Jobs in the AWS IoT Developer Guide.

- For API details, see UpdateJobExecution in AWS CLI Command Reference.

AWS IoT SiteWise examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT SiteWise.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

associate-assets

The following code example shows how to use associate-assets.
AWS CLI

To associate a child asset to a parent asset

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```bash
aws iotsitewise associate-assets \
   --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
   --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
   --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see [Associating assets](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/guides/assets.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [AssociateAssets](https://docs.aws.amazon.com/iot-sitewise/latest/APIReference/API_AssociateAssets.html) in *AWS CLI Command Reference*.

**batch-associate-project-assets**

The following code example shows how to use `batch-associate-project-assets`.

**AWS CLI**

To associate an asset to a project

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```bash
aws iotsitewise batch-associate-project-assets \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
   --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see [Adding assets to projects](https://docs.aws.amazon.com/iot-sitewise/latest/mamonitorguides/guides/assets.html) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [BatchAssociateProjectAssets](https://docs.aws.amazon.com/iot-sitewise/latest/APIReference/API_BatchAssociateProjectAssets.html) in *AWS CLI Command Reference*.

**batch-disassociate-project-assets**

The following code example shows how to use `batch-disassociate-project-assets`.
AWS CLI

To disassociate an asset from a project

The following batch-disassociate-project-assets example disassociates a wind farm asset from a project.

```
aws iotsitewise batch-disassociate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see BatchDisassociateProjectAssets in AWS CLI Command Reference.

batch-put-asset-property-value

The following code example shows how to use batch-put-asset-property-value.

AWS CLI

To send data to asset properties

The following batch-put-asset-property-value example sends power and temperature data to the asset properties identified by property aliases.

```
aws iotsitewise batch-put-asset-property-value \
    --cli-input-json file://batch-put-asset-property-value.json
```

Contents of batch-put-asset-property-value.json:

```
{
    "entries": [
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-power",
            "propertyAlias": "company-windfarm-3-turbine-7-power",
            "propertyValues": [
                {
                    "value": {
                        "doubleValue": 4.92
                    }
                }
            ]
        }
    ]
}
```
Output:

```json
{
    "errorEntries": []
}
```

For more information, see [Ingesting data using the AWS IoT SiteWise API](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/inventory-api.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [BatchPutAssetPropertyValue](https://docs.aws.amazon.com/cli/latest/reference/iot-sitewise/batch-put-asset-property-value.html) in *AWS CLI Command Reference*.

**create-access-policy**

The following code example shows how to use `create-access-policy`.

**AWS CLI**

**Example 1: To grant a user administrative access to a portal**
The following create-access-policy example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise create-access-policy \
  --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```
{
  "accessPolicyIdentity": {
    "user": {
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
    }
  },
  "accessPolicyPermission": "ADMINISTRATOR",
  "accessPolicyResource": {
    "portal": {
      "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
    }
  }
}
```

Output:

```
{
  "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
  "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE"
}
```

For more information, see [Adding or removing portal administrators](https://aws.amazon.com/documentation/iotsitewise/user-guide/) in the *AWS IoT SiteWise User Guide*.

**Example 2: To grant a user read-only access to a project**

The following create-access-policy example creates an access policy that grants a user read-only access to a wind farm project.

```
aws iotsitewise create-access-policy \
  --cli-input-json file://create-project-viewer-access-policy.json
```
Contents of create-project-viewer-access-policy.json:

```json
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "VIEWER",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
        }
    }
}
```

Output:

```json
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE"
}
```

For more information, see Assigning project viewers in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see CreateAccessPolicy in AWS CLI Command Reference.

create-asset-model

The following code example shows how to use create-asset-model.

AWS CLI

**To create an asset model**

The following create-asset-model example creates an asset model that defines a wind turbine with the following properties:

- Serial number - The serial number of a wind turbine
- Generated power - The generated power data stream from a wind turbine
- Temperature C - The temperature data stream from a wind turbine
turbine in Celsius

Temperature F - The mapped temperature data points from Celsius to Fahrenheit

```bash
aws iotsitewise create-asset-model \
   --cli-input-json file://create-wind-turbine-model.json
```

**Contents of create-wind-turbine-model.json:**

```json
{
    "assetModelName": "Wind Turbine Model",
    "assetModelDescription": "Represents a wind turbine",
    "assetModelProperties": [
        {
            "name": "Serial Number",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "name": "Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature C",
            "dataType": "DOUBLE",
            "unit": "Celsius",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature F",
            "dataType": "DOUBLE",
            "unit": "Fahrenheit",
            "type": {
                "transform": {
                    "expression": "temp_c * 9 / 5 + 32",
                    "variables": [  
```
{  
  "name": "temp_c",
  "value": {
    "propertyId": "Temperature C"
  }
}
{
  "name": "Total Generated Power",
  "dataType": "DOUBLE",
  "unit": "kW",
  "type": {
    "metric": {
      "expression": "sum(power)",
      "variables": [
        {
          "name": "power",
          "value": {
            "propertyId": "Generated Power"
          }
        }
      ],
      "window": {
        "tumbling": {
          "interval": "1h"
        }
      }
    }
  }
}

Output:

{  
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
  "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
  "assetModelStatus": {
    }
For more information, see Defining asset models in the AWS IoT SiteWise User Guide.

• For API details, see CreateAssetModel in AWS CLI Command Reference.

create-asset

The following code example shows how to use create-asset.

AWS CLI

To create an asset

The following create-asset example creates a wind turbine asset from a wind turbine asset model.

```
aws iotsitewise create-asset \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --asset-name "Wind Turbine 1"
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Creating assets in the AWS IoT SiteWise User Guide.

• For API details, see CreateAsset in AWS CLI Command Reference.

create-dashboard

The following code example shows how to use create-dashboard.
AWS CLI

To create a dashboard

The following create-dashboard example creates a dashboard with a line chart that displays total generated power for a wind farm.

```bash
aws iotsitewise create-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \ 
    --dashboard-name "Wind Farm" \ 
    --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of create-wind-farm-dashboard.json:

```json
{
    "widgets": [
    {
        "type": "monitor-line-chart",
        "title": "Generated Power",
        "x": 0,
        "y": 0,
        "height": 3,
        "width": 3,
        "metrics": [
            {
                "label": "Power",
                "type": "iotsitewise",
                "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
            }
        ]
    }
    ]
}
```

Output:

```json
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE"
}
```
For more information, see [Creating dashboards (CLI)](https://docs.aws.amazon.com/iot-sitewise/latest/userguide') in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateDashboard](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/create-dashboard.html) in *AWS CLI Command Reference*.

### create-gateway

The following code example shows how to use `create-gateway`.

**AWS CLI**

**To create a gateway**

The following `create-gateway` example creates a gateway that runs on AWS IoT Greengrass.

```bash
aws iotsitewise create-gateway
   --gateway-name ExampleCorpGateway
   --gateway-platform greengrass=
   {groupArn=arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE}
```

**Output:**

```json
{
   "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
   "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE"
}
```

For more information, see [Configuring a gateway](https://docs.aws.amazon.com/iot-sitewise/latest/userguide') in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateGateway](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/create-gateway.html) in *AWS CLI Command Reference*.

### create-portal

The following code example shows how to use `create-portal`.

**AWS CLI**

**To create a portal**

The following `create-portal` example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.
aws iotsitewise create-portal \
  --portal-name WindFarmPortal \
  --portal-description "A portal that contains wind farm projects for Example Corp." \
  --portal-contact-email support@example.com \
  --role-arn arn:aws:iam::123456789012:role/service-role/MySiteWiseMonitorServiceRole

Output:

{
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
  "portalStatus": {
    "state": "CREATING"
  },
  "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"
}

For more information, see Getting started with AWS IoT SiteWise Monitor in the AWS IoT SiteWise User Guide and Enabling AWS SSO in the AWS IoT SiteWise User Guide.

- For API details, see CreatePortal in AWS CLI Command Reference.

create-project

The following code example shows how to use create-project.

AWS CLI

To create a project

The following create-project example creates a wind farm project.

aws iotsitewise create-project \
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
  --project-name "Wind Farm 1" \
  --project-description "Contains asset visualizations for Wind Farm #1 for Example Corp."
Output:

```json
{
   "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
   "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
}
```

For more information, see Creating projects in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see CreateProject in AWS CLI Command Reference.

**delete-access-policy**

The following code example shows how to use delete-access-policy.

**AWS CLI**

**To revoke a user's access to a project or portal**

The following delete-access-policy example deletes an access policy that grants a user administrative access to a portal.

```bash
aws iotsitewise delete-access-policy \
   --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

This command produces no output.

For more information, see Adding or removing portal administrators in the AWS IoT SiteWise User Guide.

- For API details, see DeleteAccessPolicy in AWS CLI Command Reference.

**delete-asset-model**

The following code example shows how to use delete-asset-model.

**AWS CLI**

**To delete an asset model**
The following `delete-asset-model` example deletes a wind turbine asset model.

```bash
aws iotsitewise delete-asset-model \
   --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
   "assetModelStatus": {
      "state": "DELETING"
   }
}
```

For more information, see [Deleting asset models](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/aws-cli-delete-asset-model.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeleteAssetModel](https://docs.aws.amazon.com/iot-sitewise/latest/api-reference/delete-asset-model.html) in *AWS CLI Command Reference*.

---

**delete-asset**

The following code example shows how to use `delete-asset`.

**AWS CLI**

**To delete an asset**

The following `delete-asset` example deletes a wind turbine asset.

```bash
aws iotsitewise delete-asset \
   --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```json
{
   "assetStatus": {
      "state": "DELETING"
   }
}
```

For more information, see [Deleting assets](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/aws-cli-delete-asset.html) in the *AWS IoT SiteWise User Guide*.
• For API details, see `DeleteAsset` in *AWS CLI Command Reference*.

**delete-dashboard**

The following code example shows how to use `delete-dashboard`.

**AWS CLI**

**To delete a dashboard**

The following `delete-dashboard` example deletes a wind turbine dashboard.

```bash
aws iotsitewise delete-dashboard \
   --dashboard-id a1b2c3d4-5678-90ab-cdef-ffffEXAMPLE
```

This command produces no output.

For more information, see [Deleting dashboards](https://docs.aws.amazon.com/iotsitewise/latest/userguide/monitor-application-guidelines.html) in the *AWS IoT SiteWise Monitor Application Guide*.

• For API details, see `DeleteDashboard` in *AWS CLI Command Reference*.

**delete-gateway**

The following code example shows how to use `delete-gateway`.

**AWS CLI**

**To delete a gateway**

The following `delete-gateway` example deletes a gateway.

```bash
aws iotsitewise delete-gateway \
   --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

This command produces no output.

For more information, see [Ingesting data using a gateway](https://docs.aws.amazon.com/iotsitewise/latest/userguide/actions-and-scenarios.html) in the *AWS IoT SiteWise User Guide*.

• For API details, see `DeleteGateway` in *AWS CLI Command Reference*.
delete-portal

The following code example shows how to use delete-portal.

AWS CLI

To delete a portal

The following delete-portal example deletes a web portal for a wind farm company.

```bash
aws iotsitewise delete-portal \
   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```json
{
   "portalStatus": {
      "state": "DELETING"
   }
}
```

For more information, see Deleting a portal in the AWS IoT SiteWise User Guide.

- For API details, see DeletePortal in AWS CLI Command Reference.

delete-project

The following code example shows how to use delete-project.

AWS CLI

To delete a project

The following delete-project example deletes a wind farm project.

```bash
aws iotsitewise delete-project \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

This command produces no output.

For more information, see Deleting projects in the AWS IoT SiteWise Monitor Application Guide.
describe-access-policy

The following code example shows how to use describe-access-policy.

**AWS CLI**

To describe an access policy

The following describe-access-policy example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```bash
aws iotsitewise describe-access-policy \
   --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

**Output:**

```
{
   "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
   "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
   "accessPolicyIdentity": {
      "user": {
         "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
      }
   },
   "accessPolicyResource": {
      "portal": {
         "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
      }
   },
   "accessPolicyPermission": "ADMINISTRATOR",
   "accessPolicyCreationDate": "2020-02-20T22:35:15.552880124Z",
   "accessPolicyLastUpdateDate": "2020-02-20T22:35:15.552880124Z"
}
```

For more information, see [Adding or removing portal administrators](https://aws.amazon.com/about-aws/leaders/safety/iot-sitewise/) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAccessPolicy](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/describe-access-policy.html) in *AWS CLI Command Reference*.
**describe-asset-model**

The following code example shows how to use describe-asset-model.

**AWS CLI**

**To describe an asset model**

The following `describe-asset-model` example describes a wind farm asset model.

```bash
aws iotsitewise describe-asset-model \
   --asset-model-id a1b2c3d4-5678-90ab-cdef-22222EXAMPLE
```

Output:

```json
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE",
                                "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE"
                            }
                        }
                    ]
                }
            }
        }
    ]
}
```
"tumbling": {
    "interval": "1h"
  }
}
},
{

}

For more information, see Describing a specific asset model in the AWS IoT SiteWise User Guide.

- For API details, see DescribeAssetModel in AWS CLI Command Reference.

describe-asset-property

The following code example shows how to use describe-asset-property.

AWS CLI

  To describe an asset property
The following describe-asset-property example describes a wind farm asset's total generated power property.

```
aws iotsitewise describe-asset-property \
   --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
   --property-id a1b2c3d4-5678-90ab-cdef-99999EXAMPLE
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperty": {
        "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
        "name": "Total Generated Power",
        "notification": {
            "topic": "$aws/sitewise/asset-models/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE/assets/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE/properties/a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "state": "DISABLED"
        },
        "dataType": "DOUBLE",

            "metric": {
                "expression": "sum(power)",
                "variables": [
                    {
                        "name": "power",
                        "value": {
                            "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE",
                            "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE"
                        }
                    }
                ],
                "window": {
                    "tumbling": {
                        "interval": "1h"
                    }
                }
            }
        }
    };
```
For more information, see [Describing a specific asset property](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAssetProperty](#) in *AWS CLI Command Reference*.

---

describe-asset

The following code example shows how to use `describe-asset`.

**AWS CLI**

**To describe an asset**

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

**Output:**

```
{
  "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
  "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
  "assetName": "Wind Farm 1",
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
  "assetProperties": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
      "name": "Region",
      "dataType": "STRING"
    },
    {
      "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
      "name": "Total Generated Power",
      "dataType": "DOUBLE",
      "unit": "kW"
    }
  ]
}
```
For more information, see Describing a specific asset in the AWS IoT SiteWise User Guide.

- For API details, see DescribeAsset in AWS CLI Command Reference.

describe-dashboard

The following code example shows how to use describe-dashboard.

AWS CLI

To describe a dashboard

The following describe-dashboard example describes the specified wind farm dashboard.

```bash
aws iotsitewise describe-dashboard 
   --dashboard-id a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE
```

Output:

```json
{
   "dashboardId": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
   "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
   "dashboardName": "Wind Farm",
   "projectId": "a1b2c3d4-5678-90ab-cdef-eееεEXAMPLE",
   "dashboardDefinition": "{"widgets":[{"type":"monitor-line-chart","title":"Generated Power","x":0,"y":0,"height":3,"width":3,"metrics": [{"label":"Power","type":"iotsitewise","assetId":"a1b2c3d4-5678-90ab-cdef-44444EXAMPLE","propertyId":"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE\"]}]},
   "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
   ...
}
```
For more information, see Viewing dashboards in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see DescribeDashboard in AWS CLI Command Reference.

### describe-gateway-capability-configuration

The following code example shows how to use `describe-gateway-capability-configuration`.

#### AWS CLI

#### To describe a gateway capability

The following describe-gateway-capability-configuration example describes an OPC-UA source capability.

```bash
aws iotsitewise describe-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1"
```

**Output:**

```json
{
   "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
   "capabilityNamespace": "iotsitewise:opcuacollector:1",
   "capabilityConfiguration": "{"sources":[{"name":"Wind Farm #1",
   \"endpoint\":{"certificateTrust":{"type":"TrustAny"},\"endpointUri"
   \":\"opc.tcp://203.0.113.0:49320\",\"securityPolicy\":\"BASIC256\",\"messageSecurityMode\":\"SIGN_AND_ENCRYPT\",\"identityProvider\":
   \{"type\":\"Username\",\"usernameSecretArn\":\"arn:aws:secretsmanager:us-east-1:123456789012:secret:greengrass-factory1-auth-3QNDmM\"\},\"nodeFilterRules\":[]},\"measurementDataStreamPrefix\":\"\""]}

   "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see Configuring data sources in the AWS IoT SiteWise User Guide.

- For API details, see DescribeGatewayCapabilityConfiguration in AWS CLI Command Reference.
describe-gateway

The following code example shows how to use describe-gateway.

AWS CLI

To describe a gateway

The following describe-gateway example describes a gateway.

```
aws iotsitewise describe-gateway \\
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

Output:

```json
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayName": "ExampleCorpGateway",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayPlatform": {
        "greengrass": {
            "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE"
        }
    },
    "gatewayCapabilitySummaries": [
        {
            "capabilityNamespace": "iotsitewise:opcuacollector:1",
            "capabilitySyncStatus": "IN_SYNC"
        }
    ],
    "creationDate": 1588369971.457,
    "lastUpdateDate": 1588369971.457
}
```

For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.

- For API details, see DescribeGateway in AWS CLI Command Reference.

describe-logging-options

The following code example shows how to use describe-logging-options.
AWS CLI

To retrieve the current AWS IoT SiteWise logging options

The following describe-logging-options example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```bash
aws iotsitewise describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "level": "INFO"
    }
}
```

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the AWS IoT SiteWise User Guide.

- For API details, see DescribeLoggingOptions in AWS CLI Command Reference.

describe-portal

The following code example shows how to use describe-portal.

AWS CLI

To describe a portal

The following describe-portal example describes a web portal for a wind farm company.

```bash
aws iotsitewise describe-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalName": "WindFarmPortal",
```
"portalDescription": "A portal that contains wind farm projects for Example Corp.",
"portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
"portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
"portalContactEmail": "support@example.com",
"portalStatus": {
  "state": "ACTIVE"
},
"portalCreationDate": "2020-02-04T23:01:52.90248068Z",
"portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
"roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}

For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

- For API details, see DescribePortal in AWS CLI Command Reference.

**describe-project**

The following code example shows how to use describe-project.

**AWS CLI**

**To describe a project**

The following describe-project example describes a wind farm project.

```
aws iotsitewise describe-project \ 
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
  "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
  "projectName": "Wind Farm 1",
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "projectDescription": "Contains asset visualizations for Wind Farm #1 for Example Corp.",
  "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
  "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
}
```
disassociate-assets

The following code example shows how to use disassociate-assets.

AWS CLI

To disassociate a child asset from a parent asset

The following disassociate-assets example disassociates a wind turbine asset from a wind farm asset.

```bash
aws iotsitewise disassociate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the AWS IoT SiteWise User Guide.

- For API details, see DisassociateAssets in AWS CLI Command Reference.

get-asset-property-aggregates

The following code example shows how to use get-asset-property-aggregates.

AWS CLI

To retrieve an asset property's aggregated average and count values

The following get-asset-property-aggregates example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```bash
aws iotsitewise get-asset-property-aggregates \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```
--property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
--start-date 1580849400 \
--end-date 1580853000 \
--aggregate-types AVERAGE COUNT \
--resolution 1h

Output:

```
{
  "aggregatedValues": [
    {
      "timestamp": 1580850000.0,
      "quality": "GOOD",
      "value": {
        "average": 8723.46538886233,
        "count": 12.0
      }
    }
  ]
}
```

For more information, see [Querying asset property aggregates](https://aws.amazon.com/iot-sitewise/latest/userguide/) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyAggregates](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/get-asset-property-value-history.html) in *AWS CLI Command Reference*.

**get-asset-property-value-history**

The following code example shows how to use `get-asset-property-value-history`.

**AWS CLI**

**To retrieve an asset property's historical values**

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history \
--asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
--property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
--start-date 1580851800 \
--end-date 1580853000
```
Output:

```json
{
    "assetPropertyValueHistory": [
        {
            "value": {
                "doubleValue": 7217.787046814844
            },
            "timestamp": {
                "timeInSeconds": 1580852100,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6941.242811875451
            },
            "timestamp": {
                "timeInSeconds": 1580852400,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6976.797662266717
            },
            "timestamp": {
                "timeInSeconds": 1580852700,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6890.8677520453875
            },
            "timestamp": {
                "timeInSeconds": 1580853000,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        }
    ]
}
```
For more information, see Querying historical asset property values in the AWS IoT SiteWise User Guide.

- For API details, see GetAssetPropertyValueHistory in AWS CLI Command Reference.

get-asset-property-value

The following code example shows how to use get-asset-property-value.

AWS CLI

To retrieve an asset property's current value

The following get-asset-property-value example retrieves a wind turbine asset's current total power.

```bash
aws iotsitewise get-asset-property-value \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
```

Output:

```json
{
  "propertyValue": {
    "value": {
      "doubleValue": 6890.8677520453875
    },
    "timestamp": {
      "timeInSeconds": 1580853000,
      "offsetInNanos": 0
    },
    "quality": "GOOD"
  }
}
```

For more information, see Querying current asset property values in the AWS IoT SiteWise User Guide.

- For API details, see GetAssetPropertyValue in AWS CLI Command Reference.
list-access-policies

The following code example shows how to use list-access-policies.

AWS CLI

To list all access policies

The following list-access-policies example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies
  --identity-type USER
  --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{
    "accessPolicySummaries": [
    {
        "id": "a1b2c3d4-5678-90ab-cdef-ccccccEXAMPLE",
        "identity": {
            "user": {
                "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
            }
        },
        "resource": {
            "portal": {
                "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
            }
        },
        "permission": "ADMINISTRATOR"
    }
    ]
}
```

For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

- For API details, see ListAccessPolicies in AWS CLI Command Reference.

list-asset-models

The following code example shows how to use list-asset-models.
AWS CLI

To list all asset models

The following list-asset-models example lists all asset models that are defined in your AWS account in the current Region.

```
aws iotsitewise list-asset-models
```

Output:

```
{
   "assetModelSummaries": [
      {
         "id": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
         "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
         "name": "Wind Farm Model",
         "description": "Represents a wind farm that comprises many wind turbines",
         "creationDate": 1575671284.0,
         "lastUpdateDate": 1575671988.0,
         "status": {
            "state": "ACTIVE"
         }
      },
      {
         "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
         "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
         "name": "Wind Turbine Model",
         "description": "Represents a wind turbine manufactured by Example Corp",
         "creationDate": 1575671207.0,
         "lastUpdateDate": 1575686273.0,
         "status": {
            "state": "ACTIVE"
         }
      }
   ]
}
```

For more information, see Listing all asset models in the AWS IoT SiteWise User Guide.
• For API details, see ListAssetModels in AWS CLI Command Reference.

list-assets

The following code example shows how to use list-assets.

AWS CLI

Example 1: To list all top-level assets

The following list-assets example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
   --filter TOP_LEVEL
```

Output:

```
{
   "assetSummaries": [
      {
         "id": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
         "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
         "name": "Wind Farm 1",
         "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
         "creationDate": 1575672453.0,
         "lastUpdateDate": 1575672453.0,
         "status": {
            "state": "ACTIVE"
         },
         "hierarchies": [
            {
               "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
               "name": "Wind Turbines"
            }
         ]
      }
   ]
}
```

For more information, see Listing assets in the AWS IoT SiteWise User Guide.
Example 2: To list all assets based on an asset model

The following list-assets example lists all assets based on an asset model and defined in your AWS account in the current Region.

```bash
aws iotsitewise list-assets
   --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
   "assetSummaries": [
       {
           "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
           "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
           "name": "Wind Turbine 1",
           "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
           "creationDate": 1575671550.0,
           "lastUpdateDate": 1575686308.0,
           "status": {
               "state": "ACTIVE"
           },
           "hierarchies": []
       }
   ]
}
```

For more information, see Listing assets in the AWS IoT SiteWise User Guide.

- For API details, see ListAssets in AWS CLI Command Reference.

**list-associated-assets**

The following code example shows how to use list-associated-assets.

**AWS CLI**

To list all assets associated to an asset in a specific hierarchy

The following list-associated-assets example lists all wind turbine assets associated to the specified wind farm asset.
aws iotsitewise list-associated-assets \
   --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
   --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE

Output:

```
{
   "assetSummaries": [
      {
         "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
         "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
         "name": "Wind Turbine 1",
         "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
         "creationDate": 1575671550.0,
         "lastUpdateDate": 1575686308.0,
         "status": {
            "state": "ACTIVE"
         },
         "hierarchies": []
      }
   ]
}
```

For more information, see [Listing assets associated to a specific asset](https://aws.amazon.com/documentation/iotsitewise/userguide/) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAssociatedAssets](https://aws.amazon.com/documentation/cli(command-reference)) in *AWS CLI Command Reference*.

**list-dashboards**

The following code example shows how to use `list-dashboards`.

**AWS CLI**

**To list all dashboards in a project**

The following `list-dashboards` example lists all dashboards that are defined in a project.

```bash
aws iotsitewise list-dashboards \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```
Output:

```json
{
    "dashboardSummaries": [
    {
        "id": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
        "name": "Wind Farm",
        "creationDate": "2020-05-01T20:32:12.228476348Z",
        "lastUpdateDate": "2020-05-01T20:32:12.228476348Z"
    }
    ]
}
```

For more information, see [Viewing dashboards](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListDashboards](#) in *AWS CLI Command Reference*.

**list-gateways**

The following code example shows how to use list-gateways.

**AWS CLI**

**To list all gateways**

The following list-gateways example lists all gateways that are defined in your AWS account in the current Region.

```bash
aws iotsitewise list-gateways
```

**Output:**

```json
{
    "gatewaySummaries": [
    {
        "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
        "gatewayName": "ExampleCorpGateway",
        "gatewayCapabilitySummaries": [
        {
            "capabilityNamespace": "iotsitewise:opcuacollector:1",
            "capabilitySyncStatus": "IN_SYNC"
        }
        ]
    }
    ]
}
```
For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.

- For API details, see ListGateways in AWS CLI Command Reference.

### list-portals

The following code example shows how to use `list-portals`.

**AWS CLI**

**To list all portals**

The following `list-portals` example lists all portals that are defined in your AWS account in the current Region.

```bash
aws iotsitewise list-portals
```

**Output:**

```json
{
    "portalSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
            "name": "WindFarmPortal",
            "description": "A portal that contains wind farm projects for Example Corp.",
            "startUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
            "creationDate": "2020-02-04T23:01:52.90248068Z",
            "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/MySiteWiseMonitorServiceRole"
        }
    ]
}
```
For more information, see [Administering your portals](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListPortals](#) in *AWS CLI Command Reference*.

### list-project-assets

The following code example shows how to use `list-project-assets`.

**AWS CLI**

**To list all assets associated to a project**

The following `list-project-assets` example lists all assets that are associated to a wind farm project.

```bash
aws iotsitewise list-projects \
  --project-id a1b2c3d4-5678-90ab-cdef-eeeee

Output:

```json```
{
    "assetIds": [
        "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
    ]
}
```

For more information, see [Adding assets to projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListProjectAssets](#) in *AWS CLI Command Reference*.

### list-projects

The following code example shows how to use `list-projects`.

**AWS CLI**

**To list all projects in a portal**

The following `list-projects` example lists all projects that are defined in a portal.
aws iotsitewise list-projects \n   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE

Output:

```json
{
   "projectSummaries": [
      {
         "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
         "name": "Wind Farm 1",
         "description": "Contains asset visualizations for Wind Farm #1 for Example Corp.",
         "creationDate": "2020-02-20T21:58:43.362246001Z",
         "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"
      }
   ]
}
```

For more information, see Viewing project details in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see ListProjects in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list all tags for a resource**

The following list-tags-for-resource example lists all tags for a wind turbine asset.

```bash
aws iotsitewise list-tags-for-resource \n   --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```json
{
   "tags": {
```

Actions and scenarios 4113
For more information, see Tagging your resources in the AWS IoT SiteWise User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

### put-logging-options

The following code example shows how to use put-logging-options.

**AWS CLI**

**To specify the level of logging**

The following put-logging-options example enables INFO level logging in AWS IoT SiteWise. Other levels include DEBUG and OFF.

```
aws iotsitewise put-logging-options
   --logging-options level=INFO
```

This command produces no output.

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the AWS IoT SiteWise User Guide.

- For API details, see PutLoggingOptions in AWS CLI Command Reference.

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to a resource**

The following tag-resource example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```
aws iotsitewise tag-resource
```

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resource` example removes an owner tag from a wind turbine asset.

```bash
aws iotsitewise untag-resource \\
   --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \\
   --tag-keys Owner
```

This command produces no output.

For more information, see [Tagging your resources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

**update-access-policy**

The following code example shows how to use `update-access-policy`.

**AWS CLI**

**To grant a project viewer ownership of a project**

The following `update-access-policy` example updates an access policy that grants a project viewer ownership of a project.
aws iotsitewise update-access-policy
   --access-policy-id a1b2c3d4-5678-90ab-cdef-ddddEXAMPLE
   --cli-input-json file://update-project-viewer-access-policy.json

Contents of update-project-viewer-access-policy.json:

```json
{
   "accessPolicyIdentity": {
      "user": {
         "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
      }
   },
   "accessPolicyPermission": "ADMINISTRATOR",
   "accessPolicyResource": {
      "project": {
         "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
      }
   }
}
```

This command produces no output.

For more information, see Assigning project owners in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see UpdateAccessPolicy in AWS CLI Command Reference.

**update-asset-model**

The following code example shows how to use update-asset-model.

**AWS CLI**

**To update an asset model**

The following update-asset-model example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because update-asset-model overwrites the existing model with the new model.

aws iotsitewise update-asset-model
   --cli-input-json file://update-wind-farm-model.json
Contents of `update-wind-farm-model.json`:

```json
{
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",

  "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
  "assetModelStatus": {
    "state": "CREATING"
  }
}
```

For more information, see [Updating asset models](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateAssetModel](https://docs.aws.amazon.com/cli/latest/reference/aws/iot/sitewise/update-asset-model.html) in *AWS CLI Command Reference*.

### update-asset-property

The following code example shows how to use `update-asset-property`.

**AWS CLI**

#### Example 1: To update an asset property's alias

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```
aws iotsitewise update-asset-property \  
   --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \  
   --property-id a1b2c3d4-5678-90ab-cdef-55555EXAMPLE \  
   --property-alias "/examplecorp/windfarm/1/turbine/1/power" \  
   --property-notification-state DISABLED
```

This command produces no output.

Actions and scenarios 4118
For more information, see Mapping industrial data streams to asset properties in the AWS IoT SiteWise User Guide.

**Example 2: To enable asset property notifications**

The following update-asset-property example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic $aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>, where each ID is replaced by the property, asset, and model ID of the asset property.

```bash
aws iotsitewise update-asset-property \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
  --property-notification-state ENABLED \
  --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see Interacting with other services in the AWS IoT SiteWise User Guide.

- For API details, see UpdateAssetProperty in AWS CLI Command Reference.

**update-asset**

The following code example shows how to use update-asset.

**AWS CLI**

**To update an asset's name**

The following update-asset example updates a wind turbine asset's name.

```bash
aws iotsitewise update-asset \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --asset-name "Wind Turbine 2"
```

Output:

```json
{
  "assetStatus": {
```
For more information, see Updating assets in the AWS IoT SiteWise User Guide.

- For API details, see UpdateAsset in AWS CLI Command Reference.

**update-dashboard**

The following code example shows how to use update-dashboard.

**AWS CLI**

**To update a dashboard**

The following update-dashboard example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```bash
aws iotsitewise update-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of update-wind-farm-dashboard.json:

```json
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Total Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
                }
            ]
        }
    ]
}
```
This command produces no output.

For more information, see Creating dashboards (CLI) in the AWS IoT SiteWise User Guide.

- For API details, see UpdateDashboard in AWS CLI Command Reference.

update-gateway-capability-configuration

The following code example shows how to use update-gateway-capability-configuration.

AWS CLI

To update a gateway capability

The following update-gateway-capability-configuration example configures an OPC-UA source with the following properties:

- Trusts any certificate.
- Uses the Basic256 algorithm to secure messages.
- Uses the SignAndEncrypt mode to secure connections.
- Uses authentication credentials stored in an AWS Secrets Manager secret.

```bash
aws iotsitewise update-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1" \
    --capability-configuration file://opc-ua-capability-configuration.json
```

Contents of opc-ua-capability-configuration.json:

```json
{
    "sources": [
        {
            "name": "Wind Farm #1",
            "endpoint": {
                "certificateTrust": {
                    "type": "TrustAny"
                },
                "endpointUri": "opc.tcp://203.0.113.0:49320",
            },
        }
    ]
}
```
"securityPolicy": "BASIC256",
"messageSecurityMode": "SIGN_AND_ENCRYPT",
"identityProvider": {
    "type": "Username",
},
"nodeFilterRules": [],
"measurementDataStreamPrefix": ""
]
}

Output:

{
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilitySyncStatus": "OUT_OF_SYNC"
}

For more information, see Configuring data sources in the AWS IoT SiteWise User Guide.

- For API details, see UpdateGatewayCapabilityConfiguration in AWS CLI Command Reference.

update-gateway

The following code example shows how to use update-gateway.

AWS CLI

To update a gateway's name

The following update-gateway example updates a gateway's name.

```bash
aws iotsitewise update-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --gateway-name ExampleCorpGateway1
```

This command produces no output.

For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.
update-portal

The following code example shows how to use update-portal.

**AWS CLI**

**To update a portal's details**

The following update-portal example updates a web portal for a wind farm company.

```bash
aws iotsitewise update-portal \
--portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
--portal-name WindFarmPortal \
--portal-description "A portal that contains wind farm projects for Example Corp." \
--portal-contact-email support@example.com \
--role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```json
{
   "portalStatus": {
      "state": "UPDATING"
   }
}
```

For more information, see [Administrating your portals](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/) in the *AWS IoT SiteWise User Guide.*

**update-project**

The following code example shows how to use update-project.

**AWS CLI**

**To update a project's details**

The following update-project example updates a wind farm project.
This command produces no output.

For more information, see Changing project details in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see UpdateProject in AWS CLI Command Reference.

AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

associate-entity-to-thing

The following code example shows how to use associate-entity-to-thing.

AWS CLI

To associate a thing with a device
The following associate-entity-to-thing example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```bash
aws iotthingsgraph associate-entity-to-thing \
    --thing-name "MotionSensorName" \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

For more information, see Creating and Uploading Models in the AWS IoT Things Graph User Guide.

- For API details, see AssociateEntityToThing in AWS CLI Command Reference.

**create-flow-template**

The following code example shows how to use create-flow-template.

**AWS CLI**

**To create a flow**

The following create-flow-template example creates a flow (workflow). The value of MyFlowDefinition is the GraphQL that models the flow.

```bash
aws iotthingsgraph create-flow-template \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```json
{
    "summary": {
        "createdAt": 1559248067.545,
        "revisionNumber": 1
    }
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see CreateFlowTemplate in AWS CLI Command Reference.
create-system-instance

The following code example shows how to use create-system-instance.

AWS CLI

To create a system instance

The following create-system-instance example creates a system instance. The value of MySystemInstanceDefinition is the GraphQL that models the system instance.

```bash
aws iotthingsgraph create-system-instance -
    -definition language=GRAPHQL,text="MySystemInstanceDefinition" \ 
    --target CLOUD \ 
    --flow-actions-role-arn myRoleARN
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
        "status": "NOT_DEPLOYED",
        "target": "CLOUD",
        "createdAt": 1559249315.208,
        "updatedAt": 1559249315.208
    }
}
```

For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

- For API details, see CreateSystemInstance in AWS CLI Command Reference.

create-system-template

The following code example shows how to use create-system-template.

AWS CLI

To create a system
The following `create-system-template` example creates a system. The value of `MySystemDefinition` is the GraphQL that models the system.

```bash
aws iotthingsgraph create-system-template \
  --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```json
{
  "summary": {
    "createdAt": 1559249776.254,
    "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
    "revisionNumber": 1
  }
}
```

For more information, see Creating Systems in the AWS IoT Things Graph User Guide.

- For API details, see CreateSystemTemplate in AWS CLI Command Reference.

**delete-flow-template**

The following code example shows how to use `delete-flow-template`.

**AWS CLI**

**To delete a flow**

The following `delete-flow-template` example deletes a flow (workflow).

```bash
aws iotthingsgraph delete-flow-template \
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeleteFlowTemplate in AWS CLI Command Reference.
**delete-namespace**

The following code example shows how to use `delete-namespace`.

**AWS CLI**

**To delete a namespace**

The following `delete-namespace` example deletes a namespace.

```bash
aws iotthingsgraph delete-namespace
```

**Output:**

```json
{
  "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
  "namespaceName": "us-west-2/123456789012/default"
}
```

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeleteNamespace](#) in *AWS CLI Command Reference*.

**delete-system-instance**

The following code example shows how to use `delete-system-instance`.

**AWS CLI**

**To delete a system instance**

The following `delete-system-instance` example deletes a system instance.

```bash
aws iotthingsgraph delete-system-instance --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*. 

Actions and scenarios
For API details, see `DeleteSystemInstance` in *AWS CLI Command Reference*.

**delete-system-template**

The following code example shows how to use `delete-system-template`.

**AWS CLI**

To delete a system

The following `delete-system-template` example deletes a system.

```bash
aws iotthingsgraph delete-system-template \
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see *Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments* in the *AWS IoT Things Graph User Guide*.

For API details, see `DeleteSystemTemplate` in *AWS CLI Command Reference*.

**deploy-system-instance**

The following code example shows how to use `deploy-system-instance`.

**AWS CLI**

To deploy a system instance

The following `deploy-system-instance` example deploys a system instance.

```bash
aws iotthingsgraph deploy-system-instance \
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```json
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
```
For more information, see [Working with Systems and Flow Configurations](https://docs.aws.amazon.com/iotThingsGraph/latest/userguide/working-with-systems-and-flows.html) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeploySystemInstance](https://docs.aws.amazon.com/cli/latest/reference/iotthingsgraph/deploy-system-instance.html) in *AWS CLI Command Reference*.

**deprecate-flow-template**

The following code example shows how to use deprecate-flow-template.

**AWS CLI**

**To deprecate a flow**

The following deprecate-flow-template example deprecates a flow (workflow).

```bash
aws iotthingsgraph deprecate-flow-template \
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](https://docs.aws.amazon.com/iotThingsGraph/latest/userguide/lifecycle-management.html) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeprecateFlowTemplate](https://docs.aws.amazon.com/cli/latest/reference/iotthingsgraph/deprecate-flow-template.html) in *AWS CLI Command Reference*.

**deprecate-system-template**

The following code example shows how to use deprecate-system-template.

**AWS CLI**

**To deprecate a system**

The following deprecate-system-template example deprecates a system.

```bash
aws iotthingsgraph deprecate-system-template \
```
This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeprecateSystemTemplate in AWS CLI Command Reference.

**describe-namespace**

The following code example shows how to use describe-namespace.

**AWS CLI**

**To get a description of your namespace**

The following describe-namespace example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
  "namespaceName": "us-west-2/123456789012/default",
  "trackingNamespaceName": "aws",
  "trackingNamespaceVersion": 1,
  "namespaceVersion": 5
}
```

For more information, see Namespaces in the AWS IoT Things Graph User Guide.

- For API details, see DescribeNamespace in AWS CLI Command Reference.

**dissociate-entity-from-thing**

The following code example shows how to use dissociate-entity-from-thing.

**AWS CLI**

**To dissociate a thing from a device**
The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```bash
aws iotthingsgraph dissociate-entity-from-thing \
  --thing-name "MotionSensorName" \
  --entity-type "DEVICE"
```

This command produces no output.

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DissociateEntityFromThing](#) in *AWS CLI Command Reference*.

**get-entities**

The following code example shows how to use `get-entities`.

**AWS CLI**

To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```bash
aws iotthingsgraph get-entities \
  --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```json
{
  "descriptions": [
    {
      "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",
      "type": "DEVICE_MODEL",
      "createdAt": 1559256190.599,
      "definition": {
        "language": "GRAPHQL",
        "text": "##
# Specification of motion sensor devices interface.
##

type MotionSensor @deviceModel(id: "urn:tdm:aws/examples:deviceModel:MotionSensor",
        capability: "urn:tdm:aws/examples:capability:MotionSensorCapability")
{ignore: void}"
    }
  }
}
```
For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetEntities](#) in *AWS CLI Command Reference*.

### get-flow-template-revisions

The following code example shows how to use `get-flow-template-revisions`.

**AWS CLI**

**To get revision information about a flow**

The following `get-flow-template-revisions` example gets revision information about a flow (workflow).

```bash
aws iotthingsgraph get-flow-template-revisions \
```

**Output:**

```json
{
    "summaries": [
        {
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        }
    ]
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetFlowTemplateRevisions](#) in *AWS CLI Command Reference*.

### get-flow-template

The following code example shows how to use `get-flow-template`.
AWS CLI

To get a flow definition

The following get-flow-template example gets a definition for a flow (workflow).

```bash
aws iotthingsgraph get-flow-template
```

Output:

```json
{
   "description": {
      "summary": {
         "revisionNumber": 1,
         "createdAt": 1559247540.292
      },
      "definition": {
         "language": "GRAPHQL",
         "text": "{myFlow($camera: string!, $screen: string!) @workflowType(id: "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow") @annotation(type: "tgc:FlowEvent", id: "sledged790c1b2bcd949e09da0c9bfc077f79d", x: 1586, y: 653) @triggers(definition: "{MotionSensor(description: "\\\\\\\\\\\\\\\") @position(x: 1045, y: 635.6666564941406) {\n          condition(expr: "devices[name == "\\\\\\\\\\\\\\\"]" @position(x: 66.6666564941406) {\n          "devices[name == "\\\\\\\\\\\\\\\"]" .events[name == "\\\\\\\\\\\\\\\"] .lastEvent\")\n          action(expr: "\\\\\\\\\\\\\\")\n        }\n      }\n    }\n}`

For more information, see [Working with Flows](https://docs.aws.amazon.com/iotthingsgraph/latest/ug/) in the *AWS IoT Things Graph User Guide*. 
For API details, see GetFlowTemplate in AWS CLI Command Reference.

get-namespace-deletion-status

The following code example shows how to use get-namespace-deletion-status.

AWS CLI

To get the status of the namespace deletion task

The following get-namespace-deletion-status example gets the status of the namespace deletion task.

```bash
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```json
{
    "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
    "namespaceName": "us-west-2/123456789012/default",
    "status": "SUCCEEDED"
}
```

For more information, see Namespaces in the AWS IoT Things Graph User Guide.

For API details, see GetNamespaceDeletionStatus in AWS CLI Command Reference.

get-system-instance

The following code example shows how to use get-system-instance.

AWS CLI

To get a system instance

The following get-system-instance example gets a definition for a system instance.

```bash
aws iotthingsgraph get-system-instance \   
   --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:
For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

- For API details, see GetSystemInstance in AWS CLI Command Reference.

get-system-template-revisions

The following code example shows how to use get-system-template-revisions.

AWS CLI

To get revision information about a system
The following `get-system-template-revisions` example gets revision information about a system.

```bash
aws iotthingsgraph get-system-template-revisions \
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```json
{
  "summaries": [
    {
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "revisionNumber": 1,
      "createdAt": 1559247540.656
    }
  ]
}
```

For more information, see [Working with Systems and Flow Configurations](aws-iot-things-graph-user-guide) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetSystemTemplateRevisions](aws-cli-command-reference) in *AWS CLI Command Reference*.

---

**get-system-template**

The following code example shows how to use `get-system-template`.

**AWS CLI**

**To get a system**

The following `get-system-template` example gets a definition for a system.

```bash
aws iotthingsgraph get-system-template \
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```json
{
  "description": {
```
For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

- For API details, see GetSystemTemplate in AWS CLI Command Reference.

get-upload-status

The following code example shows how to use get-upload-status.

AWS CLI

To get the status of your entity upload

The following get-upload-status example gets the status of your entity upload operation. The value of MyUploadId is the ID value returned by the upload-entity-definitions operation.

aws iotthingsgraph get-upload-status \
  --upload-id "MyUploadId"

Output:
For more information, see Modeling Entities in the AWS IoT Things Graph User Guide.

- For API details, see GetUploadStatus in AWS CLI Command Reference.

list-flow-execution-messages

The following code example shows how to use list-flow-execution-messages.

AWS CLI

To get information about events in a flow execution

The following list-flow-execution-messages example gets information about events in a flow execution.

```
aws iotthingsgraph list-flow-execution-messages \
```

Output:

```
{
  "messages": [
    {
      "eventType": "EXECUTION_STARTED",
      "messageId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
      "payload": "Flow execution started",
      "timestamp": 1559247540.656
    }
  ]
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list all tags for a resource

The following list-tags-for-resource example list all tags for an AWS IoT Things Graph resource.

```bash
aws iotthingsgraph list-tags-for-resource \
```

Output:

```
{
   "tags": [
      {
         "key": "Type",
         "value": "Residential"
      }
   ]
}
```

For more information, see Tagging Your AWS IoT Things Graph Resources in the AWS IoT Things Graph User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

search-entities

The following code example shows how to use search-entities.

AWS CLI

To search for entities

The following search-entities example searches for all entities of type EVENT.
aws iotthingsgraph search-entities \  
--entity-types "EVENT"

Output:

```
{
    "descriptions": [
    {
        "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
        "type": "EVENT",
        "definition": {
            "language": "GRAPHQL",
            "text": "##
# Description of events emitted by motion
sensor.
##
type MotionSensorEvent @eventType(id: "urn:tdm:aws/
examples:event:MotionSensorEvent",
            payload: "urn:tdm:aws/
examples:property:MotionSensorStateProperty\") {ignore:void}"
        },
    },
    {
        "id": "urn:tdm:us-west-2/123456789012/
default:Event:CameraClickedEventV2",
        "type": "EVENT",
        "definition": {
            "language": "GRAPHQL",
            "text": "type CameraClickedEventV2 @eventType(id: "urn:tdm:us-
west-2/123456789012/default:event:CameraClickedEventV2",
            payload: "urn:tdm:aws:Property:Boolean\"){ignore:void}"
        },
    },
    {
        "id": "urn:tdm:us-west-2/123456789012/
default:Event:MotionSensorEventV2",
        "type": "EVENT",
        "definition": {
            "language": "GRAPHQL",
            "text": "# Event emitted by the motion sensor.

type MotionSensorEventV2 @eventType(id: "urn:tdm:us-west-2/123456789012/
default:event:MotionSensorEventV2",
            payload: "urn:tdm:us-west-2/123456789012/
default:property:MotionSensorStateProperty2\") {ignore:void}"
        }
    }
],
    "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
}
```
The following code example shows how to use `search-flow-executions`.

**AWS CLI**

To search for flow executions

The following `search-flow-executions` example search for all executions of a flow in a specified system instance.

```
aws iotthingsgraph search-flow-executions \
    --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "summaries": [
        {
            "createdAt": 1559247540.656,
            "flowExecutionId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
            "status": "RUNNING",
            "systemInstanceId": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "updatedAt": 1559247540.656
        }
    ]
}
```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchFlowExecutions](#) in *AWS CLI Command Reference*.
search-flow-templates

The following code example shows how to use search-flow-templates.

AWS CLI

To search for flows (or workflows)

The following search-flow-templates example searches for all flows (workflows) that contain the Camera device model.

```bash
aws iotthingsgraph search-flow-templates \
   --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{
   "summaries": [
   {
      "revisionNumber": 1,
      "createdAt": 1559247540.292
   },
   {
      "revisionNumber": 3,
      "createdAt": 1548283099.27
   }
   ]
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see SearchFlowTemplates in AWS CLI Command Reference.

search-system-instances

The following code example shows how to use search-system-instances.

AWS CLI

To search for system instances
The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \\
```

Output:

```
{
  "summaries": [
    {
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:DeploymentForSample",
      "status": "NOT_DEPLOYED",
      "target": "GREENGRASS",
      "greengrassGroupName": "ThingsGraphGrnGr",
      "createdAt": 1555716314.707,
      "updatedAt": 1555716314.707
    },
    {
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:MockDeployment",
      "status": "DELETED_IN_TARGET",
      "target": "GREENGRASS",
      "greengrassGroupName": "ThingsGraphGrnGr",
      "createdAt": 1549416462.049,
      "updatedAt": 1549416722.361,
      "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
      "greengrassGroupVersionId": "7365aed7-2d3e-4d13-aad8-75443d45eb05"
    },
    {
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:MockDeployment2",
      "status": "DEPLOYED_IN_TARGET",
      "target": "GREENGRASS",
      "greengrassGroupName": "ThingsGraphGrnGr",
```
search-system-templates

The following code example shows how to use search-system-templates.

AWS CLI

To search for system

The following search-system-templates example searches for all systems that contain the specified flow.

For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

• For API details, see SearchSystemInstances in AWS CLI Command Reference.
aws iotthingsgraph search-system-templates \ 

Output:

```json
{
   "summaries": [
      {
         "revisionNumber": 1,
         "createdAt": 1548283099.433
      }
   ]
}
```

For more information, see [Working with Flows](aws-iot-things-graph-user-guide) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchSystemTemplates](aws-cli-command-reference) in *AWS CLI Command Reference*.

**search-things**

The following code example shows how to use `search-things`.

**AWS CLI**

**To search for things associated with devices and device models**

The following `search-things` example searches for all things that are associated with the HCSR501MotionSensor device.

```bash
aws iotthingsgraph search-things \ 
   --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```json
{
   "things": [
```

**Actions and scenarios**
For more information, see Creating and Uploading Models in the AWS IoT Things Graph User Guide.

- For API details, see SearchThings in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To create a tag for a resource**

The following tag-resource example creates a tag for the specified resource.

```bash
aws iotthingsgraph tag-resource \
  --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/Room218" \
  --tags key="Type",value="Residential"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the AWS IoT Things Graph User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**undeploy-system-instance**

The following code example shows how to use undeploy-system-instance.
**AWS CLI**

**To undeploy a system instance from its target**

The following undeploy-system-instance example removes a system instance from its target.

```bash
aws iotthingsgraph undeploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```json
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
        "status": "PENDING_DELETE",
        "target": "GREENGRASS",
        "greengrassGroupName": "ThingsGraphGrnGr",
        "createdAt": 1553189694.255,
        "updatedAt": 1559344549.601,
        "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
        "greengrassGroupVersionId": "731b371d-d644-4b67-ac64-3934e99b75d7"
    }
}
```

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](https://docs.aws.amazon.com/iotthingsgraph/latest/ug/lifecycle-management.html) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UndeploySystemInstance](https://docs.aws.amazon.com/cli/latest/reference/iotthingsgraph/undeploy-system-instance.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove a tag for a resource**

The following untag-resource example removes a tag for the specified resource.
aws iotthingsgraph untag-resource \
   --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/Room218" \
   --tag-keys "Type"

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the AWS IoT Things Graph User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-flow-template

The following code example shows how to use update-flow-template.

AWS CLI

To update a flow

The following update-flow-template example updates a flow (workflow). The value of MyFlowDefinition is the GraphQL that models the flow.

aws iotthingsgraph update-flow-template \
   --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \
   --definition language=GRAPHQL,text="MyFlowDefinition"

Output:

```
{
   "summary": {
       "createdAt": 1559248067.545,
       "revisionNumber": 2
   }
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see UpdateFlowTemplate in AWS CLI Command Reference.
**update-system-template**

The following code example shows how to use `update-system-template`.

**AWS CLI**

```bash
aws iotthingsgraph update-system-template \
   --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \
   --definition language=GRAPHQL,text="MySystemDefinition"
```

**Output:**

```json
{
   "summary": {
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "revisionNumber": 2
   }
}
```

For more information, see [Creating Systems](https://docs.aws.amazon.com/iotthingsgraph/latest/ug/) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UpdateSystemTemplate](https://docs.aws.amazon.com/cli/latest/reference/iotthingsgraph/update-system-template.html) in *AWS CLI Command Reference*.

**upload-entity-definitions**

The following code example shows how to use `upload-entity-definitions`.

**AWS CLI**

```bash
aws iotthingsgraph upload-entity-definitions \
```

**Actions and scenarios**
Output:

```json
{
    "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da"
}
```

For more information, see [Modeling Entities](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UploadEntityDefinitions](#) in *AWS CLI Command Reference*.

**AWS IoT Wireless examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**associate-aws-account-with-partner-account**

The following code example shows how to use `associate-aws-account-with-partner-account`.

**AWS CLI**

To associate a partner account with your AWS account
The following `associate-aws-account-with-partner-account` example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \
    --sidewalk 
    AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "AppServerPrivateKey": "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see AssociateAwsAccountWithPartnerAccount in AWS CLI Command Reference.

**associate-wireless-device-with-thing**

The following code example shows how to use `associate-wireless-device-with-thing`.

**AWS CLI**

**To associate a thing to a wireless device**

The following `associate-wireless-device-with-thing` example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
For API details, see `AssociateWirelessDeviceWithThing` in *AWS CLI Command Reference*.

**associate-wireless-gateway-with-certificate**

The following code example shows how to use `associate-wireless-gateway-with-certificate`.

**AWS CLI**

To associate the certificate with the wireless gateway

The following `associate-wireless-gateway-with-certificate` associates a wireless gateway with a certificate.

```bash
aws iotwireless associate-wireless-gateway-with-certificate \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \ 
  --iot-certificate-id "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```json
{
  "IotCertificateId":
  "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
}
```

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/add-gateways-and-devices.html) in the *AWS IoT Developers Guide*.

For API details, see `AssociateWirelessGatewayWithCertificate` in *AWS CLI Command Reference*.

**associate-wireless-gateway-with-thing**

The following code example shows how to use `associate-wireless-gateway-with-thing`.

**AWS CLI**

To associate a thing to a wireless gateway

The following `associate-wireless-gateway-with-thing` example associates a thing to a wireless gateway.
aws iotwireless associate-wireless-gateway-with-thing \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
   --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see AssociateWirelessGatewayWithThing in AWS CLI Command Reference.

create-destination

The following code example shows how to use create-destination.

AWS CLI

To create an IoT wireless destination

The following create-destination example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

aws iotwireless create-destination \
   --name IoTWirelessDestination \
   --expression-type RuleName \
   --expression IoTWirelessRule \
   --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole

Output:

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination",
   "Name": "IoTWirelessDestination"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
create-device-profile

The following code example shows how to use create-device-profile.

AWS CLI

To create a new device profile

The following create-device-profile example creates a new IoT wireless device profile.

```bash
aws iotwireless create-device-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

create-service-profile

The following code example shows how to use create-service-profile.

AWS CLI

To create a new service profile

The following create-service-profile example creates a new IoT wireless service profile.

```bash
aws iotwireless create-service-profile
```

Output:
create-wireless-device

The following code example shows how to use create-wireless-device.

AWS CLI

To create an IoT wireless device

The following create-wireless-device example creates a wireless device resource of the type LoRaWAN.

```bash
aws iotwireless create-wireless-device \
   --cli-input-json file://input.json
```

Contents of input.json:

```json
{
   "Description": "My LoRaWAN wireless device"
   "DestinationName": "IoTWirelessDestination"
   "LoRaWAN": {
      "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
      "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
      "OtaaV1_1": {
         "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
         "JoinEui": "b4c231a359bc2e3d",
         "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
      },
      "DevEui": "ac12efc654d23fc2"
   },
   "Name": "SampleIoTWirelessThing"
}
```
"Type": LoRaWAN
}

Output:

{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
  "Id": "1ffd32c8-8130-4194-96df-622f072a315f"
}

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless-devices/latest/developerguide/lorawan-connect.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessDevice](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/create-wireless-device.html) in *AWS CLI Command Reference*.

### create-wireless-gateway-task-definition

The following code example shows how to use `create-wireless-gateway-task-definition`.

#### AWS CLI

**To create a wireless gateway task definition**

The following `create-wireless-gateway-task-definition` automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \\
  --cli-input-json file://input.json
```

**Contents of input.json:**

```
{
  "AutoCreateTasks": true,
  "Name": "TestAutoUpdate",
  "Update": {
    "UpdateDataSource": "s3://cupsalphagafirmwarebin/station",
    "UpdateDataRole": "arn:aws:iam::001234567890:role/SDK_Test_Role",
    "LoRaWAN": {
      "CurrentVersion": {
        "PackageVersion": "1.0.0",
```

---

**Actions and scenarios**

4157
Output:

```json
{
   "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/lora-iot-core.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

### create-wireless-gateway-task

The following code example shows how to use `create-wireless-gateway-task`.

#### AWS CLI

**To create the task for a wireless gateway**

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```bash
aws iotwireless create-wireless-gateway-task \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
   --wireless-gateway-task-definition-id "aa000102-0304-b0cd-ef56-a1b23cde456a"
```

Output:

```json
{
}
```
"WirelessGatewayTaskDefinitionId": "aa204003-0604-30fb-ac82-a4f95aaf450a",
"Status": "Success"
}

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/device-connect.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

**create-wireless-gateway**

The following code example shows how to use `create-wireless-gateway`.

**AWS CLI**

To create a wireless gateway

The following `create-wireless-gateway` example creates a wireless LoRaWAN device gateway.

```sh
aws iotwireless create-wireless-gateway \
  --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \
  --name "myFirstLoRaWANGateway" \
  --description "Using my first LoRaWAN gateway"
```

Output:

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/device-connect.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

**delete-destination**

The following code example shows how to use `delete-destination`.
AWS CLI

To delete an IoT wireless destination

The following delete-destination example deletes the wireless destination resource with the name IoTWirelessDestination that you created.

```
aws iotwireless delete-destination \
   --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/lorawan-iotcore-add-destinations.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteDestination](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-destination.html) in *AWS CLI Command Reference*.

delete-device-profile

The following code example shows how to use delete-device-profile.

AWS CLI

To delete a device profile

The following delete-device-profile example deletes a device profile with the specified ID that you created.

```
aws iotwireless delete-device-profile \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/lorawan-iotcore-add-profiles.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteDeviceProfile](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-device-profile.html) in *AWS CLI Command Reference*.

delete-service-profile

The following code example shows how to use delete-service-profile.
AWS CLI

**To delete a service profile**

The following `delete-service-profile` example deletes a service profile with the specified ID that you created.

```
aws iotwireless delete-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot-developer-guide/index.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteServiceProfile](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-service-profile.html) in *AWS CLI Command Reference*.

**delete-wireless-device**

The following code example shows how to use `delete-wireless-device`.

AWS CLI

**To delete a wireless device**

The following `delete-wireless-device` example deletes a wireless device that has the specified ID.

```
aws iotwireless delete-wireless-device \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot-developer-guide/index.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessDevice](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-wireless-device.html) in *AWS CLI Command Reference*.

**delete-wireless-gateway-task-definition**

The following code example shows how to use `delete-wireless-gateway-task-definition`. 
AWS CLI

To delete a wireless gateway task definition

The following delete-wireless-gateway-task-definition example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DeleteWirelessGatewayTaskDefinition in AWS CLI Command Reference.

delete-wireless-gateway-task

The following code example shows how to use delete-wireless-gateway-task.

AWS CLI

To delete a wireless gateway task

The following delete-wireless-gateway-task example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DeleteWirelessGatewayTask in AWS CLI Command Reference.

delete-wireless-gateway

The following code example shows how to use delete-wireless-gateway.
**AWS CLI**

**To delete a wireless gateway**

The following `delete-wireless-gateway` example deletes a wireless gateway that has the specified ID.

```bash
aws iotwireless delete-wireless-gateway \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see `DeleteWirelessGateway` in *AWS CLI Command Reference*.

**disassociate-aws-account-from-partner-account**

The following code example shows how to use `disassociate-aws-account-from-partner-account`.

**AWS CLI**

**To disassociate the partner account from the AWS account**

The following `disassociate-aws-account-from-partner-account` example disassociates a partner account from your currently associated AWS account.

```bash
aws iotwireless disassociate-aws-account-from-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see `DisassociateAwsAccountFromPartnerAccount` in *AWS CLI Command Reference*. 
disassociate-wireless-device-from-thing

The following code example shows how to use disassociate-wireless-device-from-thing.

AWS CLI

To disassociate the thing from the wireless device

The following disassociate-wireless-device-from-thing example disassociates a wireless device from its currently associated thing.

```bash
aws iotwireless disassociate-wireless-device-from-thing \
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DisassociateWirelessDeviceFromThing in AWS CLI Command Reference.

disassociate-wireless-gateway-from-certificate

The following code example shows how to use disassociate-wireless-gateway-from-certificate.

AWS CLI

To disassociate the certificate from the wireless gateway

The following disassociate-wireless-gateway-from-certificate disassociates a wireless gateway from its currently associated certificate.

```bash
aws iotwireless disassociate-wireless-gateway-from-certificate \
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
disassociate-wireless-gateway-from-thing

The following code example shows how to use disassociate-wireless-gateway-from-thing.

AWS CLI

To disassociate the thing from the wireless gateway

The following disassociate-wireless-gateway-from-thing example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

get-destination

The following code example shows how to use get-destination.

AWS CLI

To get information about an IoT wireless destination

The following get-destination example gets information about the destination resource with the name IoTWirelessDestination that you created.

```
aws iotwireless get-destination
--name "IoTWirelessDestination"
```

Output:
AWS Command Line Interface

User Guide for Version 2

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination",
   "Name": "IoTWirelessDestination",
   "Expression": "IoTWirelessRule",
   "ExpressionType": "RuleName",
   "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
```

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot-devicerendezvous/latest/developerguide/add-destinations.html) in the *AWS IoT Developers Guide*.

- For API details, see [GetDestination](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/get-destination.html) in *AWS CLI Command Reference*.

### get-device-profile

The following code example shows how to use get-device-profile.

**AWS CLI**

**To get information about a device profile**

The following `get-device-profile` example gets information about the device profile with the specified ID that you created.

```bash
aws iotwireless get-device-profile \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

**Output:**

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "LoRaWAN": {
      "MacVersion": "1.0.3",
      "MaxDutyCycle": 10,
      "Supports32BitFCnt": false,
      "RegParamsRevision": "RP002-1.0.1",
      "SupportsJoin": true,
      "RfRegion": "US915",
   }
}```
"MaxEirp": 13,
"SupportsClassB": false,
"SupportsClassC": false
}

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetDeviceProfile in AWS CLI Command Reference.

get-partner-account

The following code example shows how to use get-partner-account.

AWS CLI

To get the partner account information

The following get-partner-account example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \
  --partner-account-id "12345678901234" \
  --partner-type "Sidewalk"
```

Output:

```
{
  "Sidewalk": {
    "AmazonId": "12345678901234",
    "Fingerprint": "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234",
    "AccountLinked": false
  }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see GetPartnerAccount in AWS CLI Command Reference.
The following code example shows how to use get-service-endpoint.

**AWS CLI**

To get the service endpoint

The following get-service-endpoint example gets the account-specific endpoint for CUPS protocol.

```bash
aws iotwireless get-service-endpoint
```

Output:

```json
{
   "ServiceType": "CUPS",
   "ServiceEndpoint": "https://A1RMKZ37ACAGOT.cups.lorawan.us-east-1.amazonaws.com:443",
   "ServerTrust": "-----BEGIN CERTIFICATE-----

**get-service-profile**

The following code example shows how to use `get-service-profile`.

**AWS CLI**

**To get information about a service profile**

The following `get-service-profile` example gets information about the service profile with the specified ID that you created.

```bash
aws iotwireless get-service-profile \
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

**Output:**

```json
{
    "Arn": "arn:aws:iotwireless:us-east-1:651419225604:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0",

```

---

Actions and scenarios  4169
For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetServiceProfile in AWS CLI Command Reference.

**get-wireless-device-statistics**

The following code example shows how to use get-wireless-device-statistics.

**AWS CLI**

To get operating information about a wireless device

The following get-wireless-device-statistics example gets operating information about a wireless device.

```
aws iotwireless get-wireless-device-statistics \
    --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```
{
    "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessDeviceStatistics in AWS CLI Command Reference.

**get-wireless-device**

The following code example shows how to use get-wireless-device.

**AWS CLI**

To get information about the wireless device
The following `get-wireless-device` example lists the available widgets in your AWS account.

```
aws iotwireless get-wireless-device \
        --identifier "1ffd32c8-8130-4194-96df-622f072a315f" \
        --identifier-type WirelessDeviceID
```

Output:

```
{
    "Name": "myLoRaWANDevice",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/44b87eb4-9bce-423d-b5fc-973f5ecc358b",
    "DestinationName": "IoTWirelessDestination",

        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Description": "My LoRaWAN wireless device"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/lorawan-connection.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).  

### get-wireless-gateway-certificate

The following code example shows how to use `get-wireless-gateway-certificate`.

```bash
```
**AWS CLI**

**To get the ID of a certificate associated with a wireless gateway**

The following `get-wireless-gateway-certificate` example gets the certificate ID associated with a wireless gateway that has the specified ID.

```bash
aws iotwireless get-wireless-gateway-certificate \
  --id "6c44ab31-8b4d-407a-bed3-19b6c7cda551"
```

Output:

```json
{
  "IotCertificateId": "8ea4aeae3db34c78ccee75d9abd830356869ead6972997e0603e5fd032c804b6f"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/iot-connector-lorawan.html) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayCertificate](https://docs.aws.amazon.com/iot/latest/developerguide/iot-connector-lorawan.html) in *AWS CLI Command Reference*.

**get-wireless-gateway-firmware-information**

The following code example shows how to use `get-wireless-gateway-firmware-information`.

**AWS CLI**

**To get firmware information about a wireless gateway**

The following `get-wireless-gateway-firmware-information` example gets firmware version and other information about a wireless gateway.

```bash
aws iotwireless get-wireless-gateway-firmware-information \
  --id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```json
{
  "LoRaWAN": {
  }
}
```
For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayFirmwareInformation in AWS CLI Command Reference.

get-wireless-gateway-statistics

The following code example shows how to use get-wireless-gateway-statistics.

AWS CLI

To get operating information about a wireless gateway

The following get-wireless-gateway-statistics example gets operating information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-statistics \
   --wireless-gateway-id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
   "WirelessGatewayId": "3039b406-5cc9-4307-925b-9948c63da25b"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayStatistics in AWS CLI Command Reference.

get-wireless-gateway-task-definition

The following code example shows how to use get-wireless-gateway-task-definition.
AWS CLI

To get information about a wireless gateway task definition

The following get-wireless-gateway-task-definition example gets information about the wireless task definition with the specified ID.

```bash
aws iotwireless get-wireless-gateway-task-definition \\
--id "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
```

Output:

```json
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update": {
        "UpdateDataSource": "s3://cupsalphagafirmwarebin/station",
        "UpdateDataRole": "arn:aws:iam::001234567890:role/SDK_Test<Role",
        "LoRaWAN": {
            "CurrentVersion": {
                "PackageVersion": "1.0.0",
                "Station": "2.0.5",
                "Model": "linux"
            },
            "UpdateVersion": {
                "PackageVersion": "1.0.1",
                "Station": "2.0.5",
                "Model": "minihub"
            }
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayTaskDefinition in AWS CLI Command Reference.

get-wireless-gateway-task

The following code example shows how to use get-wireless-gateway-task.
To get information about the wireless gateway task

The following `get-wireless-gateway-task` example gets information about the wireless gateway task with the specified ID.

```
aws iotwireless get-wireless-gateway-task \
   --id "11693a46-6866-47c3-a031-c9a616e7644b"
```

Output:

```
{
   "WirelessGatewayId": "6c44ab31-8b4d-407a-bed3-19b6c7cda551",
   "WirelessGatewayTaskDefinitionId": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
   "Status": "Success"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://aws.amazon.com/iot-wireless/developers-guide) in the *AWS IoT Developers Guide*.

get-wireless-gateway

The following code example shows how to use `get-wireless-gateway`.

AWS CLI

To get information about a wireless gateway

The following `get-wireless-gateway` example gets information about the wireless gateway `myFirstLoRaWANGateway`.

```
aws iotwireless get-wireless-gateway \
   --identifier "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
   --identifier-type WirelessGatewayId
```

Output:

```
{

```
"Description": "My first LoRaWAN gateway",
"ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/a1b2c3d4-5678-90ab-cdef-12ab345c67de",
"LoRaWAN": {
  "RfRegion": "US915",
  "GatewayEui": "a1b2c3d4567890ab"
},
"ThingName": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
"Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
"Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/6c44ab31-8b4d-407a-bed3-19b6c7cda551",
"Name": "myFirstLoRaWANGateway"
}

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGateway in AWS CLI Command Reference.

**list-destinations**

The following code example shows how to use list-destinations.

**AWS CLI**

**To list the wireless destinations**

The following list-destinations example lists the available destinations registered to your AWS account.

aws iotwireless list-destinations

Output:

```json
{
  "DestinationList": [
    {
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination",
      "Name": "IoTWirelessDestination",
      "Expression": "IoTWirelessRule",
```
"Description": "Destination for messages processed using IoTWirelessRule",
"RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
},
{
"Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination2",
"Name": "IoTWirelessDestination2",
"Expression": "IoTWirelessRule2",
"RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
]
}

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListDestinations in AWS CLI Command Reference.

list-device-profiles

The following code example shows how to use list-device-profiles.

AWS CLI

To list the device profiles

The following list-device-profiles example lists the available device profiles registered to your AWS account.

```bash
aws iotwireless list-device-profiles
```

Output:

```json
{
   "DeviceProfileList": [
      {
         "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
         "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d"
      }
   ]
}
```
For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListDeviceProfiles in AWS CLI Command Reference.

**list-partner-accounts**

The following code example shows how to use list-partner-accounts.

**AWS CLI**

**To list the partner accounts**

The following list-partner-accounts example lists the available partner accounts associated with your AWS account.

```bash
aws iotwireless list-partner-accounts
```

**Output:**

```json
{
   "Sidewalk": [
      {
         "AmazonId": "78965678771228",
         "Fingerprint": "bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
      },
      {
         "AmazonId": "89656787651228",
         "Fingerprint": "bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
      }
   ]
}
```
For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see ListPartnerAccounts in AWS CLI Command Reference.

**list-service-profiles**

The following code example shows how to use list-service-profiles.

**AWS CLI**

**To list the service profiles**

The following list-service-profiles example lists the available service profiles registered to your AWS account.

```bash
aws iotwireless list-service-profiles
```

Output:

```json
{
   "ServiceProfileList": [
      {
         "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
         "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0"
      },
      {
         "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
         "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/ea8bc823-5d13-472e-8d26-9550737d8100"
      }
   ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListServiceProfiles in AWS CLI Command Reference.
**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list the tags assigned to the resource**

The following list-tags-for-resource example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \
   --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination"
```

Output:

```
{
   "Tags": [ 
   {
       "Value": "MyValue",
       "Key": "MyTag"
   }
   ]
}
```

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](https://docs.aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developers Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**list-wireless-devices**

The following code example shows how to use list-wireless-devices.

**AWS CLI**

**To list the available wireless devices**

The following list-wireless-devices example lists the available wireless devices registered to your AWS account.
aws iotwireless list-wireless-devices

Output:

```json
{
  "WirelessDeviceList": [
    {
      "Name": "myLoRaWANDevice",
      "DestinationName": "IoTWirelessDestination",
      "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
      "Type": "LoRaWAN",
      "LoRaWAN": {
        "DevEui": "ac12efc654d23fc2"
      },
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f"
    }
  ]
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot-devices/latest/developerguide/wireless-device-managed.html) in the *AWS IoT Developers Guide*.

### list-wireless-gateway-task-definitions

The following code example shows how to use `list-wireless-gateway-task-definitions`.

**AWS CLI**

**To list the wireless gateway task definitions**

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

```bash
aws iotwireless list-wireless-gateway-task-definitions
```

Output:

```json
{

```
"TaskDefinitions": [
  {
    "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
    "LoRaWAN": {
      "CurrentVersion": {
        "PackageVersion": "1.0.0",
        "Station": "2.0.5",
        "Model": "linux"
      },
      "UpdateVersion": {
        "PackageVersion": "1.0.1",
        "Station": "2.0.5",
        "Model": "minihub"
      }
    }
  }
]

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/how-to/loRaWAN.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/). For API details, see [ListWirelessGatewayTaskDefinitions](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/list-wireless-gateways.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/list-wireless-gateways.html).

### list-wireless-gateways

The following code example shows how to use `list-wireless-gateways`.

#### AWS CLI

**To list the wireless gateways**

The following `list-wireless-gateways` example lists the available wireless gateways in your AWS account.

```
aws iotwireless list-wireless-gateways
```

Output:

```json
{
  "WirelessGatewayList": [
```

Actions and scenarios
For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListWirelessGateways in AWS CLI Command Reference.

**send-data-to-wireless-device**

The following code example shows how to use send-data-to-wireless-device.

**AWS CLI**

To send data to the wireless device

The following send-data-to-wireless-device example sends a decrypted application data frame to the wireless device.

```
aws iotwireless send-data-to-wireless-device
  --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"  
```
--transmit-mode "1" \
--payload-data "SGVsbG8gVG8gRGV2c2lt" \
--wireless-metadata LoRaWAN={FPort=1}

Output:

```json
{
  MessageId: "6011dd36-0043d6eb-0072-0008"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://aws.amazon.com/iot-devices/) in the [AWS IoT Developers Guide](https://aws.amazon.com/iot/).  

**tag-resource**

The following code example shows how to use `tag-resource`.

AWS CLI

**To specify a tag key and value for a resource**

The following `tag-resource` example tags the wireless destination `IoTWirelessDestination` with the key `MyTag` and value `MyValue`.

```bash
aws iotwireless tag-resource \
  --resource-arn "arn:aws:iotwireless:us-east-1:651419225604:Destination/IoTWirelessDestination" \
  --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](https://docs.aws.amazon.com/iot/core/latest/developerguide/iot-core-lorawan-resources.html) in the [AWS IoT Developers Guide](https://aws.amazon.com/iot/).  

**test-wireless-device**

The following code example shows how to use `test-wireless-device`.

```
```
**AWS CLI**

**To test the wireless device**

The following `test-wireless-device` example sends uplink data of Hello to a device with specified ID.

```bash
aws iotwireless test-wireless-device \
   --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"
```

Output:

```json
{
   Result: "Test succeeded. one message is sent with payload: hello"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/lo-energy-cloud/developer-guide/iot-core-connecting-devices.html) in the *AWS IoT Developers Guide*.

- For API details, see [TestWirelessDevice](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/test-wireless-device.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

AWS CLI

**To remove one or more tags from a resource**

The following `untag-resource` example removes the tag MyTag and its value from the wireless destination `IoTWirelessDestination`.

```bash
aws iotwireless untag-resource \
   --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination" \
   --tag-keys "MyTag"
```

This command produces no output.

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](https://docs.aws.amazon.com/lo-energy-cloud/developer-guide/iot-core-resource-describe.html) in the *AWS IoT Developers Guide*. 
update-destination

The following code example shows how to use update-destination.

AWS CLI

To update the properties of a destination

The following update-destination example updates the description property of a wireless destination.

```bash
aws iotwireless update-destination \
   --name "IoTWirelessDestination" \
   --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

• For API details, see UpdateDestination in AWS CLI Command Reference.

update-partner-account

The following code example shows how to use update-partner-account.

AWS CLI

To update the properties of a partner account

The following update-partner-account updates the AppServerPrivateKey for the account that has the specified ID.

```bash
aws iotwireless update-partner-account \
   --partner-account-id "78965678771228" \
   --partner-type "Sidewalk" \
   --sidewalk
   AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.

• For API details, see UntagResource in AWS CLI Command Reference.
For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see UpdatePartnerAccount in AWS CLI Command Reference.

**update-wireless-device**

The following code example shows how to use update-wireless-device.

**AWS CLI**

**To update the properties of a wireless device**

The following update-wireless-device example updates the properties of a wireless device registered to your AWS account.

```bash
aws iotwireless update-wireless-device \
   --id "1ffd32c8-8130-4194-96df-622f072a315f" \
   --destination-name IoTWirelessDestination2 \
   --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see UpdateWirelessDevice in AWS CLI Command Reference.

**update-wireless-gateway**

The following code example shows how to use update-wireless-gateway.

**AWS CLI**

**To update the wireless gateway**

The following update-wireless-gateway example updates the description of your wireless gateway.

```bash
aws iotwireless update-wireless-gateway \
   --id "3285bdc7-5a12-4991-84ed-dadca65e342e" \
   --description "Using my LoRaWAN gateway"
```
This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see UpdateWirelessGateway in AWS CLI Command Reference.

Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

batch-get-channel

The following code example shows how to use batch-get-channel.

AWS CLI

To get channel configuration information about multiple channels

The following batch-get-channel example lists information about the specified channels.

```bash
```
Output:

```json
{
    "channels": [
        {
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": false,
            "latencyMode": "LOW",
            "name": "channel-1",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase": "AB1C2defGHijklMN03PqQRstUvwxyzAbCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
            "type": "STANDARD"
        },
        {
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": true,
            "latencyMode": "LOW",
            "name": "channel-2",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-2.abcdEFGH.m3u8",
            "preset": "",
        },
        {
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": false,
            "latencyMode": "LOW",
            "name": "channel-1",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",
            "preset": "",
        }
    ]
}```
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see BatchGetChannel in AWS CLI Command Reference.

**batch-get-stream-key**

The following code example shows how to use `batch-get-stream-key`.

**AWS CLI**

**To get information about multiple stream keys**

The following `batch-get-stream-key` example gets information about the specified stream keys.

```bash
aws ivs batch-get-stream-key \
```

Output:

```json
{
    "streamKeys": [
      {
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
      },
      {
        "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
      }
    ]
}
```
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see BatchGetStreamKey in AWS CLI Command Reference.

**batch-start-viewer-session-revocation**

The following code example shows how to use batch-start-viewer-session-revocation.

**AWS CLI**

**To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs**

The following batch-start-viewer-session-revocation example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the errors field if the caller does not have permission to revoke specified session.

```bash
aws ivs batch-start-viewer-session-revocation \
   --viewer-sessions '"["channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890}, \
   {"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890}"
```

Output:

```json
{
   "errors": [
      {
         "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh1",
         "viewerId": "abcdefg1",
         "code": "403",
         "message": "not authorized",
      },
      {
         "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh2",
         "viewerId": "abcdefg2",
         "code": "403",
         "message": "not authorized",
      }
   ]
}
```
For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see BatchStartViewerSessionRevocation in AWS CLI Command Reference.

create-channel

The following code example shows how to use create-channel.

AWS CLI

**Example 1: To create a channel with no recording**

The following create-channel example creates a new channel and an associated stream key to start streaming.

```
aws ivs create-channel \\
  --name "test-channel" \\
  --no-insecure-ingest
```

Output:

```
{
  "channel": {
    "authorized": false,
    "name": "test-channel",
    "latencyMode": "LOW",
    "playbackRestrictionPolicyArn": ",",
    "recordingConfigurationArn": ",",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase": "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDDefghh4ijkLM5opqrStuvWxyzAbCDEfghIJ",
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
  }
}
```
"preset": "",
"tags": {},
"type": "STANDARD"
},
"streamKey": {
"arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
"value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
"channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
"tags": {}
}
}

For more information, see [Create a Channel](#) in the [IVS Low-Latency User Guide](#).

**Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN**

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel.

```bash
aws ivs create-channel \
   --name test-channel-with-recording \
   --insecure-ingest \
```

**Output:**

```json
{
   "channel": {
      "name": "test-channel-with-recording",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "playbackRestrictionPolicyArn": "",
      "srt": {
         "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
         "passphrase": "BA1C2defGHijklMN03PqRstUvwxzyzaBCDEfghh4ijk1MN5opqrStuVWXYZabCDEfghIJ"
      }
   }
}
```
For more information, see Record to Amazon S3 in the IVS Low-Latency User Guide.

Example 3: To create a channel with a playback restriction policy specified by its ARN

The following create-channel example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel.

```bash
aws ivs create-channel \
```

Output:

```json
{
  "channel": {
    "name": "test-channel-with-playback-restriction-policy",

}

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [CreateChannel](#) in [AWS CLI Command Reference](#).

create-playback-restriction-policy

The following code example shows how to use create-playback-restriction-policy.

AWS CLI

To create a playback restriction policy

The following create-playback-restriction-policy example creates a new playback restriction policy.

```
aws ivs create-playback-restriction-policy \
  --name "test-playback-restriction-policy" \
  --enable-strict-origin-enforcement \
  --tags "key1=value1, key2=value2" \
  --allowed-countries US MX \
```
create-recording-configuration

The following code example shows how to use create-recording-configuration.

AWS CLI

To create a RecordingConfiguration resource

The following create-recording-configuration example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```bash
aws ivs create-recording-configuration \
    --name "test-recording-config" \
    --recording-reconnect-window-seconds 60 \
    --tags "key1=value1, key2=value2" \
```
---rendition-configuration renditionSelection="CUSTOM",renditions="HD" \\ 
--thumbnail-configuration recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLU\\ 
--destination-configuration s3={bucketName=demo-recording-bucket}

Output:

```json
{
  "recordingConfiguration": {
    "name": "test-recording-config",
    "destinationConfiguration": {
      "s3": {
        "bucketName": "demo-recording-bucket"
      }
    },
    "state": "CREATING",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    },
    "thumbnailConfiguration": {
      "recordingMode": "INTERVAL",
      "targetIntervalSeconds": 1,
      "resolution": "LOWEST_RESOLUTI",
      "storage": [
        "LATEST"
      ],
      "recordingReconnectWindowSeconds": 60,
      "renditionConfiguration": {
        "renditionSelection": "CUSTOM",
        "renditions": [
          "HD"
        ]
      }
    }
  }
}

For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*. 

Actions and scenarios
For API details, see CreateRecordingConfiguration in AWS CLI Command Reference.

create-stream-key

The following code example shows how to use create-stream-key.

AWS CLI

To create a stream key

The following create-stream-key example creates a stream key for a specified ARN (Amazon Resource Name).

```bash
aws ivs create-stream-key \\
   --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
   "streamKey": {
   "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
   "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
   "tags": {}
   
   
   }
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

For API details, see CreateStreamKey in AWS CLI Command Reference.

delete-channel

The following code example shows how to use delete-channel.

AWS CLI

To delete a channel and its associated stream keys

The following delete-channel example deletes the channel with the specified ARN (Amazon Resource Name).
aws ivs delete-channel \
   --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh

This command produces no output.

For more information, see Create a Channel in the IVS Low-Latency User Guide.

• For API details, see DeleteChannel in AWS CLI Command Reference.

delete-playback-key-pair

The following code example shows how to use delete-playback-key-pair.

AWS CLI

To delete a specified playback key pair

The following delete-playback-key-pair example returns the fingerprint of the specified key pair.

aws ivs delete-playback-key-pair \

This command produces no output.

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

• For API details, see DeletePlaybackKeyPair in AWS CLI Command Reference.

delete-playback-restriction-policy

The following code example shows how to use delete-playback-restriction-policy.

AWS CLI

To delete a playback restriction policy

The following delete-playback-restriction-policy example deletes the playback restriction policy with the specified policy ARN (Amazon Resource Name).

aws ivs delete-playback-restriction-policy \

This command produces no output.

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).
- For API details, see [DeletePlaybackRestrictionPolicy](#) in [AWS CLI Command Reference](#).

### delete-recording-configuration

The following code example shows how to use `delete-recording-configuration`.

**AWS CLI**

**To delete the RecordingConfiguration resource specified by its ARN**

The following `delete-recording-configuration` example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration \
  --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

This command produces no output.

For more information, see [Record to Amazon S3](#) in the [Amazon Interactive Video Service User Guide](#).
- For API details, see [DeleteRecordingConfiguration](#) in [AWS CLI Command Reference](#).

### delete-stream-key

The following code example shows how to use `delete-stream-key`.

**AWS CLI**

**To delete a stream key**

The following `delete-stream-key` example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key \
```

---

Actions and scenarios 4200
This command produces no output.

For more information, see Create a Channel in the IVS Low-Latency User Guide.

• For API details, see DeleteStreamKey in AWS CLI Command Reference.

get-channel

The following code example shows how to use get-channel.

AWS CLI

To get a channel's configuration information

The following get-channel example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```bash
aws ivs get-channel \
   --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```json
{
   "channel": {
      "name": "channel-1",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "playbackRestrictionPolicyArn": "",
      "preset": "",
      "srt": {
         "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
         "passphrase": "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijk1MN5opqrStuVwxyzAbCDEfghIJ"
      },
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "insecureIngest": false,
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```

Actions and scenarios
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetChannel in AWS CLI Command Reference.

**get-playback-key-pair**

The following code example shows how to use get-playback-key-pair.

**AWS CLI**

**To get a specified playback key pair**

The following get-playback-key-pair example returns the fingerprint of the specified key pair.

```bash
aws ivs get-playback-key-pair
```

**Output:**

```json
{
   "keyPair": {
       "name": "my-playback-key",
       "tags": {}}
}
```

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see GetPlaybackKeyPair in AWS CLI Command Reference.

**get-playback-restriction-policy**

The following code example shows how to use get-playback-restriction-policy.
AWS CLI

To get a playback restriction policy's configuration information

The following `get-playback-restriction-policy` example gets the playback restriction policy configuration with the specified policy ARN (Amazon Resource Name).

```bash
aws ivs get-playback-restriction-policy  
```

Output:

```json
{
    "playbackRestrictionPolicy": {
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

- For API details, see GetPlaybackRestrictionPolicy in AWS CLI Command Reference.

get-recording-configuration

The following code example shows how to use get-recording-configuration.
AWS CLI

To get information about a RecordingConfiguration resource

The following get-recording-configuration example gets information about the RecordingConfiguration resource for the specified ARN.

```
aws ivs get-recording-configuration \\n   --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```json
{
   "recordingConfiguration": {
      "destinationConfiguration": {
         "s3": {
            "bucketName": "demo-recording-bucket"
         }
      },
      "name": "test-recording-config",
      "recordingReconnectWindowSeconds": 60,
      "state": "ACTIVE",
      "tags": {
         "key1": "value1",
         "key2": "value2"
      },
      "thumbnailConfiguration": {
         "recordingMode": "INTERVAL",
         "targetIntervalSeconds": 1,
         "resolution": "LOWEST_RESOLUTION",
         "storage": [
            "LATEST"
         ]
      },
      "renditionConfiguration": {
         "renditionSelection": "CUSTOM",
         "renditions": [
            "HD"
         ]
      }
   }
}```
For more information, see [Record to Amazon S3](https://docs.aws.amazon.com/ivs/latest/userguide/record-to-amazon-s3.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetRecordingConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ivs/get-recording-configuration.html) in *AWS CLI Command Reference*.

### get-stream-key

The following code example shows how to use `get-stream-key`.

**AWS CLI**

**To get information about a stream**

The following `get-stream-key` example gets information about the specified stream key.

```bash
aws ivs get-stream-key
```

Output:

```json
{
   "streamKey": {
      "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}  
   }
}
```

For more information, see [Create a Channel](https://docs.aws.amazon.com/ivs/latest/userguide/creating-a-channel.html) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStreamKey](https://docs.aws.amazon.com/cli/latest/reference/ivs/get-stream-key.html) in *AWS CLI Command Reference*.

### get-stream-session

The following code example shows how to use `get-stream-session`.

**AWS CLI**

**To get metadata for a specified stream**
The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if `streamId` is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --stream-id "mystream"
```

Output:

```json
{
  "streamSession": {
    "streamId": "mystream1",
    "startTime": "2023-06-26T19:09:28+00:00",
    "channel": {
      "name": "mychannel",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "srt": {
        "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
        "passphrase": "AB1C2defGHijklMNopqrstuvwxyzAbCDEfghIJ"
      },
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "playbackUrl": "url-string",
      "authorized": false,
      "insecureIngest": false,
      "preset": ""
    },
    "ingestConfiguration": {
      "video": {
        "avcProfile": "Baseline",
        "avcLevel": "4.2",
        "codec": "avc1.42C02A",
        "encoder": "Lavf58.45.100",
        "targetBitrate": 8789062,
        "targetFramerate": 60,
        "videoHeight": 1080,
        "videoWidth": 1920
      }
    }
  }
}
```
"audio": {
    "codec": "mp4a.40.2",
    "targetBitrate": 46875,
    "sampleRate": 8000,
    "channels": 2
  },

  "recordingConfiguration": {
    "name": "test-recording-config",
    "destinationConfiguration": {
      "s3": {
        "bucketName": "demo-recording-bucket"
      }
    },
    "state": "ACTIVE",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    },
    "thumbnailConfiguration": {
      "recordingMode": "INTERVAL",
      "targetIntervalSeconds": 1,
      "resolution": "LOWEST_RESOLUTION",
      "storage": [
        "LATEST"
      ],
      "recordingReconnectWindowSeconds": 60,
      "renditionConfiguration": {
        "renditionSelection": "CUSTOM",
        "renditions": [
          "HD"
        ]
      }
    },
    "truncatedEvents": [
      {
        "name": "Recording Start",
        "type": "IVS Recording State Change",
        "eventTime": "2023-06-26T19:09:35+00:00"
      }
    ]
  },
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetStreamSession in AWS CLI Command Reference.

### get-stream

The following code example shows how to use get-stream.

#### AWS CLI

To get information about a stream

The following get-stream example gets information about the stream for the specified channel.

```
aws ivs get-stream \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "stream": {
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "startTime": "2020-05-05T21:55:38Z",
        "state": "LIVE",
        "health": "HEALTHY",
        "streamId": "st-ABCDEfghij01234KLMN5678",
```
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetStream in AWS CLI Command Reference.

**import-playback-key-pair**

The following code example shows how to use import-playback-key-pair.

**AWS CLI**

To import the public portion of a new key pair

The following import-playback-key-pair example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```bash
aws ivs import-playback-key-pair \
   --name "my-playback-key" \
   --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGRl..."
```

Output:

```json
{
   "keyPair": {
      "name": "my-playback-key",
      "tags": {}
   }
}
```

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see ImportPlaybackKeyPair in AWS CLI Command Reference.

**list-channels**

The following code example shows how to use list-channels.
Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```
aws ivs list-channels
```

Output:

```
{
   "channels": [
   {
      "name": "channel-1",
      "latencyMode": "LOW",
      "authorized": false,
      "insecureIngest": false,
      "preset": "",
      "playbackRestrictionPolicyArn": "",
      "tags": {},
      "type": "STANDARD"
   },
   {
      "name": "channel-2",
      "latencyMode": "LOW",
      "authorized": false,
      "preset": "",
      "recordingConfigurationArn": "",
      "tags": {},
      "type": "STANDARD"
   }
   ]
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.
Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN

The following list-channels example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```bash
aws ivs list-channels \
```

Output:

```json
{
   "channels": [
      {
         "name": "channel-1",
         "latencyMode": "LOW",
         "authorized": false,
         "insecureIngest": false,
         "preset": "",
         "playbackRestrictionPolicyArn": "",
         "tags": {},
         "type": "STANDARD"
      }
   ]
}
```

For more information, see [Record to Amazon S3](#) in the [IVS Low-Latency User Guide](#).

Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN

The following list-channels example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```bash
aws ivs list-channels \
```
Output:

```
{
   "channels": [
      {
         "name": "channel-2",
         "latencyMode": "LOW",
         "authorized": false,
         "preset": "",
         "recordingConfigurationArn": "",
         "tags": {},
         "type": "STANDARD"
      }
   ]
}
```

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [ListChannels](#) in [AWS CLI Command Reference](#).

### list-playback-key-pairs

The following code example shows how to use `list-playback-key-pairs`.

**AWS CLI**

**To get summary information about all playback key pairs**

The following `list-playback-key-pairs` example returns information about all key pairs.

```bash
aws ivs list-playback-key-pairs
```

Output:

```
{
   "keyPairs": [
      {
         "name": "test-key-0",
         "tags": {}
      }
   ]
}
```
For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see ListPlaybackKeyPairs in AWS CLI Command Reference.

**list-playback-restriction-policies**

The following code example shows how to use `list-playback-restriction-policies`.

**AWS CLI**

To get summary information about all playback restriction policies

The following `list-playback-restriction-policies` example lists all playback restriction policies for your AWS account.

```
aws ivs list-playback-restriction-policies
```

Output:

```
{
  "playbackRestrictionPolicies": [ 
    {
      "allowedCountries": [ 
        "US",
        "MX"
      ],
      "allowedOrigins": [ 
        "https://www.website1.com",
        "https://www.website2.com"
      ],
    }
  ]
}
```
"enableStrictOriginEnforcement": true,
"name": "test-playback-restriction-policy",
"tags": {
    "key1": "value1",
    "key2": "value2"
}
]}
]

For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

- For API details, see ListPlaybackRestrictionPolicies in AWS CLI Command Reference.

list-recording-configurations

The following code example shows how to use list-recording-configurations.

AWS CLI

To list all the RecordingConfiguration resources created in this account

The following list-recording-configurations example gets information about all RecordingConfiguration resources in your account.

```bash
aws ivs list-recording-configurations
```

Output:

```json
{
    "recordingConfigurations": [
    {
        "name": "test-recording-config-1",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket-1"
            }
        },
        "state": "ACTIVE",
        "tags": {}
    }
    ]
}
```
For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListRecordingConfigurations](#) in *AWS CLI Command Reference*.

### list-stream-keys

The following code example shows how to use `list-stream-keys`.

**AWS CLI**

**To get a list of stream keys**

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```bash
aws ivs list-stream-keys \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEfgh
```

**Output:**

```json
{
    "streamKeys": [
    {
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEfgh",
        "tags": {}  
    }
    ]
}
```
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see ListStreamKeys in AWS CLI Command Reference.

**list-stream-sessions**

The following code example shows how to use list-stream-sessions.

**AWS CLI**

To get a summary of current and previous streams for a specified channel in the current AWS region

The following list-stream-sessions example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```bash
aws ivs list-stream-sessions \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --max-results 25 \
  --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "streamSessions": [
        {
            "startTime": 1641578182,
            "endTime": 1641579982,
            "hasErrorEvent": false,
            "streamId": "mystream"
        },
        ...
    ]
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see ListStreamSessions in AWS CLI Command Reference.
list-streams

The following code example shows how to use list-streams.

**AWS CLI**

To get a list of live streams and their state

The following list-streams example lists all live streams for your AWS account.

```
aws ivs list-streams
```

Output:

```
{
   "streams": [
   {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "state": "LIVE",
      "health": "HEALTHY",
      "streamId": "st-ABCDEfghij01234KLMN5678",
      "viewerCount": 1
   }
   ]
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list all tags for an AWS resource (for example: channel, stream key)

The following list-tags-for-resource example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs list-tags-for-resource \   
```
Output:

```json
{
    "tags": {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

**put-metadata**

The following code example shows how to use `put-metadata`.

**AWS CLI**

**To insert metadata into the active stream for a specified channel**

The following `put-metadata` example inserts the given metadata into the stream for the specified channel.

```bash
aws ivs put-metadata
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
    --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [PutMetadata](#) in *AWS CLI Command Reference*.

**start-viewer-session-revocation**

The following code example shows how to use `start-viewer-session-revocation`.

**AWS CLI**

**To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair**
The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs batch-start-viewer-session-revocation \
   --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
   --viewer-id abcdefg \
   --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [StartViewerSessionRevocation](#) in *AWS CLI Command Reference*.

**stop-stream**

The following code example shows how to use `stop-stream`.

AWS CLI

To stop a specified stream

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \
   --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [StopStream](#) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: channel, stream key)
The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs tag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see [Tagging](https://docs.aws.amazon.com/ivs/latest/APIReference/API_TagResource.html) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/ivs/tag-resource.html) in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove tags for an AWS resource (for example: channel, stream key)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs untag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see [Tagging](https://docs.aws.amazon.com/ivs/latest/APIReference/API_TagResource.html) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/ivs/untag-resource.html) in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

**AWS CLI**

Example 1: To update a channel's configuration information
The following `update-channel` example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
   --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
   --name "channel-1" \
   --insecure-ingest
```

Output:

```
{
   "channel": {
      "name": "channel-1",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "playbackRestrictionPolicyArn": "",
      "recordingConfigurationArn": "",
      "srt": {
         "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
         "passphrase": "AB1C2defGHijkmNo3PQrstUvwxyzAbCDEfghh4ijk1MN5opqrStvwxyzAbCDEfghh4ijklMN5opqrStuwxyzAbCDEfghh4ijklMN5opqrStuwxyzAbCDEfghIJJ",
         "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
         "insecureIngest": true,
         "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
         "preset": "",
         "authorized": false,
         "tags": {}
      }
   }
}
```

For more information, see [Create a Channel](https://docs.aws.amazon.com/ivs/latest/userguide/ivs-low-latency-create-channel.html) in the *IVS Low-Latency User Guide*.

**Example 2: To update a channel's configuration to enable recording**

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
```
Output:

```json
{
    "channel": {
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase": "BA1C2defGHijkLMNo3PqRstUvwxzyzaBCDEfgh4ijkLMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see [Record to Amazon S3](https://docs.aws.amazon.com.ivs/latest/userguide/record-to-s3.html) in the *IVS Low-Latency User Guide*.

**Example 3: To update a channel's configuration to disable recording**

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```bash
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \ 
    --recording-configuration-arn ""
```
For more information, see [Record to Amazon S3](https://docs.aws.amazon.com.ivs/latest/userguide/ivs-low-latency-record-to-s3.html) in the `IVS Low-Latency User Guide`.

**Example 4: To update a channel's configuration to enable playback restriction**

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --no-insecure-ingest \
```

Output:

```
{
}
```
For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

Example 5: To update a channel's configuration to disable playback restriction

The following update-channel example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
   --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
   --playback-restriction-policy-arn ""
```

Output:

```
{}
```

"channel": {
  "name": "test-channel-with-playback-restriction-policy",
  "latencyMode": "LOW",
  "type": "STANDARD",
  "recordingConfigurationArn": "",
  "srt": {
    "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
    "passphrase": "AB1C2defGHijklMN03PqRstUVwxyzCBDEfghh4ijk1MN5opqrStuvWxyzAbCDEfghIJu"
  },
  "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
  "insecureIngest": false,
  "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
  "preset": "",
  "authorized": false,
  "tags": {}
}
For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [UpdateChannel](#) in [AWS CLI Command Reference](#).

**update-playback-restriction-policy**

The following code example shows how to use `update-playback-restriction-policy`.

**AWS CLI**

*To update a playback restriction policy*

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```bash
aws ivs update-playback-restriction-policy \
   --no-enable-strict-origin-enforcement
```

Output:

```json
{
}
```
"playbackRestrictionPolicy": {
    "allowedCountries": [
        "US",
        "MX"
    ],
    "allowedOrigins": [
        "https://www.website1.com",
        "https://www.website2.com"
    ],
    "enableStrictOriginEnforcement": false,
    "name": "test-playback-restriction-policy",
    "tags": {
        "key1": "value1",
        "key2": "value2"
    }
}

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

• For API details, see [UpdatePlaybackRestrictionPolicy](#) in [AWS CLI Command Reference](#).

### Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

• [Actions](#)
Actions

create-chat-token

The following code example shows how to use create-chat-token.

AWS CLI

To create a chat token

The following create-chat-token example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```bash
aws ivschat create-chat-token \
   --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6", \ 
   --userId" "11231234" \ 
   --capabilities "SEND_MESSAGE", \ 
   --sessionDurationInMinutes" 30
```

Output:

```json
{
   "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
   "sessionExpirationTime": "2022-03-16T04:44:09+00:00"
   "state": "CREATING",
   "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see Step 3: Authenticate and Authorize Chat Clients in the Amazon Interactive Video Service User Guide.

- For API details, see CreateChatToken in AWS CLI Command Reference.

create-logging-configuration

The following code example shows how to use create-logging-configuration.

AWS CLI

To create a chat LoggingConfiguration resource
The following `create-logging-configuration` example creates a LoggingConfiguration resource that allows clients to store and record sent messages.

```bash
aws ivschat create-logging-configuration \
   --destination-configuration s3={bucketName=demo-logging-bucket} \
   --name "test-logging-config" \
   --tags "key1=value1, key2=value2"
```

Output:

```json
{
  "createTime": "2022-09-14T17:48:00.653000+00:00",
  "destinationConfiguration": {
    "s3": {
      "bucketName": "demo-logging-bucket"
    }
  },
  "id": "ABcdef34ghIJ",
  "name": "test-logging-config",
  "state": "ACTIVE",
  "tags": { "key1" : "value1", "key2" : "value2" },
  "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/ivs/latest/chat-guide/getting-started.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateLoggingConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ivschat/create-logging-configuration.html) in *AWS CLI Command Reference*.

### create-room

The following code example shows how to use `create-room`.

**AWS CLI**

**To create a room**

The following `create-room` example creates a new room.

```bash
aws ivschat create-room \
```
--name "test-room-1" \
--logging-configuration-identifiers "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
--maximum-message-length 256 \
--maximum-message-rate-per-second 5

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "id": "g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {}
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see [Step 2: Create a Chat Room](https://docs.aws.amazon.com/ivs/latest/dv/Creating-a-Chat-Room.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateRoom](https://docs.aws.amazon.com/cli/latest/reference/ivschat/create-room.html) in *AWS CLI Command Reference*.

### delete-logging-configuration

The following code example shows how to use `delete-logging-configuration`.

**AWS CLI**

**To delete a chat LoggingConfiguration resource**

The following `delete-logging-configuration` example deletes the LoggingConfiguration resource for the specified ARN.

```
aws ivschat delete-logging-configuration \
```

This command produces no output.
For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteLoggingConfiguration in AWS CLI Command Reference.

**delete-message**

The following code example shows how to use delete-message.

**AWS CLI**

To delete messages from a specified room

The following delete-message example sends an even to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```bash
aws ivschat delete-message \
  --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
  --id "ABC123def456" \
  --reason "Message contains profanity"
```

Output:

```json
{
  "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteMessage in AWS CLI Command Reference.

**delete-room**

The following code example shows how to use delete-room.

**AWS CLI**

To delete a room
The following delete-room example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```bash
aws ivschat delete-room \
   --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteRoom in AWS CLI Command Reference.

**disconnect-user**

The following code example shows how to use `disconnect-user`.

**AWS CLI**

**To disconnect a user from a room**

The following `disconnect-user` example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```bash
aws ivschat disconnect-user \
   --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
   --userId "ABC123def456" \
   --reason "Violated terms of service"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DisconnectUser in AWS CLI Command Reference.

**get-logging-configuration**

The following code example shows how to use `get-logging-configuration`.
AWS CLI

**To get information about a LoggingConfiguration resource**

The following get-logging-configuration example gets information about the LoggingConfiguration resource for the specified ARN.

```bash
aws ivschat get-logging-configuration \
```

**Output:**

```json
{
   "createTime": "2022-09-14T17:48:00.653000+00:00",
   "destinationConfiguration": {
      "s3": {
         "bucketName": "demo-logging-bucket"
      }
   },
   "id": "ABcdef34ghIJ",
   "name": "test-logging-config",
   "state": "ACTIVE",
   "tags": { "key1": "value1", "key2": "value2" },
   "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/ivs/latest/chat-getting-started.html) in the Amazon Interactive Video Service User Guide.

**get-room**

The following code example shows how to use get-room.

AWS CLI

**To get the specified room**

The following get-room example gets information about the specified room.
aws ivschat get-room \
   --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"

Output:

```json
{
   "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
   "createTime": "2022-03-16T04:44:09+00:00",
   "id": "g1H2I3j4k5L6",
   "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
   "maximumMessageLength": 256,
   "maximumMessageRatePerSecond": 5,
   "name": "test-room-1",
   "tags": {},
   "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the Amazon Interactive Video Service User Guide.

- For API details, see [GetRoom](#) in AWS CLI Command Reference.

### list-logging-configurations

The following code example shows how to use `list-logging-configurations`.

**AWS CLI**

**To get summary information about all logging configurations for the user in the AWS region where the API request is processed**

The following `list-logging-configurations` example lists information about all LoggingConfiguration resources for the user in the AWS region where the API request is processed.

```
aws ivschat list-logging-configurations \
   --max-results 2 \
   --next-token ""
```

Output:
For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/AmazonIVS/latest/DeveloperGuide/Welcome.html) in the [Amazon Interactive Video Service User Guide](https://docs.aws.amazon.com/AmazonIVS/latest/DeveloperGuide/Welcome.html).

- For API details, see [ListLoggingConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ivschat/list-rooms.html) in the [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ivschat/list-rooms.html).

**list-rooms**

The following code example shows how to use `list-rooms`.

**AWS CLI**

To get summary information about all your rooms in the current region

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of `updateTime`.

```bash
aws ivschat list-rooms \
  --max-results 10 \
```
Output:

```json
{
  "nextToken": "page3",
  "rooms": [
    {
      "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
      "createTime": "2022-03-16T04:44:09+00:00",
      "id": "g1H2I3j4k5L6",
      "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
      "name": "test-room-1",
      "tags": {},
      "updateTime": "2022-03-16T07:22:09+00:00"
    }
  ]
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/ivs/latest/dg/chat-getting-started.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListRooms](https://docs.aws.amazon.com/cli/latest/reference/ivschat/list-rooms.html) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list all tags for an AWS resource (for example: Room)**

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivschat list-tags-for-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```
{
```
"tags":
{
    "key1": "value1",
    "key2": "value2"
}
}

For more information, see Tagging in the Amazon Interactive Video Service API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**send-event**

The following code example shows how to use send-event.

**AWS CLI**

**To send an event to a room**

The following send-event example sends the given event to the specified room.

```bash
aws ivschat send-event \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --eventName "SystemMessage" \
    --attributes \
        "msgType"="user-notification", \
        "msgText"="This chat room will close in 15 minutes."
```

Output:

```json
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see SendEvent in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
AWS CLI

To add or update tags for an AWS resource (for example: Room)

The following tag-resource example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat tag-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
  --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see Tagging in the Amazon Interactive Video Service API Reference.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags for an AWS resource (for example: Room)

The following untag-resource example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat untag-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
  --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Tagging in the Amazon Interactive Video Service API Reference.

- For API details, see UntagResource in AWS CLI Command Reference.

update-logging-configuration

The following code example shows how to use update-logging-configuration.
AWS CLI

To update a room's logging configuration

The following update-logging-configuration example updates a LoggingConfiguration resource with the given data.

```bash
aws ivschat update-logging-configuration \
   --destination-configuration s3={bucketName=demo-logging-bucket} \
   --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
   --name "test-logging-config"
```

Output:

```
{
   "createTime": "2022-09-14T17:48:00.653000+00:00",
   "destinationConfiguration": {
      "s3": {
        "bucketName": "demo-logging-bucket"
      }
   },
   "id": "ABcdef34ghIJ",
   "name": "test-logging-config",
   "state": "ACTIVE",
   "tags": { "key1" : "value1", "key2" : "value2" },
   "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see UpdateLoggingConfiguration in AWS CLI Command Reference.

update-room

The following code example shows how to use update-room.

AWS CLI

To update a room's configuration
The following update-room example updates the specified room's configuration with the given data.

```bash
aws ivschat update-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --name "chat-room-a" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```json
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "chat-room-a",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/ivs/latest/devguide/getting-started.html) in the [Amazon Interactive Video Service User Guide](https://docs.aws.amazon.com/ivs/latest/devguide/).

## Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-encoder-configuration**

The following code example shows how to use `create-encoder-configuration`.

**AWS CLI**

To create a composition encoder configuration

The following `create-encoder-configuration` example creates a composition encoder configuration with the specified properties.

```bash
aws ivs-realtime create-encoder-configuration \
   --name test-ec --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

**Output:**

```json
{
   "encoderConfiguration": {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef",
      "name": "test-ec",
      "tags": {},
      "video": {
         "bitrate": 3500000,
         "framerate": 30,
         "height": 1080,
         "width": 1920
      }
   }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/userguide/enabling-multiple-hosts.html) in the *Amazon Interactive Video Service User Guide*. 
create-participant-token

The following code example shows how to use create-participant-token.

AWS CLI

To create a stage participant token

The following create-participant-token example creates a participant token for the specified stage.

```bash
aws ivs-realtime create-participant-token \
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --user-id bob
```

Output:

```json
{
   "participantToken": {
      "expirationTime": "2023-03-07T09:47:43+00:00",
      "participantId": "ABCDEfghij01234KLMN6789",
      "token": "abcd1234defg5678"
   }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

create-stage

The following code example shows how to use create-stage.

AWS CLI

To create a stage

The following create-stage example creates a stage and stage participant token for a specified user.
aws ivs-realtime create-stage \
    --name stage1 \
    --participant-token-configurations userId=alice

Output:

```json
{
    "participantTokens": [
        {
            "participantId": "ABCDEfghij01234KLMN5678",
            "token": "a1b2c3d4567890ab",
            "userId": "alice"
        }
    ],
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDEFGh",
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/userguide/enabling-multiple-hosts.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStage](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/create-stage.html) in *AWS CLI Command Reference*.

### create-storage-configuration

The following code example shows how to use `create-storage-configuration`.

**AWS CLI**

**To create a composition storage configuration**

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```bash
aws ivs-realtime create-storage-configuration \
    --name "test-sc" --s3 "bucketName=test-bucket-name"
```

Output:
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dev/credits.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStorageConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ivsrealtime/create-storage-configuration.html) in *AWS CLI Command Reference*.

**delete-encoder-configuration**

The following code example shows how to use `delete-encoder-configuration`.

**AWS CLI**

*To delete a composition encoder configuration*

The following `delete-encoder-configuration` deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-encoder-configuration
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dev/credits.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteEncoderConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/delete-encoder-configuration.html) in *AWS CLI Command Reference*.

**delete-stage**

The following code example shows how to use `delete-stage`.

{  
    "storageConfiguration": {  
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABabCDcdEFef",  
        "name": "test-sc",  
        "s3": {  
            "bucketName": "test-bucket-name"  
        },  
        "tags": {}  
    }  
}
AWSCLI

To delete a stage

The following delete-stage example deletes the specified stage.

```
aws ivs-realtime delete-stage \
   --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteStage in AWS CLI Command Reference.

delete-storage-configuration

The following code example shows how to use delete-storage-configuration.

AWS CLI

To delete a composition storage configuration

The following delete-storage-configuration deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \
   --arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteStorageConfiguration in AWS CLI Command Reference.

disconnect-participant

The following code example shows how to use disconnect-participant.
AWS CLI

**To disconnect a stage participant**

The following disconnect-participant example disconnects the specified participant from the specified stage.

```bash
aws ivs-realtime disconnect-participant \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/enabling-multiple-hosts-stream.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DisconnectParticipant](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/disconnect-participant.html) in *AWS CLI Command Reference*.

**get-composition**

The following code example shows how to use get-composition.

**AWS CLI**

**Example 1: To get a composition with default layout settings**

The following get-composition example gets the composition for the ARN (Amazon Resource Name) specified.

```bash
aws ivs-realtime get-composition \
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```json
{
    "composition": {
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
                    
```
"encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEefF",
    "id": "AabBCcdDEefF",
    "startTime": "2023-10-16T23:26:00+00:00",
    "state": "ACTIVE"
},
{
    "configuration": {
        "name": ",
        "s3": {
            "encoderConfigurationArns": [
            ],
            "recordingConfiguration": {
                "format": "HLS"
            },
            "storageConfigurationArn": "arn:arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/FefABabCDcdE"
        }
    },
    "detail": {
        "s3": {
            "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/composite"
        }
    },
    "id": "GHFabcgefABC",
    "startTime": "2023-10-16T23:26:00+00:00",
    "state": "STARTING"
}
],
"layout": {
    "grid": {
        "featuredParticipantAttribute": ""
    },
    "gridGap": 2,
    "omitStoppedVideo": false,
    "videoAspectRatio": "VIDEO",
    "videoFillMode": ""
},
"stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd"
For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

Example 2: To get a composition with PiP layout

The following get-composition example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```
aws ivs-realtime get-composition \\n   --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
   "composition": {
      "destinations": [
         {
            "configuration": {
               "channel": {
                  "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
                  "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
               },
               "name": ""
            },
            "id": "AabBCcdDEefF",
            "startTime": "2023-10-16T23:26:00+00:00",
            "state": "ACTIVE"
         },
         {
            "configuration": {
               "name": ""
            },
            "s3": {
               "encoderConfigurationArns": [
```
For more information, see [Composite Recording (Real-Time Streaming)](https://docs.aws.amazon.com/ivs/latest/APIReference/endpointStream-composite.html) in the Amazon Interactive Video Service User Guide.

get-encoder-configuration

The following code example shows how to use get-encoder-configuration.

AWS CLI

To get a composition encoder configuration

The following get-encoder-configuration example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-encoder-configuration \
   --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/abcdABCDefgh"
```

Output:

```json
{
   "encoderConfiguration": {
      "name": "test-ec",
      "tags": {},
      "video": {
         "bitrate": 3500000,
         "framerate": 30,
         "height": 1080,
         "width": 1920
      }
   }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see GetEncoderConfiguration in AWS CLI Command Reference.

get-participant

The following code example shows how to use get-participant.
AWS CLI

To get a stage participant

The following get-participant example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```bash
code
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```json
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "sdkVersion": "",
        "state": "DISCONNECTED",
        "userId": ""
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/userguide/) in the Amazon Interactive Video Service User Guide.

get-stage-session

The following code example shows how to use get-stage-session.

AWS CLI

To get a stage session
The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-stage-session
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
  --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
  "stageSession": {
    "endTime": "2023-04-26T20:36:29+00:00",
    "sessionId": "st-a1b2c3d4e5f6g",
    "startTime": "2023-04-26T20:30:29.602000+00:00"
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ive/sug/guides/ive-user-guide.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStageSession](https://docs.aws.amazon.com/cli/latest/reference/ive-realtime/get-stage-session.html) in *AWS CLI Command Reference*.

**get-stage**

The following code example shows how to use `get-stage`.

**AWS CLI**

To get a stage's configuration information

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-stage
  --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
  "stage": {
    "activeSessionId": "st-a1b2c3d4e5f6g",
  }
}
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStage](#) in *AWS CLI Command Reference*.

### get-storage-configuration

The following code example shows how to use `get-storage-configuration`.

**AWS CLI**

**To get a composition storage configuration**

The following `get-storage-configuration` example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-storage-configuration \
   --name arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDdefgh"
```

Output:

```json
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDdefgh",
        "name": "test-sc",
        "s3": {
            "bucketName": "test-bucket-name"
        },
        "tags": {}
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStorageConfiguration](#) in *AWS CLI Command Reference*.  

Actions and scenarios 4252
list-compositions

The following code example shows how to use list-compositions.

AWS CLI

To get a list of compositions

The following list-compositions lists all compositions for your AWS account, in the AWS region where the API request is processed.

```bash
aws ivs-realtime list-compositions
```

Output:

```json
{
  "compositions": [
    {
      "destinations": [
        {
          "id": "AabBCcdDEefF",
          "startTime": "2023-10-16T23:25:23+00:00",
          "state": "ACTIVE"
        }
      ],
      "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
      "startTime": "2023-10-16T23:25:21+00:00",
      "state": "ACTIVE",
      "tags": {}
    },
    {
      "destinations": [
        {
          "endTime": "2023-10-16T23:25:00.786512+00:00",
          "id": "aABbcCDdeEFF",
          "startTime": "2023-10-16T23:24:01+00:00",
          "state": "STOPPED"
        }
      ],
      "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/ABcdabCDefgh",
      "startTime": "2023-10-16T23:24:01+00:00",
      "state": "ACTIVE",
      "tags": {}
    }
  ]
}
```
The following code example shows how to use list-encoder-configurations.

**AWS CLI**

**To list composition encoder configurations**

The following list-encoder-configurations lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

Output:

```
{
   "encoderConfigurations": [
   {
      "name": "test-ec-1",
   }
   ]
}
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](http://example.com) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListEncoderConfigurations](http://example.com) in *AWS CLI Command Reference*.

### list-participant-events

The following code example shows how to use `list-participant-events`.

**AWS CLI**

**To get a list of stage participant events**

The following list-participant-events example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime list-participant-events \
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --session-id st-a1b2c3d4e5f6g \
   --participant-id abCDEf12GHIj
```

Output:

```json
{
   "events": [ 
      { 
         "eventTime": "2023-04-26T20:36:28+00:00",
         "name": "LEFT",
         "participantId": "abCDEf12GHIj"
      },
      { 
         "eventTime": "2023-04-26T20:36:28+00:00",
```
"name": "PUBLISH_STOPPED",
"participantId": "abCDEf12GHIj"
},
{
"eventTime": "2023-04-26T20:30:34+00:00",
"name": "JOINED",
"participantId": "abCDEf12GHIj"
},
{
"eventTime": "2023-04-26T20:30:34+00:00",
"name": "PUBLISH_STARTED",
"participantId": "abCDEf12GHIj"
}
]
}

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see ListParticipantEvents in AWS CLI Command Reference.

**list-participants**

The following code example shows how to use list-participants.

**AWS CLI**

**To get a list of stage participants**

The following list-participants example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participants \
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
   "participants": [
      {
         "firstJoinTime": "2023-04-26T20:30:34+00:00",
         "participantId": "abCDEf12GHIj"
      }
   ]
}
```
For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see ListParticipants in AWS CLI Command Reference.

**list-stage-sessions**

The following code example shows how to use `list-stage-sessions`.

**AWS CLI**

**To get a list of stage sessions**

The following `list-stage-sessions` example lists all sessions for a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime list-stage-sessions \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

**Output:**

```json
{
    "stageSessions": [
        {
            "endTime": "2023-04-26T20:36:29+00:00",
            "sessionId": "st-a1b2c3d4e5f6g",
            "startTime": "2023-04-26T20:30:29.602000+00:00"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see ListStageSessions in AWS CLI Command Reference.
list-stages

The following code example shows how to use list-stages.

AWS CLI

To get summary information about all stages

The following list-stages example lists all stages for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-stages
```

Output:

```json
{
   "stages": [
   {
      "activeSessionId": "st-a1b2c3d4e5f6g",
      "name": "stage1",
      "tags": {}
   },
   {
      "activeSessionId": "st-a123bcd456efg",
      "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
      "name": "stage2",
      "tags": {}
   },
   {
      "activeSessionId": "st-abcDEF1234ghi",
      "name": "stage3",
      "tags": {}
   }
   ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dev/enabling_multiple_hosts.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStages](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/list-stages.html) in *AWS CLI Command Reference*. 
list-storage-configurations

The following code example shows how to use list-storage-configurations.

**AWS CLI**

**To list composition storage configurations**

The following list-storage-configurations lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-storage-configurations
```

Output:

```
{
  "storageConfigurations": [
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDefgh",
      "name": "test-sc-1",
      "s3": {
        "bucketName": "test-bucket-1-name"
      },
      "tags": {}
    },
    {
      "name": "test-sc-2",
      "s3": {
        "bucketName": "test-bucket-2-name"
      },
      "tags": {}
    }
  ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/enable-multiple-hosts.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStorageConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/list-storage-configurations.html) in *AWS CLI Command Reference*. 
**start-composition**

The following code example shows how to use `start-composition`.

**AWS CLI**

**Example 1: To start a composition with default layout settings**

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations.

```bash
aws ivs-realtime start-composition \
  --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
  --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg", "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"}}, \
```

**Output:**

```json
{
  "composition": {
    "destinations": [
      {
        "configuration": {
          "channel": {
            "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
            "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
          },
          "name": "",
          "id": "AabBCcdDEefF",
          "state": "STARTING"
        },
        "configuration": {
```

Actions and scenarios

4260
For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

Example 2: To start a composition with PiP layout
The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```bash
aws ivs-realtime start-composition
   --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd
   --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg", 
   "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEef"}}, 
   {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEef"], 
   "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/FefABabCDcdE"}]} 
   --layout pip='{featuredParticipantAttribute="abcdefg"}'
```

Output:

```json
{
   "composition": {
      "destinations": [
         {
            "configuration": {
               "channel": {
                  "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
                  "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEef"
               },
               "name": "",
            },
            "id": "AabBCcdDEefF",
            "state": "STARTING"
         },
         {
            "configuration": {
               "name": "",
               "s3": {
                  "encoderConfigurationArns": [
                  ],
                  "recordingConfiguration": {
```

Actions and scenarios
For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

- For API details, see StartComposition in AWS CLI Command Reference.

stop-composition

The following code example shows how to use stop-composition.
AWS CLI

To stop a composition

The following stop-composition stops the composition specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime stop-composition \
   --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see StopComposition in AWS CLI Command Reference.

update-stage

The following code example shows how to use update-stage.

AWS CLI

To update a stage's configuration

The following update-stage example updates a stage for a specified stage ARN to update the stage name.

```bash
aws ivs-realtime update-stage \
   --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --name stagela
```

Output:

```json
{
   "stage": {
      "name": "stagela"
   }
}
```
For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see UpdateStage in AWS CLI Command Reference.

Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- **Actions**

Actions

create-data-source

The following code example shows how to use create-data-source.

**AWS CLI**

To create an Amazon Kendra data source connector

The following create-data-source creates and configures an Amazon Kendra data source connector. You can use describe-data-source to view the status of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
```
--name "example data source 1" \
--description "Example data source 1 for example index 1 contains the first set of example documents" \
--tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources", "Value": "aws"}' \
--role-arn "arn:aws:iam::my-account-id:role/KendraRoleForS3TemplateConfigDataSource" \
--index-id exampleindex1 \
--language-code "es" \
--schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \
--configuration '{"TemplateConfiguration": {"Template": file://s3schemaconfig.json}}' \
--type "TEMPLATE" \
--custom-document-enrichment-configuration '{"PostExtractionHookConfiguration": {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs", "S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn": "arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \
--vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds": ["subnet-1c234","subnet-2b134"]}'

Output:

{
   "Id": "exampledatasource1"
}

For more information, see Getting started with an Amazon Kendra index and data source connector in the Amazon Kendra Developer Guide.

- For API details, see CreateDataSource in AWS CLI Command Reference.

create-index

The following code example shows how to use create-index.

AWS CLI

To create an Amazon Kendra index

The following create-index creates and configures an Amazon Kendra index. You can use describe-index to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.
aws kendra create-index \
   --name "example index 1" \
   --description "Example index 1 contains the first set of example documents" \
   --tags '{"Key": "test resources", "Value": "kendra"},{"Key": "test resources", "Value": "aws"}' \n   --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \n   --edition "DEVELOPER_EDITION" \n   --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \n   --user-context-policy "USER_TOKEN" \n   --user-token-configurations '{"JsonTokenTypeConfiguration": "userNameField", "UserNameAttributeField": "userNameField"}'}

Output:

{  "Id": index1 }

For more information, see [Getting started with an Amazon Kendra index and data source connector](https://docs.aws.amazon.com/kendra/latest/dg/getting-started.html) in the *Amazon Kendra Developer Guide*.

- For API details, see [CreateIndex](https://docs.aws.amazon.com/cli/latest/reference/kendra/create-index.html) in *AWS CLI Command Reference*.

### describe-data-source

The following code example shows how to use `describe-data-source`.

**AWS CLI**

To get information about an Amazon Kendra data source connector

The following `describe-data-source` gets information about an Amazon Kendra data source connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

aws kendra describe-data-source \
   --id exampledatasource1 \
   --index-id exampleindex1

Output:
{
    "Configuration": {
        "TemplateConfiguration": {
            "Template": {
                "connectionConfiguration": {
                    "repositoryEndpointMetadata": {
                        "BucketName": "my-bucket"
                    },
                },
                "repositoryConfigurations": {
                    "document": {
                        "fieldMappings": [
                            {
                                "indexFieldName": "_document_title",
                                "indexFieldType": "STRING",
                                "dataSourceFieldName": "title"
                            },
                            {
                                "indexFieldName": "_last_updated_at",
                                "indexFieldType": "DATE",
                                "dataSourceFieldName": "modified_date"
                            }
                        ]
                    }
                },
                "additionalProperties": {
                    "inclusionPatterns": [
                        "*.txt",
                        "*.doc",
                        "*.docx"
                    ],
                    "exclusionPatterns": [
                        "*.json"
                    ],
                    "inclusionPrefixes": [
                        "PublicExampleDocsFolder"
                    ],

                        "PrivateDocsFolder/private"
                    ],
                    "aclConfigurationFilePath": "ExampleDocsFolder/AclConfig.json",
                    "metadataFilesPrefix": "metadata"
                }
            }
        }
    }
}
For more information, see Getting started with an Amazon Kendra index and data source connector in the Amazon Kendra Developer Guide.

- For API details, see DescribeDataSource in AWS CLI Command Reference.

**describe-index**

The following code example shows how to use `describe-index`.
AWS CLI

To get information about an Amazon Kendra index

The following `describe-index` gets information about an Amazon Kendra index. You can view the configuration of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```bash
aws kendra describe-index \
--id exampleindex1
```

Output:

For more information, see Getting started with an Amazon Kendra index and data source connector in the Amazon Kendra Developer Guide.

- For API details, see DescribeIndex in AWS CLI Command Reference.

**update-data-source**

The following code example shows how to use update-data-source.

**AWS CLI**

To update an Amazon Kendra data source connector

The following update-data-source updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use describe-data-source to view the configuration and status of a data source connector.

```bash
aws kendra update-data-source \
```
This command produces no output.

For more information, see [Getting started with an Amazon Kendra index and data source connector](https://docs.aws.amazon.com/kendra/latest/dg/welcome.html) in the Amazon Kendra Developer Guide.

### update-index

The following code example shows how to use `update-index`.

**AWS CLI**

To update an Amazon Kendra index

The following `update-index` updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-index` to view the configuration and status of an index.

```
aws kendra update-index \
   --id enterpriseindex1 \
   --name "new name for Enterprise Edition index 1" \
   --description "new description for Enterprise Edition index 1" \
   --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
   --capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' \
```
This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the Amazon Kendra Developer Guide.

- For API details, see UpdateIndex in AWS CLI Command Reference.

**Kinesis examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Kinesis.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**add-tags-to-stream**

The following code example shows how to use add-tags-to-stream.

**AWS CLI**

To add tags to a data stream
The following add-tags-to-stream example assigns a tag with the key samplekey and value example to the specified stream.

```bash
aws kinesis add-tags-to-stream \
    --stream-name samplestream \
    --tags samplekey=example
```

This command produces no output.

For more information, see Tagging Your Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see AddTagsToStream in AWS CLI Command Reference.

create-stream

The following code example shows how to use create-stream.

**AWS CLI**

To create a data stream

The following create-stream example creates a data stream named samplestream with 3 shards.

```bash
aws kinesis create-stream \
    --stream-name samplestream \
    --shard-count 3
```

This command produces no output.

For more information, see Creating a Stream in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see CreateStream in AWS CLI Command Reference.

decrease-stream-retention-period

The following code example shows how to use decrease-stream-retention-period.
AWS CLI

To decrease data stream retention period

The following decrease-stream-retention-period example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named samplestream to 48 hours.

```
aws kinesis decrease-stream-retention-period \
   --stream-name samplestream \
   --retention-period-hours 48
```

This command produces no output.

For more information, see Changing the Data Retention Period in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DecreaseStreamRetentionPeriod in AWS CLI Command Reference.

delete-stream

The following code example shows how to use delete-stream.

AWS CLI

To delete a data stream

The following delete-stream example deletes the specified data stream.

```
aws kinesis delete-stream \
   --stream-name samplestream
```

This command produces no output.

For more information, see Deleting a Stream in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DeleteStream in AWS CLI Command Reference.

deregister-stream-consumer

The following code example shows how to use deregister-stream-consumer.
To deregister a data stream consumer

The following deregister-stream-consumer example deregisters the specified consumer from the specified data stream.

```bash
aws kinesis deregister-stream-consumer \
   --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DeregisterStreamConsumer in AWS CLI Command Reference.

describe-limits

The following code example shows how to use describe-limits.

AWS CLI

To describe shard limits

The following describe-limits example displays the shard limits and usage for the current AWS account.

```bash
aws kinesis describe-limits
```

Output:

```
{
   "ShardLimit": 500,
   "OpenShardCount": 29
}
```

For more information, see Resharding a Stream in the Amazon Kinesis Data Streams Developer Guide.
• For API details, see DescribeLimits in AWS CLI Command Reference.

describe-stream-consumer

The following code example shows how to use describe-stream-consumer.

AWS CLI

To describe a data stream consumer

The following describe-stream-consumer example returns the description of the specified consumer, registered with the specified data stream.

```
aws kinesis describe-stream-consumer \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "ConsumerDescription": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerStatus": "ACTIVE",
        "ConsumerCreationTimestamp": 1572383852.0,
    }
}
```

For more information, see Reading Data from Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

• For API details, see DescribeStreamConsumer in AWS CLI Command Reference.

describe-stream-summary

The following code example shows how to use describe-stream-summary.

AWS CLI

To describe a data stream summary
The following describe-stream-summary example provides a summarized description (without the shard list) of the specified data stream.

```bash
aws kinesis describe-stream-summary \
  --stream-name samplestream
```

Output:

```json
{
  "StreamDescriptionSummary": {
    "StreamName": "samplestream",
    "StreamStatus": "ACTIVE",
    "RetentionPeriodHours": 48,
    "StreamCreationTimestamp": 1572297168.0,
    "EnhancedMonitoring": [
      {
        "ShardLevelMetrics": []
      }
    ],
    "EncryptionType": "NONE",
    "OpenShardCount": 3,
    "ConsumerCount": 0
  }
}
```

For more information, see Creating and Managing Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DescribeStreamSummary in AWS CLI Command Reference.

describe-stream

The following code example shows how to use describe-stream.

AWS CLI

To describe a data stream

The following describe-stream example returns the details of the specified data stream.

```bash
aws kinesis describe-stream \
```
--stream-name samplestream

Output:

```
{
    "StreamDescription": {
        "Shards": [
            {
                "ShardId": "shardId-000000000000",
                "HashKeyRange": {
                    "StartingHashKey": "0",
                    "EndingHashKey": "113427455640312821154458202477256070484"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "49600871682957036442365024926191073437251060580128653314"
                }
            },
            {
                "ShardId": "shardId-000000000001",
                "HashKeyRange": {
                    "StartingHashKey": "113427455640312821154458202477256070485",
                    "EndingHashKey": "226854911280625642308916404954512140969"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "49600871682979337187563555549332609155523708941634633746"
                }
            },
            {
                "ShardId": "shardId-000000000002",
                "HashKeyRange": {
                    "StartingHashKey": "226854911280625642308916404954512140970",
                    "EndingHashKey": "340282366920938463463374607431768211455"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "49600871683001637932762086172474144873796357303140614178"
                }
            }
        ],
        "StreamName": "samplestream",
```
The following code example shows how to use `disable-enhanced-monitoring`.

**AWS CLI**

To disable enhanced monitoring for shard-level metrics

The following `disable-enhanced-monitoring` example disables enhanced Kinesis data stream monitoring for shard-level metrics.

```bash
aws kinesis disable-enhanced-monitoring \
--stream-name samplestream --shard-level-metrics ALL
```

Output:

```json
{
   "StreamName": "samplestream",
   "CurrentShardLevelMetrics": [
      "IncomingBytes",
      "OutgoingRecords",
      "IteratorAgeMilliseconds",
      "IncomingRecords",
      "ReadProvisionedThroughputExceeded",
   ]
}
```
The following code example shows how to use `enable-enhanced-monitoring`.

**AWS CLI**

To enable enhanced monitoring for shard-level metrics

The following `enable-enhanced-monitoring` example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis enable-enhanced-monitoring \
    --stream-name samplestream \
    --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [],
    "DesiredShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ]
}
```
For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see EnableEnhancedMonitoring in AWS CLI Command Reference.

get-records

The following code example shows how to use get-records.

AWS CLI

To obtain records from a shard

The following get-records example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \
  --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/TKuNgx2ukD5xipCY4cy4gU96orWwZwc5Xh3K9tAmGYeOZyLZrvzee0FVf9iN99hUPw/w/b0YWYeehfNvnf1DYt5XpDJghLKr3DzgznkTmMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/GvaGP2Hh9Fg7N++q0Adg6fIDQP74p8RpavDbk+A4sL9SWGE1
```

Output:

```
{
  "Records": [],
  "MillisBehindLatest": 80742000
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see GetRecords in AWS CLI Command Reference.

get-shard-iterator

The following code example shows how to use get-shard-iterator.

AWS CLI

To obtain a shard iterator
The following get-shard-iterator example uses the AT_SEQUENCE_NUMBER shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```bash
aws kinesis get-shard-iterator \
  --stream-name samplestream \
  --shard-id shardId-000000000001 \
  --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqgH9FiFJ+n48XWTh/IFIfsLp6o5eDueD39XNBfpZ10WL5K6ADXxk8w+5H+Qhd9cFA9k268CPXcz/kebq1TyY7VY
+lUkA9BuN3xvATxMBGxRY3zYK05gqgvaIrn94O8SqeEqwhigwZxNWxID3Ej7YYYcxQi8Q/fIrCjGBy/n2r5Z9G864YpWdfN9upNNQAR/iiOWKs"
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see GetShardIterator in AWS CLI Command Reference.

increase-stream-retention-period

The following code example shows how to use increase-stream-retention-period.

AWS CLI

To increase data stream retention period

The following increase-stream-retention-period example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```bash
aws kinesis increase-stream-retention-period \
  --stream-name samplestream \
  --retention-period-hours 168
```

This command produces no output.
For more information, see Changing the Data Retention Period in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see IncreaseStreamRetentionPeriod in AWS CLI Command Reference.

list-shards

The following code example shows how to use list-shards.

**AWS CLI**

**To list shards in a data stream**

The following list-shards example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified exclusive-start-shard-id of shardId-000000000000.

```bash
aws kinesis list-shards \
   --stream-name samplestream \
   --exclusive-start-shard-id shardId-000000000000
```

Output:

```json
{
   "Shards": [
      {
         "ShardId": "shardId-000000000001",
         "HashKeyRange": {
            "StartingHashKey": "11342745564031281154458202477256070485",
            "EndingHashKey": "226854911280625642308916404954512140969"
         },
         "SequenceNumberRange": {
            "StartingSequenceNumber": "49600871682979337187563555549332609155523708941634633746"
         }
      },
      {
         "ShardId": "shardId-000000000002",
         "HashKeyRange": {
            "StartingHashKey": "226854911280625642308916404954512140970",
            "EndingHashKey": "340282366920938463463374607431768211455"
         }
      }
   ]
}
```
For more information, see Listing Shards in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see ListShards in AWS CLI Command Reference.

**list-streams**

The following code example shows how to use list-streams.

**AWS CLI**

**To list data streams**

The following list-streams example lists all active data streams in the current account and region.

```bash
aws kinesis list-streams
```

Output:

```json
{
   "StreamNames": [
      "samplestream",
      "samplestream1"
   ]
}
```

For more information, see Listing Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

**list-tags-for-stream**

The following code example shows how to use list-tags-for-stream.
AWS CLI

To list tags for a data stream

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```
aws kinesis list-tags-for-stream \
--stream-name samplestream
```

Output:

```
{
   "Tags": [
       {
           "Key": "samplekey",
           "Value": "example"
       }
   ],
   "HasMoreTags": false
}
```

For more information, see Tagging Your Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see ListTagsForStream in AWS CLI Command Reference.

merge-shards

The following code example shows how to use `merge-shards`.

AWS CLI

To merge shards

The following `merge-shards` example merges two adjacent shards with IDs of shardId-000000000000 and shardId-000000000001 in the specified data stream and combines them into a single shard.

```
aws kinesis merge-shards \
--stream-name samplestream \
--shard-to-merge shardId-000000000000 \
--shard-to-merge shardId-000000000001
```
--adjacent-shard-to-merge shardId-000000000001

This command produces no output.

For more information, see Merging Two Shards in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see MergeShards in AWS CLI Command Reference.

put-record

The following code example shows how to use put-record.

AWS CLI

To write a record into a data stream

The following put-record example writes a single data record into the specified data stream using the specified partition key.

```bash
aws kinesis put-record \
    --stream-name samplestream \
    --data sampledatarecord \
    --partition-key samplepartitionkey
```

Output:

```json
{
    "ShardId": "shardId-000000000009",
    "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see PutRecord in AWS CLI Command Reference.

put-records

The following code example shows how to use put-records.
AWS CLI

To write multiple records into a data stream

The following put-records example writes a data record using the specified partition key and another data record using a different partition key in a single call.

```bash
aws kinesis put-records \
   --stream-name samplestream \
   --records Data=blob1,PartitionKey=partitionkey1
Data=blob2,PartitionKey=partitionkey2
```

Output:

```
{
   "FailedRecordCount": 0,
   "Records": [
      {
         "SequenceNumber": "496008833117147151967479558823853149846539990093808706",
         "ShardId": "shardId-000000000004"
      },
      {
         "SequenceNumber": "49600902273357540915989931256902715169698037101720764562",
         "ShardId": "shardId-000000000009"
      }
   ],
   "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see PutRecords in AWS CLI Command Reference.

register-stream-consumer

The following code example shows how to use register-stream-consumer.

AWS CLI

To register a data stream consumer
The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \
  --consumer-name KinesisConsumerApplication
```

Output:

```
{
  "Consumer": {
    "ConsumerName": "KinesisConsumerApplication",
    "ConsumerStatus": "CREATING",
    "ConsumerCreationTimestamp": 1572383852.0
  }
}
```

For more information, see [Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API](https://docs.aws.amazon.com/AmazonKinesis/latest/dev/DevelopingConsumersWithKinesisStreams.html) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [RegisterStreamConsumer](https://docs.aws.amazon.com/cli/latest/reference/kinesis/register-stream-consumer.html) in *AWS CLI Command Reference*.

---

### remove-tags-from-stream

The following code example shows how to use `remove-tags-from-stream`.

**AWS CLI**

**To remove tags from a data stream**

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \
  --stream-name samplestream \
  --tag-keys samplekey
```

This command produces no output.
split-shard

The following code example shows how to use split-shard.

AWS CLI

To split shards

The following split-shard example splits the specified shard into two new shards using a new starting hash key of 10.

```
aws kinesis split-shard \
  --stream-name samplestream \
  --shard-to-split shardId-000000000000 \
  --new-starting-hash-key 10
```

This command produces no output.

For more information, see Splitting a Shard in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see SplitShard in AWS CLI Command Reference.

start-stream-encryption

The following code example shows how to use start-stream-encryption.

AWS CLI

To enable data stream encryption

The following start-stream-encryption example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
  --encryption-type KMS
```
This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see StartStreamEncryption in AWS CLI Command Reference.

stop-stream-encryption

The following code example shows how to use stop-stream-encryption.

AWS CLI

To disable data stream encryption

The following stop-stream-encryption example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption
   --encryption-type KMS
   --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-b334-4d3eb496e452
   --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see StopStreamEncryption in AWS CLI Command Reference.

update-shard-count

The following code example shows how to use update-shard-count.

AWS CLI

To update the shard count in a data stream
The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count \
  --stream-name samplestream \
  --scaling-type UNIFORM_SCALING \
  --target-shard-count 6
```

Output:

```
{
  "StreamName": "samplestream",
  "CurrentShardCount": 3,
  "TargetShardCount": 6
}
```

For more information, see [Resharding a Stream](#) in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see [UpdateShardCount](#) in *AWS CLI Command Reference*.

### AWS KMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
Actions

cancel-key-deletion

The following code example shows how to use cancel-key-deletion.

AWS CLI

To cancel the scheduled deletion of a customer managed KMS key

The following cancel-key-deletion example cancels the scheduled deletion of a customer managed KMS key.

```
aws kms cancel-key-deletion \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

When the cancel-key-deletion command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is Disabled, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the enable-key command.

For more information, see Scheduling and canceling key deletion in the AWS Key Management Service Developer Guide.

- For API details, see CancelKeyDeletion in AWS CLI Command Reference.

connect-custom-key-store

The following code example shows how to use connect-custom-key-store.

AWS CLI

To connect a custom key store
The following connect-custom-key-store example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```
aws kms connect-custom-key-store \
--custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the command was effective, use the describe-custom-key-stores command.

For information about connecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

For information about connecting an external key store, see Connecting and disconnecting an external key store in the AWS Key Management Service Developer Guide.

• For API details, see ConnectCustomKeyStore in AWS CLI Command Reference.

create-alias

The following code example shows how to use create-alias.

AWS CLI

To create an alias for a KMS key

The following create-alias command creates an alias named example-alias for the KMS key identified by key ID 1234abcd-12ab-34cd-56ef-1234567890ab.

Alias names must begin with alias/. Do not use alias names that begin with alias/aws; these are reserved for use by AWS.

```
aws kms create-alias \
--alias-name alias/example-alias \
--target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command doesn't return any output. To see the new alias, use the list-aliases command.
create-custom-key-store

The following code example shows how to use create-custom-key-store.

AWS CLI

Example 1: To create an AWS CloudHSM key store

The following create-custom-key-store example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the custom-key-store-type parameter with the default value: `AWS_CLOUDHSM`.

To specify the file input for the trust-anchor-certificate command in the AWS CLI, the file:// prefix is required.

```
aws kms create-custom-key-store 
    --custom-key-store-name ExampleCloudHSMKeyStore 
    --cloud-hsm-cluster-id cluster-1a23b4cdefg 
    --key-store-password kmsPswd 
    --trust-anchor-certificate file://customerCA.crt
```

Output:

```
{
    "CustomKeyStoreId": cks-1234567890abcdef0
}
```

For more information, see Creating an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

Example 2: To create an external key store with public endpoint connectivity

The following create-custom-key-store example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the XksProxyUriPath uses an optional prefix of example-prefix.
NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
  --custom-key-store-name ExamplePublicEndpointXKS \
  --custom-key-store-type EXTERNAL_KEY_STORE \
  --xks-proxy-connectivity PUBLIC_ENDPOINT \
  --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \
  --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \
  --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
  "CustomKeyStoreId": cks-2234567890abcdef0
}
```

For more information, see Creating an external key store in the AWS Key Management Service Developer Guide.

**Example 3: To create an external key store with VPC endpoint service connectivity**

The following create-custom-key-store example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
```

```
--custom-key-store-name ExampleVPC EndpointXKS \
--custom-key-store-type EXTERNAL_KEY_STORE \n--xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
--xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
--xks-proxy-uri-path "/kms/xks/v1" \n--xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-exemple1" \n--xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
RawSecretAccessKey=DXjSUawanl2fr6SKC7G25CNxTyWKE5PF9X6H/u9pSo="

Output:

```json
{
   "CustomKeyStoreId": cks-3234567890abcdef0
}
```

For more information, see [Creating an external key store](https://docs.aws.amazon.com/kms/latest/developerguide/creating-external-key-store.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateCustomKeyStore](https://docs.aws.amazon.com/cli/latest/reference/kms/create-custom-key-store.html) in *AWS CLI Command Reference*.

### create-grant

The following code example shows how to use `create-grant`.

#### AWS CLI

**To create a grant**

The following `create-grant` example creates a grant that allows the `exampleUser` user to use the `decrypt` command on the `1234abcd-12ab-34cd-56ef-1234567890ab` example KMS key. The retiring principal is the `adminRole` role. The grant uses the `EncryptionContextSubset` grant constraint to allow this permission only when the encryption context in the `decrypt` request includes the "Department": "IT" key-value pair.

```bash
aws kms create-grant \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --grantee-principal arn:aws:iam::123456789012:user/exampleUser \
   --operations Decrypt \
   --constraints EncryptionContextSubset={Department=IT} \n   --retiring-principal arn:aws:iam::123456789012:role/adminRole
```
To view detailed information about the grant, use the `list-grants` command.

For more information, see [Grants in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateGrant](https://docs.aws.amazon.com/cli/latest/reference/kms/create-grant.html) in *AWS CLI Command Reference*.

### create-key

The following code example shows how to use `create-key`.

#### AWS CLI

**Example 1: To create a customer managed KMS key in AWS KMS**

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the [default key policy](https://docs.aws.amazon.com/kms/latest/developerguide/) for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```bash
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags` command.

**Output:**

```json
{
    "KeyMetadata": {

```
Note: The `create-key` command does not let you specify an alias. To create an alias for the new KMS key, use the `create-alias` command.

For more information, see Creating keys in the AWS Key Management Service Developer Guide.

**Example 2: To create an asymmetric RSA KMS key for encryption and decryption**

The following `create-key` example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption.

```bash
aws kms create-key
  --key-spec RSA_4096
  --key-usage ENCRYPT_DECRYPT
```

Output:

```
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2021-04-05T14:04:55-07:00",
    "CustomerMasterKeySpec": "RSA_4096",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMmetric_DEFAULT",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "AWS_KMS",
    "EncryptionAlgorithms": [
      "SYMmetric_DEFAULT"
    ]
  }
}
```
Example 3: To create an asymmetric elliptic curve KMS key for signing and verification

To create an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though SIGN_VERIFY is the only valid value for ECC KMS keys.

```
aws kms create-key \
  --key-spec ECC_NIST_P521 \
  --key-usage SIGN_VERIFY
```

Output:

```
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "ECC_NIST_P521",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
  }
}
```
"KeySpec": "ECC_NIST_P521",
"KeyState": "Enabled",
"KeyUsage": "SIGN_VERIFY",
"MultiRegion": false,
"Origin": "AWS_KMS",
"SigningAlgorithms": [
    "ECDSA_SHA_512"
]
}
}

For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Example 4: To create an HMAC KMS key

The following create-key example creates a 384-bit HMAC KMS key. The GENERATE_VERIFY_MAC value for the --key-usage parameter is required even though it's the only valid value for HMAC KMS keys.

```bash
aws kms create-key \
  --key-spec HMAC_384 \
  --key-usage GENERATE_VERIFY_MAC
```

Output:

```json
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2022-04-05T14:04:55-07:00",
    "CustomerMasterKeySpec": "HMAC_384",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "HMAC_384",
    "KeyState": "Enabled",
    "KeyUsage": "GENERATE_VERIFY_MAC",
    "MacAlgorithms": [
      "HMAC_SHA_384"
    ]
  }
}
```
For more information, see [HMAC keys in AWS KMS](https://docs.aws.amazon.com/aws-key-management/latest/devguide/aws-kms-create-key.html) in the *AWS Key Management Service Developer Guide*.

**Example 4: To create a multi-Region primary KMS key**

The following `create-key` example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the `--multi-region` parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```
aws kms create-key
  --multi-region
```

**Output:**

```json
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-west-2:111122223333:key/mrk-1234abcd12ab34cd56ef12345678990ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2021-09-02T016:15:21-09:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": ":",
    "Enabled": true,
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ],
    "KeyId": "mrk-1234abcd12ab34cd56ef12345678990ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": true,
    "MultiRegionConfiguration": {
      "MultiRegionKeyType": "PRIMARY",
      "PrimaryKey": {
```
For more information, see [Asymmetric keys in AWS KMS](https://aws.amazon.com/kms/) in the *AWS Key Management Service Developer Guide*.

**Example 5: To create a KMS key for imported key material**

The following `create-key` example creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to `EXTERNAL`.

```bash
aws kms create-key \
    --origin EXTERNAL
```

**Output:**

```json
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": false,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "PendingImport",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL"
    }
}
```
For more information, see Importing key material in AWS KMS keys in the AWS Key Management Service Developer Guide.

**Example 6: To create a KMS key in an AWS CloudHSM key store**

The following `create-key` example creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The `--custom-key-store-id` and `--origin` parameters are required.

```shell
aws kms create-key \
   --origin AWS_CLOUDHSM \
   --custom-key-store-id cks-1234567890abcdef0
```

Output:

```json
{
   "KeyMetadata": {
      "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "AWSAccountId": "111122223333",
      "CloudHsmClusterId": "cluster-1a23b4cdefg",
      "CreationDate": "2019-12-02T07:48:55-07:00",
      "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
      "CustomKeyStoreId": "cks-1234567890abcdef0",
      "Description": "",
      "Enabled": true,
      "EncryptionAlgorithms": [
         "SYMMETRIC_DEFAULT"
      ],
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "KeyManager": "CUSTOMER",
      "KeySpec": "SYMMETRIC_DEFAULT",
      "KeyState": "Enabled",
      "KeyUsage": "ENCRYPT_DECRYPT",
      "MultiRegion": false,
      "Origin": "AWS_CLOUDHSM"
   }
}
```
For more information, see AWS CloudHSM key stores in the AWS Key Management Service Developer Guide.

Example 7: To create a KMS key in an external key store

The following create-key example creates a KMS key in the specified external key store. The --custom-key-store-id, --origin, and --xks-key-id parameters are required in this command.

The --xks-key-id parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key. The value of the --origin parameter must be EXTERNAL_KEY_STORE. The custom-key-store-id parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \
   --origin EXTERNAL_KEY_STORE \n   --custom-key-store-id cks-9876543210fedcba9 \n   --xks-key-id bb8562717f809024
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-9876543210fedcba9",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL_KEY_STORE",
        "XksKeyConfiguration": {
```
For more information, see External key stores in the AWS Key Management Service Developer Guide.

- For API details, see CreateKey in AWS CLI Command Reference.

**decrypt**

The following code example shows how to use decrypt.

**AWS CLI**

**Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)**

The following decrypt command example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file. In the value of the --ciphertext-blob parameter, use the fileb:// prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the AWS Command Line Interface User Guide and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the AWS Command Line Tool Blog. Specify the KMS key to decrypt the ciphertext. The --key-id parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Request the plaintext output as a text value. The --query parameter tells the CLI to get only the value of the Plaintext field from the output. The --output parameter returns the output as text. Base64-decode the plaintext and save it in a file. The following example pipes (|) the value of the Plaintext parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the ExamplePlaintext file.
Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms decrypt \
  --ciphertext-blob fileb://ExampleEncryptedFile \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --output text \
  --query Plaintext | base64 \
  --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see [Decrypt](https://docs.aws.amazon.com/kms/latest/developerguide/aws-kms-api-example.html) in the [AWS Key Management Service API Reference](https://docs.aws.amazon.com/kms/latest/developerguide/aws-kms-api-example.html).

**Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)**

The following example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms decrypt ^
  --ciphertext-blob fileb://ExampleEncryptedFile ^
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
  --output text ^
  --query Plaintext > ExamplePlaintextFile.base64
```

Run the `certutil` command.

```bash
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```
For more information, see Decrypt in the AWS Key Management Service API Reference.

**Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)**

The following decrypt command example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the encryption-algorithm parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

- For API details, see Decrypt in AWS CLI Command Reference.

**delete-alias**

The following code example shows how to use delete-alias.

**AWS CLI**

To delete an AWS KMS alias

The following delete-alias example deletes the alias alias/example-alias. The alias name must begin with alias/.

```
aws kms delete-alias \
```
This command produces no output. To find the alias, use the list-aliases command.

For more information, see Deleting an alias in the AWS Key Management Service Developer Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.

delete-custom-key-store

The following code example shows how to use delete-custom-key-store.

AWS CLI

To delete a custom key store

The following delete-custom-key-store example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster. Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

NOTE: Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see Delete an AWS CloudHSM key store (API) in the AWS Key Management Service Developer Guide.

```
delete-custom-key-store
   --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the custom key store is deleted, use the describe-custom-key-stores command.

For information about deleting an AWS CloudHSM key stores, see Deleting an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

For information about deleting external key stores, see Deleting an external key store in the AWS Key Management Service Developer Guide.

- For API details, see DeleteCustomKeyStore in AWS CLI Command Reference.
**delete-imported-key-material**

The following code example shows how to use `delete-imported-key-material`.

**AWS CLI**

**To delete imported key material from a KMS key**

The following `delete-imported-key-material` example deletes key material that had been imported into a KMS key.

```sh
aws kms delete-imported-key-material \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the key material is deleted, use the `describe-key` command to look for a key state of `PendingImport` or `PendingDeletion`.

For more information, see Deleting imported key material<https://docs.aws.amazon.com/kms/latest/dv/guides/importing-keys-delete-key-material.html> in the AWS Key Management Service Developer Guide.

- For API details, see `DeleteImportedKeyMaterial` in AWS CLI Command Reference.

**describe-custom-key-stores**

The following code example shows how to use `describe-custom-key-stores`.

**AWS CLI**

**Example 1: To get details about an AWS CloudHSM key store**

The following `describe-custom-key-store` example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```sh
aws kms describe-custom-key-stores \
  --custom-key-store-name ExampleCloudHSMKeyStore
```
The output of this command includes useful details about the AWS CloudHSM key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

Output:

```
{
  "CustomKeyStores": [
    {
      "CloudHsmClusterId": "cluster-1a23b4cdefg",
      "ConnectionState": "CONNECTED",
      "CreationDate": "2022-04-05T14:04:55-07:00",
      "CustomKeyStoreId": "cks-1234567890abcdef0",
      "CustomKeyStoreName": "ExampleExternalKeyStore",
      "TrustAnchorCertificate": "<certificate appears here>"
    }
  ]
}
```

For more information, see Viewing an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

**Example 2: To get details about an external key store with public endpoint connectivity**

The following describe-custom-key-store example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the custom-key-store-name or custom-key-store-id parameter.

```
aws kms describe-custom-key-stores \\
  --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

Output:
For more information, see Viewing an external key store in the AWS Key Management Service Developer Guide.

**Example 3: To get details about an external key store with VPC endpoint service connectivity**

The following describe-custom-key-store example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the custom-key-store-name or custom-key-store-id parameter.

```
aws kms describe-custom-key-stores \ 
  --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

**Output:**

```json
{
  "CustomKeyStores": [
    {
      "CustomKeyStoreId": "cks-9876543210fedcba9",
      "CustomKeyStoreName": "ExampleXKS",
      "ConnectionState": "CONNECTED",
      "CreationDate": "2022-12-02T07:48:55-07:00",
      "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
      "XksProxyConfiguration": {
        "AccessKeyId": "ABCDE12345670EXAMPLE",
        "Connectivity": "PUBLIC_ENDPOINT",
        "UriEndpoint": "https://myproxy.xks.example.com",
        "UriPath": "/example-prefix/kms/xks/v1"
      }
    }
  ]
}
```
For more information, see [Viewing an external key store](#) in the AWS Key Management Service Developer Guide.

- For API details, see [DescribeCustomKeyStores](#) in AWS CLI Command Reference.

describe-key

The following code example shows how to use describe-key.

AWS CLI

**Example 1: To find detailed information about a KMS key**

The following describe-key example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the key-id parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```bash
aws kms describe-key
--key-id alias/aws/s3
```
Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "846764612917",
        "KeyId": "b8a9477d-836c-491f-857e-07937918959b",
        "CreationDate": 2017-06-30T21:44:32.140000+00:00,
        "Enabled": true,
        "Description": "Default KMS key that protects my S3 objects when no other key is defined",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "AWS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
    }
}
```

For more information, see [Viewing keys](#) in the AWS Key Management Service Developer Guide.

**Example 2: To get details about an RSA asymmetric KMS key**

The following `describe-key` example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "111122223333",
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "Arn": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2019-12-02T19:47:14.861000+00:00",
        "CustomerMasterKeySpec": "RSA_2048",
```
Example 3: To get details about a multi-Region replica key

The following describe-key example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a describe-key command for any multi-Region key returns information about the primary key and all of its replicas.

```
aws kms describe-key \
   --key-id arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab
```

Output:

```
{
   "KeyMetadata": {
      "MultiRegion": true,
      "AWSAccountId": "111122223333",
      "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
      "CreationDate": "2021-06-28T21:09:16.114000+00:00",
      "Description": "",
      "Enabled": true,
      "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
      "KeyManager": "CUSTOMER",
      "KeyUsage": "SIGN_VERIFY",
      "SigningAlgorithms": [
         "RSASSA_PKCS1_V1_5_SHA_256",
         "RSASSA_PKCS1_V1_5_SHA_384",
         "RSASSA_PKCS1_V1_5_SHA_512",
         "RSASSA_PSS_SHA_256",
         "RSASSA_PSS_SHA_384",
         "RSASSA_PSS_SHA_512"
      ]
   }
}
"KeyState": "Enabled",
"KeyUsage": "ENCRYPT_DECRYPT",
"Origin": "AWS_KMS",
"CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
"EncryptionAlgorithms": [  "SYMMETRIC_DEFAULT"
],
"MultiRegionConfiguration": {  "MultiRegionKeyType": "PRIMARY",
    "PrimaryKey": {  "Arn": "arn:aws:kms:us-west-2:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
                     "Region": "us-west-2"
    },
    "ReplicaKeys": [  {  "Arn": "arn:aws:kms:eu-west-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
                      "Region": "eu-west-1"
    },  
{  "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
                      "Region": "ap-northeast-1"
    },  
{  "Arn": "arn:aws:kms:sa-east-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
                      "Region": "sa-east-1"
    }
]  }
}

Example 4: To get details about an HMAC KMS key

The following describe-key example gets detailed information about an HMAC KMS key.

```bash
aws kms describe-key \  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:
For API details, see DescribeKey in AWS CLI Command Reference.

disable-key-rotation

The following code example shows how to use disable-key-rotation.

AWS CLI

To disable automatic rotation of a KMS key

The following disable-key-rotation example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the enable-key-rotation command.

```
aws kms disable-key-rotation \
    --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that automatic rotation is disable for the KMS key, use the get-key-rotation-status command.

For more information, see Rotating keys in the AWS Key Management Service Developer Guide.
• For API details, see DisableKeyRotation in AWS CLI Command Reference.

**disable-key**

The following code example shows how to use disable-key.

**AWS CLI**

To temporarily disable a KMS key

The following example uses the disable-key command to disable a customer managed KMS key. To re-enable the KMS key, use the enable-key command.

```bash
aws kms disable-key \  
--key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output.

For more information, see Enabling and Disabling Keys in the AWS Key Management Service Developer Guide.

• For API details, see DisableKey in AWS CLI Command Reference.

**disconnect-custom-key-store**

The following code example shows how to use disconnect-custom-key-store.

**AWS CLI**

To disconnect a custom key store

The following disconnect-custom-key-store example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.
$ aws kms disconnect-custom-key-store \ 
  --custom-key-store-id cks-1234567890abcdef0

This command produces no output. Verify that the command was effective, use the describe-custom-key-stores command.

For more information about disconnecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

For more information about disconnecting an external key store, see Connecting and disconnecting an external key store in the AWS Key Management Service Developer Guide.

- For API details, see DisconnectCustomKeyStore in AWS CLI Command Reference.

enable-key-rotation

The following code example shows how to use enable-key-rotation.

AWS CLI

To enable automatic rotation of a KMS key

The following enable-key-rotation example enables automatic rotation of a customer managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The --key-id parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The --rotation-period-in-days parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

aws kms enable-key-rotation \ 
  --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \ 
  --rotation-period-in-days 180

This command produces no output. To verify that the KMS key is enabled, use the get-key-rotation-status command.
For more information, see Rotating keys in the AWS Key Management Service Developer Guide.

- For API details, see EnableKeyRotation in AWS CLI Command Reference.

enable-key

The following code example shows how to use enable-key.

AWS CLI

To enable a KMS key

The following enable-key example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the disable-key command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the key-id parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \\
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the KMS key is enabled, use the describe-key command. See the values of the KeyState and Enabled fields in the describe-key output.

For more information, see Enabling and Disabling Keys in the AWS Key Management Service Developer Guide.

- For API details, see EnableKey in AWS CLI Command Reference.

encrypt

The following code example shows how to use encrypt.

AWS CLI

Example 1: To encrypt the contents of a file on Linux or MacOS
The following encrypt command demonstrates the recommended way to encrypt data with the AWS CLI.

```bash
aws kms encrypt
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --plaintext fileb://ExamplePlaintextFile
   --output text
   --query CiphertextBlob | base64 --decode > ExampleEncryptedFile
```

The command does several things:

- Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded. The value of the plaintext parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file. If the file is not in the current directory, type the full path to file. For example: `fileb://var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see [Loading Parameters from a File](#) in the AWS Command Line Interface User Guide and [Best Practices for Local File Parameters](#) on the AWS Command Line Tool Blog.
- Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the encrypted data, called the ciphertext, from the command's output. For more information about controlling output, see [Controlling Command Output](#) in the AWS Command Line Interface User Guide.
- Uses the base64 utility to decode the extracted output into binary data. The ciphertext that is returned by a successful encrypt command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it. Saves the binary ciphertext to a file. The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the decrypt examples.

**Example 2: Using the AWS CLI to encrypt data on Windows**

This example is the same as the previous one, except that it uses the `certutil` tool instead of base64. This procedure requires two commands, as shown in the following example.

```bash
aws kms encrypt
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --plaintext fileb://ExamplePlaintextFile
   --output text
   --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64
```
Example 3: Encrypting with an asymmetric KMS key

The following encrypt command shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all encrypt CLI commands, the plaintext parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

This command produces no output.

- For API details, see Encrypt in AWS CLI Command Reference.

`generate-data-key-pair-without-plaintext`

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

**AWS CLI**

To generate an ECC NIST P384 asymmetric data key pair

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of ECC_NIST_P384.
The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a KeySpec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair-without-plaintext \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-pair-spec ECC_NIST_P384
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdK12aJTzkK6FbhOtQkMlQJJH3PdtHvS/y+
+hAFFxmiD134doUDzMGmfCetcAAAHaTCCB2UGCSqGS1b3DQEHBqCCB1...",
    "PublicKey": "MIIBojANBgkqhkiG9w0BAQEFAOCAoCAwggEkMIIBjGk...",
    "KeyId": "arn:aws:kms:us-west-2:111122222333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyPairSpec": "ECC_NIST_P384"
}
```

The PublicKey and PrivateKeyCiphertextBlob are returned in base64-encoded format.

For more information, see Data key pairs in the AWS Key Management Service Developer Guide.

- For API details, see GenerateDataKeyPairWithoutPlaintext in AWS CLI Command Reference.

**generate-data-key-pair**

The following code example shows how to use generate-data-key-pair.

**AWS CLI**

To generate an 2048-bit RSA asymmetric data key pair

The following generate-data-key-pair example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.
To request a 2048-bit RSA asymmetric data key pair, use the **key-pair-spec** parameter with a value of **RSA_2048**.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a KeySpec value of **SYMMETRIC_DEFAULT**.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --key-pair-spec RSA_2048
```

Output:

```
{
   "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6Fbh0tQkMlQJJH3PdtHvS/y+hAFFxmiD134doUDzMGmfCETcAAAHaTCCB2UCqGSIb3DQEHBqCCB1...",
   "PrivateKeyPlaintext": "MIIG/QIBADANBgkqhkiG9w0BAQEFAAOKCAQIbGCAYEA3eGMzPvSn7+Ld1Iq1oVQ5HpeHAvbD0yND+NnmYDH/mL1OSIElLcdZ5hrMH4pk83r40l...",
   "PublicKey": "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigkKCAYEA3eGMzPvSn7+Ld1Iq1oVQ5HpeHAvbD0yND+NnmYDH/mL1OSIElLcdZ5hrMH4pk83r40l...",
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "KeyPairSpec": "RSA_2048"
}
```

The PublicKey, PrivateKeyPlaintext, and PrivateKeyCiphertextBlob are returned in base64-encoded format.

For more information, see [Data key pairs](https://docs.aws.amazon.com/kms/latest/developerguide/data-key-pairs.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKeyPair](https://docs.aws.amazon.com/cli/latest/reference/kms/generate-data-key-pair.html) in *AWS CLI Command Reference*.

---

### generate-data-key-without-plaintext

The following code example shows how to use `generate-data-key-without-plaintext`.

**AWS CLI**

To generate a 256-bit symmetric data key without a plaintext key
The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of AES_256. To request a 128-bit data key, use the `key-spec` parameter with a value of AES_128. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key-without-plaintext \
   --key-id "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab" \
   --key-spec AES_256
```

Output:

```
{
   "CiphertextBlob": 
   "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJ1GfR8P3W1wAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADB0BgkqhkiG9w0BBwEwHgYJYIZIAWUDBAEuMBEEDEFogL",
   "KeyId": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see [Data keys](https://docs.aws.amazon.com/kms/latest/developerguide/data-keys.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKeyWithoutPlaintext](https://docs.aws.amazon.com/cli/latest/reference/kms/generate-data-key-without-plaintext.html) in *AWS CLI Command Reference*.

### generate-data-key

The following code example shows how to use `generate-data-key`.

**AWS CLI**

**Example 1: To generate a 256-bit symmetric data key**

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion,
and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of `SYMMETRIC_DEFAULT`.

```
aws kms generate-data-key \
  --key-id alias/ExampleAlias \
  --key-spec AES_256
```

Output:

```
{
  "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",
  "KeyId": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "CiphertextBlob": "AQEDAHjRYf5WytIC0C857tF5nBaPn2F8DgfmThbJlgfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBBoBgtk+YdhV8MrkBQPeac0ReRVNDt9qleAt+SHgIRF8P0H+7U=
}
```

The Plaintext (plaintext data key) and the CiphertextBlob (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys> in the AWS Key Management Service Developer Guide.

**Example 2: To generate a 512-bit symmetric data key**

The following `generate-data-key` example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the `number-of-bytes` parameter. To request a 512-bit data key, the following example uses the `number-of-bytes` parameter with a value of 64 (bytes).
The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```bash
aws kms generate-data-key
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --number-of-bytes 64
```

Output:

```json
{
   "CiphertextBlob": "AQIBAHi6LtupRpdKl2aJTzK6Fbh0tQkM1QJJH3PdtHvS/y+hAEnX/QQnmMwDfg2korNMCec8AAACA0CCAmQGCSqGSIb3DQEHBqCCAlUwggJRAgEAMIICSgYJKoZ",
   "Plaintext": "ty8Lr0Bk6OF07M2Bwt6qbFdNB+G00ZLtff5MSEb4a13R2UKWGo06njAwy2n72VRm2m7z/Pm9Wpbvttz6a4Iso9hgPvKhZ5y6RTm4OovExiVfbveyX3DqxDzRswbKDPk/...",
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The Plaintext (plaintext data key) and CiphertextBlob (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys in the AWS Key Management Service Developer Guide.>

- For API details, see GenerateDataKey in AWS CLI Command Reference.

generate-random

The following code example shows how to use generate-random.

AWS CLI

Example 1: To generate a 256-bit random byte string (Linux or macOS)

The following generate-random example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file.

When you run this command, you must use the number-of-bytes parameter to specify the length of the random value in bytes.
You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

- It uses the required `--number-of-bytes` parameter with a value of 32 to request a 32-byte (256-bit) string.
- It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON.
- It uses the `--query` parameter to extract the value of the `Plaintext` property from the response.
- It pipes (`|`) the output of the command to the `base64` utility, which decodes the extracted output.
- It uses the redirection operator (`>`) to save decoded byte string to the `ExampleRandom` file.

```bash
aws kms generate-random \
  --number-of-bytes 32 \
  --output text \
  --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see GenerateRandom in the AWS Key Management Service API Reference.

Example 2: To generate a 256-bit random number (Windows Command Prompt)

The following example uses the `generate-random` command to generate a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```bash
aws kms generate-random \
  --number-of-bytes 32 \
  --output text \
  --query Plaintext > ExampleRandom.base64
```
Because the output of the generate-random command is saved in a file, this example produces no output.

Now use the certutil -decode command to decode the base64-encoded byte string in the ExampleRandom.base64 file. Then, it saves the decoded byte string in the ExampleRandom file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see GenerateRandom in the AWS Key Management Service API Reference.

- For API details, see GenerateRandom in AWS CLI Command Reference.

**get-key-policy**

The following code example shows how to use get-key-policy.

**AWS CLI**

**To copy a key policy from one KMS key to another KMS key**

The following get-key-policy example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the --policy parameter of put-key-policy requires a string, you must use the --output text option to return the output as a text string instead of JSON.

```
aws kms get-key-policy \
   --policy-name default \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --query Policy \
   --output text > policy.txt

aws kms put-key-policy \
   --policy-name default \
   --policy file policy.txt
```
This command produces no output.

For more information, see [PutKeyPolicy](https://docs.aws.amazon.com/kms/latest/developerguide/key-management-api-reference.html#kms-api-put-key-policy) in the AWS KMS API Reference.

- For API details, see [GetKeyPolicy](https://docs.aws.amazon.com/cli/latest/reference/kms/get-key-policy.html) in AWS CLI Command Reference.

### get-key-rotation-status

The following code example shows how to use get-key-rotation-status.

**AWS CLI**

To retrieve the rotation status for a KMS key.

The following get-key-rotation-status example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```bash
aws kms get-key-rotation-status \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```json
{
  "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
  "KeyRotationEnabled": true,
  "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",
  "RotationPeriodInDays": 365
}
```

For more information, see [Rotating keys](https://aws.amazon.com/key-management-service/) in the AWS Key Management Service Developer Guide.

- For API details, see [GetKeyRotationStatus](https://docs.aws.amazon.com/cli/latest/reference/kms/get-key-rotation-status.html) in AWS CLI Command Reference.

### get-parameters-for-import

The following code example shows how to use get-parameters-for-import.
To get the items required to import key material into a KMS key

The following get-parameters-for-import example gets the public key and import token that you need to import key material into a KMS key. When you use the import-key-material command, be sure to use the import token and key material encrypted by the public key that were returned in the same get-parameters-for-import command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the key-id parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```bash
aws kms get-parameters-for-import \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --wrapping-algorithm RSAES_OAEP_SHA_256 \
   --wrapping-key-spec RSA_2048
```

Output:

```json
{
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "PublicKey": "<public key base64 encoded data>",
   "ImportToken": "<import token base64 encoded data>",
   "ParametersValidTo": 1593893322.32
}
```

For more information, see Download the public key and import token in the AWS Key Management Service Developer Guide.

- For API details, see GetParametersForImport in AWS CLI Command Reference.

get-public-key

The following code example shows how to use get-public-key.

AWS CLI

Example 1: To download the public key of an asymmetric KMS key
The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "PublicKey": "jANBgkqhkiG9w0BAQEFAAOCAg8AMIICCgKCAgEAl5epvg1/QtJhxSi2g9SDEVg8QV/...",
   "CustomerMasterKeySpec": "RSA_4096",
   "KeyUsage": "ENCRYPT_DECRYPT",
   "EncryptionAlgorithms": [
      "RSAES_OAEP_SHA_1",
      "RSAES_OAEP_SHA_256"
   ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Using Symmetric and Asymmetric Keys](https://docs.aws.amazon.com/kms/latest/APIReference/API_Using_Symmetric_and_Asymmetric_Keys.html) in the *AWS Key Management Service API Reference*.

**Example 2: To convert a public key to DER format (Linux and macOS)**

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the PublicKey property as text. It Base64-decodes the PublicKey and saves it in the `public_key.der` file. The output parameter returns the output as text, instead of JSON. The `--query` parameter gets only the PublicKey property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.
This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see Using Symmetric and Asymmetric Keys in the AWS Key Management Service API Reference.

- For API details, see GetPublicKey in AWS CLI Command Reference.

import-key-material

The following code example shows how to use import-key-material.

AWS CLI

To import key material into a KMS key

The following import-key-material example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be PendingImport.

This command uses key material that you encrypted with the public key that the get-parameters-for-import command returned. It also uses the import token from the same get-parameters-for-import command.

The expiration-model parameter indicates that the key material automatically expires on the date and time specified by the valid-to parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to Pending import and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.
This command produces no output.

For more information about importing key material, see Importing Key Material in the AWS Key Management Service Developer Guide.

- For API details, see ImportKeyMaterial in AWS CLI Command Reference.

**list-aliases**

The following code example shows how to use list-aliases.

**AWS CLI**

**Example 1: To list all aliases in an AWS account and Region**

The following example uses the list-aliases command to list all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```bash
aws kms list-aliases
```

Output:

```json
{
   "Aliases": [
      {
         "AliasName": "alias/testKey",
         "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
      },
      {
         "AliasName": "alias/FinanceDept",
         "TargetKeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
      },
      {
         "AliasName": "alias/aws/dynamodb",
         "TargetKeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
      }
   ]
}
```
Example 2: To list all aliases for a particular KMS key

The following example uses the list-aliases command and its key-id parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the list-aliases command.

This example uses the key ID of the KMS key for the --key-id parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```json
{
   "Aliases": [
       {
           "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
           "AliasName": "alias/oregon-test-key"
       },
       {
           "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
           "AliasName": "alias/project121-test"
       }
   ]
}
```

For more information, see Working with Aliases in the AWS Key Management Service Developer Guide.

- For API details, see ListAliases in AWS CLI Command Reference.
list-grants

The following code example shows how to use list-grants.

AWS CLI

To view the grants on an AWS KMS key

The following list-grants example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the key-id parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the list-keys or list-aliases command.

```bash
aws kms list-grants \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (DescribeKey) and to retire grants (RetireGrant). The EncryptionContextSubset constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

```json
{
  "Grants": [
    {
      "Constraints": {
        "EncryptionContextSubset": {
          "aws:dynamodb:subscriberId": "123456789012",
          "aws:dynamodb:tableName": "Services"
        }
      },
      "IssuingAccount": "arn:aws:iam::123456789012:root",
      "Name": "8276b9a6-6cf0-46f1-b2f0-7993a7f8c89a",
      "Operations": [
        "Decrypt",
```

Actions and scenarios

4337
For more information, see [Grants in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/Grants.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListGrants](https://docs.aws.amazon.com/cli/latest/reference/kms/list-grants.html) in *AWS CLI Command Reference*.

### list-key-policies

The following code example shows how to use `list-key-policies`.

**AWS CLI**

**To get the names of key policies for a KMS key**

The following `list-key-policies` example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is `default`, this command is not useful.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-key-policies \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```
Output:

```
{
    "PolicyNames": [
        "default"
    ]
}
```

For more information about AWS KMS key policies, see [Using Key Policies in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListKeyPolicies](https://docs.aws.amazon.com/cli/latest/reference/kms/list-key-policies.html) in *AWS CLI Command Reference*.

### list-key-rotations

The following code example shows how to use `list-key-rotations`.

**AWS CLI**

**To retrieve information about all completed key material rotations**

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Rotations": [
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-03-02T10:11:36.564000+00:00",
            "RotationType": "AUTOMATIC"
        },
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-04-05T15:14:47.757000+00:00",
            "RotationType": "ON_DEMAND"
        }
    ]
}
```
For more information, see Rotating keys in the AWS Key Management Service Developer Guide.

- For API details, see ListKeyRotations in AWS CLI Command Reference.

**list-keys**

The following code example shows how to use list-keys.

**AWS CLI**

**To get the KMS keys in an account and Region**

The following list-keys example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```bash
aws kms list-keys
```

**Output:**

```json
{
  "Keys": [
    {
      "KeyArn": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
    },
    {
      "KeyArn": "arn:aws:kms:us-west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
      "KeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
    },
    {
      "KeyArn": "arn:aws:kms:us-east-2:111122223333:key/1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d",
      "KeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
    }
  ]
}
```
For more information, see Viewing Keys in the AWS Key Management Service Developer Guide.

- For API details, see ListKeys in AWS CLI Command Reference.

list-resource-tags

The following code example shows how to use list-resource-tags.

**AWS CLI**

**To get the tags on a KMS key**

The following list-resource-tags example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the tag-resource command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the key-id parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```bash
aws kms list-resource-tags \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "Tags": [
   {
       "TagKey": "Dept",
       "TagValue": "IT"
   },
   {
       "TagKey": "Purpose",
       "TagValue": "Test"
   }
   ],
   "Truncated": false
}
```

For more information about using tags in AWS KMS, see Tagging keys in the AWS Key Management Service Developer Guide.

- For API details, see ListResourceTags in AWS CLI Command Reference.
list-retirable-grants

The following code example shows how to use list-retirable-grants.

AWS CLI

To view the grants that a principal can retire

The following list-retirable-grants example displays all of the grants that the ExampleAdmin user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required `retiring-principal` parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of `retiring-principal` in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the `list-grants` command.

The output shows that ExampleAdmin user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```
aws kms list-retirable-grants \
    --retiring-principal arn:aws:iam::111122223333:user/ExampleAdmin
```

Output:

```json
{
    "Grants": [
        {
            "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "GrantId": "156b69c63cb154aa21f59929ff19760717be8d9d82b99df53e18b94a15a5e88e",
            "Name": "",
            "CreationDate": 2021-01-14T20:17:36.419000+00:00,
            "GranteePrincipal": "arn:aws:iam::111122223333:user/ExampleUser",
            "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::111122223333:root",
            "Operations": [
```
For more information, see [Grants in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/) in the AWS Key Management Service Developer Guide.

**put-key-policy**

The following code example shows how to use `put-key-policy`.

**AWS CLI**

To change the key policy for a KMS key
The following `put-key-policy` example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the `policy` parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```json
{
   "Version" : "2012-10-17",
   "Id" : "key-default-1",
   "Statement" : [
       {
           "Sid" : "Enable IAM User Permissions",
           "Effect" : "Allow",
           "Principal" : {
               "AWS" : "arn:aws:iam::111122223333:root"
           },
           "Action" : "kms:*",
           "Resource" : "*"
       },
       {
           "Sid" : "Allow Use of Key",
           "Effect" : "Allow",
           "Principal" : {
               "AWS" : "arn:aws:iam::111122223333:user/test-user"
           },
           "Action" : [
               "kms:DescribeKey",
               "kms:ListKeys"
           ],
           "Resource" : "*"
       }
   ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy
is in a file, it uses the required file:// prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the policy-name parameter with a value of default. If no policy name is specified, the default value is default. The only valid value is default.

```
aws kms put-key-policy \
   --policy-name default \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the get-key-policy command. The following example command gets the key policy for the same KMS key. The output parameter with a value of text returns a text format that is easy to read.

```
aws kms get-key-policy \
   --policy-name default \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --output text
```

Output:

```
{
   "Version" : "2012-10-17",
   "Id" : "key-default-1",
   "Statement" : [
      {
         "Sid" : "Enable IAM User Permissions",
         "Effect" : "Allow",
         "Principal" : {
            "AWS" : "arn:aws:iam::111122223333:root"
         },
         "Action" : "kms:*",
         "Resource" : "*",
      },
      {
         "Sid" : "Allow Use of Key",
         "Effect" : "Allow",
         "Principal" : {
            "AWS" : "arn:aws:iam::111122223333:user/test-user"
         },
      }
   ]
}
```
For more information, see Changing a Key Policy in the AWS Key Management Service Developer Guide.

- For API details, see PutKeyPolicy in AWS CLI Command Reference.

**re-encrypt**

The following code example shows how to use re-encrypt.

**AWS CLI**

**Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS).**

The following re-encrypt command example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file. In the value of the --ciphertext-blob parameter, use the fileb:// prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the AWS Command Line Interface User Guide and Best Practices for Local File Parameters <https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the AWS Command Line Tool Blog. Specify the source KMS key, which decrypts the ciphertext. The --source-key-id parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Specify the destination KMS key, which re-encrypts the data. The --destination-key-id parameter is always required. This example uses a key ARN, but you can use any valid key identifier. Request the plaintext output as a text value. The --query parameter tells the CLI to get only the value of the Plaintext field from the output. The --output parameter returns the output as text.
the plaintext and save it in a file. The following example pipes (|) the value of the Plaintext parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the ExamplePlaintext file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```bash
aws kms re-encrypt \
   --ciphertext-blob fileb://ExampleEncryptedFile \
   --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
   --query CiphertextBlob \
   --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the `re-encrypt` command is base64-decoded and saved in a file.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html> in the AWS Key Management Service API Reference.

**Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt).**

The following `re-encrypt` command example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms re-encrypt ^
   --ciphertext-blob fileb://ExampleEncryptedFile ^
   --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
   --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 ^
   --query CiphertextBlob ^
   --output text > ExampleReEncryptedFile.base64
```

Then use the `certutil` utility

```bash
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```
Output:

Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html> in the AWS Key Management Service API Reference.

• For API details, see ReEncrypt in AWS CLI Command Reference.

**reire-grant**

The following code example shows how to use retire-grant.

**AWS CLI**

To retire a grant on a customer master key

The following retire-grant example deletes a grant from a KMS key.

The following example command specifies the grant-id and the key-id parameters. The value of the key-id parameter must be the key ARN of the KMS key.

```bash
aws kms retire-grant \
    --grant-id 1234a2345b8a4e350500d432bccc8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was retired, use the list-grants command.

For more information, see Retiring and revoking grants in the AWS Key Management Service Developer Guide.

• For API details, see RetireGrant in AWS CLI Command Reference.

**revoke-grant**

The following code example shows how to use revoke-grant.
**AWS CLI**

**To revoke a grant on a customer master key**

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```bash
aws kms revoke-grant \
  --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see [Retiring and revoking grants](https://docs.aws.amazon.com/kms/latest/developerguide/retiring-grants.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [RevokeGrant](https://docs.aws.amazon.com/cli/latest/reference/kms/revoke-grant.html) in *AWS CLI Command Reference*.

**rotate-key-on-demand**

The following code example shows how to use `rotate-key-on-demand`.

**AWS CLI**

**To perform on-demand rotation of a KMS key**

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```bash
aws kms rotate-key-on-demand \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
  "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
}
```
For more information, see How to perform on-demand key rotation in the AWS Key Management Service Developer Guide.

- For API details, see RotateKeyOnDemand in AWS CLI Command Reference.

schedule-key-deletion

The following code example shows how to use schedule-key-deletion.

AWS CLI

To schedule the deletion of a customer managed KMS key.

The following schedule-key-deletion example schedules the specified customer managed KMS key to be deleted in 15 days.

The --key-id parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The --pending-window-in-days parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```bash
aws kms schedule-key-deletion \
    --key-id arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (PendingWindowInDays), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the PendingDeletion key state cannot be used in cryptographic operations.

```json
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "DeletionDate": "2022-06-18T23:43:51.272000+00:00",
    "KeyState": "PendingDeletion",
    "PendingWindowInDays": 15
}
```

For more information, see Deleting keys in the AWS Key Management Service Developer Guide.
For API details, see ScheduleKeyDeletion in AWS CLI Command Reference.

**sign**

The following code example shows how to use `sign`.

**AWS CLI**

**Example 1: To generate a digital signature for a message**

The following `sign` example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded Signature field that you can verify by using the `verify` command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the `describe-key` command.

In AWS CLI 2.0, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```bash
msg=(echo 'Hello World' | base64)
aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://UnsignedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

**Output:**

```json
{
    "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "Signature": "ABCDEFhpyVYyTxbafe74ccSvEJLJr3zuoV1Hfymz4qv/\nfxmNLb75e1Sf81Hw80fKZz3bJ...",
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```
For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Example 2: To save a digital signature in a file (Linux and macOS)

The following sign example generates a cryptographic signature for a short message stored in a local file. The command also gets the Signature property from the response, Base64-decodes it and saves it in the ExampleSignature file. You can use the signature file in a verify command that verifies the signature.

The sign command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the describe-key command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```bash
echo 'hello world' | base64 > EncodedMessage

aws kms sign \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --message fileb://EncodedMessage \
  --message-type RAW \
  --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
  --output text \
  --query Signature | base64 --decode > ExampleSignature
```

This command produces no output. This example extracts the Signature property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

- For API details, see Sign in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
### AWS CLI

**To add a tag to a KMS key**

The following `tag-resource` example adds "Purpose":"Test" and "Dept":"IT" tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```bash
aws kms tag-resource \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see [Tagging keys](https://docs.aws.amazon.com/kms/latest/developerguide/tagging-keys.html) in the [AWS Key Management Service Developer Guide](https://docs.aws.amazon.com/kms/latest/developerguide/).

**untag-resource**

The following code example shows how to use `untag-resource`.

### AWS CLI

**To delete a tag from a KMS key**

The following `untag-resource` example deletes the tag with the "Purpose" key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms untag-resource \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --tag-key 'Purpose'
```
This command produces no output. To view the tags on an AWS KMS KMS key, use the list-resource-tags command.

For more information about using tags in AWS KMS, see Tagging keys in the AWS Key Management Service Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-alias**

The following code example shows how to use update-alias.

**AWS CLI**

*To associate an alias with a different KMS key*

The following update-alias example associates the alias alias/test-key with a different KMS key.

The --alias-name parameter specifies the alias. The alias name value must begin with alias/. The --target-key-id parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```
aws kms update-alias \
   --alias-name alias/test-key \
   --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To find the alias, use the list-aliases command.

For more information, see Updating aliases in the AWS Key Management Service Developer Guide.

- For API details, see UpdateAlias in AWS CLI Command Reference.

**update-custom-key-store**

The following code example shows how to use update-custom-key-store.

**AWS CLI**

*Example 1: To edit the friendly name of a custom key store*
The following `update-custom-key-store` example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the `custom-key-store-id` to identify the key store. Use the `new-custom-key-store-name` parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the `disconnect-custom-key-store` command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store
  --custom-key-store-id cks-1234567890abcdef0
  --new-custom-key-store-name ExampleKeyStore
```

This command does not return any data. To verify that the command worked, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the AWS Key Management Service Developer Guide.

For more information about updating an external key store, see Editing external key store properties in the AWS Key Management Service Developer Guide.

**Example 2: To edit the kmsuser password of an AWS CloudHSM key store**

The following `update-custom-key-store` example updates the value of the `kmsuser` password to the current password for the `kmsuser` in the CloudHSM cluster associated with the specified key store. This command doesn't change the `kmsuser` password in the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current `kmsuser` password, it cannot connect to the AWS CloudHSM key store.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store
  --custom-key-store-id cks-1234567890abcdef0
  --key-store-password ExamplePassword
```
This command does not return any output. To verify that the change was effective, use a describe-custom-key-stores command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the AWS Key Management Service Developer Guide.

Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store

The following example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the disconnect-custom-key-store command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the connect-custom-key-store command.

```bash
aws kms update-custom-key-store \   
  --custom-key-store-id cks-1234567890abcdef0 \   
  --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command does not return any output. To verify that the change was effective, use a describe-custom-key-stores command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the AWS Key Management Service Developer Guide.

Example 4: To edit the proxy authentication credential of an external key store

The following example updates the proxy authentication credential for your external key store. You must specify both the raw-secret-access-key and the access-key-id, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the describe-custom-key-store command.

```bash
aws kms update-custom-key-store \   
```
This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](https://docs.aws.amazon.com/kms/latest/developerguide/editing-external-key-store-properties.html) in the *AWS Key Management Service Developer Guide*.

**Example 5: To edit the proxy connectivity of an external key store**

The following example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

**NOTE:** Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```bash
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \ 
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \ 
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \ 
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-example"
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](https://docs.aws.amazon.com/kms/latest/developerguide/editing-external-key-store-properties.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UpdateCustomKeyStore](https://docs.aws.amazon.com/cli/latest/reference/kms/update-custom-key-store.html) in *AWS CLI Command Reference*.

**update-key-description**

The following code example shows how to use `update-key-description`.

```bash
aws kms update-key-description \
    --key-id alias/my-key
```

This command does not return any output. To verify that the change was effective, use a `describe-key` command.

For more information about updating a key description, see [Updating a Key Description](https://docs.aws.amazon.com/kms/latest/developerguide/key-management-key-version-update-key-description.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UpdateKeyDescription](https://docs.aws.amazon.com/cli/latest/reference/kms/update-key-description.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

4357
AWS CLI

Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \
  --key-id arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
  --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see [UpdateKeyDescription](https://docs.aws.amazon.com/kms/latest/APIReference/API_UpdateKeyDescription.html) in the [AWS Key Management Service API Reference](https).

Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter with an empty string value (""") deletes the existing description.

```
aws kms update-key-description \
  --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
  --description ''
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see [UpdateKeyDescription](https://docs.aws.amazon.com/kms/latest/APIReference/API_UpdateKeyDescription.html) in the [AWS Key Management Service API Reference](https).
For API details, see UpdateKeyDescription in AWS CLI Command Reference.

verify

The following code example shows how to use verify.

AWS CLI

To verify a digital signature

The following verify example verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message. The signature that you specify cannot be base64-encoded. For help decoding the signature that the sign command returns, see the sign command examples.

The output of the command includes a Boolean SignatureValid field that indicates that the signature was verified. If the signature validation fails, the verify command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms verify \\
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \\
   --message fileb://EncodedMessage \\
   --message-type RAW \\
   --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \\
   --signature fileb://ExampleSignature
```

Output:

```
{
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "SignatureValid": true,
   "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Using asymmetric keys in the AWS Key Management Service Developer Guide.
Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

add-lf-tags-to-resource

The following code example shows how to use add-lf-tags-to-resource.

AWS CLI

To attach one or more LF-tags to an existing resource

The following add-lf-tags-to-resource example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \
   --cli-input-json file://input.json
```

Contents of input.json:

```
{
```
For more information, see Assigning LF-Tags to Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see AddLfTagsToResource in AWS CLI Command Reference.

**batch-grant-permissions**

The following code example shows how to use batch-grant-permissions.

**AWS CLI**

To bulk grant permissions on resources to the principals

The following batch-grant-permissions example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
--cli-input-json file://input.json
```
Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "Entries": [[
        "Id": "1",
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
        },

            "Name": "dl_tpc_promotion"
          }
        },
        "Permissions": [
```

```json
}
```
```
{"failures":[]}
```

For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/lakeformation/latest/dg/grant-revoke-permissions-data-catalog-resources.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [BatchRevokePermissions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/batch-revoke-permissions.html) in *AWS CLI Command Reference*.

**cancel-transaction**

The following code example shows how to use `cancel-transaction`.

```
To cancel a transaction

The following cancel-transaction example cancels the transaction.

```bash
aws lakeformation cancel-transaction \
--transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see CancelTransaction in AWS CLI Command Reference.

commit-transaction

The following code example shows how to use commit-transaction.

AWS CLI

To commit transaction

The following commit-transaction example commits the transaction.

```bash
aws lakeformation commit-transaction \
--transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{
    "TransactionStatus": "committed"
}
```

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see CommitTransaction in AWS CLI Command Reference.
create-data-cells-filter

The following code example shows how to use create-data-cells-filter.

**AWS CLI**

**Example 1: To create data cell filter**

The following `create-data-cells-filter` example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```bash
aws lakeformation create-data-cells-filter
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
  "TableData": {
    "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
    "DatabaseName": "tpc",
    "Name": "developer_promotion",
    "RowFilter": {
      "FilterExpression": "p_promo_name='ese'"
    },
    "TableCatalogId": "123456789111",
    "TableName": "dl_tpc_promotion"
  }
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation](https://docs.aws.amazon.com/lakeformation/latest/dg/data-filtering-cell-level-security.html) in the *AWS Lake Formation Developer Guide*.

**Example 2: To create column filter**

The following `create-data-cells-filter` example creates a data filter to allow one to grant access to certain columns.

```bash
aws lakeformation create-data-cells-filter
  --cli-input-json file://input.json
```

Contents of `input.json`:
This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.

**Example 3: To create data filter with exclude columns**

The following create-data-cells-filter example creates a data filter to allow one to grant access all except the mentioned columns.

```bash
aws lakeformation create-data-cells-filter \ 
   --cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
   "TableData": {
      "ColumnWildcard": {
         "ExcludedColumnNames": ["p_channel_details", "p_start_date_sk"]
      },
      "DatabaseName": "tpc",
      "Name": "developer_promotion_excludecolumn",
      "RowFilter": {
         "AllRowsWildcard": {}
      },
      "TableCatalogId": "123456789111",
      "TableName": "dl_tpc_promotion"
   }
}
```
AWS Command Line Interface

User Guide for Version 2

This command produces no output.
For more information, see Data ﬁltering and cell-level security in Lake Formation in the AWS
Lake Formation Developer Guide.
• For API details, see CreateDataCellsFilter in AWS CLI Command Reference.
create-lf-tag
The following code example shows how to use create-lf-tag.
AWS CLI
To create LF-Tag
The following create-lf-tag example creates an LF-Tag with the speciﬁed name and values.
aws lakeformation create-lf-tag \
--catalog-id '123456789111' \
--tag-key 'usergroup' \
--tag-values '["developer","analyst","campaign"]'

This command produces no output.
For more information, see Managing LF-Tags for metadata access control in the AWS Lake
Formation Developer Guide.
• For API details, see CreateLfTag in AWS CLI Command Reference.
delete-data-cells-filter
The following code example shows how to use delete-data-cells-filter.
AWS CLI
To delete data cell ﬁlter
The following delete-data-cells-filter example deletes given data cell ﬁlter.
aws lakeformation delete-data-cells-filter \
--cli-input-json file://input.json

Contents of input.json:
Actions and scenarios

4369


This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.

- For API details, see DeleteDataCellsFilter in AWS CLI Command Reference.

**delete-lf-tag**

The following code example shows how to use delete-lf-tag.

**AWS CLI**

**To delete LF-Tag definition**

The following delete-lf-tag example deletes LF-Tag definition.

```
aws lakeformation delete-lf-tag
   --catalog-id '123456789111' \
   --tag-key 'usergroup'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.

- For API details, see DeleteLfTag in AWS CLI Command Reference.

**delete-objects-on-cancel**

The following code example shows how to use delete-objects-on-cancel.

**AWS CLI**

**To delete object when transaction is cancelled**
The following `delete-objects-on-cancel` example deletes the listed s3 object when the transaction is cancelled.

```bash
aws lakeformation delete-objects-on-cancel \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "CatalogId": "012345678901",
   "DatabaseName": "tpc",
   "TableName": "dl_tpc_household_demographics_gov",
   "TransactionId": "1234d972ca8347b89825e33c5774aec4",
   "Objects": [{
      "Uri": "s3://lf-data-lake-012345678901/target/dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-ff26b17504414fe88b302cd795eabd00.parquet",
      "ETag": "1234ab1fc50a316b149b4e1f21a73800"
   }]
}
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/AmazonLakeFormation/latest/developerguide/reading-writing-data-lake-transactions.html) in the [AWS Lake Formation Developer Guide](https://docs.aws.amazon.com/AmazonLakeFormation/latest/developerguide/).

deregister-resource

The following code example shows how to use `deregister-resource`.

**AWS CLI**

**To deregister data lake storage**

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```bash
aws lakeformation deregister-resource \
   --cli-input-json file://input.json
```
Contents of input.json:

```json
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the AWS Lake Formation Developer Guide.

- For API details, see DeregisterResource in AWS CLI Command Reference.

describe-transaction

The following code example shows how to use describe-transaction.

AWS CLI

**To retrieve a transaction details**

The following describe-transaction example returns the details of a single transaction.

```bash
aws lakeformation describe-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

Output:

```json
{
    "TransactionDescription": {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    }
}
```

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see DescribeTransaction in AWS CLI Command Reference.
**extend-transaction**

The following code example shows how to use extend-transaction.

**AWS CLI**

To extend a transaction

The following extend-transaction example extends the transaction.

```bash
aws lakeformation extend-transaction \
--transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see ExtendTransaction in AWS CLI Command Reference.

**get-data-lake-settings**

The following code example shows how to use get-data-lake-settings.

**AWS CLI**

To retrieve AWS Lake Formation-managed data lake settings

The following get-data-lake-settings example retrieves the list of data lake administrators and other data lake settings.

```bash
aws lakeformation get-data-lake-settings \
--cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
    "CatalogId": "123456789111"
}
```

Output:
For more information, see Changing the default security settings for your data lake in the AWS Lake Formation Developer Guide.

- For API details, see GetDataLakeSettings in AWS CLI Command Reference.

get-effective-permissions-for-path

The following code example shows how to use get-effective-permissions-for-path.

AWS CLI

To retrieve permissions on resources located at specific path

The following get-effective-permissions-for-path example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.
aws lakeformation get-effective-permissions-for-path \
--cli-input-json file://input.json

Contents of input.json:

{
   "CatalogId": "123456789111",
   "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
}

Output:

{
   "Permissions": [{
      "Principal": {
         "DataLakePrincipalIdentifier": "arn:aws:iам::123456789111:user/lf-campaign-manager"
      },
      "Resource": {
         "Database": {
            "Name": "tpc"
         }
      },
      "Permissions": ["DESCRIBE"],
      "PermissionsWithGrantOption": []
   },
   {
      "Principal": {
         "DataLakePrincipalIdentifier": "arn:aws:iам::123456789111:role/EMR-RuntimeRole"
      },
      "Resource": {
         "Database": {
            "Name": "tpc"
         }
      },
      "Permissions": ["ALL"],
      "PermissionsWithGrantOption": []
   }
}
{,
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:saml-provider/oktaSAMLProvider:user/emr-developer"
  },
  "Resource": {
    "Database": {
      "Name": "tpc"
    }
  },
  "Permissions": [
    "ALL",
    "DESCRIBE"
  ],
  "PermissionsWithGrantOption": []
},
{
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
  },
  "Resource": {
    "Database": {
      "Name": "tpc"
    }
  },
  "Permissions": [
    "ALL",
    "ALTER",
    "CREATE_TABLE",
    "DESCRIBE",
    "DROP"
  ],
  "PermissionsWithGrantOption": [
    "ALL",
    "ALTER",
    "CREATE_TABLE",
    "DESCRIBE",
    "DROP"
  ]
},
For more information, see [Managing Lake Formation permissions](https://docs.aws.amazon.com/lakeformation/latest/dg/lakeformation-manage-lf-permissions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetEffectivePermissionsForPath](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-effective-permissions-for-path.html) in *AWS CLI Command Reference*.

### get-lf-tag

The following code example shows how to use `get-lf-tag`.

**AWS CLI**

**To retrieve LF-tag definition**

The following `get-lf-tag` example retrieves LF-tag definition.

```
aws lakeformation get-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

**Output:**

```
{
    "CatalogId": "123456789111",
    "TagKey": "usergroup",
    "TagValues": [
```
"analyst",
"campaign",
"developer"
]
}

For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.

- For API details, see GetLfTag in AWS CLI Command Reference.

get-query-state

The following code example shows how to use get-query-state.

AWS CLI

To retrieve state of a submitted query

The following get-query-state example returns the state of a query previously submitted.

```bash
aws lakeformation get-query-state \
--query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```json
{
  "State": "FINISHED"
}
```

For more information, see Transactional data operations in the AWS Lake Formation Developer Guide.

- For API details, see GetQueryState in AWS CLI Command Reference.

get-query-statistics

The following code example shows how to use get-query-statistics.

AWS CLI

To retrieve query statistics
The following `get-query-statistics` example retrieves statistics on the planning and execution of a query.

```bash
aws lakeformation get-query-statistics \
--query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```json
{
  "ExecutionStatistics": {
    "AverageExecutionTimeMillis": 0,
    "DataScannedBytes": 0,
    "WorkUnitsExecutedCount": 0
  },
  "PlanningStatistics": {
    "EstimatedDataToScanBytes": 43235,
    "PlanningTimeMillis": 2377,
    "QueueTimeMillis": 440,
    "WorkUnitsGeneratedCount": 1
  },
  "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"
}
```

For more information, see [Transactional data operations](https://docs.aws.amazon.com/lakeformation/latest/dg/transactional-data-operations.html) in the *AWS Lake Formation Developer Guide*.

### get-resource-lf-tags

The following code example shows how to use `get-resource-lf-tags`.

**AWS CLI**

**To list LF-tags**

The following `list-lf-tags` example returns list of LF-tags that the requester has permission to view.

```bash
aws lakeformation list-lf-tags \
--cli-input-json file://input.json
```
Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "ResourceShareType": "ALL",
    "MaxResults": 2
}
```

Output:

```json
{
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "category",
        "TagValues": [
            "private",
            "public"
        ]
    },
    {
        "CatalogId": "123456789111",
        "TagKey": "group",
        "TagValues": [
            "analyst",
            "campaign",
            "developer"
        ]
    }]
},

"NextToken": "kIwIiZXhwaXJhdGlvbI6eyJzZWNvbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
}
```

For more information, see [Managing LF-Tags for metadata access control](https://docs.aws.amazon.com/AmazonLakeFormation/latest/DeveloperGuide/lf-tags.html) in the AWS Lake Formation Developer Guide.

**get-table-objects**

The following code example shows how to use `get-table-objects`.

**AWS CLI**

To list objects of governed table
The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```bash
aws lakeformation get-table-objects \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
  "CatalogId": "012345678901",
  "DatabaseName": "tpc",
  "TableName": "dl_tpc_household_demographics_gov",
  "QueryAsOfTime": "2022-08-10T15:00:00"
}
```

Output:

```json
{
  "Objects": [
    {
      "PartitionValues": [],
      "Objects": [
        {
          "Uri": "s3://lf-data-lake-012345678901/target/dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-ff26b1750414fe88b502cd795eab00.parquet",
          "ETag": "123456b350a316b149b4e1f21a73800",
          "Size": 43235
        }
      ]
    }
  ]
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetTableObjects](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-table-objects.html) in *AWS CLI Command Reference*.

---

**get-work-unit-results**

The following code example shows how to use `get-work-unit-results`.

**AWS CLI**

To retrieve work units of given query
The following `get-work-unit-results` example returns the work units resulting from the query.

```
aws lakeformation get-work-units \\
   --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b' \\
   --work-unit-id '0' \\
   --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

Output:

```
outfile with Blob content.
```

For more information, see [Transactional data operations](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetWorkUnitResults](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-work-units.html) in *AWS CLI Command Reference*.

### get-work-units

The following code example shows how to use `get-work-units`.

**AWS CLI**

**To retrieve work units**

The following `get-work-units` example retrieves the work units generated by the `StartQueryPlanning` operation.

```
aws lakeformation get-work-units \\
   --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
   "WorkUnitRanges": [
      {
         "WorkUnitIdMax": 0,
         "WorkUnitIdMin": 0,
         "WorkUnitToken":
         "1234eMAk4kL04umqEL4Z5WuxL04AXwABABVhd3MtY335cHRvLXB1YmxpYy1rZXkAREEwYm9QbkhINmFYTWphbmMxZWhf88jzGrYq22gE6jQ4pOL0B
         +0et2eqNufAAAfjB8BbgkqhkkiG9w0BBwagbzBtAgEAMGgGCSqG5Ib3DQEHAeBglghkgBZQMEAS4wEQMCOEWRd
```
grant-permissions

The following code example shows how to use grant-permissions.

AWS CLI

Example 1: To grant permissions to the principal on resources using LF-Tags

The following grant-permissions example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions \\
   --cli-input-json file://input.json
```

Contents of input.json:

```
{
   "CatalogId": "123456789111",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
   },
   "Resource": {
      "LFTagPolicy": {
         "CatalogId": "123456789111",
         "ResourceType": "DATABASE",
         "Expression": [{
```
This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

Example 2: To grant column level permissions to the principal

The following grant-permissions example grants permission to select specific column to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "TableWithColumns": {
            "CatalogId": "123456789111",
            "ColumnNames": ["p_end_date_sk"],
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    }
}
```
This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/lakeformation/latest/developerguide/permissions-on-data-catalog-resources.html) in the *AWS Lake Formation Developer Guide*.

**Example 3: To grant table permissions to the principal**

The following `grant-permissions` example grants select permission on all tables of given database to the principal.

```bash
cat input.json
```

```json
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "TableWildcard": {}
    }
  },
  "Permissions": [
    "SELECT"
  ],
  "PermissionsWithGrantOption": []
}
```

This command produces no output.
For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/lakeformation/latest/dg/permissions.html) in the *AWS Lake Formation Developer Guide*.

**Example 4: To grant permissions on LF-Tags to the principal**

The following `grant-permissions` example grants associate permission on LF-Tags to the principal.

```bash
aws lakeformation grant-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private",
                "public"
            ]
        }
    },
    "Permissions": [
        "ASSOCIATE"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/lakeformation/latest/dg/permissions.html) in the *AWS Lake Formation Developer Guide*.

**Example 5: To grant permissions on data locations to the principal**

The following `grant-permissions` example grants permission on data location to the principal.
aws lakeformation grant-permissions \
   --cli-input-json file://input.json

Contents of input.json:

{
   "CatalogId": "123456789111",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
   },
   "Resource": {
      "DataLocation": {
         "CatalogId": "123456789111",
         "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
      }
   },
   "Permissions": [
      "DATA_LOCATION_ACCESS"
   ],
   "PermissionsWithGrantOption": []
}

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see GrantPermissions in AWS CLI Command Reference.

list-data-cells-filter

The following code example shows how to use list-data-cells-filter.

AWS CLI

To list data cell filters

The following list-data-cells-filter example list data cell filter for given table.

aws lakeformation list-data-cells-filter \
   --cli-input-json file://input.json
Contents of input.json:

```
{
    "MaxResults": 2,
    "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "tpc",
        "Name": "dl_tpc_promotion"
    }
}
```

Output:

```
{
    "DataCellsFilters": [{
        "TableCatalogId": "123456789111",
        "DatabaseName": "tpc",
        "TableName": "dl_tpc_promotion",
        "Name": "developer_promotion",
        "RowFilter": {
            "FilterExpression": "p_promo_name='ese'"
        },
        "ColumnNames": [
            "p_channel_details",
            "p_start_date_sk",
            "p_purpose",
            "p_promo_id",
            "p_promo_name",
            "p_end_date_sk",
            "p_discount_active"
        ]
    },
    {
        "TableCatalogId": "123456789111",
        "DatabaseName": "tpc",
        "TableName": "dl_tpc_promotion",
        "Name": "developer_promotion_allrows",
        "RowFilter": {
            "FilterExpression": "TRUE",
            "AllRowsWildcard": {}  
        },
        "ColumnNames": [
            "p_channel_details",
            "p_promo_name",
            "p_end_date_sk",
            "p_discount_active"
        ]
    }
}
```
For more information, see [Data filtering and cell-level security in Lake Formation](https://docs.aws.amazon.com/lakeformation/latest/dg/data-filtering-cell-level-security.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListDataCellsFilter](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/list-data-cells-filter.html) in *AWS CLI Command Reference*.

### list-permissions

The following code example shows how to use `list-permissions`.

**AWS CLI**

**Example 1: To retrieve list of principal permissions on the resource**

The following `list-permissions` example returns a list of principal permissions on the database resources.

```bash
cat input.json
```

```json
{
    "CatalogId": "123456789111",
    "ResourceType": "DATABASE",
    "MaxResults": 2
}
```

**Output:**

```json
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-campaign-manager"
        }
    },
```
For more information, see Managing Lake Formation permissions in the AWS Lake Formation Developer Guide.

**Example 2: To retrieve list of principal permissions on the table with data filters**

The following list-permissions example list the permissions on the table with related data filters granted to the principal.

```bash
aws lakeformation list-permissions \n    --cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_customer"
        }
    },
    "IncludeRelated": "TRUE",
    "MaxResults": 10
}
```
Output:

```json
{
   "PrincipalResourcePermissions": [{
      "Principal": {
         "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/Admin"
      },
      "Resource": {
         "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "customer",
            "Name": "customer_invoice"
         }
      },
      "Permissions": [
         "ALL",
         "ALTER",
         "DELETE",
         "DESCRIBE",
         "DROP",
         "INSERT"
      ],
      "PermissionsWithGrantOption": [
         "ALL",
         "ALTER",
         "DELETE",
         "DESCRIBE",
         "DROP",
         "INSERT"
      ]
   },
   {  
      "Principal": {  
         "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/Admin"
      },
      "Resource": {  
         "TableWithColumns": {  
            "CatalogId": "123456789111",
            "DatabaseName": "customer",
            "Name": "customer_invoice",
            "ColumnWildcard": {}
         }
      }
   }
}
```
For more information, see Managing Lake Formation permissions in the AWS Lake Formation Developer Guide.

Example 3: To retrieve list of principal permissions on the LF-Tags

The following list-permissions example list the permissions on the LF-Tags granted to the principal.

```bash
aws lakeformation list-permissions --cli-input-json file://input.json
```
Contents of input.json:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": ["private"
        ]
    },
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
        },
        "Resource": {
            "LFTag": {
                "CatalogId": "123456789111",
                "TagKey": "category",
                "TagValues": ["*
            ]
        },
        "Permissions": [
            "DESCRIBE"
        ],
        "PermissionsWithGrantOption": [
            "DESCRIBE"
        ]
    },
    {
        "Principal": {
```
"DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin",
  "Resource": {
    "LFTag": {
      "CatalogId": "123456789111",
      "TagKey": "category",
      "TagValues": [
        "*
      ]
    }},
  "Permissions": [
    "ASSOCIATE"
  ],
  "PermissionsWithGrantOption": [
    "ASSOCIATE"
  ]
}]
"NextToken": "EJwY21GMGFXOXVJanA3SW5Ocm1pc3Npb25zIjpmYWxzZX0="

For more information, see [Managing Lake Formation permissions](https://docs.aws.amazon.com/lakeformation/latest/dg/permissions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListPermissions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/list-permissions.html) in *AWS CLI Command Reference*.

### list-resources

The following code example shows how to use `list-resources`.

**AWS CLI**

To lists the resources managed by the Lake Formation

The following `list-resources` example lists the resources matching the condition that is managed by the Lake Formation.

```
aws lakeformation list-resources \
  --cli-input-json file://input.json
```

Contents of `input.json`:
AWS Command Line Interface

User Guide for Version 2

```
{
    "FilterConditionList": [{
        "Field": "ROLE_ARN",
        "ComparisonOperator": "CONTAINS",
        "StringValueList": [
            "123456789111"
        ]
    }],
    "MaxResults": 10
}
```

Output:

```
{
    "ResourceInfoList": [
        {
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
            "LastModified": "2022-07-21T02:12:46.669000+00:00"
        },
        {
            "ResourceArn": "arn:aws:s3:::lf-emr-test-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
            "LastModified": "2022-07-29T16:22:03.211000+00:00"
        }
    ]
}
```

For more information, see Managing Lake Formation permissions in the AWS Lake Formation Developer Guide.

- For API details, see ListResources in AWS CLI Command Reference.

**list-transactions**

The following code example shows how to use list-transactions.

**AWS CLI**

**To list all transactions details**

The following list-transactions example returns metadata about transactions and their status.
aws lakeformation list-transactions \
--cli-input-json file://input.json

Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "StatusFilter": "ALL",
    "MaxResults": 3
}
```

Output:

```json
{
    "Transactions": [{
        "TransactionId": "1234569f08804cb790d950d4d0fe485e",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",
        "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"
    },
    {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    },
    {
        "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",
        "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"
    }
],
    "NextToken": "77X1ebypsi7os+x21hHsZLGncDK3nNGpwRdpicSOHgcX1/7MoniUAKcpR3kj3ts3PVdMA=="
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/devguide/transactions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListTransactions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/list-transactions.html) in *AWS CLI Command Reference*. 

Actions and scenarios 4396
put-data-lake-settings

The following code example shows how to use put-data-lake-settings.

AWS CLI

To set AWS Lake Formation-managed data lake settings

The following put-data-lake-settings example sets the list of data lake administrators and other data lake settings.

```bash
aws lakeformation put-data-lake-settings \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
  "DataLakeSettings": {
    "DataLakeAdmins": [{
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    }],
    "CreateDatabaseDefaultPermissions": [],
    "CreateTableDefaultPermissions": [],
    "TrustedResourceOwners": [],
    "AllowExternalDataFiltering": true,
    "ExternalDataFilteringAllowList": [{
      "DataLakePrincipalIdentifier": "123456789111"
    }],
    "AuthorizedSessionTagValueList": ["Amazon EMR"]
  }
}
```

This command produces no output.

For more information, see [Changing the default security settings for your data lake](https://docs.aws.amazon.com/lakeformation/latest/dg/default-security-settings.html) in the AWS Lake Formation Developer Guide.

register-resource

The following code example shows how to use register-resource.

AWS CLI

Example 1: To register data lake storage using Service Linked Role

The following register-resource example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \\
   --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
   "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
   "UseServiceLinkedRole": true
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the AWS Lake Formation Developer Guide.

Example 2: To register data lake storage using custom role

The following register-resource example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \\
   --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
   "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
   "UseServiceLinkedRole": false,
   "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole"
}
```
This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the AWS Lake Formation Developer Guide.

- For API details, see RegisterResource in AWS CLI Command Reference.

**remove-lf-tags-from-resource**

The following code example shows how to use remove-lf-tags-from-resource.

**AWS CLI**

**To remove LF-Tag from a resource**

The following remove-lf-tags-from-resource example removes the LF-Tag association with the table resource.

```
aws lakeformation remove-lf-tags-from-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [
        {
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }
    ]
}
```

Output:
For more information, see Assigning LF-Tags to Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see RemoveLfTagsFromResource in AWS CLI Command Reference.

revoke-permissions

The following code example shows how to use revoke-permissions.

AWS CLI

To revoke permissions on resources from the principal

The following revoke-permissions example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
   --cli-input-json file://input.json
```

Contents of input.json:

```
{
   "CatalogId": "123456789111",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
   },
   "Resource": {
      "Table": {
         "CatalogId": "123456789111",
         "DatabaseName": "tpc",
         "Name": "dl_tpc_promotion"
      }
   },
   "Permissions": [
      "ALL"
   ],
   "PermissionsWithGrantOption": []
}
```
This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see RevokePermissions in AWS CLI Command Reference.

**search-databases-by-lf-tags**

The following code example shows how to use search-databases-by-lf-tags.

**AWS CLI**

**To search on database resources by LFTags**

The following search-databases-by-lf-tags example search on database resources matching LFTag expression.

```
aws lakeformation search-databases-by-lf-tags \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "MaxResults": 1,
   "CatalogId": "123456789111",
   "Expression": [
      {
         "TagKey": "usergroup",
         "TagValues": [
            "developer"
         ]
      }
   ]
}
```

Output:

```json
{
   "DatabaseList": [
      {
         "CatalogId": "123456789111",
         "Name": "tpc"
      }
   ]
}
```
For more information, see Viewing the resources that a LF-Tag is assigned to in the AWS Lake Formation Developer Guide.

- For API details, see SearchDatabasesByLfTags in AWS CLI Command Reference.

**search-tables-by-lf-tags**

The following code example shows how to use search-tables-by-lf-tags.

**AWS CLI**

To search on table resources by LFTags

The following search-tables-by-lf-tags example search on table resources matching LFTag expression.

```bash
aws lakeformation search-tables-by-lf-tags \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
  "MaxResults": 2,
  "CatalogId": "123456789111",
  "Expression": [
    {
      "TagKey": "usergroup",
      "TagValues": [ "developer"
    }
  ]
}
```
Output:

```json
{
    "NextToken": "c2VhcmNoQWxsVGFnQ0luVGFibGVzIjpmYWxzZX0=",
    "TableList": [{
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_item"
        },
        "LFTagOnDatabase": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnTable": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnColumns": [{
            "Name": "i_item_desc",
            "LFTags": [{
                "CatalogId": "123456789111",
                "TagKey": "usergroup",
                "TagValues": [
                    "developer"
                ]
            }],
            "Name": "i_container",
            "LFTags": [{
                "CatalogId": "123456789111",
                "TagKey": "usergroup",
                "TagValues": [
                    "developer"
                ]
            }]
        }]
    }
}
```

```json
{
    "Name": "i_wholesale_cost",
    "LFTags": [{
        "CatalogId": "123456789111",

### start-query-planning

The following code example shows how to use `start-query-planning`.

**AWS CLI**

To process query statement

The following `start-query-planning` example submits a request to process a query statement.
aws lakeformation start-query-planning \
   --cli-input-json file://input.json

Contents of input.json:

```json
{
   "QueryPlanningContext": {
      "CatalogId": "012345678901",
      "DatabaseName": "tpc"
   },
   "QueryString": "select * from dl_tpc_household_demographics_gov where hd_income_band_sk=9"
}
```

Output:

```json
{
   "QueryId": "772a273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the [AWS Lake Formation Developer Guide](https).

- For API details, see [StartQueryPlanning](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/start-query-planning.html) in *AWS CLI Command Reference*.

**start-transaction**

The following code example shows how to use start-transaction.

**AWS CLI**

**To start new transaction**

The following start-transaction example starts a new transaction and returns its transaction ID.

```bash
aws lakeformation start-transaction \
   --transaction-type = 'READ_AND_WRITE'
```

Output:
AWS Command Line Interface

User Guide for Version 2

{
"TransactionId": "b014d972ca8347b89825e33c5774aec4"
}

For more information, see Reading from and writing to the data lake within transactions in the
AWS Lake Formation Developer Guide.
• For API details, see StartTransaction in AWS CLI Command Reference.
update-lf-tag
The following code example shows how to use update-lf-tag.
AWS CLI
To update LF-Tag deﬁnition
The following update-lf-tag example updates LF-Tag deﬁnition.
aws lakeformation update-lf-tag \
--catalog-id '123456789111' \
--tag-key 'usergroup' \
--tag-values-to-add '["admin"]'

This command produces no output.
For more information, see Managing LF-Tags for metadata access control in the AWS Lake
Formation Developer Guide.
• For API details, see UpdateLfTag in AWS CLI Command Reference.
update-table-objects
The following code example shows how to use update-table-objects.
AWS CLI
To modify objects of governed table
The following update-table-objects example adds provided S3 objects to the speciﬁed
governed table.
Actions and scenarios

4410


aws lakeformation update-table-objects \
   --cli-input-json file://input.json

Contents of input.json:

```
{
   "CatalogId": "012345678901",
   "DatabaseName": "tpc",
   "TableName": "dl_tpc_household_demographics_gov",
   "TransactionId": "12347a9f75424b9b915f6ff201d2a190",
   "WriteOperations": [
      {
         "AddObject": {
            "Uri": "s3://lf-data-lake-012345678901/target/dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "1234ab1fc50a316b149b4e1f21a73800",
            "Size": 42200
         }
      }
   ]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see UpdateTableObjects in AWS CLI Command Reference.

Lambda examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- Actions

Actions

add-layer-version-permission

The following code example shows how to use `add-layer-version-permission`.

**AWS CLI**

To add permissions to a layer version

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```
aws lambda add-layer-version-permission \
   --layer-name my-layer \
   --statement-id xaccount \
   --action lambda:GetLayerVersion \
   --principal 123456789012 \
   --version-number 1
```

Output:

```
{
    "RevisionId": "35d87451-f796-4a3f-a618-95a3671b0a0c",
    "Statement": 
    {
        "Sid":"xaccount",
        "Effect":"Allow",
        "Principal":{
            "AWS":"arn:aws:iam::210987654321:root"
        },
        "Action":"lambda:GetLayerVersion",
    }
}
```

For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/layer-structure.html) in the *AWS Lambda Developer Guide*. 

Actions and scenarios
**add-permission**

The following code example shows how to use `add-permission`.

**AWS CLI**

To add permissions to an existing Lambda function

The following add-permission example grants the Amazon SNS service permission to invoke a function named `my-function`.

```bash
aws lambda add-permission \
    --function-name my-function \
    --action lambda:InvokeFunction \
    --statement-id sns \
    --principal sns.amazonaws.com
```

Output:

```json
{
    "Statement": {
        "Sid": "sns",
        "Effect": "Allow",
        "Principal": {
            "Service": "sns.amazonaws.com"
        },
        "Action": "lambda:InvokeFunction",
    }
}
```

**create-alias**

The following code example shows how to use `create-alias`.

• For API details, see [AddLayerVersionPermission](https://docs.aws.amazon.com/cli/latest/reference/lambda/add-layer-version-permission.html) in *AWS CLI Command Reference*.

• For API details, see [AddPermission](https://docs.aws.amazon.com/cli/latest/reference/lambda/add-permission.html) in *AWS CLI Command Reference*.
AWS CLI

To create an alias for a Lambda function

The following create-alias example creates an alias named LIVE that points to version 1 of the my-function Lambda function.

```
aws lambda create-alias \
  --function-name my-function \
  --description "alias for live version of function" \
  --function-version 1 \
  --name LIVE
```

Output:

```
{
    "FunctionVersion": "1",
    "Name": "LIVE",
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see CreateAlias in AWS CLI Command Reference.

create-event-source-mapping

The following code example shows how to use create-event-source-mapping.

AWS CLI

To create a mapping between an event source and an AWS Lambda function

The following create-event-source-mapping example creates a mapping between an SQS queue and the my-function Lambda function.

```
aws lambda create-event-source-mapping \
  --function-name my-function \
```
Output:

```json
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Creating",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see [AWS Lambda Event Source Mapping](https://docs.aws.amazon.com/lambda/latest/dg/using-eventsources.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).

- For API details, see [CreateEventSourceMapping](https://docs.aws.amazon.com/cli/latest/reference/lambda/create-event-source-mapping.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/lambda/).

### create-function

The following code example shows how to use create-function.

#### AWS CLI

To create a Lambda function

The following create-function example creates a Lambda function named my-function.

```bash
aws lambda create-function \
    --function-name my-function \
    --runtime nodejs18.x \
    --zip-file fileb://my-function.zip \
    --handler my-function.handler \
    --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of my-function.zip:

This file is a deployment package that contains your function code and any dependencies.
Output:

```json
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "PFn4S+er27qk+UuZSTKEQfNKG/XNN7QJs90mJgg6oH8=",
    "FunctionName": "my-function",
    "CodeSize": 308,
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "MemorySize": 128,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-zgur6bf4",
    "Timeout": 3,
    "LastModified": "2023-10-14T22:26:11.234+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs18.x",
    "Description": ""
}
```

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-create-function.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/)

- For API details, see [CreateFunction](https://docs.aws.amazon.com/cli/latest/reference/lambda/create-function.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/lambda/)

### delete-alias

The following code example shows how to use `delete-alias`.

**AWS CLI**

**To delete an alias of a Lambda function**

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```
aws lambda delete-alias \
    --function-name my-function \
    --name LIVE
```
This command produces no output.

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.

**delete-event-source-mapping**

The following code example shows how to use delete-event-source-mapping.

**AWS CLI**

To delete the mapping between an event source and an AWS Lambda function

The following delete-event-source-mapping example deletes the mapping between an SQS queue and the my-function Lambda function.

```bash
aws lambda delete-event-source-mapping \
   --uuid a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
   "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
   "StateTransitionReason": "USER_INITIATED",
   "LastModified": 1569285870.271,
   "BatchSize": 5,
   "State": "Deleting",
   "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.

- For API details, see DeleteEventSourceMapping in AWS CLI Command Reference.

**delete-function-concurrency**

The following code example shows how to use delete-function-concurrency.
AWS CLI

To remove the reserved concurrent execution limit from a function

The following delete-function-concurrency example deletes the reserved concurrent execution limit from the my-function function.

```bash
aws lambda delete-function-concurrency \
   --function-name  my-function
```

This command produces no output.

For more information, see Reserving Concurrency for a Lambda Function in the AWS Lambda Developer Guide.

- For API details, see DeleteFunctionConcurrency in AWS CLI Command Reference.

delete-function-event-invoke-config

The following code example shows how to use delete-function-event-invoke-config.

AWS CLI

To delete an asynchronous invocation configuration

The following delete-function-event-invoke-config example deletes the asynchronous invocation configuration for the GREEN alias of the specified function.

```bash
aws lambda delete-function-event-invoke-config --function-name my-function:GREEN
```

- For API details, see DeleteFunctionEventInvokeConfig in AWS CLI Command Reference.

delete-function

The following code example shows how to use delete-function.

AWS CLI

Example 1: To delete a Lambda function by function name

The following delete-function example deletes the Lambda function named my-function by specifying the function's name.
aws lambda delete-function \
--function-name my-function

This command produces no output.

**Example 2: To delete a Lambda function by function ARN**

The following delete-function example deletes the Lambda function named my-function by specifying the function's ARN.

aws lambda delete-function \

This command produces no output.

**Example 3: To delete a Lambda function by partial function ARN**

The following delete-function example deletes the Lambda function named my-function by specifying the function's partial ARN.

aws lambda delete-function \
--function-name 123456789012:function:my-function

This command produces no output.

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration.html) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteFunction](https://docs.aws.amazon.com/cli/latest/reference/lambda/delete-function.html) in *AWS CLI Command Reference*.

**delete-layer-version**

The following code example shows how to use delete-layer-version.

**AWS CLI**

**To delete a version of a Lambda layer**

The following delete-layer-version example deletes version 2 of the layer named my-layer.
This command produces no output.

For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/developer-guide) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteLayerVersion](https://docs.aws.amazon.com/cli/latest/reference/lambda/delete-layer-version.html) in *AWS CLI Command Reference*.

### delete-provisioned-concurrency-config

The following code example shows how to use `delete-provisioned-concurrency-config`.

**AWS CLI**

**To delete a provisioned concurrency configuration**

The following `delete-provisioned-concurrency-config` example deletes the provisioned concurrency configuration for the GREEN alias of the specified function.

```
aws lambda delete-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier GREEN
```

- For API details, see [DeleteProvisionedConcurrencyConfig](https://docs.aws.amazon.com/cli/latest/reference/lambda/delete-provisioned-concurrency-config.html) in *AWS CLI Command Reference*.

### get-account-settings

The following code example shows how to use `get-account-settings`.

**AWS CLI**

**To retrieve details about your account in an AWS Region**

The following `get-account-settings` example displays the Lambda limits and usage information for your account.

```
aws lambda get-account-settings
```

**Output:**
For more information, see AWS Lambda Limits in the AWS Lambda Developer Guide.

- For API details, see GetAccountSettings in AWS CLI Command Reference.

**get-alias**

The following code example shows how to use get-alias.

**AWS CLI**

To retrieve details about a function alias

The following get-alias example displays details for the alias named LIVE on the my-function Lambda function.

```bash
aws lambda get-alias \
   --function-name my-function \
   --name LIVE
```

Output:

```json
{
   "FunctionVersion": "3",
   "Name": "LIVE",
   "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
   "Description": "alias for live version of function"
}
```
get-event-source-mapping

The following code example shows how to use get-event-source-mapping.

AWS CLI

To retrieve details about an event source mapping

The following get-event-source-mapping example displays the details for the mapping between an SQS queue and the my-function Lambda function.

```bash
aws lambda get-event-source-mapping
  --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```json
{
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
  "StateTransitionReason": "USER_INITIATED",
  "LastModified": 1569284520.333,
  "BatchSize": 5,
  "State": "Enabled",
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.

- For API details, see GetEventSourceMapping in AWS CLI Command Reference.

get-function-concurrency

The following code example shows how to use get-function-concurrency.
AWS CLI

To view the reserved concurrency setting for a function

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```bash
aws lambda get-function-concurrency \
  --function-name my-function
```

Output:

```json
{
    "ReservedConcurrentExecutions": 250
}
```

- For API details, see [GetFunctionConcurreny](aws cli command reference) in *AWS CLI Command Reference*.

get-function-configuration

The following code example shows how to use `get-function-configuration`.

AWS CLI

To retrieve the version-specific settings of a Lambda function

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```bash
aws lambda get-function-configuration \
  --function-name my-function:2
```

Output:

```json
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
```
"Runtime": "nodejs10.x",
"TracingConfig": {
  "Mode": "PassThrough"
},
"CodeSha256": "5tT2qgzYUHaqwR716pZ2dPKn/0J1FrzJm1KioaCgk=",
"Description": "",
"VpcConfig": {
  "SubnetIds": [],
  "VpcId": "",
  "SecurityGroupIds": []
},
"CodeSize": 304,
"Handler": "index.handler"
}

For more information, see [AWS Lambda Function Configuration](#) in the [AWS Lambda Developer Guide](#).

- For API details, see [GetFunctionConfiguration](#) in [AWS CLI Command Reference](#).

**get-function-eventinvoke-config**

The following code example shows how to use `get-function-event-invoke-config`.

**AWS CLI**

**To view an asynchronous invocation configuration**

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the BLUE alias of the specified function.

```bash
aws lambda get-function-event-invoke-config --function-name my-function:BLUE
```

**Output:**

```json
{
  "LastModified": 1577824396.653,
  "MaximumRetryAttempts": 0,
  "MaximumEventAgeInSeconds": 3600,
}
```
"DestinationConfig": {
  "OnSuccess": {},
  "OnFailure": {
    "Destination": "arn:aws:sqs:us-east-2:123456789012:failed-invocations"
  }
}

- For API details, see GetFunctionEventInvokeConfig in AWS CLI Command Reference.

get-function

The following code example shows how to use get-function.

**AWS CLI**

**To retrieve information about a function**

The following get-function example displays information about the my-function function.

```bash
aws lambda get-function \
  --function-name my-function
```

**Output:**

```json
{
  "Concurrency": {
    "ReservedConcurrentExecutions": 100
  },
  "Code": {
    "RepositoryType": "S3",
    "Location": "https://awslambda-us-west-2-tasks.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-function..."
  },
  "Configuration": {
    "TracingConfig": {
      "Mode": "PassThrough"
    },
    "Version": "$LATEST",

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-parameters.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).

### get-layer-version-by-arn

The following code example shows how to use `get-layer-version-by-arn`.

**AWS CLI**

**To retrieve information about a Lambda layer version**

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```bash
aws lambda get-layer-version-by-arn \
```

**Output:**

```json
{
}```
For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/layer-overview.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/layer-overview.html).

### get-layer-version-policy

The following code example shows how to use get-layer-version-policy.

#### AWS CLI

**To retrieve the permissions policy for a Lambda layer version**

The following `get-layer-version-policy` example displays policy information about version 1 for the layer named `my-layer`.

```
aws lambda get-layer-version-policy \
  --layer-name my-layer \
  --version-number 1
```

**Output:**

```
{

```
"Policy": {
   "Version":"2012-10-17",
   "Id":"default",
   "Statement": [
   {
      "Sid":"xaccount",
      "Effect":"Allow",
      "Principal": {"AWS":"arn:aws:iam::123456789012:root"},
      "Action":"lambda:GetLayerVersion",
   }
   ],
   "RevisionId": "c68f21d2-cbf0-4026-90f6-1375ee465cd0"
}

For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/layer-howto.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/layer-howto.html).

**get-layer-version**

The following code example shows how to use get-layer-version.

**AWS CLI**

To retrieve information about a Lambda layer version

The following get-layer-version example displays information for version 1 of the layer named my-layer.

```
aws lambda get-layer-version \
   --layer-name my-layer \
   --version-number 1
```

Output:

```
{
   "Content": {
      "Location": "https://awslambda-us-east-2-layers.s3.us-east-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
versionId=27iWyA73cCAyqyH...",
```
get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve the resource-based IAM policy for a function, version, or alias

The following get-policy example displays policy information about the my-function Lambda function.

```bash
aws lambda get-policy \
  --function-name my-function
```

Output:

```json
{
  "Policy": {
    "Version": "2012-10-17",
    "Id": "default",
    "Statement": [
      {
        "Sid": "iot-events",
```
For more information, see Using Resource-based Policies for AWS Lambda in the AWS Lambda Developer Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

get-provisioned-concurrency-config

The following code example shows how to use get-provisioned-concurrency-config.

AWS CLI

To view a provisioned concurrency configuration

The following get-provisioned-concurrency-config example displays details for the provisioned concurrency configuration for the BLUE alias of the specified function.

```bash
aws lambda get-provisioned-concurrency-config \
  --function-name my-function \
  --qualifier BLUE
```

Output:

```json
{
  "RequestedProvisionedConcurrentExecutions": 100,
  "AvailableProvisionedConcurrentExecutions": 100,
  "AllocatedProvisionedConcurrentExecutions": 100,
  "Status": "READY",
  "LastModified": "2019-12-31T20:28:49+0000"
}
```

- For API details, see GetProvisionedConcurrencyConfig in AWS CLI Command Reference.
invoke

The following code example shows how to use invoke.

AWS CLI

Example 1: To invoke a Lambda function synchronously

The following invoke example invokes the my-function function synchronously. The cli-binary-format option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the AWS Command Line Interface User Guide.

```
aws lambda invoke \
    --function-name my-function \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "ExecutedVersion": "$LATEST",
    "StatusCode": 200
}
```

For more information, see Synchronous Invocation in the AWS Lambda Developer Guide.

Example 2: To invoke a Lambda function asynchronously

The following invoke example invokes the my-function function asynchronously. The cli-binary-format option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the AWS Command Line Interface User Guide.

```
aws lambda invoke \
    --function-name my-function \
    --invocation-type Event \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```
Output:

```json
{
    "StatusCode": 202
}
```

For more information, see [Asynchronous Invocation](#) in the AWS Lambda Developer Guide.

- For API details, see [Invoke](#) in AWS CLI Command Reference.

### list-aliases

The following code example shows how to use `list-aliases`.

#### AWS CLI

**To retrieve the list of aliases for a Lambda function**

The following `list-aliases` example displays a list of the aliases for the `my-function` Lambda function.

```
aws lambda list-aliases \
    --function-name my-function
```

Output:

```json
{
    "Aliases": [
        {
            "RevisionId": "a410117f-ab16-494e-8035-7e204bb7933b",
            "FunctionVersion": "2",
            "Name": "BETA",
            "Description": "alias for beta version of function"
        },
        {
            "RevisionId": "21d40116-f8b1-40ba-9360-3ea284da1bb5",
            "FunctionVersion": "1",
            "Name": "LIVE",
            "Description": "alias for live version of function"
        }
    ]
}
```
For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see ListAliases in AWS CLI Command Reference.

**list-event-source-mappings**

The following code example shows how to use list-event-source-mappings.

AWS CLI

To list the event source mappings for a function

The following list-event-source-mappings example displays a list of the event source mappings for the my-function Lambda function.

```bash
aws lambda list-event-source-mappings \\
--function-name my-function
```

Output:

```
{
   "EventSourceMappings": [
      {
        "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "StateTransitionReason": "USER_INITIATED",
        "LastModified": 1569284520.333,
        "BatchSize": 5,
        "State": "Enabled",
        "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
      }
   ]
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.
For API details, see `ListEventSourceMappings` in *AWS CLI Command Reference*.

**list-function-event-invoke-configs**

The following code example shows how to use `list-function-event-invoke-configs`.

**AWS CLI**

**To view a list of asynchronous invocation configurations**

The following `list-function-event-invoke-configs` example lists the asynchronous invocation configurations for the specified function.

```
aws lambda list-function-event-invoke-configs \\
   --function-name my-function
```

**Output:**

```json
{
   "FunctionEventInvokeConfigs": [
      {
         "LastModified": 1577824406.719,
         "MaximumRetryAttempts": 2,
         "MaximumEventAgeInSeconds": 1800
      },
      {
         "LastModified": 1577824396.653,
         "MaximumRetryAttempts": 0,
         "MaximumEventAgeInSeconds": 3600
      }
   ]
}
```

For API details, see `ListFunctionEventInvokeConfigs` in *AWS CLI Command Reference*.

**list-functions**

The following code example shows how to use `list-functions`.

```
aws lambda list-functions
```

**Output:**

```
{
   "Functions": [
      {
         "FunctionName": "my-function",
         "LastModified": 1577824406.719,
         "Role": "arn:aws:iam::123456789012:role/lambda-role",
         "Handler": "index.handler",
         "Runtime": "nodejs14.x",
         "Timeout": 3,
         "MemorySize": 128
      },
      {
         "FunctionName": "my-function:BLUE",
         "LastModified": 1577824396.653,
         "Role": "arn:aws:iam::123456789012:role/lambda-role",
         "Handler": "index.handler",
         "Runtime": "nodejs14.x",
         "Timeout": 3,
         "MemorySize": 128
      }
   ]
}
```
AWS CLI

To retrieve a list of Lambda functions

The following list-functions example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```
{
   "Functions": [
    {
        "TracingConfig": {
            "Mode": "PassThrough"
        },

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-execution-environment.html) in the *AWS Lambda Developer Guide*.

- For API details, see [ListFunctions](https://docs.aws.amazon.com/cli/latest/reference/lambda/list-functions.html) in *AWS CLI Command Reference*.

### list-layer-versions

The following code example shows how to use `list-layer-versions`.

**AWS CLI**

**To list the versions of an AWS Lambda layer**

The following `list-layers-versions` example displays information about the versions for the layer named `my-layer`.

```bash
aws lambda list-layer-versions \
   --layer-name my-layer
```

**Output:**

```
{
   "Layers": [
      {
         "Version": 2,
         "Description": "My layer",
         "CreatedDate": "2023-11-15T00:37:46.592+0000",
         "CompatibleRuntimes": [ "python3.10",
      ...
```
For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/lambda-layers.html) in the *AWS Lambda Developer Guide*.

- For API details, see `ListLayerVersions` in *AWS CLI Command Reference*.

### list-layers

The following code example shows how to use `list-layers`.

**AWS CLI**

To list the layers that are compatible with your function's runtime

The following `list-layers` example displays information about layers that are compatible with the Python 3.11 runtime.

```bash
aws lambda list-layers \
  --compatible-runtime python3.11
```

**Output:**

```json
{
  "Layers": [
    {
      "LayerName": "my-layer",
      "LatestMatchingVersion": {
        "Version": 2,
        "Description": "My layer",
        "CreatedDate": "2023-11-15T00:37:46.592+0000",
        "CompatibleRuntimes": [
          "python3.10",
          "python3.11"
        ]
      }
    }
  ]
}
```
For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

- For API details, see ListLayers in AWS CLI Command Reference.

**list-provisioned-concurrency-configs**

The following code example shows how to use list-provisioned-concurrency-configs.

**AWS CLI**

**To get a list of provisioned concurrency configurations**

The following list-provisioned-concurrency-configs example lists the provisioned concurrency configurations for the specified function.

```bash
aws lambda list-provisioned-concurrency-configs \
   --function-name my-function
```

**Output:**

```json
{
   "ProvisionedConcurrencyConfigs": [
      {
         "RequestedProvisionedConcurrentExecutions": 100,
         "AvailableProvisionedConcurrentExecutions": 100,
         "AllocatedProvisionedConcurrentExecutions": 100,
         "Status": "READY",
         "LastModified": "2019-12-31T20:29:00+0000"
      },
      {
         "RequestedProvisionedConcurrentExecutions": 100,
         "AvailableProvisionedConcurrentExecutions": 100,
         "AllocatedProvisionedConcurrentExecutions": 100,
         "Status": "READY",
         "LastModified": "2019-12-31T20:28:49+0000"
      }
   ]
}
```
list-tags

The following code example shows how to use list-tags.

AWS CLI

To retrieve the list of tags for a Lambda function

The following list-tags example displays the tags attached to the my-function Lambda function.

```
aws lambda list-tags \
```

Output:

```
{
   "Tags": {
      "Category": "Web Tools",
      "Department": "Sales"
   }
}
```

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

• For API details, see ListTags in AWS CLI Command Reference.

list-versions-by-function

The following code example shows how to use list-versions-by-function.

AWS CLI

To retrieve a list of versions of a function

The following list-versions-by-function example displays the list of versions for the my-function Lambda function.
aws lambda list-versions-by-function \
--function-name my-function

Output:

```json
{
"Versions": [
{
"TracingConfig": {
"Mode": "PassThrough"
},
"Version": "$LATEST",
"CodeSha256": "sU0cJ2/hOZevwV/1TxCuQqK3gDZP3i8gUoqUUVrMcY6E=",
"FunctionName": "my-function",

]
For more information, see `Configuring AWS Lambda Function Aliases` in the *AWS Lambda Developer Guide*.

- For API details, see `ListVersionsByFunction` in *AWS CLI Command Reference*.

**publish-layer-version**

The following code example shows how to use `publish-layer-version`.

### AWS CLI

**To create a Lambda layer version**

The following `publish-layer-version` example creates a new Python library layer version. The command retrieves the layer content a file named `layer.zip` in the specified S3 bucket.

```
aws lambda publish-layer-version \
   --layer-name my-layer \
   --description "My Python layer" \
   --license-info "MIT" \
   --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \
   --compatible-runtimes python3.10 python3.11
```

**Output:**

```
{
   "Content": {
      "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
       snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
       versionId=27iWyA73cCAyqyH...",
      "CodeSha256": "tv9jJ0+rPbXUUXuRKi7CwHzKtLDkDRLB3cC3Z/ouXo=",
      "CodeSize": 169
   },
   "Description": "My Python layer",
   "CreatedDate": "2023-11-14T23:03:52.894+0000",
   "Version": 1,
   "LicenseInfo": "MIT",
   "CompatibleRuntimes": [
      "python3.10",
      "python3.11"
   ]
}
```
For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

* For API details, see PublishLayerVersion in AWS CLI Command Reference.

```
publish-version

The following code example shows how to use publish-version.

AWS CLI

**To publish a new version of a function**

The following publish-version example publishes a new version of the my-function Lambda function.

```
aws lambda publish-version \\
  --function-name my-function
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "dBG9m8SGdm1Ejw/JYX1hhvCrAv5TvxXsbL/RMz0fT/I=",
    "FunctionName": "my-function",
    "CodeSize": 294,
    "RevisionId": "f31d3d39-cc63-4520-97d4-43cd44c94c20",
    "MemorySize": 128,
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-zgur6bf4",
    "Timeout": 3,
    "LastModified": "2019-09-23T18:32:33.857+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs10.x",
    "Description": ""
}
```
For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see PublishVersion in AWS CLI Command Reference.

put-function-concurrency

The following code example shows how to use put-function-concurrency.

AWS CLI

To configure a reserved concurrency limit for a function

The following put-function-concurrency example configures 100 reserved concurrent executions for the my-function function.

```bash
aws lambda put-function-concurrency \
  --function-name my-function \
  --reserved-concurrent-executions 100
```

Output:

```json
{
  "ReservedConcurrentExecutions": 100
}
```

For more information, see Reserving Concurrency for a Lambda Function in the AWS Lambda Developer Guide.

- For API details, see PutFunctionConcurrency in AWS CLI Command Reference.

put-function-event-invoke-config

The following code example shows how to use put-function-event-invoke-config.

AWS CLI

To configure error handling for asynchronous invocation

The following put-function-event-invoke-config example sets a maximum event age of one hour and disables retries for the specified function.
aws lambda put-function-event-invoke-config \
  --function-name my-function \
  --maximum-event-age-in-seconds 3600 \
  --maximum-retry-attempts 0

Output:

```
{
   "LastModified": 1573686021.479,
   "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
$LATEST",
   "MaximumRetryAttempts": 0,
   "MaximumEventAgeInSeconds": 3600,
   "DestinationConfig": {
      "OnSuccess": {},
      "OnFailure": {}
   }
}
```

• For API details, see [PutFunctionEventInvokeConfig](aws-cli-command-reference) in *AWS CLI Command Reference*.

### put-provisioned-concurrency-config

The following code example shows how to use `put-provisioned-concurrency-config`.

#### AWS CLI

**To allocate provisioned concurrency**

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the BLUE alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \
  --function-name my-function \
  --qualifier BLUE \
  --provisioned-concurrent-executions 100
```

Output:

```
{
   "Requested ProvisionedConcurrentExecutions": 100,
```
For API details, see `PutProvisionedConcurrencyConfig` in *AWS CLI Command Reference*.

remove-layer-version-permission

The following code example shows how to use `remove-layer-version-permission`.

**AWS CLI**

To delete layer-version permissions

The following `remove-layer-version-permission` example deletes permission for an account to configure a layer version.

```
aws lambda remove-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --version-number 1
```

This command produces no output.

For more information, see *AWS Lambda Layers* in the *AWS Lambda Developer Guide*.

For API details, see `RemoveLayerVersionPermission` in *AWS CLI Command Reference*.

remove-permission

The following code example shows how to use `remove-permission`.

**AWS CLI**

To remove permissions from an existing Lambda function

The following `remove-permission` example removes permission to invoke a function named `my-function`.

```
aws lambda remove-permission \
    --function-name my-function \
```
This command produces no output.

For more information, see Using Resource-based Policies for AWS Lambda in the AWS Lambda Developer Guide.

- For API details, see RemovePermission in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to an existing Lambda function

The following tag-resource example adds a tag with the key name DEPARTMENT and a value of Department A to the specified Lambda function.

```
aws lambda tag-resource \
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
  --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from an existing Lambda function

The following untag-resource example removes the tag with the key name DEPARTMENT tag from the my-function Lambda function.

```
aws lambda untag-resource \
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
```
This command produces no output.

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-alias

The following code example shows how to use update-alias.

AWS CLI

To update a function alias

The following update-alias example updates the alias named LIVE to point to version 3 of the my-function Lambda function.

```bash
aws lambda update-alias \
    --function-name my-function \
    --function-version 3 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see UpdateAlias in AWS CLI Command Reference.

update-event-source-mapping

The following code example shows how to use update-event-source-mapping.
AWS CLI

To update the mapping between an event source and an AWS Lambda function

The following `update-event-source-mapping` example updates the batch size to 8 in the specified mapping.

```bash
aws lambda update-event-source-mapping \
    --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --batch-size 8
```

Output:

```json
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 8,
    "State": "Updating",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see [AWS Lambda Event Source Mapping](https://docs.aws.amazon.com/lambda/latest/dg/eventsources.html) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateEventSourceMapping](https://docs.aws.amazon.com/cli/latest/reference/lambda/update-event-source-mapping.html) in *AWS CLI Command Reference*.

**update-function-code**

The following code example shows how to use `update-function-code`.

AWS CLI

To update the code of a Lambda function

The following `update-function-code` example replaces the code of the unpublished ($LATEST) version of the `my-function` function with the contents of the specified zip file.

```bash
aws lambda update-function-code \
    --function-name my-function
```
--zip-file fileb://my-function.zip

Output:

```json
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "Handler": "index.handler"
}
```

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-update.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).

### update-function-configuration

The following code example shows how to use update-function-configuration.

#### AWS CLI

**To modify the configuration of a function**

The following update-function-configuration example modifies the memory size to be 256 MB for the unpublished ($LATEST) version of the my-function function.
aws lambda update-function-configuration \
    --function-name my-function \ 
    --memory-size 256

Output:

```json
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKIdWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "Handler": "index.handler"
}
```

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-update.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).  

**update-function-event-invoke-config**

The following code example shows how to use `update-function-event-invoke-config`.

**AWS CLI**

To update an asynchronous invocation configuration
The following update-function-event-involve-config example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```bash
aws lambda update-function-event-involve-config \
  --function-name my-function \
```

Output:

```json
{
    "LastModified": 1573687896.493,
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:destination"
        }
    }
}
```

- For API details, see [UpdateFunctionEventInvokeConfig](#) in AWS CLI Command Reference.

**License Manager examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- **Actions**

**Actions**

**create-license-configuration**

The following code example shows how to use `create-license-configuration`.

**AWS CLI**

**Example 1: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```bash
aws license-manager create-license-configuration --name my-license-configuration \
    --license-counting-type Core \
    --license-count 10 \
    --license-count-hard-limit
```

**Output:**

```json
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE1111"
}
```

**Example 2: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```bash
aws license-manager create-license-configuration --name my-license-configuration \
    --license-counting-type vCPU \
    --license-count 100 \
    --license-rules "#honorVcpuOptimization=true"
```

**Output:**

```json
{
}
```
```json
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE2222"
}
```

- For API details, see [CreateLicenseConfiguration](#) in *AWS CLI Command Reference*.

**delete-license-configuration**

The following code example shows how to use `delete-license-configuration`.

**AWS CLI**

**To delete a license configuration**

The following `delete-license-configuration` example deletes the specified license configuration.

```bash
aws license-manager delete-license-configuration \
```

This command produces no output.

- For API details, see [DeleteLicenseConfiguration](#) in *AWS CLI Command Reference*.

**get-license-configuration**

The following code example shows how to use `get-license-configuration`.

**AWS CLI**

**To get license configuration information**

The following `get-license-configuration` example displays details for the specified license configuration.

```bash
aws license-manager get-license-configuration \
```
Output:

```json
{
    "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
    "Name": "my-license-configuration",
    "LicenseCountingType": "vCPU",
    "LicenseRules": [],
    "LicenseCountHardLimit": false,
    "ConsumedLicenses": 0,
    "Status": "AVAILABLE",
    "OwnerAccountId": "123456789012",
    "ConsumedLicenseSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "ConsumedLicenses": 0
        }
    ],
    "ManagedResourceSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_AMI",
            "AssociationCount": 2
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "AssociationCount": 0
        }
    ]
}
```
get-service-settings

The following code example shows how to use get-service-settings.

AWS CLI

To get the License Manager settings

The following get-service-settings example displays the service settings for License Manager in the current Region.

```bash
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

```json
{
   "OrganizationConfiguration": {
      "EnableIntegration": false
   },
   "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

```json
{
   "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-bb",
   "OrganizationConfiguration": {
      "EnableIntegration": true
   },
   "EnableCrossAccountsDiscovery": true
}
```

For API details, see `GetLicenseConfiguration` in AWS CLI Command Reference.

For API details, see `GetServiceSettings` in AWS CLI Command Reference.
list-associations-for-license-configuration

The following code example shows how to use list-associations-for-license-configuration.

AWS CLI

To get associations for a license configuration

The following list-associations-for-license-configuration example displays detailed information for the associations of the specified license configuration.

```
aws license-manager list-associations-for-license-configuration \
```

Output:

```
{
   "LicenseConfigurationAssociations": [ 
   {
      "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
      "ResourceType": "EC2_AMI",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1568825118.617
   },
   {
      "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
      "ResourceType": "EC2_AMI",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1568825118.946
   }
   ]
}
```

- For API details, see ListAssociationsForLicenseConfiguration in AWS CLI Command Reference.

list-license-configurations

The following code example shows how to use list-license-configurations.
Example 1: To list all of your license configurations

The following `list-license-configurations` example lists all your license configurations.

```bash
aws license-manager list-license-configurations
```

Output:

```json
{
   "LicenseConfigurations": [
      {
         "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
         "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
         "Name": "my-license-configuration",
         "LicenseCountingType": "Core",
         "LicenseRules": [],
         "LicenseCount": 10,
         "LicenseCountHardLimit": true,
         "ConsumedLicenses": 0,
         "Status": "AVAILABLE",
         "OwnerAccountId": "123456789012",
         "ConsumedLicenseSummaryList": [
            {
               "ResourceType": "EC2_INSTANCE",
               "ConsumedLicenses": 0
            },
            {
               "ResourceType": "EC2_HOST",
               "ConsumedLicenses": 0
            },
            {
               "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
               "ConsumedLicenses": 0
            }
         ],
         "ManagedResourceSummaryList": [
            {
               "ResourceType": "EC2_INSTANCE",
               "AssociationCount": 0
            }
         ]
      }
   ]
}
```
Example 2: To list a specific license configuration

The following `list-license-configurations` example lists only the specified license configuration.

```
aws license-manager list-license-configurations \
```

- For API details, see `ListLicenseConfigurations` in AWS CLI Command Reference.

list-license-specifications-for-resource

The following code example shows how to use `list-license-specifications-for-resource`.

AWS CLI

To list the license configurations for a resource

The following `list-license-specifications-for-resource` example lists the license configurations associated with the specified Amazon Machine Image (AMI).
aws license-manager list-license-specifications-for-resource \
   --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0

Output:

{
   "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"
}

• For API details, see ListLicenseSpecificationsForResource in AWS CLI Command Reference.

list-resource-inventory

The following code example shows how to use list-resource-inventory.

AWS CLI

To list resources in the resource inventory

The following list-resource-inventory example lists the resources managed using Systems Manager inventory.

aws license-manager list-resource-inventory

Output:

{
   "ResourceInventoryList": [
   
   { 
      "Platform": "Red Hat Enterprise Linux Server",
      "ResourceType": "EC2Instance",
      "PlatformVersion": "7.4",
      "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/i-05d3cdfb05bd36376",
      "ResourceId": "i-05d3cdfb05bd36376",
      "ResourceOwningAccountId": "1234567890129"
   },
   
   { 
      "Platform": "Amazon Linux",
      "ResourceType": "EC2Instance",
      "PlatformVersion": "7.7",
      "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/i-05d3cdfb05bd36376",
      "ResourceId": "i-05d3cdfb05bd36376",
      "ResourceOwningAccountId": "1234567890129"
   }
   
   ]
}
For API details, see [ListResourceInventory](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/license-manager/list-resource-inventory.html) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a license configuration**

The following `list-tags-for-resource` example lists the tags for the specified license configuration.

```bash
aws license-manager list-tags-for-resource \
```

**Output:**

```json
{
    "Tags": [
        {
```
For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

```
list-usage-for-license-configuration
```

The following code example shows how to use `list-usage-for-license-configuration`.

**AWS CLI**

To list the licenses in use for a license configuration

The following `list-usage-for-license-configuration` example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```
aws license-manager list-usage-for-license-configuration \
```

Output:

```
{
   "LicenseConfigurationUsageList": [
      {
         "ResourceType": "EC2_INSTANCE",
         "ResourceStatus": "running",
         "ResourceOwnerId": "123456789012",
         "AssociationTime": 1570892850.519,
         "ConsumedLicenses": 2
      }
   ]
}
```

For API details, see [ListUsageForLicenseConfiguration](#) in *AWS CLI Command Reference*.
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag a license configuration**

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \\
   --tags Key=project,Value=lima \\
```

This command produces no output.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/license-manager/tag-resource.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a license configuration**

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \\
   --tag-keys project \\
```

This command produces no output.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/license-manager/untag-resource.html) in *AWS CLI Command Reference*.

**update-license-configuration**

The following code example shows how to use `update-license-configuration`.
AWS CLI

To update a license configuration

The following update-license-configuration example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \
   --no-license-count-hard-limit \
   --license-configuration-arn arn:aws:license-manager:us-west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

The following update-license-configuration example updates the specified license configuration to change its status to DISABLED.

```
aws license-manager update-license-configuration \
   --license-configuration-status DISABLED \
   --license-configuration-arn arn:aws:license-manager:us-west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see UpdateLicenseConfiguration in AWS CLI Command Reference.

update-license-specifications-for-resource

The following code example shows how to use update-license-specifications-for-resource.

AWS CLI

To update the license configurations for a resource

The following update-license-specifications-for-resource example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \
   --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \
```
This command produces no output.

- For API details, see `UpdateLicenseSpecificationsForResource` in *AWS CLI Command Reference*.

**update-service-settings**

The following code example shows how to use `update-service-settings`.

**AWS CLI**

**To update the License Manager settings**

The following `update-service-settings` example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
  --organization-configuration EnableIntegration=true \
  --enable-cross-accounts-discovery \
  --s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

- For API details, see `UpdateServiceSettings` in *AWS CLI Command Reference*.

**Lightsail examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**allocate-static-ip**

The following code example shows how to use `allocate-static-ip`.

**AWS CLI**

**To create a static IP**

The following `allocate-static-ip` example creates the specified static IP, which can be attached to an instance.

```bash
aws lightsail allocate-static-ip \
   --static-ip-name StaticIp-1
```

**Output:**

```json
{
   "operations": [
      {
         "id": "b5d06d13-2f19-4683-889f-dEXAMPLEed79",
         "resourceName": "StaticIp-1",
         "resourceType": "StaticIp",
         "createdAt": 1571071325.076,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationType": "AllocateStaticIp",
         "status": "Succeeded",
         "statusChangedAt": 1571071325.274
      }
   ]
}
```
For API details, see `AllocateStaticIp` in *AWS CLI Command Reference*.

### attach-disk

The following code example shows how to use `attach-disk`.

#### AWS CLI

**To attach a block storage disk to an instance**

The following `attach-disk` example attaches disk Disk-1 to instance WordPress_Multisite-1 with the disk path of `/dev/xvdf`

```bash
aws lightsail attach-disk \
  --disk-name Disk-1 \
  --disk-path /dev/xvdf \
  --instance-name WordPress_Multisite-1
```

**Output:**

```
{
  "operations": [ 
    {
      "id": "10a08267-19ce-43be-b913-6EXAMPLE7e80",
      "resourceName": "Disk-1",
      "resourceType": "Disk",
      "createdAt": 1571071465.472,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,

      "status": "Started",
      "statusChangedAt": 1571071465.472
    },
    {
      "id": "2912c477-5295-4539-88c9-bEXAMPLEd1f0",
      "resourceName": "WordPress_Multisite-1",
      "resourceType": "Instance",
      "createdAt": 1571071465.474,
      "location": {
```

Actions and scenarios
attach-instances-to-load-balancer

The following code example shows how to use attach-instances-to-load-balancer.

AWS CLI

To attach instances to a load balancer

The following attach-instances-to-load-balancer example attaches instances MEAN-1, MEAN-2, and MEAN-3 to the load balancer LoadBalancer-1.

```bash
aws lightsail attach-instances-to-load-balancer \
  --instance-names MEAN-1,MEAN-2,MEAN-3 \
  --load-balancer-name LoadBalancer-1
```

Output:

```json
{
  "operations": [
    {
      "id": "8055d19d-abb2-40b9-b527-1EXAMPLE3c7b",
      "resourceName": "LoadBalancer-1",
      "resourceType": "LoadBalancer",
      "createdAt": 1571071699.892,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      ...
    }
  ]
}
```

- For API details, see AttachDisk in AWS CLI Command Reference.

attach-load-balancer-tls-certificate

The following code example shows how to use attach-load-balancer-tls-certificate.

AWS CLI

To attach a TLS certificate to a load balancer

The following attach-load-balancer-tls-certificate example attaches the load balancer TLS certificate Certificate2 to the load balancer LoadBalancer-1.

```
aws lightsail attach-load-balancer-tls-certificate \
  --certificate-name Certificate2 \
  --load-balancer-name LoadBalancer-1
```

Output:

```
{
  "operations": [
    {
      "id": "cf1ad6e3-3cbb-4b8a-a7f2-3EXAMPLEa118",

    }
  ]
}
```
attach-static-ip

The following code example shows how to use attach-static-ip.

AWS CLI

To attach a static IP to an instance

The following attach-static-ip example attaches static IP StaticIp-1 to instance MEAN-1.

```bash
aws lightsail attach-static-ip \
  --static-ip-name StaticIp-1 \
  --instance-name MEAN-1
```

Output:

```
{
  "operations": [
    {
      "id": "45e6fa13-4808-4b8d-9292-EXAMPLE20b2",
      "resourceName": "StaticIp-1",

      "statusChangedAt": 1571072555.416
    }
  ]
}
```

- For API details, see [AttachLoadBalancerTlsCertificate](#) in [AWS CLI Command Reference](#).

Actions and scenarios
For API details, see [AttachStaticIp](https://awscli.amazonaws.com/v2/documentation/api/current/reference/service/lightsail.html#lightsail-api-attach-static-ip) in *AWS CLI Command Reference*.

### close-instance-public-ports

The following code example shows how to use `close-instance-public-ports`.

**AWS CLI**

#### To close firewall ports for an instance

The following `close-instance-public-ports` example closes TCP port 22 on instance MEAN-2.

```bash
aws lightsail close-instance-public-ports \   --instance-name MEAN-2 \   --port-info fromPort=22,protocol=TCP,toPort=22
```

**Output:**

```json
{
  "operation": {
  
  }
}
```
For API details, see `CloseInstancePublicPorts` in *AWS CLI Command Reference*.

**copy-snapshot**

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**Example 1: To copy a snapshot within the same AWS Region**

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-Copy` within the same AWS Region `us-west-2`.

```bash
code
aws lightsail copy-snapshot \
   --source-snapshot-name MEAN-1-1571075291 \
   --target-snapshot-name MEAN-1-Copy \
   --source-region us-west-2
```

Output:

```json
code
{
   "operations": [
      {
         "id": "ced16fc1-f401-4556-8d82-1EXAMPLEb982",
         "resourceName": "MEAN-1-Copy",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1571072845.737,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "22/tcp",
         "operationType": "CloseInstancePublicPorts",
         "status": "Succeeded",
         "statusChangedAt": 1571072845.737
      }
   ]
}
```
For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](https://lightsail.aws.amazon.com/AmazonLightsail续约版/docs/lightsail_copying-regional-snapshots.html) in the *Lightsail Dev Guide*.

**Example 2: To copy a snapshot from one AWS Region to another**

The following `copy-snapshot` example copies instance snapshot MEAN-1-1571075291 as instance snapshot MEAN-1-1571075291-Copy from AWS Region us-west-2 to us-east-1.

```bash
aws lightsail copy-snapshot
   --source-snapshot-name MEAN-1-1571075291
   --target-snapshot-name MEAN-1-1571075291-Copy
   --source-region us-west-2
   --region us-east-1
```

**Output:**

```json
{
   "operations": [
      {
         "id": "91116b79-119c-4451-b44a-dEXAMPLEd97b",
         "resourceName": "MEAN-1-1571075291-Copy",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1571075695.069,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-east-1"
         },
         "isTerminal": false,
         "operationDetails": "us-west-2:MEAN-1-1571075291",
         "status": "Started",
         "statusChangedAt": 1571075581.498
      }
   ]
}
```
"operationType": "CopySnapshot",
"status": "Started",
"statusChangedAt": 1571075695.069
}
]
}

For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](https://lightsail.aws.amazon.com/developerguide/snapshot-copy.html) in the *Lightsail Dev Guide*.

**Example 3: To copy an automatic snapshot within the same AWS Region**

```
aws lightsail copy-snapshot \
   --source-resource-name WordPress-1 \
   --restore-date 2019-10-14 \
   --target-snapshot-name WordPress-1-10142019 \
   --source-region us-west-2
```

Output:

```
{
   "operations": [
      {
         "id": "be3e6754-cd1d-48e6-ad9f-2EXAMPLE1805",
         "resourceName": "WordPress-1-10142019",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1571082412.311,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationDetails": "us-west-2:WordPress-1",
         "operationType": "CopySnapshot",
         "status": "Started",
         "statusChangedAt": 1571082412.311
      }
   ]
}
```
For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the Lightsail Dev Guide.

Example 4: To copy an automatic snapshot from one AWS Region to another

The following copy-snapshot example copies automatic snapshot 2019-10-14 of instance WordPress-1 as a manual snapshot WordPress-1-10142019 from the AWS Region us-west-2 to us-east-1.

```bash
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```json
{
    "operations": [
        {
            "id": "dffa128b-0b07-476e-b390-bEXAMPLE3775",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082493.422,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082493.422
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the Lightsail Dev Guide.

- For API details, see CopySnapshot in AWS CLI Command Reference.
create-disk-from-snapshot

The following code example shows how to use create-disk-from-snapshot.

AWS CLI

To create a disk from a disk snapshot

The following create-disk-from-snapshot example creates a block storage disk named Disk-2 from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```bash
aws lightsail create-disk-from-snapshot \
   --disk-name Disk-2 \
   --disk-snapshot-name Disk-1-1566839161 \
   --availability-zone us-west-2a \
   --size-in-gb 32
```

Output:

```
{
   "operations": [
     {
       "id": "d42b605d-5ef1-4b4a-8791-7a3e8b66b5e7",
       "resourceName": "Disk-2",
       "resourceType": "Disk",
       "createdAt": 1569624941.471,
       "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
       },
       "isTerminal": false,
       "operationType": "CreateDiskFromSnapshot",
       "status": "Started",
       "statusChangedAt": 1569624941.791
     }
   ]
}
```

For more information, see Creating a block storage disk from a snapshot in Amazon Lightsail in the Lightsail Developer Guide.

- For API details, see CreateDiskFromSnapshot in AWS CLI Command Reference.
create-disk-snapshot

The following code example shows how to use create-disk-snapshot.

AWS CLI

Example 1: To create a snapshot of a disk

The following create-disk-snapshot example creates a snapshot named DiskSnapshot-1 of the specified block storage disk.

```bash
aws lightsail create-disk-snapshot \\
   --disk-name Disk-1 \\
   --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
   "operations": [
       {
           "id": "fa74c6d2-03a3-4f42-a7c7-792f124d534b",
           "resourceName": "DiskSnapshot-1",
           "resourceType": "DiskSnapshot",
           "createdAt": 1569625129.739,
           "location": {
               "availabilityZone": "all",
               "regionName": "us-west-2"
           },
           "isTerminal": false,
           "operationDetails": "Disk-1",
           "operationType": "CreateDiskSnapshot",
           "status": "Started",
           "statusChangedAt": 1569625129.739
       },
       {
           "id": "920a25df-185c-4528-87cd-7b85f5488c06",
           "resourceName": "Disk-1",
           "resourceType": "Disk",
           "createdAt": 1569625129.739,
           "location": {
               "availabilityZone": "us-west-2a",
               "regionName": "us-west-2"
           }
       }
   ]
}
```
Example 2: To create a snapshot of an instance's system disk

The following `create-disk-snapshot` example creates a snapshot of the specified instance's system disk.

```bash
aws lightsail create-disk-snapshot
  --instance-name WordPress-1
  --disk-snapshot-name SystemDiskSnapshot-1
```

Output:

```json
{
  "operations": [
    {
      "id": "f508cf1c-6597-42a6-a4c3-4aebd75af0d9",
      "resourceName": "SystemDiskSnapshot-1",

      "createdAt": 1569625294.685,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      }
    }
  ]
}
```
"availabilityZone": "us-west-2a",
"regionName": "us-west-2"
},
"isTerminal": false,
"operationDetails": "SystemDiskSnapshot-1",
"operationType": "CreateDiskSnapshot",
"status": "Started",
"statusChangedAt": 1569625294.685
}
]
}

For more information, see Snapshots in Amazon Lightsail and Creating a snapshot of an instance root volume in Amazon Lightsail in the Lightsail Developer Guide.

- For API details, see CreateDiskSnapshot in AWS CLI Command Reference.

**create-disk**

The following code example shows how to use create-disk.

**AWS CLI**

**To create a block storage disk**

The following create-disk example creates a block storage disk Disk-1 in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk
   --disk-name Disk-1
   --availability-zone us-west-2a
   --size-in-gb 32
```

**Output:**

```
{
   "operations": [
      {
        "id": "1c85e2ec-86ba-4697-b936-77f4d3dc013a",
        "resourceName": "Disk-1",
        "resourceType": "Disk",
        "createdAt": 1569449220.36,
        "location": {
```
For API details, see CreateDisk in AWS CLI Command Reference.

create-domain-entry

The following code example shows how to use create-domain-entry.

AWS CLI

To create a domain entry (DNS record)

The following create-domain-entry example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

Note: Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the --region us-east-1 parameter or the command fails.

```bash
aws lightsail create-domain-entry
   --region us-east-1
   --domain-name example.com
   --domain-entry name=example.com,type=A,target=192.0.2.0
```

Output:

```json
{
   "operation": {
      "id": "5be4494d-56f4-41fc-8730-693dcd0ef9e2",
      "resourceName": "example.com",
      "resourceType": "Domain",
      "createdAt": 1569865296.519,
      "createdAt": 1569865296.519,
      "location": {
```
For more information, see [DNS in Amazon Lightsail](#) and [Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateDomainEntry](#) in *AWS CLI Command Reference*.

**create-domain**

The following code example shows how to use `create-domain`.

**AWS CLI**

**To create a domain (DNS zone)**

The following `create-domain` example creates a DNS zone for the specified domain.

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```bash
aws lightsail create-domain \
    --region us-east-1 \
    --domain-name example.com
```

**Output:**

```json
{
    "operation": {
        "id": "64e522c8-9ae1-4c05-9b65-3f237324dc34",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569864291.92,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        }
    },
    "isTerminal": true,
    "operationType": "CreateDomainEntry",
    "status": "Succeeded",
    "statusChangedAt": 1569865296.519
}
```
"regionName": "global",
"isTerminal": true,
"operationType": "CreateDomain",
"status": "Succeeded",
"statusChangedAt": 1569864292.109
}
}

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the Lightsail Developer Guide.

- For API details, see CreateDomain in AWS CLI Command Reference.

create-instance-snapshot

The following code example shows how to use create-instance-snapshot.

AWS CLI

To create a snapshot of an instance

The following create-instance-snapshot example creates a snapshot from the specified instance.

```bash
aws lightsail create-instance-snapshot \
  --instance-name WordPress-1 \
  --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```json
{
  "operations": [
    {
      "id": "4c3db559-9dd0-41e7-89c0-2cb88c19786f",
      "resourceName": "WordPress-Snapshot-1",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1569866438.48,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
```
For API details, see [CreateInstanceSnapshot](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/lightsail/create-instances-from-snapshot.html) in *AWS CLI Command Reference*.

**create-instances-from-snapshot**

The following code example shows how to use create-instances-from-snapshot.

**AWS CLI**

**To create an instance from a snapshot**

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the $10 USD bundle.

**Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```bash
aws lightsail create-instances-from-snapshot
  --instance-snapshot-name WordPress-1-1569866208
  --instance-names WordPress-2
```
--availability-zone us-west-2a \
--bundle-id medium_2_0

Output:

```json
{
  "operations": [
    {
      "id": "003f8271-b711-464d-b9b8-7f3806cb496e",
      "resourceName": "WordPress-2",
      "resourceType": "Instance",
      "createdAt": 1569865914.908,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstancesFromSnapshot",
      "status": "Started",
      "statusChangedAt": 1569865914.908
    }
  ]
}
```

- For API details, see [CreateInstancesFromSnapshot](#) in AWS CLI Command Reference.

create-instances

The following code example shows how to use create-instances.

AWS CLI

**Example 1: To create a single instance**

The following create-instances example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```bash
aws lightsail create-instances \
  --instance-names Instance-1 \
  --availability-zone us-west-2a \
  --blueprint-id wordpress_5_1_1_2 \
  --bundle-id nano_2_0
```
Example 2: To create multiple instances at one time

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```bash
aws lightsail create-instances \
   --instance-names {"Instance1","Instance2","Instance3"} \
   --availability-zone us-west-2a \
   --blueprint-id wordpress_5_1_1_2 \
   --bundle-id nano_2_0
```

Output:

```json
{
   "operations": [
   {
      "id": "5492f015-9d2e-48c6-8eea-b516840e6903",
      "resourceName": "Instance1",
      "resourceType": "Instance",
      "createdAt": 1569448780.054,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569447986.061
   }
   ]
}
```
For API details, see [CreateInstances](#) in AWS CLI Command Reference.

**create-key-pair**

The following code example shows how to use create-key-pair.
AWS CLI

To create a key pair

The following create-key-pair example creates a key pair that you can use to authenticate and connect to an instance.

```
aws lightsail create-key-pair \
  --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. **Note**: Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

```
{
  "keyPair": {
    "name": "MyPersonalKeyPair",
    "supportCode": "621291663362/MyPersonalKeyPair",
    "createdAt": 1569866556.567,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "resourceType": "KeyPair"
  },

```
For API details, see [CreateKeyPair](https://aws.amazon.com/cli/#CreateKeyPair) in *AWS CLI Command Reference*.

**create-load-balancer-tls-certificate**

The following code example shows how to use `create-load-balancer-tls-certificate`.

**AWS CLI**

**To create a TLS certificate for a load balancer**

The following `create-load-balancer-tls-certificate` example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. **Note:** Only two certificates can be created for a load balancer.

```
aws lightsail create-load-balancer-tls-certificate \
  --certificate-alternative-names abc.example.com \
  --certificate-domain-name example.com \
  --certificate-name MySecondCertificate \
  --load-balancer-name MyFirstLoadBalancer
```

**Output:**

**Actions and scenarios** 4491
For API details, see CreateLoadBalancerTlsCertificate in AWS CLI Command Reference.

create-load-balancer

The following code example shows how to use create-load-balancer.
**AWS CLI**

**To create a load balancer**

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```
aws lightsail create-load-balancer \
    --certificate-alternative-names www.example.com test.example.com \
    --certificate-domain-name example.com \
    --certificate-name Certificate-1 \
    --instance-port 80 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "cc7b920a-83d8-4762-a74e-9174fe1540be",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867169.406,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1569867169.406
        },
        {
            "id": "658ed43b-f729-42f3-a8e4-3f8024d3c98d",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867170.193,

            },
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
```

```
For more information, see Lightsail load balancers in the Lightsail Developer Guide.

- For API details, see CreateLoadBalancer in AWS CLI Command Reference.

**create-relational-database-from-snapshot**

The following code example shows how to use create-relational-database-from-snapshot.

**AWS CLI**

**To create a managed database from a snapshot**

The following create-relational-database-from-snapshot example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the $15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```bash
aws lightsail create-relational-database-from-snapshot \
  --relational-database-snapshot-name Database-Oregon-1-1566839359 \
```
create-relational-database-snapshot

The following code example shows how to use `create-relational-database-snapshot`:

```bash
aws lightsail create-relational-database-snapshot \
  --relational-database-name Database1 \
  --relational-database-snapshot-name RelationalDatabaseSnapshot1
```

For API details, see CreateRelationalDatabaseFromSnapshot in AWS CLI Command Reference.
Output:

```
{
  "operations": [
    {
      "id": "853667fb-ea91-4c02-8d20-8fc5fd43b9eb",

      "createdAt": 1569868074.645,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "RelationalDatabaseSnapshot1",
      "operationType": "CreateRelationalDatabaseSnapshot",
      "status": "Started",
      "statusChangedAt": 1569868074.645
    }
  ]
}
```

- For API details, see `CreateRelationalDatabaseSnapshot` in *AWS CLI Command Reference*.

### create-relational-database

The following code example shows how to use `create-relational-database`. 
To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (`mysql_5_6`), and the $15 USD standard database bundle (`micro_1_0`). The managed database is pre-populated a master user name, and is not publicly accessible.

```shell
aws lightsail create-relational-database
  --relational-database-name Database-1
  --availability-zone us-west-2a
  --relational-database-blueprint-id mysql_5_6
  --relational-database-bundle-id micro_1_0
  --master-database-name dbmaster
  --master-username user
  --no-publicly-accessible
```

Output:

```json
{
  "operations": [
    {
      "id": "b52bedee-73ed-4798-8d2a-9c12df89adcd",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1569450017.244,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateRelationalDatabase",
      "status": "Started",
      "statusChangedAt": 1569450018.637
    }
  ]
}
```

• For API details, see [CreateRelationalDatabase](#) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

**4497**
delete-auto-snapshot

The following code example shows how to use delete-auto-snapshot.

AWS CLI

To delete an automatic snapshot

The following delete-auto-snapshot example deletes the automatic snapshot 2019-10-10 of instance WordPress-1.

```bash
aws lightsail delete-auto-snapshot \
   --resource-name WordPress-1 \
   --date 2019-10-10
```

Output:

```json
{
   "operations": [
      {
         "id": "31c36e09-3d52-46d5-b6d8-7EXAMPLE534a",
         "resourceName": "WordPress-1",
         "resourceType": "Instance",
         "createdAt": 1571088141.501,
         "location": {
            "availabilityZone": "us-west-2",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "DeleteAutoSnapshot-2019-10-10",
         "operationType": "DeleteAutoSnapshot",
         "status": "Succeeded"
      }
   ]
}
```

For more information, see Deleting automatic snapshots of instances or disks in Amazon Lightsail in the Lightsail Dev Guide.

- For API details, see DeleteAutoSnapshot in AWS CLI Command Reference.
delete-disk-snapshot

The following code example shows how to use delete-disk-snapshot.

AWS CLI

To delete a snapshot of a block storage disk

The following delete-disk-snapshot example deletes the specified snapshot of a block storage disk

aws lightsail delete-disk-snapshot \
--disk-snapshot-name DiskSnapshot-1

Output:

```
{
  "operations": [
    {
      "id": "d1e5766d-b81e-4595-ad5d-02afbccfd5d",
      "resourceName": "DiskSnapshot-1",
      "resourceType": "DiskSnapshot",
      "createdAt": 1569873552.79,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "DeleteDiskSnapshot",
      "status": "Succeeded",
      "statusChangedAt": 1569873552.79
    }
  ]
}
```

- For API details, see [DeleteDiskSnapshot](#) in [AWS CLI Command Reference](#).

delete-disk

The following code example shows how to use delete-disk.
AWS CLI

To delete a block storage disk

The following delete-disk example deletes the specified block storage disk.

```bash
aws lightsail delete-disk \
   --disk-name Disk-1
```

Output:

```
{
   "operations": [
      {
        "id": "6378c70f-4d75-4f7a-ab66-730fca0bb2fc",
        "resourceName": "Disk-1",
        "resourceType": "Disk",
        "createdAt": 1569872887.864,
        "location": {
          "availabilityZone": "us-west-2a",
          "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "DeleteDisk",
        "status": "Succeeded",
        "statusChangedAt": 1569872887.864
      }
   ]
}
```

For API details, see [DeleteDisk](https://docs.aws.amazon.com/cli/latest/reference/lightsail/delete-disk.html) in *AWS CLI Command Reference*.

**delete-domain-entry**

The following code example shows how to use delete-domain-entry.

AWS CLI

To delete a domain entry (DNS record)

The following delete-domain-entry example deletes the specified domain entry from an existing domain.
**Note:** Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```bash
aws lightsail delete-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```json
{
    "operation": {
        "id": "06eacd01-d785-420e-8daa-823150c7dca1",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569874157.005,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569874157.005
    }
}
```

- For API details, see [DeleteDomainEntry](awscli://awscli/docs/latest/reference/index.html) in *AWS CLI Command Reference*.

delete-domain

The following code example shows how to use `delete-domain`.

**AWS CLI**

To delete a domain (DNS zone)

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).
**Note:** Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```bash
aws lightsail delete-domain \\
   --region us-east-1 \\
   --domain-name example.com
```

Output:

```json
{
   "operation": {
      "id": "fcef5265-5af1-4a46-a3d7-90b5e18b9b32",
      "resourceName": "example.com",
      "resourceType": "Domain",
      "createdAt": 1569873788.13,
      "location": {
         "availabilityZone": "all",
         "regionName": "global"
      },
      "isTerminal": true,
      "operationType": "DeleteDomain",
      "status": "Succeeded",
      "statusChangedAt": 1569873788.13
   }
}
```

- For API details, see [DeleteDomain](https://docs.aws.amazon.com/cli/latest/reference/lightsail/delete-domain.html) in **AWS CLI Command Reference**.

**delete-instance-snapshot**

The following code example shows how to use `delete-instance-snapshot`.

```bash
aws lightsail delete-instance-snapshot \
```

**AWS CLI**

**title**

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.

```bash
aws lightsail delete-instance-snapshot \
```
--instance-snapshot-name WordPress-1-Snapshot-1

Output:

```
{
   "operations": [
      {
         "id": "14dad182-976a-46c6-bfd4-9480482bf0ea",
         "resourceName": "WordPress-1-Snapshot-1",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1569874524.562,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationType": "DeleteInstanceSnapshot",
         "status": "Succeeded",
         "statusChangedAt": 1569874524.562
      }
   ]
}
```

- For API details, see [DeleteInstanceSnapshot](#) in *AWS CLI Command Reference*.

### delete-instance

The following code example shows how to use `delete-instance`.

**AWS CLI**

*To delete an instance*

The following `delete-instance` example deletes the specified instance.

```bash
aws lightsail delete-instance \
   --instance-name WordPress-1
```

Output:

```
{
   "operations": [
```

Actions and scenarios
Actions and scenarios
• For API details, see DeleteInstance in AWS CLI Command Reference.

**delete-key-pair**

The following code example shows how to use delete-key-pair.

**AWS CLI**

**To delete a key pair**

The following delete-key-pair example deletes the specified key pair.

```bash
aws lightsail delete-key-pair \
    --key-pair-name MyPersonalKeyPair
```

**Output:**

```
{
    "operation": {
        "id": "81621463-df38-4810-b866-6e801a15abbf",

        "operationType": "DeleteKeyPair",
        "status": "Succeeded",
        "statusChangedAt": 1569874626.685
    }
}
```

• For API details, see DeleteKeyPair in AWS CLI Command Reference.

**delete-known-host-keys**

The following code example shows how to use delete-known-host-keys.
AWS CLI

To delete known host keys from an instance

The following delete-known-host-keys example deletes the known host key from the specified instance.

```bash
aws lightsail delete-known-host-keys \
   --instance-name Instance-1
```

Output:

```json
{
   "operations": [
      {
         "id": "c61afe9c-45a4-41e6-a97e-d212364da3f5",
         "resourceName": "Instance-1",
         "resourceType": "Instance",
         "createdAt": 1569874760.201,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationType": "DeleteKnownHostKeys",
         "status": "Succeeded",
         "statusChangedAt": 1569874760.201
      }
   ]
}
```

For more information, see Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client in the Lightsail Dev Guide.

- For API details, see DeleteKnownHostKeys in AWS CLI Command Reference.

delete-load-balancer-tls-certificate

The following code example shows how to use delete-load-balancer-tls-certificate.

AWS CLI

To delete a TLS certificate for a load balancer
The following delete-load-balancer-tls-certificate example deletes the specific TLS certificate from the specified load balancer.

```bash
aws lightsail delete-load-balancer-tls-certificate \
   --load-balancer-name MyFirstLoadBalancer \
   --certificate-name MyFirstCertificate
```

Output:

```json
{
   "operations": [
      {
         "id": "50bec274-e45e-4caa-8a69-b763ef636583",
         "resourceName": "MyFirstCertificate",
         "resourceType": "LoadBalancerTlsCertificate",
         "createdAt": 1569874989.48,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "DeleteLoadBalancerTlsCertificate",
         "status": "Started",
         "statusChangedAt": 1569874989.48
      },
      {
         "id": "78c58cdc-a59a-4b27-8213-500638634a8f",
         "resourceName": "MyFirstLoadBalancer",
         "resourceType": "LoadBalancer",
         "createdAt": 1569874989.48,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "DeleteLoadBalancerTlsCertificate",
         "status": "Started",
         "statusChangedAt": 1569874989.48
      }
   ]
}
```

delete-load-balancer

The following code example shows how to use delete-load-balancer.

AWS CLI

To delete a load balancer

The following delete-load-balancer example deletes the specified load balancer and any associated TLS certificates.

```bash
aws lightsail delete-load-balancer \
   --load-balancer-name MyFirstLoadBalancer
```

Output:

```json
{
   "operations": [ 
      {
         "id": "a8c968c7-72a3-4680-a714-af8f03eea535",
         "resourceName": "MyFirstLoadBalancer",
         "resourceType": "LoadBalancer",
         "createdAt": 1569875092.125,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationType": "DeleteLoadBalancer",
         "status": "Succeeded",
         "statusChangedAt": 1569875092.125
      },
      {
         "id": "f91a29fc-8ce3-4e69-a227-ea70ca890bf5",
         "resourceName": "MySecondCertificate",
         "resourceType": "LoadBalancerTlsCertificate",
         "createdAt": 1569875091.938,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "DeleteLoadBalancerTlsCertificate",
```
For more information, see title in the guide.

- For API details, see [DeleteLoadBalancer](#) in AWS CLI Command Reference.

`delete-relational-database-snapshot`

The following code example shows how to use `delete-relational-database-snapshot`.

**AWS CLI**

**To delete a snapshot of a managed database**

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
   --relational-database-snapshot-name Database-Oregon-1-1566839359
```

**Output:**

```
{
   "operations": [
```

For API details, see `DeleteRelationalDatabaseSnapshot` in *AWS CLI Command Reference*.

delete-relational-database

The following code example shows how to use `delete-relational-database`.

**AWS CLI**

**To delete a managed database**

The following `delete-relational-database` example deletes the specified managed database.

```
aws lightsail delete-relational-database \
   --relational-database-name Database-1
```

Output:

```json
{
   "operations": [
      {
         "id": "3b0c41c1-053d-46f0-92a3-14f76141dc86",
         "resourceName": "Database-1",
         "resourceType": "RelationalDatabase",
         "createdAt": 1569875293.58
      }
   ]
}
```
For API details, see [DeleteRelationalDatabase](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-relational-database) in *AWS CLI Command Reference*.

**Actions and scenarios**

4511
**detach-static-ip**

The following code example shows how to use detach-static-ip.

**AWS CLI**

**To detach a static IP from an instance**

The following detach-static-ip example detaches static IP StaticIp-1 from any attached instance.

```bash
aws lightsail detach-static-ip \
  --static-ip-name StaticIp-1
```

Output:

```json
{
  "operations": [
    {
      "id": "2a43d8a3-9f2d-4fe7-bdd0-eEXAMPLE3cf3",
      "resourceName": "StaticIp-1",
      "resourceType": "StaticIp",
      "createdAt": 1571088261.999,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationDetails": "MEAN-1",
      "operationType": "DetachStaticIp",
      "status": "Succeeded",
      "statusChangedAt": 1571088261.999
    },
    {
      "id": "41a7d40c-74e8-4d2e-a837-cEXAMPLEf747",

      "createdAt": 1571088262.022,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": true,
```
"operationDetails": "StaticIp-1",
"operationType": "DetachStaticIp",
"status": "Succeeded",
"statusChangedAt": 1571088262.022
}
]
}

- For API details, see [DetachStaticIp](#) in *AWS CLI Command Reference*.

**get-active-names**

The following code example shows how to use get-active-names.

**AWS CLI**

**To get active resource names**

The following get-active-names example returns the active resource names in the configured AWS Region.

```
aws lightsail get-active-names
```

**Output:**

```
{
   "activeNames": [
       "WordPress-1",
       "StaticIp-1",
       "MEAN-1",
       "Plesk_Hosting_Stack_on_Ubuntu-1"
   ]
}
```

- For API details, see [GetActiveNames](#) in *AWS CLI Command Reference*.

**get-auto-snapshots**

The following code example shows how to use get-auto-snapshots.
**AWS CLI**

**To get the available automatic snapshots for an instance**

The following `get-auto-snapshots` example returns the available automatic snapshots for instance *WordPress-1*.

```bash
aws lightsail get-auto-snapshots \
  --resource-name WordPress-1
```

**Output:**

```json
{
  "resourceName": "WordPress-1",
  "resourceType": "Instance",
  "autoSnapshots": [
    {
      "date": "2019-10-14",
      "createdAt": 1571033872.0,
      "status": "Success",
      "fromAttachedDisks": []
    },
    {
      "date": "2019-10-13",
      "createdAt": 1570947473.0,
      "status": "Success",
      "fromAttachedDisks": []
    },
    {
      "date": "2019-10-12",
      "createdAt": 1570861072.0,
      "status": "Success",
      "fromAttachedDisks": []
    },
    {
      "date": "2019-10-11",
      "createdAt": 1570774672.0,
      "status": "Success",
      "fromAttachedDisks": []
    }
  ]
}
```
For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](https://lightsail.aws.amazon.com/lightsail/dev-guide) in the *Lightsail Dev Guide*.

- For API details, see [GetAutoSnapshots](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-autosnapshots) in *AWS CLI Command Reference*.

### get-blueprints

The following code example shows how to use get-blueprints.

**AWS CLI**

**To get the blueprints for new instances**

The following get-blueprints example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

**Output:**

```json
{
   "blueprints": [
      {
         "blueprintId": "wordpress",
         "name": "WordPress",
         "group": "wordpress",
         "type": "app",
         "description": "Bitnami, the leaders in application packaging, and Automattic, the experts behind WordPress, have teamed up to offer this official WordPress image. This image is a pre-configured, ready-to-run image for running WordPress on Amazon Lightsail. WordPress is the world's most popular content management platform. Whether it's for an enterprise or small business website, or a personal or corporate blog, content authors can easily create content using its new Gutenberg editor, and developers can extend the base platform with additional features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail, Google Analytics for WordPress, and Amazon Polly are all pre-installed in this image. Let's Encrypt SSL certificates are supported through an auto-configuration script.",
         "isActive": true,
         "minPower": 0,
         "version": "5.2.2-3",
         "versionCode": "1",
         "productUrl": "https://aws.amazon.com/marketplace/pp/B00NN8Y43U"
      }
   ]
}
```
LAMP with PHP 7.x certified by Bitnami greatly simplifies the development and deployment of PHP applications. It includes the latest versions of PHP 7.x, Apache and MySQL together with phpMyAdmin and popular PHP frameworks Zend, Symfony, CodeIgniter, CakePHP, Smarty, and Laravel. Other pre-configured components and PHP modules include FastCGI, ModSecurity, SQLite, Varnish, ImageMagick, xDebug, Xcache, OpenLDAP, Memcache, OAuth, PEAR, PECL, APC, GD and cURL. It is secure by default and supports multiple applications, each with its own virtual host and project directory. Let's Encrypt SSL certificates are supported through an auto-configuration script.

Node.js certified by Bitnami is a pre-configured, ready to run image for Node.js on Amazon EC2. It includes the latest version of Node.js, Apache, Python and Redis. The image supports multiple Node.js applications, each with its own virtual host and project directory. It is configured for production use and is secure by default, as all ports except HTTP, HTTPS and SSH ports are closed. Let's Encrypt SSL certificates are supported through an auto-configuration script. Developers benefit from instant access to a secure, update and consistent Node.js environment without having to manually install and configure multiple components and libraries.
For API details, see GetBlueprints in AWS CLI Command Reference.

get-bundles

The following code example shows how to use get-bundles.

AWS CLI

To get the bundles for new instances

The following get-bundles example displays details about all of the available bundles that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-bundles
```

Output:

```json
{
    "bundles": [
        {
            "price": 3.5,
            "cpuCount": 1,
            "diskSizeInGb": 20,
            "bundleId": "nano_2_0",
            "instanceType": "nano",
            "isActive": true,
            "name": "Nano",
            "power": 300,
        },
        ...,
    ]
}
```
• For API details, see [GetBundles](#) in [AWS CLI Command Reference](#).
get-cloud-formation-stack-records

The following code example shows how to use `get-cloud-formation-stack-records`.

AWS CLI

To get the CloudFormation stack records and their associated stacks

The following `get-cloud-formation-stack-records` example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```bash
aws lightsail get-cloud-formation-stack-records
```

Output:

```
{
   "cloudFormationStackRecords": [
      {
         "name": "CloudFormationStackRecord-588a4243-e2d1-490d-8200-3a7513ecebdf",
         "createdAt": 1565301666.586,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "CloudFormationStackRecord",
         "state": "Succeeded",
         "sourceInfo": [
            {
               "resourceType": "ExportSnapshotRecord",
               "name": "ExportSnapshotRecord-e02f23d7-0453-4aa9-9c95-91aa01a141dd",
            }
         ],
         "destinationInfo": {
            "id": "arn:aws:cloudformation:us-west-2:111122223333:stack/Lightsail-Stack-588a4243-e2d1-490d-8200-3EXAMPLEebdf/063203b0-ba28-11e9-838b-0EXAMPLE8b00"
         }
      }
   ]
}
```
• For API details, see GetCloudFormationStackRecords in AWS CLI Command Reference.

get-disk-snapshot

The following code example shows how to use get-disk-snapshot.

AWS CLI

To get information about a disk snapshot

The following get-disk-snapshot example displays details about the disk snapshot Disk-1-1566839161.

```bash
aws lightsail get-disk-snapshot \
  --disk-snapshot-name Disk-1-1566839161
```

Output:

```json
{
  "diskSnapshot": {
    "name": "Disk-1-1566839161",
    "arn": "arn:aws:lightsail:us-west-2:111122223333:DiskSnapshot/e2d0fa53-8ee0-41a0-8e56-0EXAMPLE1051",
    "supportCode": "6EXAMPLE3362/snap-0EXAMPLE06100d09",
    "createdAt": 1566839163.749,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "resourceType": "DiskSnapshot",
    "tags": [],
    "sizeInGb": 8,
    "state": "completed",
    "progress": "100%",
    "fromDiskName": "Disk-1",
  }
}```
For more information, see title in the guide.

- For API details, see GetDiskSnapshot in AWS CLI Command Reference.

**get-disk-snapshots**

The following code example shows how to use get-disk-snapshots.

**AWS CLI**

**To get information about all disk snapshots**

The following get-disk-snapshots example displays details about all of the disk snapshots in the configured AWS Region.

```bash
aws lightsail get-disk-snapshots
```

**Output:**

```json
{
    "diskSnapshots": [
        {
            "name": "Disk-2-1571090588",
            "supportCode": "6EXAMPLE3362/snap-0EXAMPLE1ca192a4",
            "createdAt": 1571090591.226,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "DiskSnapshot",
            "tags": [],
            "sizeInGb": 8,
            "state": "completed",
            "progress": "100%",
        }
    ]
}
```
For API details, see [GetDiskSnapshots](awscli://lightsail/get/disk) in *AWS CLI Command Reference*.

**get-disk**

The following code example shows how to use `get-disk`.

**AWS CLI**

To get information about a block storage disk

The following `get-disk` example displays details about the disk Disk-1.

```
aws lightsail get-disk \
  --disk-name Disk-1
```
Output:

```json
{
    "disk": {
        "name": "Disk-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:Disk/c21cfb0a-07f2-44ae-9a23-bEXAMPLE8096",
        "supportCode": "6EXAMPLE3362/vol-0EXAMPLEf2f88b32f",
        "createdAt": 1566585439.587,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "resourceType": "Disk",
        "tags": [],
        "sizeInGb": 8,
        "isSystemDisk": false,
        "iops": 100,
        "path": "/dev/xvdf",
        "state": "in-use",
        "attachedTo": "WordPress_Multisite-1",
        "isAttached": true,
        "attachmentState": "attached"
    }
}
```

For more information, see title in the *guide*.

- For API details, see [GetDisk](#) in [AWS CLI Command Reference](#).

**get-disks**

The following code example shows how to use `get-disks`.

**AWS CLI**

To get information about all block storage disks

The following `get-disks` example displays details about all of the disks in the configured AWS Region.

```
aws lightsail get-disks
```
Output:

```json
{
    "disks": [
        {
            "name": "Disk-2",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:Disk/6a343ff8-6341-422d-86e2-bEXAMPLE16c2",

            "path": "/dev/xvdf",
            "state": "in-use",
            "attachedTo": "WordPress_Multisite-1",
            "isAttached": true,
            "attachmentState": "attached"
        }
    ]
}
```
get-domain

The following code example shows how to use get-domain.

AWS CLI

To get information about a domain

The following get-domain example displays details about the domain example.com.

Note: Lightsail's domain-related API operations are available in only the us-east-1 AWS Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail get-domain \
   --domain-name example.com \
   --region us-east-1
```

Output:

```json
{
   "domain": {
      "name": "example.com",

get-domains

The following code example shows how to use get-domains.

AWS CLI

To get information about all domains

The following get-domains example displays details about all of the domains in the configured AWS Region.

Note: Lightsail's domain-related API operations are available in only the us-east-1 AWS Region. If your CLI profile is configured to use a different Region, you must include the --region us-east-1 parameter or the command fails.

```plaintext
aws lightsail get-domains \
   --region us-east-1
```

Output:

```json
{
   "domains": [
      {
        "name": "example.com",
        "arn": "arn:aws:lightsail:global:1111222333:Domain/28cda903-3f15-44b2-9baf-3EXAMPLEb304",

For API details, see [GetDomains](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-domains) in *AWS CLI Command Reference*.

### get-export-snapshot-record

The following code example shows how to use `get-export-snapshot-record`.

**AWS CLI**

**To get the records of snapshots exported to Amazon EC2**

The following `get-export-snapshot-record` example displays details about Amazon Lightsail instance or disk snapshots exported to Amazon EC2.

```bash
aws lightsail get-export-snapshot-records
```

**Output:**

```json
{
   "exportSnapshotRecords": [
      {
         "name": "ExportSnapshotRecord-d2da10ce-0b3c-4ae1-ab3a-2EXAMPLEa586",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:ExportSnapshotRecord/076c7060-b0cc-4162-98f0-2EXAMPLEe28e",
         "createdAt": 1543534665.678,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "ExportSnapshotRecord",
         "state": "Succeeded",
         "sourceInfo": {
            "resourceType": "InstanceSnapshot",
            "createdAt": 1540339310.706,
            "name": "WordPress-512MB-Oregon-1-1540339219",
            "fromResourceName": "WordPress-512MB-Oregon-1",
         }
      }
   ]
}
```

            ]
        }
    }
}
• For API details, see **GetExportSnapshotRecord** in *AWS CLI Command Reference*.

**get-instance-access-details**

The following code example shows how to use get-instance-access-details.

**AWS CLI**

**To get host key information for an instance**

The following get-instance-access-details example displays host key information for instance **WordPress_Multisite-1**.

```bash
aws lightsail get-instance-access-details \
  --instance-name WordPress_Multisite-1
```

**Output:**

```json
{
  "accessDetails": {

```
get-instance-metric-data

The following code example shows how to use get-instance-metric-data.

AWS CLI

To get metric data for an instance

The following get-instance-metric-data example returns the average percent of CPUUtilization every 7200 seconds (2 hours) between 1571342400 and 1571428800 for instance MEAN-1.

We recommend that you use a unix time converter to identify the start and end times.

```bash
aws lightsail get-instance-metric-data \
  --instance-name MEAN-1 \
  --metric-name CPUUtilization \
  --period 7200 \
  --start-time 1571342400 \
  --end-time 1571428800 \
  --unit Percent \
  --statistics Average
```

Output:

```json
{
  "metricName": "CPUUtilization",
  "metricData": [
    {
      "average": 0.26113718770120725,

For API details, see [GetInstanceMetricData](awscli) in [AWS CLI Command Reference](awscli).

### get-instance-port-states

The following code example shows how to use get-instance-port-states.

**AWS CLI**

**To get firewall information for an instance**

The following `get-instance-port-states` example returns the firewall ports configured for instance MEAN-1.

```
aws lightsail get-instance-port-states \
  --instance-name MEAN-1
```

**Output:**

```
{
  "portStates": [
    {
      "fromPort": 80,
      "toPort": 80,
      "protocol": "tcp",
      "state": "open"
    },
    {
      "fromPort": 22,
      "toPort": 22,
      "protocol": "tcp",
      "state": "open"
    },
    {
      "fromPort": 443,
      "toPort": 443,
      "protocol": "tcp",
      "state": "open"
    }
  ]
}
```
For API details, see [GetInstancePortStates](#) in [AWS CLI Command Reference](#).

**get-instance-snapshot**

The following code example shows how to use `get-instance-snapshot`.

**AWS CLI**

**To get information about a specified instance snapshot**

The following `get-instance-snapshot` example displays details about the specified instance snapshot.

```
aws lightsail get-instance-snapshot \
  --instance-snapshot-name MEAN-1-1571419854
```

**Output:**

```
{
    "instanceSnapshot": {
        "name": "MEAN-1-1571419854",
        "supportCode": "6EXAMPLE3362/ami-0EXAMPLE67a73020d",
        "createdAt": 1571419891.927,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "InstanceSnapshot",
        "tags": [],
        "state": "available",
        "fromAttachedDisks": [],
        "fromInstanceName": "MEAN-1",
        "fromInstanceArn": "arn:aws:lightsail:us-west-2:111122223333:Instance/bd470fc5-a68b-44c5-8dbc-8EXAMPLEbada",
        "fromBlueprintId": "mean_4_0_9",
        "fromBundleId": "medium_2_0",
        "isFromAutoSnapshot": false,
```

Actions and scenarios
get-instance-snapshots

The following code example shows how to use get-instance-snapshots.

AWS CLI

To get information about all of your instance snapshots

The following get-instance-snapshots example displays details about all of the instance snapshots in the configured AWS Region.

```bash
aws lightsail get-instance-snapshots
```

Output:

```json
{
   "instanceSnapshots": [
      {
         "name": "MEAN-1-1571421498",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/a20e6ebe-b0ee-4ae4-a750-3EXAMPLEcb0c",
         "supportCode": "6EXAMPLE3362/ami-0EXAMPLEe33cabfa1",
         "createdAt": 1571421527.755,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "InstanceSnapshot",
         "tags": [
            {
               "key": "no_delete"
            }
         ],
         "state": "available",
         "fromAttachedDisks": [],
         "fromInstanceName": "MEAN-1"
      }
   ]
}
```
For API details, see [GetInstanceSnapshots](#) in [AWS CLI Command Reference](#).

get-instance-state

The following code example shows how to use `get-instance-state`.

AWS CLI

To get information about the state of an instance

The following `get-instance-state` example returns the state of the specified instance.
aws lightsail get-instance-state \
--instance-name MEAN-1

Output:

```json
{
  "state": {
    "code": 16,
    "name": "running"
  }
}
```

• For API details, see [GetInstanceState](#) in [AWS CLI Command Reference](#).

get-instance

The following code example shows how to use get-instance.

AWS CLI

To get information about an instance

The following get-instance example displays details about the instance MEAN-1.

```sh
aws lightsail get-instance \
--instance-name MEAN-1
```

Output:

```json
{
  "instance": {
    "name": "MEAN-1",
    "supportCode": "6EXAMPLE3362/i-05EXAMPLE407c97d3",
    "createdAt": 1570635023.124,
    "location": {
      "availabilityZone": "us-west-2a",
      "regionName": "us-west-2"
    },
    "resourceType": "Instance",
    "tags": []
  }
}
```
"blueprintId": "mean_4_0_9",

}
For API details, see `GetInstances` in *AWS CLI Command Reference*.

**get-instances**

The following code example shows how to use `get-instances`.

**AWS CLI**

*To get information about all instances*

The following `get-instances` example displays details about all of the instances in the configured AWS Region.

```
aws lightsail get-instances
```

**Output:**

```
{
    "instances": [
        {
            "name": "Windows_Server_2016-1",
            "state": {

• For API details, see [GetInstances](GetInstances) in *AWS CLI Command Reference*.

**get-key-pair**

The following code example shows how to use `get-key-pair`.

**AWS CLI**

**To get information about a key pair**

The following `get-key-pair` example displays details about the specified key pair.

```
aws lightsail get-key-pair \
   --key-pair-name MyKey1
```

Output:

```json
{
   "keyPair": {
      "name": "MyKey1",
      "supportCode": "6EXAMPLE3362/MyKey1",
   }
}
```
The following code example shows how to use `get-key-pairs`.

**AWS CLI**

To get information about all key pairs

The following `get-key-pairs` example displays details about all of the key pairs in the configured AWS Region.

```
aws lightsail get-key-pairs
```

Output:

```
{
   "keyPairs": [
   {
      "name": "MyKey1",
      "supportCode": "6EXAMPLE3362/MyKey1",
      "createdAt": 1571255026.975,
      "location": {
         "availabilityZone": "all",
         "regionName": "us-west-2"
      },
      "resourceType": "KeyPair",
   }
   ]
}
```
For API details, see GetKeyPairs in AWS CLI Command Reference.

get-load-balancer-tls-certificates

The following code example shows how to use get-load-balancer-tls-certificates.

AWS CLI

To get information about TLS certificates for a load balancer

The following get-load-balancer-tls-certificates example displays details about the TLS certificates for the specified load balancer.

```bash
aws lightsail get-load-balancer-tls-certificates \
--load-balancer-name LoadBalancer-1
```

Output:

```json
{
   "tlsCertificates": [
      {
         "name": "example-com",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancerTlsCertificate/d7bf4643-6a02-4cd4-b3c4-fEXAMPLE9b4d",
         "supportCode": "6EXAMPLE3362/arn:aws:acm:us-west-2:333322221111:certificate/9af8e32c-a54e-4a67-8c63-cEXAMPLEb314",
         "createdAt": 1571678025.3,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "LoadBalancerTlsCertificate",
         "loadBalancerName": "LoadBalancer-1",
      }
   ]
}
```
For API details, see `GetLoadBalancerTlsCertificates` in *AWS CLI Command Reference*.

### get-load-balancer

The following code example shows how to use `get-load-balancer`.

**AWS CLI**

**To get information about a load balancer**

The following `get-load-balancer` example displays details about the specified load balancer.

```
aws lightsail get-load-balancer \
  --load-balancer-name LoadBalancer-1
```
Output:

```json
{
    "loadBalancer": {
        "name": "LoadBalancer-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancer/40486b2b-1ad0-4152-83e4-cEXAMPLE6f4b",
        "supportCode": "GEXAMPLE3362/arn:aws:elasticloadbalancing:us-west-2:333322221111:loadbalancer/app/bEXAMPLE128cb59d86f946a9395dd304/1EXAMPLE8dd9d77e",
        "createdAt": 1571677906.723,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "LoadBalancer",
        "tags": [],
        "dnsName": "bEXAMPLE128cb59d86f946a9395dd304-1486911371.us-west-2.elb.amazonaws.com",
        "state": "active",
        "protocol": "HTTP",
        "publicPorts": [
            80
        ],
        "healthCheckPath": "/",
        "instancePort": 80,
        "instanceHealthSummary": [
            {
                "instanceName": "MEAN-3",
                "instanceHealth": "healthy"
            },
            {
                "instanceName": "MEAN-1",
                "instanceHealth": "healthy"
            },
            {
                "instanceName": "MEAN-2",
                "instanceHealth": "healthy"
            }
        ],
        "tlsCertificateSummaries": [
            {
                "name": "example-com",
                "isAttached": false
            }
        ]
    }
}
```
For API details, see `GetLoadBalancer` in *AWS CLI Command Reference*.

**get-load-balancers**

The following code example shows how to use `get-load-balancers`.

**AWS CLI**

**To get information about all load balancers**

The following `get-load-balancers` example displays details about all of the load balancers in the configured AWS Region.

```
aws lightsail get-load-balancers
```

**Output:**

```
{
    "loadBalancers": [
        {
            "name": "LoadBalancer-1",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancer/40486b2b-1ad0-4152-83e4-cEXAMPLE6f4b",
            "supportCode": "6EXAMPLE3362/arn:aws:elasticloadbalancing:us-west-2:333322221111:loadbalancer/app/bEXAMPLE128cb59d86f946a9395dd304/1EXAMPLE8dd9d77e",
            "createdAt": 1571677906.723,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "LoadBalancer",
        }
    ]
}
```
• For API details, see [GetLoadBalancers](#) in [AWS CLI Command Reference](#).

**get-operation**

The following code example shows how to use get-operation.
To get information about a single operation

The following get-operation example displays details about the specified operation.

```
aws lightsail get-operation \
   --operation-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

Output:

```
{
   "operation": {
      "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",
      "resourceName": "Instance-1",
      "resourceType": "Instance",
      "createdAt": 1571679872.404,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "CreateInstance",
      "status": "Succeeded",
      "statusChangedAt": 1571679890.304
   }
}
```

- For API details, see [GetOperation](#) in *AWS CLI Command Reference*.

get-operations-for-resource

The following code example shows how to use get-operations-for-resource.

AWS CLI

To get all operations for a resource

The following get-operations-for-resource example displays details about all operations for the specified resource.

```
aws lightsail get-operations-for-resource \
```
Output:

```json
{
   "operations": [
      {
         "id": "e2973046-43f8-4252-a4b4-9EXAMPLE69ce",
         "resourceName": "LoadBalancer-1",
         "resourceType": "LoadBalancer",
         "createdAt": 1571678786.071,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "MEAN-1",
         "operationType": "DetachInstancesFromLoadBalancer",

      }
   ]
}```
For API details, see [GetOperationsForResource](#) in *AWS CLI Command Reference*.

### get-operations

The following code example shows how to use `get-operations`.

**AWS CLI**

**To get information about all operations**

The following `get-operations` example displays details about all of the operations in the configured AWS Region.

```
aws lightsail get-operations
```

Output:

```json
{
  "operations": [
    {
      "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",
      "resourceName": "Instance-1",
      "resourceType": "Instance",
      "createdAt": 1571679872.404,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      }
    }
  ]
}
```
For API details, see [GetOperations](#) in *AWS CLI Command Reference*. 
get-regions

The following code example shows how to use get-regions.

AWS CLI

To get all AWS Regions for Amazon Lightsail

The following get-regions example displays details about all of the AWS Regions for Amazon Lightsail.

aws lightsail get-regions

Output:

```json
{
    "regions": [
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern United States",
            "displayName": "Ohio",
            "name": "us-east-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern United States",
            "displayName": "Oregon",
            "name": "us-west-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        }
    ]
}
```
• For API details, see GetRegions in AWS CLI Command Reference.

get-relational-database-blueprints

The following code example shows how to use get-relational-database-blueprints.

AWS CLI

To get the blueprints for new relational databases

The following get-relational-database-blueprints example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

aws lightsail get-relational-database-blueprints

Output:

```
{
    "blueprints": [
    {
        "blueprintId": "mysql_5_6",
        "engine": "mysql",
        "engineVersion": "5.6.44",
        "engineDescription": "MySQL Community Edition",
        "engineVersionDescription": "MySQL 5.6.44",
        "isEngineDefault": false
    },
    {
        "blueprintId": "mysql_5_7",
        "engine": "mysql",
        "engineVersion": "5.7.26",
        "engineDescription": "MySQL Community Edition",
        "engineVersionDescription": "MySQL 5.7.26",
        "isEngineDefault": true
    }
    ]
}
```
For API details, see [GetRelationalDatabaseBlueprints](https://docs.aws.amazon.com/cli/latest/reference/chef/index.html) in *AWS CLI Command Reference*.

### get-relational-database-bundles

The following code example shows how to use `get-relational-database-bundles`.
AWS CLI

To get the bundles for new relational databases

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```
aws lightsail get-relational-database-bundles
```

Output:

```
{
   "bundles": [
   {
      "bundleId": "micro_2_0",
      "name": "Micro",
      "price": 15.0,
      "ramSizeInGb": 1.0,
      "diskSizeInGb": 40,
      "transferPerMonthInGb": 100,
      "cpuCount": 2,
      "isEncrypted": true,
      "isActive": true
   },
   {
      "bundleId": "micro_ha_2_0",
      "name": "Micro with High Availability",
      "price": 30.0,
      "ramSizeInGb": 1.0,
      "diskSizeInGb": 40,
      "transferPerMonthInGb": 100,
      "cpuCount": 2,
      "isEncrypted": true,
      "isActive": true
   },
   {
      "bundleId": "small_2_0",
      "name": "Small",
      "price": 30.0,
      "ramSizeInGb": 2.0,
   }
   ]
}
```
"diskSizeInGb": 80,
"transferPerMonthInGb": 100,
"cpuCount": 2,
"isEncrypted": true,
"isActive": true
},
{
  "bundleId": "small_ha_2_0",
  "name": "Small with High Availability",
  "price": 60.0,
  "ramSizeInGb": 2.0,
  "diskSizeInGb": 80,
  "transferPerMonthInGb": 100,
  "cpuCount": 2,
  "isEncrypted": true,
  "isActive": true
},
{
  "bundleId": "medium_2_0",
  "name": "Medium",
  "price": 60.0,
  "ramSizeInGb": 4.0,
  "diskSizeInGb": 120,
  "transferPerMonthInGb": 100,
  "cpuCount": 2,
  "isEncrypted": true,
  "isActive": true
},
{
  "bundleId": "medium_ha_2_0",
  "name": "Medium with High Availability",
  "price": 120.0,
  "ramSizeInGb": 4.0,
  "diskSizeInGb": 120,
  "transferPerMonthInGb": 100,
  "cpuCount": 2,
  "isEncrypted": true,
  "isActive": true
},
{
  "bundleId": "large_2_0",
  "name": "Large",
  "price": 115.0,
  "ramSizeInGb": 8.0,
For more information, see [Creating a database in Amazon Lightsail](https://lightsail.aws.amazon.com/consol/home/environment/lightsail/doc/creating-a-database-in-amazon-lightsail) in the *Amazon Lightsail Developer Guide*.

- For API details, see [GetRelationalDatabase Bundles](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-relational-database-events.html) in *AWS CLI Command Reference*.

### get-relational-database-events

The following code example shows how to use get-relational-database-events.

#### AWS CLI

**To get the events for a relational database**

The following get-relational-database-events example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```bash
aws lightsail get-relational-database-events \
  --relational-database-name Database-1 \
  --duration-in-minutes 1020
```

**Output:**

```
{
```
"relationalDatabaseEvents": [
    {
        "resource": "Database-1",
        "createdAt": 1571654146.553,
        "message": "Backing up Relational Database",
        "eventCategories": [
            "backup"
        ]
    },
    {
        "resource": "Database-1",
        "createdAt": 1571654249.98,
        "message": "Finished Relational Database backup",
        "eventCategories": [
            "backup"
        ]
    }
]

For API details, see GetRelationalDatabaseEvents in AWS CLI Command Reference.

get-relational-database-log-events

The following code example shows how to use get-relational-database-log-events.

**AWS CLI**

To get log events for a relational database

The following get-relational-database-log-events example displays details about the specified log between 1570733176 and 1571597176 for relational database Database1. The information returned is configured to start from head.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-log-events \\n    --relational-database-name Database1 \\n    --log-stream-name error \\n    --start-from-head \\n    --start-time 1570733176 \\n    --end-time 1571597176
```
Output:

```json
{
  "resourceLogEvents": [
    {
      "createdAt": 1570820267.0,
      "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0' could not be resolved: Name or service not known"
    },
    {
      "createdAt": 1570860974.0,
      "message": "2019-10-12 06:16:14 20969 [Warning] IP address '8192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860977.0,
      "message": "2019-10-12 06:16:17 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860979.0,
      "message": "2019-10-12 06:16:19 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860981.0,
      "message": "2019-10-12 06:16:21 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860982.0,
      "message": "2019-10-12 06:16:22 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860984.0,
      "message": "2019-10-12 06:16:24 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    },
    {
      "createdAt": 1570860986.0,
      "message": "2019-10-12 06:16:26 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
    }
  ]
}
```
get-relational-database-log-streams

The following code example shows how to use get-relational-database-log-streams.

AWS CLI

To get the log streams for a relational database

The following get-relational-database-log-streams example returns all of the available log streams for the specified relational database.

```bash
aws lightsail get-relational-database-log-streams \
--relational-database-name Database1
```

Output:

```json
{
   "logStreams": [
      "audit",
      "error",
      "general",
      "slowquery"
   ]
}
```

For API details, see GetRelationalDatabaseLogStreams in AWS CLI Command Reference.
get-relational-database-master-user-password

The following code example shows how to use get-relational-database-master-user-password.

**AWS CLI**

*To get the master user password for a relational database*

The following get-relational-database-master-user-password example returns information about the master user password for the specified relational database.

```bash
aws lightsail get-relational-database-master-user-password \
  --relational-database-name Database-1
```

**Output:**

```
{
   "masterUserPassword": "VEXAMPLEec.9qvX,_t<)Wkf)kwboM,>2",
   "createdAt": 1571259453.959
}
```

*For API details, see GetRelationalDatabaseMasterUserPassword in AWS CLI Command Reference.*

get-relational-database-metric-data

The following code example shows how to use get-relational-database-metric-data.

**AWS CLI**

*To get metric data for a relational database*

The following get-relational-database-metric-data example returns the count sum of the metric DatabaseConnections over the period of 24 hours (86400 seconds) between 1570733176 and 1571597176 for relational database Database1.

We recommend that you use a unix time converter to identify the start and end times.

```bash
aws lightsail get-relational-database-metric-data \
  --relational-database-name Database1 \
```
```
--metric-name DatabaseConnections \
--period 86400 \
--start-time 1570733176 \
--end-time 1571597176 \
--unit Count \
--statistics Sum
```

**Output:**

```
{
   "metricName": "DatabaseConnections",
   "metricData": [
      {
         "sum": 1.0,
         "timestamp": 1571510760.0,
         "unit": "Count"
      },
      {
         "sum": 1.0,
         "timestamp": 1570733160.0,
         "unit": "Count"
      },
      {
         "sum": 1.0,
         "timestamp": 1570992360.0,
         "unit": "Count"
      },
      {
         "sum": 0.0,
         "timestamp": 1571251560.0,
         "unit": "Count"
      },
      {
         "sum": 721.0,
         "timestamp": 1570819560.0,
         "unit": "Count"
      },
      {
         "sum": 1.0,
         "timestamp": 1571078760.0,
         "unit": "Count"
      },
      {
```
For API details, see `GetRelationalDatabaseMetricData` in *AWS CLI Command Reference*.

**get-relational-database-parameters**

The following code example shows how to use `get-relational-database-parameters`.

**AWS CLI**

To get parameters for a relational database

The following `get-relational-database-parameters` example returns information about all of the available parameters for the specified relational database.

```bash
aws lightsail get-relational-database-parameters \
    --relational-database-name Database-1
```

Output:

```json
{
    "parameters": [ }

```json
{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "dynamic",
  "dataType": "boolean",
  "description": "Automatically set all granted roles as active after the user has authenticated successfully.",
  "isModifiable": true,
  "parameterName": "activate_all_roles_on_login",
  "parameterValue": "0"
},
{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "static",
  "dataType": "boolean",
  "description": "Controls whether user-defined functions that have only an xxx symbol for the main function can be loaded",
  "isModifiable": false,
  "parameterName": "allow-suspicious-udfs"
},
{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "dynamic",
  "dataType": "boolean",
  "description": "Sets the autocommit mode",
  "isModifiable": true,
  "parameterName": "autocommit"
},
{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "static",
  "dataType": "boolean",
  "description": "Controls whether the server autogenerates SSL key and certificate files in the data directory, if they do not already exist.",
  "isModifiable": false,
  "parameterName": "auto_generate_certs"
},
...
}
```
For more information, see [Updating database parameters in Amazon Lightsail](https://docs.aws.amazon.com/lightsail/latest/devguide/update-relational-database-parameters.html) in the *Lightsail Dev Guide*.

- For API details, see [GetRelationalDatabaseParameters](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-relational-database-parameters.html) in *AWS CLI Command Reference*.

**get-relational-database-snapshot**

The following code example shows how to use `get-relational-database-snapshot`.

**AWS CLI**

**To get information about a relational database snapshot**

The following `get-relational-database-snapshot` example displays details about the specified relational database snapshot.

```
aws lightsail get-relational-database-snapshot \
  --relational-database-snapshot-name Database-1-1571350042
```

**Output:**

```json
{
  "relationalDatabaseSnapshot": {
    "name": "Database-1-1571350042",
    "supportCode": "6EXAMPLE3362/ls-8EXAMPLE2ba7ad041451946faf2ad19cfb9eb2",
    "createdAt": 1571350046.238,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "resourceType": "RelationalDatabaseSnapshot",
    "tags": [],
    "engine": "mysql",
    "engineVersion": "8.0.16",
    "sizeInGb": 40,
    "state": "available",
    "fromRelationalDatabaseName": "Database-1",
    "id": "0389bbad-4b85-4c3d-9EXAMPLEaee3643d2"
  }
}
```
The following code example shows how to use `get-relational-database-snapshots`.

**AWS CLI**

To get information about all relational database snapshots

The following `get-relational-database-snapshots` example displays details about all of the relational database snapshots in the configured AWS Region.

```bash
aws lightsail get-relational-database-snapshots
```

**Output:**

```json
{
   "relationalDatabaseSnapshots": [
      {
         "name": "Database-1-1571350042",
         "supportCode": "6EXAMPLE3362/ls-8EXAMPLE2ba7ad041451946fafcc2ad19cfd9eb2",
         "createdAt": 1571350046.238,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "RelationalDatabaseSnapshot",
         "tags": [],
         "engine": "mysql",
         "engineVersion": "8.0.16",
         "sizeInGb": 40,
         ...
      }
   ]
}
```
For API details, see [GetRelationalDatabaseSnapshots](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-relational-database-snapshots) in *AWS CLI Command Reference*.

**get-relational-database**

The following code example shows how to use `get-relational-database`.
AWS CLI

To get information about a relational database

The following get-relational-database example displays details about the specified relational database.

```bash
aws lightsail get-relational-database \
   --relational-database-name Database-1
```

Output:

```json
{
   "relationalDatabase": {
      "name": "Database-1",
      "arn": "arn:aws:lightsail:us-west-2:111122223333:RelationalDatabase/7ea932b1-b85a-4bd5-9b3e-bEXAMPLE8cc4",
      "supportCode": "6EXAMPLE3362/ls-9EXAMPLE8ad863723b62cc8901a8aa6e794ae0d2",
      "createdAt": 1571259453.795,
      "location": {
         "availabilityZone": "us-west-2a",

      "publiclyAccessible": true
   }
}
```
• For API details, see `GetRelationalDatabase` in *AWS CLI Command Reference*.

**get-relational-databases**

The following code example shows how to use `get-relational-databases`.

**AWS CLI**

To get information about all relational databases

The following `get-relational-databases` example displays details about all of the relational databases in the configured AWS Region.

```
aws lightsail get-relational-databases
```

Output:

```
{
    "relationalDatabases": [
    {
        "name": "MySQL",
        "supportCode": "6EXAMPLE3362/ls-3EXAMPLEa995d8c3b06b4501356e5f2f28e1aea",
        "createdAt": 1554306019.155,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "resourceType": "RelationalDatabase",
        "tags": [],
        "relationalDatabaseBlueprintId": "mysql_8_0",
```
"relationalDatabaseBundleId": "micro_1_0",

### get-static-ip

The following code example shows how to use `get-static-ip`.

**AWS CLI**

To get information about a static IP

The following `get-static-ip` example displays details about the specified static IP.

```bash
aws lightsail get-static-ip \
   --static-ip-name StaticIp-1
```

Output:

```json
{
}
```
For API details, see GetStaticIp in AWS CLI Command Reference.

get-static-ips

The following code example shows how to use get-static-ips.

AWS CLI

To get information about all static IPs

The following get-static-ips example displays details about all of the static IPs in the configured AWS Region.

aws lightsail get-static-ips

Output:

```json
{
  "staticIps": [
    {
      "name": "StaticIp-1",
      "arn": "arn:aws:lightsail:us-west-2:11112222333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",

        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "resourceType": "StaticIp",
      "ipAddress": "192.0.2.0",
      "isAttached": false
    }
  ]
}```
For API details, see `GetStaticIps` in *AWS CLI Command Reference*.

**is-vpc-peered**

The following code example shows how to use `is-vpc-peered`.

**AWS CLI**

**To identify if your Amazon Lightsail virtual private cloud is peered**

The following `is-vpc-peered` example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```bash
aws lightsail is-vpc-peered \
    --region us-west-2
```

Output:
open-instance-public-ports

The following code example shows how to use open-instance-public-ports.

AWS CLI

To open firewall ports for an instance

The following open-instance-public-ports example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
   --instance-name MEAN-2 \
   --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
   "operation": {
      "id": "719744f0-a022-46f2-9f11-6EXAMPLE4642",
      "resourceName": "MEAN-2",
      "resourceType": "Instance",
      "createdAt": 1571072906.849,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationDetails": "22/tcp",
      "operationType": "OpenInstancePublicPorts",
      "status": "Succeeded",
      "statusChangedAt": 1571072906.849
   }
}
```

• For API details, see **IsVpcPeered** in *AWS CLI Command Reference*.

• For API details, see **OpenInstancePublicPorts** in *AWS CLI Command Reference*.
peer-vpc

The following code example shows how to use peer-vpc.

AWS CLI

To peer the Amazon Lightsail virtual private cloud

The following peer-vpc example peers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```bash
aws lightsail peer-vpc \
   --region us-west-2
```

Output:

```json
{
   "operation": {
      "id": "787e846a-54ac-497f-bce2-9EXAMPLE5d91",
      "resourceName": "vpc-0EXAMPLEa5261efb3",
      "resourceType": "PeeredVpc",
      "createdAt": 1571694233.104,
      "location": {
         "availabilityZone": "all",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationDetails": "vpc-e2b3eb9b",
      "operationType": "PeeredVpc",
      "status": "Succeeded",
      "statusChangedAt": 1571694233.104
   }
}
```

- For API details, see PeerVpc in AWS CLI Command Reference.

reboot-instance

The following code example shows how to use reboot-instance.

AWS CLI

To reboot an instance
The following `reboot-instance` example reboots the specified instance.

```bash
code
aws lightsail reboot-instance \
   --instance-name MEAN-1
```

Output:

```json
code
{
   "operations": [
      {
         "id": "2b679f1c-8b71-4bb4-8e97-8EXAMPLEed93",
         "resourceName": "MEAN-1",
         "resourceType": "Instance",
         "createdAt": 1571694445.49,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "",
         "operationType": "RebootInstance",
         "status": "Succeeded",
         "statusChangedAt": 1571694445.49
      }
   ]
}
```

- For API details, see [RebootInstance](https://docs.aws.amazon.com/cli/latest/reference/lightsail/reboot-instance.html) in *AWS CLI Command Reference*.

### reboot-relational-database

The following code example shows how to use `reboot-relational-database`.

**AWS CLI**

**To reboot a relational database**

The following `reboot-relational-database` example reboots the specified relational database.

```bash
code
aws lightsail reboot-relational-database \
```

---

**Actions and scenarios**

4585
Output:

```json
{
  "operations": [
    {
      "id": "e4c980c0-3137-496c-9c91-1EXAMPLEdec2",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1571694532.91,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "",
      "operationType": "RebootRelationalDatabase",
      "status": "Started",
      "statusChangedAt": 1571694532.91
    }
  ]
}
```

- For API details, see [RebootRelationalDatabase](aws-cli-command-reference) in *AWS CLI Command Reference*.

**release-static-ip**

The following code example shows how to use `release-static-ip`.

**AWS CLI**

**To delete a static IP**

The following `release-static-ip` example deletes the specified static IP.

```bash
aws lightsail release-static-ip \
  --static-ip-name StaticIp-1
```

Output:

```json
{
}
```
For API details, see `ReleaseStaticIp` in *AWS CLI Command Reference*.

**start-instance**

The following code example shows how to use `start-instance`.

**AWS CLI**

To start an instance

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
    {
        "id": "f88d2a93-7cea-4165-afce-2d688cb18f23",
        "resourceName": "WordPress-1",
        "resourceType": "Instance",
        "createdAt": 1571695583.463,
    }
    ]
}
```
• For API details, see StartInstance in AWS CLI Command Reference.

start-relational-database

The following code example shows how to use start-relational-database.

AWS CLI

To start a relational database

The following start-relational-database example starts the specified relational database.

```bash
aws lightsail start-relational-database \
    --relational-database-name Database-1
```

Output:

```json
{
    "operations": [
        {
            "id": "4d5294ec-a38a-4fda-9e37-aEXAMPLE0d24",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695998.822,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartInstance",
            "status": "Started",
            "statusChangedAt": 1571695583.463
        }
    ]
}
```
"operationType": "StartRelationalDatabase",
        "status": "Started",
        "statusChangedAt": 1571695998.822
    }
]}
}

- For API details, see [StartRelationalDatabase](#) in [AWS CLI Command Reference](#).

### stop-instance

The following code example shows how to use `stop-instance`.

#### AWS CLI

**To stop an instance**

The following `stop-instance` example stops the specified instance.

```bash
aws lightsail stop-instance \
    --instance-name WordPress-1
```

**Output:**

```json
{
    "operations": [
        {
            "id": "265357e2-2943-4d51-888a-1EXAMPLE7585",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695471.134,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopInstance",
            "status": "Started",
            "statusChangedAt": 1571695471.134
        }
    ]
}
```
stop-relational-database

The following code example shows how to use stop-relational-database.

AWS CLI

To stop a relational database

The following stop-relational-database example stops the specified relational database.

```
aws lightsail stop-relational-database \
  --relational-database-name Database-1
```

Output:

```json
{
   "operations": [
   {
      "id": "cc559c19-4adb-41e4-b75b-5EXAMPLE4e61",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1571695526.29,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "StopRelationalDatabase",
      "status": "Started",
      "statusChangedAt": 1571695526.29
   }
   ]
}
```

• For API details, see StopRelationalDatabase in AWS CLI Command Reference.

unpeer-vpc

The following code example shows how to use unpeer-vpc.
AWS CLI

To unpeer the Amazon Lightsail virtual private cloud

The following `unpeer-vpc` example unpeers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```bash
aws lightsail unpeer-vpc \
  --region us-west-2
```

Output:

```json
{
  "operation": {
    "id": "531aca64-7157-47ab-84c6-eEXAMPLEd898",
    "resourceName": "vpc-0EXAMPLEa5261efb3",
    "resourceType": "PeeredVpc",
    "createdAt": 1571694109.945,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "isTerminal": true,
    "operationDetails": "vpc-e2b3eb9b",
    "operationType": "UnpeeredVpc",
    "status": "Succeeded",
    "statusChangedAt": 1571694109.945
  }
}
```

- For API details, see [UnpeerVpc](#) in *AWS CLI Command Reference*.

Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**describe-buckets**

The following code example shows how to use `describe-buckets`.

**AWS CLI**

To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with `MY-S3` and are in the current AWS Region.

```bash
aws macie2 describe-buckets \
  --criteria '{"bucketName":{"prefix":"my-S3"}}'
```

Output:

```json
{
  "buckets": [
    {
      "accountId": "123456789012",
      "allowsUnencryptedObjectUploads": "FALSE",

**Actions**

**list-workspaces**

The following code example shows how to use `list-workspaces`.

**AWS CLI**

**To list workspaces for the account in the Region specified by the user credential**

The following `list-workspaces` example lists Grafana workspaces for the account's Region.

```bash
aws grafana list-workspaces
```

**Output:**

```json
{
  "workspaces": [
    {
      "authentication": {
        "providers": [
```
For API details, see ListWorkspaces in AWS CLI Command Reference.

MediaConnect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConnect.
**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**add-flow-outputs**

The following code example shows how to use `add-flow-outputs`.

**AWS CLI**

**To add outputs to a flow**

The following `add-flow-outputs` example adds outputs to the specified flow.

```bash
aws mediaconnect add-flow-outputs \
--outputs Description='NYC' stream',Destination=192.0.2.12,Name=NYC,Port=3333,Protocol=rtp-fec,SmoothingLatency=100 Description='LA' stream',Destination=203.0.113.9,Name=LA,Port=4444,Protocol=rtp-fec,SmoothingLatency=100
```

**Output:**

```json
{
   "Outputs": [
      {
         "Port": 3333,
         "Description": "NYC stream",
         "Destination": "192.0.2.12",

         "Name": "LA",
         "Port": 4444,
         "Protocol": "rtp-fec",
         "SmoothingLatency": 100
      }
   ]
}
```
For more information, see Adding Outputs to a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see AddFlowOutputs in AWS CLI Command Reference.

**create-flow**

The following code example shows how to use create-flow.

**AWS CLI**

To create a flow

The following create-flow example creates a flow with the specified configuration.

```
aws mediaconnect create-flow \
  --availability-zone us-west-2c \  
  --name ExampleFlow 
```
Output:

```json
{
    "Flow": {
        "AvailabilityZone": "us-west-2c",
        "EgressIp": "54.245.71.21",
        "Source": {
            "IngestPort": 1055,
            "SourceArn": "arn:aws:mediaconnect:us-east-1:123456789012:source:2-3aBC45dEF67hiJ89-c34de5f678h:BackupSource",
            "Transport": {
                "Protocol": "rtp",
                "MaxBitrate": 80000000
            },
            "Description": "Example source, backup",
            "IngestIp": "54.245.71.21",
            "WhitelistCidr": "10.24.34.0/23",
            "Name": "mySource"
        },
        "Entitlements": [],
        "Name": "ExampleFlow",
        "Outputs": [],
        "Status": "STANDBY",
        "Description": "Example source, backup"
    }
}
```

For more information, see [Creating a Flow](https://docs.aws.amazon.com/mediacustomizes/latest/API/Creating a Flow) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [CreateFlow](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/create-flow.html) in *AWS CLI Command Reference*.

### delete-flow

The following code example shows how to use `delete-flow`.

**AWS CLI**

**To delete a flow**
The following delete-flow example deletes the specified flow.

```bash
aws mediaconnect delete-flow \
```

Output:

```
{
  "Status": "DELETING"
}
```

For more information, see Deleting a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see DeleteFlow in AWS CLI Command Reference.

### describe-flow

The following code example shows how to use describe-flow.

#### AWS CLI

**To view the details of a flow**

The following describe-flow example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```bash
aws mediaconnect describe-flow \
```

Output:

```
{
  "Flow": {
    "EgressIp": "54.201.4.39",
    "AvailabilityZone": "us-west-2c",
    "Status": "ACTIVE",
```

The following code example shows how to use `grant-flow-entitlements`.

**AWS CLI**

**To grant an entitlement on a flow**

The following `grant-flow-entitlements` example grants an entitlement to the specified existing flow to share your content with another AWS account.

```bash
aws mediaconnect grant-flow-entitlements \
  --entitlements Description='For AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-key,RoleArn=arn:aws:iam::111122223333:role/MediaConnect-ASM,SecretArn=arn:aws:secretsmanager:us-west-2:111122223333:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=444455556666 Description='For Example Corp',Name=ExampleCorp,Subscribers=777788889999
```

**Output:**

```json
{
  "Entitlements": [
    {
      "Name": "AnyCompany_Entitlement",
```
    "Subscribers": [
      "444455556666"
    ],
    "Description": "For AnyCompany",
    "Encryption": {
      "Algorithm": "aes128",
      "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
      "KeyType": "static-key"
    }
  },
  {
    "Name": "ExampleCorp",
    "Subscribers": [
      "777788889999"
    ],
    "Description": "For Example Corp"
  }
],
}

For more information, see Granting an Entitlement on a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see GrantFlowEntitlements in AWS CLI Command Reference.

list-entitlements

The following code example shows how to use list-entitlements.

AWS CLI

To view a list of entitlements

The following list-entitlements example displays a list of all entitlements that have been granted to the account.
aws mediaconnect list-entitlements

Output:

```json
{
    "Entitlements": [
    {
        "EntitlementName": "MyEntitlement"
    }
    ]
}
```

For more information, see ListEntitlements in the AWS Elemental MediaConnect API Reference.

- For API details, see ListEntitlements in AWS CLI Command Reference.

list-flows

The following code example shows how to use list-flows.

AWS CLI

To view a list of flows

The following list-flows example displays a list of flows.

aws mediaconnect list-flows

Output:

```json
{
    "Flows": [
    {
        "Status": "STANDBY",
        "SourceType": "OWNED",
        "AvailabilityZone": "us-west-2a",
        "Description": "NYC awards show",
        "Name": "AwardsShow",
```

Actions and scenarios
For more information, see Viewing a List of Flows in the AWS Elemental MediaConnect User Guide.

- For API details, see ListFlows in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a MediaConnect resource**

The following list-tags-for-resource example displays the tag keys and values associated with the specified MediaConnect resource.

```
aws mediaconnect list-tags-for-resource \
```

Output:

```
{
    "Tags": {
        "region": "west",
        "stage": "prod"
    }
}
```
The following code example shows how to use `remove-flow-output`.

### AWS CLI

**To remove an output from a flow**

The following `remove-flow-output` example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
```

Output:

```json
{
    "OutputArn": "arn:aws:mediaconnect:us-east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see [Removing Outputs from a Flow](https://docs.aws.amazon.com/mediaconnect/latest/userguide/) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RemoveFlowOutput](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/remove-flow-output.html) in *AWS CLI Command Reference*.

---

The following code example shows how to use `revoke-flow-entitlement`.

### revoke-flow-entitlement

The following code example shows how to use `revoke-flow-entitlement`.

```
aws mediaconnect revoke-flow-entitlement \
```

Output:

```json
{
}
```

For more information, see [Revoking Flow Entitlements](https://docs.aws.amazon.com/mediaconnect/latest/userguide/) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RevokeFlowEntitlement](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/revoke-flow-entitlement.html) in *AWS CLI Command Reference*. 
AWS CLI

To revoke an entitlement

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```bash
aws mediaconnect revoke-flow-entitlement \
```

Output:

```json
{
}
```

For more information, see [Revoking an Entitlement](https://docs.aws.amazon.com/ElementalMediaConnect/latest/UserGuide/) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RevokeFlowEntitlement](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/revoke-flow-entitlement.html) in *AWS CLI Command Reference*.

**start-flow**

The following code example shows how to use `start-flow`.

AWS CLI

To start a flow

The following `start-flow` example starts the specified flow.

```bash
aws mediaconnect start-flow \
```
This command produces no output. Output:

```
{
    "Status": "STARTING"
}
```

For more information, see Starting a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see StartFlow in AWS CLI Command Reference.

**stop-flow**

The following code example shows how to use stop-flow.

**AWS CLI**

**To stop a flow**

The following stop-flow example stops the specified flow.

```
aws mediaconnect stop-flow \
```

Output:

```
{
    "Status": "STOPPING",
}
```

For more information, see Stopping a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see StopFlow in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
AWS CLI

To add tags to a MediaConnect resource

The following tag-resource example adds a tag with a key name and value to the specified MediaConnect resource.

```
aws mediaconnect tag-resource \
  --tags region=west
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the AWS Elemental MediaConnect API Reference.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a MediaConnect resource

The following untag-resource example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```
aws mediaconnect untag-resource \
  --tag-keys region
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the AWS Elemental MediaConnect API Reference.

- For API details, see UntagResource in AWS CLI Command Reference.
update-flow-entitlement

The following code example shows how to use update-flow-entitlement.

**AWS CLI**

**To update an entitlement**

The following update-flow-entitlement example updates the specified entitlement with a new description and subscriber.

```bash
aws mediaconnect update-flow-entitlement \
  --description 'For AnyCompany Affiliate' \
  --subscribers 777788889999
```

**Output:**

```json
{
  "Entitlement": {
    "Name": "AnyCompany_Entitlement",
    "Description": "For AnyCompany Affiliate",
    "Encryption": {
      "KeyType": "static-key",
      "Algorithm": "aes128",
      "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
    },
    "Subscribers": [777788889999]
  }
}
```
For more information, see Updating an Entitlement in the AWS Elemental MediaConnect User Guide.

- For API details, see UpdateFlowEntitlement in AWS CLI Command Reference.

update-flow-output

The following code example shows how to use update-flow-output.

AWS CLI

To update an output on a flow

The following update-flow-output example update an output on the specified flow.

```
aws mediaconnect update-flow-output \
    --output-arn arn:aws:mediaconnect:us-east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC \
    --port 3331
```

Output:

```
{
    "Output": {
        "Name": "NYC",
        "Port": 3331,
        "Description": "NYC stream",
        "Transport": {
            "Protocol": "rtp-fec",
            "SmoothingLatency": 100
        },
        "Destination": "192.0.2.12"
    }
}
```

For more information, see Updating Outputs on a Flow in the AWS Elemental MediaConnect User Guide.
For API details, see UpdateFlowOutput in AWS CLI Command Reference.

update-flow-source

The following code example shows how to use update-flow-source.

AWS CLI

To update the source of an existing flow

The following update-flow-source example updates the source of an existing flow.

```bash
aws mediaconnect update-flow-source \
    --source-arn arn:aws:mediaconnect:us-east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \
    --description 'Friday night show' \
    --ingest-port 3344 \
    --protocol rtp-fec \
    --whitelist-cidr 10.24.34.0/23
```

Output:

```json
{
    "Source": {
        "IngestIp": "34.210.136.56",
        "WhitelistCidr": "10.24.34.0/23",
        "Transport": {
            "Protocol": "rtp-fec"
        },
        "IngestPort": 3344,
        "Name": "ShowSource",
        "Description": "Friday night show",
        "SourceArn": "arn:aws:mediaconnect:us-east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"
    }
}
```
For more information, see Updating the Source of a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see UpdateFlowSource in AWS CLI Command Reference.

### MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics
- **Actions**

#### Actions

**cancel-job**

The following code example shows how to use cancel-job.

**AWS CLI**

**To cancel a job that is in a queue**

The following cancel-job example cancels the job with ID 1234567891234-abc123. You can't cancel a job that the service has started processing.

```bash
aws mediaconvert cancel-job 
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com 
   --region region-name-1 
   --id 1234567891234-abc123
```
To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the AWS Elemental MediaConvert User Guide.

- For API details, see [CancelJob](#) in [AWS CLI Command Reference](#).

### create-job-template

The following code example shows how to use `create-job-template`.

**AWS CLI**

**To create a job template**

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```bash
aws mediaconvert create-job-template \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1 \
   --name JobTemplate1 \
   --cli-input-json file://~/job-template.json
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the `JobTemplate` object, but keep the `Settings` child object inside it. Also, make sure to remove the following key-value pairs: LastUpdated, Arn, Type, and CreatedAt. You can specify the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see [CreateJobTemplate](#) in [AWS CLI Command Reference](#).
create-job

The following code example shows how to use `create-job`.

**AWS CLI**

**To create a job**

The following `create-job` example creates a transcoding job with the settings that are specified in a file `job.json` that resides on the system that you send the command from. This JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```bash
aws mediaconvert create-job \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1 \
   --cli-input-json file://~/job.json
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

- For API details, see [CreateJob](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/create-job.html) in *AWS CLI Command Reference*.

create-preset

The following code example shows how to use `create-preset`.

**AWS CLI**

**To create a custom output preset**
The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```bash
aws mediaconvert create-preset \
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
  --region region-name-1 \
  --cli-input-json file://~/preset.json
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

### create-queue

The following code example shows how to use `create-queue`.

**AWS CLI**

To create a custom queue

The following `create-queue` example creates a custom transcoding queue.

```bash
aws mediaconvert create-queue \
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
  --region region-name-1 \
  --name Queue1 \n  --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

**Output:**
For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.

- For API details, see CreateQueue in AWS CLI Command Reference.

**delete-job-template**

The following code example shows how to use delete-job-template.

**AWS CLI**

**To delete a job template**

The following delete-job-template example deletes the specified custom job template.

```
aws mediaconvert delete-job-template \
   --name "DASH Streaming" \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run aws mediaconvert list-job-templates to confirm that your template was deleted.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see DeleteJobTemplate in AWS CLI Command Reference.

**delete-preset**

The following code example shows how to use delete-preset.
AWS CLI

To delete a custom on-demand queue

The following delete-preset example deletes the specified custom preset.

```bash
aws mediaconvert delete-preset \
  --name SimpleMP4 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the AWS Elemental MediaConvert User Guide.

- For API details, see DeletePreset in AWS CLI Command Reference.

delete-queue

The following code example shows how to use delete-queue.

AWS CLI

To delete a custom on-demand queue

The following delete-queue example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```bash
aws mediaconvert delete-queue \
  --name Customer1 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.

- For API details, see DeleteQueue in AWS CLI Command Reference.
describe-endpoints

The following code example shows how to use describe-endpoints.

AWS CLI

To get your account-specific endpoint

The following describe-endpoints example retrieves the endpoint that you need to send any other request to the service.

```bash
aws mediaconvert describe-endpoints
```

Output:

```json
{
   "Endpoints": [
      {
         "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
      }
   ]
}
```

For more information, see Getting Started with MediaConvert Using the API in the AWS Elemental MediaConvert API Reference.

- For API details, see DescribeEndpoints in AWS CLI Command Reference.

get-job-template

The following code example shows how to use get-job-template.

AWS CLI

To get details for a job template

The following get-job-template example displays the JSON definition of the specified custom job template.

```bash
aws mediaconvert get-job-template \
   --name "DASH Streaming" \
   --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com
```
Output:

```json
{
  "JobTemplate": {
    "StatusUpdateInterval": "SECONDS_60",
    "LastUpdated": 1568652998,
    "Description": "Create a DASH streaming ABR stack",
    "CreatedAt": 1568652998,
    "Priority": 0,
    "Name": "DASH Streaming",
    "Settings": {
      ...
    },
    "Type": "CUSTOM"
  }
}
```

- For API details, see [GetJobTemplate](https://aws.amazon.com/documentation/mediapackage/latest/reference/get-job.html) in *AWS CLI Command Reference*.

**get-job**

The following code example shows how to use `get-job`.

**AWS CLI**

To get details for a particular job

The following example requests the information for the job with ID 1234567890987-1ab2c3, which in this example ended in an error.

```
aws mediaconvert get-job \
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
  --region region-name-1 \n  --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.
If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data, as follows:

```
{
    "Job": {
        "Status": "ERROR",
        "Queue": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Settings": {
            ...<truncated for brevity>...
        },
        "ErrorMessage": "Unable to open input file [s3://my-input-bucket/file-name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
        "ErrorCode": 1434,
        "Role": "arn:aws:iam::012345678998:role/MediaConvertServiceRole",
        "Arn": "arn:aws:mediaconvert:us-west-1:012345678998:jobs/1234567890987-1ab2c3",
        "UserMetadata": {},
        "Timing": {
            "FinishTime": 1517442131,
            "SubmitTime": 1517442103,
            "StartTime": 1517442104
        },
        "Id": "1234567890987-1ab2c3",
        "CreatedAt": 1517442103
    }
}
```

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [GetJob](#) in *AWS CLI Command Reference*.

**get-preset**

The following code example shows how to use get-preset.

**AWS CLI**

To get details for a particular preset

The following `get-preset` example requests the JSON definition of the specified custom preset.
aws mediaconvert get-preset \
   --name SimpleMP4 \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com

Output:

```json
{
    "Preset": {
        "Description": "Creates basic MP4 file. No filtering or preprocessing.",
        "LastUpdated": 1568843141,
        "Name": "SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Mp4Settings": {
                    "FreeSpaceBox": "EXCLUDE",
                    "CslgAtom": "INCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                },
                "Container": "MP4"
            },
            "AudioDescriptions": [

For more information, see Working with AWS Elemental MediaConvert Output Presets in the AWS Elemental MediaConvert User Guide.

- For API details, see GetPreset in AWS CLI Command Reference.

**get-queue**

The following code example shows how to use get-queue.

**AWS CLI**

**To get details for a queue**

The following get-queue example retrieves the details of the specified custom queue.

```bash
aws mediaconvert get-queue \
   --name Customer1 \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```json
{
   "Queue": {
      "LastUpdated": 1526428502,
      "Type": "CUSTOM",
      "SubmittedJobsCount": 0,
      "Status": "ACTIVE",
      "PricingPlan": "ON_DEMAND",
      "CreatedAt": 1526428502,
      "ProgressingJobsCount": 0,
      "Name": "Customer1"
   }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.
list-job-templates

The following code example shows how to use list-job-templates.

**AWS CLI**

**Example 1: To list your custom job templates**

The following list-job-templates example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```
aws mediaconvert list-job-templates \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
   "JobTemplates": [
   {
      "Description": "Create a DASH streaming ABR stack",
      "Name": "DASH Streaming",
      "LastUpdated": 1568653007,
      "Priority": 0,
      "Settings": {
         ...<truncated for brevity>...
      },
      "Type": "CUSTOM",
      "StatusUpdateInterval": "SECONDS_60",
      "CreatedAt": 1568653007
   },
   {
      "Description": "Create a high-res file",
      "Name": "File",
      "LastUpdated": 1568653007,
      "Priority": 0,
      "Settings": {
         ...<truncated for brevity>...
      },
   }
}
Example 2: To list the MediaConvert system job templates

The following `list-job-templates` example lists all system job templates.

```
aws mediaconvert list-job-templates \
   --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com \
   --list-by SYSTEM
```

Output:

```
{
   "JobTemplates": [
       {
           "CreatedAt": 1568321779,
           "Arn": "arn:aws:mediaconvert:us-east-1:123456789012:jobTemplates/System-Generic_Mp4_Hev1_Avc_Aac_Sdr_Qvbr",
           "Name": "System-Generic_Mp4_Hev1_Avc_Aac_Sdr_Qvbr",
           "Description": "GENERIC, MP4, AVC + HEVC(HEVC,SDR), AAC, SDR, QVBR",
           "Category": "GENERIC",
           "Settings": {
               "AdAvailOffset": 0,
               "OutputGroups": [
                   {
                       "Outputs": [
                           {
                               "Extension": "mp4",
                               "Preset": "System-
Generic_Hd_Mp4_Avc_Aac_16x9_Sdr_1280x720p_30Hz_5Mbps_Qvbr_Vq9",

For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see ListJobTemplates in AWS CLI Command Reference.

list-jobs

The following code example shows how to use list-jobs.

AWS CLI

To get details for all jobs in a region

The following example requests the information for all of your jobs in the specified region.

```
aws mediaconvert list-jobs \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1
```

To get your account-specific endpoint, use describe-endpoints, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the AWS Elemental MediaConvert User Guide.

- For API details, see ListJobs in AWS CLI Command Reference.

list-presets

The following code example shows how to use list-presets.

AWS CLI

Example 1: To list your custom output presets

The following list-presets example lists your custom output presets. To list the system presets, see the next example.
Example 2: To list the system output presets

The following list-presets example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```
aws mediaconvert list-presets \
   --list-by SYSTEM \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```json
{
   "Presets": [
      {
         "Name": "SimpleMP4",
         "CreatedAt": 1568841521,
         "Settings": {
            ...
         },
         "Type": "CUSTOM",
         "LastUpdated": 1568843141,
         "Description": "Creates basic MP4 file. No filtering or preprocessing."
      },
      {
         "Name": "SimpleTS",
         "CreatedAt": 1568843113,
         "Settings": {
            ...
         },
         "Type": "CUSTOM",
         "LastUpdated": 1568843113,
         "Description": "Create a basic transport stream."
      }
   ]
}
```
For more information, see https://docs.aws.amazon.com/mediaconvert/latest/userguide/working-with-mediaconvert-presets.html in the AWS Elemental MediaConvert User Guide.

- For API details, see ListPresets in AWS CLI Command Reference.

**list-queues**

The following code example shows how to use list-queues.
AWS CLI

To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```bash
aws mediaconvert list-queues \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
   "Queues": [
       {
           "PricingPlan": "ON_DEMAND",
           "Type": "SYSTEM",
           "Status": "ACTIVE",
           "CreatedAt": 1503451595,
           "Name": "Default",
           "SubmittedJobsCount": 0,
           "ProgressingJobsCount": 0,
           "LastUpdated": 1534549158
       },
       {
           "PricingPlan": "ON_DEMAND",
           "Type": "CUSTOM",
           "Status": "ACTIVE",
           "CreatedAt": 1537460025,
           "Name": "Customer1",
           "SubmittedJobsCount": 0,
           "ProgressingJobsCount": 0,
           "LastUpdated": 1537460025
       },
       {
           "ProgressingJobsCount": 0,
           "Status": "ACTIVE",
           "Name": "transcode-library",
           "SubmittedJobsCount": 0,
           "LastUpdated": 1564066204,
           "ReservationPlan": {
```
For more information, see [Working with AWS Elemental MediaConvert Queues](https://docs.aws.amazon.com/mediaconvert/latest/userguide/working-with-queues.html) in the [AWS Elemental MediaConvert User Guide](https://docs.aws.amazon.com/mediaconvert/latest/userguide/)

- For API details, see [ListQueues](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/list-queues.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/list-queues.html).

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags on a MediaConvert queue, job template, or output preset

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```bash
aws mediaconvert list-tags-for-resource \
  --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```json
{
  "ResourceTags": {
    "Tags": {
      "customer": "zippyVideo"
    }
  }
}
```
For more information, see [Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets](https://docs.aws.amazon.com/mediacompute/latest/userguide/mediaconvert-user-guide.html) in the AWS Elemental MediaConvert User Guide.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/list-tags-for-resource.html) in AWS CLI Command Reference.

### update-job-template

The following code example shows how to use update-job-template.

**AWS CLI**

**To change a job template**

The following update-job-template example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

```bash
```

**Contents of job-template-update.json:**

```json
{
    "Description": "A simple job template that generates a single file output.",
    "Name": "SimpleFile",
    "Settings": {
        "OutputGroups": [
            {
                "Name": "File Group",
                "Outputs": [
                    {
                        "ContainerSettings": {
                            "Container": "MP4",
                            "Mp4Settings": {
                                "CslgAtom": "INCLUDE",
                                "FreeSpaceBox": "EXCLUDE",
                                "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                            }
                        }
                    }
                ]
            }
        ]
    }
}
```
"VideoDescription": {
    "ScalingBehavior": "DEFAULT",
    "TimecodeInsertion": "DISABLED",
    "AntiAlias": "ENABLED",
    "Sharpness": 50,
    "CodecSettings": {
        "Codec": "H_264",
        "H264Settings": {
            "InterlaceMode": "PROGRESSIVE",
            "NumberReferenceFrames": 3,
            "Syntax": "DEFAULT",
            "Softness": 0,
            "GopClosedCadence": 1,
            "GopSize": 90,
            "Slices": 1,
            "GopBReference": "DISABLED",
            "SlowPal": "DISABLED",
            "SpatialAdaptiveQuantization": "ENABLED",
            "TemporalAdaptiveQuantization": "ENABLED",
            "FlickerAdaptiveQuantization": "DISABLED",
            "EntropyEncoding": "CABAC",
            "Bitrate": 400000,
            "FramerateControl": "INITIALIZE_FROM_SOURCE",
            "RateControlMode": "CBR",
            "CodecProfile": "MAIN",
            "Telecine": "NONE",
            "MinIInterval": 0,
            "AdaptiveQuantization": "HIGH",
            "CodecLevel": "AUTO",
            "FieldEncoding": "PAFF",
            "SceneChangeDetect": "ENABLED",
            "QualityTuningLevel": "SINGLE_PASS",
            "FramerateConversionAlgorithm": "DUPLICATE_DROP",
            "UnregisteredSeiTimecode": "DISABLED",
            "GopSizeUnits": "FRAMES",
            "ParControl": "INITIALIZE_FROM_SOURCE",
            "NumberBFramesBetweenReferenceFrames": 2,
            "RepeatPps": "DISABLED",
            "DynamicSubGop": "STATIC"
        }
    },
    "AfdSignaling": "NONE",
    "DropFrameTimecode": "ENABLED",
}}
The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.
For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see UpdateJobTemplate in AWS CLI Command Reference.

update-preset

The following code example shows how to use update-preset.

AWS CLI

To change a preset

The following update-preset example replaces the description for the specified preset.

```bash
aws mediaconvert update-preset \
  --name Customer1 \
  --description "New description text." \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Output:

```json
{
  "Preset": {
    "Settings": {
      ...
    },
    "Type": "CUSTOM",
    "LastUpdated": 1568938411,
    "Description": "New description text."
  }
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the AWS Elemental MediaConvert User Guide.

- For API details, see UpdatePreset in AWS CLI Command Reference.
update-queue

The following code example shows how to use update-queue.

AWS CLI

To change a queue

The following update-queue example pauses the specified queue, by changing its status to PAUSED.

```bash
aws mediaconvert update-queue \
--name Customer1 \
--status PAUSED \
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
  "Queue": {
    "LastUpdated": 1568839845,
    "Status": "PAUSED",
    "ProgressingJobsCount": 0,
    "CreatedAt": 1526428516,
    "Name": "Customer1",
    "SubmittedJobsCount": 0,
    "PricingPlan": "ON_DEMAND",
    "Type": "CUSTOM"
  }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.

- For API details, see UpdateQueue in AWS CLI Command Reference.

MediaLive examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-channel

The following code example shows how to use create-channel.

AWS CLI

To create a channel

The following create-channel example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

InputAttachments, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source. Destinations, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords. EncoderSettings, which contains subsections. AudioDescriptions, which specifies that the channel contains one audio output asset, which uses the source from InputAttachments, and produces audio in
AAC format. CaptionDescriptions, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in WebVTT format. VideoDescriptions, which specifies that the channel contains one video output asset, with the specified resolution. OutputGroups, which specifies the output groups. In this example there is one group named Akamai. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named Video_high) and the audio asset (named Audio_EN). One output is for the captions asset (named WebVTT_EN).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the Video_and_audio output contains several nested parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```bash
aws medialive create-channel \
--cli-input-json file://channel-in-hls-out-hls-akamai.json
```

      "M3u8Settings": {}
    },
    "NameModifier": "_2"
  }
}
"TimecodeConfig": {
  "Source": "EMBEDDED"
}

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

ARN for the channel. The last part of the ARN is the unique channel ID. EgressEndpoints is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to. OutputGroups, Outputs. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply. LogLevel is set to the default (DISABLED). Tags is set to the default (null). PipelinesRunningCount and State show the current status of the channel.

For more information, see Creating a Channel from Scratch in the AWS Elemental MediaLive User Guide.

- For API details, see CreateChannel in AWS CLI Command Reference.

create-input

The following code example shows how to use create-input.
AWS CLI

To create an input

The following create-input example creates an HLS PULL input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```bash
aws medialive create-input \
   --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```json
{
   "Name": "local_news",
   "RequestId": "cli000059",
   "Sources": [
      {
         "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
         "Username": "examplecorp",
         "PasswordParam": "/medialive/examplecorp1"
      },
      {
         "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
         "Username": "examplecorp",
         "PasswordParam": "examplecorp2"
      }
   ],
   "Type": "URL_PULL"
}
```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

Arn for the input. The last part of the ARN is the unique input ID. Attached Channels, which is always empty for a newly created input. Destinations, which is empty in this example because it is used only with a PUSH input. Id for the input, the same as the ID in the ARN. MediaConnectFlows, which is empty in this example because it is used only with an input
of type MediaConnect.SecurityGroups, which is empty in this example because it is used only with a PUSH input. State of this input. Tags, which is empty (the default for this parameter).

For more information, see Creating an Input in the AWS Elemental MediaLive User Guide.

- For API details, see CreateInput in AWS CLI Command Reference.

MediaPackage examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-channel

The following code example shows how to use create-channel.

AWS CLI

To create a channel

The following create-channel command creates a channel named sportschannel in the current account.

```bash
aws mediapackage create-channel --id sportschannel
```

Output:
```json
{
   "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
   "HlsIngest": {
      "IngestEndpoints": [
         {
            "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
            "Password": "generatedwebdavpassword1",
            "Url": "https://f31c86aed53b815a.mediapackage.us-west-2.amazonaws.com/in/v2/6d345804ec3f46c9b454a91d4a80d0e0/6d345804ec3f46c9b454a91d4a80d0e0/channel",
            "Username": "generatedwebdavusername1"
         },
         {
            "Id": "2daa32878af24803b24183727211b8ff",
            "Password": "generatedwebdavpassword2",
            "Url": "https://6ebbe7e04c4b0afa.mediapackage.us-west-2.amazonaws.com/in/v2/6d345804ec3f46c9b454a91d4a80d0e0/2daa32878af24803b24183727211b8ff/channel",
            "Username": "generatedwebdavusername2"
         }
      ],
      "Id": "sportschannel",
      "Tags": {
         "region": "west"
      }
   }
}
```

For more information, see [Creating a Channel](https://docs.aws.amazon.com/media-package/latest/userguide/creating-channel.html) in the AWS Elemental MediaPackage User Guide.

- For API details, see [CreateChannel](https://docs.aws.amazon.com/cli/latest/reference/mediapackage/create-origin-endpoint.html) in AWS CLI Command Reference.

**create-origin-endpoint**

The following code example shows how to use create-origin-endpoint.

**AWS CLI**

To create an origin endpoint

The following create-origin-endpoint command creates an origin endpoint named cmafsports with the package settings provided in a JSON file and specified endpoint settings.
aws mediapackage create-origin-endpoint \
   --channel-id sportschannel \ 
   --id cmafsports \ 
   --cmaf-package file://file/path/cmafpkg.json --description "cmaf output of sports" \ 
   --id cmaf_sports \ 
   --manifest-name sports_channel \ 
   --startover-window-seconds 300 \ 
   --tags region=west,media=sports \ 
   --time-delay-seconds 10

Output:

{
   "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
   "ChannelId": "sportschannel",
   "CmafPackage": {
      "HlsManifests": [
         {
            "AdMarkers": "PASSTHROUGH",

"Whitelist": []
}

For more information, see Creating an Endpoint in the AWS Elemental MediaPackage User Guide.

• For API details, see CreateOriginEndpoint in AWS CLI Command Reference.

delete-channel

The following code example shows how to use delete-channel.

AWS CLI

To delete a channel

The following delete-channel command deletes the channel named test.

aws mediapackage delete-channel \
--id test

This command produces no output.

For more information, see Deleting a Channel in the AWS Elemental MediaPackage User Guide.

• For API details, see DeleteChannel in AWS CLI Command Reference.

delete-origin-endpoint

The following code example shows how to use delete-origin-endpoint.

AWS CLI

To delete an origin endpoint

The following delete-origin-endpoint command deletes the origin endpoint named tester2.

aws mediapackage delete-origin-endpoint \
--id tester2
For more information, see Deleting an Endpoint in the AWS Elemental MediaPackage User Guide.

- For API details, see DeleteOriginEndpoint in AWS CLI Command Reference.

describe-channel

The following code example shows how to use describe-channel.

AWS CLI

To describe a channel

The following describe-channel command displays all of the details of the channel named test.

```bash
aws mediapackage describe-channel \
  --id test
```

Output:

```json
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
  "HlsIngest": {
    "IngestEndpoints": [
      {
        "Id": "584797f1740548c389a273585dd22a63",
        "Password": "webdavgeneratedpassword1",
        "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
        "Username": "webdavgeneratedusername1"
      },
      {
        "Id": "7d187c8616fd455f88aaa5a9fcf74442",
        "Password": "webdavgeneratedpassword2",
        "Url": "https://7bf454c57220328d.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
        "Username": "webdavgeneratedusername2"
      }
    ]
  }
}
```
For more information, see Viewing Channel Details<https://docs.aws.amazon.com/mediapackage/latest/ug/channels-view.html> in the **AWS Elemental MediaPackage User Guide**

- For API details, see **DescribeChannel** in **AWS CLI Command Reference**.

### describe-origin-endpoint

The following code example shows how to use `describe-origin-endpoint`.

**AWS CLI**

#### To describe an origin endpoint

The following `describe-origin-endpoint` command displays all of the details of the origin endpoint named `cmaf_sports`.

```bash/aws mediapackage describe-origin-endpoint \
--id cmaf_sports
```

**Output:**

```
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
  "ChannelId": "sportschannel",
  "CmafPackage": {
    "HlsManifests": [
      {
        "AdMarkers": "NONE",
        "Id": "cmaf_sports_endpoint",
        "IncludeIframeOnlyStream": false,
        "PlaylistType": "EVENT",
        "PlaylistWindowSeconds": 60,
        "ProgramDateTimeIntervalSeconds": 0,
        "Url": "https://c4af3793bf76b33c.mediapackage.us-west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/index.m3u8"
      }
    ]
  }
}
```
The following code example shows how to use `list-channels`.

**AWS CLI**

**To list all channels**

The following `list-channels` command lists all of the channels that are configured on the current AWS account.

```bash
aws mediapackage list-channels
```

**Output:**

```json
{
   "Channels": [
      {
         "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd2a63",
         "HlsIngest": {
            "IngestEndpoints": [

```
list-origin-endpoints

The following code example shows how to use list-origin-endpoints.

AWS CLI

To list all origin-endpoints on a channel

The following list-origin-endpoints command lists all of the origin endpoints that are configured on the channel named test.

```
aws mediapackage list-origin-endpoints \
   --channel-id test
```
Output:

```json
{
    "OriginEndpoints": [
        {
            "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/247bff87f2845d3805129be22f2c0a2",
            "ChannelId": "test",

"Whitelist": []
]
]

For more information, see Viewing all Endpoints Associated with a Channel in the AWS Elemental MediaPackage User Guide.

- For API details, see ListOriginEndpoints in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list the tags assigned to a resource**

The following list-tags-for-resource command lists the tags that are assigned to the specified resource.

```
aws mediapackage list-tags-for-resource \
    --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0
```

Output:

```json
{
```
For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**rotate-ingest-endpoint-credentials**

The following code example shows how to use rotate-ingest-endpoint-credentials.

**AWS CLI**

**To rotate ingest credentials**

The following rotate-ingest-endpoint-credentials command rotates the WebDAV username and password for the specified ingest endpoint.

```
aws mediapackage rotate-ingest-endpoint-credentials \
  --id test \
  --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavregeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavregeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a0f6f74442",
                "Password": "webdavgeneratedpassword2",
                "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/7d187c8616fd455f88aaa5a0f6f74442/7d187c8616fd455f88aaa5a0f6f74442/channel",
                "Username": "webdavgeneratedusername2"
            }
        ]
    }
}
```
For more information, see Rotating Credentials on an Input URL in the AWS Elemental MediaPackage User Guide.

- For API details, see RotateIngestEndpointCredentials in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to a resource**

The following `tag-resource` commands adds a region=west key and value pair to the specified resource.

```sh/aws mediapackage tag-resource \
  --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
  --tags region=west
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.
AWS CLI

To remove a tag from a resource

The following untag-resource command removes the tag with the key `region` from the specified channel.

```
aws mediapackage untag-resource \
  --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
  --tag-keys region
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-channel

The following code example shows how to use update-channel.

AWS CLI

To update a channel

The following update-channel command updates the channel named `sportschannel` to include the description `24x7 sports`.

```
aws mediapackage update-channel \
  --id sportschannel \
  --description "24x7 sports"
```

Output:

```
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
  "Description": "24x7 sports",
  "HlsIngest": {
    "IngestEndpoints": [
      {
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
        "Password": "generatedwebdavpassword1",
```

```
        "IngestEndpoints": [
      {
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
        "Password": "generatedwebdavpassword1",
```

```
For more information, see Editing a Channel in the AWS Elemental MediaPackage User Guide.

- For API details, see UpdateChannel in AWS CLI Command Reference.

update-origin-endpoint

The following code example shows how to use update-origin-endpoint.

AWS CLI

To update an origin endpoint

The following update-origin-endpoint command updates the origin endpoint named cmaf_sports. It changes the time delay to 0 seconds.

```bash
aws mediapackage update-origin-endpoint \
  --id cmaf_sports \
  --time-delay-seconds 0
```

Output:

```json
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
  "Id": "cmaf_sports",
  "Tags": {}
}
```
"ChannelId": "sportschannel",
"CmafPackage": {
    "HlsManifests": [
        {
            "AdMarkers": "NONE",
            "Id": "cmaf_sports_endpoint",
            "IncludeIframeOnlyStream": false,
            "PlaylistType": "EVENT",
            "PlaylistWindowSeconds": 60,
            "ProgramDateTimeIntervalSeconds": 0,
            "Url": "https://c4af3793bf76b33c.mediapackage.us-west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/index.m3u8"
        }
    ],
    "SegmentDurationSeconds": 2,
    "SegmentPrefix": "sportschannel"
},
"Id": "cmaf_sports",
"ManifestName": "index",

"Tags": {
    "region": "west",
    "media": "sports"
},
"TimeDelaySeconds": 0,
"Url": "",
"Whitelist": []
}

For more information, see [Editing an Endpoint](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [UpdateOriginEndpoint](#) in *AWS CLI Command Reference*.

## MediaPackage VOD examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

**Actions**

create-asset

The following code example shows how to use create-asset.

**AWS CLI**

To create an asset

The following create-asset example creates an asset named Chicken_Asset in the current AWS account. The asset ingests the file 30sec_chicken.smil to MediaPackage.

```
aws mediapackage-vod create-asset \
  --id chicken_asset \
  --packaging-group-id hls_chicken_gp \
  --source-role-arn arn:aws:iam::111122223333:role/EMP_Vod \
  --source-arn arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil
```

Output:

```json
{
  "Id":"chicken_asset",
  "PackagingGroupId":"hls_chicken_gp",
  "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
  "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
  "EgressEndpoints": [ 
    {
      "PackagingConfigurationId":"New_config_1",
      "Url":"https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-vod.us-west-2.amazonaws.com/out/
    }
  ]
}
```
create-packaging-configuration

The following code example shows how to use create-packaging-configuration.

AWS CLI

To create a packaging configuration

The following create-packaging-configuration example creates a packaging configuration named new_hls in the packaging group named hls_chicken. This example uses a file on disk named hls_pc.json to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
   --id new_hls \
   --packaging-group-id hls_chicken \
   --hls-package file://hls_pc.json
```

Contents of hls_pc.json:

```json
{
   "HlsManifests": [
      {
         "AdMarkers": "NONE",
         "IncludeIframeOnlyStream": false,
         "ManifestName": "string",
         "ProgramDateTimeIntervalSeconds": 60,
      }
   ]
}
```
"RepeatExtXKey":true,
"StreamSelection":{
    "MaxVideoBitsPerSecond":1000,
    "MinVideoBitsPerSecond":0,
    "StreamOrder":"ORIGINAL"
}
},
"SegmentDurationSeconds":6,
"UseAudioRenditionGroup":false
}

Output:
{
    "Id":"new_hls",
    "PackagingGroupId":"hls_chicken",
    "HlsManifests":{
        "SegmentDurationSeconds":6,
        "UseAudioRenditionGroup":false,
        "HlsMarkers":[
            {
                "AdMarkers":"NONE",
                "IncludeIframeOnlyStream":false,
                "ManifestName":"string",
                "ProgramDateTimeIntervalSeconds":60,
                "RepeatExtXKey":true,
                "StreamSelection":{
                    "MaxVideoBitsPerSecond":1000,
                    "MinVideoBitsPerSecond":0,
                    "StreamOrder":"ORIGINAL"
                }
            }
        ]
    }
}

For more information, see [Creating a Packaging Configuration](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreatePackagingConfiguration](#) in *AWS CLI Command Reference*. 

Actions and scenarios
**create-packaging-group**

The following code example shows how to use `create-packaging-group`.

**AWS CLI**

**To create a packaging group**

The following `create-packaging-group` example lists all of the packaging groups that are configured in the current AWS account.

```bash
aws mediapackage-vod create-packaging-group \
   --id hls_chicken
```

**Output:**

```json
{
   "Id": "hls_chicken"
}
```

For more information, see [Creating a Packaging Group](https://docs.aws.amazon.com/mediapackage/latest/userguide/creating-packaging-group.html) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreatePackagingGroup](https://docs.aws.amazon.com/cli/latest/reference/mediapackage-vod/create-packaging-group.html) in *AWS CLI Command Reference*.

**delete-asset**

The following code example shows how to use `delete-asset`.

**AWS CLI**

**To delete an asset**

The following `delete-asset` example deletes the asset named 30sec_chicken.

```bash
aws mediapackage-vod delete-asset \
   --id 30sec_chicken
```

This command produces no output.

For more information, see [Deleting an Asset](https://docs.aws.amazon.com/mediapackage/latest/userguide/deleting-asset.html) in the *AWS Elemental MediaPackage User Guide*. 
• For API details, see DeleteAsset in AWS CLI Command Reference.

delete-packaging-configuration

The following code example shows how to use delete-packaging-configuration.

AWS CLI

**To delete a packaging configuration**

The following delete-packaging-configuration example deletes the packaging configuration named CMAF.

```
aws mediapackage-vod delete-packaging-configuration --id CMAF
```

This command produces no output.

For more information, see Deleting a Packaging Configuration in the AWS Elemental MediaPackage User Guide.

• For API details, see DeletePackagingConfiguration in AWS CLI Command Reference.

delete-packaging-group

The following code example shows how to use delete-packaging-group.

AWS CLI

**To delete a packaging group**

The following delete-packaging-group example deletes the packaging group named Dash_widevine.

```
aws mediapackage-vod delete-packaging-group --id Dash_widevine
```

This command produces no output.

For more information, see Deleting a Packaging Group in the AWS Elemental MediaPackage User Guide.

• For API details, see DeletePackagingGroup in AWS CLI Command Reference.
describe-asset

The following code example shows how to use describe-asset.

AWS CLI

To describe an asset

The following describe-asset example displays all of the details of the asset named 30sec_chicken.

```bash
aws mediapackage-vod describe-asset \
   --id 30sec_chicken
```

Output:

```
{
   "Id":"30sec_chicken",
   "PackagingGroupId":"Packaging_group_1",
   "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
   "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
   "EgressEndpoints":[
      {
         "PackagingConfigurationId":"DASH",
         "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-vod.us-west-2.amazonaws.com/out/v1/aad7962c569946119c2d5a691be5663c/66c25aff456d463aae0855172b3beb27/4ddfda6da1c7c279a1b8401cb678c95/index.mpd"
      },
      {
         "PackagingConfigurationId":"HLS",
         "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-vod.us-west-2.amazonaws.com/out/v1/aad7962c569946119c2d5a691be5663c/6e5bf286a3414254a2bf0d22ae148d7e/06b5875b4d004c3cbdc4da2dc449d8/index.m3u8"
      },
      {
         "PackagingConfigurationId":"CMAF",
         "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-vod.us-west-2.amazonaws.com/out/v1/aad7962c569946119c2d5a691be5663c/628fb5d8d89e4702958b020af27fde0e/05eb062214064238ad6330a443b5ed/index.m3u8"
      }
   ]
}
```
describe-packaging-configuration

The following code example shows how to use describe-packaging-configuration.

AWS CLI

To describe a packaging configuration

The following describe-packaging-configuration example displays all of the details of the packaging configuration named DASH.

```
aws mediapackage-vod describe-packaging-configuration "--id DASH"
```

Output:

```
{
    "Id":"DASH",
    "PackagingGroupId":"Packaging_group_1",
    "DashPackage": [
        {
            "SegmentDurationSeconds": "2"
        },
        {
            "DashManifests": {
                "ManifestName": "index",
                "MinBufferTimeSeconds": "30",
                "Profile": "NONE"
            }
        }
    ]
}
```
For more information, see [Viewing Packaging Configuration Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingConfiguration](#) in *AWS CLI Command Reference*.

### describe-packaging-group

The following code example shows how to use `describe-packaging-group`.

**AWS CLI**

To describe a packaging group

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```bash
aws mediapackage-vod describe-packaging-group \
   --id Packaging_group_1
```

**Output:**

```
{
   "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/Packaging_group_1",
   "Id": "Packaging_group_1"
}
```

For more information, see [Viewing Packaging Group Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingGroup](#) in *AWS CLI Command Reference*.

### list-assets

The following code example shows how to use `list-assets`.

**AWS CLI**

To list all assets

The following `list-assets` example lists all of the assets that are configured in the current AWS account.
aws mediapackage-vod list-assets

Output:

```json
{
  "Assets": [
    {
      "Id": "30sec_chicken",
      "PackagingGroupId": "Packaging_group_1",
      "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
      "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod"
    }
  ]
}
```

For more information, see [Viewing Asset Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListAssets](#) in *AWS CLI Command Reference*.

### list-packaging-configurations

The following code example shows how to use `list-packaging-configurations`.

**AWS CLI**

#### To list all packaging configurations

The following `list-packaging-configurations` example lists all of the packaging configurations that are configured on the packaging group named *Packaging_group_1*.

```
aws mediapackage-vod list-packaging-configurations \
  --packaging-group-id Packaging_group_1
```

Output:

```json
{
  "PackagingConfigurations": [
    {
      "Id": "CMAF",
      "PackagingGroupId": "Packaging_group_1",
      
```
"CmafPackage": [  
    {  
        "SegmentDurationSeconds": "2"
    },  
    {  
        "HlsManifests": {  
            "AdMarkers": "NONE",
            "RepeatExtXKey": "False",
            "ManifestName": "index",
            "ProgramDateTimeIntervalSeconds": "0",
            "IncludeIframeOnlyStream": "False"
        }
    }
],  
"Id": "DASH",
"PackagingGroupId": "Packaging_group_1",
"DashPackage": [  
    {  
        "SegmentDurationSeconds": "2"
    },  
    {  
        "DashManifests": {  
            "ManifestName": "index",
            "MinBufferTimeSeconds": "30",
            "Profile": "NONE"
        }
    }
],

                        "81376844-f976-481e-a84e-cc25d39b0b33"
                    ]
                }
            }
        },
        {
            "HlsManifests": {
                "AdMarkers": "NONE",
                "RepeatExtXKey": "False",
                "ManifestName": "index",
                "ProgramDateTimeIntervalSeconds": "0",
                "IncludeIframeOnlyStream": "False"
            }
        }
    ]
}
For more information, see Viewing Packaging Configuration Details in the AWS Elemental MediaPackage User Guide.

- For API details, see ListPackagingConfigurations in AWS CLI Command Reference.

list-packaging-groups

The following code example shows how to use list-packaging-groups.

AWS CLI

To list all packaging groups

The following list-packaging-groups example lists all of the packaging groups that are configured in the current AWS account.

```bash
aws mediapackage-vod list-packaging-groups
```

Output:

```json
{
  "PackagingGroups": [
    {
      "Id": "Dash_widevine"
    },
    {
      "Id": "Encrypted_HLS"
    },
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/Packaging_group_1",
      "Id": "Packaging_group_1"
    }
  ]
}
```
For more information, see Viewing Packaging Group Details in the AWS Elemental MediaPackage User Guide.

- For API details, see ListPackagingGroups in AWS CLI Command Reference.

**MediaStore Data Plane examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**delete-object**

The following code example shows how to use delete-object.

**AWS CLI**

**To delete an object**

The following delete-object example deletes the specified object.

```
aws mediastore-data delete-object
    --endpoint=https://aaabbbccdddddee.data.mediastore.us-west-2.amazonaws.com
    --path=/folder_name/README.md
```

This command produces no output.
For more information, see Deleting an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteObject in AWS CLI Command Reference.

describe-object

The following code example shows how to use describe-object.

AWS CLI

To view the headers for an object

The following describe-object example displays the headers for an object at the specified path.

```bash
aws mediastore-data describe-object \\
--endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \\
--path events/baseball/setup.jpg
```

Output:

```
{
  "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
  "ContentType": "image/jpeg",
  "ContentLength": "3860266",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DescribeObject in AWS CLI Command Reference.

get-object

The following code example shows how to use get-object.

AWS CLI

Example 1: To download an entire object

The following get-object example downloads the specified object.
aws mediastore-data get-object \   --endpoint https://aaabbbccdddde.data.mediastore.us-west-2.amazonaws.com \   --path events/baseball/setup.jpg setup.jpg

Output:

```
{
    "ContentType": "image/jpeg",
    "StatusCode": 200,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "3860266",
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"
}
```

Example 2: To download part of an object

The following get-object example downloads the specified part of an object.

aws mediastore-data get-object \   --endpoint https://aaabbbccdddde.data.mediastore.us-west-2.amazonaws.com \   --path events/baseball/setup.jpg setup.jpg \   --range "bytes=0-100"

Output:

```
{
    "StatusCode": 206,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentRange": "bytes 0-100/3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "101"
}
```

For more information, see [Downloading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetObject](#) in *AWS CLI Command Reference*.

**list-items**

The following code example shows how to use list-items.
AWS CLI

Example 1: To view a list of items (objects and folders) stored in a container

The following list-items example displays a list of items (objects and folders) stored in the specified container.

```bash
aws mediastore-data list-items \
   --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```json
{
   "Items": [
      {
         "Type": "OBJECT",
         "ContentLength": 3784,
         "Name": "setup.jpg",
         "ETag": "2aa333bb88d8d22d777e999c88d4a9eeeee4dd89ff7f555555555555555da6d3",
         "ContentType": "image/jpeg",
         "LastModified": 1563571859.379
      },
      {
         "Type": "FOLDER",
         "Name": "events"
      }
   ]
}
```

Example 2: To view a list of items (objects and folders) stored in a folder

The following list-items example displays a list of items (objects and folders) stored in the specified folder.

```bash
aws mediastore-data list-items \
   --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com \
   --path events/baseball
```

Output:

```json
{
}
```
For more information, see View a List of Objects in the AWS Elemental MediaStore User Guide.

- For API details, see ListItems in AWS CLI Command Reference.

**put-object**

The following code example shows how to use put-object.

**AWS CLI**

**Example 1: To upload an object to a container**

The following put-object example uploads an object to the specified container.

```bash
aws mediastore-data put-object \
    --endpoint https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

**Output:**

```json
{
    "ContentSHA256": "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eefeee4dd89ff7f55555555555da6d3"
}
```
Example 2: To upload an object to a folder within a container

The following put-object example upload an object to the specified folder within a container.

```bash
aws mediastore-data put-object \
   --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com \
   --body ReadMe.md \n   --path /september-events/ReadMe.md \n   --cache-control "max-age=6, public" \n   --content-type binary/octet-stream
```

Output:

```json
{
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f555555555555da6d3",
   "ContentSHA256": "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
   "StorageClass": "TEMPORAL"
}
```

For more information, see [Uploading an Object](#) in the AWS Elemental MediaStore User Guide.

- For API details, see [PutObject](#) in AWS CLI Command Reference.

### MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

delete-playback-configuration

The following code example shows how to use delete-playback-configuration.

AWS CLI

To delete a configuration

The following delete-playback-configuration deletes a configuration named campaign_short.

```bash
aws mediatailor delete-playback-configuration \
  --name campaign_short
```

This command produces no output.

For more information, see Deleting a Configuration in the AWS Elemental MediaTailor User Guide.

- For API details, see DeletePlaybackConfiguration in AWS CLI Command Reference.

get-playback-configuration

The following code example shows how to use get-playback-configuration.

AWS CLI

To describe a configuration

The following get-playback-configuration displays all of the details of the configuration named west_campaign.

```bash
aws mediatailor get-playback-configuration \
  --name west_campaign
```

Output:
For more information, see Viewing a Configuration in the AWS Elemental MediaTailor User Guide.

- For API details, see GetPlaybackConfiguration in AWS CLI Command Reference.

list-playback-configurations

The following code example shows how to use list-playback-configurations.

AWS CLI

To list all configurations

The following list-playback-configurations displays all of the details of the configuration on the current AWS account.
aws mediatailor list-playback-configurations

Output:

```json
{
    "Items": [
        {
            "AdDecisionServerUrl": "http://your.ads.url",
            "CdnConfiguration": {},

  }
}

For more information, see Viewing a Configuration in the AWS Elemental MediaTailor User Guide.

- For API details, see ListPlaybackConfigurations in AWS CLI Command Reference.

put-playback-configuration

The following code example shows how to use put-playback-configuration.

AWS CLI

To create a configuration

The following put-playback-configuration creates a configuration named campaign_short.

```bash
aws mediatailor put-playback-configuration \
  --name campaign_short \n  --ad-decision-server-url http://your.ads.url \n  --video-content-source-url http://video.bucket/index.m3u8
```
Output:

```json
{
    "AdDecisionServerUrl": "http://your.ads.url",
    "CdnConfiguration": {},
    "DashConfiguration": {
        "ManifestEndpointPrefix": "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/dash/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
        "MpdLocation": "EMT_DEFAULT",
        "OriginManifestType": "MULTI_PERIOD"
    },
    "HlsConfiguration": {

Actions

**copy-snapshot**

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**To copy a snapshot**

The following copy-snapshot example creates a copy of a snapshot.

```bash
aws memorydb copy-snapshot \
   --source-snapshot-name my-cluster-snapshot \
   --target-snapshot-name my-cluster-snapshot-copy
```

**Output**

```
{
   "Snapshot": {
      "Name": "my-cluster-snapshot-copy",
      "Status": "creating",
      "Source": "manual",
      "ClusterConfiguration": {
         "Name": "my-cluster",
         "Description": "",
         "NodeType": "db.r6g.large",
         "EngineVersion": "6.2",
         "MaintenanceWindow": "wed:03:00-wed:04:00",
         "Port": 6379,
```
For more information, see [Copying a snapshot](https://aws.amazon.com/memorystore/user-guide/) in the MemoryDB User Guide.

- For API details, see [CopySnapshot](https://docs.aws.amazon.com/cli/latest/reference/memorydb/copy-snapshot.html) in AWS CLI Command Reference.

### create-acl

The following code example shows how to use create-acl.

**AWS CLI**

**To create an ACL**

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
  --acl-name "new-acl-1"  \
  --user-names "my-user"
```

**Output:**

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "creating",
        "UserNames": [
            "my-user"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
    }
}
```
For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [CreateAcl](#) in *AWS CLI Command Reference*.

**create-cluster**

The following code example shows how to use create-cluster.

**AWS CLI**

**To create a cluster**

The following `create-cluster` example creates a new cluster.

```bash
aws memorydb create-cluster \
  --cluster-name my-new-cluster \
  --node-type db.r6g.large \
  --acl-name my-acl \
  --subnet-group my-sg
```

**Output:**

```json
{
  "Cluster": {
    "Name": "my-new-cluster",
    "Status": "creating",
    "NumberOfShards": 1,
    "AvailabilityMode": "MultiAZ",
    "ClusterEndpoint": {
      "Port": 6379
    },
    "NodeType": "db.r6g.large",
    "EngineVersion": "6.2",
    "EnginePatchVersion": "6.2.6",
    "ParameterGroupName": "default.memorydb-redis6",
    "ParameterGroupStatus": "in-sync",
    "SubnetGroupName": "my-sg",
    "TLSEnabled": true,
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-new-cluster",
    "SnapshotRetentionLimit": 0,
    "MaintenanceWindow": "sat:10:00-sat:11:00",
    "SnapshotWindow": "07:30-08:30",
  }
}
```
For more information, see Managing Clusters in the MemoryDB User Guide.

- For API details, see CreateCluster in AWS CLI Command Reference.

create-parameter-group

The following code example shows how to use create-parameter-group.

**AWS CLI**

**To create a parameter group**

The following create-parameter-group example creates a parameter group.

```bash
aws memorydb create-parameter-group \
   --parameter-group-name myRedis6x \
   --family memorydb_redis6 \
   --description "my-parameter-group"
```

**Output:**

```json
{
   "ParameterGroup": {
      "Name": "myredis6x",
      "Family": "memorydb_redis6",
      "Description": "my-parameter-group",
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:parametergroup/myredis6x"
   }
}
```

For more information, see Creating a parameter group in the MemoryDB User Guide.

- For API details, see CreateParameterGroup in AWS CLI Command Reference.

create-snapshot

The following code example shows how to use create-snapshot.
AWS CLI

To create a snapshot

The following create-snapshot example creates a snapshot.

```
aws memorydb create-snapshot \
  --cluster-name my-cluster \
  --snapshot-name my-cluster-snapshot
```

Output:

```
{
  "Snapshot": {
    "Name": "my-cluster-snapshot1",
    "Status": "creating",
    "Source": "manual",
    "ClusterConfiguration": {
      "Name": "my-cluster",
      "Description": "",
      "NodeType": "db.r6g.large",
      "EngineVersion": "6.2",
      "MaintenanceWindow": "wed:03:00-wed:04:00",
      "Port": 6379,
      "ParameterGroupName": "default.memorydb-redis6",
      "SubnetGroupName": "my-sg",
      "VpcId": "vpc-862xxxxx",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "04:30-05:30",
      "NumShards": 2
    }
  }
}
```

For more information, see Making manual snapshots in the MemoryDB User Guide.

- For API details, see CreateSnapshot in AWS CLI Command Reference.

create-subnet-group

The following code example shows how to use create-subnet-group.
To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```bash
aws memorydb create-subnet-group \
  --subnet-group-name mysubnetgroup \
  --description "my subnet group" \
  --subnet-ids subnet-5623xxxx
```

Output:

```json
{
  "SubnetGroup": {
    "Name": "mysubnetgroup",
    "Description": "my subnet group",
    "VpcId": "vpc-86257xxx",
    "Subnets": [
      {
        "Identifier": "subnet-5623xxxx",
        "AvailabilityZone": {
          "Name": "us-east-1a"
        }
      }
    ],
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxx:subnetgroup/mysubnetgroup"
  }
}
```

For more information, see [Creating a subnet group](#) in the MemoryDB User Guide.

- For API details, see [CreateSubnetGroup](#) in AWS CLI Command Reference.

create-user

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.
aws memorydb create-user \
  --user-name user-name-1 \
  --access-string "~objects:* ~items:* ~public:*" \
  --authentication-mode \
    Passwords="enterapasswordhere",Type=password

Output:

```
{
  "User": {
    "Name": "user-name-1",
    "Status": "active",
    "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
    "ACLNames": [],
    "MinimumEngineVersion": "6.2",
    "Authentication": {
      "Type": "password",
      "PasswordCount": 1
    },
    "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/user-name-1"
  }
}
```

For more information, see [Authenticating users with Access Control Lists](https://docs.aws.amazon.com/memorydb/latest/userguide/Authenticating-users-with-ACLs.html) in the [MemoryDB User Guide](https://docs.aws.amazon.com/memorydb/latest/userguide/)

**delete-acl**

The following code example shows how to use delete-acl.

**AWS CLI**

**To delete an ACL**

The following `delete-acl` example deletes an Access control list.

```
aws memorydb delete-acl \
  --acl-name "new-acl-1"
```

Output:
For more information, see Authenticating users with Access Control Lists in the MemoryDB User Guide.

- For API details, see DeleteAcl in AWS CLI Command Reference.

**delete-cluster**

The following code example shows how to use delete-cluster.

**AWS CLI**

**To delete a cluster**

The following delete-cluster example deletes a cluster.

```bash
aws memorydb delete-cluster \
  --cluster-name my-new-cluster
```

**Output:**

```json
{
  "Cluster": {
    "Name": "my-new-cluster",
    "Status": "deleting",
    "NumberOfShards": 1,
    "ClusterEndpoint": {
      "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-east-1.amazonaws.com",
    }
  }
}
```
"Port": 6379
"NodeType": "db.r6g.large",
"EngineVersion": "6.2",
"EnginePatchVersion": "6.2.6",
"ParameterGroupName": "default.memorydb-redis6",
"ParameterGroupStatus": "in-sync",
"SubnetGroupName": "my-sg",
"TLSEnabled": true,
"ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-new-cluster",
"SnapshotRetentionLimit": 0,
"MaintenanceWindow": "sat:10:00-sat:11:00",
"SnapshotWindow": "07:30-08:30",
"AutoMinorVersionUpgrade": true
}
}

For more information, see Deleting a cluster in the MemoryDB User Guide.

- For API details, see DeleteCluster in AWS CLI Command Reference.

delete-parameter-group

The following code example shows how to use delete-parameter-group.

AWS CLI

To delete a parameter group

The following delete-parameter-group example deletes a parameter group.

```
aws memorydb delete-parameter-group \
  --parameter-group-name myRedis6x
```

Output:

```
{
  "ParameterGroup": {
    "Name": "myredis6x",
    "Family": "memorydb_redis6",
    "Description": "my-parameter-group",
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/myredis6x"
  }
}
```
For more information, see Deleting a parameter group in the MemoryDB User Guide.

- For API details, see DeleteParameterGroup in AWS CLI Command Reference.

### delete-snapshot

The following code example shows how to use delete-snapshot.

**AWS CLI**

**To delete a snapshot**

The following delete-snapshot example deletes a snapshot.

```bash
aws memorydb delete-snapshot \
  --snapshot-name my-cluster-snapshot
```

**Output:**

```json
{
  "Snapshot": {
    "Name": "my-cluster-snapshot",
    "Status": "deleting",
    "Source": "manual",
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-
    snapshot",
    "ClusterConfiguration": {
      "Name": "my-cluster",
      "Description": "",
      "NodeType": "db.r6g.large",
      "EngineVersion": "6.2",
      "MaintenanceWindow": "wed:03:00-wed:04:00",
      "Port": 6379,
      "ParameterGroupName": "default.memorydb-redis6",
      "SubnetGroupName": "my-sg",
      "VpcId": "vpc-862xxxxx",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "04:30-05:30",
      "NumShards": 2
    }
  }
}
```
For more information, see [Deleting a snapshot](#) in the MemoryDB User Guide.

- For API details, see [DeleteSnapshot](#) in AWS CLI Command Reference.

### delete-subnet-group

The following code example shows how to use delete-subnet-group.

**AWS CLI**

**To delete a subnet group**

The following delete-subnet-group example deletes a subnet.

```bash
aws memorydb delete-subnet-group \\
   --subnet-group-name mysubnetgroup
```

**Output:**

```
{
   "SubnetGroup": {
       "Name": "mysubnetgroup",
       "Description": "my subnet group",
       "VpcId": "vpc-86xxxx4fc",
       "Subnets": [
            {
                "Identifier": "subnet-56xxxx61b",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            },
            {
                "Identifier": "subnet-56xxxx61b",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
       "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
   }
}
```

For more information, see [Deleting a subnet group](#) in the MemoryDB User Guide.
• For API details, see [DeleteSubnetGroup](#) in *AWS CLI Command Reference*.

**delete-user**

The following code example shows how to use `delete-user`.

**AWS CLI**

To delete a user

The following `delete-user` example deletes a user.

```
aws memorydb delete-user \\
   --user-name my-user
```

Output:

```json
{
   "User": {
      "Name": "my-user",
      "Status": "deleting",
      "AccessString": "on ~app:* resetchannels -@all +@read",
      "ACLNames": [
         "my-acl"
      ],
      "MinimumEngineVersion": "6.2",
      "Authentication": {
         "Type": "password",
         "PasswordCount": 1
      },
      "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
   }
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

• For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

**describe-acls**

The following code example shows how to use `describe-acls`.
AWS CLI

To return a list of ACLs

The following `describe-acls` returns a list of ACLs.

```
aws memorydb describe-acls
```

Output:

```json
{
   "ACLs": [
      {
         "Name": "open-access",
         "Status": "active",
         "UserNames": [
            "default"
         ],
         "MinimumEngineVersion": "6.2",
         "Clusters": [],
         "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/open-access"
      },
      {
         "Name": "my-acl",
         "Status": "active",
         "UserNames": [],
         "MinimumEngineVersion": "6.2",
         "Clusters": [
            "my-cluster"
         ],
         "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:acl/my-acl"
      }
   ]
}
```

For more information, see [Authenticating users with Access Control Lists](https://docs.aws.amazon.com/memorydb/latest/userguide/Authenticating-Users.html) in the [MemoryDB User Guide](https://docs.aws.amazon.com/memorydb/latest/userguide/Introduction.html).

**describe-clusters**

The following code example shows how to use `describe-clusters`. 
AWS CLI

To return a list of clusters

The following describe-clusters returns a list of clusters.

```bash
aws memorydb describe-clusters
```

Output:

```json
{
   "Clusters": [
      {
         "Name": "my-cluster",
         "Status": "available",
         "NumberOfShards": 2,
         "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.llru6f.memorydb.us-east-1.amazonaws.com",
            "Port": 6379
         },
         "NodeType": "db.r6g.large",
         "EngineVersion": "6.2",
         "EnginePatchVersion": "6.2.6",
         "ParameterGroupName": "default.memorydb-redis6",
         "ParameterGroupStatus": "in-sync",
         "SecurityGroups": [
            {
               "SecurityGroupId": "sg-0a1434xxxxxc9fae",
               "Status": "active"
            }
         ],
         "SubnetGroupName": "pat-sg",
         "TLSEnabled": true,
         "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:cluster/my-cluster",
         "SnapshotRetentionLimit": 0,
         "MaintenanceWindow": "wed:03:00-wed:04:00",
         "SnapshotWindow": "04:30-05:30",
         "ACLName": "my-acl",
         "AutoMinorVersionUpgrade": true
      }
   ]
}
```
For more information, see Managing clusters in the MemoryDB User Guide.

- For API details, see DescribeClusters in AWS CLI Command Reference.

**describe-engine-versions**

The following code example shows how to use describe-engine-versions.

**AWS CLI**

**To return a list of engine versions**

The following describe-engine-versions returns a list of engine versions.

```bash
aws memorydb describe-engine-versions
```

**Output:**

```json
{
   "EngineVersions": [
      {
         "EngineVersion": "6.2",
         "EnginePatchVersion": "6.2.6",
         "ParameterGroupFamily": "memorydb_redis6"
      }
   ]
}
```

For more information, see Engine versions and upgrading in the MemoryDB User Guide.

- For API details, see DescribeEngineVersions in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use describe-events.

**AWS CLI**

**To return a list of events**

The following describe-events returns a list of events.

```bash
aws memorydb describe-events
```
Output:

```json
{
  "Events": [
    {
      "SourceName": "my-cluster",
      "SourceType": "cluster",
      "Message": "Increase replica count started for replication group my-cluster on 2022-07-22T14:09:01.440Z",
      "Date": "2022-07-22T07:09:01.443000-07:00"
    },
    {
      "SourceName": "my-user",
      "SourceType": "user",
      "Message": "Create user my-user operation completed.",
      "Date": "2022-07-22T07:00:02.975000-07:00"
    }
  ]
}
```

For more information, see [Monitoring events](#) in the [MemoryDB User Guide](#).

- For API details, see [DescribeEvents](#) in [AWS CLI Command Reference](#).

### describe-parameter-groups

The following code example shows how to use `describe-parameter-groups`.

**AWS CLI**

**To return a list of parameter groups**

The following `describe-parameter-groups` returns a list of parameter groups.

```
aws memorydb describe-parameter-groups
```

**Output:**

```json
{
  "ParameterGroups": [
    {
      "Name": "default.memorydb-redis6",
      "Family": "memorydb_redis6",
      ...
    }
  ]
}
```
For more information, see Configuring engine parameters using parameter groups in the MemoryDB User Guide.

- For API details, see DescribeParameterGroups in AWS CLI Command Reference.

describe-parameters

The following code example shows how to use describe-parameters.

AWS CLI

To return a list of parameters

The following describe-parameters returns a list of parameters.

aws memorydb describe-parameters

Output:

{
   "Parameters": [
   {
   "Name": "acllog-max-len",
   "Value": "128",
   "Description": "The maximum length of the ACL Log",
   "DataType": "integer",
   "AllowedValues": "1-10000",
   "MinimumEngineVersion": "6.2.4"
   },

For more information, see Configuring engine parameters using parameter groups in the MemoryDB User Guide.

- For API details, see DescribeParameters in AWS CLI Command Reference.

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

To return a list of snapshots

The following describe-snapshots returns a list of snapshots.

```bash
aws memorydb describe-snapshots
```

Output:

```
{
  "Snapshots": [
    {
      "Name": "my-cluster-snapshot",
      "Status": "available",
      "Source": "manual",
      "ClusterConfiguration": {
        "Name": "zset-max-ziplist-value",
        "Value": "64",
        "Description": "The threshold of biggest sorted set entries in order for the dataset to be compressed",
        "DataType": "integer",
        "AllowedValues": "0-",
        "MinimumEngineVersion": "6.2.4"
      }
    }
  ]
}
```
For more information, see **Snapshot and restore** in the *MemoryDB User Guide*.

- For API details, see **DescribeSnapshots** in *AWS CLI Command Reference*.

### describe-subnet-groups

The following code example shows how to use `describe-subnet-groups`.

**AWS CLI**

**To return a list of subnet groups**

The following `aws memorydb describe-subnet-groups` returns a list of subnet groups.

```
aws memorydb describe-subnet-groups
```

**Output**

```
{
  "SubnetGroups": [
    {
      "Name": "my-sg",
      "Description": "pat-sg",
      "VpcId": "vpc-86xxx4fc",
      "Subnets": [
        {
          "Identifier": "subnet-faxx84a6",
```
"AvailabilityZone": {
    "Name": "us-east-1b"
},

{
    "Identifier": "subnet-56xxf61b",
    "AvailabilityZone": {
        "Name": "us-east-1a"
    }
}
],

"ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:subnetgroup/my-sg"
}
}

For more information, see Subnets and subnet groups in the MemoryDB User Guide.

- For API details, see DescribeSubnetGroups in AWS CLI Command Reference.

describe-users

The following code example shows how to use describe-users.

AWS CLI

To return a list of users

The following describe-users returns a list of users.

aws memorydb describe-users

Output

{
    "Users": [
        {
            "Name": "default",
            "Status": "active",
            "AccessString": "on ~* &* +@all",
            "ACLNames": [
                "open-access"
            ],
        }
    ]
}
For more information, see [Authenticating users with Access Control Lists](#) in the MemoryDB User Guide.

- For API details, see [DescribeUsers](#) in AWS CLI Command Reference.

## failover-shard

The following code example shows how to use `failover-shard`.

### AWS CLI

#### To fail over a shard

The following `failover-shard` command fails over a shard.

```
aws memorydb failover-shard \
  --cluster-name my-cluster --shard-name 0001
```

**Output:**

{
For more information, see [Minimizing downtime with MultiAZ](https://docs.aws.amazon.com/memorydb/latest/userguide/Minimizing-downtime-with-MultiAZ.html) in the *MemoryDB User Guide*.

- For API details, see [FailoverShard](https://docs.aws.amazon.com/cli/latest/reference/memorydb/failover-shard.html) in *AWS CLI Command Reference*.

### list-allowed-node-type-updates

The following code example shows how to use `list-allowed-node-type-updates`.

#### AWS CLI

**To return a list of allowed node type updates**

The following `list-allowed-node-type-updates` returns a list of available node type updates.
aws memorydb list-allowed-node-type-updates

Output:

```json
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxxx45c9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see [Scaling](#) in the MemoryDB User Guide.

- For API details, see [ListAllowedNodeTypeUpdates](#) in AWS CLI Command Reference.

**list-tags**

The following code example shows how to use list-tags.
AWS CLI

To return a list of tags

The following list-tags returns a list of tags.

```
aws memorydb list-tags \
```

Output:

```
{
   "TagList": [
      {
         "Key": "mytag",
         "Value": "myvalue"
      }
   ]
}
```

For more information, see [Tagging resources](#) in the [MemoryDB User Guide](#).

- For API details, see [ListTags](#) in [AWS CLI Command Reference](#).

reset-parameter-group

The following code example shows how to use reset-parameter-group.

AWS CLI

To reset a parameter group

The following reset-parameter-group resets a parameter group.

```
aws memorydb reset-parameter-group \
   --parameter-group-name my-parameter-group \
   --all-parameters
```

Output:

```
{
}
```
"ParameterGroup": {
    "Name": "my-parameter-group",
    "Family": "memorydb_redis6",
    "Description": "my parameter group",
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/my-parameter-group"
}

For more information, see Configuring engine parameters using parameter groups in the MemoryDB User Guide.

- For API details, see ResetParameterGroup in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource ` adds a tag to a resource.

aws memorydb tag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster \
    --tags Key="mykey",Value="myvalue"

Output:

{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        },
        {
            "Key": "mykey",
            "Value": "myvalue"
        }
    ]
}
For more information, see Tagging resources in the MemoryDB User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To update an ACL

The following update-acl ` updates an ACL by adding a user.

```
aws memorydb untag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster \
    --tag-keys mykey
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the MemoryDB User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-cluster

The following code example shows how to use update-cluster.

AWS CLI

To update a cluster

The following update-cluster ` updates the parameter group of a cluster to my-parameter-group.
aws memorydb update-cluster \
   --cluster-name my-cluster \
   --parameter-group-name my-parameter-group

Output:

{
   "Cluster": {
       "Name": "my-cluster",
       "Status": "available",
       "NumberOfShards": 2,
       "AvailabilityMode": "MultiAZ",
       "ClusterEndpoint": {
           "Address": "clustercfg.my-cluster.llru6f.memorydb.us-east-1.amazonaws.com",
           "Port": 6379
       },
       "NodeType": "db.r6g.large",
       "EngineVersion": "6.2",
       "EnginePatchVersion": "6.2.6",
       "ParameterGroupName": "my-parameter-group",
       "ParameterGroupStatus": "in-sync",
       "SecurityGroups": [
           {
               "SecurityGroupId": "sg-0a143xxxxxc9fae",
               "Status": "active"
           }
       ],
       "SubnetGroupName": "pat-sg",
       "TLSEnabled": true,
       "ARN": "arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster",
       "SnapshotRetentionLimit": 0,
       "MaintenanceWindow": "wed:03:00-wed:04:00",
       "SnapshotWindow": "04:30-05:30",
       "ACLName": "my-acl",
       "AutoMinorVersionUpgrade": true
   }
}

For more information, see [Modifying a cluster](Modifying-a-cluster) in the [MemoryDB User Guide](MemoryDB_User_Guide).

- For API details, see [UpdateCluster](UpdateCluster) in [AWS CLI Command Reference](AWS_CLI_Command_Reference).
**update-parameter-group**

The following code example shows how to use `update-parameter-group`.

**AWS CLI**

To update a parameter group

The following `update-parameter-group` updates a parameter group.

```bash
aws memorydb update-parameter-group \
   --parameter-group-name my-parameter-group \
   --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```json
{
   "ParameterGroup": {
      "Name": "my-parameter-group",
      "Family": "memorydb_redis6",
      "Description": "my parameter group",
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/my-parameter-group"
   }
}
```

For more information, see [Modifying a parameter group](#) in the *MemoryDB User Guide*.

- For API details, see [UpdateParameterGroup](#) in *AWS CLI Command Reference*.

**update-subnet-group**

The following code example shows how to use `update-subnet-group`.

**AWS CLI**

To update a subnet group

The following `update-subnet-group` updates a subnet group's subnet ID.

```bash
aws memorydb update-subnet-group \
   --subnet-group-name my-sg \
   --subnet-ids subnet-01f29d458f3xxxxx
```
Output:

```
{
   "SubnetGroup": {
      "Name": "my-sg-1",
      "Description": "my-sg",
      "VpcId": "vpc-09d2cfc01xxxxxxxx",
      "Subnets": [
         {
            "Identifier": "subnet-01f29d458fxxxxxx",
            "AvailabilityZone": {
               "Name": "us-east-1a"
            }
         }
      ],
      "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/my-sg"
   }
}
```

For more information, see Subnets and subnet groups in the MemoryDB User Guide.

- For API details, see UpdateSubnetGroup in AWS CLI Command Reference.

**update-user**

The following code example shows how to use update-user.

**AWS CLI**

**To update a user**

The following update-user modifies a user's access string.

```
aws memorydb update-user --user-name my-user --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
   "User": {
      "Name": "my-user",
      "Status": "modifying",
   }
}
```
"AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
"ACLNames": [    "myt-acl"
],
"MinimumEngineVersion": "6.2",
"Authentication": {
    "Type": "password",
    "PasswordCount": 2
},
"ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
}

For more information, see [Authenticating users with Access Control Lists](#) in the MemoryDB User Guide.

- For API details, see [UpdateUser](#) in AWS CLI Command Reference.

### Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-cluster**

The following code example shows how to use create-cluster.
To create an Amazon MSK cluster

The following create-cluster example creates an MSK cluster named MessagingCluster with three broker nodes. A JSON file named brokernodegroupinfo.json specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the DEFAULT level.

```
aws kafka create-cluster \
  --cluster-name "MessagingCluster" \
  --broker-node-group-info file://brokernodegroupinfo.json \
  --kafka-version "2.2.1" \
  --number-of-broker-nodes 3
```

Contents of brokernodegroupinfo.json:

```json
{
  "InstanceType": "kafka.m5.xlarge",
  "BrokerAZDistribution": "DEFAULT",
  "ClientSubnets": [
    "subnet-012345678911abcd",
    "subnet-0123456789222abcd",
    "subnet-0123456789333abcd"
  ]
}
```

Output:

```
{
a1b2c3d4-5678-90ab-cdef-111111EXAMPLE-2",
  "ClusterName": "MessagingCluster",
  "State": "CREATING"
}
```

For more information, see Create an Amazon MSK Cluster in the Amazon Managed Streaming for Apache Kafka.

- For API details, see CreateCluster in AWS CLI Command Reference.
create-configuration

The following code example shows how to use create-configuration.

AWS CLI

To create a custom Amazon MSK configuration

The following create-configuration example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \
   --name "CustomConfiguration" \
   --description "Topic autolocation enabled; Apache ZooKeeper timeout 2000 ms; Log rolling 604800000 ms." \
   --kafka-versions "2.2.1" \
   --server-properties file://configuration.txt
```

Contents of configuration.txt:

```
auto.create.topics.enable = true
zookeeper.connection.timeout.ms = 2000
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{
   "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
   "CreationTime": "2019-10-09T15:26:05.548Z",
   "LatestRevision":
      {
         "CreationTime": "2019-10-09T15:26:05.548Z",
         "Description": "Topic autolocation enabled; Apache ZooKeeper timeout 2000 ms; Log rolling 604800000 ms.",
         "Revision": 1
      },
   "Name": "CustomConfiguration"
}
```

For more information, see Amazon MSK Configuration Operations in the Amazon Managed Streaming for Apache Kafka Developer Guide.
For API details, see CreateConfiguration in AWS CLI Command Reference.

describe-cluster

The following code example shows how to use describe-cluster.

AWS CLI

To describe a cluster

The following describe-cluster example describes an Amazon MSK cluster.

```bash
aws kafka describe-cluster \
   --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```json
{
   "ClusterInfo": {
      "BrokerNodeGroupInfo": {
         "BrokerAZDistribution": "DEFAULT",
         "ClientSubnets": [
            "subnet-cbfff283",
            "subnet-6746046b"
         ],
         "InstanceType": "kafka.m5.large",
         "SecurityGroups": [
            "sg-f839b688"
         ],
         "StorageInfo": {
            "EbsStorageInfo": {
               "VolumeSize": 100
            }
         }
      },
      "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
      "ClusterName": "demo-cluster-1",
      "CreationTime": "2020-07-09T02:31:36.223000+00:00",
      "CurrentBrokerSoftwareInfo": {
         "KafkaVersion": "2.2.1"
      }
   }
}
```
For more information, see Listing Amazon MSK Clusters in the Amazon Managed Streaming for Apache Kafka Developer Guide.

- For API details, see DescribeCluster in AWS CLI Command Reference.

get-bootstrap-brokers

The following code example shows how to use get-bootstrap-brokers.
**AWS CLI**

**To get bootstrap brokers**

The following get-bootstrap-brokers example retrieves the bootstrap broker information for an Amazon MSK cluster.

```bash
aws kafka get-bootstrap-brokers
   --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```json
{
   "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9092",
   "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9094"
}
```

For more information, see [Getting the Bootstrap Brokers](#) in the Amazon Managed Streaming for Apache Kafka Developer Guide.

- For API details, see [GetBootstrapBrokers](#) in AWS CLI Command Reference.

**list-clusters**

The following code example shows how to use list-clusters.

AWS CLI

**To list the available clusters**

The following list-clusters example lists the Amazon MSK clusters in your AWS account.

```bash
aws kafka list-clusters
```

Output:

```json
{

```
"ClusterInfoList": [
{
   "BrokerNodeGroupInfo": {
      "BrokerAZDistribution": "DEFAULT",
      "ClientSubnets": [
         "subnet-cbfff283",
         "subnet-6746046b"
      ],
      " InstanceType": "kafka.m5.large",
      "SecurityGroups": [
         "sg-f839b688"
      ],
      "StorageInfo": {
         "EbsStorageInfo": {
            "VolumeSize": 100
         }
      }
   },
   "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
   "ClusterName": "demo-cluster-1",
   "CreationTime": "2020-07-09T02:31:36.223000+00:00",
   "CurrentBrokerSoftwareInfo": {
      "KafkaVersion": "2.2.1"
   },
   "CurrentVersion": "K3AEGXETSR30VB",
   "EncryptionInfo": {
      "EncryptionAtRest": {
         "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/a7ca56d5-0768-4b64-a670-339a9f8ef81c"
      },
      "EncryptionInTransit": {
         "ClientBroker": "TLS_PLAINTEXT",
         "InCluster": true
      }
   },
   "EnhancedMonitoring": "DEFAULT",
   "OpenMonitoring": {
      "Prometheus": {
         "JmxExporter": {
            "EnabledInBroker": false
         },
         "NodeExporter": {
            "EnabledInBroker": false
         }
      }
   }
}]}

For more information, see [Listing Amazon MSK Clusters](https://docs.aws.amazon.com/msk/latest/developerguide/list亚马mazon-clusters.html) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [ListClusters](https://docs.aws.amazon.com/cli/latest/reference/clusters/list-clusters.html) in *AWS CLI Command Reference*.

**update-broker-storage**

The following code example shows how to use `update-broker-storage`.

**AWS CLI**

**To update the EBS storage for brokers**

The following `update-broker-storage` example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```bash
aws kafka update-broker-storage \
  --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-1111EXAMPLE-2" \
  --current-version "K21V3IB1VIZYYH" \
  --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"
```

The output returns an ARN for this `update-broker-storage` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.
For more information, see [Update the EBS Storage for Brokers](https://aws.amazon.com/documentation/managedstreamingforapachekafka/#update_ebs_storage_for_brokers) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [UpdateBrokerStorage](https://docs.aws.amazon.com/cli/latest/reference/kafka/update-broker-storage.html) in *AWS CLI Command Reference*.

**update-cluster-configuration**

The following code example shows how to use `update-cluster-configuration`.

**AWS CLI**

To update the configuration of an Amazon MSK cluster

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```
aws kafka update-cluster-configuration
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2"
    --configuration-info file://configuration-info.json
    --current-version "K21V3IB1VIZYYH"
```

Contents of `configuration-info.json`:

```json
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "Revision": 1
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.
For more information, see Update the Configuration of an Amazon MSK Cluster in the Amazon Managed Streaming for Apache Kafka Developer Guide.

• For API details, see UpdateClusterConfiguration in AWS CLI Command Reference.

Network Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

• Actions

Actions

associate-customer-gateway

The following code example shows how to use associate-customer-gateway.

AWS CLI

To associate a customer gateway
The following `associate-customer-gateway` example associates customer gateway `cgw-11223344556677889` in the specified global network with device `device-07f6fd08867abc123`.

```bash
aws networkmanager associate-customer-gateway \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```json
{
    "CustomerGatewayAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "PENDING"
    }
}
```

For more information, see [Customer Gateway Associations](https://docs.aws.amazon.com/networkmanager/latest/userguide/transit-gateway-network-manager.html) in the *Transit Gateway Network Manager Guide*.

- For API details, see [AssociateCustomerGateway](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/associate-customer-gateway.html) in *AWS CLI Command Reference*.

### associate-link

The following code example shows how to use `associate-link`.

**AWS CLI**

**To associate a link**

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```bash
aws networkmanager associate-link \
```
For more information, see [Device and Link Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [AssociateLink](#) in *AWS CLI Command Reference*.

### create-core-network

The following code example shows how to use `create-core-network`.

**AWS CLI**

**To create a core network**

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network
   --global-network-id global-network-0d59060f16a73bc41
   --description "Main headquarters location"
   --tags Key=Name,Value="New York City office"
```

**Output:**

```
{
}
```
"CoreNetwork": {
    "GlobalNetworkId": "global-network-0d59060f16a73bc41",
    "CoreNetworkId": "core-network-0fab62fe438d94db6",
    "CoreNetworkArn": "arn:aws:networkmanager::987654321012:core-network/core-network-0fab62fe438d94db6",
    "Description": "Main headquarters location",
    "CreatedAt": "2022-01-10T19:53:59+00:00",
    "State": "AVAILABLE",
    "Tags": [
        {
            "Key": "Name",
            "Value": "New York City office"
        }
    ]
}
}

For more information, see Core networks in the AWS Cloud WAN User Guide.

- For API details, see CreateCoreNetwork in AWS CLI Command Reference.

create-device

The following code example shows how to use create-device.

AWS CLI

To create a device

The following create-device example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```bash
aws networkmanager create-device
  --global-network-id global-network-01231231231231231 \
  --description "New York office device" \
  --type "office device" \
  --vendor "anycompany" \
  --model "abcabc" \
  --serial-number "1234" \
  --region us-west-2
```

Output:
For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateDevice](#) in *AWS CLI Command Reference*.

### create-global-network

The following code example shows how to use create-global-network.

**AWS CLI**

**To create a global network**

The following create-global-network examples creates a new global network. The initial state upon creation is PENDING.

```bash
aws networkmanager create-global-network
```

**Output:**

```json
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-00a77fc0f722dae74",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/global-network-00a77fc0f722dae74",
        "CreatedAt": "2022-03-14T20:31:56+00:00",
    }
}
```
create-link

The following code example shows how to use create-link.

**AWS CLI**

To create a link

The following create-link example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```bash
aws networkmanager create-link \
   --global-network-id global-network-01231231231231231 \n   --description "VPN Link" \n   --type "broadband" \n   --bandwidth UploadSpeed=10,DownloadSpeed=20 \n   --provider "AnyCompany" \n   --site-id site-444555aaabbb11223 \n   --region us-west-2
```

Output:

```json
{
   "Link": {
      "LinkId": "link-1112222aaaabbb1",
      "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-1112222aaaabbb1",
      "GlobalNetworkId": "global-network-01231231231231231",
      "SiteId": "site-444555aaabbb11223",
      "Description": "VPN Link",
      "Type": "broadband",
      "Bandwidth": {
         "UploadSpeed": 10,
         "DownloadSpeed": 20
      }
   }
}
```

- For API details, see CreateGlobalNetwork in AWS CLI Command Reference.
create-site

The following code example shows how to use create-site.

**AWS CLI**

To create a site

The following create-site example creates a site in the specified global network. The site details include a description and the location information.

```
aws networkmanager create-site \
  --global-network-id global-network-01231231231231231 \ 
  --description  "New York head office" \ 
  --location Latitude=40.7128,Longitude=-74.0060 \ 
  --region us-west-2
```

Output:

```
{
  "Site": {
    "SiteId": "site-444555aaabbb11223",
    "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
    "GlobalNetworkId": "global-network-01231231231231231",
    "Description": "New York head office",
    "Location": {
      "Latitude": "40.7128",
      "Longitude": "-74.0060"
    },
    "CreatedAt": 1575554300.0,
  }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateLink](#) in *AWS CLI Command Reference*.

Actions and scenarios
create-vpc-attachment

The following code example shows how to use create-vpc-attachment.

AWS CLI

To create a VPC attachment

The following create-vpc-attachment example creates a VPC attachment with IPv6 support in a core network.

```
aws networkmanager create-vpc-attachment \
   --core-network-id core-network-0fab62fe438d94db6 \
   --vpc-arn arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786ebe8 \n   --subnet-arns arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7 \n   --Ipv6Support=true
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0fab62fe438d94db6",
            "AttachmentId": "attachment-05e1da6e6a87a06e6",
            "OwnerAccountId": "987654321012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-east-1",
            "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786ebe8",
            "Tags": [],
            "CreatedAt": "2022-03-10T20:59:14+00:00",
            "UpdatedAt": "2022-03-10T20:59:14+00:00"
        }
    }
}
```
For more information, see Create an attachment in the Cloud WAN User Guide.

- For API details, see CreateVpcAttachment in AWS CLI Command Reference.

delete-attachment

The following code example shows how to use delete-attachment.

AWS CLI

To delete an attachment

The following delete-attachment example deletes a Connect attachment.

```
aws networkmanager delete-attachment \
    --attachment-id attachment-01feddaeae26ab68c
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
        "AttachmentId": "attachment-01feddaeae26ab68c",
        "OwnerAccountId": "987654321012",
        "AttachmentType": "CONNECT",
        "State": "DELETING",
        "EdgeLocation": "us-east-1",
        "ResourceArn": "arn:aws:networkmanager::987654321012:attachment/attachment-02c3964448fedf5aa",
        "CreatedAt": "2022-03-15T19:18:41+00:00",
        "UpdatedAt": "2022-03-15T19:28:59+00:00"
    }
}
For more information, see [Delete attachments](#) in the Cloud WAN User Guide.

- For API details, see [DeleteAttachment](#) in [AWS CLI Command Reference](#).

**delete-bucket-analytics-configuration**

The following code example shows how to use delete-bucket-analytics-configuration.

**AWS CLI**

**To delete an analytics configuration for a bucket**

The following delete-bucket-analytics-configuration example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \\
    --bucket my-bucket \\
    --id 1
```

This command produces no output.

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in [AWS CLI Command Reference](#).

**delete-bucket-metrics-configuration**

The following code example shows how to use delete-bucket-metrics-configuration.

**AWS CLI**

**To delete a metrics configuration for a bucket**

The following delete-bucket-metrics-configuration example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \\
    --bucket my-bucket \\
    --id 123
```

This command produces no output.
• For API details, see DeleteBucketMetricsConfiguration in AWS CLI Command Reference.

delete-core-network

The following code example shows how to use delete-core-network.

AWS CLI

To delete a core network

The following delete-core-network example deletes a core network from a Cloud WAN global network.

```sh
aws networkmanager delete-core-network \
  --core-network-id core-network-0fab62fe438d94db6
```

Output:

```json
{
  "CoreNetwork": {
    "GlobalNetworkId": "global-network-0d59060f16a73bc41",
    "CoreNetworkId": "core-network-0fab62fe438d94db6",
    "Description": "Main headquarters location",
    "CreatedAt": "2021-12-09T18:31:11+00:00",
    "State": "DELETING",
    "Segments": [
      {
        "Name": "dev",
        "EdgeLocations": [
          "us-east-1"
        ],
        "SharedSegments": []
      }
    ],
    "Edges": [
      {
        "EdgeLocation": "us-east-1",
        "Asn": 64512,
        "InsideCidrBlocks": []
      }
    ]
  }
}```
For more information, see [Core networks](#) in the *Cloud WAN User Guide*.

- For API details, see [DeleteCoreNetwork](#) in *AWS CLI Command Reference*.

**delete-device**

The following code example shows how to use `delete-device`.

**AWS CLI**

**To delete a device**

The following `delete-device` example deletes the specified device from the specified global network.

```bash
aws networkmanager delete-device 
  --global-network-id global-network-01231231231231231 
  --device-id device-07f6fd08867abc123 
  --region us-west-2
```

Output:

```json
{
  "Device": {
    "DeviceId": "device-07f6fd08867abc123",
    "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
    "GlobalNetworkId": "global-network-01231231231231231",
    "Description": "New York office device",
    "Type": "office device",
    "Vendor": "anycompany",
    "Model": "abcabc",
    "SerialNumber": "1234",
    "SiteId": "site-444555aaabbb11223",
    "CreatedAt": 1575554005.0,
    "State": "DELETING"
  }
}
```

For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.
For API details, see `DeleteDevice` in `AWS CLI Command Reference`.

**delete-global-network**

The following code example shows how to use `delete-global-network`.

**AWS CLI**

**To delete a global network**

The following `delete-global-network` example deletes a global network.

```bash
aws networkmanager delete-global-network \\
  --global-network-id global-network-052bedddcccb193b6b
```

**Output:**

```json
{
  "GlobalNetwork": {
    "GlobalNetworkId": "global-network-052bedddcccb193b6b",
    "CreatedAt": "2021-12-09T18:19:12+00:00",
    "State": "DELETING"
  }
}
```

For API details, see `DeleteGlobalNetwork` in `AWS CLI Command Reference`.

**delete-link**

The following code example shows how to use `delete-link`.

**AWS CLI**

**To delete a link**

The following `delete-link` example deletes the specified link from the specified global network.

```bash
aws networkmanager delete-link \\
  --global-network-id global-network-052bedddcccb193b6b
```
Output:

```json
{
   "Link": {
      "LinkId": "link-11112222aaaabbb1",
      "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbb1",
      "GlobalNetworkId": "global-network-01231231231231231",
      "SiteId": "site-444555aaabbb11223",
      "Description": "VPN Link",
      "Type": "broadband",
      "Bandwidth": {
         "UploadSpeed": 20,
         "DownloadSpeed": 20
      },
      "Provider": "AnyCompany",
      "CreatedAt": 1575555811.0,
      "State": "DELETING"
   }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeleteLink](#) in *AWS CLI Command Reference*.

### delete-public-access-block

The following code example shows how to use `delete-public-access-block`.

**AWS CLI**

**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
   --bucket my-bucket
```
This command produces no output.

- For API details, see `DeletePublicAccessBlock` in *AWS CLI Command Reference*.

**delete-site**

The following code example shows how to use `delete-site`.

**AWS CLI**

**To delete a site**

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```bash
aws networkmanager delete-site \
  --global-network-id global-network-01231231231231231 \
  --site-id site-444555aaabbb11223 \
  --region us-west-2
```

**Output:**

```json
{
  "Site": {
    "SiteId": "site-444555aaabbb11223",
    "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
    "GlobalNetworkId": "global-network-01231231231231231",
    "Description": "New York head office",
    "Location": {
      "Latitude": "40.7128",
      "Longitude": "-74.0060"
    },
    "CreatedAt": 1575554300.0,
    "State": "DELETING"
  }
}
```

For more information, see [Working with Sites](https://docs.aws.amazon.com/networkmanager/latest/userguide/working-with-sites.html) in the *Transit Gateway Network Manager Guide*.

- For API details, see `DeleteSite` in *AWS CLI Command Reference*. 
deregister-transit-gateway

The following code example shows how to use deregister-transit-gateway.

**AWS CLI**

**To deregister a transit gateway from a global network**

The following deregister-transit-gateway example deregisters the specified transit gateway from the specified global network.

```
aws networkmanager deregister-transit-gateway \
   --global-network-id global-network-01231231231231231 \
   --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/tgw-123abc05e04123abc \
   --region us-west-2
```

Output:

```
{
   "TransitGatewayRegistration": {
      "GlobalNetworkId": "global-network-01231231231231231",
      "State": {
         "Code": "DELETING"
      }
   }
}
```

For more information, see [Transit Gateway Registrations](#) in the [Transit Gateway Network Manager Guide](#).
- For API details, see [DeregisterTransitGateway](#) in [AWS CLI Command Reference](#).

describe-global-networks

The following code example shows how to use describe-global-networks.

**AWS CLI**

**To describe your global networks**
The following `describe-global-networks` example describes all of your global networks in your account.

```bash
aws networkmanager describe-global-networks \\
--region us-west-2
```

Output:

```json
{
   "GlobalNetworks": [
   {
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "Company 1 global network",
      "CreatedAt": 1575553525.0,
      "State": "AVAILABLE"
   }
   ]
}
```

For API details, see [DescribeGlobalNetworks](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/describe-global-networks.html) in *AWS CLI Command Reference*.

---

**disassociate-customer-gateway**

The following code example shows how to use `disassociate-customer-gateway`.

**AWS CLI**

**To disassociate a customer gateway**

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (`cgw-11223344556677889`) from the specified global network.

```bash
aws networkmanager disassociate-customer-gateway \\
   --global-network-id global-network-01231231231231231 \\
   --region us-west-2
```

Output:
For more information, see Customer Gateway Associations in the Transit Gateway Network Manager Guide.

- For API details, see DisassociateCustomerGateway in AWS CLI Command Reference.

disassociate-link

The following code example shows how to use disassociate-link.

AWS CLI

To disassociate a link

The following disassociate-link example disassociates the specified link from device device-07f6fd08867abc123 in the specified global network.

```
aws networkmanager disassociate-link \\
   --global-network-id global-network-01231231231231231 \\
   --device-id device-07f6fd08867abc123 \\
   --link-id link-11112222aaaabbb1 \\
   --region us-west-2
```

Output:

```
{
   "LinkAssociation": {
      "GlobalNetworkId": "global-network-01231231231231231",
      "DeviceId": "device-07f6fd08867abc123",
      "LinkId": "link-11112222aaaabbb1",
      "LinkAssociationState": "DELETING"
   }
}
```
For more information, see [Device and Link Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateLink](#) in *AWS CLI Command Reference*.

### get-bucket-analytics-configuration

The following code example shows how to use `get-bucket-analytics-configuration`.

**AWS CLI**

**To retrieve the analytics configuration for a bucket with a specific ID**

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```bash
aws s3api get-bucket-analytics-configuration \
  --bucket my-bucket \ 
  --id 1
```

Output:

```json
{
  "AnalyticsConfiguration": {
      "StorageClassAnalysis": {},
      "Id": "1"
  }
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

### get-bucket-metrics-configuration

The following code example shows how to use `get-bucket-metrics-configuration`.

**AWS CLI**

**To retrieve the metrics configuration for a bucket with a specific ID**

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.
aws s3api get-bucket-metrics-configuration \
--bucket my-bucket \
--id 123

Output:

```json
{
   "MetricsConfiguration": {
      "Filter": {
         "Prefix": "logs"
      },
      "Id": "123"
   }
}
```

- For API details, see `GetBucketMetricsConfiguration` in *AWS CLI Command Reference*.

**get-customer-gateway-associations**

The following code example shows how to use `get-customer-gateway-associations`.

**AWS CLI**

**To get your customer gateway associations**

The following `get-customer-gateway-associations` example gets the customer gateway associations for the specified global network.

```bash
aws networkmanager get-customer-gateway-associations \
--global-network-id global-network-01231231231231231 \
--region us-west-2
```

Output:

```json
{
   "CustomerGatewayAssociations": [
      {
         "GlobalNetworkId": "global-network-01231231231231231",
         "DeviceId": "device-07f6fd08867abc123",
      }
   ]
}
```
get-devices

The following code example shows how to use get-devices.

**AWS CLI**

**To get your devices**

The following get-devices example gets the devices in the specified global network.

```shell
aws networkmanager get-devices \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

Output:

```
{
   "Devices": [
      {
       "DeviceId": "device-07f6fd08867abc123",
       "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
       "GlobalNetworkId": "global-network-01231231231231231",
       "Description": "NY office device",
       "Type": "office device",
       "Vendor": "anycompany",
       "Model": "abcabc",
       "SerialNumber": "1234",
       "CreatedAt": 1575554005.0,
       "State": "AVAILABLE"
      }
   ]
}
```

- For API details, see [GetCustomerGatewayAssociations](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-customer-gateway-associations.html) in *AWS CLI Command Reference*. 

- For API details, see [GetDevices](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-devices.html) in *AWS CLI Command Reference*. 

get-link-associations

The following code example shows how to use `get-link-associations`.

**AWS CLI**

To get your link associations

The following `get-link-associations` example gets the link associations in the specified global network.

```
aws networkmanager get-link-associations \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

Output:

```
{
   "LinkAssociations": [
      {
         "GlobalNetworkId": "global-network-01231231231231231",
         "DeviceId": "device-07f6fd08867abc123",
         "LinkId": "link-11112222aaaabbbb1",
         "LinkAssociationState": "AVAILABLE"
      }
   ]
}
```

- For API details, see [GetLinkAssociations](#) in *AWS CLI Command Reference*.

get-links

The following code example shows how to use `get-links`.

**AWS CLI**

To get your links

The following `get-links` example gets the links in the specified global network.

```
aws networkmanager get-links \
   --global-network-id global-network-01231231231231231 \
```

Actions and scenarios

4750
Output:

```json
{
  "Links": [
    {
      "LinkId": "link-11112222aaaabbbb1",
      "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbbb1",
      "GlobalNetworkId": "global-network-01231231231231231",
      "SiteId": "site-444555aaabbb11223",
      "Description": "VPN Link",
      "Type": "broadband",
      "Bandwidth": {
        "UploadSpeed": 10,
        "DownloadSpeed": 20
      },
      "Provider": "AnyCompany",
      "CreatedAt": 1575555811.0,
      "State": "AVAILABLE"
    }
  ]
}
```

- For API details, see [GetLinks](#) in *AWS CLI Command Reference*.

### get-object-retention

The following code example shows how to use `get-object-retention`.

**AWS CLI**

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
  --bucket my-bucket-with-object-lock \
  --key doc1.rtf
```
Output:

```json
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see [GetObjectRetention](#) in *AWS CLI Command Reference*.

### get-public-access-block

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

**To set or modify the block public access configuration for a bucket**

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block --bucket my-bucket
```

Output:

```json
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see [GetPublicAccessBlock](#) in *AWS CLI Command Reference*.

### get-sites

The following code example shows how to use `get-sites`.
**AWS CLI**

**To get your sites**

The following `get-sites` example gets the sites in the specified global network.

```
aws networkmanager get-sites \
   --global-network-id global-network-01231231231231231 \\ 
   --region us-west-2
```

Output:

```json
{
    "Sites": [
        {
            "SiteId": "site-444555aaabbb11223",
            "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY head office",
            "Location": {
                "Latitude": "40.7128",
                "Longitude": "-74.0060"
            },
            "CreatedAt": 1575554528.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see [GetSites](#) in [AWS CLI Command Reference](#).

**get-transit-gateway-registrations**

The following code example shows how to use `get-transit-gateway-registrations`.

**AWS CLI**

**To get your transit gateway registrations**

The following `get-transit-gateway-registrations` example gets the transit gateways that are registered to the specified global network.
aws networkmanager get-transit-gateway-registrations \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2

Output:

```
{
   "TransitGatewayRegistrations": [
   {
       "GlobalNetworkId": "global-network-01231231231231231",
       "State": {
           "Code": "AVAILABLE"
       }
   }
   ]
}
```

- For API details, see [GetTransitGatewayRegistrations](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-transit-gateway-registrations.html) in *AWS CLI Command Reference*.

### get-vpc-attachment

The following code example shows how to use `get-vpc-attachment`.

**AWS CLI**

To get a VPC attachment

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \
   --attachment-id attachment-03b7ea450134787da
```

Output:

```
{
   "VpcAttachment": {
       "Attachment": {
           "CoreNetworkId": "core-network-0522de1b226a5d7b3",
           "AttachmentId": "attachment-03b7ea450134787da",
           "State": {
               "Code": "ATTACHING"
           }
       }
   }
}
```
"OwnerAccountId": "987654321012",
"AttachmentType": "VPC",
"State": "CREATING",
"EdgeLocation": "us-east-1",
"ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
"Tags": [
    {
        "Key": "Name",
        "Value": "DevVPC"
    }
],
"CreatedAt": "2022-03-11T17:48:58+00:00",
"UpdatedAt": "2022-03-11T17:48:58+00:00"
},
"SubnetArns": [
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-2387ae02",
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-cda9dfffc"
],
"Options": {
    "Ipv6Support": false
}
}

For more information, see Attachments in the Cloud WAN User Guide.

- For API details, see GetVpcAttachment in AWS CLI Command Reference.

**list-bucket-analytics-configurations**

The following code example shows how to use list-bucket-analytics-configurations.

**AWS CLI**

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket my-bucket
```
Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in AWS CLI Command Reference.

**list-bucket-metrics-configurations**

The following code example shows how to use list-bucket-metrics-configurations.

**AWS CLI**

To retrieve a list of metrics configurations for a bucket

The following list-bucket-metrics-configurations example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
```
For API details, see ListBucketMetricsConfigurations in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a resource

The following list-tags-for-resource example lists the tags for the specified device resource (device-07f6fd08867abc123).

```
aws networkmanager list-tags-for-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "TagList": [
        {
            "Key": "Network",
            "Value": "Northeast"
        }
    ]
}
```

For API details, see ListTagsForResource in AWS CLI Command Reference.

put-bucket-metrics-configuration

The following code example shows how to use put-bucket-metrics-configuration.
AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```bash
aws s3api put-bucket-metrics-configuration \
  --bucket my-bucket \
  --id 123 \
  --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see `PutBucketMetricsConfiguration` in AWS CLI Command Reference.

put-object-retention

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```bash
aws s3api put-object-retention \
  --bucket my-bucket-with-object-lock \
  --key doc1.rtf \
  --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see `PutObjectRetention` in AWS CLI Command Reference.

put-public-access-block

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket
The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```bash
aws s3api put-public-access-block \
   --bucket my-bucket \
   --public-access-block-configuration
   "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=true"
```

This command produces no output.

- For API details, see [PutPublicAccessBlock](#) in *AWS CLI Command Reference*.

**register-transit-gateway**

The following code example shows how to use `register-transit-gateway`.

**AWS CLI**

**To register a transit gateway in a global network**

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```bash
aws networkmanager register-transit-gateway \
   --global-network-id global-network-01231231231231231 \
   --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/tgw-123abc05e04123abc \
   --region us-west-2
```

**Output:**

```json
{
   "TransitGatewayRegistration": {
      "GlobalNetworkId": "global-network-01231231231231231",
      "State": {"Code": "PENDING"}
   }
}
```
For more information, see [Transit Gateway Registrations](#) in the [Transit Gateway Network Manager Guide](#).

- For API details, see [RegisterTransitGateway](#) in [AWS CLI Command Reference](#).

### reject-attachment

The following code example shows how to use `reject-attachment`.

**AWS CLI**

**To reject an attachment**

The following `reject-attachment` example rejects a VPC attachment request.

```bash
aws networkmanager reject-attachment \
   --attachment-id attachment-03b7ea450134787da
```

**Output:**

```json
{
   "Attachment": {
      "CoreNetworkId": "core-network-0522de1b226a5d7b3",
      "AttachmentId": "attachment-03b7ea450134787da",
      "OwnerAccountId": "987654321012",
      "AttachmentType": "VPC",
      "State": "AVAILABLE",
      "EdgeLocation": "us-east-1",
      "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
      "CreatedAt": "2022-03-11T17:48:58+00:00",
      "UpdatedAt": "2022-03-11T17:51:25+00:00"
   }
}
```

For more information, see [Attachment acceptance](#) in the [Cloud WAN User Guide](#).

- For API details, see [RejectAttachment](#) in [AWS CLI Command Reference](#).

### start-route-analysis

The following code example shows how to use `start-route-analysis`.

**Actions and scenarios**
To start route analysis

The following `start-route-analysis` example starts the analysis between a source and destination, including the optional `include-return-path`.

```bash/aws networkmanager start-route-analysis \
   --global-network-id global-network-00aa0aaa0b0aaa000 \
   --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:503089527312:transit-gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \
   --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-west-1:503089527312:transit-gateway-attachment/tgw-attach-002577f30bb1b181742,IpAddress=11.0.0.0 \
   --include-return-path
```

Output:

```json
{
   "RouteAnalysis": {
      "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000",
      "OwnerAccountId": "1111222233333",
      "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",
      "StartTimestamp": 1695760154.0,
      "Status": "RUNNING",
      "Source": {
         "IpAddress": "10.0.0.0"
      },
      "Destination": {
         "IpAddress": "11.0.0.0"
      },
      "IncludeReturnPath": true,
      "UseMiddleboxes": false
   }
}
```
For more information, see Route Analyzer in the AWS Global Networks for Transit Gateways User Guide.

- For API details, see StartRouteAnalysis in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To apply tags to a resource

The following tag-resource example applies the tag Network=Northeast to the device device-07f6fd08867abc123.

```
aws networkmanager tag-resource \
  --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
  --tags Key=Network,Value=Northeast \
  --region us-west-2
```

This command produces no output.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

To remove tags from a resource

The following untag-resource example removes the tag with the key Network from the device device-07f6fd08867abc123.

```
aws networkmanager untag-resource \
  --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
  --tag-keys Network \
  --region us-west-2
```
This command produces no output.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-device**

The following code example shows how to use update-device.

**AWS CLI**

To update a device

The following update-device example updates device device-07f6fd08867abc123 by specifying a site ID for the device.

```
aws networkmanager update-device \
   --global-network-id global-network-01231231231231231 \
   --device-id device-07f6fd08867abc123 \
   --site-id site-444555aaabbb11223 \
   --region us-west-2
```

Output:

```
{
   "Device": {
      "DeviceId": "device-07f6fd08867abc123",
      "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "NY office device",
      "Type": "Office device",
      "Vendor": "anycompany",
      "Model": "abcabc",
      "SerialNumber": "1234",
      "SiteId": "site-444555aaabbb11223",
      "CreatedAt": 1575554005.0,
      "State": "UPDATING"
   }
}
```

For more information, see Working with Devices in the Transit Gateway Network Manager Guide.

- For API details, see UpdateDevice in AWS CLI Command Reference.
update-global-network

The following code example shows how to use update-global-network.

AWS CLI

To update a global network

The following update-global-network example updates the description for global network global-network-01231231231231231.

```
aws networkmanager update-global-network \
    --global-network-id global-network-01231231231231231 \
    --description "Head offices" \
    --region us-west-2
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "Head offices",
        "CreatedAt": 1575553525.0,
        "State": "UPDATING"
    }
}
```

For more information, see Global Networks in the Transit Gateway Network Manager Guide.

- For API details, see UpdateGlobalNetwork in AWS CLI Command Reference.

update-link

The following code example shows how to use update-link.

AWS CLI

To update a link

The following update-link example updates the bandwidth information for link link-11112222aaaabbb1.
aws networkmanager update-link \
  --global-network-id global-network-01231231231231231 \
  --link-id link-11112222aaaabbbb1 \
  --bandwidth UploadSpeed=20,DownloadSpeed=20 \
  --region us-west-2

Output:

```
{
  "Link": {
    "LinkId": "link-11112222aaaabbbb1",
    "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbbb1",
    "GlobalNetworkId": "global-network-01231231231231231",
    "SiteId": "site-444555aaabbb11223",
    "Description": "VPN Link",
    "Type": "broadband",
    "Bandwidth": {
      "UploadSpeed": 20,
      "DownloadSpeed": 20
    },
    "Provider": "AnyCompany",
    "CreatedAt": 1575555811.0,
    "State": "UPDATING"
  }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateLink](#) in *AWS CLI Command Reference*.

**update-site**

The following code example shows how to use *update-site*.

**AWS CLI**

**To update a site**

The following *update-site* example updates the description for site *site-444555aaabbb11223* in the specified global network.
aws networkmanager update-site \
--global-network-id global-network-01231231231231231 \
--site-id site-444555aaabbb11223 \
--description "New York Office site" \
--region us-west-2

Output:

{
   "Site": {
      "SiteId": "site-444555aaabbb11223",
      "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "New York Office site",
      "Location": {
         "Latitude": "40.7128",
         "Longitude": "-74.0060"
      },
      "CreatedAt": 1575554528.0,
      "State": "UPDATING"
   }
}

For more information, see Working with Sites in the Transit Gateway Network Manager Guide.
- For API details, see UpdateSite in AWS CLI Command Reference.

Nimble Studio examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Nimble Studio.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- **Actions**

Actions

get-eula

The following code example shows how to use `get-eula`.

**AWS CLI**

To get information about your studio

The following `get-eula` example lists the information about an EULA.

```bash
aws nimble get-eula \
    --eula-id "EULAid"
```

Output:

```json
{
    "eula": {
        "content": "https://www.mozilla.org/en-US/MPL/2.0/",
        "createdAt": "2021-04-20T16:45:23+00:00",
        "eulaId": "gJZLygd-Srq_SNNbSfiaLg",
        "name": "Mozilla-FireFox",
        "updatedAt": "2021-04-20T16:45:23+00:00"
    }
}
```

For more information, see [Accept the EULA](#) in the *Amazon Nimble Studio User Guide*.

- For API details, see [GetEula](#) in *AWS CLI Command Reference*.

get-launch-profile-details

The following code example shows how to use `get-launch-profile-details`.

**AWS CLI**

To list the available widgets
The following `get-launch-profile-details` example lists the details about a launch profile.

```bash
aws nimble get-launch-profile-details \
    --studio-id "StudioID" \
    --launch-profile-id "LaunchProfileID"
```

Output:

```json
{
    "launchProfile": {
        "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/yeG71DwQNEW7777D7DrV7Q",

### get-launch-profile

The following code example shows how to use get-launch-profile.

#### AWS CLI

**To list the available widgets**

The following get-launch-profile example lists information about a launch profile.

```
aws nimble get-launch-profile 
```
--studio-id "StudioID" \ 
--launch-profile-id "LaunchProfileID"

Output:

```json
{
    "launchProfile": {
        "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/yG7lDwNQEiwNTv7TDrV7Q",
        "createdAt": "2022-01-27T21:18:59+00:00",
        "createdBy": "AROA3002NEICCVRNDNFT:id-EXAMPLE11111",
        "description": "The Launch Profile for the Render workers created by StudioBuilder.",
        "ec2SubnetIds": [
            "subnet-EXAMPLE11111"
        ],
        "launchProfileId": "yeG7lDwNQEiwNTv7TDrV7Q",
        "launchProfileProtocolVersions": [
            "2021-03-31"
        ],
        "name": "RenderWorker-Default",
        "state": "READY",
        "statusCode": "LAUNCH_PROFILE_CREATED",
        "statusMessage": "Launch Profile has been created",
        "streamConfiguration": {
            "clipboardMode": "ENABLED",
            "ec2InstanceTypes": [
                "g4dn.4xlarge",
                "g4dn.8xlarge"
            ],
            "maxSessionLengthInMinutes": 690,
            "maxStoppedSessionLengthInMinutes": 0,
            "streamingImageIds": [
                "Cw_jXnp1QcSSxhE2hkNRoQ",
                "YGXAqgoWtnCNSV8VP20sHQ"
            ]
        },
        "studioComponentIds": [
            "_hR_-RaReSOjAnLakbX7Q",

            "45Kj0SPPRzK2ovyvCuQ6qw"
        ]
    }
}
```
get-studio

The following code example shows how to use get-studio.

AWS CLI

To get information about your studio
The following `get-studio` example lists the studios in your AWS account.

```
aws nimble get-studio \
   --studio-id "StudioID"
```

Output:

```
{
   "studio": {
      "adminRoleArn": "arn:aws:iam::123456789012:role/studio-admin-role",
      "createdAt": "2022-01-27T20:29:35+00:00",
      "displayName": "studio-name",

      "userRoleArn": "arn:aws:iam::123456789012:role/studio-user-role"
   }
}
```

For more information, see **What is Amazon Nimble Studio?** in the *Amazon Nimble Studio User Guide*.

- For API details, see **GetStudio** in *AWS CLI Command Reference*.

### list-eula-acceptances

The following code example shows how to use `list-eula-acceptances`.

**AWS CLI**

To list the available widgets
The following `list-eula-acceptances` example lists the accepted EULAs in your AWS account.

```bash
aws nimble list-eula-acceptances
   --studio-id "StudioID"
```

**Output:**

```json
{
   "eulaAcceptances": [ 
   {
      "acceptedAt": "2022-01-28T17:44:35+00:00",

OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

create-elasticsearch-domain

The following code example shows how to use `create-elasticsearch-domain`.

**AWS CLI**

To create an Amazon Elasticsearch Service domain

The following `create-elasticsearch-domain` command creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```
aws es create-elasticsearch-domain \
  --domain-name vpc-cli-example \
  --elasticsearch-version 6.2 \
  --elasticsearch-cluster-config \
  InstanceType=m4.large.elasticsearch,InstanceCount=1 \

**describe-elasticsearch-domains**

The following code example shows how to use describe-elasticsearch-domains.

**AWS CLI**

To get details for one or more domains
The following `describe-elasticsearch-domains` example provides configuration details for one or more domains.

```bash
aws es describe-elasticsearch-domains
   --domain-names cli-example-1 cli-example-2
```

Output:

```json
{
   "DomainStatusList": [{
      "DomainId": "123456789012/cli-example-1",
      "DomainName": "cli-example-1",

describe-reserved-elasticsearch-instances

The following code example shows how to use describe-reserved-elasticsearch-instances.

**AWS CLI**

**To view all reserved instances**

The following describe-elasticsearch-domains example provides a summary of all instances you have reserved in a region.

```bash
aws es describe-reserved-elasticsearch-instances
```

Output:

```json
{
    "ReservedElasticsearchInstances": [{
        "FixedPrice": 100.0,
        "ReservedElasticsearchInstanceOfferingId": "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",
        "ReservationName": "my-reservation",
        "PaymentOption": "PARTIAL_UPFRONT",
        "UsagePrice": 0.0,
        "ReservedElasticsearchInstanceId": "9a8a7a6a-5a4a-3a2a-1a0a-9a8a7a6a5a4a",
        "RecurringCharges": [{
            "RecurringChargeAmount": 0.603,
            "RecurringChargeFrequency": "Hourly"
        }],
        "State": "payment-pending",
        "StartTime": 1522872571.229,
    }
}
```
For more information, see [Reserved Instances](https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/reservedinstances.html) in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see [DescribeReservedElasticsearchInstances](https://docs.aws.amazon.com/cli/latest/reference/es/describe-reserved-elasticsearch-instances.html) in *AWS CLI Command Reference*.

### list-domain-names

The following code example shows how to use `list-domain-names`.

**AWS CLI**

**To list all domains**

The following `list-domain-names` example provides a quick summary of all domains in the region.

```bash
aws es list-domain-names
```

**Output:**

```json
{
  "DomainNames": [
    {
      "DomainName": "cli-example-1"
    },
    {
      "DomainName": "cli-example-2"
    }
  ]
}
```

For more information, see [Creating and Managing Amazon Elasticsearch Service Domains](https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/creating-domain.html) in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see [ListDomainNames](https://docs.aws.amazon.com/cli/latest/reference/es/list-domain-names.html) in *AWS CLI Command Reference*. 
AWS OpsWorks examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- Actions

**Actions**

**assign-instance**

The following code example shows how to use assign-instance.

**AWS CLI**

**To assign a registered instance to a layer**

The following example assigns a registered instance to a custom layer.

```
aws opsworks --region us-east-1 assign-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --layer-ids 26cf1d32-6876-42fa-bbf1-9cadc0bff938
```

*Output:* None.

**More Information**

For more information, see Assigning a Registered Instance to a Layer in the *AWS OpsWorks User Guide.*
assign-volume

The following code example shows how to use assign-volume.

AWS CLI

To assign a registered volume to an instance

The following example assigns a registered Amazon Elastic Block Store (Amazon EBS) volume to an instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID. Before you run assign-volume, you must first run update-volume to assign a mount point to the volume.

```
aws opsworks --region us-east-1 assign-volume --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --volume-id 26cf1d32-6876-42fa-bbf1-9cad0b9938
```

Output: None.

More Information

For more information, see Assigning Amazon EBS Volumes to an Instance in the AWS OpsWorks User Guide.

• For API details, see AssignVolume in AWS CLI Command Reference.

associate-elastic-ip

The following code example shows how to use associate-elastic-ip.

AWS CLI

To associate an Elastic IP address with an instance

The following example associates an Elastic IP address with a specified instance.

```
aws opsworks --region us-east-1 associate-elastic-ip --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f --elastic-ip 54.148.130.96
```
Output: None.

More Information

For more information, see Resource Management in the AWS OpsWorks User Guide.

• For API details, see AssociateElasticIp in AWS CLI Command Reference.

attach-elastic-load-balancer

The following code example shows how to use attach-elastic-load-balancer.

AWS CLI

To attach a load balancer to a layer

The following example attaches a load balancer, identified by its name, to a specified layer.

aws opsworks --region us-east-1 attach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4

Output: None.

More Information

For more information, see Elastic Load Balancing in the AWS OpsWorks User Guide.

• For API details, see AttachElasticLoadBalancer in AWS CLI Command Reference.

create-app

The following code example shows how to use create-app.

AWS CLI

Example 1: To create an app

The following example creates a PHP app named SimplePHPApp from code stored in a GitHub repository. The command uses the shorthand form of the application source definition.

aws opsworks create-app \
--region us-east-1 \

Example 2: To create an app with an attached database

The following example creates a JSP app from code stored in .zip archive in a public S3 bucket. It attaches an RDS DB instance to serve as the app's data store. The application and database sources are defined in separate JSON files that are in the directory from which you run the command.

```
aws opsworks create-app
   --region us-east-1
   --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
   --name SimpleJSP
   --type java
   --app-source file://appsource.json
   --data-sources file://datasource.json
```

The application source information is in `appsource.json` and contains the following.

```
{
   "Type": "archive",
   "Url": "https://s3.amazonaws.com/opsworks-demo-assets/simplejsp.zip"
}
```

The database source information is in `datasource.json` and contains the following.

```
[
   {
      "Type": "RdsDbInstance",
   }
]
Note: For an RDS DB instance, you must first use `register-ids-db-instance` to register the instance with the stack. For MySQL App Server instances, set `Type` to `OpsworksMysqlInstance`. These instances are created by AWS OpsWorks, so they do not have to be registered.

Output:

```json
{
    "AppId": "26a61ead-d201-47e3-b55c-2a7c666942f8"
}
```

For more information, see Adding Apps in the *AWS OpsWorks User Guide*.

- For API details, see [CreateApp](https://docs.aws.amazon.com/cli/latest/reference/opsworks/create-app) in *AWS CLI Command Reference*.

create-deployment

The following code example shows how to use `create-deployment`.

**AWS CLI**

**Example 1: To deploy apps and run stack commands**

The following examples show how to use the `create-deployment` command to deploy apps and run stack commands. Notice that the quote ("`) characters in the JSON object that specifies the command are all preceded by escape characters (\). Without the escape characters, the command might return an invalid JSON error.

The following `create-deployment` example deploys an app to a specified stack.

```bash
aws opsworks create-deployment \
    --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
    --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \
    --command "{"Name":"deploy"}"
```

Output:
Example 2: To deploy a Rails App and Migrate the Database

The following create-deployment command deploys a Ruby on Rails app to a specified stack and migrates the database.

```bash
aws opsworks create-deployment \
    --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \n    --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \n    --command "{"Name":"deploy", "Args":{"migrate":["true"]}}"
```

Output:

```json
{
    "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

For more information on deployment, see Deploying Apps in the AWS OpsWorks User Guide.

Example 3: Run a Recipe

The following create-deployment command runs a custom recipe, phpapp::appsetup, on the instances in a specified stack.

```bash
aws opsworks create-deployment \
    --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \n    --command "{"Name":"execute_recipes", "Args":{"recipes":[
    \n    ["phpapp::appsetup"]}}"
```

Output:

```json
{
    "DeploymentId": "5cbaa7b9-4e09-4e53-aa1b-314fbd106038"
}
```

For more information, see Run Stack Commands in the AWS OpsWorks User Guide.
Example 4: Install Dependencies

The following create-deployment command installs dependencies, such as packages or Ruby gems, on the instances in a specified stack.

```
aws opsworks create-deployment \
   --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
   --command "{"Name":"install_dependencies"}"
```

Output:

```
{
   "DeploymentId": "aef5b255-8604-4928-81b3-9b0187f962ff"
}
```

For more information, see Run Stack Commands in the AWS OpsWorks User Guide.

- For API details, see CreateDeployment in AWS CLI Command Reference.

create-instance

The following code example shows how to use create-instance.

AWS CLI

To create an instance

The following create-instance command creates an m1.large Amazon Linux instance named myinstance1 in a specified stack. The instance is assigned to one layer.

```
aws opsworks --region us-east-1 create-instance \
   --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
   --layer-ids 5c8c272a-f2d5-42e3-8245-5bf3927cb65b --hostname myinstance1 --instance-type m1.large --os "Amazon Linux"
```

To use an autogenerated name, call get-hostname-suggestion, which generates a hostname based on the theme that you specified when you created the stack. Then pass that name to the hostname argument.

Output:
```json
{
  "InstanceId": "5f9adeaa-c94c-42c6-aeef-28a5376002cd"
}
```

**More Information**

For more information, see Adding an Instance to a Layer in the *AWS OpsWorks User Guide*.

- For API details, see [CreateInstance](https://docs.aws.amazon.com/cli/latest/reference/opsworks/create-instance/) in *AWS CLI Command Reference*.

---

**create-layer**

The following code example shows how to use `create-layer`.

### AWS CLI

**To create a layer**

The following `create-layer` command creates a PHP App Server layer named MyPHPLayer in a specified stack.

```bash
aws opsworks create-layer --region us-east-1 --stack-id f6673d70-32e6-4425-8999-265dd002fec7 --type php-app --name MyPHPLayer --shortname myphplayer
```

**Output**:

```json
{
  "LayerId": "0b212672-6b4b-40e4-8a34-5a943cf2e07a"
}
```

**More Information**

For more information, see How to Create a Layer in the *AWS OpsWorks User Guide*.

- For API details, see [CreateLayer](https://docs.aws.amazon.com/cli/latest/reference/opsworks/create-layer/) in *AWS CLI Command Reference*.

---

**create-server**

The following code example shows how to use `create-server`.

---

**Actions and scenarios**

4806
AWS CLI

To create a server

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in Getting Started with AWS OpsWorks for Chef Automate in the AWS Opsworks for Chef Automate User Guide.

```bash
aws opsworks-cm create-server \
    --engine "ChefAutomate" \
    --instance-profile-arn "arn:aws:iam::012345678901:instance-profile/aws-opsworks-cm-ec2-role" \
    --instance-type "t2.medium" \
    --server-name "automate-06" \
    --service-role-arn "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-role"
```

Output:

```json
{
    "Server": {
        "AssociatePublicIpAddress": true,
        "BackupRetentionCount": 10,
        "CreatedAt": 2019-12-29T13:38:47.520Z,
        "DisableAutomatedBackup": FALSE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "ChefAutomate",
        "EngineAttributes": [
            {
                "Name": "CHEF_AUTOMATE_ADMIN_PASSWORD",
                "Value": "1Example1"
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "2019-08",
        "InstanceProfileArn": "arn:aws:iam::012345678901:instance-profile/aws-opsworks-cm-ec2-role",
        "InstanceType": "t2.medium",
        "PreferredBackupWindow": "Sun:02:00",
        "PreferredMaintenanceWindow": "00:00",
        "SecurityGroupIds": [ "sg-12345678" ]
    }
}
```
For more information, see CreateServer in the AWS OpsWorks for Chef Automate API Reference.
• For API details, see CreateServer in AWS CLI Command Reference.

create-stack

The following code example shows how to use create-stack.

AWS CLI

To create a stack

The following create-stack command creates a stack named CLI Stack.

```bash
```

The service-role-arn and default-instance-profile-arn parameters are required. You typically use the ones that AWS OpsWorks creates for you when you create your first stack. To get the Amazon Resource Names (ARNs) for your account, go to the IAM console, choose Roles in the navigation panel, choose the role or profile, and choose the Summary tab.

Output:

```json
{
  "StackId": "f6673d70-32e6-4425-8999-265dd002fec7"
}
```

More Information

For more information, see Create a New Stack in the AWS OpsWorks User Guide.
create-user-profile

The following code example shows how to use create-user-profile.

AWS CLI

To create a user profile

You import an AWS Identity and Access Manager (IAM) user into AWS OpsWorks by calling `create-user-profile` to create a user profile. The following example creates a user profile for the cli-user-test IAM user, who is identified by Amazon Resource Name (ARN). The example assigns the user an SSH username of `myusername` and enables self management, which allows the user to specify an SSH public key.

```
aws opsworks --region us-east-1 create-user-profile --iam-user-arn 
  arn:aws:iam::123456789102:user/cli-user-test --ssh-username myusername --allow-self-management
```

**Output:**

```
{
   "IamUserArn": "arn:aws:iam::123456789102:user/cli-user-test"
}
```

**Tip:** This command imports an IAM user into AWS OpsWorks, but only with the permissions that are granted by the attached policies. You can grant per-stack AWS OpsWorks permissions by using the `set-permissions` command.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see `CreateUserProfile` in *AWS CLI Command Reference*.

delete-app

The following code example shows how to use delete-app.
AWS CLI

To delete an app

The following example deletes a specified app, which is identified by its app ID. You can obtain an app ID by going to the app's details page on the AWS OpsWorks console or by running the describe-apps command.

```
aws opsworks delete-app --region us-east-1 --app-id 577943b9-2ec1-4baf-a7bf-1d347601edc5
```

*Output:* None.

More Information

For more information, see Apps in the AWS OpsWorks User Guide.

- For API details, see DeleteApp in AWS CLI Command Reference.

delete-instance

The following code example shows how to use delete-instance.

AWS CLI

To delete an instance

The following delete-instance example deletes a specified instance, which is identified by its instance ID. You can find an instance ID by opening the instance's details page in the AWS OpsWorks console, or by running the describe-instances command.

If the instance is online, you must first stop the instance by calling stop-instance, and then you must wait until the instance has stopped. Run describe-instances to check the instance status.

To remove the instance's Amazon EBS volumes or Elastic IP addresses, add the --delete-volumes or --delete-elastic-ip arguments, respectively.

```
aws opsworks delete-instance \
    --region us-east-1 \
```
This command produces no output.

For more information, see Deleting AWS OpsWorks Instances in the AWS OpsWorks User Guide.
- For API details, see DeleteInstance in AWS CLI Command Reference.

delete-layer

The following code example shows how to use delete-layer.

AWS CLI

To delete a layer

The following example deletes a specified layer, which is identified by its layer ID. You can obtain a layer ID by going to the layer's details page on the AWS OpsWorks console or by running the describe-layers command.

Note: Before deleting a layer, you must use delete-instance to delete all of the layer's instances.

```bash
aws opsworks delete-layer --region us-east-1 --layer-id a919454e-b816-4598-b29a-5796afb498ed
```

Output: None.

More Information

For more information, see Deleting AWS OpsWorks Instances in the AWS OpsWorks User Guide.
- For API details, see DeleteLayer in AWS CLI Command Reference.

delete-stack

The following code example shows how to use delete-stack.

AWS CLI

To delete a stack
The following example deletes a specified stack, which is identified by its stack ID. You can obtain a stack ID by clicking **Stack Settings** on the AWS OpsWorks console or by running the `describe-stacks` command.

**Note:** Before deleting a layer, you must use `delete-app`, `delete-instance`, and `delete-layer` to delete all of the stack's apps, instances, and layers.

```
aws opsworks delete-stack --region us-east-1 --stack-id 154a9d89-7e9e-433b-8de8-617e53756c84
```

*Output:* None.

**More Information**

For more information, see Shut Down a Stack in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteStack](https://docs.aws.amazon.com/cli/latest/reference/opsworks/delete-stack.html) in *AWS CLI Command Reference*.

### delete-user-profile

The following code example shows how to use `delete-user-profile`.

**AWS CLI**

**To delete a user profile and remove an IAM user from AWS OpsWorks**

The following example deletes the user profile for a specified AWS Identity and Access Management (IAM) user, who is identified by Amazon Resource Name (ARN). The operation removes the user from AWS OpsWorks, but does not delete the IAM user. You must use the IAM console, CLI, or API for that task.

```
aws opsworks --region us-east-1 delete-user-profile --iam-user-arn arn:aws:iam::123456789102:user/cli-user-test
```

*Output:* None.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteUserProfile](https://docs.aws.amazon.com/cli/latest/reference/opsworks/delete-user-profile.html) in *AWS CLI Command Reference*.
deregister-elastic-ip

The following code example shows how to use deregister-elastic-ip.

AWS CLI

To deregister an Elastic IP address from a stack

The following example deregisters an Elastic IP address, identified by its IP address, from its stack.

```bash
aws opsworks deregister-elastic-ip --region us-east-1 --elastic-ip 54.148.130.96
```

Output: None.

More Information

For more information, see Deregistering Elastic IP Addresses in the AWS OpsWorks User Guide.
- For API details, see DeregisterElasticIp in AWS CLI Command Reference.

deregister-instance

The following code example shows how to use deregister-instance.

AWS CLI

To deregister a registered instance from a stack

The following deregister-instance command deregisters a registered instance from its stack.

```bash
aws opsworks --region us-east-1 deregister-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2
```

Output: None.

More Information

For more information, see Deregistering a Registered Instance in the AWS OpsWorks User Guide.
- For API details, see DeregisterInstance in AWS CLI Command Reference.
deregister-rds-db-instance

The following code example shows how to use deregister-rds-db-instance.

AWS CLI

To deregister an Amazon RDS DB instance from a stack

The following example deregisters an RDS DB instance, identified by its ARN, from its stack.

```
```

Output: None.

More Information

For more information, see Deregistering Amazon RDS Instances in the AWS OpsWorks User Guide.

• For API details, see DeregisterRdsDbInstance in AWS CLI Command Reference.

deregister-volume

The following code example shows how to use deregister-volume.

AWS CLI

To deregister an Amazon EBS volume

The following example deregisters an EBS volume from its stack. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigned when you registered the volume with the stack, not the EC2 volume ID.

```
aws opsworks deregister-volume --region us-east-1 --volume-id 5c48ef52-3144-4bf5-beaa-fda4deb23d4d
```
Output: None.

More Information

For more information, see Deregistering Amazon EBS Volumes in the AWS OpsWorks User Guide.

- For API details, see DeregisterVolume in AWS CLI Command Reference.

describe-apps

The following code example shows how to use describe-apps.

AWS CLI

To describe apps

The following describe-apps command describes the apps in a specified stack.

```
aws opsworks describe-apps \
  --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a \
  --region us-east-1
```

Output:

```
{
  "Apps": [
    {
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
      "AppSource": {
        "Url": "https://s3-us-west-2.amazonaws.com/opsworks-demo-assets/simplejsp.zip",
        "Type": "archive"
      },
      "Name": "SimpleJSP",
      "EnableSsl": false,
      "SslConfiguration": {},
      "AppId": "da1decc1-0dff-43ea-ad7c-bb667cd87c8b",
      "Attributes": {
        "RailsEnv": null,
        "AutoBundleOnDeploy": "true",
        "DocumentRoot": "ROOT"
      },
      "Shortname": "simplejsp",
    }
  ]
}
```
For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see `DescribeApps` in *AWS CLI Command Reference*.

**describe-commands**

The following code example shows how to use `describe-commands`.

**AWS CLI**

**To describe commands**

The following `describe-commands` command describes the commands in a specified instance.

```bash
aws opsworks describe-commands \
   --instance-id 8c2673b9-3fe5-420d-9cfa-78d875ee7687 \
   --region us-east-1
```

**Output:**

```json
{
   "Commands": [
      {
         "Status": "successful",
         "CompletedAt": "2013-07-25T18:57:47+00:00",
         "InstanceId": "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
         "DeploymentId": "6ed0df4c-9ef7-4812-8dac-d54a05be1029",
         "AcknowledgedAt": "2013-07-25T18:57:41+00:00",
         "LogUrl": "https://s3.amazonaws.com/<bucket-name>/logs/008c1a91-ec59-4d51-971d-3adff54b00cc?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1375394373&Signature=HkXil6UuNfxTCC37EPQAa462E1E%3D&response-cache-control=private&response-content-encoding=gzip&response-content-type=text%2Fplain",
         "Type": "undeploy",
         "CommandId": "008c1a91-ec59-4d51-971d-3adff54b00cc",
         "CreatedAt": "2013-07-25T18:57:34+00:00",
         "ExitCode": 0
      }
   ]
}
```
For more information, see AWS OpsWorks Lifecycle Events in the AWS OpsWorks User Guide.

- For API details, see DescribeCommands in AWS CLI Command Reference.

describe-deployments

The following code example shows how to use describe-deployments.

AWS CLI

To describe deployments

The following describe-deployments command describes the deployments in a specified stack.

```
aws opsworks --region us-east-1 describe-deployments --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a
```

Output:

```
{
    "Deployments": [
        {
            "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
            "InstanceId": "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
            "DeploymentId": "19d3121e-d949-4ff2-9f9d-94eac087862a",
            "AcknowledgedAt": "2013-07-25T18:55:32+00:00",
            "LogUrl": "https://s3.amazonaws.com/<bucket-name>/logs/899d3d64-0384-47b6-a586-33433aad117c?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1375394373&Signature=xMsJvtLuUqWmsr8s%2FAjVru0BtRs%3D&response-cache-control=private&response-content-encoding=gzip&response-content-type=text/plain",
            "Type": "deploy",
            "CommandId": "899d3d64-0384-47b6-a586-33433aad117c",
            "CreatedAt": "2013-07-25T18:55:29+00:00",
            "ExitCode": 0
        }
    ]
}
```
More Information

For more information, see Deploying Apps in the AWS OpsWorks User Guide.

- For API details, see DescribeDeployments in AWS CLI Command Reference.

describe-elastic-ips

The following code example shows how to use describe-elastic-ips.
**AWS CLI**

**To describe Elastic IP instances**

The following describe-elastic-ips command describes the Elastic IP addresses in a specified instance.

```
aws opsworks --region us-east-1 describe-elastic-ips --instance-id b62f3e04-e9eb-436c-a91f-d9e9a396b7b0
```

*Output:*

```
{
    "ElasticIps": [
        {
            "Ip": "192.0.2.0",
            "Domain": "standard",
            "Region": "us-west-2"
        }
    ]
}
```

**More Information**

For more information, see Instances in the *AWS OpsWorks User Guide.*

- For API details, see [DescribeElasticIps](#) in *AWS CLI Command Reference.*

**describe-elastic-load-balancers**

The following code example shows how to use describe-elastic-load-balancers.

**AWS CLI**

**To describe a stack's elastic load balancers**

The following describe-elastic-load-balancers command describes a specified stack's load balancers.

```
aws opsworks --region us-west-2 describe-elastic-load-balancers --stack-id 6f4660e5-37a6-4e42-bfa0-1358ebd9c182
```
**Output:** This particular stack has one load balancer.

```json
{
    "ElasticLoadBalancers": [
        {
            "SubnetIds": [
                "subnet-60e4ea04",
                "subnet-66e1c110"
            ],
            "Ec2InstanceId": [],
            "ElasticLoadBalancerName": "my-balancer",
            "Region": "us-west-2",
            "LayerId": "344973cb-bf2b-4cd0-8d93-51cd819bab04",
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b"
            ],
            "VpcId": "vpc-b319f9d4",
            "StackId": "6f4660e5-37a6-4e42-bfa0-1358ebd9c182",
            "DnsName": "my-balancer-2094040179.us-west-2.elb.amazonaws.com"
        }
    ]
}
```

**More Information**

For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeElasticLoadBalancers](#) in *AWS CLI Command Reference*.

**describe-instances**

The following code example shows how to use `describe-instances`.

**AWS CLI**

**To describe instances**

The following `describe-instances` command describes the instances in a specified stack:

```
aws opsworks --region us-east-1 describe-instances --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```
Output: The following output example is for a stack with two instances. The first is a registered EC2 instance, and the second was created by AWS OpsWorks.

```json
{
  "Instances": [
    {
      "StackId": "71c7ca72-55ae-4b6a-8ee1-a8dc0d3fa0f",
      "PrivateDns": "ip-10-31-39-66.us-west-2.compute.internal",
      "LayerIds": [
        "26cf1d32-6876-42fa-bbf1-9cadc0b9f38"
      ],
      "EbsOptimized": false,
      "ReportedOs": {
        "Version": "14.04",
        "Name": "ubuntu",
        "Family": "debian"
      },
      "Status": "online",
      "InstanceId": "4d6d1710-ded9-42a1-b08e-b043ad7af1e2",
      "SshKeyName": "US-West-2",
      "InfrastructureClass": "ec2",
      "RootDeviceVolumeId": "vol-d08ec6c1",
      "SubnetId": "subnet-b8de0ddd",
      "InstanceType": "t1.micro",
      "CreatedAt": "2015-02-24T20:52:49+00:00",
      "AmiId": "ami-35501205",
      "Hostname": "ip-192-0-2-0",
      "Ec2InstanceId": "i-5cd23551",
      "PublicDns": "ec2-192-0-2-0.us-west-2.compute.amazonaws.com",
      "SecurityGroupIds": [
        "sg-c4d3f09a1"
      ],
      "Architecture": "x86_64",
      "RootDeviceType": "ebs",
      "InstallUpdatesOnBoot": true,
      "Os": "Custom",
      "VirtualizationType": "paravirtual",
      "AvailabilityZone": "us-west-2a",
      "PrivateIp": "10.31.39.66",
      "PublicIp": "192.0.2.06",
      "RegisteredBy": "arn:aws:iam::123456789102:user/AWS/OpsWorks/OpsWorks-EC2Register-i-5cd23551"

  ]
}
```
More Information

For more information, see Instances in the AWS OpsWorks User Guide.
For API details, see `DescribeInstances` in *AWS CLI Command Reference*.

**describe-layers**

The following code example shows how to use `describe-layers`.

**AWS CLI**

To describe a stack’s layers

The following `describe-layers` command describes the layers in a specified stack:

```bash
aws opsworks --region us-east-1 describe-layers --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a
```

**Output:**

```json
{
  "Layers": [
  {
    "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
    "Type": "db-master",

describe-load-based-auto-scaling

The following code example shows how to use `describe-load-based-auto-scaling`.

**AWS CLI**

**To describe a layer's load-based scaling configuration**

The following example describes a specified layer's load-based scaling configuration. The layer is identified by its layer ID, which you can find on the layer's details page or by running `describe-layers`.

```bash
aws opsworks describe-load-based-auto-scaling --region us-east-1 --layer-ids 6bec29c9-c866-41a0-aba5-fa3e374ce2a1
```

*Output: The example layer has a single load-based instance.*

```json
{
    "LoadBasedAutoScalingConfigurations": [
        {
            "DownScaling": {
                "IgnoreMetricsTime": 10,
                "ThresholdsWaitTime": 10,
                "InstanceCount": 1,
                "CpuThreshold": 30.0
            },
            "Enable": true,
            "UpScaling": {
                "IgnoreMetricsTime": 5,
                "ThresholdsWaitTime": 5,
                "InstanceCount": 1,
                "CpuThreshold": 80.0
            },
            "LayerId": "6bec29c9-c866-41a0-aba5-fa3e374ce2a1"
        }
    ]
}
```
More Information

For more information, see How Automatic Load-based Scaling Works in the *AWS OpsWorks User Guide*.

- For API details, see `DescribeLoadBasedAutoScaling` in *AWS CLI Command Reference*.

describe-my-user-profile

The following code example shows how to use `describe-my-user-profile`.

**AWS CLI**

**To obtain a user's profile**

The following example shows how to obtain the profile of the AWS Identity and Access Management (IAM) user that is running the command.

```bash
aws opsworks --region us-east-1 describe-my-user-profile
```

**Output:** For brevity, most of the user's SSH public key is replaced by an ellipsis (...).

```
{
    "UserProfile": {
        "IamUserArn": "arn:aws:iam::123456789012:user/myusername",
        "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQ...3LQ4aXjpXQw== rsa-key-20141104",
        "Name": "myusername",
        "SshUsername": "myusername"
    }
}
```

More Information

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see `DescribeMyUserProfile` in *AWS CLI Command Reference*.

describe-permissions

The following code example shows how to use `describe-permissions`.

Actions and scenarios
AWS CLI

**To obtain a user's per-stack AWS OpsWorks permission level**

The following example shows how to obtain an AWS Identity and Access Management (IAM) user's permission level on a specified stack.

```bash
aws opsworks --region us-east-1 describe-permissions --iam-user-arn arn:aws:iam::123456789012:user/cli-user-test --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06
```

**Output:**

```json
{
   "Permissions": [
      {
         "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
         "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
         "Level": "manage",
         "AllowSudo": true,
         "AllowSsh": true
      }
   ]
}
```

**More Information**

For more information, see Granting Per-Stack Permissions Levels in the *AWS OpsWorks User Guide*.

- For API details, see [DescribePermissions](https://docs.aws.amazon.com/cli/latest/reference/opsworks/describe-permissions.html) in *AWS CLI Command Reference*.

**describe-raid-arrays**

The following code example shows how to use `describe-raid-arrays`.

AWS CLI

**To describe RAID arrays**

The following example describes the RAID arrays attached to the instances in a specified stack.
aws opsworks --region us-east-1 describe-raid-arrays --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06

**Output:** The following is the output for a stack with one RAID array.

```json
{
   "RaidArrays": [
      {
         "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
         "AvailabilityZone": "us-west-2a",
         "Name": "Created for php-app1",
         "NumberOfDisks": 2,
         "InstanceId": "9f14adbc-ced5-43b6-bf01-e7d0db6cf2f7",
         "RaidLevel": 0,
         "VolumeType": "standard",
         "RaidArrayId": "f2d4e470-5972-4676-b1b8-bae41ec3e51c",
         "Device": "/dev/md0",
         "MountPoint": "/mnt/workspace",
         "CreatedAt": "2015-02-26T23:53:09+00:00",
         "Size": 100
      }
   ]
}
```

For more information, see EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeRaidArrays](https://awscli.amazonaws.com/v2/documentation/api/2018-06-25/index.html#aws-opsworks describe-raid-arrays) in *AWS CLI Command Reference*.

---

**describe-rds-db-instances**

The following code example shows how to use `describe-rds-db-instances`.

**AWS CLI**

**To describe a stack's registered Amazon RDS instances**

The following example describes the Amazon RDS instances registered with a specified stack.

```bash
aws opsworks --region us-east-1 describe-rds-db-instances --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06
```

**Output:** The following is the output for a stack with one registered RDS instance.
For more information, see Resource Management in the *AWS OpsWorks User Guide.*

- For API details, see [DescribeRdsDbInstances](#) in *AWS CLI Command Reference.*

**describe-stack-provisioning-parameters**

The following code example shows how to use `describe-stack-provisioning-parameters`.

**AWS CLI**

To return the provisioning parameters for a stack

The following `describe-stack-provisioning-parameters` example returns the provisioning parameters for a specified stack. Provisioning parameters include settings such as the agent installation location and public key that OpsWorks uses to manage the agent on instances in a stack.

```
aws opsworks describe-stack-provisioning-parameters \
  --stack-id 62744d97-6faf-4ecb-969b-a086fEXAMPLE
```

**Output:**

```
{
```
"Parameters": {
  "agent_installer_tgz": "opsworks-agent-installer.tgz",
  "assets_download_bucket": "opsworks-instance-assets-us-west-2.s3.amazonaws.com",
  "charlie_public_key": "-----BEGIN PUBLIC KEY-----PUBLIC_KEY_EXAMPLE
-----END PUBLIC KEY-----",
  "instance_service_endpoint": "opsworks-instance-service.us-west-2.amazonaws.com",
  "instance_service_port": "443",
  "instance_service_region": "us-west-2",
  "instance_service_ssl_verify_peer": "true",
  "instance_service_use_ssl": "true",
  "ops_works_endpoint": "opsworks.us-west-2.amazonaws.com",
  "ops_works_port": "443",
  "ops_works_region": "us-west-2",
  "ops_works_ssl_verify_peer": "true",
  "ops_works_use_ssl": "true",
  "verbose": "false",
  "wait_between_runs": "30"
}

For more information, see Run Stack Commands in the AWS OpsWorks User Guide.

- For API details, see DescribeStackProvisioningParameters in AWS CLI Command Reference.

describe-stack-summary

The following code example shows how to use describe-stack-summary.

AWS CLI

To describe a stack's configuration

The following describe-stack-summary command returns a summary of the specified stack's configuration.

```bash
aws opsworks --region us-east-1 describe-stack-summary --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

Output:
More Information

For more information, see Stacks in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeStackSummary](https://docs.aws.amazon.com/cli/latest/reference/opsworks/describe-stack-summary.html) in *AWS CLI Command Reference*.

descrbe-stacks

The following code example shows how to use `describe-stacks`.

**AWS CLI**

To describe stacks

The following `describe-stacks` command describes an account's stacks.

```
aws opsworks --region us-east-1 describe-stacks
```

**Output:**

```json
{
   "Stacks": [
       {
            "ServiceRoleArn": "arn:aws:iam::44445556666:role/aws-opsworks-service-role",

}
More Information

For more information, see Stacks in the AWS OpsWorks User Guide.
- For API details, see DescribeStacks in AWS CLI Command Reference.

describe-timebased-auto-scaling

The following code example shows how to use describe-timebased-auto-scaling.

AWS CLI

To describe the time-based scaling configuration of an instance

The following example describes a specified instance's time-based scaling configuration. The instance is identified by its instance ID, which you can find on the instance's details page or by running describe-instances.

```
aws opsworks describe-time-based-auto-scaling --region us-east-1 --instance-ids 701f2ffe-5d8e-4187-b140-77b75f55de8d
```

Output: The example has a single time-based instance.

```
{
  "TimeBasedAutoScalingConfigurations": [
    {
      "InstanceId": "701f2ffe-5d8e-4187-b140-77b75f55de8d",
      "AutoScalingSchedule": {
        "Monday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
        },
        "Tuesday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
        }
      }
    }
  ]
}
```
More Information

For more information, see How Automatic Time-based Scaling Works in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeTimeBasedAutoScaling](aws-cli-command-reference) in *AWS CLI Command Reference*.

**describe-user-profiles**

The following code example shows how to use `describe-user-profiles`.

**AWS CLI**

**To describe user profiles**

The following `describe-user-profiles` command describes the account's user profiles.

```
aws opsworks --region us-east-1 describe-user-profiles
```

**Output:**

```
{
  "UserProfiles": [
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/someuser",
      "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQAAAQEAk0uP7i80q3Cko...",
      "AllowSelfManagement": true,
      "Name": "someuser",
      "SshUsername": "someuser"
    },
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
      "AllowSelfManagement": true,
      "Name": "cli-user-test",
      "SshUsername": "myusername"
    }
  ]
}
```
More Information

For more information, see Managing AWS OpsWorks Users in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeUserProfiles](https://docs.aws.amazon.com/cli/latest/reference/opsworks/describe-user-profiles) in *AWS CLI Command Reference*.

**describe-volumes**

The following code example shows how to use `describe-volumes`.

**AWS CLI**

To describe a stack's volumes

The following example describes a stack's EBS volumes.

```bash
aws opsworks --region us-east-1 describe-volumes --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

**Output:**

```json
{
  "Volumes": [
    {
      "Status": "in-use",
      "AvailabilityZone": "us-west-2a",
      "Name": "CLITest",
      "InstanceId": "dfe18b02-5327-493d-91a4-c5c0c448927f",
      "VolumeType": "standard",
      "VolumeId": "56b66fbd-e1a1-4aff-9227-70f77118d4c5",
      "Device": "/dev/sdi",
      "Ec2VolumeId": "vol-295c1638",
      "MountPoint": "/mnt/myvolume",
      "Size": 1
    }
  ]
}
```
More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeVolumes](#) in *AWS CLI Command Reference*.

**detach-elastic-load-balancer**

The following code example shows how to use `detach-elastic-load-balancer`.

**AWS CLI**

To detach a load balancer from its layer

The following example detaches a load balancer, identified by its name, from its layer.

```
aws opsworks --region us-east-1 detach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

*Output:* None.

More Information

For more information, see Elastic Load Balancing in the *AWS OpsWorks User Guide*.

- For API details, see [DetachElasticLoadBalancer](#) in *AWS CLI Command Reference*.

**disassociate-elastic-ip**

The following code example shows how to use `disassociate-elastic-ip`.

**AWS CLI**

To disassociate an Elastic IP address from an instance

The following example disassociates an Elastic IP address from a specified instance.

```
aws opsworks --region us-east-1 disassociate-elastic-ip --elastic-ip 54.148.130.96
```

*Output:* None.
More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [DisassociateElasticIp](#) in *AWS CLI Command Reference*.

get-hostname-suggestion

The following code example shows how to use get-hostname-suggestion.

**AWS CLI**

**To get the next hostname for a layer**

The following example gets the next generated hostname for a specified layer. The layer used for this example is a Java Application Server layer with one instance. The stack's hostname theme is the default, Layer_Dependent.

```
aws opsworks --region us-east-1 get-hostname-suggestion --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

**Output:**

```
{
    "Hostname": "java-app2",
    "LayerId": "888c5645-09a5-4d0e-95a8-812ef1db76a4"
}
```

More Information

For more information, see Create a New Stack in the *AWS OpsWorks User Guide*.

- For API details, see [GetHostnameSuggestion](#) in *AWS CLI Command Reference*.

reboot-instance

The following code example shows how to use reboot-instance.

**AWS CLI**

**To reboot an instance**
The following example reboots an instance.

```bash
aws opsworks --region us-east-1 reboot-instance --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f
```

**Output:** None.

**More Information**

For more information, see Rebooting an Instance in the *AWS OpsWorks User Guide*.

- For API details, see [RebootInstance](#) in *AWS CLI Command Reference*.

### register-elastic-ip

The following code example shows how to use `register-elastic-ip`.

**AWS CLI**

**To register an Elastic IP address with a stack**

The following example registers an Elastic IP address, identified by its IP address, with a specified stack.

**Note:** The Elastic IP address must be in the same region as the stack.

```bash
aws opsworks register-elastic-ip --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --elastic-ip 54.148.130.96
```

**Output**

```json
{
   "ElasticIp": "54.148.130.96"
}
```

**More Information**

For more information, see Registering Elastic IP Addresses with a Stack in the *OpsWorks User Guide*.

- For API details, see [RegisterElasticIp](#) in *AWS CLI Command Reference*. 
register-rds-db-instance

The following code example shows how to use register-rds-db-instance.

AWS CLI

To register an Amazon RDS instance with a stack

The following example registers an Amazon RDS DB instance, identified by its Amazon Resource Name (ARN), with a specified stack. It also specifies the instance's master username and password. Note that AWS OpsWorks does not validate either of these values. If either one is incorrect, your application will not be able to connect to the database.

```bash
aws opsworks register-rds-db-instance --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --rds-db-instance-arn arn:aws:rds:us-west-2:123456789012:db:clitestdb --db-user cliuser --db-password some23!pwd
```

Output: None.

More Information

For more information, see Registering Amazon RDS Instances with a Stack in the AWS OpsWorks User Guide.

- For API details, see RegisterRdsDbInstance in AWS CLI Command Reference.

register-volume

The following code example shows how to use register-volume.

AWS CLI

To register an Amazon EBS volume with a stack

The following example registers an Amazon EBS volume, identified by its volume ID, with a specified stack.

```bash
aws opsworks register-volume --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --ec2-volume-id vol-295c1638
```

Output:
More Information

For more information, see Registering Amazon EBS Volumes with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see `RegisterVolume` in *AWS CLI Command Reference*.

**register**

The following code example shows how to use `register`.

**AWS CLI**

**To register instances with a stack**

The following examples show a variety of ways to register instances with a stack that were created outside of AWS Opsworks. You can run `register` from the instance to be registered, or from a separate workstation. For more information, see Registering Amazon EC2 and On-premises Instances in the *AWS OpsWorks User Guide*.

**Note**: For brevity, the examples omit the `region` argument.

**To register an Amazon EC2 instance**

To indicate that you are registering an EC2 instance, set the `--infrastructure-class` argument to `ec2`.

The following example registers an EC2 instance with the specified stack from a separate workstation. The instance is identified by its EC2 ID, `i-12345678`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, `register` queries for the password.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb i-12345678
```
The following example registers an EC2 instance with the specified stack from a separate workstation. It uses the --ssh-username and --ssh-private-key arguments to explicitly specify the SSH username and private key file that the command uses to log into the instance. ec2-user is the standard username for Amazon Linux instances. Use ubuntu for Ubuntu instances.

```bash
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username ec2-user --ssh-private-key ssh_private_key i-12345678
```

The following example registers the EC2 instance that is running the register command. Log in to the instance with SSH and run register with the --local argument instead of an instance ID or hostname.

```bash
aws opsworks register --infrastructure-class ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

To register an on-premises instance

To indicate that you are registering an on-premises instance, set the --infrastructure-class argument to on-premises.

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address, 192.0.2.3. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, register queries for the password.

```bash
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb 192.0.2.3
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its hostname, host1. The --override-... arguments direct AWS OpsWorks to display webserver1 as the host name and 192.0.2.3 and 10.0.0.2 as the instance's public and private IP addresses, respectively.

```bash
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-hostname webserver1 --override-public-ip 192.0.2.3 --override-private-ip 10.0.0.2 host1
```
The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address. `register` logs into the instance using the specified SSH username and private key file.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username admin --ssh-private-key ssh_private_key 192.0.2.3
```

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The command logs into the instance using a custom SSH command string that specifies the SSH password and the instance's IP address.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-ssh "sshpass -p 'mypassword' ssh your-user@192.0.2.3"
```

The following example registers the on-premises instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

**Output:** The following is typical output for registering an EC2 instance.

```
Warning: Permanently added '52.11.41.206' (ECDSA) to the list of known hosts.
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current

[Tue, 24 Feb 2015 20:48:37 +0000] opsworks-init: Checking if OS is supported
[Tue, 24 Feb 2015 20:48:37 +0000] opsworks-init: Running on supported OS
```
More Information

For more information, see Registering an Instance with an AWS OpsWorks Stack in the AWS OpsWorks User Guide.

- For API details, see Register in AWS CLI Command Reference.

set-load-based-auto-scaling

The following code example shows how to use set-load-based-auto-scaling.

AWS CLI

To set the load-based scaling configuration for a layer

The following example enables load-based scaling for a specified layer and sets the configuration for that layer. You must use create-instance to add load-based instances to the layer.

```
```

The example puts the upscaling threshold settings in a separate file in the working directory named upscale.json, which contains the following.

```json
{
```
The example puts the downscaling threshold settings in a separate file in the working directory named `downscale.json`, which contains the following.

```json
{
  "InstanceCount": 2,
  "ThresholdsWaitTime": 3,
  "IgnoreMetricsTime": 3,
  "CpuThreshold": 85,
  "MemoryThreshold": 85,
  "LoadThreshold": 85
}
```

**Output:** None.

**More Information**

For more information, see Using Automatic Load-based Scaling in the *AWS OpsWorks User Guide*.

- For API details, see [SetLoadBasedAutoScaling](#) in *AWS CLI Command Reference*.

**set-permission**

The following code example shows how to use `set-permission`.

**AWS CLI**

**To grant per-stack AWS OpsWorks permission levels**

When you import an AWS Identity and Access Management (IAM) user into AWS OpsWorks by calling `create-user-profile`, the user has only those permissions that are granted by the attached IAM policies. You can grant AWS OpsWorks permissions by modifying a user's policies. However, it is often easier to import a user and then use the `set-permission` command to
grant the user one of the standard permission levels for each stack to which the user will need access.

The following example grants permission for the specified stack for a user, who is identified by Amazon Resource Name (ARN). The example grants the user a Manage permissions level, with sudo and SSH privileges on the stack's instances.

```bash
aws opsworks set-permission --region us-east-1 --stack-id 71c7ca72-55ae-4b6a-8ee1-a8dc6d3fa0f --level manage --iam-user-arn arn:aws:iam::123456789102:user/cli-user-test --allow-ssh --allow-sudo
```

**Output:** None.

**More Information**

For more information, see Granting AWS OpsWorks Users Per-Stack Permissions in the *AWS OpsWorks User Guide*.

- For API details, see [SetPermission](https://docs.aws.amazon.com/cli/latest/reference/opsworks/set-permission.html) in *AWS CLI Command Reference*.

### set-time-based-auto-scaling

The following code example shows how to use set-time-based-auto-scaling.

**AWS CLI**

**To set the time-based scaling configuration for a layer**

The following example sets the time-based configuration for a specified instance. You must first use `create-instance` to add the instance to the layer.

```bash
aws opsworks --region us-east-1 set-time-based-auto-scaling --instance-id 69b6237c-08c0-4edb-a6af-78f3d01cedf2 --auto-scaling-schedule file://schedule.json
```

The example puts the schedule in a separate file in the working directory named `schedule.json`. For this example, the instance is on for a few hours around midday UTC (Coordinated Universal Time) on Monday and Tuesday.

```json
{
    "Monday": {
        "10": "on",
```
"11": "on",
"12": "on",
"13": "on"
},
"Tuesday": {
"10": "on",
"11": "on",
"12": "on",
"13": "on"
}
}

**Output:** None.

**More Information**

For more information, see Using Automatic Time-based Scaling in the *AWS OpsWorks User Guide*.

### start-instance

The following code example shows how to use `start-instance`.

**AWS CLI**

**To start an instance**

The following `start-instance` command starts a specified 24/7 instance.

```
aws opsworks start-instance --instance-id f705ee48-9000-4890-8bd3-20eb05825aaf
```

**Output:** None. Use `describe-instances` to check the instance's status.

**Tip** You can start every offline instance in a stack with one command by calling `start-stack`.

**More Information**

For more information, see Manually Starting, Stopping, and Rebooting 24/7 Instances in the *AWS OpsWorks User Guide*.

Actions and scenarios
**start-stack**

The following code example shows how to use start-stack.

**AWS CLI**

**To start a stack's instances**

The following example starts all of a stack's 24/7 instances. To start a particular instance, use start-instance.

```bash
aws opsworks --region us-east-1 start-stack --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

*Output*: None.

**More Information**

For more information, see Starting an Instance in the *AWS OpsWorks User Guide*.
- For API details, see [StartStack](#) in *AWS CLI Command Reference*.

**stop-instance**

The following code example shows how to use stop-instance.

**AWS CLI**

**To stop an instance**

The following example stops a specified instance, which is identified by its instance ID. You can obtain an instance ID by going to the instance's details page on the AWS OpsWorks console or by running the describe-instances command.

```bash
aws opsworks stop-instance --region us-east-1 --instance-id 3a21cfac-4a1f-4ce2-a921-b2cfba6f7771
```

You can restart a stopped instance by calling start-instance or by deleting the instance by calling delete-instance.

*Output*: None.

**More Information**
For more information, see Stopping an Instance in the *AWS OpsWorks User Guide*.

- For API details, see [StopInstance](#) in *AWS CLI Command Reference*.

**stop-stack**

The following code example shows how to use `stop-stack`.

**AWS CLI**

**To stop a stack's instances**

The following example stops all of a stack's 24/7 instances. To stop a particular instance, use `stop-instance`.

```bash
aws opsworks --region us-east-1 stop-stack --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

*Output: No output.*

**More Information**

For more information, see Stopping an Instance in the *AWS OpsWorks User Guide*.

- For API details, see [StopStack](#) in *AWS CLI Command Reference*.

**unassign-instance**

The following code example shows how to use `unassign-instance`.

**AWS CLI**

**To unassign a registered instance from its layers**

The following `unassign-instance` command unassigns an instance from its attached layers.

```bash
aws opsworks --region us-east-1 unassign-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2
```

*Output: None.*

**More Information**
For more information, see Unassigning a Registered Instance in the AWS OpsWorks User Guide.

- For API details, see UnassignInstance in AWS CLI Command Reference.

**unassign-volume**

The following code example shows how to use unassign-volume.

**AWS CLI**

**To unassign a volume from its instance**

The following example unassigns a registered Amazon Elastic Block Store (Amazon EBS) volume from its instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.

```bash
aws opsworks --region us-east-1 unassign-volume --volume-id 8430177d-52b7-4948-9c62-e195af4703df
```

*Output: None.*

**More Information**

For more information, see Unassigning Amazon EBS Volumes in the AWS OpsWorks User Guide.
- For API details, see UnassignVolume in AWS CLI Command Reference.

**update-app**

The following code example shows how to use update-app.

**AWS CLI**

**To update an app**

The following example updates a specified app to change its name.

```bash
aws opsworks --region us-east-1 update-app --app-id 26a61ead-d201-47e3-b55c-2a7c666942f8 --name NewAppName
```

*Output: None.*
More Information

For more information, see Editing Apps in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateApp](#) in *AWS CLI Command Reference*.

### update-elastic-ip

The following code example shows how to use `update-elastic-ip`.

**AWS CLI**

**To update an Elastic IP address name**

The following example updates the name of a specified Elastic IP address.

```
aws opsworks --region us-east-1 update-elastic-ip --elastic-ip 54.148.130.96 --name NewIPName
```

*Output*: None.

**More Information**

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateElasticIp](#) in *AWS CLI Command Reference*.

### update-instance

The following code example shows how to use `update-instance`.

**AWS CLI**

**To update an instance**

The following example updates a specified instance's type.

```
aws opsworks --region us-east-1 update-instance --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f --instance-type c3.xlarge
```

*Output*: None.

**More Information**

Actions and scenarios
update-layer

The following code example shows how to use update-layer.

AWS CLI

To update a layer

The following example updates a specified layer to use Amazon EBS-optimized instances.

```
aws opsworks --region us-east-1 update-layer --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4 --use-ebs-optimized-instances
```

Output: None.

More Information

For more information, see Editing an OpsWorks Layer's Configuration in the AWS OpsWorks User Guide.

- For API details, see UpdateLayer in AWS CLI Command Reference.

update-my-user-profile

The following code example shows how to use update-my-user-profile.

AWS CLI

To update a user's profile

The following example updates the development user's profile to use a specified SSH public key. The user's AWS credentials are represented by the development profile in the credentials file (~/.aws/credentials), and the key is in a .pem file in the working directory.

```
aws opsworks --region us-east-1 --profile development update-my-user-profile --ssh-public-key file://development_key.pem
```
**Output**: None.

**More Information**

For more information, see Editing AWS OpsWorks User Settings in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateMyUserProfile](#) in *AWS CLI Command Reference*.

---

**update-rds-db-instance**

The following code example shows how to use `update-rds-db-instance`.

**AWS CLI**

**To update a registered Amazon RDS DB instance**

The following example updates an Amazon RDS instance's master password value. Note that this command does not change the RDS instance's master password, just the password that you provide to AWS OpsWorks. If this password does not match the RDS instance's password, your application will not be able to connect to the database.

```bash
aws opsworks --region us-east-1 update-rds-db-instance --db-password 123456789
```

**Output**: None.

**More Information**

For more information, see Registering Amazon RDS Instances with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateRdsDbInstance](#) in *AWS CLI Command Reference*.

---

**update-volume**

The following code example shows how to use `update-volume`.

**AWS CLI**

**To update a registered volume**
The following example updates a registered Amazon Elastic Block Store (Amazon EBS) volume's mount point. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns to the volume when you register it with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID:

```
aws opsworks --region us-east-1 update-volume --volume-id 8430177d-52b7-4948-9c62-e195af4703df --mount-point /mnt/myvol
```

*Output*: None.

More Information

For more information, see Assigning Amazon EBS Volumes to an Instance in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateVolume](aws-cli-command-reference) in *AWS CLI Command Reference*.

AWS OpsWorks CM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks CM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

**associate-node**

The following code example shows how to use `associate-node`.
AWS CLI

To associate nodes

The following associate-node command associates a node named i-44de882p with a Chef Automate server named automate-06, meaning that the automate-06 server manages the node, and communicates recipe commands to the node through chef-client agent software that is installed on the node by the associate-node command. Valid node names are EC2 instance IDs:

```
aws opsworks-cm associate-node --server-name "automate-06" --node-name "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization' Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. Output:

```
{
  "NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DiJa55OLp5o14DH/rHRqHDWxwVoNBxcEyi4V7R0NOfymh7E/1HumOBPsmpQFEdcGaiFk"
}
```

More Information

For more information, see Adding Nodes Automatically in AWS OpsWorks for Chef Automate in the AWS OpsWorks User Guide.

- For API details, see AssociateNode in AWS CLI Command Reference.

create-backup

The following code example shows how to use create-backup.

AWS CLI

To create backups

The following create-backup command starts a manual backup of a Chef Automate server named automate-06 in the us-east-1 region. The command adds a descriptive message to the backup in the --description parameter.

```
aws opsworks-cm create-backup \
```
```
--server-name 'automate-06' \ 
--description "state of my infrastructure at launch"
```

The output shows you information similar to the following about the new backup.

Output:

```
{
  "Backups": [
    {
      "BackupArn": "string",
      "BackupId": "automate-06-20160729133847520",
      "BackupType": "MANUAL",
      "CreatedAt": "2016-07-29T13:38:47.520Z",
      "Description": "state of my infrastructure at launch",
      "Engine": "Chef",
      "EngineModel": "Single",
      "EngineVersion": "12",
      "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4U2WRM2",
      "InstanceType": "m4.large",
      "KeyPair": "",
      "PreferredBackupWindow": "",
      "PreferredMaintenanceWindow": "",
      "S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/automate-06-20160729133847520",
      "SecurityGroupIds": [ "sg-1a24c270" ],
      "ServerName": "automate-06",
      "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
      "Status": "OK",
      "StatusDescription": "",
      "SubnetIds": [ "subnet-49436a18" ],
      "ToolsVersion": "string",
      "UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
    }
  ],
}
```

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see [CreateBackup](#) in AWS CLI Command Reference.
**create-server**

The following code example shows how to use `create-server`.

**AWS CLI**

**To create a server**

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in [Getting Started with AWS OpsWorks for Chef Automate](https://docs.aws.amazon.com/opsworks/latest/userguide/opsworks-chef-automa.html) in the *AWS Opsworks for Chef Automate User Guide*.

```bash
aws opsworks-cm create-server \
  --engine "Chef" \
  --engine-model "Single" \
  --engine-version "12" \
  --server-name "automate-06" \
  --instance-profile-arn "arn:aws:iam::1019881987024:instance-profile/aws-opsworks-cm-ec2-role" \
  --instance-type "t2.medium" \
  --key-pair "amazon-test" \
  --service-role-arn "arn:aws:iam::044726508045:role/aws-opsworks-cm-service-role"
```

The output shows you information similar to the following about the new server:

```json
{
  "Server": {
    "BackupRetentionCount": 10,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": false,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
        "Value": "1Password1"
      }
    ],
    "EngineModel": "Single",
    "EngineVersion": "12",
    "NumberOfInstances": 1
  }
}
```
"InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/aws-opsworks-cm-ec2-role",
  "InstanceType": "t2.medium",
  "KeyPair": "amazon-test",
  "MaintenanceStatus": "",
  "PreferredBackupWindow": "Sun:02:00",
  "PreferredMaintenanceWindow": "00:00",
  "SecurityGroupIds": [ "sg-1a24c270" ],
  "ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4UUZWRM2",
  "ServerName": "automate-06",
  "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role",
  "Status": "CREATING",
  "StatusReason": "",
  "SubnetIds": [ "subnet-49436a18" ]
}

For more information, see [UpdateServer](#) in the [AWS OpsWorks for Chef Automate API Reference](#).

- For API details, see [CreateServer](#) in [AWS CLI Command Reference](#).

**delete-backup**

The following code example shows how to use delete-backup.

**AWS CLI**

**To delete backups**

The following delete-backup command deletes a manual or automated backup of a Chef Automate server, identified by the backup ID. This command is useful when you are approaching the maximum number of backups that you can save, or you want to minimize your Amazon S3 storage costs.:

```bash
aws opsworks-cm delete-backup --backup-id "automate-06-2016-11-19T23:42:40.240Z"
```

The output shows whether the backup deletion succeeded.

**More Information**
For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteBackup](#) in *AWS CLI Command Reference*.

**delete-server**

The following code example shows how to use delete-server.

**AWS CLI**

**To delete servers**

The following `delete-server` command deletes a Chef Automate server, identified by the server's name. After the server is deleted, it is no longer returned by `DescribeServer` requests:

```
aws opsworks-cm delete-server --server-name "automate-06"
```

The output shows whether the server deletion succeeded.

**More Information**

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteServer](#) in *AWS CLI Command Reference*.

**describe-account-attributes**

The following code example shows how to use describe-account-attributes.

**AWS CLI**

**To describe account attributes**

The following `describe-account-attributes` command returns information about your account's usage of AWS OpsWorks for Chef Automate resources:

```
aws opsworks-cm describe-account-attributes
```
The output for each account attribute entry returned by the command resembles the following.

**Output:**

```json
{
  "Attributes": [
    {
      "Maximum": 5,
      "Name": "ServerLimit",
      "Used": 2
    }
  ]
}
```

**More Information**

For more information, see DescribeAccountAttributes in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

---

**describe-backups**

The following code example shows how to use `describe-backups`.

**AWS CLI**

**To describe backups**

The following `describe-backups` command returns information about all backups associated with your account in your default region.

```
aws opsworks-cm describe-backups
```

The output for each backup entry returned by the command resembles the following.

**Output:**

```json
{
  "Backups": [
    {
      "BackupArn": "string",
      …
    }
  ]
}
```
"BackupId": "automate-06-20160729133847520",
"BackupType": "MANUAL",
"CreatedAt": 2016-07-29T13:38:47.520Z,
"Description": "state of my infrastructure at launch",
"Engine": "Chef",
"EngineModel": "Single",
"EngineVersion": "12",
"InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4UU2WRM2",
"InstanceType": "m4.large",
"KeyPair": "",
"PreferredBackupWindow": "",
"PreferredMaintenanceWindow": "",
"S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/automate-06-20160729133847520",
"SecurityGroupIds": [ "sg-1a24c270" ],
"ServerName": "automate-06",
"ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
"Status": "Successful",
"StatusDescription": "",
"SubnetIds": [ "subnet-49436a18" ],
"ToolsVersion": "string",
"UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
}]
}

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see DescribeBackups in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use describe-events.

**AWS CLI**

To describe events

The following describe-events example returns information about all events that are associated with the specified Chef Automate server.
aws opsworks-cm describe-events \
   --server-name 'automate-06'

The output for each event entry returned by the command resembles the following example:

```json
{
   "ServerEvents": [
      {
         "CreatedAt": "2016-07-29T13:38:47.520Z",
         "LogUrl": "https://s3.amazonaws.com/<bucket-name>/automate-06-20160729133847520",
         "Message": "Updates successfully installed.",
         "ServerName": "automate-06"
      }
   ]
}
```

For more information, see General Troubleshooting Tips in the AWS OpsWorks User Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

describe-node-association-status

The following code example shows how to use describe-node-association-status.

AWS CLI

To describe node association status

The following describe-node-association-status command returns the status of a request to associate a node with a Chef Automate server named automate-06:

```bash
aws opsworks-cm describe-node-association-status --server-name "automate-06" --node-association-status-token "AflJKl+/GoKLZJbdDQEx0065CDi57b1Qe9nKM8jo5okQ0pQ9xr8DqApBN9/106sLdSv1fDEKkEx+eoCHvjoWHa0s=
```

The output for each account attribute entry returned by the command resembles the following.

```
{ "NodeAssociationStatus": "IN_PROGRESS"
}
More Information

For more information, see DescribeNodeAssociationStatus in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [DescribeNodeAssociationStatus](aws-cli-command-reference) in *AWS CLI Command Reference*.

**describe-servers**

The following code example shows how to use `describe-servers`.

**AWS CLI**

**To describe servers**

The following `describe-servers` command returns information about all servers that are associated with your account, and in your default region:

```bash
aws opsworks-cm describe-servers
```

The output for each server entry returned by the command resembles the following. *Output:*

```json
{
    "Servers": [
        {
            "BackupRetentionCount": 8,
            "CreatedAt": "2016-07-29T13:38:47.520Z",
            "DisableAutomatedBackup": false,
            "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
            "Engine": "Chef",
            "EngineAttributes": [
                {
                    "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
                    "Value": "1Password1"
                }
            ],
            "EngineModel": "Single",
            "EngineVersion": "12",
            "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4UU2WRM2",
```
"InstanceType": "m4.large",
"KeyPair": "",
"MaintenanceStatus": "SUCCESS",
"PreferredBackupWindow": "03:00",
"PreferredMaintenanceWindow": "Mon:09:00",
"SecurityGroupIds": [ "sg-1a24c270" ],
"ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4UU2WRM2",
"ServerName": "automate-06",
"ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
"Status": "HEALTHY",
"StatusReason": "",
"SubnetIds": [ "subnet-49436a18" ]
}
]
}

More Information

For more information, see DescribeServers in the AWS OpsWorks for Chef Automate API Guide.

- For API details, see DescribeServers in AWS CLI Command Reference.

disassociate-node

The following code example shows how to use disassociate-node.

AWS CLI

To disassociate nodes

The following disassociate-node command disassociates a node named i-44de882p, removing the node from management by a Chef Automate server named automate-06. Valid node names are EC2 instance IDs:

```bash
aws opsworks-cm disassociate-node --server-name "automate-06" --node-name "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization' Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. Output:

```json
{
```
More Information

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see DisassociateNode in AWS CLI Command Reference.

**restore-server**

The following code example shows how to use `restore-server`.

**AWS CLI**

**To restore a server**

The following `restore-server` command performs an in-place restoration of a Chef Automate server named `automate-06` in your default region from a backup with an ID of `automate-06-2016-11-22T16:13:27.998Z`. Restoring a server restores connections to the nodes that the Chef Automate server was managing at the time that the specified backup was performed.

```
aws opsworks-cm restore-server --backup-id "automate-06-2016-11-22T16:13:27.998Z" --server-name "automate-06"
```

The output is the command ID only. **Output:**

(None)

More Information

For more information, see Restore a Failed AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see RestoreServer in AWS CLI Command Reference.

**start-maintenance**

The following code example shows how to use `start-maintenance`.
AWS CLI

To start maintenance

The following start-maintenance example manually starts maintenance on the specified Chef Automate or Puppet Enterprise server in your default region. This command is useful if an earlier, automated maintenance attempt failed, and the underlying cause of maintenance failure has been resolved.

```
aws opsworks-cm start-maintenance \
   --server-name 'automate-06'
```

Output:

```json
{
    "Server": {
        "AssociatePublicIpAddress": true,
        "BackupRetentionCount": 10,
        "ServerName": "automate-06",
        "CreatedAt": 1569229584.842,
        "CloudFormationStackArn": "arn:aws:cloudformation:us-west-2:123456789012:stack/aws-opsworks-cm-instance-automate-06-1606611794746/EXAMPLE0-31de-11eb-bdb0-0a5b0a1353b8",
        "DisableAutomatedBackup": false,
        "Endpoint": "automate-06-EXAMPLEvr8gjfk5f.us-west-2.opsworks-cm.io",
        "Engine": "ChefAutomate",
        "EngineModel": "Single",
        "EngineAttributes": [],
        "EngineVersion": "2020-07",
        "InstanceProfileArn": "arn:aws:iam::123456789012:instance-profile/aws-opsworks-cm-ec2-role",
        "InstanceType": "m5.large",
        "PreferredMaintenanceWindow": "Sun:01:00",
        "PreferredBackupWindow": "Sun:15:00",
        "SecurityGroupIds": ["sg-EXAMPLE"],
        "ServiceRoleArn": "arn:aws:iam::123456789012:role/service-role/aws-opsworks-cm-service-role",
        "Status": "UNDER_MAINTENANCE",
        "SubnetIds": ["subnet-EXAMPLE"]
    }
}
```

- For API details, see [StartMaintenance](https://docs.aws.amazon.com/cli/latest/cli-reference/) in AWS CLI Command Reference.

**update-server-engine-attributes**

The following code example shows how to use `update-server-engine-attributes`.

**AWS CLI**

**To update server engine attributes**

The following `update-server-engine-attributes` command updates the value of the `CHEF_PIVOTAL_KEY` engine attribute for a Chef Automate server named `automate-06`. It is currently not possible to change the value of other engine attributes.

```bash
aws opsworks-cm update-server-engine-attributes
  --attribute-name CHEF_PIVOTAL_KEY
  --attribute-value "new key value"
  --server-name "automate-06"
```

The output shows you information similar to the following about the updated server.

```
{
  "Server": {
    "BackupRetentionCount": 2,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": FALSE,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_PIVOTAL_KEY",
        "Value": "new key value"
      }
    ]
  }
}
```
For more information, see `UpdateServerEngineAttributes` in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see `UpdateServerEngineAttributes` in *AWS CLI Command Reference*.

### update-server

The following code example shows how to use `update-server`.

**AWS CLI**

**To update a server**

The following `update-server` command updates the maintenance start time of the specified Chef Automate server in your default region. The `--preferred-maintenance-window` parameter is added to change the start day and time of server maintenance to Mondays at 9:15 a.m. UTC:

```
aws opsworks-cm update-server
```
--server-name "automate-06" \n--preferred-maintenance-window "Mon:09:15"

The output shows you information similar to the following about the updated server.

```json
{
  "Server": {
    "BackupRetentionCount": 8,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": TRUE,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
        "Value": "1Password1"
      }
    ],
    "EngineModel": "Single",
    "EngineVersion": "12",
    "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4UU2WRM2",
    "InstanceType": "m4.large",
    "KeyPair": "",
    "MaintenanceStatus": "OK",
    "PreferredBackupWindow": "Mon:09:15",
    "PreferredMaintenanceWindow": "03:00",
    "SecurityGroupIds": [ "sg-1a24c270" ],
    "ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4UU2WRM2",
    "ServerName": "automate-06",
    "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
    "Status": "HEALTHY",
    "StatusReason": "",
    "SubnetIds": [ "subnet-49436a18" ]
  }
}
```

For more information, see [UpdateServer](#) in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [UpdateServer](#) in *AWS CLI Command Reference*. 

Actions and scenarios
Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

accept-handshake

The following code example shows how to use accept-handshake.

AWS CLI

To accept a handshake from another account

Bill, the owner of an organization, has previously invited Juan's account to join his organization. The following example shows Juan's account accepting the handshake and thus agreeing to the invitation.

```
aws organizations accept-handshake --handshake-id h-examplehandshakeid111
```

The output shows the following:

```json
{
    "Handshake": {
        "Action": "INVITE",
```

"Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
  "RequestedTimestamp": 1481656459.257,
  "ExpirationTimestamp": 1482952459.257,
  "Id": "h-examplehandshakeid111",
  "Parties": [
    {
      "Id": "o-exampleorgid",
      "Type": "ORGANIZATION"
    },
    {
      "Id": "juan@example.com",
      "Type": "EMAIL"
    }
  ],
  "Resources": [
    {
      "Resources": [
        {
          "Type": "MASTER_EMAIL",
          "Value": "bill@amazon.com"
        },
        {
          "Type": "MASTER_NAME",
          "Value": "Org Master Account"
        },
        {
          "Type": "ORGANIZATION_FEATURE_SET",
          "Value": "ALL"
        }
      ],
      "Type": "ORGANIZATION",
      "Value": "o-exampleorgid"
    },
    {
      "Type": "EMAIL",
      "Value": "juan@example.com"
    }
  ],
  "State": "ACCEPTED"
}

• For API details, see AcceptHandshake in AWS CLI Command Reference.
**attach-policy**

The following code example shows how to use `attach-policy`.

**AWS CLI**

**To attach a policy to a root, OU, or account**

**Example 1**

The following example shows how to attach a service control policy (SCP) to an OU:

```
aws organizations attach-policy
   --policy-id p-examplepolicyid111
   --target-id ou-examplerooid111-exampleouid111
```

**Example 2**

The following example shows how to attach a service control policy directly to an account:

```
aws organizations attach-policy
   --policy-id p-examplepolicyid111
   --target-id 333333333333
```

- For API details, see [AttachPolicy](#) in *AWS CLI Command Reference*.

**cancel-handshake**

The following code example shows how to use `cancel-handshake`.

**AWS CLI**

**To cancel a handshake sent from another account**

Bill previously sent an invitation to Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The following example shows Bill's cancellation:

```
aws organizations cancel-handshake --handshake-id h-examplehandshakeid111
```
The output includes a handshake object that shows that the state is now CANCELED:

```json
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "CANCELED",
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "susan@example.com",
                "Type": "EMAIL"
            }
        ],
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "CONSOLIDATED_BILLING"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            },
            {
                "Type": "NOTES",
```
"Value": "This is a request for Susan's account to join Bob's organization."
}
",
"RequestedTimestamp": 1.47008383521E9,
"ExpirationTimestamp": 1.47137983521E9
}
}

- For API details, see CancelHandshake in AWS CLI Command Reference.

**create-account**

The following code example shows how to use `create-account`.

**AWS CLI**

**To create a member account that is automatically part of the organization**

The following example shows how to create a member account in an organization. The member account is configured with the name Production Account and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name of OrganizationAccountAccessRole because the roleName parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of ALLOW because the IamUserAccessToBilling parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email:

```bash
aws organizations create-account --email susan@example.com --account-name "Production Account"
```

The output includes a request object that shows that the status is now IN_PROGRESS:

```json
{

  "CreateAccountStatus": {
    "State": "IN_PROGRESS",
    "Id": "car-examplecreateaccountrequestid111"

  }

}
```
You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see Creating an AWS Account in Your Organization in the AWS Organizations Users Guide.

- For API details, see CreateAccount in AWS CLI Command Reference.

**create-organization**

The following code example shows how to use create-organization.

**AWS CLI**

**Example 1: To create a new organization**

Bill wants to create an organization using credentials from account 111111111111. The following example shows that the account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```
aws organizations create-organization
```

The output includes an organization object with details about the new organization:

```
{
    "Organization": {
        "AvailablePolicyTypes": [
            {
                "Status": "ENABLED",
                "Type": "SERVICE_CONTROL_POLICY"
            }
        ],
        "MasterAccountId": "111111111111",
        "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
        "MasterAccountEmail": "bill@example.com",
        "FeatureSet": "ALL",
        "Id": "o-exampleorgid",
        "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid"
    }
}
```
Example 2: To create a new organization with only consolidated billing features enabled

The following example creates an organization that supports only the consolidated billing features:

```bash
aws organizations create-organization --feature-set CONSOLIDATED_BILLING
```

The output includes an organization object with details about the new organization:

```json
{
   "Organization": {
      "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid",
      "AvailablePolicyTypes": [],
      "Id": "o-exampleorgid",
      "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
      "MasterAccountEmail": "bill@example.com",
      "MasterAccountId": "111111111111",
      "FeatureSet": "CONSOLIDATED_BILLING"
   }
}
```

For more information, see Creating an Organization in the *AWS Organizations Users Guide*.

- For API details, see [CreateOrganization](https://docs.aws.amazon.com/cli/latest/reference/organizations/create-organization.html) in *AWS CLI Command Reference*.

**create-organizational-unit**

The following code example shows how to use `create-organizational-unit`.

**AWS CLI**

**To create an OU in a root or parent OU**

The following example shows how to create an OU that is named AccountingOU:

```bash
aws organizations create-organizational-unit --parent-id r-examplerootid111 --name AccountingOU
```
The output includes an organizationalUnit object with details about the new OU:

```
{
    "OrganizationalUnit": {
        "Id": "ou-examplerootid111-exampleouid111",
        "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
        "Name": "AccountingOU"
    }
}
```

- For API details, see [CreateOrganizationalUnit](https://docs.aws.amazon.com/cli/latest/reference/organizations/create-organizational-unit.html) in *AWS CLI Command Reference*.

**create-policy**

The following code example shows how to use `create-policy`.

**AWS CLI**

**Example 1: To create a policy with a text source file for the JSON policy**

The following example shows you how to create an service control policy (SCP) named `AllowAllS3Actions`. The policy contents are taken from a file on the local computer called `policy.json`.

```
aws organizations create-policy --content file://policy.json --name AllowAllS3Actions, --type SERVICE_CONTROL_POLICY --description "Allows delegation of all S3 actions"
```

The output includes a policy object with details about the new policy:

```
{
    "Policy": {
        "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\": \"Allow\",\"Action\":\"s3:*\",\"Resource\":\"*\"]}],
        "PolicySummary": {
            "Arn": "arn:aws:organizations::o-exampleorgid:policy/service_control_policy/p-examplepolicyid111",
            "Description": "Allows delegation of all S3 actions",
            "Name": "AllowAllS3Actions",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```
Example 2: To create a policy with a JSON policy as a parameter

The following example shows you how to create the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes:

```shell
aws organizations create-policy --content "{"Version":"2012-10-17","Statement": [{"Effect":"Allow","Action":["s3:*"],"Resource":["*"raphics/}}]" --name AllowAllS3Actions --type SERVICE_CONTROL_POLICY --description "Allows delegation of all S3 actions"
```

For more information about creating and using policies in your organization, see Managing Organization Policies in the AWS Organizations User Guide.

- For API details, see [CreatePolicy](https://docs.aws.amazon.com/cli/latest/reference/organizations/create-policy.html) in AWS CLI Command Reference.

decline-handshake

The following code example shows how to use `decline-handshake`.

**AWS CLI**

**To decline a handshake sent from another account**

The following example shows that Susan, an admin who is the owner of account 222222222222, declines an invitation to join Bill's organization. The DeclineHandshake operation returns a handshake object, showing that the state is now DECLINED:

```shell
aws organizations decline-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows the new state of DECLINED:

```json
{
   "Handshake": {
       "Id": "h-examplehandshakeid111",
       "State": "DECLINED"
   }
}
```
"Resources": [ 
  {
    "Type": "ORGANIZATION",
    "Value": "o-exampleorgid",
    "Resources": [
      {
        "Type": "MASTER_EMAIL",
        "Value": "bill@example.com"
      },
      {
        "Type": "MASTER_NAME",
        "Value": "Master Account"
      }
    ]
  },
  {
    "Type": "EMAIL",
    "Value": "susan@example.com"
  },
  {
    "Type": "NOTES",
    "Value": "This is an invitation to Susan's account to join the Bill's organization."
  }
],
"Parties": [ 
  {
    "Type": "EMAIL",
    "Id": "susan@example.com"
  },
  {
    "Type": "ORGANIZATION",
    "Id": "o-exampleorgid"
  }
],
"Action": "INVITE",
"RequestedTimestamp": 1470684478.687,
"ExpirationTimestamp": 1471980478.687,
"Arn": "arn:aws:organizations::11111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111"
}

- For API details, see DeclineHandshake in AWS CLI Command Reference.
delete-organization

The following code example shows how to use delete-organization.

AWS CLI

To delete an organization

The following example shows how to delete an organization. To perform this operation, you must be an admin of the master account in the organization. The example assumes that you previously removed all the member accounts, OUs, and policies from the organization:

```
aws organizations delete-organization
```

- For API details, see DeleteOrganization in AWS CLI Command Reference.

delete-organizational-unit

The following code example shows how to use delete-organizational-unit.

AWS CLI

To delete an OU

The following example shows how to delete an OU. The example assumes that you previously removed all accounts and other OUs from the OU:

```
aws organizations delete-organizational-unit --organizational-unit-id ou-examplerootid111-exampleouid111
```

- For API details, see DeleteOrganizationalUnit in AWS CLI Command Reference.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a policy
The following example shows how to delete a policy from an organization. The example assumes that you previously detached the policy from all entities:

```
aws organizations delete-policy --policy-id p-examplepolicyid111
```

- For API details, see `DeletePolicy` in *AWS CLI Command Reference*.

**describe-account**

The following code example shows how to use `describe-account`.

**AWS CLI**

To get the details about an account

The following example shows you how to request details about an account:

```
aws organizations describe-account --account-id 555555555555
```

The output shows an account object with the details about the account:

```json
{
   "Account": {
      "Id": "555555555555",
      "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/555555555555",
      "Name": "Beta account",
      "Email": "anika@example.com",
      "JoinedMethod": "INVITED",
      "JoinedTimeStamp": 1481756563.134,
      "Status": "ACTIVE"
   }
}
```

- For API details, see `DescribeAccount` in *AWS CLI Command Reference*.

**describe-create-account-status**

The following code example shows how to use `describe-create-account-status`.
AWS CLI

To get the latest status about a request to create an account

The following example shows how to request the latest status for a previous request to create an account in an organization. The specified --request-id comes from the response of the original call to create-account. The account creation request shows by the status field that Organizations successfully completed the creation of the account.

Command:

```bash
aws organizations describe-create-account-status --create-account-request-id car-examplecreateaccountrequestid111
```

Output:

```
{
    "CreateAccountStatus": {
        "State": "SUCCEEDED",
        "AccountId": "555555555555",
        "AccountName": "Beta account",
        "RequestedTimestamp": 1470684478.687,
        "CompletedTimestamp": 1470684532.472,
        "Id": "car-examplecreateaccountrequestid111"
    }
}
```

- For API details, see [DescribeCreateAccountStatus](https://docs.aws.amazon.com/cli/latest/reference/organizations/describe-create-account-status.html) in AWS CLI Command Reference.

describe-handshake

The following code example shows how to use describe-handshake.

AWS CLI

To get information about a handshake

The following example shows you how to request details about a handshake. The handshake ID comes either from the original call to InviteAccountToOrganization, or from a call to ListHandshakesForAccount or ListHandshakesForOrganization:
aws organizations describe-handshake --handshake-id h-examplehandshakeid111

The output includes a handshake object that has all the details about the requested handshake:

```json
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "OPEN",
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            }
        ],
        "Parties": [
            {
                "Type": "ORGANIZATION",
                "Id": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Id": "anika@example.com"
            }
        ],
        "Action": "INVITE",
        "RequestedTimestamp": 1470158698.046,
        "ExpirationTimestamp": 1471454698.046,
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111"
}
```
describe-organization

The following code example shows how to use describe-organization.

AWS CLI

**To get information about the current organization**

The following example shows you how to request details about an organization:

```
aws organizations describe-organization
```

The output includes an organization object that has the details about the organization:

```
{
   "Organization": {
      "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
      "MasterAccountEmail": "bill@example.com",
      "MasterAccountId": "111111111111",
      "Id": "o-exampleorgid",
      "FeatureSet": "ALL",
      "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid",
      "AvailablePolicyTypes": [
         {
            "Status": "ENABLED",
            "Type": "SERVICE_CONTROL_POLICY"
         }
      ]
   }
}
```

For API details, see [DescribeOrganization](#) in *AWS CLI Command Reference*. 

• For API details, see [DescribeHandshake](#) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

4885
describe-organizational-unit

The following code example shows how to use describe-organizational-unit.

AWS CLI

To get information about an OU

The following describe-organizational-unit example requests details about an OU.

```bash
aws organizations describe-organizational-unit \
   --organizational-unit-id ou-examplerootid111-exampleouid111
```

Output:

```
{
   "OrganizationalUnit": {
      "Name": "Accounting Group",
      "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-examplerootid111-exampleouid111",
      "Id": "ou-examplerootid111-exampleouid111"
   }
}
```

- For API details, see DescribeOrganizationalUnit in AWS CLI Command Reference.

describe-policy

The following code example shows how to use describe-policy.

AWS CLI

To get information about a policy

The following example shows how to request information about a policy:

```bash
aws organizations describe-policy --policy-id p-examplepolicyid111
```

The output includes a policy object that contains details about the policy:

```
{
   "Policy": {
```
For API details, see [DescribePolicy](#) in *AWS CLI Command Reference*.

**detach-policy**

The following code example shows how to use `detach-policy`.

**AWS CLI**

To detach a policy from a root, OU, or account

The following example shows how to detach a policy from an OU:

```bash
aws organizations detach-policy --target-id ou-examplerootid111-exampleouid111 --policy-id p-examplepolicyid111
```

For API details, see [DetachPolicy](#) in *AWS CLI Command Reference*.

**disable-policy-type**

The following code example shows how to use `disable-policy-type`.

**AWS CLI**

To disable a policy type in a root

The following example shows how to disable the service control policy (SCP) policy type in a root:
aws organizations disable-policy-type --root-id r-examplerooid111 --policy-type SERVICE_CONTROL_POLICY

The output shows that the PolicyTypes response element no longer includes SERVICE_CONTROL_POLICY:

```
{
   "Root": {
      "PolicyTypes": [],
      "Name": "Root",
      "Id": "r-examplerooid111",
      "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerooid111"
   }
}
```

- For API details, see DisablePolicyType in AWS CLI Command Reference.

enable-all-features

The following code example shows how to use enable-all-features.

AWS CLI

To enable all features in an organization

This example shows the administrator asking all the invited accounts in the organization to approve enabled all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts:

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval:

```
{
   "Handshake": {
```

Actions and scenarios
"Action": "ENABLE_ALL_FEATURES",
"Arn": "arn:aws:organizations::11111111111:handshake/o-exampleorgid/enable_all_features/h-examplehandshakeid111",
"ExpirationTimestamp": 1.483127868609E9,
"Id": "h-examplehandshakeid111",
"Parties": [

    {
        "id": "o-exampleorgid",
        "type": "ORGANIZATION"
    }
],
"requestedTimestamp": 1.481831868609E9,
"resources": [

    {
        "type": "ORGANIZATION",
        "value": "o-exampleorgid"
    }
],
"state": "REQUESTED"
}

• For API details, see EnableAllFeatures in AWS CLI Command Reference.

enable-policy-type

The following code example shows how to use enable-policy-type.

AWS CLI

To enable the use of a policy type in a root

The following example shows how to enable the service control policy (SCP) policy type in a root:

```
aws organizations enable-policy-type --root-id r-examplerootid111 --policy-type SERVICE_CONTROL_POLICY
```

The output shows a root object with a policyTypes response element showing that SCPs are now enabled:

```
For API details, see EnablePolicyType in AWS CLI Command Reference.

**invite-account-to-organization**

The following code example shows how to use `invite-account-to-organization`.

**AWS CLI**

To invite an account to join an organization

The following example shows the master account owned by bill@example.com inviting the account owned by juan@example.com to join an organization:

```bash
aws organizations invite-account-to-organization --target '{"Type": "EMAIL", "Id": "juan@example.com"}' --notes "This is a request for Juan's account to join Bill's organization."
```

The output includes a handshake structure that shows what is sent to the invited account:

```json
{
    "Handshake": {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
```
• For API details, see InviteAccountToOrganization in AWS CLI Command Reference.

leave-organization

The following code example shows how to use leave-organization.
AWS CLI

To leave an organization as a member account

The following example shows the administrator of a member account requesting to leave the organization it is currently a member of:

```bash
aws organizations leave-organization
```

- For API details, see `LeaveOrganization` in *AWS CLI Command Reference*.

list-accounts-for-parent

The following code example shows how to use `list-accounts-for-parent`.

AWS CLI

To retrieve a list of all of the accounts in a specified parent root or OU

The following example shows how to request a list of the accounts in an OU:

```bash
aws organizations list-accounts-for-parent --parent-id ou-examplerootid111-exampleouid111
```

The output includes a list of account summary objects.

```json
{
    "Accounts": [
        {
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/333333333333",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481835795.536,
            "Id": "333333333333",
            "Name": "Development Account",
            "Email": "juan@example.com",
            "Status": "ACTIVE"
        },
        {
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/444444444444",
            "JoinedMethod": "INVITED",
```
For API details, see ListAccountsForParent in AWS CLI Command Reference.

list-accounts

The following code example shows how to use list-accounts.

AWS CLI

To retrieve a list of all of the accounts in an organization

The following example shows you how to request a list of the accounts in an organization:

aws organizations list-accounts

The output includes a list of account summary objects.

```json
{
    "Accounts": [
        {
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481830215.45,
            "Id": "111111111111",
            "Name": "Master Account",
            "Email": "bill@example.com",
            "Status": "ACTIVE"
        },
        {
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/222222222222",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481835741.044,
            "Id": "222222222222",
            "Name": "Test Account",
            "Email": "anika@example.com",
            "Status": "ACTIVE"
        }
    ]
}
```
For API details, see ListAccounts in AWS CLI Command Reference.

**list-children**

The following code example shows how to use list-children.

**AWS CLI**

To retrieve the child accounts and OUs of a parent OU or root

The following example you how to list the root or OU that contains that account 444444444444:

```
aws organizations list-children --child-type ORGANIZATIONAL_UNIT --parent-id ou-examplerootid111-exampleouid111
```
The output shows the two child OUs that are contained by the parent:

```
{
    "Children": [
        {
            "Id": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        },
        {
            "Id": "ou-examplerootid111-exampleouid222",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

- For API details, see [ListChildren](#) in *AWS CLI Command Reference*.

### list-create-account-status

The following code example shows how to use `list-create-account-status`.

**AWS CLI**

**Example 1: To retrieve a list of the account creation requests made in the current organization**

The following example shows how to request a list of account creation requests for an organization that have completed successfully:

```
aws organizations list-create-account-status --states SUCCEEDED
```

The output includes an array of objects with information about each request.

```
{
    "CreateAccountStatuses": [
        {
            "AccountId": "444444444444",
            "AccountName": "Developer Test Account",
            "CompletedTimeStamp": 1481835812.143,
            "Id": "car-examplecreateaccountrequestid111",
            "RequestedTimeStamp": 1481829432.531,
        }
    ]
}
```
Example 2: To retrieve a list of the in progress account creation requests made in the current organization

The following example gets a list of in-progress account creation requests for an organization:

```
aws organizations list-create-account-status --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

```
{
   "CreateAccountStatuses": [
      {
         "State": "IN_PROGRESS",
         "Id": "car-examplecreateaccountrequestid111",
         "RequestedTimeStamp": 1481829432.531,
         "AccountName": "Production Account"
      }
   ]
}
```

- For API details, see [ListCreateAccountStatus](https://docs.aws.amazon.com/cli/latest/reference/orgs/list-create-account-status.html) in *AWS CLI Command Reference*.

**list-handshakes-for-account**

The following code example shows how to use `list-handshakes-for-account`.

**AWS CLI**

To retrieve a list of the handshakes sent to an account

The following example shows how to get a list of all handshakes that are associated with the account of the credentials that were used to call the operation:

```
aws organizations list-handshakes-for-account
```
The output includes a list of handshake structures with information about each handshake including its current state:

```json
{
    "Handshake": {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "juan@example.com",
                "Type": "EMAIL"
            }
        ],
        "RequestedTimestamp": 1481656459.257,
        "Resources": [
            {
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@amazon.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Org Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "FULL"
                    }
                ],
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Value": "juan@example.com"
            }
        ]
    }
}
```
For API details, see `ListHandshakesForAccount` in *AWS CLI Command Reference.*

**list-handshakes-for-organization**

The following code example shows how to use `list-handshakes-for-organization`.

**AWS CLI**

**To retrieve a list of the handshakes associated with an organization**

The following example shows how to get a list of handshakes that are associated with the current organization:

```
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED:

```
{
    "Handshakes": [
        {
            "Action": "INVITE",
            "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
            "ExpirationTimestamp": 1482952459.257,
            "Id": "h-examplehandshakeid111",
            "Parties": [
                {
                    "Id": "o-exampleorgid",
                    "Type": "ORGANIZATION"
                },
                {
                    "Id": "juan@example.com",
                    "Type": "EMAIL"
                }
            ]
        }
    ]
}
```
"RequestedTimestamp": 1481656459.257,
"Resources": [
  {
    "Resources": [
      {
        "Type": "MASTER_EMAIL",
        "Value": "bill@amazon.com"
      },
      {
        "Type": "MASTER_NAME",
        "Value": "Org Master Account"
      },
      {
        "Type": "ORGANIZATION_FEATURE_SET",
        "Value": "FULL"
      }
    ],
    "Type": "ORGANIZATION",
    "Value": "o-exampleorgid"
  },
  {
    "Type": "EMAIL",
    "Value": "juan@example.com"
  },
  {
    "Type": "NOTES",
    "Value": "This is an invitation to Juan's account to join Bill's organization."
  }
],
"State": "OPEN"
},
{
  "Action": "INVITE",
  "State": "ACCEPTED",
  "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
  "ExpirationTimestamp": 1.471797437427E9,
  "Id": "h-examplehandshakeid222",
  "Parties": [
    {
      "Id": "o-exampleorgid",
      "Type": "MASTER_EMAIL",
      "Value": "bill@amazon.com"
    },
    {
      "Id": "o-exampleorgid",
      "Type": "MASTER_NAME",
      "Value": "Org Master Account"
    },
    {
      "Id": "o-exampleorgid",
      "Type": "ORGANIZATION_FEATURE_SET",
      "Value": "FULL"
    }
  ]
}
For API details, see ListHandshakesForOrganization in AWS CLI Command Reference.

**list-organizational-units-for-parent**

The following code example shows how to use list-organizational-units-for-parent.
To retrieve a list of the OUs in a parent OU or root

The following example shows you how to get a list of OUs in a specified root:

```
aws organizations list-organizational-units-for-parent --parent-id r-examplerootid111
```

The output shows that the specified root contains two OUs and shows details of each:

```
{
   "OrganizationalUnits": [
      {
         "Name": "AccountingDepartment",
         "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerootid111/ou-exampleouid111"
      },
      {
         "Name": "ProductionDepartment",
         "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerootid111/ou-exampleouid222"
      }
   ]
}
```

- For API details, see [ListOrganizationalUnitsForParent](#) in *AWS CLI Command Reference*.

### list-parents

The following code example shows how to use list-parents.

**AWS CLI**

To list the parent OUs or roots for an account or child OU

The following example shows you how to list the root or parent OU that contains that account `444444444444`:

```
aws organizations list-parents --child-id 444444444444
```

The output shows that the specified account is in the OU with specified ID:
• For API details, see ListParents in AWS CLI Command Reference.

**list-policies-for-target**

The following code example shows how to use list-policies-for-target.

**AWS CLI**

**To retrieve a list of the SCPs attached directly to an account**

The following example shows how to get a list of all service control policies (SCPs), as specified by the Filter parameter, that are directly attached to an account:

```
aws organizations list-policies-for-target --filter SERVICE_CONTROL_POLICY --target-id 444444444444
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy:

```
{
   "Policies": [ 
      {
         "Type": "SERVICE_CONTROL_POLICY",
         "Name": "AllowAllEC2Actions",
         "AwsManaged": false,
         "Id": "p-examplepolicyid222",
         "Arn": "arn:aws:organizations::o-exampleorgid:policy/service_control_policy/p-examplepolicyid222",
         "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
      }
   ]
}
```
For API details, see [ListPoliciesForTarget](#) in *AWS CLI Command Reference*.

**list-policies**

The following code example shows how to use `list-policies`.

**AWS CLI**

To retrieve a list of all policies in an organization of a certain type

The following example shows you how to get a list of SCPs, as specified by the filter parameter:

```
aws organizations list-policies --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information:

```json
{
   "Policies": [
      {
        "Type": "SERVICE_CONTROL_POLICY",
        "Name": "AllowAllS3Actions",
        "AwsManaged": false,
        "Id": "p-examplepolicyid111",
        "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid111",
        "Description": "Enables account admins to delegate permissions for any S3 actions to users and roles in their accounts."
      },
      {
        "Type": "SERVICE_CONTROL_POLICY",
        "Name": "AllowAllEC2Actions",
        "AwsManaged": false,
        "Id": "p-examplepolicyid222",
        "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid222",
        "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
      }
   ]
}
```
• For API details, see ListPolicies in AWS CLI Command Reference.

list-roots

The following code example shows how to use list-roots.

AWS CLI

To retrieve a list of the roots in an organization

This example shows you how to get the list of roots for an organization:

aws organizations list-roots

The output includes a list of root structures with summary information:

```json
{
    "Roots": [
        {
            "Name": "Root",
            "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerootid111",
            "Id": "r-examplerootid111",
            "PolicyTypes": [
                {
                    "Status": "ENABLED",
                    "Type": "SERVICE_CONTROL_POLICY"
                }
            ]
        }
    ]
}
```
list-targets-for-policy

The following code example shows how to use list-targets-for-policy.

AWS CLI

To retrieve a list of the roots, OUs, and accounts that a policy is attached to

The following example shows how to get a list of the roots, OUs, and accounts that the specified policy is attached to:

```
aws organizations list-targets-for-policy --policy-id p-FullAWSAccess
```

The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to:

```json
{
    "Targets": [
        {
            "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerootid111",
            "Name": "Root",
            "TargetId": "r-examplerootid111",
            "Type": "ROOT"
        },
        {
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/333333333333;",
            "Name": "Developer Test Account",
            "TargetId": "333333333333",
            "Type": "ACCOUNT"
        },
        {
            "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-examplerootid111-exampleouid111",
            "Name": "Accounting",
            "TargetId": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```
move-account

The following code example shows how to use move-account.

AWS CLI

To move an account between roots or OUs

The following example shows you how to move the master account in the organization from the root to an OU:

```
aws organizations move-account --account-id 333333333333 --source-parent-id r-examplerootid111 --destination-parent-id ou-examplerootid111-exampleouid111
```

- For API details, see MoveAccount in AWS CLI Command Reference.

remove-account-from-organization

The following code example shows how to use remove-account-from-organization.

AWS CLI

To remove an account from an organization as the master account

The following example shows you how to remove an account from an organization:

```
aws organizations remove-account-from-organization --account-id 333333333333
```

- For API details, see RemoveAccountFromOrganization in AWS CLI Command Reference.

update-organizational-unit

The following code example shows how to use update-organizational-unit.
**AWS CLI**

**To rename an OU**

This example shows you how to rename an OU: In this example, the OU is renamed "AccountingOU":

```bash
aws organizations update-organizational-unit --organizational-unit-id ou-examplerootid111-exampleouid111 --name AccountingOU
```

The output shows the new name:

```json
{
   "OrganizationalUnit": {
      "Id": "ou-examplerootid111-exampleouid111",
      "Name": "AccountingOU",
      "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-examplerootid111-exampleouid111"
   }
}
```

- For API details, see [UpdateOrganizationalUnit](#) in *AWS CLI Command Reference*.

**update-policy**

The following code example shows how to use update-policy.

**AWS CLI**

**Example 1: To rename a policy**

The following update-policy example renames a policy and gives it a new description.

```bash
aws organizations update-policy \
   --policy-id p-examplepolicyid111 \
   --name Renamed-Policy \
   --description "This description replaces the original."
```

The output shows the new name and description.

```json
{
   "Policy": {
```
Example 2: To replace a policy's JSON text content

The following example shows you how to replace the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2:

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \n    --content "{"Version": "2012-10-17", "Statement": {"Effect": "Allow", 
        "Action": "s3:*", "Resource": "*"}}"
```

The output shows the new content:

```
{
    "Policy": {
        "Content": "{ "Version": "2012-10-17", "Statement": { "Effect": "Allow", 
        "Action": "s3:*", "Resource": "*" } },
        "PolicySummary": {
            "Arn": "arn:aws:organizations::111111111111:policy/o-exampleorgid/service_control_policy/p-examplepolicyid111",
            "AwsManaged": false,
            "Description": "This description replaces the original.",
            "Id": "p-examplepolicyid111",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```
For API details, see UpdatePolicy in AWS CLI Command Reference.

**AWS Outposts examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

**get-outpost-instance-types**

The following code example shows how to use `get-outpost-instance-types`.

**AWS CLI**

**To get the instance types on your Outpost**

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```bash
aws outposts get-outpost-instance-types \
  --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```json
{
  "InstanceTypes": [
```

---

4909

**Actions and scenarios**
For more information, see [Launch an instance on your Outpost](https://docs.aws.amazon.com/.aws toolkit/latest/ug/outposts_launch.html) in the *AWS Outposts User Guide*.

- For API details, see [GetOutpostInstanceTypes](https://docs.aws.amazon.com/cli/latest/reference/outposts/get-outpost.html) in *AWS CLI Command Reference*.

### get-outpost

The following code example shows how to use `get-outpost`.

#### AWS CLI

**To get Outpost details**

The following `get-outpost` example displays the details for the specified Outpost.

```bash
aws outposts get-outpost \
  --outpost-id op-0ab23c4567EXAMPLE
```

**Output:**

```json
{
   "Outpost": {
      "OutpostId": "op-0ab23c4567EXAMPLE",
      "OwnerId": "123456789012",
      "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/op-0ab23c4567EXAMPLE"
   },
   "OutpostId": "op-0ab23c4567EXAMPLE",
   "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/op-0ab23c4567EXAMPLE"
}
```
For more information, see Working with Outposts in the AWS Outposts User Guide.

- For API details, see GetOutpost in AWS CLI Command Reference.

**list-outposts**

The following code example shows how to use list-outposts.

**AWS CLI**

**To list Outposts**

The following list-outposts example lists the Outposts in your AWS account.

```shell
aws outposts list-outposts
```

**Output:**

```json
{
  "Outposts": [
    {
      "OutpostId": "op-0ab23c4567EXAMPLE",
      "OwnerId": "123456789012",
      "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/op-0ab23c4567EXAMPLE",
      "SiteId": "os-0ab12c3456EXAMPLE",
      "Name": "EXAMPLE",
      "Description": "example",
      "LifeCycleStatus": "ACTIVE",
      "AvailabilityZone": "us-west-2a",
      "AvailabilityZoneId": "usw2-az1",
      "Tags": {
        "Name": "EXAMPLE"
      }
    }
  ]
}
```
For more information, see [Working with Outposts](#) in the [AWS Outposts User Guide](#).

- For API details, see [ListOutposts](#) in [AWS CLI Command Reference](#).

### list-sites

The following code example shows how to use `list-sites`.

#### AWS CLI

**To list sites**

The following `list-sites` example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "os-0ab12c3456EXAMPLE",
            "AccountId": "123456789012",
            "Name": "EXAMPLE",
            "Description": "example",
            "Tags": {}
        }
    ]
}
```
AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

create-alias

The following code example shows how to use create-alias.

AWS CLI

To create an alias for a key

The following create-alias example creates an alias for a key.

```bash
aws payment-cryptography create-alias \
   --alias-name alias/sampleAlias1 \
   --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/\n   kwapwa6qaifllw2h
```
Output:

```json
{
   "Alias": {
      "AliasName": "alias/sampleAlias1",
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h"
   }
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

**create-key**

The following code example shows how to use `create-key`.

**AWS CLI**

**To create a key**

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```bash
aws payment-cryptography create-key \
   --exportable \
   --key-attributes KeyAlgorithm=TDES_2KEY,\n   KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,KeyClass=SYMMETRIC_KEY,\n   KeyModesOfUse={Generate=true,Verify=true}
```

Output:

```json
{
   "Key": {
      "CreateTimestamp": "1686800690",
      "Enabled": true,
      "Exportable": true,
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h",
      "KeyAttributes": {
         "KeyAlgorithm": "TDES_2KEY",
```
"KeyClass": "SYMMETRIC_KEY",
"KeyModesOfUse": {
  "Decrypt": false,
  "DeriveKey": false,
  "Encrypt": false,
  "Generate": true,
  "NoRestrictions": false,
  "Sign": false,
  "Unwrap": false,
  "Verify": true,
  "Wrap": false
},
"KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY",
"KeyCheckValue": "F2E50F",
"KeyCheckValueAlgorithm": "ANSI_X9_24",
"KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
"KeyState": "CREATE_COMPLETE",
"UsageStartTimestamp": "1686800690"
}

For more information, see Generating keys in the AWS Payment Cryptography User Guide.

- For API details, see CreateKey in AWS CLI Command Reference.

**delete-alias**

The following code example shows how to use delete-alias.

**AWS CLI**

**To delete an alias**

The following delete-alias example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \\
  --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see About aliases in the AWS Payment Cryptography User Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.
**delete-key**

The following code example shows how to use delete-key.

**AWS CLI**

**To delete a key**

The following delete-key example schedules a key for deletion after 7 days, which is the default waiting period.

```bash
aws payment-cryptography delete-key 
   --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h
```

**Output:**

```json
{
   "Key": {
      "CreateTimestamp": "1686801198",
      "DeletePendingTimestamp": "1687405998",
      "Enabled": true,
      "Exportable": true,
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h",
      "KeyAttributes": {
         "KeyAlgorithm": "TDES_2KEY",
         "KeyClass": "SYMMETRIC_KEY",
         "KeyModesOfUse": {
            "Decrypt": false,
            "DeriveKey": false,
            "Encrypt": false,
            "Generate": true,
            "NoRestrictions": false,
            "Sign": false,
            "Unwrap": false,
            "Verify": true,
            "Wrap": false
         },
         "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
      },
      "KeyCheckValue": "F2E50F",
      "KeyCheckValueAlgorithm": "ANSI_X9_24"
   }
}
```
For more information, see [Deleting keys](#) in the AWS Payment Cryptography User Guide.

- For API details, see [DeleteKey](#) in AWS CLI Command Reference.

### export-key

The following code example shows how to use export-key.

#### AWS CLI

**To export a key**

The following export-key example exports a key.

```
aws payment-cryptography export-key \
    --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/lco3w6agsk7zgu2l \
    --key-material '{"Tr34KeyBlock": { \
        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-west-2:123456789012:key/ftobshq7pvioc5fx", \
        "ExportToken": "export-token-cu4lg26ofcziixny", \
        "KeyBlockFormat": "X9_TR34_2012", \
        "WrappingKeyCertificate": file://wrapping-key-certificate.pem }}'
```

Contents of `wrapping-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2VENDQXFXZ0F3SUJBZ0lSQU1ZZS8xMXFUK2svVzlRUDJQOElVdWd3RFFZSktvWklodmNOQVFFTkJRQX...
```

Output:

```
{
    "WrappedKey": {
        "KeyMaterial": "308205A106092A864886F70D010702A08205923082058E020101310D300B06096086480165030402013082031F06092A864886F70D010703A08203100...2FD4D2BABC69BDDBD6B17EB376FA9ADD83C2974292447E63F26D168E66A4558ED97E417BDE97837188DB4F414A2219BAC50A8D726CD54C3C1EXAMPLE",
        "WrappedKeyMaterialFormat": "TR34_KEY_BLOCK"
    }
}
```
For more information, see Export keys in the AWS Payment Cryptography User Guide.
- For API details, see ExportKey in AWS CLI Command Reference.

**get-alias**

The following code example shows how to use get-alias.

**AWS CLI**

**To get an alias**

The following get-alias example returns the ARN of the key associated with the alias.

```bash
aws payment-cryptography get-alias \
   --alias-name alias/sampleAlias1
```

Output:

```json
{
   "Alias": {
      "AliasName": "alias/sampleAlias1",
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h"
   }
}
```

For more information, see About aliases in the AWS Payment Cryptography User Guide.
- For API details, see GetAlias in AWS CLI Command Reference.

**get-key**

The following code example shows how to use get-key.

**AWS CLI**

**To get the metadata of a key**
The following get-key example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key 
    --key-identifier alias/sampleAlias1
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see [Get keys](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/get-keys.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GetKey](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography/get-key.html) in *AWS CLI Command Reference*. 
get-parameters-for-export

The following code example shows how to use get-parameters-for-export.

**AWS CLI**

To initialize the export process

The following get-parameters-for-export example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-export \
   --signing-key-algorithm RSA_2048 \
   --key-material-type TR34_KEY_BLOCK
```

Output:

```
{
"ExportToken": "export-token-ep5cwzun7eyoa53",
"ParametersValidUntilTimestamp": "1687415640",
"SigningKeyAlgorithm": "RSA_2048",
"SigningKeyCertificate": "MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMCVVMx
b24xfDASBbNVbAxTrQ8bKb976PqInSm6aIykIvT4nTb NNiytVbZPQOQQSYaxu2jXnvmv3IrnszlaEXAMPLE=",
"SigningKeyCertificateChain": "MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

}
```

**Actions and scenarios**

4920
get-parameters-for-import

The following code example shows how to use get-parameters-for-import.

AWS CLI

To initialize the import process

The following get-parameters-for-import example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-import \\
--key-material-type TR34_KEY_BLOCK \\
--wrapping-key-algorithm RSA_2048
```

Output:

```
{
    "ImportToken": "import-token-qgmafpaa7nt2kfbb",
    "ParametersValidUntilTimestamp": "1687415640",
    "WrappingKeyAlgorithm": "RSA_2048",
    "WrappingKeyCertificate":
        "MIICiTCCAfICQD6m7oRx0uXOjANBgkqhkiG9w0BAQUFADBbAwIDBQMBAAEwDQYJKoZIhvcNAQEFBQADgY0RAgIADgE-folder.png",
        "MIICiTCCAfICQD6m7oRx0uXOjANBgkqhkiG9w0BAQUFADBbAwIDBQMBAAEwDQYJKoZIhvcNAQEFBQADgY0RAgIADgE-folder.png"
}
```
For more information, see [Import keys](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/import-keys.html) in the AWS Payment Cryptography User Guide.

### get-public-key-certificate

The following code example shows how to use `get-public-key-certificate`.

**AWS CLI**

**To return the public key**

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```
aws payment-cryptography get-public-key-certificate \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```
import-key

The following code example shows how to use import-key.

For more information, see Get the public key/certificate associated with a key pair in the AWS Payment Cryptography User Guide.

• For API details, see GetPublicKeyCertificate in AWS CLI Command Reference.
AWS CLI

To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
   --key-material='{
   "Tr34KeyBlock": "\
   CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-
   cryptography:us-west-2:123456789012:key/rmm5wn2q564njnjm", \
   "ImportToken": "import-token-5ott6ho5nts7bbcg", \
   "KeyBlockFormat": "X9_TR34_2012", \
   "SigningKeyCertificate": file://signing-key-certificate.pem, \
   "WrappedKeyBlock": file://wrapped-key-block.pem }
}'
```

Contents of `signing-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tRU5EIENFUlRJRklDQVRFLS0tLS0=
```

Contents of `wrapped-key-block.pem`:

```
3082059806092A864886F70D010702A082058930820585020101310D300B06096086480165030402013082031606
```

Output:

```
{
   "Key": {
      "CreateTimestamp": "2023-06-09T16:56:27.621000-07:00",
      "Enabled": true,
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/bzmvgxyxdg3sktwxd",
      "KeyAttributes": {
         "KeyAlgorithm": "TDES_2KEY",
         "KeyClass": "SYMMETRIC_KEY",
         "KeyModesOfUse": {
            "Decrypt": false,
            "DeriveKey": false,
            "Encrypt": false,
            "Generate": true,
            "NoRestrictions": false,
            "Sign": false,
            "Unwrap": false,
```
list-aliases

The following code example shows how to use list-aliases.

AWS CLI

To get a list of aliases

The following list-aliases example shows all of the aliases in your account in this Region.

```bash
aws payment-cryptography list-aliases
```

Output:

```
{
  "Aliases": [
    {
      "AliasName": "alias/sampleAlias1",
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h"
    },
    {
      "AliasName": "alias/sampleAlias2",
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h"
    }
  ]
}
```

For more information, see Import keys in the AWS Payment Cryptography User Guide.

- For API details, see ImportKey in AWS CLI Command Reference.
For more information, see About aliases in the AWS Payment Cryptography User Guide.

- For API details, see ListAliases in AWS CLI Command Reference.

list-keys

The following code example shows how to use list-keys.

AWS CLI

To get a list of keys

The following list-keys example shows all of the keys in your account in this Region.

```bash
aws payment-cryptography list-keys
```

Output:

```json
{
   "Keys": [
     {
       "CreateTimestamp": "1666506840",
       "Enabled": false,
       "Exportable": true,
       "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
       "KeyAttributes": {
         "KeyAlgorithm": "TDES_3KEY",
         "KeyClass": "SYMMETRIC_KEY",
         "KeyModesOfUse": {
           "Decrypt": true,
           "DeriveKey": false,
           "Encrypt": true,
           "Generate": false,
           "NoRestrictions": false,
           "Sign": false,
           "Unwrap": true,
           "Verify": false,
           "Wrap": true
         }
       }
     }
   ]
}
```
For more information, see List keys in the AWS Payment Cryptography User Guide.

- For API details, see ListKeys in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To get the list of tags for a key

The following list-tags-for-resource example gets the tags for a key.

```
aws payment-cryptography list-tags-for-resource \
    kwapwa6qaifllw2h
```

Output:

```
{
    "Tags": [
        {
            "Key": "BIN",
            "Value": "20151120"
        },
        {
            "Key": "Project",
            "Value": "Production"
        }
    ]
}
```
For more information, see Managing key tags with API operations in the AWS Payment Cryptography User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**restore-key**

The following code example shows how to use restore-key.

**AWS CLI**

To restore a key that is scheduled for deletion

The following restore-key example cancels the deletion of a key.

```bash
aws payment-cryptography restore-key \
   --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

Output:

```
{
   "Key": {
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
      "KeyAttributes": {
         "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",
         "KeyClass": "SYMMETRIC_KEY",
         "KeyAlgorithm": "TDES_3KEY",
         "KeyModesOfUse": {
            "Encrypt": false,
            "Decrypt": false,
            "Wrap": false,
            "Unwrap": false,
            "Generate": true,
            "Sign": false,
            "Verify": true,
            "DeriveKey": false,
            "NoRestrictions": false
         }
      }
   }
}
```
For more information, see Deleting keys in the AWS Payment Cryptography User Guide.

- For API details, see RestoreKey in AWS CLI Command Reference.

**start-key-usage**

The following code example shows how to use start-key-usage.

**AWS CLI**

**To enable a key**

The following start-key-usage example enables a key to be used.

```bash
aws payment-cryptography start-key-usage \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

Output:

```json
{
  "Key": {
    "CreateTimestamp": "1686800690",
    "Enabled": true,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/alsuwfxug3pgy6xh",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_3KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyModesOfUse": {}}
  }
}
```
For more information, see Enabling and disabling keys in the AWS Payment Cryptography User Guide.

- For API details, see StartKeyUsage in AWS CLI Command Reference.

stop-key-usage

The following code example shows how to use stop-key-usage.

AWS CLI

To disable a key

The following stop-key-usage example disables a key.

```bash
aws payment-cryptography stop-key-usage \\
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

Output:

```json
{
    "Key": {
```
For more information, see [Enabling and disabling keys](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/enabling-and-disabling-keys.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [StopKeyUsage](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography/stop-key-usage.html) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a key**

The following `tag-resource` example tags a key.
This command produces no output.

For more information, see Managing key tags in the AWS Payment Cryptography User Guide.

• For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a key

The following untag-resource example removes a tag from a key.

```
aws payment-cryptography untag-resource \
   --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \
   --tag-keys sampleTag
```

This command produces no output.

For more information, see Managing key tags in the AWS Payment Cryptography User Guide.

• For API details, see UntagResource in AWS CLI Command Reference.

update-alias

The following code example shows how to use update-alias.

AWS CLI

To update an alias

The following update-alias example associates the alias with a different key.

```
aws payment-cryptography update-alias \
```

Actions and scenarios
Output:

```json
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/tqv5yij6wttx64pi"
    }
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [UpdateAlias](#) in *AWS CLI Command Reference*.

---

**AWS Payment Cryptography Data Plane examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*decrypt-data*

The following code example shows how to use *decrypt-data*. 

```
AWS CLI

To decrypt ciphertext

The following decrypt-data example decrypts ciphertext data using a symmetric key. For this operation, the key must have KeyModesOfUse set to Decrypt and KeyUsage set to TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY.

```bash
aws payment-cryptography-data decrypt-data \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h \
  --cipher-text 33612AB9D6929C3A828EB6030082B2BD \
  --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```json
{
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h",
  "KeyCheckValue": "71D7AE",
  "PlainText": "31323334313233343132333431323334"
}
```

For more information, see Decrypt data in the AWS Payment Cryptography User Guide.

- For API details, see DecryptData in AWS CLI Command Reference.

encrypt-data

The following code example shows how to use encrypt-data.

AWS CLI

To encrypt data

The following encrypt-data example encrypts plaintext data using a symmetric key. For this operation, the key must have KeyModesOfUse set to Encrypt and KeyUsage set to TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY.

```bash
aws payment-cryptography-data encrypt-data \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h \
```
Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "CipherText": "33612AB9D6929C3A828EB6030082B2BD"
}
```

For more information, see Encrypt data in the AWS Payment Cryptography User Guide.

- For API details, see EncryptData in AWS CLI Command Reference.

**generate-card-validation-data**

The following code example shows how to use generate-card-validation-data.

**AWS CLI**

**To generate a CVV**

The following generate-card-validation-data example generates a CVV/CVV2.

```bash
aws payment-cryptography-data generate-card-validation-data
   --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
   --primary-account-number=171234567890123
   --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
    "KeyCheckValue": "CADDA1",
    "ValidationData": "801"
}
```

For more information, see Generate card data in the AWS Payment Cryptography User Guide.
For API details, see [GenerateCardValidationData](#) in *AWS CLI Command Reference*.

### generate-mac

The following code example shows how to use `generate-mac`.

**AWS CLI**

**To generate a MAC**

The following `generate-card-validation-data` example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have `KeyUsage` set to TR31_M7_HMAC_KEY and `KeyModesOfUse` to Generate.

```
aws payment-cryptography-data generate-mac \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h \
  --message-data "3b313038383439303031303733393431353d32343038323236303037303030303f33" \
  --generation-attributes Algorithm=HMAC_SHA256
```

**Output:**

```
{
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h",
  "KeyCheckValue": "2976E7",
  "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C"
}
```

For more information, see [Generate MAC](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GenerateMac](#) in *AWS CLI Command Reference*.

### generate-pin-data

The following code example shows how to use `generate-pin-data`.

**AWS CLI**

**To generate a PIN**

Actions and scenarios
The following `generate-card-validation-data` example generates a new random PIN using the Visa PIN scheme.

```bash
aws payment-cryptography-data generate-pin-data \
  --generation-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2 \
  --encryption-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt \
  --primary-account-number 171234567890123 \
  --pin-block-format ISO_FORMAT_0 \
  --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```json
{
  "GenerationKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2",
  "GenerationKeyCheckValue": "7F2363",
  "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt",
  "EncryptionKeyCheckValue": "7CC9E2",
  "EncryptedPinBlock": "AC17DC148BDA645E",
  "PinData": {
    "VerificationValue": "5507"
  }
}
```

For more information, see [Generate PIN data](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/generate-pin-data.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GeneratePinData](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography-data/generate-pin-data.html) in *AWS CLI Command Reference*.

**re-encrypt-data**

The following code example shows how to use `re-encrypt-data`.

**AWS CLI**

**To re-encrypt data with a different key**

The following `re-encrypt-data` example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.
aws payment-cryptography-data re-encrypt-data
   --incoming-key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/hyvv7ymboitd4vfy
   --outgoing-key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/jl6ythkc1vzesbxen
   --cipher-text
   4D2B0BDBA192D5AEFEAA5B3EC284A65383C313FFA25140101560F75FE1B99F27192A90980AB9334
   --incoming-encryption-attributes
   "Dukpt={Mode=ECB,KeySerialNumber=0123456789111111}"
   --outgoing-encryption-attributes '{"Symmetric": {"Mode": "ECB"}}'

Output:

```
{
   "CipherText":
   "F94959DA30EEFF0C035483C6067667CF6796E3C1AD28C2B61F9CFEB772A8DD41C0D6822931E0D3B1",
   "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/jl6ythkc1vzesbxen",
   "KeyCheckValue": "2E8CD9"
}
```

For more information, see Encrypt and decrypt data in the AWS Payment Cryptography User Guide.

- For API details, see ReEncryptData in AWS CLI Command Reference.

translate-pin-data

The following code example shows how to use translate-pin-data.

AWS CLI

To translate PIN data

The following translate-pin-data example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

aws payment-cryptography-data translate-pin-data
   --encrypted-pin-block "AC17DC148BDA645E"
   --incoming-translation-attributes=IsoFormat0='[PrimaryAccountNumber=171234567890123]'

Actions and scenarios 4938
Output:

```
{
   "PinBlock": "1F4209C670E49F83E75CC72E81B787D9",
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/iivi5ksfsuplneuyt",
   "KeyCheckValue": "7CC9E2"
}
```

For more information, see [Translate PIN data](https://aws.amazon.com) in the AWS Payment Cryptography User Guide.

- For API details, see [TranslatePinData](https://aws.amazon.com) in AWS CLI Command Reference.

### verify-auth-request-cryptogram

The following code example shows how to use `verify-auth-request-cryptogram`.

#### AWS CLI

**To verify an auth request**

The following `verify-auth-request-cryptogram` example verifies an Authorization Request Cryptogram (ARQC).

```bash
aws payment-cryptography-data verify-auth-request-cryptogram
   --auth-request-cryptogram F6E1BD1E6037FB3E
   --auth-response-attributes '{"ArpcMethod1": {"AuthResponseCode": "1111"}}'
   --key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/pboipdfzd4mdklya
   --major-key-derivation-mode "EMV_OPTION_A"
   --session-key-derivation-attributes '{"EmvCommon":
   {"ApplicationTransactionCounter": "1234","PanSequenceNumber": "01","PrimaryAccountNumber": "471234567890123"}}'
   --transaction-data "123456789ABCD
```
Output:

```json
{
   "AuthResponseValue": "D899B8C6FBF971AA",
   "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/pboipdfzd4mdklya",
   "KeyCheckValue": "985792"
}
```

For more information, see [Verify auth request (ARQC) cryptogram](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyAuthRequestCryptogram](#) in *AWS CLI Command Reference*.

### verify-card-validation-data

The following code example shows how to use `verify-card-validation-data`.

#### AWS CLI

**To validate a CVV**

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```bash
aws payment-cryptography-data verify-card-validation-data \\
   --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/tqv5yij6wtxx64pi \\
   --primary-account-number=171234567890123 \\
   --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \\
   --validation-data 801
```

Output:

```json
{
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/tqv5yij6wtxx64pi",
   "KeyCheckValue": "CADD1A"
}
```

For more information, see [Verify card data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyCardValidationData](#) in *AWS CLI Command Reference*. 
**verify-mac**

The following code example shows how to use verify-mac.

**AWS CLI**

**To verify a MAC**

The following verify-mac example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```
aws payment-cryptography-data verify-mac \
  --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl5lghrzunce6 \
  --message-data "3b343038383439303031303733393431353d32343030323236303030373030303033f33" \
  --verification-attributes='Algorithm=HMAC_SHA256' \
  --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```
{
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl5lghrzunce6",
  "KeyCheckValue": "2976E7",
}
```

For more information, see [Verify MAC](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/verify-mac.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyMac](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography-data/verify-mac.html) in *AWS CLI Command Reference*.

**verify-pin-data**

The following code example shows how to use verify-pin-data.

**AWS CLI**

**To verify a PIN**

The following verify-pin-data example validates a PIN for a PAN.

```
aws payment-cryptography-data verify-pin-data \
```

Actions and scenarios
--verification-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2ts145p5zjhh2
--encryption-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt
--primary-account-number 171234567890123
--pin-block-format ISO FORMAT_0
--verification-attributes VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" 
--encrypted-pin-block AC17DC148BDA645E

Output:

```
{
    "VerificationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
}
```

For more information, see [Verify PIN data](#) in the [AWS Payment Cryptography User Guide](#).

- For API details, see [VerifyPinData](#) in [AWS CLI Command Reference](#).

### Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- [Actions](#)
Actions

create-app

The following code example shows how to use create-app.

AWS CLI

Example 1: To create an application

The following create-app example creates a new application (project).

```bash
aws pinpoint create-app \
   --create-application-request Name=ExampleCorp
```

Output:

```json
{
   "ApplicationResponse": {
      "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVS6Q6C2EXAMPLE:apps/810c7a9b86d42fb2b56c8c966example",
      "Id": "810c7a9b86d42fb2b56c8c966example",
      "Name": "ExampleCorp",
      "tags": {}
   }
}
```

Example 2: To create an application that is tagged

The following create-app example creates a new application (project) and associates a tag (key and value) with the application.

```bash
aws pinpoint create-app \
   --create-application-request Name=ExampleCorp,tags={"Stack"="Test"}
```

Output:

```json
{
   "ApplicationResponse": {
      "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVS6Q6C2EXAMPLE:apps/810c7a9b86d42fb2b56c8c966example",
      "Id": "810c7a9b86d42fb2b56c8c966example",
      "Name": "ExampleCorp",
      "tags": {}
   }
}
```
For API details, see CreateApp in AWS CLI Command Reference.

**create-sms-template**

The following code example shows how to use create-sms-template.

**AWS CLI**

*Creates a message template for messages that are sent through the SMS channel*

The following create-sms-template example creates a SMS message template.

```bash
aws pinpoint create-sms-template \
   --template-name TestTemplate \
   --sms-template-request file://myfile.json \
   --region us-east-1
```

Contents of `myfile.json`:

```json
{
   "Body": "hello\n how are you?\n food is good",
   "TemplateDescription": "Test SMS Template"
}
```

Output:

```json
{
   "CreateTemplateMessageBody": {
      "Message": "Created",
      "RequestID": "8c36b17f-a0b0-400f-ac21-29e9b62a975d"
   }
}
```
For more information, see Amazon Pinpoint message templates in the Amazon Pinpoint User Guide.

- For API details, see CreateSmsTemplate in AWS CLI Command Reference.

delete-app

The following code example shows how to use delete-app.

AWS CLI

To delete an application

The following delete-app example deletes an application (project).

```
aws pinpoint delete-app \
   --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{
   "ApplicationResponse": {
      "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
      "Id": "810c7aab86d42fb2b56c8c966example",
      "Name": "ExampleCorp",
      "tags": {}
   }
}
```

- For API details, see DeleteApp in AWS CLI Command Reference.

get-apns-channel

The following code example shows how to use get-apns-channel.

AWS CLI

To retrieve information about the status and settings of the APNs channel for an application

The following get-apns-channel example retrieves information about the status and settings of the APNs channel for an application.
aws pinpoint get-apns-channel \
   --application-id 9ab1068eb0a6461c86cce7f27ce0efd7 \
   --region us-east-1

Output:

```
{
   "APNSChannelResponse": {
      "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",
      "CreationDate": "2019-05-09T21:54:45.082Z",
      "DefaultAuthenticationMethod": "CERTIFICATE",
      "Enabled": true,
      "HasCredential": true,
      "HasTokenKey": false,
      "Id": "apns",
      "IsArchived": false,
      "LastModifiedDate": "2019-05-09T22:04:01.067Z",
      "Platform": "APNS",
      "Version": 2
   }
}
```

- For API details, see [GetApnsChannel](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/apnschannel/get-apns-channel.html) in *AWS CLI Command Reference*.

**get-app**

The following code example shows how to use get-app.

**AWS CLI**

To retrieve information about an application (project)

The following get-app example retrieves information about an application (project).

```bash
aws pinpoint get-app \
   --application-id 810c7aab86d42fb2b56c8c966example \
   --region us-east-1
```

Output:

```
{
```
For API details, see `GetApp` in `AWS CLI Command Reference`.

**get-apps**

The following code example shows how to use `get-apps`.

**AWS CLI**

**To retrieve information about all of your applications**

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

Output:

```
{
   "ApplicationsResponse": {
      "Item": [
         {
            "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
            "Id": "810c7aab86d42fb2b56c8c966example",
            "Name": "ExampleCorp",
            "tags": {
              "Year": "2019",
              "Stack": "Production"
            }
         },
         {
```
```
The presence of the NextToken response value indicates that there is more output available. Call the command again and supply that value as the NextToken input parameter.

- For API details, see GetApps in AWS CLI Command Reference.

get-campaign

The following code example shows how to use get-campaign.

AWS CLI

To retrieve information about the status, configuration, and other settings for a campaign

The following get-campaign example retrieves information about the status, configuration, and other settings for a campaign.

aws pinpoint get-campaign \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d \
   --region us-east-1
Output:

```json
{
    "CampaignResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/6e0b7591a90841d2b5d93fa11143e5a7/campaigns/a1e63c6cc0eb43ed826ffcc3cc90b30d",
        "CreationDate": "2019-10-08T18:40:16.581Z",
        "Description": "",
        "HoldoutPercent": 0,
        "Id": "a1e63c6cc0eb43ed826ffcc3cc90b30d",
        "IsPaused": false,
        "LastModifiedDate": "2019-10-08T18:40:16.581Z",
        "Limits": {
            "Daily": 0,
            "MaximumDuration": 60,
            "MessagesPerSecond": 50,
            "Total": 0
        },
        "MessageConfiguration": {
            "EmailMessage": {
                "FromAddress": "sender@example.com",
                "HtmlBody": "<!DOCTYPE html>
                <html lang="en">
                <head>
                <meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
                <body>Hello</body>
                "Title": "PinpointDemo"
            }
        },
        "Name": "MyCampaign",
        "Schedule": {
            "IsLocalTime": false,
            "StartTime": "IMMEDIATE",
            "Timezone": "utc"
        },
        "SegmentId": "b66c9e42f71444b2aa2e0ffcf1df28f60",
        "SegmentVersion": 1,
        "State": {
            "CampaignStatus": "COMPLETED"
        },
        "tags": {},
        "TemplateConfiguration": {},
        "Version": 1
    }
}
```
For API details, see GetCampaign in AWS CLI Command Reference.

**get-campaigns**

The following code example shows how to use get-campaigns.

**AWS CLI**

To retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application.

The following get-campaigns example retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application.

```bash
aws pinpoint get-campaigns \
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
  --region us-east-1
```

Output:

```json
{
  "CampaignsResponse": {
    "Item": [
      {
        "AdditionalTreatments": [],
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/6e0b7591a90841d2b5d93fa11143e5a7/campaigns/7e1280344c8f4a9aa40a00b006fe44f1",

    "EmailMessage": {
        "FromAddress": "sender@example.com",
        "Subject": "My Campaign 1"}}}
• For API details, see GetCampaigns in AWS CLI Command Reference.

get-channels

The following code example shows how to use get-channels.

AWS CLI

To retrieve information about the history and status of each channel for an application

The following get-channels example retrieves information about the history and status of each channel for an application.

```
aws pinpoint get-channels \
  --application-id 6e0b7591a90841d2b5d93fa1143e5a7 \
  --region us-east-1
```

Output:
```
{
   "ChannelsResponse": {
   "Channels": {
   "GCM": {
   "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
   "CreationDate": "2019-10-08T18:28:23.182Z",
   "Enabled": true,
   "HasCredential": true,

   },
   "IN_APP": {
   "Enabled": true,
   "IsArchived": false,
   "Version": 0
   }
   }
   }
   }
```

- For API details, see [GetChannels](https://docs.aws.amazon.com/cli/latest/reference/sns/get-channels.html) in *AWS CLI Command Reference*.
get-email-channel

The following code example shows how to use get-email-channel.

AWS CLI

To retrieve information about the status and settings of the Email channel for an application

The following get-email-channel example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \
  --application-id 6e0b7591a0841d2b5d93fa11143e5a7 \
  --region us-east-1
```

Output:

```
{
    "EmailChannelResponse": {
        "ApplicationId": "6e0b7591a0841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:27:23.990Z",

        "FromAddress": "sender@example.com",
        "Id": "email",
        "Identity": "arn:aws:ses:us-east-1:AIDACKCEVSQ6C2EXAMPLE:identity/sender@example.com",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:27:23.990Z",
        "MessagesPerSecond": 1,
        "Platform": "EMAIL",
        "RoleArn": "arn:aws:iam::AIDACKCEVSQ6C2EXAMPLE:role/pinpoint-events",
        "Version": 1
    }
}
```

- For API details, see GetEmailChannel in AWS CLI Command Reference.

get-endpoint

The following code example shows how to use get-endpoint.
AWS CLI

To retrieve information about the settings and attributes of a specific endpoint for an application

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \
  --application-id 611e3e3cdd47474c9c1399a505665b91 \ 
  --endpoint-id testendpoint \ 
  --region us-east-1
```

Output:

```
{
  "EndpointResponse": {
    "Address": "+11234567890",
    "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
    "Attributes": {},
    "ChannelType": "SMS",
    "CohortId": "63",
    "EffectiveDate": "2021-08-06T00:04:51.763Z",
    "EndpointStatus": "ACTIVE",
    "Id": "testendpoint",
    "Location": {
      "Country": "USA"
    },
    "Metrics": {
      "SmsDelivered": 1.0
    },
    "OptOut": "ALL",
    "RequestId": "a204b1f2-7e26-48a7-9c80-b49a2143489d",
    "User": {
      "UserAttributes": {
        "Age": [
          "24"
        ]
      },
      "UserId": "testuser"
    }
  }
}
```
For API details, see GetEndpoint in AWS CLI Command Reference.

get-gcm-channel

The following code example shows how to use get-gcm-channel.

AWS CLI

To retrieve information about the status and settings of the GCM channel for an application

The following get-gcm-channel example retrieves information about the status and settings of the GCM channel for an application.

```
aws pinpoint get-gcm-channel \
--application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
--region us-east-1
```

Output:

```
{
  "GCMChannelResponse": {
    "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
    "CreationDate": "2019-10-08T18:28:23.182Z",
    "Enabled": true,
    "HasCredential": true,
    "Id": "gcm",
    "IsArchived": false,
    "LastModifiedDate": "2019-10-08T18:28:23.182Z",
    "Platform": "GCM",
    "Version": 1
  }
}
```

For API details, see GetGcmChannel in AWS CLI Command Reference.

get-sms-channel

The following code example shows how to use get-sms-channel.

```
AWS CLI

To retrieve information about the status and settings of the SMS channel for an application

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1
```

Output:

```
{
   "SMSChannelResponse": {
      "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
      "CreationDate": "2019-10-08T18:39:18.511Z",
      "Enabled": true,
      "Id": "sms",
      "IsArchived": false,
      "LastModifiedDate": "2019-10-08T18:39:18.511Z",
      "Platform": "SMS",
      "PromotionalMessagesPerSecond": 20,
      "TransactionalMessagesPerSecond": 20,
      "Version": 1
   }
}
```

- For API details, see GetSmsChannel in AWS CLI Command Reference.

get-sms-template

The following code example shows how to use get-sms-template.

AWS CLI

Retrieves the content and settings of a message template for messages that are sent through the SMS channel

The following `get-sms-template` example retrieves the content and settings of a SMS message template.
aws pinpoint get-sms-template \
   --template-name TestTemplate \
   --region us-east-1

Output:

{
   "SMSTemplateResponse": {
      "Body": "hello\n how are you?\n food is good",
      "CreationDate": "2023-06-20T21:37:30.124Z",
      "LastModifiedDate": "2023-06-20T21:37:30.124Z",
      "tags": {},
      "TemplateDescription": "Test SMS Template",
      "TemplateName": "TestTemplate",
      "TemplateType": "SMS",
      "Version": "1"
   }
}

For more information, see Amazon Pinpoint message templates in the Amazon Pinpoint User Guide.

- For API details, see GetSmsTemplate in AWS CLI Command Reference.

get-voice-channel

The following code example shows how to use get-voice-channel.

AWS CLI

To retrieve information about the status and settings of the voice channel for an application

The following get-voice-channel example retrieves status and settings of the voice channel for an application.

aws pinpoint get-voice-channel \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1

Output:
For API details, see `GetVoiceChannel` in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To retrieve a list of tags for a resource

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```
aws pinpoint list-tags-for-resource \
  --resource-arn arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```
{
   "TagsModel": {
      "tags": {
         "Year": "2019",
         "Stack": "Production"
      }
   }
}
```
For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>' in the Amazon Pinpoint Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**phone-number-validate**

The following code example shows how to use phone-number-validate.

**AWS CLI**

Retrieves information about a phone number

The following phone-number-validate retrieves information about a phone number.

```bash
aws pinpoint phone-number-validate \
  --number-validate-request PhoneNumber="+12065550142" \
  --region us-east-1
```

Output:

```
{
    "NumberValidateResponse": {
        "Carrier": "ExampleCorp Mobile",
        "City": "Seattle",
        "CleansedPhoneNumberE164": "+12065550142",
        "CleansedPhoneNumberNational": "2065550142",
        "Country": "United States",
        "CountryCodeIso2": "US",
        "CountryCodeNumeric": "1",
        "OriginalPhoneNumber": "+12065550142",
        "PhoneType": "MOBILE",
        "PhoneTypeCode": 0,
        "Timezone": "America/Los_Angeles",
        "ZipCode": "98101"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the Amazon Pinpoint User Guide.

- For API details, see PhoneNumberValidate in AWS CLI Command Reference.
**send-messages**

The following code example shows how to use send-messages.

**AWS CLI**

**To send SMS message using the endpoint of an application**

The following send-messages example sends a direct message for an application with an endpoint.

```bash
aws pinpoint send-messages \
   --application-id 611e3e3cdd47474c9c1399a505665b91 \ 
   --message-request file://myfile.json \ 
   --region us-west-2
```

Contents of `myfile.json`:

```json
{
   "MessageConfiguration": {
      "SMSMessage": {
         "Body": "hello, how are you?"
      }
   },
   "Endpoints": {
      "testendpoint": {}
   }
}
```

Output:

```json
{
   "MessageResponse": {
      "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
      "EndpointResult": {
         "testendpoint": {
            "Address": "+12345678900",
            "DeliveryStatus": "SUCCESSFUL",
            "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0",
            "StatusCode": 200,
            "StatusMessage": "MessageId: itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0"
         }
      }
   }
}
```
send-users-messages

The following code example shows how to use send-users-messages.

AWS CLI

To send SMS message for an user of an application

The following send-users-messages example sends a direct message for an user of an application.

```bash
aws pinpoint send-users-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --send-users-message-request file://myfile.json \
    --region us-west-2
```

Contents of `myfile.json`:

```json
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Users": {
        "testuser": {}
    }
}
```

Output:

```json
{
```
"SendUsersMessageResponse": {
    "ApplicationId": "61e3e3cdd47474c9c1399a505665b91",
    "RequestId": "e0b12cf5-2359-11e9-bb0b-d5fb91876b25",
    "Result": {
        "testuser": {
            "testuserendpoint": {
                "DeliveryStatus": "SUCCESSFUL",
                "MessageId": "7qu4hk5bqhda3i7i2n4pjf98qcuhi8b7p45ifsmo0",
                "StatusCode": 200,
                "StatusMessage": "MessageId:
7qu4hk5bqhda3i7i2n4pjf98qcuhi8b7p45ifsmo0",
                "Address": "+12345678900"
            }
        }
    }
}

For more information, see [Amazon Pinpoint SMS channel](https://docs.aws.amazon.com/pinpoint/latest/devguide/amazon-pinpoint-sms-channel.html) in the Amazon Pinpoint User Guide.

- For API details, see [SendUsersMessages](https://docs.aws.amazon.com/cli/latest COMMAND NAME) in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a resource**

The following example adds two tags (key names and values) to a resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-east-1:AIDACKCEVS6C2EXAMPLE:apps/8t0c7aab86d42fb2b56c8c966example \
    --tags-model tags={Stack=Production,Year=2019}
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/devguide/tagging-resources.html>' in the Amazon Pinpoint Developer Guide.
For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**Example 1: To remove a tag from a resource**

The following `untag-resource` example removes the specified tag (key name and value) from a resource.

```bash
aws pinpoint untag-resource \\
    --resource-arn arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \\
    --tag-keys Year
```

This command produces no output.

**Example 2: To remove multiple tags from a resource**

The following `untag-resource` example removes the specified tags (key names and values) from a resource.

```bash
aws pinpoint untag-resource \\
    --resource-arn arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \\
    --tag-keys Year Stack
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>' in the *Amazon Pinpoint Developer Guide*.

For API details, see `UntagResource` in *AWS CLI Command Reference*.

**update-sms-channel**

The following code example shows how to use `update-sms-channel`.
AWS CLI

To enable SMS channel or to update the status and settings of the SMS channel for an application.

The following update-sms-channel example enables SMS channel for an SMS channel for an application.

```
aws pinpoint update-sms-channel \
   --application-id 611e3e3cdd47474c9c1399a505665b91 \
   --sms-channel-request Enabled=true \
   --region us-west-2
```

Output:

```
{
   "SMSChannelResponse": {
      "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
      "CreationDate": "2019-01-28T23:25:25.224Z",
      "Enabled": true,
      "Id": "sms",
      "IsArchived": false,
      "LastModifiedDate": "2023-05-18T23:22:50.977Z",
      "Platform": "SMS",
      "PromotionalMessagesPerSecond": 20,
      "TransactionalMessagesPerSecond": 20,
      "Version": 3
   }
}
```

For more information, see Amazon Pinpoint SMS channel in the Amazon Pinpoint User Guide.

- For API details, see UpdateSmsChannel in AWS CLI Command Reference.

Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

delete-lexicon

The following code example shows how to use delete-lexicon.

AWS CLI

To delete a lexicon

The following delete-lexicon example deletes the specified lexicon.

```
aws polly delete-lexicon \
   --name w3c
```

This command produces no output.

For more information, see Using the DeleteLexicon operation in the Amazon Polly Developer Guide.
• For API details, see DeleteLexicon in AWS CLI Command Reference.

get-lexicon

The following code example shows how to use get-lexicon.

AWS CLI

To retrieve the content of a lexicon

The following get-lexicon example retrieves the content of the specified pronunciation lexicon.
aws polly get-lexicon \
   --name w3c

Output:

```
{
   "Lexicon": {
      "Content": "<?xml version="1.0" encoding="UTF-8"?>
      <lexicon version="1.0"
      xmlns= "http://www.w3.org/2005/01/pronunciation-lexicon"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
      http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
      alphabet="ipa"
      xml:lang="en-US">
         <lexeme>
            <grapheme>W3C</grapheme>
            <alias>World Wide Web Consortium</alias>
         </lexeme>
      </lexicon>
   },
   "LexiconAttributes": {
      "Alphabet": "ipa",
      "LanguageCode": "en-US",
      "LastModified": 1603908910.99,
      "LexemesCount": 1,
      "Size": 492
   }
}
```

For more information, see [Using the GetLexicon operation](#) in the Amazon Polly Developer Guide.

- For API details, see [GetLexicon](#) in AWS CLI Command Reference.

get-speech-synthesis-task

The following code example shows how to use get-speech-synthesis-task.

AWS CLI

To get information about a speech synthesis task

The following get-speech-synthesis-task example retrieves information about the specified speech synthesis task.
aws polly get-speech-synthesis-task \\ 
--task-id 70b61c0f-57ce-4715-a247-cae8729dcce9

Output:

```
{
   "SynthesisTask": {
      "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
      "TaskStatus": "completed",
      "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
      "CreationTime": 1603911042.689,
      "RequestCharacters": 1311,
      "OutputFormat": "mp3",
      "TextType": "text",
      "VoiceId": "Joanna"
   }
}
```

For more information, see [Creating long audio files](https://docs.aws.amazon.com/polly/latest/dg/creating-long-audio-files.html) in the *Amazon Polly Developer Guide*.

**list-lexicons**

The following code example shows how to use `list-lexicons`.

**AWS CLI**

**To list your lexicons**

The following `list-lexicons` example lists your pronunciation lexicons.

```
aws polly list-lexicons
```

Output:

```
{
   "Lexicons": [
      {
         "Name": "w3c",
```
For more information, see [Using the ListLexicons operation](#) in the Amazon Polly Developer Guide.

- For API details, see [ListLexicons](#) in AWS CLI Command Reference.

### list-speech-synthesis-tasks

The following code example shows how to use `list-speech-synthesis-tasks`.

#### AWS CLI

**To list your speech synthesis tasks**

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```
aws polly list-speech-synthesis-tasks
```

**Output:**

```
{
    "SynthesisTasks": [
        {
            "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
            "TaskStatus": "completed",
            "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
            "CreationTime": 1603911042.689,
            "RequestCharacters": 1311,
            "OutputFormat": "mp3",
            "TextType": "text",
        }
    ]
}
```
For more information, see [Creating long audio files](#) in the [Amazon Polly Developer Guide](#).

- For API details, see [ListSpeechSynthesisTasks](#) in [AWS CLI Command Reference](#).

**put-lexicon**

The following code example shows how to use put-lexicon.

**AWS CLI**

To store a lexicon

The following put-lexicon example stores the specified pronunciation lexicon. The example.pls file specifies a W3C PLS-compliant lexicon.

```bash
aws polly put-lexicon \
   --name w3c \
   --content file://example.pls
```

Contents of example.pls

```xml
{
   <?xml version="1.0" encoding="UTF-8"?>
   <lexicon version="1.0"
      xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
      http://www.w3.org/2005/01/pronunciation-lexicon-20071212/pls.xsd"
      alphabet="ipa"
      xml:lang="en-US">
      <lexeme>
         <grapheme>W3C</grapheme>
         <alias>World Wide Web Consortium</alias>
      </lexeme>
   </lexicon>
}
```
This command produces no output.

For more information, see [Using the PutLexicon operation](https://docs.aws.amazon.com/polly/latest/dg/using-putlexicon.html) in the *Amazon Polly Developer Guide*.

- For API details, see [PutLexicon](https://docs.aws.amazon.com/cli/latest/reference/polly/put-lexicon.html) in *AWS CLI Command Reference*.

### start-speech-synthesis-task

The following code example shows how to use `start-speech-synthesis-task`.

**AWS CLI**

**To synthesize text**

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```bash
aws polly start-speech-synthesis-task \
    --output-format mp3 \
    --output-s3-bucket-name my-s3-bucket \
    --text file://text_file.txt \
    --voice-id Joanna
```

**Output:**

```json
{
    "SynthesisTask": {
        "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
        "TaskStatus": "scheduled",
        "OutputUri": "https://s3.us-east-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see [Creating long audio files](https://docs.aws.amazon.com/polly/latest/dg/creating-long-audio-files.html) in the *Amazon Polly Developer Guide*.

- For API details, see [StartSpeechSynthesisTask](https://docs.aws.amazon.com/cli/latest/reference/polly/start-speech-synthesis-task.html) in *AWS CLI Command Reference*.
AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

describe-services

The following code example shows how to use describe-services.

**AWS CLI**

*To retrieve service metadata*

This example retrieves the metadata for the Amazon EC2 service code.

Command:

```
aws pricing describe-services --service-code AmazonEC2 --format-version aws_v1 --max-items 1
```

Output:

```json
{
   "Services": [
      {
         "ServiceCode": "AmazonEC2",
         "AttributeNames": [
```

For API details, see `DescribeServices` in `AWS CLI Command Reference`.

**get-attribute-values**

The following code example shows how to use `get-attribute-values`.

**AWS CLI**

To retrieve a list of attribute values

The following `get-attribute-values` example retrieves a list of values available for the given attribute.

```
aws pricing get-attribute-values \
  --service-code AmazonEC2 \
  --attribute-name volumeType \
  --max-items 2
```

Output:
get-products

The following code example shows how to use get-products.

AWS CLI

To retrieve a list of products

This example retrieves a list of products that match the given criteria.

Command:

```
aws pricing get-products --filters file://filters.json --format-version aws_v1 --max-results 1 --service-code AmazonEC2
```

filters.json:

```
[
  {
    "Type": "TERM_MATCH",
    "Field": "ServiceCode",
    "Value": "AmazonEC2"
  },
  {
    "Type": "TERM_MATCH",
    "Field": "volumeType",
    "Value": "Provisioned IOPS"
  }
]
```
Output:

```json
{
    "FormatVersion": "aws_v1",
    "NextToken": "WGDY7ko8fQXdaUZVdasFQ==:RVSagyIfn770XQozdUIcO9BY6ucBG9itXAZGZF/ziOuZ6sUKh6PCcPWAoYpZRIePeb986TeokYB9155fw/CyoMq5ymnGmt1Vj39TjbbA1hcqnVftmPiiIx8Uy5bdDaByYe/20fw9Edzsykbs8L7BuNbiDQ+BBds5yeI9AQkUepruKk3aEahFPxJ55kx/zk",

**AWS Private CA examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

Actions

**create-certificate-authority-audit-report**

The following code example shows how to use **create-certificate-authority-audit-report**.

**AWS CLI**

**To create a certificate authority audit report**

The following create-certificate-authority-audit-report command creates an audit report for the private CA identified by the ARN.

```bash
```

- For API details, see [CreateCertificateAuthorityAuditReport](https://docs.aws.amazon.com/cli/latest/reference/acm-pca/create-certificate-authority-audit-report.html) in *AWS CLI Command Reference*.

**create-certificate-authority**

The following code example shows how to use **create-certificate-authority**.

**AWS CLI**

**To create a private certificate authority**

The following create-certificate-authority command creates a private certificate authority in your AWS account.

```bash
aws acm-pca create-certificate-authority --certificate-authority-configuration file://C:\ca_config.txt --revocation-configuration file://C:\revoke_config.txt --certificate-authority-type "SUBORDINATE" --idempotency-token 98256344
```
For API details, see CreateCertificateAuthority in AWS CLI Command Reference.

delete-certificate-authority

The following code example shows how to use delete-certificate-authority.

AWS CLI

To delete a private certificate authority

The following delete-certificate-authority command deletes the certificate authority identified by the ARN.

```bash
```

For API details, see DeleteCertificateAuthority in AWS CLI Command Reference.

describe-certificate-authority-audit-report

The following code example shows how to use describe-certificate-authority-audit-report.

AWS CLI

To describe an audit report for a certificate authority

The following describe-certificate-authority-audit-report command lists information about the specified audit report for the CA identified by the ARN.

```bash
```

For API details, see DescribeCertificateAuthorityAuditReport in AWS CLI Command Reference.

describe-certificate-authority

The following code example shows how to use describe-certificate-authority.

Actions and scenarios

4978
AWS CLI

To describe a private certificate authority

The following describe-certificate-authority command lists information about the private CA identified by the ARN.

```
```

• For API details, see [DescribeCertificateAuthority](#) in *AWS CLI Command Reference*.

get-certificate-authority-certificate

The following code example shows how to use get-certificate-authority-certificate.

AWS CLI

To retrieve a certificate authority (CA) certificate

The following get-certificate-authority-certificate command retrieves the certificate and certificate chain for the private CA specified by the ARN.

```
```

• For API details, see [GetCertificateAuthorityCertificate](#) in *AWS CLI Command Reference*.

get-certificate-authority-csr

The following code example shows how to use get-certificate-authority-csr.

AWS CLI

To retrieve the certificate signing request for a certificate authority

The following get-certificate-authority-csr command retrieves the CSR for the private CA specified by the ARN.

- For API details, see [GetCertificateAuthorityCsr](#) in *AWS CLI Command Reference*.

### get-certificate

The following code example shows how to use get-certificate.

#### AWS CLI

**To retrieve an issued certificate**

The following get-certificate example retrieves a certificate from the specified private CA.

```
aws acm-pca get-certificate
   --output text
```

**Output:**

```
-----BEGIN CERTIFICATE-----
MIIEzdCCAvegAwIBAgIRAJuJ8f6ZVYL7gG/rS3qrZMwDQYJKoZIhvcNAQELBQAw
ctELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
....certificate body truncated for brevity....
kJCSqlgZzd4Fdlw1EKGm+UVXnodwMtJEQyy3oTfZjURPIyyaqskTu/KSS7YdJkO
KQNy73D6Ltd0EbaYq10XiDxqY411vKHzJ1nZrPaBmYNABxU=
-----END CERTIFICATE-----

-----BEGIN CERTIFICATE-----
MIIDrzCCApegAwIBAgIRAOskdzLvcj1eShkoyEE693AwDQYJKoZIhvcNAQELBQAw
cTELMakGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
....certificate body truncated for brevity....
kdRGB6P2hpxtDOUIwAoCboawWfA4ybJznf+jOQhAziN1RdKQR8nODWpKt7H9w
dJ5nxSTk/fnI1z86Dtp6n8s82wYdK3cVfeK72A9aTCOU=
-----END CERTIFICATE-----
```

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the `--output text` option, a TAB
character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

- For API details, see `GetCertificate` in `AWS CLI Command Reference`.

**import-certificate-authority-certificate**

The following code example shows how to use `import-certificate-authority-certificate`.

**AWS CLI**

**To import your certificate authority certificate into ACM PCA**

The following `import-certificate-authority-certificate` command imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```
```

- For API details, see `ImportCertificateAuthorityCertificate` in `AWS CLI Command Reference`.

**issue-certificate**

The following code example shows how to use `issue-certificate`.

**AWS CLI**

**To issue a private certificate**

The following `issue-certificate` command uses the private CA specified by the ARN to issue a private certificate.

```
```

- For API details, see `IssueCertificate` in `AWS CLI Command Reference`.
**list-certificate-authorities**

The following code example shows how to use `list-certificate-authorities`.

**AWS CLI**

**To list your private certificate authorities**

The following `list-certificate-authorities` command lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities --max-results 10
```

- For API details, see [ListCertificateAuthorities](https://docs.aws.amazon.com/cli/latest/reference/acm-pca/list-certificate-authorities.html) in *AWS CLI Command Reference*.

**list-tags**

The following code example shows how to use `list-tags`.

**AWS CLI**

**To list the tags for your certificate authority**

The following `list-tags` command lists the tags associated with the private CA specified by the ARN.

```
```

- For API details, see [ListTags](https://docs.aws.amazon.com/cli/latest/reference/acm-pca/list-tags.html) in *AWS CLI Command Reference*.

**revoke-certificate**

The following code example shows how to use `revoke-certificate`.

**AWS CLI**

**To revoke a private certificate**

The following `revoke-certificate` command revokes a private certificate from the CA identified by the ARN.
For API details, see [RevokeCertificate](#) in *AWS CLI Command Reference*.

### tag-certificate-authority

The following code example shows how to use `tag-certificate-authority`.

**AWS CLI**

**To attach tags to a private certificate authority**

The following `tag-certificate-authority` command attaches one or more tags to your private CA.

```bash
```

For API details, see [TagCertificateAuthority](#) in *AWS CLI Command Reference*.

### untag-certificate-authority

The following code example shows how to use `untag-certificate-authority`.

**AWS CLI**

**To remove one or more tags from your private certificate authority**

The following `untag-certificate-authority` command removes tags from the private CA identified by the ARN.

```bash
```

For API details, see [UntagCertificateAuthority](#) in *AWS CLI Command Reference*. 
**update-certificate-authority**

The following code example shows how to use `update-certificate-authority`.

**AWS CLI**

To update the configuration of your private certificate authority

The following `update-certificate-authority` command updates the status and configuration of the private CA identified by the ARN.

```bash
```

- For API details, see [UpdateCertificateAuthority](https://docs.aws.amazon.com/cli/latest/reference/acm-pca/update-certificate-authority.html) in *AWS CLI Command Reference*.

**AWS Proton examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**cancel-service-instance-deployment**

The following code example shows how to use `cancel-service-instance-deployment`.
AWS CLI

To cancel a service instance deployment

The following cancel-service-instance-deployment example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \
  --service-instance-name "instance-one" \
  --service-name "simple-svc"
```

Output:

```
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",
    "deploymentStatus": "CANCELLING",
    "environmentName": "simple-env",
    "lastDeploymentAttemptedAt": "2021-04-02T21:45:15.406000+00:00",
    "lastDeploymentSucceededAt": "2021-04-02T21:38:00.823000+00:00",
    "name": "instance-one",
    "serviceName": "simple-svc",
    "spec": "proton: ServiceSpec\npipeline:
      my_sample_pipeline_optional_input: abc
      my_sample_pipeline_required_input: '123'
    instances:
      - name: my-instance
        environment: MySimpleEnv
        spec:
          my_sample_service_instance_optional_input: def
          my_sample_service_instance_required_input: '456'
      - name: my-other-instance
        environment: MySimpleEnv
        spec:
          my_sample_service_instance_required_input: '789'
            "templateMajorVersion": "1",
            "templateMinorVersion": "1",
            "templateName": "svc-simple"
  }
}
```

For more information, see [Update a service instance](https://docs.aws.amazon.com/proton/latest/adminguide/update-service-instance.html) in the *The AWS Proton Administrator Guide* or [Update a service instance](https://docs.aws.amazon.com/proton/latest/userguide/update-service-instance.html) in the *The AWS Proton User Guide*.

- For API details, see [CancelServiceInstanceDeployment](https://docs.aws.amazon.com/cli/latest/reference/proton/cancel-service-instance-deployment.html) in *AWS CLI Command Reference*.
cancel-service-pipeline-deployment

The following code example shows how to use `cancel-service-pipeline-deployment`.

**AWS CLI**

To cancel a service pipeline deployment

The following `cancel-service-pipeline-deployment` example cancels a service pipeline deployment.

```
aws proton cancel-service-pipeline-deployment
   --service-name "simple-svc"
```

Output:

```
{
   "pipeline": {
      "createdAt": "2021-04-02T21:29:59.962000+00:00",
      "deploymentStatus": "CANCELLING",
      "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",
      "lastDeploymentSucceededAt": "2021-04-02T21:39:28.991000+00:00",
      "templateMajorVersion": "1",
      "templateMinorVersion": "1",
      "templateName": "svc-simple"
   }
}
```

For more information, see [Update a service pipeline](https://docs.aws.amazon.com/proton/latest/userguide/update-service-pipeline.html) in *The AWS Proton Administrator Guide* or [Update a service pipeline](https://docs.aws.amazon.com/proton/latest/userguide/update-service-pipeline.html) in *The AWS Proton User Guide*.

- For API details, see [CancelServicePipelineDeployment](https://docs.aws.amazon.com/cli/latest/reference/proton/cancel-service-pipeline-deployment.html) in *AWS CLI Command Reference*.

create-service

The following code example shows how to use `create-service`.

**AWS CLI**

To create a service
The following `create-service` example creates a service with a service pipeline.

```bash
aws proton create-service \
  --name "MySimpleService" \
  --template-name "fargate-service" \
  --template-major-version "1" \
  --branch-name "mainline" \
  --repository-connection-arn "arn:aws:codestar-connections:region-id:account-id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
  --repository-id "myorg/myapp" \
  --spec file://spec.yaml
```

Contents of `spec.yaml`:

```yaml
proton: ServiceSpec

pipeline:
  my_sample_pipeline_required_input: "hello"
  my_sample_pipeline_optional_input: "bye"

instances:
  - name: "acme-network-dev"
    environment: "ENV_NAME"
    spec:
      my_sample_service_instance_required_input: "hi"
      my_sample_service_instance_optional_input: "ho"
```

Output:

```json
{
  "service": {
    "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
    "createdAt": "2020-11-18T19:50:27.460000+00:00",
    "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",
    "name": "MySimpleService",

    "repositoryId": "myorg/myapp",
    "status": "CREATE_IN_PROGRESS",
    "templateName": "fargate-service"
  }
}
```
For more information, see Create a service in the The AWS Proton Administrator Guide and Create a service in the The AWS Proton User Guide.

- For API details, see CreateService in AWS CLI Command Reference.

delete-service

The following code example shows how to use delete-service.

AWS CLI

To delete a service

The following delete-service example deletes a service.

```bash
aws proton delete-service \
   --name "simple-svc"
```

Output:

```
{
   "service": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
      "branchName": "mainline",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "description": "Edit by updating description",
      "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",
      "name": "simple-svc",
      "repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "repositoryId": "myorg/myapp",
      "status": "DELETE_IN_PROGRESS",
      "templateName": "fargate-service"
   }
}
```

For more information, see Delete a service in the The AWS Proton Administrator Guide.

- For API details, see DeleteService in AWS CLI Command Reference.

get-service-instance

The following code example shows how to use get-service-instance.
AWS CLI

To get service instance details

The following get-service-instance example gets detail data for a service instance.

```bash
aws proton get-service-instance \
   --name "instance-one" \
   --service-name "simple-svc"
```

Output:

```json
{
   "serviceInstance": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "deploymentStatus": "SUCCEEDED",
      "environmentName": "simple-env",
      "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
      "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
      "name": "instance-one",
      "serviceName": "simple-svc",
      "spec": "proton: ServiceSpec
pipeline:
   my_sample_pipeline_optional_input: hello world
   my_sample_pipeline_required_input: pipeline up
instances:
   - name: instance-one
   environment: my-simple-env
   spec:
      my_sample_service_instance_optional_input: Ola
      my_sample_service_instance_required_input: Ciao",

   "templateMajorVersion": "1",
   "templateMinorVersion": "0",
   "templateName": "svc-simple"
}
```

For more information, see View service data in the The AWS Proton Administrator Guide or View service data in the The AWS Proton User Guide.

- For API details, see GetServiceInstance in AWS CLI Command Reference.

get-service

The following code example shows how to use get-service.
AWS CLI

To get service details

The following get-service example gets detail data for a service.

aws proton get-service \
   --name "simple-svc"

Output:

```
{
   "service": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
      "branchName": "mainline",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
      "name": "simple-svc",
      "pipeline": {
         "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "createdAt": "2020-11-28T22:40:50.512000+00:00",

         "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
         "spec": "proton: ServiceSpec
my_sample_pipeline_required_input: hello\nmy_sample_pipeline_optional_input: bye\ninstances:\n- name: instance-svc-simple\nenvironment: my-simple-env\nspec:\n   my_sample_service_instance_required_input: hi\n   my_sample_service_instance_optional_input: ho",
         "templateMajorVersion": "1",
         "templateMinorVersion": "1",
         "templateName": "svc-simple"
      },
      "repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "repositoryId": "myorg/myapp",
      "spec": "proton: ServiceSpec
my_sample_pipeline_required_input: hello\nmy_sample_pipeline_optional_input: bye\ninstances:\n- name: instance-svc-simple\nenvironment: my-simple-env\nspec:\n   my_sample_service_instance_required_input: hi\n   my_sample_service_instance_optional_input: ho",
      "status": "ACTIVE",
```

Actions and scenarios 4990
For more information, see View service data in the The AWS Proton Administrator Guide or View service data in the The AWS Proton User Guide.

- For API details, see GetService in AWS CLI Command Reference.

list-service-instances

The following code example shows how to use list-service-instances.

AWS CLI

Example 1: To list all service instances

The following list-service-instances example lists service instances.

aws proton list-service-instances

Output:

```json
{
  "serviceInstances": [
    {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "deploymentStatus": "SUCCEEDED",
      "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
      "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
      "name": "instance-one",
      "serviceName": "simple-svc",
      "templateMajorVersion": "1",
      "templateMinorVersion": "0",
      "templateName": "fargate-service"
    }
  ]
}
```
Example 2: To list the specified service instance

The following get-service-instance example gets a service instance.

```
aws proton get-service-instance \\
  --name "instance-one" \\
  --service-name "simple-svc"
```

Output:

```
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2020-11-28T22:40:50.512000+00:00",
    "deploymentStatus": "SUCCEEDED",
    "environmentName": "simple-env",
    "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
    "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
    "name": "instance-one",
    "serviceName": "simple-svc",
    "spec": "proton: ServiceSpec\n    pipeline:
      my_sample_pipeline_optional_input: hello world\n      my_sample_pipeline_required_input: pipeline up\n    instances:
      - name: instance-one
        environment: my-simple-env
        spec:
          my_sample_service_instance_optional_input: Ola
          my_sample_service_instance_required_input: Ciao",
    "templateMajorVersion": "1",
    "templateMinorVersion": "0",
    "templateName": "svc-simple"
  }
}
```

For more information, see View service instance data in the The AWS Proton Administrator Guide or View service instance data in the The AWS Proton User Guide.

- For API details, see ListServiceInstances in AWS CLI Command Reference.

update-service-instance

The following code example shows how to use update-service-instance.
AWS CLI

To update a service instance to a new minor version

The following update-service-instance example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```bash
aws proton update-service-instance \
  --service-name "simple-svc" \
  --spec "file://service-spec.yaml " \
  --template-major-version "1" \
  --template-minor-version "1" \
  --deployment-type "MINOR_VERSION" \
  --name "instance-one"
```

Contents of service-spec.yaml:

```yaml
proton: ServiceSpec
pipeline:
  my_sample_pipeline_optional_input: "abc"
  my_sample_pipeline_required_input: "123"
instances:
  - name: "instance-one"
    environment: "simple-env"
    spec:
      my_sample_service_instance_optional_input: "def"
      my_sample_service_instance_required_input: "456"
  - name: "my-other-instance"
    environment: "simple-env"
    spec:
      my_sample_service_instance_required_input: "789"
```

Output:

```json
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "environmentName": "arn:aws:proton:region-id:123456789012:environment/simple-env",
```
For more information, see Update a service instance in the The AWS Proton Administrator Guide or Update a service instance in the The AWS Proton User Guide.

- For API details, see UpdateServiceInstance in AWS CLI Command Reference.

**update-service-pipeline**

The following code example shows how to use update-service-pipeline.

**AWS CLI**

**To update a service pipeline**

The following update-service-pipeline example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \  
   --service-name "simple-svc" \  
   --spec "file://service-spec.yaml" \  
   --template-major-version "1" \  
   --template-minor-version "1" \  
   --deployment-type "MINOR_VERSION"
```

**Output:**

```
{
   "pipeline": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "createdAt": "2021-04-02T21:29:59.962000+00:00",
      "deploymentStatus": "IN_PROGRESS",
      "lastDeploymentAttemptedAt": "2021-04-02T21:39:28.991000+00:00",
```
For more information, see Update a service pipeline in the The AWS Proton Administrator Guide or Update a service pipeline in the The AWS Proton User Guide.

- For API details, see UpdateServicePipeline in AWS CLI Command Reference.

update-service

The following code example shows how to use update-service.

AWS CLI

To update a service

The following update-service example edits a service description.

```bash
aws proton update-service \
  --name "MySimpleService" \ 
  --description "Edit by updating description"
```

Output:

```json
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "branchName": "mainline",
        "createdAt": "2021-03-12T22:39:42.318000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2021-03-12T22:42:31.800000+00:00",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```
"name": "MySimpleService",
"repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"repositoryId": "myorg/myapp",
"status": "ACTIVE",
"templateName": "fargate-service"
}
}

For more information, see Edit a service in the The AWS Proton Administrator Guide or Edit a service in the The AWS Proton User Guide.

- For API details, see UpdateService in AWS CLI Command Reference.

**QLDB examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with QLDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**cancel-journal-kinesis-stream**

The following code example shows how to use cancel-journal-kinesis-stream.

**AWS CLI**

To cancel a journal stream
The following `cancel-journal-kinesis-stream` example cancels the specified journal stream from a ledger.

```bash
aws qldb cancel-journal-kinesis-stream \
   --ledger-name myExampleLedger \
   --stream-id 7ISChqwe4y25YyHLzYUFAf
```

Output:

```json
{
   "StreamId": "7ISChqwe4y25YyHLzYUFAf"
}
```

For more information, see [Streaming journal data from Amazon QLDB](http://example.com) in the *Amazon QLDB Developer Guide*.

- For API details, see [CancelJournalKinesisStream](http://example.com) in *AWS CLI Command Reference*.

### create-ledger

The following code example shows how to use `create-ledger`.

**AWS CLI**

**Example 1: To create a ledger with default properties**

The following `create-ledger` example creates a ledger with the name `myExampleLedger` and the permissions mode `STANDARD`. The optional parameters for deletion protection and AWS KMS key are not specified, so they default to `true` and an AWS owned KMS key respectively.

```bash
aws qldb create-ledger \
   --name myExampleLedger \
   --permissions-mode STANDARD
```

Output:

```json
{
   "State": "CREATING",
   "DeletionProtection": true,
```

**Actions and scenarios**
Example 2: To create a ledger with deletion protection disabled, a customer managed KMS key, and specified tags

The following `create-ledger` example creates a ledger with the name `myExampleLedger2` and the permissions mode `STANDARD`. The deletion protection feature is disabled, the specified customer managed KMS key is used for encryption at rest, and the specified tags are attached to the resource.

```bash
aws qldb create-ledger \
  --name myExampleLedger2 \
  --permissions-mode STANDARD \
  --no-deletion-protection \
  --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --tags IsTest=true,Domain=Test
```

Output:

```json
{
  "DeletionProtection": false,
  "CreationDateTime": 1568839543.557,
  "State": "CREATING",
  "Name": "myExampleLedger2",
  "PermissionsMode": "STANDARD",
  "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see CreateLedger in AWS CLI Command Reference.

**delete-ledger**

The following code example shows how to use `delete-ledger`.

AWS CLI

To delete a ledger

The following delete-ledger example deletes the specified ledger.

aws qldb delete-ledger \
   --name myExampleLedger

This command produces no output.

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see DeleteLedger in AWS CLI Command Reference.

describe-journal-kinesis-stream

The following code example shows how to use describe-journal-kinesis-stream.

AWS CLI

To describe a journal stream

The following describe-journal-kinesis-stream example displays the details for the specified journal stream from a ledger.

aws qldb describe-journal-kinesis-stream \
   --ledger-name myExampleLedger \
   --stream-id 7ISCkqwe4y25YyHLzYUFAf

Output:

{
   "Stream": {
      "LedgerName": "myExampleLedger",
      "CreationTime": 1591221984.677,
      "InclusiveStartTime": 1590710400.0,
      "ExclusiveEndTime": 1590796799.0,
      "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
      "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
   }
}
"Arn": "arn:aws:qldb:us-east-1:123456789012:stream/myExampleLedger/7ISckqwe4y25YyHLzYUFAf",
  "Status": "ACTIVE",
  "KinesisConfiguration": {
    "AggregationEnabled": true,
  },
  "StreamName": "myExampleLedger-stream"
}
}

For more information, see [Streaming journal data from Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/) in the *Amazon QLDB Developer Guide*.

- For API details, see [DescribeJournalKinesisStream](https://docs.aws.amazon.com/cli/latest/reference/qldb/describe-journal-kinesis-stream.html) in *AWS CLI Command Reference*.

### describe-journal-s3-export

The following code example shows how to use `describe-journal-s3-export`.

**AWS CLI**

**To describe a journal export job**

The following `describe-journal-s3-export` example displays the details for the specified export job from a ledger.

```bash
aws qldb describe-journal-s3-export \
  --name myExampleLedger \
  --export-id ADR2ONPKS5LINYGb4dp7yZ
```

**Output:**

```json
{
  "ExportDescription": {
    "S3ExportConfiguration": {
      "Bucket": "awsExampleBucket",
      "Prefix": "ledgerexport1/",
      "EncryptionConfiguration": {
        "ObjectEncryptionType": "SSE_S3"
      }
    }
  }
}
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see DescribeJournalS3Export in AWS CLI Command Reference.

describe-ledger

The following code example shows how to use describe-ledger.

AWS CLI

To describe a ledger

The following describe-ledger example displays the details for the specified ledger.

```bash
aws qldb describe-ledger \
   --name myExampleLedger
```

Output:

```json
{
   "CreationDateTime": 1568839243.951,
   "State": "ACTIVE",
   "Name": "myExampleLedger",
   "DeletionProtection": true,
   "PermissionsMode": "STANDARD",
   "EncryptionDescription": {
      "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "EncryptionStatus": "ENABLED"
   }
}
```
export-journal-to-s3

The following code example shows how to use export-journal-to-s3.

AWS CLI

To export journal blocks to S3

The following export-journal-to-s3 example creates an export job for journal blocks within a specified date and time range from a ledger with the name myExampleLedger. The export job writes the blocks into a specified Amazon S3 bucket.

```
aws qldb export-journal-to-s3 \
   --name myExampleLedger \
   --inclusive-start-time 2019-09-18T00:00:00Z \
   --exclusive-end-time 2019-09-18T22:59:59Z \
   --role-arn arn:aws:iam::123456789012:role/my-s3-export-role \
   --s3-export-configuration file://my-s3-export-config.json
```

Contents of `my-s3-export-config.json`:

```
{
   "Bucket": "awsExampleBucket",
   "Prefix": "ledgerexport1/",
   "EncryptionConfiguration": {
      "ObjectEncryptionType": "SSE_S3"
   }
}
```

Output:

```
{
   "ExportId": "ADR2ONPK5LNYGb4dp7yZ"
}
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see ExportJournalToS3 in AWS CLI Command Reference.

get-block

The following code example shows how to use get-block.

AWS CLI

Example 1: To get a journal block and proof for verification using input files

The following get-block example requests a block data object and a proof from the specified ledger. The request is for a specified digest tip address and block address.

```
aws qldb get-block \
    --name vehicle-registration \
    --block-address file://myblockaddress.json \
    --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{
    "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100}"
}
```

Contents of `mydigesttipaddress.json`:

```
{
    "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:123}"
}
```

Output:

```
{
    "Block": {
        "IonText": "{blockAddress:{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100},transactionId:"FnQeJBAicTX0Ah3ZnVtSX","blockTimestamp:2019-09-16T19:37:05.360Z,blockHash:
```
For more information, see [Data Verification in Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/qlb-data-verification.html) in the Amazon QLDB Developer Guide.

Example 2: To get a journal block and proof for verification using shorthand syntax

The following `get-block` example requests a block data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address and block address.

```
aws qldb get-block
  --name vehicle-registration
```

For more information, see [Data Verification in Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/qlb-data-verification.html) in the Amazon QLDB Developer Guide.
Output:

```json
{
    "Block": {

```
For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see GetBlock in AWS CLI Command Reference.

get-digest

The following code example shows how to use get-digest.

AWS CLI

To get a digest for a ledger

The following get-digest example requests a digest from the specified ledger at the latest committed block in the journal.

```bash
aws qldb get-digest \\
  --name vehicle-registration
```

Output:

```json
{
  "Digest": "6m6BMXobbJKpMhahwVthAEsN6awgnHK62Qq5McGP1Gk=",
  "DigestTipAddress": {
    "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:123}"
  }
}
```

For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see GetDigest in AWS CLI Command Reference.

get-revision

The following code example shows how to use get-revision.

AWS CLI

Example 1: To get a document revision and proof for verification using input files
The following `get-revision` example requests a revision data object and a proof from the specified ledger. The request is for a specified digest tip address, document ID, and block address of the revision.

```
aws qldb get-revision \
  --name vehicle-registration \
  --block-address file://myblockaddress.json \
  --document-id JUJgkIcNbhS2goq8RqLuZ4 \
  --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{
  "IonText": "\{strandId:"KmA3ZZca7vAIiJAK955Iwl\",sequenceNo:100\}"
}
```

Contents of `mydigesttipaddress.json`:

```
{
  "IonText": "\{strandId:"KmA3ZZca7vAIiJAK955Iwl\",sequenceNo:123\}"
}
```

Output:

```
{
  "Revision": {
    "IonText": "\{blockAddress:\{strandId:"KmA3ZZca7vAIiJAK955Iwl\",sequenceNo:100\},hash:\{mHVex/yjHAWjFPpwhBuH2GKXmKJjJ2FBa9faqoUVNtg=\},data:

```
For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

**Example 2: To get a document revision and proof for verification using shorthand syntax**

The following get-revision example requests a revision data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address, document ID, and block address of the revision.

```bash/aws qldb get-revision \
  --name vehicle-registration \
  --block-address 'IonText="{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100}"' \
  --document-id JUJgkICnbhS2goq8RqLuZ4 \
  --digest-tip-address 'IonText="{strandId:"KmA3ZZca7vAIiJAK9S5Iwl \
  ",sequenceNo:123}"'
```

**Output:**

```json
{
  "Revision": {
    "IonText": "{blockAddress:{strandId:"KmA3ZZca7vAIiJAK9S5Iwl \
  ",sequenceNo:100},hash:{mHVex/yjHAWjFPpwhBuHZGKXmKJkK2Ba9faqoUVNtg=}},data:
  {VIN:"1N4AL11D75C109151",LicensePlateNumber:"LEWISR261LL",State:"WA \\

- For API details, see [GetRevision](https://docs.aws.amazon.com/cli/latest/reference/qldb/get-revision.html) in *AWS CLI Command Reference*.

### list-journal-kinesis-streams-for-ledger

The following code example shows how to use `list-journal-kinesis-streams-for-ledger`.

**AWS CLI**

**To list journal streams for a ledger**

The following `list-journal-kinesis-streams-for-ledger` example lists journal streams for the specified ledger.

```
aws qldb list-journal-kinesis-streams-for-ledger --ledger-name myExampleLedger
```

**Output:**

```
{
    "Streams": [
        {
            "LedgerName": "myExampleLedger",
            "CreationTime": 1591221984.677,
            "InclusiveStartTime": 1590710400.0,
            "ExclusiveEndTime": 1590796799.0,
            "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
            "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
            "Arn": "arn:aws:qldb:us-east-1:123456789012:stream/myExampleLedger/7ISCkqwe4y25YyHLzYUFAf",
            "Status": "ACTIVE",
            "KinesisConfiguration": {
                "AggregationEnabled": true
            }
        }
    ]
}
```
For more information, see [Streaming journal data from Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalKinesisStreamsForLedger](https://docs.aws.amazon.com/cli/latest/reference/qldb/list-journal-kinesis-streams-for-ledger) in *AWS CLI Command Reference*.

### list-journal-s3-exports-for-ledger

The following code example shows how to use `list-journal-s3-exports-for-ledger`.

**AWS CLI**

**To list journal export jobs for a ledger**

The following `list-journal-s3-exports-for-ledger` example lists journal export jobs for the specified ledger.

```
aws qldb list-journal-s3-exports-for-ledger \\
  --name myExampleLedger
```

**Output:**

```json
{
    "JournalS3Exports": [
        {
            "LedgerName": "myExampleLedger",
            "ExclusiveEndTime": 1568847599.0,
            "ExportCreationTime": 1568847801.418,
            "S3ExportConfiguration": {
                "Bucket": "awsExampleBucket",
                "Prefix": "ledgerexport1/",
                "EncryptionConfiguration": {
                    "ObjectEncryptionType": "SSE_S3"
                }
            },
            "ExportId": "ADR2ONPKN5LINYGb4dp7yZ",
            "RoleArn": "arn:aws:iam::123456789012:role/qldb-s3-export",
            "InclusiveStartTime": 1568764800.0,
            "Status": "IN_PROGRESS"
        }
    ]
}
```
For more information, see [Exporting Your Journal in Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalS3ExportsForLedger](https://docs.aws.amazon.com/cli/latest/reference/qldb/list-journal-s3-exports.html) in *AWS CLI Command Reference*.

### list-journal-s3-exports

The following code example shows how to use `list-journal-s3-exports`.

**AWS CLI**

**To list journal export jobs**

The following `list-journal-s3-exports` example lists journal export jobs for all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-journal-s3-exports
```

**Output:**

```json
{
   "JournalS3Exports": [
      {
         "Status": "IN_PROGRESS",
         "LedgerName": "myExampleLedger",
         "S3ExportConfiguration": {
            "EncryptionConfiguration": {
               "ObjectEncryptionType": "SSE_S3"
            },
            "Bucket": "awsExampleBucket",
            "Prefix": "ledgerexport1/"
         },
         "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
         "ExportCreationTime": 1568847801.418,
         "ExportId": "ADR2ONPKN5LINYGb4dp7yZ",
         "InclusiveStartTime": 1568764800.0,
         "ExclusiveEndTime": 1568847599.0
      },
      {
      }
   ]
}
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see ListJournalS3Exports in AWS CLI Command Reference.

**list-ledgers**

The following code example shows how to use list-ledgers.

**AWS CLI**

**To list your available ledgers**

The following list-ledgers example lists all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-ledgers
```

**Output:**

```
{
   "Ledgers": [
   {
      "State": "ACTIVE",
      "CreationDateTime": 1568839243.951,
```
For more information, see [Basic Operations for Amazon QLDB Ledgers](https://docs.aws.amazon.com/qldb/latest/devguide/) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListLedgers](https://docs.aws.amazon.com/cli/latest/reference/qldb/list-ledgers.html) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags attached to a ledger**

The following `list-tags-for-resource` example lists all tags attached to the specified ledger.

```bash
aws qldb list-tags-for-resource \
```

**Output:**

```json
{
  "Tags": {
    "IsTest": "true",
    "Domain": "Test"
  }
}
```

For more information, see [Tagging Amazon QLDB Resources](https://docs.aws.amazon.com/qldb/latest/devguide/) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/qldb/list-tags-for-resource.html) in *AWS CLI Command Reference*. 
stream-journal-to-kinesis

The following code example shows how to use stream-journal-to-kinesis.

AWS CLI

Example 1: To stream journal data to Kinesis Data Streams using input files

The following stream-journal-to-kinesis example creates a stream of journal data within a specified date and time range from a ledger with the name myExampleLedger. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qldb stream-journal-to-kinesis \
    --ledger-name myExampleLedger \
    --inclusive-start-time 2020-05-29T00:00:00Z \
    --exclusive-end-time 2020-05-29T23:59:59Z \
    --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \
    --kinesis-configuration file://my-kinesis-config.json \
    --stream-name myExampleLedger-stream
```

Contents of `my-kinesis-config.json`:

```
{
    "AggregationEnabled": true
}
```

Output:

```
{
    "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the Amazon QLDB Developer Guide.

Example 2: To stream journal data to Kinesis Data Streams using shorthand syntax

The following stream-journal-to-kinesis example creates a stream of journal data within a specified date and time range from a ledger with the name myExampleLedger. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qldb stream-journal-to-kinesis --ledger-name myExampleLedger --stream-name myExampleLedger-stream
```
aws qldb stream-journal-to-kinesis \
   --ledger-name myExampleLedger \
   --inclusive-start-time 2020-05-29T00:00:00Z \
   --exclusive-end-time 2020-05-29T23:59:59Z \
   --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \
   --stream-name myExampleLedger-stream \

Output:

```json
{
   "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see StreamJournalToKinesis in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a ledger**

The following tag-resource example adds a set of tags to a specified ledger.

```bash
aws qldb tag-resource \
   --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
   --tags IsTest=true,Domain=Test
```

This command produces no output.

For more information, see Tagging Amazon QLDB Resources in the Amazon QLDB Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a resource

The following untag-resource example removes tags with the specified tag keys from a specified ledger.

```bash
aws qldb untag-resource \
   --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
   --tag-keys IsTest Domain
```

This command produces no output.

For more information, see Tagging Amazon QLDB Resources in the Amazon QLDB Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-ledger-permissions-mode

The following code example shows how to use update-ledger-permissions-mode.

AWS CLI

Example 1: To update the permissions mode of a ledger to STANDARD

The following update-ledger-permissions-mode example assigns the STANDARD permissions mode to the specified ledger.

```bash
aws qldb update-ledger-permissions-mode \
   --name myExampleLedger \
   --permissions-mode STANDARD
```

Output:

```
{
   "Name": "myExampleLedger",
   "PermissionsMode": "STANDARD"
}
```
Example 2: To update the permissions mode of a ledger to ALLOW_ALL

The following update-ledger-permissions-mode example assigns the ALLOW_ALL permissions mode to the specified ledger.

```
aws qldb update-ledger-permissions-mode \
  --name myExampleLedger \
  --permissions-mode ALLOW_ALL
```

Output:

```
{
  "Name": "myExampleLedger",
  "PermissionsMode": "ALLOW_ALL"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see UpdateLedgerPermissionsMode in AWS CLI Command Reference.

update-ledger

The following code example shows how to use update-ledger.

AWS CLI

Example 1: To update the deletion protection property of a ledger

The following update-ledger example updates the specified ledger to disable the deletion protection feature.

```
aws qldb update-ledger \
  --name myExampleLedger \
  --no-deletion-protection
```

Output:

```
{
}
```
Example 2: To update the AWS KMS key of a ledger to a customer managed key

The following `update-ledger` example updates the specified ledger to use a customer managed KMS key for encryption at rest.

```
aws qldb update-ledger \
  --name myExampleLedger \
  --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-example11111
```

Output:

```
{
  "CreationDateTime": 1568839243.951,
  "DeletionProtection": false,
  "Name": "myExampleLedger",
  "State": "ACTIVE",
  "EncryptionDescription": {
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-example11111",
    "EncryptionStatus": "UPDATING"
  }
}
```

Example 3: To update the AWS KMS key of a ledger to an AWS owned key

The following `update-ledger` example updates the specified ledger to use an AWS owned KMS key for encryption at rest.

```
aws qldb update-ledger \
  --name myExampleLedger \
  --kms-key AWS_OWNED_KMS_KEY
```

Output:

```
For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see UpdateLedger in AWS CLI Command Reference.

Amazon RDS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**add-option-to-option-group**

The following code example shows how to use add-option-to-option-group.
To add an option to an option group

The following add-option-to-option-group example adds an option to the specified option group.

```
aws rds add-option-to-option-group \
    --option-group-name myoptiongroup \
    --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test Option Group",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "12.1",
        "Options": [
            {
                "OptionName": "Timezone",
                "OptionDescription": "Change time zone",
                "Persistent": true,
                "Permanent": false,
                "OptionSettings": [
                    {
                        "Name": "TIME_ZONE",
                        "Value": "Australia/Sydney",
                        "DefaultValue": "UTC",
                        "Description": "Specifies the timezone the user wants to change the system time to",
                        "ApplyType": "DYNAMIC",
                        "DataType": "STRING",

add-role-to-db-cluster

The following code example shows how to use add-role-to-db-cluster.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB cluster

The following add-role-to-db-cluster example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \
  --db-cluster-identifier mydbcluster \
  --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the Amazon Aurora User Guide.

- For API details, see AddRoleToDbCluster in AWS CLI Command Reference.

add-role-to-db-instance

The following code example shows how to use add-role-to-db-instance.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following add-role-to-db-instance example adds the role to an Oracle DB instance named test-instance.

```
aws rds add-role-to-db-instance \
  --db-instance-identifier test-instance \
  --feature-name S3_INTEGRATION \
  --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.
For more information, see Prerequisites for Amazon RDS Oracle Integration with Amazon S3 in the Amazon RDS User Guide.

- For API details, see AddRoleToDbInstance in AWS CLI Command Reference.

add-source-identifier-to-subscription

The following code example shows how to use add-source-identifier-to-subscription.

**AWS CLI**

To add a source identifier to a subscription

The following add-source-identifier example adds another source identifier to an existing subscription.

```
aws rds add-source-identifier-to-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
   "EventSubscription": {
       "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
       "CustSubscriptionId": "my-instance-events",
       "Enabled": false,
       "Status": "modifying",
       "EventCategoriesList": [
           "backup",
           "recovery"
       ],
       "CustomerAwsId": "123456789012",
       "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
       "SourceType": "db-instance",
       "SourceIdsList": [
           "test-instance",
           "test-instance-repl"
       ]
   }
}```
• For API details, see AddSourceIdentifierToSubscription in AWS CLI Command Reference.

add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

To add tags to a resource

The following add-tags-to-resource example add tags to an RDS database.

```bash
aws rds add-tags-to-resource \
   --resource-name arn:aws:rds:us-east-1:123456789012:db:database-mysql \
   --tags "[{"Key": \"Name\",\"Value\": \"MyDatabase\"},{\"Key\": \"Environment\",\"Value\": \"test\"]}"
```

This command produces no output.

For more information, see Tagging Amazon RDS Resources in the Amazon RDS User Guide.
• For API details, see AddTagsToResource in AWS CLI Command Reference.

apply-pending-maintenance-action

The following code example shows how to use apply-pending-maintenance-action.

AWS CLI

To apply pending maintenance actions

The following apply-pending-maintenance-action example applies the pending maintenance actions for a DB cluster.

```bash
aws rds apply-pending-maintenance-action \
   --resource-identifier arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster \
   --apply-action system-update \
   --opt-in-type immediate
```

Output:
For more information, see `Maintaining a DB instance` in the *Amazon RDS User Guide* and `Maintaining an Amazon Aurora DB cluster` in the *Amazon Aurora User Guide*.

- For API details, see `ApplyPendingMaintenanceAction` in *AWS CLI Command Reference*.

**authorize-db-security-group-ingress**

The following code example shows how to use `authorize-db-security-group-ingress`.

### AWS CLI

**To associate an AWS Identity and Access Management (IAM) role with a DB instance**

The following `authorize-db-security-group-ingress` example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```bash
aws rds authorize-db-security-group-ingress
   --db-security-group-name default
   --cidrip 192.0.2.0/24
```

**Output:**

```json
{
   "DBSecurityGroup": {
      "OwnerId": "123456789012",
      "OwnerName": "default",
      "DBSecurityGroupName": "default",
      "VpcId": "vpc-0123456789012",
      "EC2SecurityGroupName": "default",
      "EC2SecurityGroupOwnerId": "123456789012",
      "CIDRList": [
         "192.0.2.0/24",
         "192.0.3.0/24"
      ]
   }
}
```
"DBSecurityGroupDescription": "default",
"EC2SecurityGroups": [],
"IPRanges": [
    {
        "Status": "authorizing",
        "CIDRIP": "192.0.2.0/24"
    }
],
"DBSecurityGroupArn": "arn:aws:rds:us-east-1:111122223333:secgrp:default"
}

For more information, see Authorizing Network Access to a DB Security Group from an IP Range in the Amazon RDS User Guide.

- For API details, see AuthorizeDbSecurityGroupIngress in AWS CLI Command Reference.

backtrack-db-cluster

The following code example shows how to use backtrack-db-cluster.

AWS CLI

To backtrack an Aurora DB cluster

The following backtrack-db-cluster example backtracks the specified DB cluster sample-cluster to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster --db-cluster-identifier sample-cluster --backtrack-to 2018-03-19T10:00:00+00:00
```

This command outputs a JSON block that acknowledges the change to the RDS resource.

- For API details, see BacktrackDbCluster in AWS CLI Command Reference.

cancel-export-task

The following code example shows how to use cancel-export-task.

AWS CLI

To cancel a snapshot export to Amazon S3
The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```bash
aws rds cancel-export-task \
  --export-task-identifier my-s3-export-1
```

Output:

```
{
  "ExportTaskIdentifier": "my-s3-export-1",
  "SnapshotTime": "2019-03-24T20:01:09.815Z",
  "S3Bucket": "mybucket",
  "S3Prefix": "",
  "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",
  "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd0000-7bfd-4594-af38-aabbccddeeff",
  "Status": "CANCELING",
  "PercentProgress": 0,
  "TotalExtractedDataInGB": 0
}
```

For more information, see [Canceling a snapshot export task](https://docs.aws.amazon.com/rds/latest/userguide/MultiAZUpgrade.html) in the *Amazon RDS User Guide* or [Canceling a snapshot export task](https://docs.aws.amazon.com/aurora/latest/userguide/au-gs-upgrade-export.html) in the *Amazon Aurora User Guide*.

- For API details, see [CancelExportTask](https://docs.aws.amazon.com/cli/latest/reference/rds/cancel-export-task.html) in *AWS CLI Command Reference*.

### copy-db-cluster-parameter-group

The following code example shows how to use `copy-db-cluster-parameter-group`.

**AWS CLI**

**To copy a DB cluster parameter group**

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```bash
aws rds copy-db-cluster-parameter-group \
  --source-db-cluster-parameter-group-identifier mydbclusterpg \
```
--target-db-cluster-parameter-group-identifier mydbclusterpgcopy \
--target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter group"

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterpgcopy",
        "DBParameterGroupFamily": "aurora-mysql5.7",
        "Description": "Copy of mydbclusterpg parameter group"
    }
}
```

For more information, see Copying a DB Cluster Parameter Group in the Amazon Aurora Users Guide.

- For API details, see CopyDbClusterParameterGroup in AWS CLI Command Reference.

**copy-db-cluster-snapshot**

The following code example shows how to use copy-db-cluster-snapshot.

**AWS CLI**

**To copy a DB cluster snapshot**

The following copy-db-cluster-snapshot example creates a copy of a DB cluster snapshot, including its tags.

```
aws rds copy-db-cluster-snapshot \
    --target-db-cluster-snapshot-identifier myclustersnapshotcopy \
    --copy-tags
```

Output:

```
{
}
```
For more information, see Copying a Snapshot in the Amazon Aurora User Guide.

- For API details, see CopyDbClusterSnapshot in AWS CLI Command Reference.

**copy-db-parameter-group**

The following code example shows how to use copy-db-parameter-group.

**AWS CLI**

To copy a DB cluster parameter group

The following copy-db-parameter-group example makes a copy of a DB parameter group.

```
aws rds copy-db-parameter-group \
```
copy-db-snapshot

The following code example shows how to use `copy-db-snapshot`.

**AWS CLI**

**To copy a DB snapshot**

The following `copy-db-snapshot` example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \
  --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38 \
  --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{
  "DBSnapshot": {
    "VpcId": "vpc-6594f31c",
    "Status": "creating",
    "Encrypted": true,
  }
}
```
The following code example shows how to use `copy-option-group`.

**AWS CLI**

**To copy an option group**

The following `copy-option-group` example makes a copy of an option group.

```bash
aws rds copy-option-group \
   --source-option-group-identifier myoptiongroup \
   --target-option-group-identifier new-option-group \
   --target-option-group-description "My option group copy"
```

For more information, see [Copying a Snapshot](https://docs.aws.amazon.com/AmazonRDS/UserGuide/DBInstances.Instances.html) in the *Amazon RDS User Guide*.

- For API details, see [CopyDbSnapshot](https://boto3.amazonaws.com/v1/documentation/api/latest/reference/services/rds.html#rds.Client.copy_snapshot) in *AWS CLI Command Reference*.
Output:

```

{
    "OptionGroup": {
        "Options": [],
        "OptionGroupName": "new-option-group",
        "MajorEngineVersion": "11.2",
        "OptionGroupDescription": "My option group copy",
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "EngineName": "oracle-ee",
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:new-option-group"
    }
}
```

For more information, see [Making a Copy of an Option Group](http://amazonaws.com) in the *Amazon RDS User Guide*.

- For API details, see [CopyOptionGroup](https://aws.amazon.com) in *AWS CLI Command Reference*.

### create-blue-green-deployment

The following code example shows how to use `create-blue-green-deployment`.

**AWS CLI**

**Example 1: To create a blue/green deployment for an RDS for MySQL DB instance**

The following `create-blue-green-deployment` example creates a blue/green deployment for a MySQL DB instance.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name bgd-cli-test-instance \
    --source arn:aws:rds:us-east-1:123456789012:db:my-db-instance \
    --target-engine-version 8.0 \
    --target-db-parameter-group-name mysql-80-group
```

**Output:**

```

{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
```

---

**Actions and scenarios**

5032
For more information, see [Creating a blue/green deployment](#) in the *Amazon RDS User Guide*.

**Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster**
The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name my-blue-green-deployment \
    --source arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster \
    --target-engine-version 8.0 \
    --target-db-cluster-parameter-group-name ams-80-binlog-enabled \
    --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
                "Status": "PROVISIONING"
            },
            {
                "Status": "PROVISIONING"
            },
            {
                "Status": "PROVISIONING"
            },
            {
                "Status": "PROVISIONING"
            },
            {
                "Status": "PROVISIONING"
            }
        ]
    }
}
```

For more information, see [Creating a blue/green deployment](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/USER_MigrateDBCluster.html) in the Amazon Aurora User Guide.

- For API details, see [CreateBlueGreenDeployment](https://docs.aws.amazon.com/cli/latest/index.html) in AWS CLI Command Reference.

**create-db-cluster-endpoint**

The following code example shows how to use `create-db-cluster-endpoint`.

**AWS CLI**

To create a custom DB cluster endpoint
The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```bash
aws rds create-db-cluster-endpoint \
  --db-cluster-endpoint-identifier mycustomendpoint \
  --endpoint-type reader \
  --db-cluster-identifier mydbcluster \
  --static-members dbinstance1 dbinstance2
```

Output:

```json
{
  "DBClusterEndpointIdentifier": "mycustomendpoint",
  "DBClusterIdentifier": "mydbcluster",
  "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
  "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
  "Status": "creating",
  "EndpointType": "CUSTOM",
  "CustomEndpointType": "READER",
  "StaticMembers": [
    "dbinstance1",
    "dbinstance2"
  ],
  "ExcludedMembers": [],
  "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the Amazon Aurora User Guide.

- For API details, see CreateDbClusterEndpoint in AWS CLI Command Reference.

create-db-cluster-parameter-group

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create a DB cluster parameter group
The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```bash
aws rds create-db-cluster-parameter-group \
   --db-cluster-parameter-group-name mydbclusterparametergroup \
   --db-parameter-group-family aurora5.6 \
   --description "My new cluster parameter group"
```

Output:

```json
{
   "DBClusterParameterGroup": {
      "DBClusterParameterGroupName": "mydbclusterparametergroup",
      "DBParameterGroupFamily": "aurora5.6",
      "Description": "My new cluster parameter group",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-pg:mydbclusterparametergroup"
   }
}
```

For more information, see [Creating a DB Cluster Parameter Group](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/AmazonAuroraCLI.html) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

### create-db-cluster-snapshot

The following code example shows how to use `create-db-cluster-snapshot`.

**AWS CLI**

**To create a DB cluster snapshot**

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```bash
aws rds create-db-cluster-snapshot \
   --db-cluster-identifier mydbcluster \
   --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```json
{
}
```
"DBClusterSnapshot": {
    "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1e"
    ],
    "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
    "DBClusterIdentifier": "mydbcluster",
    "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
    "Engine": "aurora-mysql",
    "AllocatedStorage": 1,
    "Status": "creating",
    "Port": 0,
    "VpcId": "vpc-6594f31c",
    "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
    "MasterUsername": "myadmin",
    "EngineVersion": "5.7.mysql_aurora.2.04.2",
    "LicenseModel": "aurora-mysql",
    "SnapshotType": "manual",
    "PercentProgress": 0,
    "StorageEncrypted": true,
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
    "IAMDatabaseAuthenticationEnabled": false
}

For more information, see [Creating a DB Cluster Snapshot](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/Overview.rds-creating-dbsnapshot.html) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-cluster-snapshot.html) in *AWS CLI Command Reference*.

**create-db-cluster**

The following code example shows how to use `create-db-cluster`.

**AWS CLI**

**Example 1: To create a MySQL 5.7-compatible DB cluster**

The following `create-db-cluster` example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password.
When you use the console to create a DB cluster, Amazon RDS automatically creates the writer
DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine aurora-mysql \
    --engine-version 5.7 \
    --master-username admin \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "DBSubnetGroup": "default",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "AllocatedStorage": 1,
        "AssociatedRoles": [],
        "PreferredBackupWindow": "09:12-09:42",
        "ClusterCreateTime": "2023-02-27T23:21:33.048Z",
        "DeletionProtection": false,
        "IAMDatabaseAuthenticationEnabled": false,
        "ReadReplicaIdentifiers": [],
        "EngineMode": "provisioned",
        "Engine": "aurora-mysql",
        "StorageEncrypted": false,
        "MultiAZ": false,
        "PreferredMaintenanceWindow": "mon:04:31-mon:05:01",
        "HttpEndpointEnabled": false,
        "BackupRetentionPeriod": 1,
        "DbClusterResourceId": "cluster-ANPAJ4AE5446DAAEXAMPLE",
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
```
Example 2: To create a PostgreSQL-compatible DB cluster

The following `create-db-cluster` example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```bash
aws rds create-db-cluster \
  --db-cluster-identifier sample-pg-cluster \
  --engine aurora-postgresql \
  --master-username master \
  --master-user-password secret99 \
  --db-subnet-group-name default \
  --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```json
{
  "DBCluster": {
    "Endpoint": "sample-pg-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
    "HttpEndpointEnabled": false,
    "DBClusterMembers": [],
    "CopyTagsToSnapshot": false
  }
}
```

   "us-east-1b",
   "us-east-1c"
],
"Read Replica Identifiers": [],
"DBSubnetGroup": "default"
}
}

For more information, see Creating an Amazon Aurora DB cluster in the Amazon Aurora User Guide.
create-db-instance-read-replica

The following code example shows how to use `create-db-instance-read-replica`.

AWS CLI

**To create a DB instance read replica**

This example creates a read replica of an existing DB instance named `test-instance`. The read replica is named `test-instance-repl`.

```bash/aws rds create-db-instance-read-replica \
   --db-instance-identifier test-instance-repl \
   --source-db-instance-identifier test-instance
```

Output:

```json
{
   "DBInstance": {
      "IAMDatabaseAuthenticationEnabled": false,
      "MonitoringInterval": 0,
      "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
      "DBInstanceIdentifier": "test-instance-repl",
      ...
   }
}
```

• For API details, see CreateDbInstanceReadReplica in AWS CLI Command Reference.

create-db-instance

The following code example shows how to use `create-db-instance`.

AWS CLI

**To create a DB instance**

The following `create-db-instance` example uses the required options to launch a new DB instance.
aws rds create-db-instance \
  --db-instance-identifier test-mysql-instance \
  --db-instance-class db.t3.micro \
  --engine mysql \
  --master-username admin \
  --master-user-password secret99 \
  --allocated-storage 20

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "test-mysql-instance",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "creating",
    "MasterUsername": "admin",
    "AllocatedStorage": 20,
    "PreferredBackupWindow": "12:55-13:25",
    "BackupRetentionPeriod": 1,

}
}

For more information, see Creating an Amazon RDS DB Instance in the Amazon RDS User Guide.

- For API details, see CreateDBInstance in AWS CLI Command Reference.

create-db-parameter-group

The following code example shows how to use create-db-parameter-group.

AWS CLI

To create a DB parameter group

The following create-db-parameter-group example creates a DB parameter group.

aws rds create-db-parameter-group \ 
   --db-parameter-group-name mydbparametergroup \ 
   --db-parameter-group-family MySQL5.6 \ 
   --description "My new parameter group"

Output:

{
   "DBParameterGroup": {
      "DBParameterGroupName": "mydbparametergroup",
      "DBParameterGroupFamily": "mysql5.6",
      "Description": "My new parameter group",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:mydbparametergroup"}
create-db-proxy-endpoint

The following code example shows how to use create-db-proxy-endpoint.

AWS CLI

To create a DB proxy endpoint for an RDS database

The following create-db-proxy-endpoint example creates a DB proxy endpoint.

```bash
aws rds create-db-proxy-endpoint \
   --db-proxy-name proxyExample \
   --db-proxy-endpoint-name "proxyep1" \
   --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```json
{
   "DBProxyEndpoint": {
      "DBProxyEndpointName": "proxyep1",
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
      "DBProxyName": "proxyExample",
      "Status": "creating",
      "VpcId": "vpc-1234567",
      "VpcSecurityGroupIds": ["sg-1234", "sg-5678"],
      "VpcSubnetIds": ["subnetgroup1", "subnetgroup2"],
      "Endpoint": "proxyep1.endpoint.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
   }
}
```
For more information, see Creating a proxy endpoint in the Amazon RDS User Guide and Creating a proxy endpoint in the Amazon Aurora User Guide.

- For API details, see CreateDbProxyEndpoint in AWS CLI Command Reference.

cREATE-DB-PROXY

The following code example shows how to use create-db-proxy.

AWS CLI

To create a DB proxy for an RDS database

The following create-db-proxy example creates a DB proxy.

```bash
aws rds create-db-proxy \
   --db-proxy-name proxyExample \
   --engine-family MYSQL \
   --auth Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-west-2:123456789123:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQL_NATIVE_PASSWORD" \
   --role-arn arn:aws:iam::123456789123:role/ProxyRole \
   --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
   "DBProxy": {
       "DBProxyName": "proxyExample",
       "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
       "EngineFamily": "MYSQL",
       "VpcId": "vpc-1234567",
       "VpcSecuritytGroupIds": [
           "sg-1234",
           "sg-5678",
           "sg-9101"
       ]
   }
}
```
For more information, see Creating an RDS Proxy in the Amazon RDS User Guide and Creating an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see CreateDbProxy in AWS CLI Command Reference.

create-db-security-group

The following code example shows how to use create-db-security-group.

AWS CLI

To create an Amazon RDS DB security group

The following create-db-security-group command creates a new Amazon RDS DB security group:

```
aws rds create-db-security-group --db-security-group-name mysecgroup --db-security-group-description "My Test Security Group"
```
In the example, the new DB security group is named mysecgroup and has a description.

Output:

```json
{
   "DBSecurityGroup": {
      "OwnerId": "123456789012",
      "DBSecurityGroupName": "mysecgroup",
      "DBSecurityGroupDescription": "My Test Security Group",
      "VpcId": "vpc-a1b2c3d4",
      "EC2SecurityGroups": [],
      "IPRanges": [],
   }
}
```

- For API details, see `CreateDbSecurityGroup` in *AWS CLI Command Reference*.

### create-db-shard-group

The following code example shows how to use `create-db-shard-group`.

**AWS CLI**

**Example 1: To create an Aurora PostgreSQL primary DB cluster**

The following `create-db-cluster` example creates an Aurora PostgreSQL SQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database.

```bash
aws rds create-db-cluster \
   --db-cluster-identifier my-sv2-cluster \
   --engine aurora-postgresql \
   --engine-version 15.2-limitless \
   --storage-type aurora-iopt1 \
   --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \
   --enable-limitless-database \
   --master-username myuser \
   --master-user-password mypassword \
   --enable-cloudwatch-logs-exports postgresql
```

**Output:**

Actions and scenarios
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-2b",
            "us-east-2c",
            "us-east-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "my-sv2-cluster",
        "DBClusterParameterGroup": "default.aurora-postgresql15",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "my-sv2-cluster.cluster-cekycexample.us-east-2.rds.amazonaws.com",
        "ReaderEndpoint": "my-sv2-cluster.cluster-ro-cekycexample.us-east-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "15.2-limitless",
        "Port": 5432,
        "MasterUsername": "myuser",
        "PreferredBackupWindow": "06:05-06:35",
        "PreferredMaintenanceWindow": "mon:08:25-mon:08:55",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z2XHWR1EXAMPLE",
        "StorageEncrypted": false,
        "DBClusterResourceId": "cluster-XYEDT6ML6FHIXH4Q2J1EXAMPLE",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": false,
        "ClusterCreateTime": "2024-02-19T16:24:07.771000+00:00",
        "EnabledCloudwatchLogsExports": [
            "postgresql"
        ],
        "EngineMode": "provisioned",
    }
}
Example 2: To create the primary (writer) DB instance

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-instance \
  --db-instance-identifier my-sv2-instance \
  --db-cluster-identifier my-sv2-cluster \
  --engine aurora-postgresql \
  --db-instance-class db.serverless
```

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "my-sv2-instance",
    "DBInstanceClass": "db.serverless",
```
"Engine": "aurora-postgresql",
"DBInstanceStatus": "creating",
"MasterUsername": "myuser",
"AllocatedStorage": 1,
"PreferredBackupWindow": "06:05-06:35",
"BackupRetentionPeriod": 1,
"DBSecurityGroups": [],
"VpcSecurityGroups": [
    {
        "VpcSecurityGroupId": "sg-########",
        "Status": "active"
    }
],
"DBParameterGroups": [
    {
        "DBParameterGroupName": "default.aurora-postgresql15",
        "ParameterApplyStatus": "in-sync"
    }
],
"DBSubnetGroup": {
    "DBSubnetGroupName": "default",
    "DBSubnetGroupDescription": "default",
    "VpcId": "vpc-########",
    "SubnetGroupStatus": "Complete",
    "Subnets": [
        {
            "SubnetIdentifier": "subnet-########",
            "SubnetAvailabilityZone": {
                "Name": "us-east-2c"
            },
            "SubnetOutpost": {},
            "SubnetStatus": "Active"
        },
        {
            "SubnetIdentifier": "subnet-########",
            "SubnetAvailabilityZone": {
                "Name": "us-east-2a"
            },
            "SubnetOutpost": {},
            "SubnetStatus": "Active"
        },
        {
            "SubnetIdentifier": "subnet-########",
            "SubnetAvailabilityZone": {
                "Name": "us-east-2c"
            },
            "SubnetOutpost": {},
            "SubnetStatus": "Active"
        }
    ]
}
"Name": "us-east-2b",
   "SubnetOutpost": {},
   "SubnetStatus": "Active"
}

"PreferredMaintenanceWindow": "fri:09:01-fri:09:31",
"PendingModifiedValues": {
   "PendingCloudwatchLogsExports": {

"TagList": [],
"CustomerOwnedIpEnabled": false,
Example 3: To create the DB shard group

The following create-db-shard-group example creates a DB shard group in your Aurora PostgreSQL primary DB cluster.

```bash
aws rds create-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --db-cluster-identifier my-sv2-cluster \
    --max-acu 768
```

Output:

```json
{
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "creating",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
}
```

For more information, see [Using Aurora Serverless v2](https://docs.aws.amazon.com/aurora/latest/userguide/serverless.html) in the [Amazon Aurora User Guide](https://docs.aws.amazon.com/aurora/latest/userguide/).  

**create-db-snapshot**

The following code example shows how to use `create-db-snapshot`.
AWS CLI

To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```bash
aws rds create-db-snapshot \
    --db-instance-identifier database-mysql \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```json
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "creating",
        "Port": 3306,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",
        "LicenseModel": "general-public-license",
        "SnapshotType": "manual",
        "Iops": 1000,
        "OptionGroupName": "default:mysql-5-6",
        "PercentProgress": 0,
        "StorageType": "io1",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see [Creating a DB Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/rds-create-db-snapshot.html) in the Amazon RDS User Guide.

- For API details, see [CreateDBSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-snapshot.html) in AWS CLI Command Reference.
create-db-subnet-group

The following code example shows how to use create-db-subnet-group.

AWS CLI

To create a DB subnet group

The following create-db-subnet-group example creates a DB subnet group called mysubnetgroup using existing subnets.

```bash
aws rds create-db-subnet-group \
   --db-subnet-group-name mysubnetgroup \
   --db-subnet-group-description "test DB subnet group" \
   --subnet-ids \
   ['"subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaa","subnet-00f5b198bc0abcdef"]
```

Output:

```json
{
   "DBSubnetGroup": {
      "DBSubnetGroupName": "mysubnetgroup",
      "DBSubnetGroupDescription": "test DB subnet group",
      "VpcId": "vpc-0f08e7610a1b2c3d4",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-070dd7ecb3aaaaaa",
            "SubnetAvailabilityZone": {
               "Name": "us-west-2b"
            },
            "SubnetStatus": "Active"
         },
         {
            "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
            "SubnetAvailabilityZone": {
               "Name": "us-west-2d"
            },
            "SubnetStatus": "Active"
         },
         {
            "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
            "SubnetAvailabilityZone": {
```
For more information, see [Creating a DB Instance in a VPC](#) in the *Amazon RDS User Guide*.

- For API details, see [CreateDbSubnetGroup](#) in *AWS CLI Command Reference*.

### create-event-subscription

The following code example shows how to use `create-event-subscription`.

**AWS CLI**

**To create an event subscription**

The following `create-event-subscription` example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by `--sns-topic-arn`.

```bash
aws rds create-event-subscription
   --subscription-name my-instance-events
   --source-type db-instance
   --event-categories '["backup","recovery"]'
   --sns-topic-arn arn:aws:sns:us-east-1:123456789012:interesting-events
```

**Output:**

```json
{
   "EventSubscription": {
      "Status": "creating",
      "CustSubscriptionId": "my-instance-events",
      "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
      "EventCategoriesList": [
         "backup",
         "recovery"
      ],
```
• For API details, see `CreateEventSubscription` in *AWS CLI Command Reference*.

**create-global-cluster**

The following code example shows how to use `create-global-cluster`.

**AWS CLI**

**To create a global DB cluster**

The following `create-global-cluster` example creates a new Aurora MySQL-compatible global DB cluster.

```
aws rds create-global-cluster \
  --global-cluster-identifier myglobalcluster \
  --engine aurora-mysql
```

Output:

```
{
  "GlobalCluster": {
    "GlobalClusterIdentifier": "myglobalcluster",
    "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
    "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
    "Status": "available",
    "Engine": "aurora-mysql",
    "EngineVersion": "5.7.mysql_aurora.2.07.2",
    "StorageEncrypted": false,
    "DeletionProtection": false,
    "GlobalClusterMembers": []
  }
}
```
For more information, see Creating an Aurora global database in the Amazon Aurora User Guide.

- For API details, see CreateGlobalCluster in AWS CLI Command Reference.

**create-option-group**

The following code example shows how to use create-option-group.

**AWS CLI**

**To Create an Amazon RDS option group**

The following create-option-group command creates a new Amazon RDS option group for Oracle Enterprise Edition version 11.2`, is named `MyOptionGroup and includes a description.

```bash
aws rds create-option-group \
   --option-group-name MyOptionGroup \
   --engine-name oracle-ee \
   --major-engine-version 11.2 \
   --option-group-description "Oracle Database Manager Database Control"
```

Output:

```json
{
   "OptionGroup": {
      "OptionGroupName": "myoptiongroup",
      "OptionGroupDescription": "Oracle Database Manager Database Control",
      "EngineName": "oracle-ee",
      "MajorEngineVersion": "11.2",
      "Options": [],
      "AllowsVpcAndNonVpcInstanceMemberships": true,
   }
}
```

- For API details, see CreateOptionGroup in AWS CLI Command Reference.

**delete-blue-green-deployment**

The following code example shows how to use delete-blue-green-deployment.
**Example 1: To delete resources in green environment for an RDS for MySQL DB instance**

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \\
   --blue-green-deployment-identifier bgd-v53303651eexfake \\
   --delete-target
```

**Output:**

```json
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
      "BlueGreenDeploymentName": "bgd-cli-test-instance",
      "SwitchoverDetails": [
         {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-rkfbpe",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-replica-1-green-j382ha",
            "Status": "AVAILABLE"
         },
         {
            "Status": "AVAILABLE"
         }
      ]
   }
}
```
For more information, see Deleting a blue/green deployment in the Amazon RDS User Guide.

Example 2: To delete resources in green environment for an Aurora MySQL DB cluster

The following delete-blue-green-deployment example deletes the resources in a green environment for an Aurora MySQL DB cluster.

```
aws rds delete-blue-green-deployment \  
  --blue-green-deployment-identifier bgd-wi89nwzglccsfake \  
  --delete-target
```

Output:
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3rnukl",

}

```

For more information, see [Deleting a blue/green deployment](https://docs.aws.amazon.com/Aurora/latest/UserGuide/UG-deleting-bluegreen.html) in the Amazon Aurora User Guide.

- For API details, see [DeleteBlueGreenDeployment](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-blue-green-deployment.html) in AWS CLI Command Reference.

### delete-db-cluster-endpoint

The following code example shows how to use `delete-db-cluster-endpoint`.

#### AWS CLI

To delete a custom DB cluster endpoint
The following delete-db-cluster-endpoint example deletes the specified custom DB cluster endpoint.

```
aws rds delete-db-cluster-endpoint \\
   --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```json
{
   "DBClusterEndpointIdentifier": "mycustomendpoint",
   "DBClusterIdentifier": "mydbcluster",
   "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
   "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
   "Status": "deleting",
   "EndpointType": "CUSTOM",
   "CustomEndpointType": "READER",
   "StaticMembers": [
      "dbinstance1",
      "dbinstance2",
      "dbinstance3"
   ],
   "ExcludedMembers": [],
   "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the Amazon Aurora User Guide.

- For API details, see DeleteDbClusterEndpoint in AWS CLI Command Reference.

**delete-db-cluster-parameter-group**

The following code example shows how to use delete-db-cluster-parameter-group.

**AWS CLI**

To delete a DB cluster parameter group

The following delete-db-cluster-parameter-group example deletes the specified DB cluster parameter group.
aws rds delete-db-cluster-parameter-group \
   --db-cluster-parameter-group-name mydbclustercannotgroupp
For more information, see [Deleting a Snapshot](https://docs.aws.amazon.com/AmazonAurora/latest/AuroraUserGuide/chap_amazonaurora_management.html) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-cluster-snapshot.html) in *AWS CLI Command Reference*.

**delete-db-cluster**

The following code example shows how to use `delete-db-cluster`.

### AWS CLI

**Example 1: To delete a DB instance in a DB cluster**

The following `delete-db-instance` example deletes the final DB instance in a DB cluster. You can't delete a DB cluster if it contains DB instances that aren't in the deleting state. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```bash
aws rds delete-db-instance \
    --db-instance-identifier database-3
```

**Output:**

```json
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-3",
        "DBInstanceClass": "db.r4.large",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "deleting",
```
For more information, see Deleting a DB Instance in an Aurora DB Cluster in the Amazon Aurora User Guide.

Example 2: To delete a DB cluster

The following delete-db-cluster example deletes the DB cluster named mycluster and takes a final snapshot named mycluster-final-snapshot. The status of the DB cluster is available while the snapshot is being taken. To follow the progress of the deletion, use the describe-db-clusters CLI command.

```bash
aws rds delete-db-cluster \\
--db-cluster-identifier mycluster \\
--no-skip-final-snapshot \\
--final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "mycluster",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default-vpc-aa11bb22",
        "Status": "available",
        ...output omitted...
    }
}
```
For more information, see Aurora Clusters with a Single DB Instance in the Amazon Aurora User Guide.

- For API details, see DeleteDbCluster in AWS CLI Command Reference.

delete-db-instance-automated-backup

The following code example shows how to use delete-db-instance-automated-backup.

AWS CLI

To delete a replicated automated backup from a Region

The following delete-db-instance-automated-backup example deletes the automated backup with the specified Amazon Resource Name (ARN).

aws rds delete-db-instance-automated-backup \
   --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"

Output:

```json
{
   "DBInstanceAutomatedBackup": {
      "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
      "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
      "Region": "us-east-1",
      "DBInstanceIdentifier": "new-orcl-db",
      "RestoreWindow": {},
      "AllocatedStorage": 20,
      "Status": "deleting",
      "Port": 1521,
      "AvailabilityZone": "us-east-1b",
      "VpcId": "vpc-########",
      "InstanceCreateTime": "2020-12-04T15:28:31Z",
      "MasterUsername": "admin",
      "Engine": "oracle-se2",
      "EngineVersion": "12.1.0.2.v21",
      "LicenseModel": "bring-your-own-license",
      "OptionGroupName": "default:oracle-se2-12-1",
      "Encrypted": false,
      "StorageType": "gp2",
```
"IAMDatabaseAuthenticationEnabled": false,
"BackupRetentionPeriod": 7,
"DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrkttni2bn4example"
}
}

For more information, see Deleting replicated backups in the Amazon RDS User Guide.

- For API details, see DeleteDbInstanceAutomatedBackup in AWS CLI Command Reference.

**delete-db-instance**

The following code example shows how to use delete-db-instance.

**AWS CLI**

**To delete a DB instance**

The following delete-db-instance example deletes the specified DB instance after creating a final DB snapshot named test-instance-final-snap.

```bash
aws rds delete-db-instance \
   --db-instance-identifier test-instance \
   --final-db-snapshot-identifier test-instance-final-snap
```

**Output:**

```json
{
   "DBInstance": {
      "DBInstanceIdentifier": "test-instance",
      "DBInstanceStatus": "deleting",
      ...some output truncated...
   }
}
```

- For API details, see DeleteDBInstance in AWS CLI Command Reference.

**delete-db-parameter-group**

The following code example shows how to use delete-db-parameter-group.
AWS CLI

To delete a DB parameter group

The following command example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \\
   --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups in the Amazon RDS User Guide.

• For API details, see DeleteDBParameterGroup in AWS CLI Command Reference.

delete-db-proxy-endpoint

The following code example shows how to use delete-db-proxy-endpoint.

AWS CLI

To delete a DB proxy endpoint for an RDS database

The following delete-db-proxy-endpoint example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \\
   --db-proxy-endpoint-name proxyEP1
```

Output:

```json
{
   "DBProxyEndpoint":
   {
      "DBProxyEndpointName": "proxyEP1",
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
      "DBProxyName": "proxyExample",
      "Status": "deleting",
      "VpcId": "vpc-1234567",
      "VpcSecurityGroupIds": [
         "sg-1234",
      ]
   }
}
```
For more information, see Deleting a proxy endpoint in the Amazon RDS User Guide and Deleting a proxy endpoint in the Amazon Aurora User Guide.

- For API details, see DeleteDbProxyEndpoint in AWS CLI Command Reference.

**delete-db-proxy**

The following code example shows how to use delete-db-proxy.

**AWS CLI**

**To delete a DB proxy for an RDS database**

The following delete-db-proxy example deletes a DB proxy.

```bash
aws rds delete-db-proxy \
   --db-proxy-name proxyExample
```

**Output:**

```json
{
   "DBProxy": {
      "DBProxyName": "proxyExample",
      "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
      "Status": "deleting",
      "EngineFamily": "PostgreSQL",
   }
}
```
For more information, see Deleting an RDS Proxy in the Amazon RDS User Guide and Deleting an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DeleteDbProxy in AWS CLI Command Reference.

**delete-db-security-group**

The following code example shows how to use delete-db-security-group.

**AWS CLI**

**To delete a DB security group**

The following delete-db-security-group example deletes a DB security group named mysecuritygroup.
aws rds delete-db-security-group \
   --db-security-group-name mysecuritygroup

This command produces no output.

For more information, see Working with DB security groups (EC2-Classic platform) in the Amazon RDS User Guide.

- For API details, see DeleteDbSecurityGroup in AWS CLI Command Reference.

delete-db-shard-group

The following code example shows how to use delete-db-shard-group.

AWS CLI

Example 1: To delete a DB shard group unsuccessfully

The following delete-db-shard-group example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

```bash
aws rds delete-db-shard-group \
   --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup operation: Unable to delete the DB shard group limitless-test-db-shard-group. Delete all of your Limitless Database databases and schemas, then try again.
```

Example 2: To delete a DB shard group successfully

The following delete-db-shard-group example deletes a DB shard group after you've deleted all of your databases and schemas, including the public schema.

```bash
aws rds delete-db-shard-group \
   --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
{
```
For more information, see Deleting Aurora DB clusters and DB instances in the Amazon Aurora User Guide.

- For API details, see DeleteDbShardGroup in AWS CLI Command Reference.

**delete-db-snapshot**

The following code example shows how to use delete-db-snapshot.

**AWS CLI**

To delete a DB snapshot

The following delete-db-snapshot example deletes the specified DB snapshot.

```bash
aws rds delete-db-snapshot \
   --db-snapshot-identifier mydbsnapshot
```

Output:

```json
{
   "DBSnapshot": {
      "DBSnapshotIdentifier": "mydbsnapshot",
      "DBInstanceIdentifier": "database-mysql",
      "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",
      "Engine": "mysql",
      "AllocatedStorage": 100,
      "Status": "deleted",
      "Port": 3306,
      "AvailabilityZone": "us-east-1b",
      "VpcId": "vpc-6594f31c",
      "InstanceCreateTime": "2019-04-30T15:45:53.663Z"
   }
}
```
For more information, see [Deleting a Snapshot](https://docs.aws.amazon.com/rds/latest/userguide/RDS.DeleteSnapshot.html) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-snapshot.html) in *AWS CLI Command Reference*.

### delete-db-subnet-group

The following code example shows how to use `delete-db-subnet-group`.

**AWS CLI**

**To delete a DB subnet group**

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see [Working with a DB Instance in a VPC](https://docs.aws.amazon.com/rds/latest/userguide/RDS.VPC.Debrief.html) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSubnetGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-subnet-group.html) in *AWS CLI Command Reference*.

### delete-event-subscription

The following code example shows how to use `delete-event-subscription`.
AWS CLI

To delete an event subscription

The following delete-event-subscription example deletes the specified event subscription.

```bash
data rds delete-event-subscription --subscription-name my-instance-events
```

Output:

```
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "Enabled": false,
      "SourceIdsList": [ "test-instance" ],
      "SourceType": "db-instance",
      "EventCategoriesList": [ "backup", "recovery" ],
      "CustSubscriptionId": "my-instance-events",
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
      "Status": "deleting"
   }
}
```

- For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

**delete-global-cluster**

The following code example shows how to use delete-global-cluster.

AWS CLI

To delete a global DB cluster
The following delete-global-cluster example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent describe-global-clusters commands don't list that DB cluster.

```bash
aws rds delete-global-cluster \
   --global-cluster-identifier myglobalcluster
```

Output:

```json
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Deleting an Aurora global database in the Amazon Aurora User Guide.

- For API details, see DeleteGlobalCluster in AWS CLI Command Reference.

delete-option-group

The following code example shows how to use delete-option-group.

AWS CLI

To delete an option group

The following delete-option-group example deletes the specified option group.

```bash
aws rds delete-option-group \
   --option-group-name myoptiongroup
```
This command produces no output.

For more information, see Deleting an Option Group in the Amazon RDS User Guide.

- For API details, see DeleteOptionGroup in AWS CLI Command Reference.

deregister-db-proxy-targets

The following code example shows how to use deregister-db-proxy-targets.

AWS CLI

To deregister a DB proxy target from database target group

The following deregister-db-proxy-targets example removes the association between the proxy proxyExample and its target.

```bash
aws rds deregister-db-proxy-targets \
   --db-proxy-name proxyExample \
   --db-instance-identifiers database-1
```

This command produces no output.

For more information, see Deleting an RDS Proxy in the Amazon RDS User Guide and Deleting an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DeregisterDbProxyTargets in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe account attributes

The following describe-account-attributes example retrieves the attributes for the current AWS account.

```bash
aws rds describe-account-attributes
```
Output:

```json
{
    "AccountQuotas": [
        {
            "Max": 40,
            "Used": 4,
            "AccountQuotaName": "DBInstances"
        },
        {
            "Max": 40,
            "Used": 0,
            "AccountQuotaName": "ReservedDBInstances"
        },
        {
            "Max": 100000,
            "Used": 40,
            "AccountQuotaName": "AllocatedStorage"
        },
        {
            "Max": 25,
            "Used": 0,
            "AccountQuotaName": "DBSecurityGroups"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "AuthorizationsPerDBSecurityGroup"
        },
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBParameterGroups"
        },
        {
            "Max": 100,
            "Used": 3,
            "AccountQuotaName": "ManualSnapshots"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "EventSubscriptions"
        }
    ]
}
```
For API details, see `DescribeAccountAttributes` in AWS CLI Command Reference.

describe-blue-green-deployments

The following code example shows how to use describe-blue-green-deployments.
Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment after creation completes.

```bash
aws rds describe-blue-green-deployments \
   --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```json
{
   "BlueGreenDeployments": [
      {
         "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
         "BlueGreenDeploymentName": "bgd-cli-test-instance",
         "SwitchoverDetails": [
            {
               "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
               "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-rkfbp",
               "Status": "AVAILABLE"
            },
            {
               "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-replica-1-green-j382ha",
               "Status": "AVAILABLE"
            },
            {
               "Status": "AVAILABLE"
            }
         ]
      }
   ]
}
```
Example 2: To describe a blue/green deployment for an Aurora MySQL DB cluster

The following describe-blue-green-deployment example retrieves the details of a blue/green deployment.

```bash
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-wi89nwglccsfake
```

Output:
{  
  "BlueGreenDeployments": [  
  
  {  
    "BlueGreenDeploymentIdentifier": "bgd-wi89nwglccsfake",
    "BlueGreenDeploymentName": "my-blue-green-deployment",
    "SwitchoverDetails": [  
      {  
        "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
        "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3rnukl",
        "Status": "AVAILABLE"
      },
      {  
        "Status": "AVAILABLE"
      },
      {  
        "Status": "AVAILABLE"
      },
      {  
        "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-3-green-mkxies",
        "Status": "AVAILABLE"
      },
      {  
      }
  ]
  }  
]
For more information, see [Viewing a blue/green deployment](https://aws.amazon.com) in the Amazon Aurora User Guide.

**Example 3: To describe a blue/green deployment for an Aurora MySQL cluster after switchover**

The following describe-blue-green-deployment example retrieves the details about a blue/green deployment after the green environment is promoted to be the production environment.
aws rds describe-blue-green-deployments \
   --blue-green-deployment-identifier bgd-wi89nwzglccsfake

Output:

```json
{
   "BlueGreenDeployments": [
       {
           "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
           "BlueGreenDeploymentName": "my-blue-green-deployment",
           "SwitchoverDetails": [
               {
                   "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-old1",
                   "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
                   "Status": "SWITCHOVER_COMPLETED"
               },
               {
                   "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-1",
                   "Status": "SWITCHOVER_COMPLETED"
               },
               {
                   "Status": "SWITCHOVER_COMPLETED"
               },
               {
                   "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-3-old1",
                   "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-3",
                   "Status": "SWITCHOVER_COMPLETED"
               }
           ]
       }
   ]
}
```
For more information, see [Viewing a blue/green deployment](https://docs.aws.amazon.com/AmazonAurora/latest/ug/aurora-user-guide-rds-how-to-blue-green-deploy.html) in the *Amazon Aurora User Guide*.

**Example 4: To describe a combined blue/green deployment**
The following `describe-blue-green-deployment` example retrieves the details of a combined blue/green deployment.

```
aws rds describe-blue-green-deployments
```

Output:

```
{
   "BlueGreenDeployments": [ 
   {
      "BlueGreenDeploymentIdentifier": "bgd-wi89nwzgfaelccs",
      "BlueGreenDeploymentName": "my-blue-green-deployment",

For more information, see Viewing a blue/green deployment in the Amazon RDS User Guide and Viewing a blue/green deployment in the Amazon Aurora User Guide.

- For API details, see DescribeBlueGreenDeployments in AWS CLI Command Reference.

describe-certificates

The following code example shows how to use describe-certificates.

AWS CLI

To describe certificates

The following describe-certificates example retrieves the details of the certificate associated with the user's default region.

```bash
aws rds describe-certificates
```

Output:

```json
{
   "Certificates": [
   {
   "CertificateIdentifier": "rds-ca-ecc384-g1",
   "CertificateType": "CA",
   "Thumbprint": "2ee3dcc06e50192559b13929e73484354f23387d",
   "ValidFrom": "2021-05-24T22:06:59+00:00",
   "ValidTill": "2121-05-24T23:06:59+00:00",
   "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-ecc384-g1",
   "CustomerOverride": false
   },
   {
   "CertificateIdentifier": "rds-ca-rsa4096-g1",
   "CertificateType": "CA",
   "Thumbprint": "5343d206e50192559b13929e73484354f23387d",
   "ValidFrom": "2021-05-24T22:06:59+00:00",
   "ValidTill": "2121-05-24T23:06:59+00:00",
   "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-rsa4096-g1",
   "CustomerOverride": false
   }
   ]
}
```
For more information, see Using SSL/TLS to encrypt a connection to a DB instance in the Amazon RDS User Guide and Using SSL/TLS to encrypt a connection to a DB cluster in the Amazon Aurora User Guide.

- For API details, see DescribeCertificates in AWS CLI Command Reference.

**describe-db-cluster-backtracks**

The following code example shows how to use describe-db-cluster-backtracks.

**AWS CLI**

To describe backtracks for a DB cluster
The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```
aws rds describe-db-cluster-backtracks \
   --db-cluster-identifier mydbcluster
```

Output:

```json
{
   "DBClusterBacktracks": [
      {
         "DBClusterIdentifier": "mydbcluster",
         "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
         "BacktrackTo": "2021-02-12T04:59:22Z",
         "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
         "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
         "Status": "COMPLETED"
      },
      {
         "DBClusterIdentifier": "mydbcluster",
         "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
         "BacktrackTo": "2021-02-11T22:53:46Z",
         "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
         "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
         "Status": "COMPLETED"
      }
   ]
}
```

For more information, see [Backtracking an Aurora DB cluster](https://docs.aws.amazon.com/Aurora/latest/aurora-userguide/rds-backtracking.html) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterBacktracks](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-cluster-backtracks.html) in *AWS CLI Command Reference*.

### `describe-db-cluster-endpoints`

The following code example shows how to use `describe-db-cluster-endpoints`.

**AWS CLI**

```
Example 1: To describe DB cluster endpoints
```
The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for `SELECT` and other read-only SQL statements.

```bash
aws rds describe-db-cluster-endpoints
```

Output:

```json
{
"DBClusterEndpoints": [
{
"DBClusterIdentifier": "my-database-1",
"Endpoint": "my-database-1.cluster-cnpexample.us-east-1.rds.amazonaws.com",
"Status": "creating",
"EndpointType": "WRITER"
},
{
"DBClusterIdentifier": "my-database-1",
"Endpoint": "my-database-1.cluster-ro-cnpexample.us-east-1.rds.amazonaws.com",
"Status": "creating",
"EndpointType": "READER"
},
{
"DBClusterIdentifier": "mydbcluster",
"Endpoint": "mydbcluster.cluster-cnpexamle.us-east-1.rds.amazonaws.com",
"Status": "available",
"EndpointType": "WRITER"
},
{
"DBClusterIdentifier": "mydbcluster",
"Endpoint": "mydbcluster.cluster-ro-cnpexample.us-east-1.rds.amazonaws.com",
"Status": "available",
"EndpointType": "READER"
}
]
}
```
Example 2: To describe DB cluster endpoints of a single DB cluster

The following describe-db-cluster-endpoints example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of WRITER.

```bash
aws rds describe-db-cluster-endpoints \
  --db-cluster-identifier serverless-cluster
```

Output:

```json
{
  "DBClusterEndpoints": [
    {
      "Status": "available",
      "Endpoint": "serverless-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
      "DBClusterIdentifier": "serverless-cluster",
      "EndpointType": "WRITER"
    }
  ]
}
```

For more information, see Amazon Aurora Connection Management in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusterEndpoints in AWS CLI Command Reference.

describe-db-cluster-parameter-groups

The following code example shows how to use describe-db-cluster-parameter-groups.

AWS CLI

To describe DB cluster parameter groups

The following describe-db-cluster-parameter-groups example retrieves details for your DB cluster parameter groups.

```bash
aws rds describe-db-cluster-parameter-groups
```

Output:
For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.
For API details, see DescribeDbClusterParameterGroups in AWS CLI Command Reference.

**describe-db-cluster-parameters**

The following code example shows how to use describe-db-cluster-parameters.

### AWS CLI

**Example 1: To describe the parameters in a DB cluster parameter group**

The following describe-db-cluster-parameters example retrieves details about the parameters in a DB cluster parameter group.

```bash
aws rds describe-db-cluster-parameters \
--db-cluster-parameter-group-name mydbclusterg
```

Output:

```json
{
  "Parameters": [ 
    {
      "ParameterName": "allow-suspicious-udfs",
      "Description": "Controls whether user-defined functions that have only an xxx symbol for the main function can be loaded",
      "Source": "engine-default",
      "ApplyType": "static",
      "DataType": "boolean",
      "AllowedValues": "0,1",
      "IsModifiable": false,
      "ApplyMethod": "pending-reboot",
      "SupportedEngineModes": [ 
        "provisioned"
      ]
    },
    {
      "ParameterName": "aurora_lab_mode",
      "ParameterValue": "0",
      "Description": "Enables new features in the Aurora engine.",
      "Source": "engine-default",
      "ApplyType": "static",
      "DataType": "boolean",
      "AllowedValues": "0,1",
      "IsModifiable": true,
```
"ApplyMethod": "pending-reboot",
"SupportedEngineModes": [
  "provisioned"
],
...some output truncated...
}
}

**Example 2: To list only the parameter names in a DB cluster parameter group**

The following describe-db-cluster-parameters example retrieves only the names of the parameters in a DB cluster parameter group.

```bash
aws rds describe-db-cluster-parameters \
  --db-cluster-parameter-group-name default.aurora-mysql5.7 \
  --query 'Parameters[].{ParameterName:ParameterName}'
```

Output:

```json
[
  {
    "ParameterName": "allow-suspicious-udfs"
  },
  {
    "ParameterName": "aurora_binlog_read_buffer_size"
  },
  {
    "ParameterName": "aurora_binlog_replication_max_yield_seconds"
  },
  {
    "ParameterName": "aurora_binlog_use_large_read_buffer"
  },
  {
    "ParameterName": "aurora_lab_mode"
  },
  ...

  ...some output truncated...
]
```

**Example 3: To describe only the modifiable parameters in a DB cluster parameter group**
The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```bash
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} | 
    [?IsModifiable == 'true']'
```

Output:

```
[
    {
        "ParameterName": "aurora_binlog_read_buffer_size",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },
    ...
    ]
```

**Example 4: To describe only the modifiable Boolean parameters in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```bash
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} | 
    [?IsModifiable == true]'
```
Output:

```
{
  "DataType": "boolean",
  "ParameterName": "aurora_binlog_use_large_read_buffer",
  "IsModifiable": true,
},
{
  "DataType": "boolean",
  "ParameterName": "aurora_lab_mode",
  "IsModifiable": true,
},
{
  "DataType": "boolean",
  "ParameterName": "autocommit",
  "IsModifiable": true,
},
{
  "DataType": "boolean",
  "ParameterName": "automatic_sp_privileges",
  "IsModifiable": true,
},
...some output truncated...
]
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusterParameters in AWS CLI Command Reference.

### describe-db-cluster-snapshot-attributes

The following code example shows how to use describe-db-cluster-snapshot-attributes.

**AWS CLI**

To describe the attribute names and values for a DB cluster snapshot
The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```
aws rds describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see [Sharing a DB Cluster Snapshot](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/AmazonAurora-WorkingWithSnapshots.html) in the Amazon Aurora User Guide.

- For API details, see [DescribeDbClusterSnapshotAttributes](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-cluster-snapshot-attributes.html) in AWS CLI Command Reference.

### `describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

**AWS CLI**

**To describe a DB cluster snapshot for a DB cluster**

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```
aws rds describe-db-cluster-snapshots \
    --db-cluster-identifier mydbcluster
```

Output:
{
    "DBClusterSnapshots": [
    {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],

{
    "DBInstanceIdentifier": "mydbcluster",
    "IsClusterWriter": false,
Example 2: To list certain attributes of all DB clusters

The following describe-db-clusters example retrieves only the DBClusterIdentifier, Endpoint, and ReaderEndpoint attributes of all your DB clusters in the current AWS Region.
Example 3: To list DB clusters with a specific attribute

The following describe-db-clusters example retrieves only the DBClusterIdentifier and Engine attributes of your DB clusters that use the aurora-postgresql DB engine.

```
aws rds describe-db-clusters \
   --query 'DBClusters[].{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} | 
    [?Engine == `aurora-postgresql`]' | 
```

Output:
[{
  "Engine": "aurora-postgresql",
  "DBClusterIdentifier": "pg2-cluster"
}]

For more information, see Amazon Aurora DB Clusters in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusters in AWS CLI Command Reference.

describe-db-engine-versions

The following code example shows how to use describe-db-engine-versions.

AWS CLI

To describe the DB engine versions for the MySQL DB engine

The following describe-db-engine-versions example displays details about each of the DB engine versions for the specified DB engine.

```
aws rds describe-db-engine-versions \
  --engine mysql
```

Output:

```json
{
  "DBEngineVersions": [
    {
      "Engine": "mysql",
      "EngineVersion": "5.5.46",
      "DBParameterGroupFamily": "mysql5.5",
      "DBEngineDescription": "MySQL Community Edition",
      "ValidUpgradeTarget": [
        {
          "Engine": "mysql",
          "EngineVersion": "5.5.53",
          "Description": "MySQL 5.5.53",
          "AutoUpgrade": false,
          "IsMajorVersionUpgrade": false
        }
      ]
    }
  ]
}
```
For more information, see [What Is Amazon Relational Database Service (Amazon RDS)?](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/what-is-rds.html) in the Amazon RDS User Guide.

- For API details, see [DescribeDBEngineVersions](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-engine-versions.html) in AWS CLI Command Reference.

### describe-db-instance-automated-backups

The following code example shows how to use `describe-db-instance-automated-backups`.

**AWS CLI**

**To describe the automated backups for a DB instance**

The following `describe-db-instance-automated-backups` example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```bash
aws rds describe-db-instance-automated-backups \
    --db-instance-identifier new-orcl-db
```

**Output:**

```json
{
    "DBInstanceAutomatedBackups": [
```
describe-db-instances

The following code example shows how to use describe-db-instances.

AWS CLI

To describe a DB instance

The following describe-db-instances example retrieves details about the specified DB instance.

For more information, see Finding information about replicated backups in the Amazon RDS User Guide.

- For API details, see DescribeDbInstanceAutomatedBackups in AWS CLI Command Reference.
aws rds describe-db-instances \
   --db-instance-identifier mydbinstancecf

Output:

```json
{
   "DBInstances": [
      {
         "DBInstanceIdentifier": "mydbinstancecf",
         "DBInstanceClass": "db.t3.small",
         "Engine": "mysql",
         "DBInstanceStatus": "available",
         "MasterUsername": "masterawsuser",
         "Endpoint": {
            "Address": "mydbinstancecf.abcexample.us-east-1.rds.amazonaws.com",
            "Port": 3306,
            "HostedZoneId": "Z2R2ITUGPM61AM"
         },
         ...some output truncated...
      }
   ]
}
```

- For API details, see [DescribeDBInstances](#) in *AWS CLI Command Reference*.

### describe-db-log-files

The following code example shows how to use `describe-db-log-files`.

**AWS CLI**

**To describe the log files for a DB instance**

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```bash
aws rds describe-db-log-files -\n   --db-instance-identifier test-instance
```

Output:
For API details, see **DescribeDbLogFiles** in **AWS CLI Command Reference**.

**describe-db-parameter-groups**

The following code example shows how to use describe-db-parameter-groups.
AWS CLI

To describe your DB parameter group

The following `describe-db-parameter-groups` example retrieves details about your DB parameter groups.

```bash/aws rds describe-db-parameter-groups
```

Output:

```
{
   "DBParameterGroups": [ 
   {
      "DBParameterGroupName": "default.aurora-mysql5.7",
      "DBParameterGroupFamily": "aurora-mysql5.7",
      "Description": "Default parameter group for aurora-mysql5.7",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-mysql5.7"
   },
   {
      "DBParameterGroupName": "default.aurora-postgresql9.6",
      "DBParameterGroupFamily": "aurora-postgresql9.6",
      "Description": "Default parameter group for aurora-postgresql9.6",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-postgresql9.6"
   },
   {
      "DBParameterGroupName": "default.aurora5.6",
      "DBParameterGroupFamily": "aurora5.6",
      "Description": "Default parameter group for aurora5.6",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora5.6"
   },
   {
      "DBParameterGroupName": "default.mariadb10.1",
      "DBParameterGroupFamily": "mariadb10.1",
      "Description": "Default parameter group for mariadb10.1",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.mariadb10.1"
   }
   ...
   some output truncated...
   ]
```
For more information, see [Working with DB Parameter Groups](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Concepts.DBParameterGroups.html) in the *Amazon RDS User Guide*.  
- For API details, see [DescribeDBParameterGroups](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-parameter-groups.html) in *AWS CLI Command Reference*.

**describe-db-parameters**

The following code example shows how to use `describe-db-parameters`.

**AWS CLI**

To describe the parameters in a DB parameter group

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```bash
aws rds describe-db-parameters \
   --db-parameter-group-name mydbpg
```

**Output:**

```json
{
   "Parameters": [
   {
   "ParameterName": "allow-suspicious-udfs",
   "Description": "Controls whether user-defined functions that have only
an xxx symbol for the main function can be loaded",
   "Source": "engine-default",
   "ApplyType": "static",
   "DataType": "boolean",
   "AllowedValues": "0,1",
   "IsModifiable": false,
   "ApplyMethod": "pending-reboot"
   },
   {
   "ParameterName": "auto_generate_certs",
   "Description": "Controls whether the server autogenerated SSL key and
certificate files in the data directory, if they do not already exist.",
   "Source": "engine-default",
   "ApplyType": "static",
   "DataType": "boolean",
   "AllowedValues": "0,1",
   "IsModifiable": false,
   "ApplyMethod": "pending-reboot"
   }
   ]
}
```
For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.  
- For API details, see [DescribeDBParameters](#) in *AWS CLI Command Reference*.

**describe-db-proxies**

The following code example shows how to use describe-db-proxies.

**AWS CLI**

**To describe a DB proxy for an RDS database**

The following describe-db-proxies example returns information about DB proxies.

```bash
aws rds describe-db-proxies
```

**Output:**

```json
{
   "DBProxies": [
   {
       "DBProxyName": "proxyExample1",
       "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
       "Status": "available",
       "EngineFamily": "PostgreSQL",
       "VpcId": "vpc-1234567",
       "VpcSecurityGroupId": [  
            "sg-1234"
       ],
       "VpcSubnetIds": [  
            "subnetgroup1",
            "subnetgroup2"
       ],
       "Auth": "[  
            "
```

```json
{
    "Description": "proxydescription1",
    "AuthScheme": "SECRETS",
    "IAMAuth": "DISABLED"
}
]
",
    "RoleArn": "arn:aws:iam::123456789123:role/ProxyPostgreSQLRole",
    "Endpoint": "proxyExample1.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
    "RequireTLS": false,
    "IdleClientTimeout": 1800,
    "DebuggingLogging": false,
    "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
    "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
},
{
    "DBProxyName": "proxyExample2",
    "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-1234a12b23456c1ab",
    "Status": "available",
    "EngineFamily": "PostgreSQL",
    "VpcId": "sg-1234567",
    "VpcSecurityGroupIds": [
        "sg-1234"
    ],
    "VpcSubnetIds": [
        "subnetgroup1",
        "subnetgroup2"
    ],
    "Auth": "[
        {
            "Description": "proxydescription2",
            "AuthScheme": "SECRETS",
            "IAMAuth": "DISABLED"
        }
    ],
    "RoleArn": "arn:aws:iam::123456789123:role/ProxyPostgreSQLRole",

    "RequireTLS": false,
    "IdleClientTimeout": 1800,
    "DebuggingLogging": false,
    "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
    "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
}
```
For more information, see Viewing an RDS Proxy in the Amazon RDS User Guide and Viewing an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxies in AWS CLI Command Reference.

**describe-db-proxy-endpoints**

The following code example shows how to use describe-db-proxy-endpoints.

**AWS CLI**

**To describe a DB proxy endpoints**

The following describe-db-proxy-endpoints example returns information about DB proxy endpoints.

```
aws rds describe-db-proxy-endpoints
```

Output:

```
{
  "DBProxyEndpoints": [
    {
      "DBProxyEndpointName": "proxyEndpoint1",
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
      "DBProxyName": "proxyExample",
      "Status": "available",
      "VpcId": "vpc-1234567",
      "VpcSecurityGroupIds": [
        "sg-1234"
      ],
      "VpcSubnetIds": [
        "subnetgroup1",
      ]
    }
  ]
}
```
"subnetgroup2"
],
"Endpoint": "proxyEndpoint1.endpoint.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
"CreatedDate": "2023-04-05T16:09:33.452000+00:00",
"TargetRole": "READ_WRITE",
"IsDefault": false
},
{
"DBProxyEndpointName": "proxyEndpoint2",
"DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-4567a01b12345c0ab",
"DBProxyName": "proxyExample2",
"Status": "available",
"VpcId": "vpc1234567",
"VpcSecurityGroupIds": [
  "sg-5678"
],
"VpcSubnetIds": [
  "subnetgroup1",
  "subnetgroup2"
],
"Endpoint": "proxyEndpoint2.endpoint.proxy-cd1ef2klmnop.us-east-1.rds.amazonaws.com",
"CreatedDate": "2023-04-05T16:09:33.452000+00:00",
"TargetRole": "READ_WRITE",
"IsDefault": false
}
]

For more information, see Viewing a proxy endpoint in the Amazon RDS User Guide and Creating a proxy endpoint in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyEndpoints in AWS CLI Command Reference.

describe-db-proxy-target-groups

The following code example shows how to use describe-db-proxy-target-groups.

AWS CLI

To describe a DB proxy endpoints
The following `describe-db-proxy-target-groups` example returns information about DB proxy target groups.

```bash
aws rds describe-db-proxy-target-groups \
   --db-proxy-name proxyExample
```

Output:

```json
{
   "TargetGroups": {
      "DBProxyName": "proxyExample",
      "TargetGroupName": "default",
      "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-tg-0123a01b12345c0ab",
      "IsDefault": true,
      "Status": "available",
      "ConnectionPoolConfig": {
         "MaxConnectionsPercent": 100,
         "MaxIdleConnectionsPercent": 50,
         "ConnectionBorrowTimeout": 120,
         "SessionPinningFilters": []
      },
      "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
      "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
   }
}
```

For more information, see Viewing an RDS Proxy in the Amazon RDS User Guide and Viewing an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyTargetGroups in AWS CLI Command Reference.

### describe-db-proxy-targets

The following code example shows how to use `describe-db-proxy-targets`.

**AWS CLI**

To describe DB proxy targets
The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```bash
cmd
aws rds describe-db-proxy-targets 
  --db-proxy-name proxyExample
```

Output:

```json
{
  "Targets": [
    {
      "Endpoint": "database1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "TrackedClusterId": "database1",
      "RdsResourceId": "database1-instance-1",
      "Port": 3306,
      "Type": "RDS_INSTANCE",
      "Role": "READ_WRITE",
      "TargetHealth": {
        "State": "UNAVAILABLE",
        "Reason": "PENDING_PROXY_CAPACITY",
        "Description": "DBProxy Target is waiting for proxy to scale to desired capacity"
      }
    }
  ]
}
```

For more information, see Viewing an RDS proxy in the Amazon RDS User Guide and Viewing an RDS proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyTargets in AWS CLI Command Reference.

**describe-db-recommendations**

The following code example shows how to use `describe-db-recommendations`.

**AWS CLI**

**Example 1: To list all DB recommendations**

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.
aws rds describe-db-recommendations

Output:

```json
{
    "DBRecommendations": [
        {
            "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",
            "TypeId": "config_recommendation::old_minor_version",
            "Severity": "informational",
            "Status": "active",
            "CreatedTime": "2024-02-21T23:14:19.292000+00:00",
            "UpdatedTime": "2024-02-21T23:14:19+00:00",
            "Detection": "**[resource-name]** is not running the latest minor DB engine version",
            "Recommendation": "Upgrade to latest engine version",
            "Description": "Your database resources aren't running the latest minor DB engine version. The latest minor version contains the latest security fixes and other improvements."
        },
        {
            "ActionId": "12ab34c5de6fg7h89i0jk1lm234n5678",
            "Operation": "modifyDbInstance",
            "Parameters": [
                {
                    "Key": "EngineVersion",
                    "Value": "5.7.44"
                },
                {
                    "Key": "DBInstanceIdentifier",
                    "Value": "database-1"
                }
            ],
            "ApplyModes": [
                "immediately",

]
For more information, see Viewing and responding to Amazon RDS recommendations in the Amazon RDS User Guide and Viewing and responding to Amazon RDS recommendations in the Amazon Aurora User Guide.

Example 2: To list high severity DB recommendations

The following describe-db-recommendations example lists high severity DB recommendations in your AWS account.

```bash
aws rds describe-db-recommendations \
   --filters Name=severity,Values=high
```

Output:

```json
{
   "DBRecommendations": [
      {
         "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

For more information, see Viewing and responding to Amazon RDS recommendations in the Amazon RDS User Guide and Viewing and responding to Amazon RDS recommendations in the Amazon Aurora User Guide.

Example 3: To list DB recommendations for a specified DB instance

The following describe-db-recommendations example lists all DB recommendations for a specified DB instance.

```
aws rds describe-db-recommendations \\
    --filters Name=dbi-resource-id,Values=database-1
```

Output:

```json
{
    "DBRecommendations": [
    {
        "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k91m",
        "TypeId": "config_recommendation::old_minor_version",
        "Severity": "informational",

**Example 4: To list all active DB recommendations**

The following describe-db-recommendations example lists all active DB recommendations in your AWS account.

```
aws rds describe-db-recommendations \
  --filters Name=status,Values=active
```

Output:

```
{
  "DBRecommendations": [
    {
      "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

**describe-db-security-groups**

The following code example shows how to use describe-db-security-groups.

**AWS CLI**

**To list DB security groups**

The following describe-db-security-groups example lists DB security groups.

```bash
aws rds describe-db-security-groups
```

Output:

```json
{
  "DBSecurityGroups": [
    {
      "OwnerId": "123456789012",
    }
  ]
}
```
The following code example shows how to use `describe-db-shard-groups`.

**AWS CLI**

**Example 1: To describe DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```bash
aws rds describe-db-shard-groups
```

**Output:**

```json
{
   "DBShardGroups": [
      {
         "DBSecurityGroupName": "default",
         "DBSecurityGroupDescription": "default",
         "EC2SecurityGroups": [],
         "IPRanges": [],
      },
      {
         "OwnerId": "123456789012",
         "DBSecurityGroupName": "mysecgroup",
         "DBSecurityGroupDescription": "My Test Security Group",
         "VpcId": "vpc-1234567f",
         "EC2SecurityGroups": [],
         "IPRanges": [],
      }
   ]
```

For more information, see Listing Available DB Security Groups in the Amazon RDS User Guide.

- For API details, see DescribeDbSecurityGroups in AWS CLI Command Reference.
For more information, see Amazon Aurora DB Clusters in the Amazon Aurora User Guide.

- For API details, see DescribeDbShardGroups in AWS CLI Command Reference.

**describe-db-snapshot-attributes**

The following code example shows how to use describe-db-snapshot-attributes.

**AWS CLI**

To describe the attribute names and values for a DB snapshot

The following describe-db-snapshot-attributes example describes the attribute names and values for a DB snapshot.

```
aws rds describe-db-snapshot-attributes \ 
   --db-snapshot-identifier mydbsnapshot
```

**Output:**
For more information, see [Sharing a DB Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/sharing-db-snapshots.html) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbSnapshotAttributes](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-snapshot-attributes.html) in *AWS CLI Command Reference*.

### describe-db-snapshots

The following code example shows how to use `describe-db-snapshots`.

**AWS CLI**

**Example 1: To describe a DB snapshot for a DB instance**

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```bash
aws rds describe-db-snapshots \
   --db-snapshot-identifier mydbsnapshot
```

**Output:**

```json
{
   "DBSnapshots": [
      {
         "DBSnapshotIdentifier": "mydbsnapshot",
         "DBInstanceIdentifier": "mysqldb",
         "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",
         "Engine": "mysql",
         "AttributeName": "restore",
         "AttributeValues": [
            "123456789012",
            "210987654321"
         ]
      }
   ]
}
```
For more information, see [Creating a DB Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_CreateSnapshot.html) in the *Amazon RDS User Guide*.

**Example 2: To find the number of manual snapshots taken**

The following `describe-db-snapshots` example uses the `length` operator in the `--query` option to return the number of manual snapshots that have been taken in a particular AWS Region.

```bash
aws rds describe-db-snapshots \
  --snapshot-type manual \
  --query "length(*[].{DBSnapshots:SnapshotType})" \
  --region eu-central-1
```

**Output:**

```
35
```

For more information, see [Creating a DB Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_CreateSnapshot.html) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBSnapshots](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-dbsnapshots.html) in *AWS CLI Command Reference*. 

**Actions and scenarios**

5131
describe-db-subnet-groups

The following code example shows how to use describe-db-subnet-groups.

AWS CLI

**To describe a DB subnet group**

The following describe-db-subnet-groups example retrieves the details of the specified DB subnet group.

```sh
aws rds describe-db-subnet-groups
```

Output:

```json
{
    "DBSubnetGroups": [
        {
            "DBSubnetGroupName": "mydbsubnetgroup",
            "DBSubnetGroupDescription": "My DB Subnet Group",
            "VpcId": "vpc-971c12ee",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-d8c8e7f4",
                    "SubnetAvailabilityZone": { "Name": "us-east-1a" },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-718fdc7d",
                    "SubnetAvailabilityZone": { "Name": "us-east-1f" },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-cbc8e7e7",
                    "SubnetAvailabilityZone": { "Name": "us-east-1a" },
                    "SubnetStatus": "Active"
                }
            ]
        }
    ]
}
```
For more information, see Amazon Virtual Private Cloud VPCs and Amazon RDS in the Amazon RDS User Guide.

- For API details, see DescribeDbSubnetGroups in AWS CLI Command Reference.

describe-engine-default-cluster-parameters

The following code example shows how to use describe-engine-default-cluster-parameters.

AWS CLI

To describe the default engine and system parameter information for the Aurora database engine

The following describe-engine-default-cluster-parameters example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```
aws rds describe-engine-default-cluster-parameters \\n   --db-parameter-group-family aurora-mysql5.7
```

Output:

```json
{  
   "EngineDefaults": {  
      "Parameters": [  
```
For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.

- For API details, see DescribeEngineDefaultClusterParameters in AWS CLI Command Reference.

describe-engine-default-parameters

The following code example shows how to use describe-engine-default-parameters.

AWS CLI

To describe the default engine and system parameter information for the database engine

The following describe-engine-default-parameters example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```
aws rds describe-engine-default-parameters \
    --db-parameter-group-family mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "allow-suspicious-udfs",
            
```
"Description": "Controls whether user-defined functions that have only an xxx symbol for the main function can be loaded",
"Source": "engine-default",
"ApplyType": "static",
"DataType": "boolean",
"AllowedValues": "0,1",
"IsModifiable": false
},
...some output truncated...
]
}
}
}

For more information, see [Working with DB Parameter Groups](#) in the [Amazon RDS User Guide](#).

- For API details, see [DescribeEngineDefaultParameters](#) in [AWS CLI Command Reference](#).

describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories

The following describe-event-categories example retrieves details about the event categories for all available event sources.

```bash
aws rds describe-event-categories
```

Output:

```json
{
   "EventCategoriesMapList": [
      {
         "SourceType": "db-instance",
         "EventCategories": [
            "deletion",
            "read replica",
            "failover",
            "restoration",
            "maintenance",
            "low storage",
```
"configuration change",
"backup",
"creation",
"availability",
"recovery",
"failure",
"backtrack",
"notification"
]
},
{
  "SourceType": "db-security-group",
  "EventCategories": [
    "configuration change",
    "failure"
  ]
},
{
  "SourceType": "db-parameter-group",
  "EventCategories": [
    "configuration change"
  ]
},
{
  "SourceType": "db-snapshot",
  "EventCategories": [
    "deletion",
    "creation",
    "restoration",
    "notification"
  ]
},
{
  "SourceType": "db-cluster",
  "EventCategories": [
    "failover",
    "failure",
    "notification"
  ]
},
{
  "SourceType": "db-cluster-snapshot",
  "EventCategories": [
    "backup"
  ]
• For API details, see DescribeEventCategories in AWS CLI Command Reference.

describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

This example describes all of the Amazon RDS event subscriptions for the current AWS account.

aws rds describe-event-subscriptions

Output:

```json
{
  "EventSubscriptionsList": [
    {
      "EventCategoriesList": [
        "backup",
        "recovery"
      ],
      "Enabled": true,
      "Status": "creating",
      "SourceType": "db-instance",
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-instance-events",
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events"
    },
    ...
    some output truncated...
  ]
}
```
**describe-events**

The following code example shows how to use `describe-events`.

**AWS CLI**

**To describe events**

The following `describe-events` example retrieves details for the events that have occurred for the specified DB instance.

```bash
aws rds describe-events \
  --source-identifier test-instance \
  --source-type db-instance
```

**Output:**

```json
{
  "Events": [
    {
      "SourceType": "db-instance",
      "SourceIdentifier": "test-instance",
      "EventCategories": [
        "backup"
      ],
      "Message": "Backing up DB instance",
      "Date": "2018-07-31T23:09:23.983Z",
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
    },
    {
      "SourceType": "db-instance",
      "SourceIdentifier": "test-instance",
      "EventCategories": [
        "backup"
      ],
      "Message": "Finished DB Instance backup",
      "Date": "2018-07-31T23:15:13.049Z",
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
    }
  ]
}
```
describe-export-tasks

The following code example shows how to use `describe-export-tasks`.

AWS CLI

To describe snapshot export tasks

The following `describe-export-tasks` example returns information about snapshot exports to Amazon S3.

```bash
aws rds describe-export-tasks
```

Output:

```json
{
   "ExportTasks": [
   {
       "ExportTaskIdentifier": "test-snapshot-export",
       "SnapshotTime": "2020-03-02T18:26:28.163Z",
       "TaskStartTime": "2020-03-02T18:57:56.896Z",
       "TaskEndTime": "2020-03-02T19:10:31.985Z",
       "S3Bucket": "mybucket",
       "S3Prefix": "",
       "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
       "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabbccddeeff",
       "Status": "COMPLETE",
       "PercentProgress": 100,
       "TotalExtractedDataInGB": 0
   },
   {
       "ExportTaskIdentifier": "my-s3-export",
       "SnapshotTime": "2020-03-27T20:48:42.023Z",
       "TaskStartTime": "2020-03-27T20:50:09.123Z",
       "S3Bucket": "mybucket",
       "S3Prefix": "",
       "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
       "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabbccddeeff",
       "Status": "COMPLETE",
       "PercentProgress": 100,
       "TotalExtractedDataInGB": 0
   }
}
```
For more information, see Monitoring Snapshot Exports in the Amazon RDS User Guide.

- For API details, see DescribeExportTasks in AWS CLI Command Reference.

describe-global-clusters

The following code example shows how to use describe-global-clusters.

AWS CLI

To describe global DB clusters

The following describe-global-clusters example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

Output:

```
{
   "GlobalClusters": [
       {
           "GlobalClusterIdentifier": "myglobalcluster",
           "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",
           "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
           "Status": "available",
           "Engine": "aurora-mysql",
           "EngineVersion": "5.7.mysql_aurora.2.07.2",
           "StorageEncrypted": false,
           "DeletionProtection": false,
       }
   ]
}
```
For more information, see Managing an Aurora global database in the Amazon Aurora User Guide.

- For API details, see DescribeGlobalClusters in AWS CLI Command Reference.

describe-option-group-options

The following code example shows how to use describe-option-group-options.

AWS CLI

To describe all available options

The following describe-option-group-options example lists two options for an Oracle Database 19c instance.

```
aws rds describe-option-group-options \
   --engine-name oracle-ee \
   --major-engine-version 19 \
   --max-items 2
```

Output:

```
{
   "OptionGroupOptions": [
   {
       "Name": "APEX",
       "Description": "Oracle Application Express Runtime Environment",
       "EngineName": "oracle-ee",
       "MajorEngineVersion": "19",
       "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
       "PortRequired": false,
       "OptionsDependedOn": [],
       "OptionsConflictsWith": [],
       "Persistent": false,
       "Permanent": false,
       "RequiresAutoMinorEngineVersionUpgrade": false,
   }
   ]
}
```
For more information, see [Listing the Options and Option Settings for an Option Group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-metadata-options.html) in the Amazon RDS User Guide.

- For API details, see [DescribeOptionGroupOptions](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-option-group-options.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-option-group-options.html).

**describe-option-groups**

The following code example shows how to use describe-option-groups.
To describe the available option groups

The following describe-option-groups example lists the options groups for an Oracle Database 19c instance.

```bash
aws rds describe-option-groups \
   --engine-name oracle-ee \
   --major-engine-version 19
```

Output:

```json
{
   "OptionGroupsList": [
      {
         "OptionGroupName": "default:oracle-ee-19",
         "OptionGroupDescription": "Default option group for oracle-ee 19",
         "EngineName": "oracle-ee",
         "MajorEngineVersion": "19",
         "Options": [],
         "AllowsVpcAndNonVpcInstanceMemberships": true,
      }
   ]
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the Amazon RDS User Guide.

- For API details, see DescribeOptionGroups in AWS CLI Command Reference.

describe-orderable-db-instance-options

The following code example shows how to use describe-orderable-db-instance-options.

AWS CLI

To describe orderable DB instance options

The following describe-orderable-db-instance-options example retrieves details about the orderable options for a DB instances running the MySQL DB engine.
aws rds describe-orderable-db-instance-options \
--engine mysql

Output:

```json
{
   "OrderableDBInstanceOptions": [
      {
         "MinStorageSize": 5,
         "Read Replica Capable": true,
         "MaxStorageSize": 6144,
         "Availability Zones": [
            {
               "Name": "us-east-1a"
            },
            {
               "Name": "us-east-1b"
            },
            {
               "Name": "us-east-1c"
            },
            {
               "Name": "us-east-1d"
            }
         ],
         "Supports Iops": false,
         "Available Processor Features": [],
         "Multi AZ Capable": true,
         "DB Instance Class": "db.m1.large",
         "Vpc": true,
         "Storage Type": "gp2",
         "License Model": "general-public-license",
         "Engine Version": "5.5.46",

```
describe-pending-maintenance-actions

The following code example shows how to use `describe-pending-maintenance-actions`.

**AWS CLI**

To list resources with at least one pending maintenance action

The following `describe-pending-maintenance-actions` example lists the pending maintenance action for a DB instance.

```
aws rds describe-pending-maintenance-actions
```

Output:

```
{
   "PendingMaintenanceActions": [
   {
      "PendingMaintenanceActionDetails": [
         {
            "Action": "system-update",
            "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
         }
      ]
   }
]}
```

For more information, see [Maintaining a DB Instance](https://docs.aws.amazon.com/AmazonRDS/UserGuide) in the *Amazon RDS User Guide*.

- For API details, see `DescribePendingMaintenanceActions` in *AWS CLI Command Reference*.

describe-reserved-db-instances-offerings

The following code example shows how to use `describe-reserved-db-instances-offerings`.

```
```
AWS CLI

To describe reserved DB instance offerings

The following describe-reserved-db-instances-offerings example retrieves details about reserved DB instance options for oracle.

```
aws rds describe-reserved-db-instances-offerings \
   --product-description oracle
```

Output:

```
{
   "ReservedDBInstancesOfferings": [
      {
         "CurrencyCode": "USD",
         "UsagePrice": 0.0,
         "ProductDescription": "oracle-se2(li)",
         "ReservedDBInstancesOfferingId": "005bdee3-9ef4-4182-aa0c-58ef7cb6c2f8",
         "MultiAZ": true,
         "DBInstanceClass": "db.m4.xlarge",
         "OfferingType": "Partial Upfront",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": 0.594,
               "RecurringChargeFrequency": "Hourly"
            }
         ],
         "FixedPrice": 4089.0,
         "Duration": 31536000
      },
      ...some output truncated...
   }
```

- For API details, see DescribeReservedDbInstancesOfferings in AWS CLI Command Reference.

**describe-reserved-db-instances**

The following code example shows how to use describe-reserved-db-instances.
AWS CLI

To describe reserved DB instances

The following describe-reserved-db-instances example retrieves details about any reserved DB instances in the current AWS account.

```
aws rds describe-reserved-db-instances
```

Output:

```
{
    "ReservedDBInstances": [
        {
            "ReservedDBInstanceId": "myreservedinstance",
            "ReservedDBInstancesOfferingId": "12ab34cd-59af-4b2c-a660-1abcdef23456",
            "DBInstanceClass": "db.t3.micro",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "DBInstanceCount": 1,
            "ProductDescription": "sqlserver-ex(li)",
            "OfferingType": "No Upfront",
            "MultiAZ": false,

                {
                    "RecurringChargeAmount": 0.014,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "LeaseId": "a1b2c3d4-6b69-4a59-be89-5e11aa446666"
        }
    ]
}
```

For more information, see [Reserved DB Instances for Amazon RDS](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/reserved-db-instances.html) in the [Amazon RDS User Guide](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/).
describe-source-regions

The following code example shows how to use describe-source-regions.

**AWS CLI**

To describe source Regions

The following describe-source-regions example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```bash
aws rds describe-source-regions \
--region us-east-1
```

Output:

```
{
    "SourceRegions": [
        {
            "RegionName": "af-south-1",
            "Endpoint": "https://rds.af-south-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-east-1",
            "Endpoint": "https://rds.ap-east-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-northeast-1",
            "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-northeast-2",
            "Endpoint": "https://rds.ap-northeast-2.amazonaws.com",

"Status": "available",
"SupportsDBInstanceAutomatedBackupsReplication": true
}
]
}

For more information, see Finding information about replicated backups in the Amazon RDS User Guide.

- For API details, see DescribeSourceRegions in AWS CLI Command Reference.

describe-valid-db-instance-modifications

The following code example shows how to use describe-valid-db-instance-modifications.

AWS CLI

To describe valid modifications for a DB instance

The following describe-valid-db-instance-modifications example retrieves details about the valid modifications for the specified DB instance.

```bash
aws rds describe-valid-db-instance-modifications \
   --db-instance-identifier test-instance
```

Output:
{
  "ValidDBInstanceModificationsMessage": {
    "ValidProcessorFeatures": [],
    "Storage": [
      {
        "StorageSize": [
          {
            "Step": 1,
            "To": 20,
            "From": 20
          },
          {
            "Step": 1,
            "To": 6144,
            "From": 22
          }
        ],
        "ProvisionedIops": [
          {
            "Step": 1,
            "To": 0,

    {
      "To": 0.0,
      "From": 0.0
    }
  ],
  "StorageType": "magnetic"
}
download-db-log-file-portion

The following code example shows how to use download-db-log-file-portion.

AWS CLI

To download a DB log file

The following download-db-log-file-portion example downloads only the latest part of your log file, saving it to a local file named tail.txt.

```
aws rds download-db-log-file-portion \
  --db-instance-identifier test-instance \
  --log-file-name log.txt \
  --output text > tail.txt
```

To download the entire file, you need to include the `--starting-token 0` parameter. The following example saves the output to a local file named full.txt.

```
aws rds download-db-log-file-portion \
  --db-instance-identifier test-instance \
  --log-file-name log.txt \
  --starting-token 0 \
  --output text > full.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded. This generally doesn't cause any trouble in your log file analysis.

generate-auth-token

The following code example shows how to use generate-auth-token.

AWS CLI

To generate an authentication token

The following generate-db-auth-token example generates an authentication token for use with IAM database authentication.
aws rds generate-db-auth-token
  --hostname aurmysql-test.cdgmuiadpid.us-west-2.rds.amazonaws.com \
  --port 3306 \
  --region us-east-1 \
  --username jane_doe

Output:
aurmysql-test.cdgmuiadpid.us-west-2.rds.amazonaws.com:3306/?
Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIESZCNJ3OEXAMPLE%2F20180731%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-Date=20180731T235209Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-Signature=5a8753ebEXAMPLEa2c724e5667797EXAMPLE9d6ec6e3f427191fa41aeEXAMPLE

• For API details, see GenerateAuthToken in AWS CLI Command Reference.

generate-db-auth-token

The following code example shows how to use generate-db-auth-token.

AWS CLI

To generate an IAM authentication token

The following generate-db-auth-token example generates IAM authentication token to connect to a database.

aws rds generate-db-auth-token
  --hostname mydb.123456789012.us-east-1.rds.amazonaws.com \
  --port 3306 \
  --region us-east-1 \
  --username db_user

Output:
mydb.123456789012.us-east-1.rds.amazonaws.com:3306/?
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIEXAMPLE%2F20210123%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-Date=20210123T011543Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-Signature=88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
For more information, see [Connecting to your DB instance using IAM authentication](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Connecting-to-your-DB-instance-using-IAM-authentication.html) in the *Amazon RDS User Guide* and [Connecting to your DB cluster using IAM authentication](https://docs.aws.amazon.com/AmazonAurora/latest/USERGUIDE/Connecting-to-your-DDB-cluster-using-IAM-authentication.html) in the *Amazon Aurora User Guide*.

- For API details, see [GenerateDbAuthToken](https://docs.aws.amazon.com/cli/latest/reference/rds/generate-db-auth-token.html) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags on an Amazon RDS resource**

The following `list-tags-for-resource` example lists all tags on a DB instance.

```bash
code example: aws rds list-tags-for-resource \  --resource-name arn:aws:rds:us-east-1:123456789012:db:orcl1
```

**Output:**

```json
Output:
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "test"
        },
        {
            "Key": "Name",
            "Value": "MyDatabase"
        }
    ]
}
```

For more information, see [Tagging Amazon RDS Resources](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Tagging.html) in the *Amazon RDS User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/rds/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**modify-certificates**

The following code example shows how to use `modify-certificates`.

**Actions and scenarios**
AWS CLI

To temporarily override the system-default SSL/TLS certificate for new DB instances

The following modify-certificates example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```bash
aws rds modify-certificates \
  --certificate-identifier rds-ca-2019
```

Output:

```json
{
  "Certificate": {
    "CertificateIdentifier": "rds-ca-2019",
    "CertificateType": "CA",
    "Thumbprint": "EXAMPLE123456789012",
    "ValidFrom": "2019-09-19T18:16:53Z",
    "ValidTill": "2024-08-22T17:08:50Z",
    "CustomerOverride": true,
    "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"
  }
}
```

For more information, see [Rotating your SSL/TLS certificate](https://docs.aws.amazon.com/rds/latest/userguide/ssl-rotating.html) in the Amazon RDS User Guide and [Rotating your SSL/TLS certificate](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-ssl-rotating.html) in the Amazon Aurora User Guide.

- For API details, see [ModifyCertificates](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-certificates.html) in AWS CLI Command Reference.

modify-current-db-cluster-capacity

The following code example shows how to use modify-current-db-cluster-capacity.

AWS CLI

To scale the capacity of an Aurora Serverless DB cluster

The following modify-current-db-cluster-capacity example scales the capacity of an Aurora Serverless DB cluster to 8.

```bash
aws rds modify-current-db-cluster-capacity \
  --db-cluster-identifier mydbcluster \
```

Actions and scenarios
--capacity 8

Output:

```json
{
    "DBClusterIdentifier": "mydbcluster",
    "PendingCapacity": 8,
    "CurrentCapacity": 1,
    "SecondsBeforeTimeout": 300,
    "TimeoutAction": "ForceApplyCapacityChange"
}
```

For more information, see [Scaling Aurora Serverless v1 DB cluster capacity manually](https://docs.aws.amazon.com/AmazonAuroraServerlessUserGuide/index.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyCurrentDbClusterCapacity](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster.html) in *AWS CLI Command Reference*.

**modify-db-cluster-endpoint**

The following code example shows how to use `modify-db-cluster-endpoint`.

**AWS CLI**

**To modify a custom DB cluster endpoint**

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```json
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
    "Status": "modifying",
    "EndpointType": "CUSTOM",
```
"CustomEndpointType": "READER",
"StaticMembers": [
   "dbinstance1",
   "dbinstance2",
   "dbinstance3"
],
"ExcludedMembers": [],
"DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}

For more information, see Amazon Aurora Connection Management in the Amazon Aurora User Guide.

- For API details, see ModifyDbClusterEndpoint in AWS CLI Command Reference.

modify-db-cluster-parameter-group

The following code example shows how to use modify-db-cluster-parameter-group.

AWS CLI

To modify parameters in a DB cluster parameter group

The following modify-db-cluster-parameter-group example modifies the values of parameters in a DB cluster parameter group.

```
aws rds modify-db-cluster-parameter-group \
   --db-cluster-parameter-group-name mydbclusterpg \
   --parameters
   "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate" \
   "ParameterName=server_audit_logs_upload,ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
   "DBClusterParameterGroupName": "mydbclusterpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the Amazon Aurora User Guide.
modify-db-cluster-snapshot-attribute

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

**AWS CLI**

**To modify a DB cluster snapshot attribute**

The following `modify-db-cluster-snapshot-attribute` example makes changes to the specified DB cluster snapshot attribute.

```bash
aws rds modify-db-cluster-snapshot-attribute \
   --db-cluster-snapshot-identifier myclustersnapshot \ 
   --attribute-name restore \ 
   --values-to-add 123456789012
```

**Output:**

```json
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotIdentifier": "myclustersnapshot",
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "123456789012"
            ]
         }
      ]
   }
}
```

For more information, see [Restoring from a DB Cluster Snapshot](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/USER_WorkingWithDBClusterSnapshots.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster-snapshot-attribute.html) in *AWS CLI Command Reference*.

modify-db-cluster

The following code example shows how to use `modify-db-cluster`.

Actions and scenarios
Example 1: To modify a DB cluster

The following modify-db-cluster example changes the master user password for the DB cluster named cluster-2 and sets the backup retention period to 14 days. The --apply-immediately parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-cluster \
    --db-cluster-identifier cluster-2 \
    --backup-retention-period 14 \
    --master-user-password newpassword99 \
    --apply-immediately
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 14,
        "DatabaseName": "",
        "DBClusterIdentifier": "cluster-2",
        "DBClusterParameterGroup": "default.aurora5.6",
        "DBSubnetGroup": "default-vpc-2305ca49",
        "Status": "available",
        "EarliestRestorableTime": "2020-06-03T02:07:29.637Z",
        "Endpoint": "cluster-2.cluster-############.eu-central-1.rds.amazonaws.com",

            }
        ]
    }
}
```
modify-db-instance

The following code example shows how to use modify-db-instance.

**AWS CLI**

**Example 1: To modify a DB instance**

The following modify-db-instance example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The --apply-immediately parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-instance \
   --db-instance-identifier database-2 \
   --option-group-name test-se-2017 \
   --db-parameter-group-name test-sqlserver-se-2017 \
   --apply-immediately
```

Output:

```
{
   "DBInstance": {
      "DBInstanceIdentifier": "database-2",
      "DBInstanceClass": "db.r4.large",
      "Engine": "sqlserver-se",
      "DBInstanceStatus": "available",
      ...
   }
}
```

For more information, see [Controlling access with security groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbCluster](#) in *AWS CLI Command Reference.*
For more information, see Modifying an Amazon RDS DB Instance in the Amazon RDS User Guide.

**Example 2: To associate VPC security group with a DB instance**

The following modify-db-instance example associates a specific VPC security group and removes DB security groups from a DB instance:

```bash
cmd
aws rds modify-db-instance \   --db-instance-identifier dbName 
```
Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "dbName",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "available",
        "MasterUsername": "admin",
        "Endpoint": {
            "Address": "dbName.abcdefghijk.us-west-2.rds.amazonaws.com",
            "Port": 3306,

        ...
    }
}
```

For more information, see [Controlling access with security groups](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_VPC_SECURITYGROUPS.html) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDBInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-instance.html) in *AWS CLI Command Reference*. 

---

*Actions and scenarios*  

Page 5166
modify-db-parameter-group

The following code example shows how to use modify-db-parameter-group.

AWS CLI

To modify a DB parameter group

The following modify-db-parameter-group example changes the value of the clr enabled parameter in a DB parameter group. The --apply-immediately parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-parameter-group \
   --db-parameter-group-name test-sqlserver-se-2017 \
   --parameters "ParameterName='clr enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
   "DBParameterGroupName": "test-sqlserver-se-2017"
}
```

For more information, see Modifying Parameters in a DB Parameter Group in the Amazon RDS User Guide.

- For API details, see ModifyDBParameterGroup in AWS CLI Command Reference.

modify-db-proxy-endpoint

The following code example shows how to use modify-db-proxy-endpoint.

AWS CLI

To modify a DB proxy endpoint for an RDS database

The following modify-db-proxy-endpoint example modifies a DB proxy endpoint proxyEndpoint to set the read-timeout to 65 seconds.

```
aws rds modify-db-proxy-endpoint \
   --db-proxy-endpoint-name proxyEndpoint \
```

Actions and scenarios
Output:

```json
{
  "DBProxyEndpoint":{
    "DBProxyEndpointName": "proxyEndpoint",
    "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
    "DBProxyName": "proxyExample",
    "Status": "available",
    "VpcId": "vpc-1234567",
    "VpcSecurityGroupIds": [
      "sg-1234"
    ],
    "VpcSubnetIds": [
      "subnetgroup1",
      "subnetgroup2"
    ],

    "TargetRole": "READ_WRITE",
    "IsDefault": "false"
  }
}
```

For more information, see [Modifying a proxy endpoint](https://docs.aws.amazon.com/rds/latest/userguide/RDS-DBProxy.ModifyProxy.html) in the *Amazon RDS User Guide* and [Modifying a proxy endpoint](https://docs.aws.amazon.com/aurora/latest/userguide/AURORA_DB_PROXY.ModifyProxy.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbProxyEndpoint](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-proxy-endpoint.html) in *AWS CLI Command Reference*.

### modify-db-proxy-target-group

The following code example shows how to use `modify-db-proxy-target-group`.

**AWS CLI**

To modify a DB proxy endpoints

The following `modify-db-proxy-target-group` example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.
aws rds modify-db-proxy-target-group \
  --target-group-name default \
  --db-proxy-name proxyExample \
  --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10

Output:

```json
{
  "DBProxyTargetGroup": {
    "DBProxyName": "proxyExample",
    "TargetGroupName": "default",
    "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-tg-0123a01b12345c0ab",
    "IsDefault": true,
    "Status": "available",
    "ConnectionPoolConfig": {
      "MaxConnectionsPercent": 80,
      "MaxIdleConnectionsPercent": 10,
      "ConnectionBorrowTimeout": 120,
      "SessionPinningFilters": []
    },
    "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
    "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
  }
}
```

For more information, see Modifying an RDS Proxy in the Amazon RDS User Guide and Modifying an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see ModifyDbProxyTargetGroup in AWS CLI Command Reference.

modify-db-proxy

The following code example shows how to use modify-db-proxy.

AWS CLI

To modify a DB proxy for an RDS database

The following modify-db-proxy example modifies a DB proxy named proxyExample to require SSL for its connections.

Actions and scenarios
aws rds modify-db-proxy
   --db-proxy-name proxyExample
   --require-tls

Output:

{
   "DBProxy":{
      "DBProxyName": "proxyExample",
      "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
      "Status": "modifying",
      "EngineFamily": "PostgreSQL",
      "VpcId": "sg-1234567",
      "VpcSecurityGroupIds": ["sg-1234"],
      "VpcSubnetIds": ["subnetgroup1", "subnetgroup2"],
      "Auth": [
         {
            "Description": "proxydescription1",
            "AuthScheme": "SECRETS",
            "IAMAuth": "DISABLED"
         }
      ],
      "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
      "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "RequireTLS": true,
      "IdleClientTimeout": 1800,
      "DebuggingLogging": false,
      "CreatedAt": "2023-04-05T16:09:33.452000+00:00",
      "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
   }
}

- For API details, see [ModifyDbProxy](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-proxy.html) in *AWS CLI Command Reference*.

modify-db-shard-group

The following code example shows how to use modify-db-shard-group.

**AWS CLI**

**Example 1: To modify a DB shard group**

The following modify-db-shard-group example changes the maximum capacity of a DB shard group.

```bash
aws rds modify-db-shard-group \
   --db-shard-group-identifier my-db-shard-group \
   --max-acu 1000
```

**Output:**

```
{
   "DBShardGroups": [ 
      {
         "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
         "DBShardGroupIdentifier": "my-db-shard-group",
         "DBClusterIdentifier": "my-sv2-cluster",
         "MaxACU": 768.0,
         "ComputeRedundancy": 0,
         "Status": "available",
         "PubliclyAccessible": false,
         "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
      }
   ]
}
```

For more information, see [Amazon Aurora DB Clusters](https://docs.aws.amazon.com/Aurora/latest/AuroraDBProxyUserGuide/what-you-cannot-do.html) in the *Amazon Aurora User Guide*.

**Example 2: To describe your DB shard groups**
The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `modify-db-shard-group` command. The maximum capacity of the DB shard group `my-db-shard-group` is now 1000 Aurora capacity units (ACUs).

```
aws rds describe-db-shard-groups
```

Output:

```json
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see [Amazon Aurora DB Clusters](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/index.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbShardGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-shard-group.html) in *AWS CLI Command Reference*.

### modify-db-snapshot-attribute

The following code example shows how to use `modify-db-snapshot-attribute`.
AWS CLI

**Example 1: To enable two AWS accounts to restore a DB snapshot**

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```bash
aws rds modify-db-snapshot-attribute \
  --db-snapshot-identifier mydbsnapshot \
  --attribute-name restore \
  --values-to-add "111122223333","444455556666"
```

Output:

```json
{
  "DBSnapshotAttributesResult": {
    "DBSnapshotIdentifier": "mydbsnapshot",
    "DBSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValue": ["111122223333", "444455556666"]
      }
    ]
  }
}
```

For more information, see [Sharing a Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/任务.共享快照.html) in the *Amazon RDS User Guide*.

**Example 2: To prevent an AWS account from restoring a DB snapshot**

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```bash
aws rds modify-db-snapshot-attribute \
  --db-snapshot-identifier mydbsnapshot \
  --attribute-name restore \
  --values-to-remove 444455556666
```
Output:

```json
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333"
                ]
            }
        ]
    }
}
```

For more information, see [Sharing a Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Concepts.SharedSnapshots.html) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-snapshot-attribute.html) in *AWS CLI Command Reference*.

**modify-db-snapshot-attribute**

The following code example shows how to use `modify-db-snapshot-attribute`.

**AWS CLI**

**To modify a DB snapshot attribute**

The following `modify-db-snapshot-attribute` example permits two AWS account identifiers, 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```sh
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add '"111122223333","444455556666"'
```

Output:

```json
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
```
"DBSnapshotAttributes": [ 
  { 
    "AttributeName": "restore", 
    "AttributeValues": [ 
      "111122223333", 
      "444455556666"
    ]
  }
]
}

For more information, see Sharing a Snapshot in the Amazon RDS User Guide.

- For API details, see ModifyDbSnapshotAttributes in AWS CLI Command Reference.

**modify-db-snapshot**

The following code example shows how to use modify-db-snapshot.

**AWS CLI**

**To modify a DB snapshot**

The following modify-db-snapshot example upgrades a PostgreSQL 10.6 snapshot named db5-snapshot-upg-test to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is available.

```bash
aws rds modify-db-snapshot \
  --db-snapshot-identifier db5-snapshot-upg-test \
  --engine-version 11.7
```

**Output:**

```json
{
  "DBSnapshot": {
    "DBSnapshotIdentifier": "db5-snapshot-upg-test",
    "DBInstanceIdentifier": "database-5",
    "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",
    "Engine": "postgres",
    "AllocatedStorage": 20,
    "Status": "upgrading",
    "Port": 5432,
    "StatusMessage": "Upgrading"  
  }
}
```
"AvailabilityZone": "us-west-2a",
"VpcId": "vpc-2ff27557",
"InstanceCreateTime": "2020-03-27T19:59:04.735Z",
"MasterUsername": "postgres",
"EngineVersion": "10.6",
"LicenseModel": "postgresql-license",
"SnapshotType": "manual",
"OptionGroupName": "default:postgres-11",
"PercentProgress": 100,
"StorageType": "gp2",
"Encrypted": false,
"IAMDatabaseAuthenticationEnabled": false,
"ProcessorFeatures": [],
"DbiResourceId": "db-GJMF75LM42IL6BTFRE4UZJ5YM4"
}

For more information, see Upgrading a PostgreSQL DB Snapshot in the Amazon RDS User Guide. For API details, see ModifyDbSnapshot in AWS CLI Command Reference.

modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify a DB subnet group

The following modify-db-subnet-group example adds a subnet with the ID subnet-08e41f9e230222222 to the DB subnet group named mysubnetgroup. To keep the existing subnets in the subnet group, include their IDs as values in the --subnet-ids option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```
aws rds modify-db-subnet-group \\
  --db-subnet-group-name mysubnetgroup \\
  --subnet-ids \\
  '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaa","subnet-00f5b198bc0abcdef","subnet-
```

Output:
For more information, see Step 3: Create a DB Subnet Group in the Amazon RDS User Guide.
modify-event-subscription

The following code example shows how to use modify-event-subscription.

**AWS CLI**

**To modify an event subscription**

The following modify-event-subscription example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```
aws rds modify-event-subscription \
  --subscription-name my-instance-events \
  --no-enabled
```

**Output:**

```
{
  "EventSubscription": {
    "EventCategoriesList": [
      "backup",
      "recovery"
    ],
    "CustomerAwsId": "123456789012",
    "SourceType": "db-instance",
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
    "CustSubscriptionId": "my-instance-events",
    "Status": "modifying",
    "Enabled": false
  }
}
```

• For API details, see [ModifyEventSubscription](#) in *AWS CLI Command Reference*. 
modify-global-cluster

The following code example shows how to use modify-global-cluster.

AWS CLI

To modify a global DB cluster

The following modify-global-cluster example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```
aws rds modify-global-cluster \\
  --global-cluster-identifier myglobalcluster \\
  --deletion-protection
```

Output:

```
{
  "GlobalCluster": {

    "EngineVersion": "5.7.mysql_aurora.2.07.2",
    "StorageEncrypted": false,
    "DeletionProtection": true,
    "GlobalClusterMembers": []
  }
}
```

For more information, see Managing an Aurora global database in the Amazon Aurora User Guide.

- For API details, see ModifyGlobalCluster in AWS CLI Command Reference.

promote-read-replica-db-cluster

The following code example shows how to use promote-read-replica-db-cluster.
AWS CLI

To promote a DB cluster read replica

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```
aws rds promote-read-replica-db-cluster \
   --db-cluster-identifier mydbcluster-1
```

Output:

```
{
   "DBCluster": {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1b",
         "us-east-1c"
      ],
      "BackupRetentionPeriod": 1,
      "DatabaseName": "",
      "DBClusterIdentifier": "mydbcluster-1",
      ...some output truncated...
   }
}
```

For more information, see Promoting a read replica to be a DB cluster in the Amazon Aurora User Guide.

- For API details, see PromoteReadReplicaDbCluster in AWS CLI Command Reference.

promote-read-replica

The following code example shows how to use `promote-read-replica`.

AWS CLI

To promote a read replica

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.
aws rds promote-read-replica \
   --db-instance-identifier test-instance-repl

Output:

```json
{
  "DBInstance": {
    "StorageType": "standard",
    "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
    "DBInstanceStatus": "modifying",
    ...some output truncated...
  }
}
```

- For API details, see [PromoteReadReplica](#) in *AWS CLI Command Reference*.

**purchase-reserved-db-instance**

The following code example shows how to use `purchase-reserved-db-instance`.

**AWS CLI**

To purchase a reserved DB instance offering

The following `purchase-reserved-db-instances-offering` example purchases a reserved DB instance offering. The `reserved-db-instances-offering-id` must be a valid offering ID, as returned by the `describe-reserved-db-instances-offering` command.

```bash
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 438012d3-4a52-4cc7-b2e3-8dff72e0e706
```

- For API details, see [PurchaseReservedDbInstance](#) in *AWS CLI Command Reference*.

**purchase-reserved-db-instances-offerings**

The following code example shows how to use `purchase-reserved-db-instances-offerings`.

**AWS CLI**

Example 1: To find a reserved DB instance to purchase
The following `describe-reserved-db-instances-offerings` example lists the available reserved MySQL DB instances with the `db.t2.micro` instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description mysql \
    --db-instance-class db.t2.micro \
    --duration 1
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
            "DBInstanceClass": "db.t2.micro",
            "Duration": 31536000,
            "FixedPrice": 51.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "ProductDescription": "mysql",
            "OfferingType": "Partial Upfront",
            "MultiAZ": false,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.006,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        },
        ... some output truncated ...
    ]
}
```

For more information, see [Reserved DB Instances for Amazon RDS](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_ReserveDBInstances.html) in the [Amazon RDS User Guide](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/).  

**Example 2: To purchase a reserved DB instance**

The following `purchase-reserved-db-instances-offering` example shows how to buy the reserved DB instance offering from the previous example.
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 8ba30be1-b9ec-447f-8f23-6114e3f4c7b4

Output:

```
{
    "ReservedDBInstance": {
        "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
        "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
        "DBInstanceClass": "db.t2.micro",
        "StartTime": "2020-06-29T16:54:57.670Z",
        "Duration": 31536000,
        "FixedPrice": 51.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "DBInstanceCount": 1,
        "ProductDescription": "mysql",
        "OfferingType": "Partial Upfront",
        "MultiAZ": false,
        "State": "payment-pending",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.006,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
    }
}
```

For more information, see [Reserved DB Instances for Amazon RDS](https://docs.aws.amazon.com/rds/latest/userguide/_RESERVED_DB_INSTANCES.html) in the Amazon RDS User Guide.

- For API details, see [PurchaseReservedDbInstancesOfferings](https://docs.aws.amazon.com/cli/latest/reference/rds/purchase-reserved-db-instances-offering.html) in AWS CLI Command Reference.

**reboot-db-instance**

The following code example shows how to use reboot-db-instance.

**AWS CLI**

To reboot a DB instance
The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```
aws rds reboot-db-instance \
   --db-instance-identifier test-mysql-instance
```

Output:

```json
{
   "DBInstance": {
      "DBInstanceIdentifier": "test-mysql-instance",
      "DBInstanceClass": "db.t3.micro",
      "Engine": "mysql",
      "DBInstanceStatus": "rebooting",
      "MasterUsername": "admin",
      "Endpoint": {
         "Address": "test-mysql-instance.############.us-west-2.rds.amazonaws.com",
         "Port": 3306,
         "HostedZoneId": "Z1PVIF0EXAMPLE"
      },
      ...
      output omitted...
   }
}
```

For more information, see [Rebooting a DB Instance](https://docs.aws.amazon.com/rds/latest/userguide/Rebooting-a-DB-Instance.html) in the Amazon RDS User Guide.

- For API details, see [RebootDBInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/reboot-db-instance.html) in AWS CLI Command Reference.

**reboot-db-shard-group**

The following code example shows how to use `reboot-db-shard-group`.

**AWS CLI**

**Example 1: To reboot a DB shard group**

The following `reboot-db-shard-group` example reboots a DB shard group.

```
aws rds reboot-db-shard-group \
   --db-shard-group-identifier test-mysql-shard-group
```
Example 2: To describe your DB shard groups

The following describe-db-shard-groups example retrieves the details of your DB shard groups after you run the reboot-db-shard-group command. The DB shard group my-db-shard-group is now rebooting.

```bash
aws rds describe-db-shard-groups
```

Output:

```json
{
   "DBShardGroups": [
   {
      "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
      "DBShardGroupIdentifier": "limitless-test-shard-grp",
      "DBClusterIdentifier": "limitless-test-cluster",
      "MaxACU": 768.0,
      "ComputeRedundancy": 0,
      "PubliclyAccessible": false,
      "Endpoint": "my-sv2-cluster.limitless-cekyexample.us-east-2.rds.amazonaws.com"
   }
   ]
}
```
For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the Amazon Aurora User Guide.

- For API details, see RebootDbShardGroup in AWS CLI Command Reference.

**register-db-proxy-targets**

The following code example shows how to use `register-db-proxy-targets`.

**AWS CLI**

**To register a DB proxy with a database**

The following `register-db-proxy-targets` example creates the association between a database and a proxy.

```bash
aws rds register-db-proxy-targets \
  --db-proxy-name proxyExample \
  --db-cluster-identifiers database-5
```

Output:

```json
{
}
```
"DBProxyTargets": [
  {
    "RdsResourceId": "database-5",
    "Port": 3306,
    "Type": "TRACKED_CLUSTER",
    "TargetHealth": {
      "State": "REGISTERING"
    }
  },
  {
    "Endpoint": "database-5instance-1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
    "RdsResourceId": "database-5",
    "Port": 3306,
    "Type": "RDS_INSTANCE",
    "TargetHealth": {
      "State": "REGISTERING"
    }
  }
]

- For API details, see [RegisterDbProxyTargets](https://docs.aws.amazon.com/cli/latest/reference/rds/register-db-proxy-targets.html) in AWS CLI Command Reference.

**remove-from-global-cluster**

The following code example shows how to use `remove-from-global-cluster`.

### AWS CLI

#### To detach an Aurora secondary cluster from an Aurora global database cluster

The following `remove-from-global-cluster` example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```bash
aws rds remove-from-global-cluster \
  --region us-west-2 \
  --global-cluster-identifier myglobalcluster
```
Output:

```json
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-abc123def456gh",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.11",
        "StorageEncrypted": true,
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "Readers": [
                ],
                "IsWriter": true
            },
            {
                "Readers": [],
                "IsWriter": false,
                "GlobalWriteForwardingStatus": "disabled"
            }
        ]
    }
}
```

For more information, see [Removing a cluster from an Amazon Aurora global database](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/GUID-REM-CLR-CLUSTER-DELETE.html) in the Amazon Aurora User Guide.

- For API details, see [RemoveFromGlobalCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/remove-from-global-cluster.html) in AWS CLI Command Reference.

**remove-option-from-option-group**

The following code example shows how to use `remove-option-from-option-group`.
AWS CLI

To delete an option from an option group

The following `remove-option-from-option-group` example removes the OEM option from `myoptiongroup`.

```bash
aws rds remove-option-from-option-group \
   --option-group-name myoptiongroup \
   --options OEM \
   --apply-immediately
```

Output:

```json
{
   "OptionGroup": {
      "OptionGroupName": "myoptiongroup",
      "OptionGroupDescription": "Test",
      "EngineName": "oracle-ee",
      "MajorEngineVersion": "19",
      "Options": [],
      "AllowsVpcAndNonVpcInstanceMemberships": true,
      "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
   }
}
```

For more information, see [Removing an Option from an Option Group](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-security-group.html) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveOptionFromOptionGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/remove-option-from-option-group.html) in *AWS CLI Command Reference*.

remove-role-from-db-cluster

The following code example shows how to use `remove-role-from-db-cluster`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```bash
aws rds remove-role-from-db-cluster \
```
This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the Amazon Aurora User Guide.

- For API details, see RemoveRoleFromDbCluster in AWS CLI Command Reference.

**remove-role-from-db-instance**

The following code example shows how to use remove-role-from-db-instance.

**AWS CLI**

To disassociate an AWS Identity and Access Management (IAM) role from a DB instance

The following remove-role-from-db-instance example removes the role named rds-s3-integration-role from an Oracle DB instance named test-instance.

```
aws rds remove-role-from-db-instance \\
    --db-instance-identifier test-instance \\
    --feature-name S3_INTEGRATION \\
    --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Disabling RDS SQL Server Integration with S3 in the Amazon RDS User Guide.

- For API details, see RemoveRoleFromDbInstance in AWS CLI Command Reference.

**remove-source-identifier-from-subscription**

The following code example shows how to use remove-source-identifier-from-subscription.

**AWS CLI**

To remove a source identifier from a subscription
The following remove-source-identifier example removes the specified source identifier from an existing subscription.

```bash
aws rds remove-source-identifier-from-subscription \
  --subscription-name my-instance-events \
  --source-identifier test-instance-repl
```

Output:

```json
{
  "EventSubscription": {
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
    "EventCategoriesList": [
      "backup",
      "recovery"
    ],
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
    "Status": "modifying",
    "CustSubscriptionId": "my-instance-events",
    "CustomerAwsId": "123456789012",
    "SourceIdsList": [
      "test-instance"
    ],
    "SourceType": "db-instance",
    "Enabled": false
  }
}
```

- For API details, see [RemoveSourceIdentifierFromSubscription](#) in AWS CLI Command Reference.

**remove-tags-from-resource**

The following code example shows how to use remove-tags-from-resource.

**AWS CLI**

**To remove tags from a resource**

The following remove-tags-from-resource example removes tags from a resource.
This command produces no output.

For more information, see [Tagging Amazon RDS resources](https://aws.amazon.com/rds/userguide) in the *Amazon RDS User Guide* and [Tagging Amazon RDS resources](https://aws.amazon.com/aurora/userguide) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveTagsFromResource](https://docs.aws.amazon.com/cli/latest/reference/rds/remove-tags-from-resource.html) in *AWS CLI Command Reference*.

### reset-db-cluster-parameter-group

The following code example shows how to use `reset-db-cluster-parameter-group`.

#### AWS CLI

**Example 1: To reset all parameters to their default values**

The following `reset-db-cluster-parameter-group` example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```bash
aws rds reset-db-cluster-parameter-group
   --db-cluster-parameter-group-name mydbclpg
   --reset-all-parameters
```

Output:

```json
{
   "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](https://aws.amazon.com/aurora/userguide) in the *Amazon Aurora User Guide*.

**Example 2: To reset specific parameters to their default values**

The following `reset-db-cluster-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```bash
aws rds reset-db-cluster-parameter-group
```
The following code example shows how to use `reset-db-parameter-group`.

**AWS CLI**

**Example 1: To reset all parameters to their default values**

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```bash/aws rds reset-db-parameter-group \
   --db-parameter-group-name mypg \
   --reset-all-parameters
```

Output:

```
{
   "DBParameterGroupName": "mypg"
}
```

For more information, see [Working with DB parameter groups](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/working-with-db-parameter-groups.html) in the Amazon RDS User Guide and [Working with DB parameter groups and DB cluster parameter groups](https://docs.aws.amazon.com/Aurora/latest/UserGuide/working-with-db-parameter-groups.html) in the Amazon Aurora User Guide.

**Example 2: To reset specific parameters to their default values**
The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --parameters "ParameterName=max_connections,ApplyMethod=immediate" \
    "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

- For API details, see [ResetDbParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/reset-db-parameter-group.html) in *AWS CLI Command Reference*.

### restore-db-cluster-from-s3

The following code example shows how to use `restore-db-cluster-from-s3`.

**AWS CLI**

**To restore an Amazon Aurora DB cluster from Amazon S3**

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```
aws rds restore-db-cluster-from-s3 \
    --db-cluster-identifier cluster-s3-restore \
    --engine aurora-mysql \
    --master-username admin \
    --master-user-password mypassword \
    --s3-bucket-name mybucket \
    --s3-prefix test-backup \
    --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup \
    --source-engine mysql \
    --source-engine-version 5.7.28
```
Output:
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "cluster-s3-restore",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "cluster-s3-restore.cluster-co3xyzabc123.us-west-2.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-s3-restore.cluster-ro-co3xyzabc123.us-west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.12",
        "Port": 3306,
        "MasterUsername": "admin",
        "PreferredBackupWindow": "11:15-11:45",
        "PreferredMaintenanceWindow": "thu:12:19-thu:12:49",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z1PVIF0EXAMPLE",
        "StorageEncrypted": false,
        "DbClusterResourceId": "cluster-SU5THYQQHOWCZDDGXREXAMPLE",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": false,
        "EngineMode": "provisioned",
        "DeletionProtection": false,
    }
}
For more information, see [Migrating Data from MySQL by Using an Amazon S3 Bucket](https://docs.aws.amazon.com/aurora/latest/userguide/migrate-to-aurora-mysql.html) in the Amazon Aurora User Guide.

- For API details, see [RestoreDbClusterFromS3](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-cluster-from-s3.html) in AWS CLI Command Reference.

**restore-db-cluster-from-snapshot**

The following code example shows how to use `restore-db-cluster-from-snapshot`.

**AWS CLI**

**To restore a DB cluster from a snapshot**

The following `restore-db-cluster-from-snapshot` restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```bash
aws rds restore-db-cluster-from-snapshot
  --db-cluster-identifier newdbcluster
  --snapshot-identifier test-instance-snapshot
  --engine aurora-postgresql
  --engine-version 10.7
```

**Output:**

```json
{
   "DBCluster": {
       "AllocatedStorage": 1,
       "AvailabilityZones": [
           "us-west-2c",
           "us-west-2a",
           "us-west-2b"
       ],
       "BackupRetentionPeriod": 7,
       "DatabaseName": "",
   }
}
```
For more information, see [Restoring from a DB Cluster Snapshot](#) in the [Amazon Aurora User Guide](#).

- For API details, see [RestoreDbClusterFromSnapshot](#) in [AWS CLI Command Reference](#).
restore-db-cluster-to-point-in-time

The following code example shows how to use restore-db-cluster-to-point-in-time.

AWS CLI

To restore a DB cluster to a specified time

The following restore-db-cluster-to-point-in-time example restores the DB cluster named database-4 to the latest possible time. Using copy-on-write as the restore type restores the new DB cluster as a clone of the source DB cluster.

```bash
aws rds restore-db-cluster-to-point-in-time
  --source-db-cluster-identifier database-4 \
  --db-cluster-identifier sample-cluster-clone \
  --restore-type copy-on-write \n  --use-latest-restorable-time
```

Output:

```json
{
  "DBCluster": {
    "AllocatedStorage": 1,
    "AvailabilityZones": [
      "us-west-2c",
      "us-west-2a",
      "us-west-2b"
    ],
    "BackupRetentionPeriod": 7,
    "DatabaseName": "",
    "DBClusterIdentifier": "sample-cluster-clone",
    "DBClusterParameterGroup": "default.aurora-postgresql10",
    "DBSubnetGroup": "default",
    "Status": "creating",
    "Endpoint": "sample-cluster-clone.cluster-############.us-west-2.rds.amazonaws.com",
    "ReaderEndpoint": "sample-cluster-clone.cluster-ro-############.us-west-2.rds.amazonaws.com",
    "MultiAZ": false,
    "Engine": "aurora-postgresql",
    "EngineVersion": "10.7",
    "Port": 5432,
  }
}
```
For more information, see [Restoring a DB Cluster to a Specified Time](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-cluster-recovery.html) in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-cluster-point-in-time.html) in *AWS CLI Command Reference*.

### restore-db-instance-from-db-snapshot

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

**AWS CLI**

To restore a DB instance from a DB snapshot
The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```bash
aws rds restore-db-instance-from-db-snapshot \
  --db-instance-identifier db7-new-instance \
  --db-snapshot-identifier db7-test-snapshot \
  --db-instance-class db.t3.small
```

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "db7-new-instance",
    "DBInstanceClass": "db.t3.small",
    "Engine": "mysql",
    "DBInstanceStatus": "creating",
    ...output omitted...
    "PreferredMaintenanceWindow": "mon:07:37-mon:08:07",
    "PendingModifiedValues": {},
    "MultiAZ": false,
    "EngineVersion": "5.7.22",
    "AutoMinorVersionUpgrade": true,
    "ReadReplicaDBInstanceIdentifiers": [],
    "LicenseModel": "general-public-license",
    ...output omitted...
    "IAMDatabaseAuthenticationEnabled": false,
    "PerformanceInsightsEnabled": false,
    "DeletionProtection": false,
    "AssociatedRoles": []
  }
}
```

For more information, see [Restoring from a DB Snapshot](https://docs.aws.amazon.com/rds/latest/userguide/(DB-Concepts.RestoreDBInstanceFromDbSnapshot.html) in the *[Amazon RDS User Guide](https://docs.aws.amazon.com/rds/latest/userguide/)*.

- For API details, see [RestoreDbInstanceFromDbSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-instance-from-db-snapshot.html) in *[AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/)*.
**restore-db-instance-from-s3**

The following code example shows how to use `restore-db-instance-from-s3`.

**AWS CLI**

**To restore a DB instance from a backup in Amazon S3**

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```
aws rds restore-db-instance-from-s3 \
    --db-instance-identifier restored-test-instance \
    --allocated-storage 250 --db-instance-class db.m4.large --engine mysql \
    --master-username master --master-user-password secret99 \
    --s3-bucket-name my-backups --s3-ingestion-role-arn arn:aws:iam::123456789012:role/my-role \
    --source-engine mysql --source-engine-version 5.6.27
```

- For API details, see [RestoreDbInstanceFromS3](#) in *AWS CLI Command Reference*.

---

**restore-db-instance-to-point-in-time**

The following code example shows how to use `restore-db-instance-to-point-in-time`.

**AWS CLI**

**Example 1: To restore a DB instance to a point in time**

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-identifier test-instance \
    --target-db-instance restored-test-instance \
    --restore-time 2018-07-30T23:45:00.000Z
```

Output:

```
{
}
```
"DBInstance": {
  "AllocatedStorage": 20,
  "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:restored-test-instance",
  "DBInstanceStatus": "creating",
  "DBInstanceIdentifier": "restored-test-instance",
  ...some output omitted...
}
}

For more information, see Restoring a DB instance to a specified time in the Amazon RDS User Guide.

Example 2: To restore a DB instance to a specified time from a replicated backup

The following restore-db-instance-to-point-in-time example restores an Oracle DB instance to the specified time from a replicated automated backup.

```bash
aws rds restore-db-instance-to-point-in-time \
  --source-db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example" \
  --target-db-instance-identifier myorclinstance-from-replicated-backup \
  --restore-time 2020-12-08T18:45:00.000Z
```

Output:

```json
{
  "DBInstance": {
    "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "oracle-se2",
    "DBInstanceStatus": "creating",
    "MasterUsername": "admin",
    "DBName": "ORCL",
    "AllocatedStorage": 20,
    "PreferredBackupWindow": "07:45-08:15",
    "BackupRetentionPeriod": 14,
    ... some output omitted ...
    "DbiResourceId": "db-KGLXG75BGVIWKQT7NQ4EXAMPLE",
    "CACertificateIdentifier": "rds-ca-2019",
    "CertificateIdentifier": "rds-ca-2019",
    "CopyTagsToSnapshot": false,
```
The following code example shows how to use `start-activity-stream`.

**AWS CLI**

To start a database activity stream

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named `my-pg-cluster`.

```
aws rds start-activity-stream \
   --region us-east-1 \
   --mode async \
   --kms-key-id arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-h123-456i789jk0l1 \
   --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
   --apply-immediately
```

Output:

```
{
   "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-h123-456i789jk0l1",
   "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFHIJKLM2NOPQ3R4S",
   "Status": "starting",
}
```
"Mode": "async",
   "ApplyImmediately": true
}

For more information, see Starting a database activity stream in the Amazon Aurora User Guide.

- For API details, see StartActivityStream in AWS CLI Command Reference.

**start-db-cluster**

The following code example shows how to use start-db-cluster.

**AWS CLI**

**To start a DB cluster**

The following start-db-cluster example starts a DB cluster and its DB instances.

```bash
aws rds start-db-cluster \
   --db-cluster-identifier mydbcluster
```

Output:

```json
{
   "DBCluster": {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1e",
         "us-east-1b"
      ],
      "BackupRetentionPeriod": 1,
      "DatabaseName": "mydb",
      "DBClusterIdentifier": "mydbcluster",
      ...some output truncated...
   }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the Amazon Aurora User Guide.

- For API details, see StartDbCluster in AWS CLI Command Reference.
**start-db-instance-automated-backups-replication**

The following code example shows how to use `start-db-instance-automated-backups-replication`.

**AWS CLI**

**To enable cross-Region automated backups**

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```
aws rds start-db-instance-automated-backups-replication \
   --region us-west-2 \
   --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \
   --backup-retention-period 14
```

Output:

```
{
   "DBInstanceAutomatedBackup": {
      "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
      "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
      "Region": "us-east-1",
      "DBInstanceIdentifier": "new-orcl-db",
      "RestoreWindow": {},
      "AllocatedStorage": 20,
      "Status": "pending",
      "Port": 1521,
      "InstanceCreateTime": "2020-12-04T15:28:31Z",
      "MasterUsername": "admin",
      "Engine": "oracle-se2",
      "EngineVersion": "12.1.0.2.v21",
      "LicenseModel": "bring-your-own-license",
      "OptionGroupName": "default:oracle-se2-12-1",
      "Encrypted": false,
      "StorageType": "gp2",
      "IAMDatabaseAuthenticationEnabled": false,
      "BackupRetentionPeriod": 14,
      "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
   }
}```
For more information, see Enabling cross-Region automated backups in the Amazon RDS User Guide.

- For API details, see StartDbInstanceAutomatedBackupsReplication in AWS CLI Command Reference.

**start-db-instance**

The following code example shows how to use start-db-instance.

**AWS CLI**

**To start a DB instance**

The following start-db-instance example starts the specified DB instance.

```bash
aws rds start-db-instance \
   --db-instance-identifier test-instance
```

Output:

```json
{
   "DBInstance": {
      "DBInstanceStatus": "starting",
      ...some output truncated...
   }
}
```

- For API details, see StartDbInstance in AWS CLI Command Reference.

**start-export-task**

The following code example shows how to use start-export-task.

**AWS CLI**

**To export a snapshot to Amazon S3**

The following start-export-task example exports a DB snapshot named db5-snapshot-test to the Amazon S3 bucket named mybucket.
aws rds start-export-task \
   --export-task-identifier my-s3-export \
   --s3-bucket-name mybucket \
   --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole \
   --kms-key-id arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabbccddeeff

Output:

```json
{
   "ExportTaskIdentifier": "my-s3-export",
   "SnapshotTime": "2020-03-27T20:48:42.023Z",
   "S3Bucket": "mybucket",
   "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabbccddeeff",
   "Status": "STARTING",
   "PercentProgress": 0,
   "TotalExtractedDataInGB": 0
}
```

For more information, see [Exporting a Snapshot to an Amazon S3 Bucket](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_SnapshotS3.html) in the *Amazon RDS User Guide*.

- For API details, see [StartExportTask](https://docs.aws.amazon.com/cli/latest/reference/rds/start-export-task.html) in *AWS CLI Command Reference*.

### stop-activity-stream

The following code example shows how to use `stop-activity-stream`.

**AWS CLI**

**To stop a database activity stream**

The following `stop-activity-stream` example stops an activity stream in an Aurora cluster named `my-pg-cluster`.

```
aws rds stop-activity-stream \
   --region us-east-1 \
```
The following code example shows how to use `stop-db-cluster`.

**AWS CLI**

**To stop a DB cluster**

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \
   --db-cluster-identifier mydbcluster
```

Output:

```
{
   "DBCluster": {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1e",
         "us-east-1b"
      ],
      "BackupRetentionPeriod": 1,
      "DatabaseName": "mydb",
      "DBClusterIdentifier": "mydbcluster",
      "Status": "stopped"
   }
}
```

For more information, see the [Amazon Aurora User Guide](https://docs.aws.amazon.com/aurora/latest/userguide/). For API details, see [StopActivityStream](https://docs.aws.amazon.com/cli/latest/reference/rds/stop-activity-stream.html) in the [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/index.html).
For more information, see STOPPING AND STARTING AN AMAZON AURORA DB CLUSTER in the Amazon Aurora User Guide.

- For API details, see STOPDBCLUSTER in AWS CLI Command Reference.

**stop-db-instance-automated-backups-replication**

The following code example shows how to use stop-db-instance-automated-backups-replication.

**AWS CLI**

**To stop replicating automated backups**

The following `stop-db-instance-automated-backups-replication` ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```bash
aws rds stop-db-instance-automated-backups-replication \
   --region us-west-2 \
```

**Output:**

```
{
   "DBInstanceAutomatedBackup": {
      "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
      "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
      "Region": "us-east-1",
      "DBInstanceIdentifier": "new-orcl-db",
      "RestoreWindow": {
         "LatestTime": "2020-12-07T19:59:57Z"
      },
      "AllocatedStorage": 20,
      "Status": "replicating",
      "Port": 1521,
      "InstanceCreateTime": "2020-12-04T15:28:31Z",
```

...some output truncated...
"MasterUsername": "admin",
"Engine": "oracle-se2",
"EngineVersion": "12.1.0.2.v21",
"LicenseModel": "bring-your-own-license",
"OptionGroupName": "default:oracle-se2-12-1",
"Encrypted": false,
"StorageType": "gp2",
"IAMDatabaseAuthenticationEnabled": false,
"BackupRetentionPeriod": 7,
"DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
}
}

For more information, see Stopping automated backup replication in the Amazon RDS User Guide.

- For API details, see StopDbInstanceAutomatedBackupsReplication in AWS CLI Command Reference.

**stop-db-instance**

The following code example shows how to use stop-db-instance.

**AWS CLI**

**To stop a DB instance**

The following stop-db-instance example stops the specified DB instance.

```bash
aws rds stop-db-instance \
  --db-instance-identifier test-instance
```

Output:

```json
{
  "DBInstance": {
    "DBInstanceStatus": "stopping",
    ...some output truncated...
  }
}
```
For API details, see StopDbInstance in AWS CLI Command Reference.

switchover-blue-green-deployment

The following code example shows how to use switchover-blue-green-deployment.

AWS CLI

Example 1: To switch a blue/green deployment for an RDS DB instance

The following switchover-blue-green-deployment example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```json
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-blhile",
                "Status": "AVAILABLE"
            },
            {
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-replica-1-green-k5fv7u",
                "Status": "AVAILABLE"
            }
        ]
    }
}
```
"TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-replica-2-green-ggsh8m",
"Status": "AVAILABLE"
},
{
"TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-replica-3-green-o2vwm0",
"Status": "AVAILABLE"
}
],
"Tasks": [

{
"Name": "CONFIGURE_BACKUPS",
"Status": "COMPLETED"
},
{
"Name": "CREATING_TOPOLOGY_OF_SOURCE",
"Status": "COMPLETED"
}
],
"Status": "SWITCHOVER_IN_PROGRESS",
"CreateTime": "2022-02-25T22:33:22.225000+00:00"
}

For more information, see [Switching a blue/green deployment](https://docs.aws.amazon.com/rds/latest/userguide/AmazonRDS-BlueGreen.html) in the *Amazon RDS User Guide*.

**Example 2: To promote a blue/green deployment for an Aurora MySQL DB cluster**

The following switchover-blue-green-deployment example promotes the specified green environment as the new production environment.
aws rds switchover-blue-green-deployment \
--blue-green-deployment-identifier bgd-wi89nwgclccsfake \n--switchover-timeout 300

Output:

```json
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-wi89nwgclccsfake",
      "BlueGreenDeploymentName": "my-blue-green-deployment",
      "Target": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3ud82z6",
      "SwitchoverDetails": [
         {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3ud82z6",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-1-green-bvxc73",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-2-green-7wc4ie",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-3-green-p4xxkz",
            "Status": "AVAILABLE"
         }
      ]
   }
}
```
For more information, see Switching a blue/green deployment in the Amazon Aurora User Guide.

- For API details, see SwitchoverBlueGreenDeployment in AWS CLI Command Reference.
Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

batch-execute-statement

The following code example shows how to use batch-execute-statement.

AWS CLI

To execute a batch SQL statement

The following batch-execute-statement example executes a batch SQL statement over an array of data with a parameter set.

```bash
aws rds-data batch-execute-statement \
   --database "mydb" \
   --sql "insert into mytable values (:id, :val)" \
   --parameter-sets "[[{"name": "id", "value": {"longValue": 1}},{"name": "val"}, \
   {"stringValue": "ValueOne"}],\n   [{"name": "id", "value": {"longValue": 2}},{"name": "val", \
   {"stringValue": "ValueTwo"}],\n   [{"name": "id", "value": {"longValue": 3}},{"name": "val", \
   {"stringValue": "ValueThree"}]"
```
This command produces no output.

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see BatchExecuteStatement in AWS CLI Command Reference.

**begin-transaction**

The following code example shows how to use `begin-transaction`.

**AWS CLI**

**To start a SQL transaction**

The following `begin-transaction` example starts a SQL transaction.

```
aws rds-data begin-transaction \
    --database "mydb" \ 
```

Output:

```
{
   "transactionId": "ABC1234567890xyz"
}
```

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see BeginTransaction in AWS CLI Command Reference.

**commit-transaction**

The following code example shows how to use `commit-transaction`.

**AWS CLI**

**To commit a SQL transaction**

The following `commit-transaction` example ends the specified SQL transaction and commits the changes that you made as part of it.
aws rds-data commit-transaction \
  --transaction-id "ABC1234567890xyz"

Output:

{
  "transactionStatus": "Transaction Committed"
}

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see CommitTransaction in AWS CLI Command Reference.

execute-statement

The following code example shows how to use execute-statement.

AWS CLI

Example 1: To execute a SQL statement that is part of a transaction

The following execute-statement example runs a SQL statement that is part of a transaction.

aws rds-data execute-statement \
  --database "mydb" \
  --sql "update mytable set quantity=5 where id=201" \
  --transaction-id "ABC1234567890xyz"

Output:

{
  "numberOfRecordsUpdated": 1
}

Example 2: To execute a SQL statement with parameters
The following `execute-statement` example runs a SQL statement with parameters.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-east-1:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-east-1:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameters "[{"name": "id", "value": {"longValue": 1}},{"name": "val", "value": {"stringValue": "value1"}}]"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

For more information, see [Using the Data API for Aurora Serverless](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_AuroraServerless.html) in the *Amazon RDS User Guide*.

- For API details, see [ExecuteStatement](https://docs.aws.amazon.com/cli/latest/reference/rds-data/execute-statement.html) in *AWS CLI Command Reference*.

### rollback-transaction

The following code example shows how to use `rollback-transaction`.

**AWS CLI**

**To roll back a SQL transaction**

The following `rollback-transaction` example rolls back the specified SQL transaction.

```
aws rds-data rollback-transaction \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Rollback Complete"
}
```
For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [RollbackTransaction](#) in *AWS CLI Command Reference*.

### Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics

#### Actions

**describe-dimension-keys**

The following code example shows how to use `describe-dimension-keys`.

### AWS CLI

**To describe dimension keys**

This example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

**Command:**

```bash
aws pi describe-dimension-keys --service-type RDS --identifier db-LKCG0BK26374TPTDFX0IWCPPM --start-time 1527026400 --end-time 1527080400 --metric db.load.avg --group-by '{"Group":"db.wait_event"}'
```
Output:

```json
{
   "AlignedEndTime": 1.5270804E9,
   "AlignedStartTime": 1.5270264E9,
   "Keys": [
      {
         "Dimensions": {
            "db.wait_event.name": "wait/synch/mutex/innodb/aurora_lock_thread_slot_futex"
         },
         "Total": 0.05906906851195666
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/io/aurora_redo_log_flush"
         },
         "Total": 0.015824722186149193
      },
      {
         "Dimensions": {
            "db.wait_event.name": "CPU"
         },
         "Total": 0.008014396230265477
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/io/aurora_respond_to_client"
         },
         "Total": 0.0036361612526204477
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/io/table/sql/handler"
         },
         "Total": 0.0019108398419382965
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/synch/cond/mysys/my_thread_var::suspend"
         },
         "Total": 8.533847837782684E-4
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/io/file/csv/data"
         },
         "Total": 6.864181956477376E-4
      },
      {
         "Dimensions": {
            "db.wait_event.name": "Unknown"
         },
         "Total": 3.895887056379051E-4
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/synch/mutex/sql/FILE_AS_TABLE::LOCK_shim_lists"
         },
         "Total": 0.0008014396230265477
      }
   ]
}
```
For API details, see `DescribeDimensionKeys` in `AWS CLI Command Reference`.

**get-resource-metrics**

The following code example shows how to use `get-resource-metrics`.

**AWS CLI**

**To get resource metrics**

This example requests data points for the `db.wait_event` dimension group, and for the `db.wait_event.name` dimension within that group. In the response, the relevant data points are grouped by the requested dimension (`db.wait_event.name`).

**Command:**

```bash
aws pi get-resource-metrics --service-type RDS --identifier db-LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --period-in-seconds 300 --metric db.load.avg --metric-queries file://metric-queries.json
```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`. Here are the contents of that file:

```json
[
  {
    "Metric": "db.load.avg",
    "GroupBy": {
      "Group":"db.wait_event"
    }
  }
]
```
Output:

```json
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-LKCGOBK26374TPTDFXOIWVCPPM",
    "MetricList": [
        {
            "Key": {
                "Metric": "db.load.avg"
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 1.3533333333333333
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.88
                },
                <...remaining output omitted...>
            ]
        },
        {
            "Key": {
                "Metric": "db.load.avg",
                "Dimensions": {
                    "db.wait_event.name": "wait/synch/mutex/innodb/aurora_lock_thread_slot_futex"
                }
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 0.8566666666666667
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.8633333333333333
                },
                <...remaining output omitted...>
            ]
        },
        <...remaining output omitted...>
    ]
}
```
For API details, see `GetResourceMetrics` in *AWS CLI Command Reference*.

### Amazon Redshift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Redshift.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*accept-reserved-node-exchange*

The following code example shows how to use `accept-reserved-node-exchange`.

**AWS CLI**

### To accept reserved node exchange

The following `accept-reserved-node-exchange` example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```bash
aws redshift accept-reserved-node-exchange /
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE /
    --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

**Output:**
For more information, see [Upgrading Reserved Nodes With the AWS CLI](#) in the Amazon Redshift Cluster Management Guide.

- For API details, see [AcceptReservedNodeExchange](#) in AWS CLI Command Reference.

### authorize-cluster-security-group-ingress

The following code example shows how to use authorize-cluster-security-group-ingress.

**AWS CLI**

Authorizing Access to an EC2 Security Group

This example authorizes access to a named Amazon EC2 security group.

**Command:**

```bash
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-owner-id 123445677890
```
Authorizing Access to a CIDR range

This example authorizes access to a CIDR range.

Command:

```bash
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see [AuthorizeClusterSecurityGroupIngress](#) in *AWS CLI Command Reference*.

**authorize-snapshot-access**

The following code example shows how to use authorize-snapshot-access.

**AWS CLI**

Authorize an AWS Account to Restore a Snapshot

This example authorizes the AWS account 444455556666 to restore the snapshot my-snapshot-id. By default, the output is in JSON format.

Command:

```bash
aws redshift authorize-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 444455556666
```

Result:

```json
{
    "Snapshot": {
        "Status": "available",
        "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
        "EstimatedSecondsToCompletion": 0,
        "AvailabilityZone": "us-east-1a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "Encrypted": false,
        "OwnerAccount": "111122223333",
        "BackupProgressInMegabytes": 11.0,
        "ElapsedTimeInSeconds": 0,
        "DBName": "dev",
        "CurrentBackupRateInMegabytesPerSecond": 0.1534,
        "ActualIncrementalBackupSizeInMegabytes": 11.0,
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster"
    }
}
```
• For API details, see AuthorizeSnapshotAccess in AWS CLI Command Reference.

batch-delete-cluster-snapshots

The following code example shows how to use batch-delete-cluster-snapshots.

AWS CLI

To delete a set of cluster snapshots

The following batch-delete-cluster-snapshots example deletes a set of manual cluster snapshots.

```bash
aws redshift batch-delete-cluster-snapshots
  --identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12
  SnapshotIdentifier=mycluster-2019-11-06-14-20
```

Output:

```json
{
  "Resources": [
    "mycluster-2019-11-06-14-12",
    "mycluster-2019-11-06-14-20"
  ]
}
```

For more information, see Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

• For API details, see BatchDeleteClusterSnapshots in AWS CLI Command Reference.

batch-modify-cluster-snapshots

The following code example shows how to use batch-modify-cluster-snapshots.
AWS CLI

To modify a set of cluster snapshots

The following batch-modify-cluster-snapshots example modifies the settings for a set of cluster snapshots.

```bash
aws redshift batch-modify-cluster-snapshots \
   --manual-snapshot-retention-period 30
```

Output:

```json
{
   "Resources": [
      "mycluster-2019-11-06-16-31",
      "mycluster-2019-11-06-16-32"
   ],
   "Errors": [],
   "ResponseMetadata": {
      "RequestId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
      "HTTPStatusCode": 200,
      "HTTPHeaders": {
         "x-amzn-requestid": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
         "content-type": "text/xml",
         "content-length": "480",
         "date": "Sat, 07 Dec 2019 00:36:09 GMT",
         "connection": "keep-alive"
      },
      "RetryAttempts": 0
   }
}
```

For more information, see Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

- For API details, see BatchModifyClusterSnapshots in AWS CLI Command Reference.

```bash
cancel-resize
```

The following code example shows how to use cancel-resize.
AWS CLI

### To cancel resize of a cluster

The following `cancel-resize` example cancels a classic resize operation for a cluster.

```bash
aws redshift cancel-resize \
  --cluster-identifier mycluster
```

Output:

```
{
  "TargetNodeType": "dc2.large",
  "TargetNumberOfNodes": 2,
  "TargetClusterType": "multi-node",
  "Status": "CANCELLING",
  "ResizeType": "ClassicResize",
  "TargetEncryptionType": "NONE"
}
```

For more information, see [Resizing Clusters in Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/dg/resizing-cluster-create.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CancelResize](https://docs.aws.amazon.com/redshift/latest/APIReference/API_CancelResize.html) in [AWS CLI Command Reference](https).

### copy-cluster-snapshot

The following code example shows how to use `copy-cluster-snapshot`.

**AWS CLI**

#### Get a Description of All Cluster Versions

This example returns a description of all cluster versions. By default, the output is in JSON format.

Command:

```bash
```

Result:

```
{
  "Snapshot": {
```

Actions and scenarios
For API details, see CopyClusterSnapshot in AWS CLI Command Reference.

create-cluster-parameter-group

The following code example shows how to use create-cluster-parameter-group.

AWS CLI

Create a Cluster Parameter Group

This example creates a new cluster parameter group.

Command:

```bash
aws redshift create-cluster-parameter-group --parameter-group-name myclusterparametergroup --parameter-group-family redshift-1.0 --description "My first cluster parameter group"
```

Result:

```json
{
   "ClusterParameterGroup": {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
      "ParameterGroupName": "myclusterparametergroup"
   }
}
```
For API details, see [CreateClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-cluster-parameter-group) in *AWS CLI Command Reference*.

### `create-cluster-security-group`

The following code example shows how to use `create-cluster-security-group`.

#### AWS CLI

```
Creating a Cluster Security Group
This example creates a new cluster security group. By default, the output is in JSON format.
Command:

```bash
aws redshift create-cluster-security-group --cluster-security-group-name mysecuritygroup --description "This is my cluster security group"
```

Result:

```json
{
   "create_cluster_security_group_response": {
      "create_cluster_security_group_result": {
         "cluster_security_group": {
            "description": "This is my cluster security group",
            "owner_id": "300454760768",
            "cluster_security_group_name": "mysecuritygroup",
            "ec2_security_groups": [],
            "ip_ranges": []
         }
      },
      "response_metadata": {
         "request_id": "5df486a0-343a-11e2-b0d8-d15d0ef48549"
      }
   }
}
```

You can also obtain the same information in text format using the `--output text` option.

Command:

```
--output text
```
option.Command:

aws redshift create-cluster-security-group --cluster-security-group-name mysecuritygroup --description "This is my cluster security group" --output text

Result:

This is my cluster security group   300454760768    mysecuritygroup
a0c0bfab-343a-11e2-95d2-c3dc9fe8ab57

- For API details, see CreateClusterSecurityGroup in AWS CLI Command Reference.

create-cluster-snapshot

The following code example shows how to use create-cluster-snapshot.

AWS CLI

Create a Cluster SnapshotThis example creates a new cluster snapshot. By default, the output is in JSON format.Command:

aws redshift create-cluster-snapshot --cluster-identifier mycluster --snapshot-identifier my-snapshot-id

Result:

{
   "Snapshot": {
      "Status": "creating",
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "mycluster",
      "Port": 5439,
      "NumberOfNodes": "2",
      "SnapshotIdentifier": "my-snapshot-id"  
   }
}
create-cluster-subnet-group

The following code example shows how to use create-cluster-subnet-group.

AWS CLI

Create a Cluster Subnet Group

This example creates a new cluster subnet group.

Command:

```
aws redshift create-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup --description "My subnet group" --subnet-ids subnet-763fdd1c
```

Result:

```
{
    "ClusterSubnetGroup": {
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-763fdd1c",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "VpcId": "vpc-7e3fdd14",
        "SubnetGroupStatus": "Complete",
        "Description": "My subnet group",
        "ClusterSubnetGroupName": "mysubnetgroup"
    },
    "ResponseMetadata": {
        "RequestId": "500b8ce2-698f-11e2-9790-fd67517fb6fd"
    }
}
```

For API details, see [CreateClusterSubnetGroup](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-cluster-subnet-group.html) in AWS CLI Command Reference.
create-cluster

The following code example shows how to use create-cluster.

AWS CLI

Create a Cluster with Minimal Parameters

This example creates a cluster with the minimal set of parameters. By default, the output is in JSON format.

Command:

```
aws redshift create-cluster --node-type dw.hs1.xlarge --number-of-nodes 2 --master-username adminuser --master-user-password TopSecret1 --cluster-identifier mycluster
```

Result:

```
{
  "Cluster": {
    "NodeType": "dw.hs1.xlarge",
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
      {
        "Status": "active",
        "ClusterSecurityGroupName": "default"
      }
    ],
    "AllowVersionUpgrade": true,
    "VpcSecurityGroups": [],
    "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
    "AutomatedSnapshotRetentionPeriod": 1,
    "ClusterStatus": "creating",
    "ClusterIdentifier": "mycluster",
    "DBName": "dev",
    "NumberOfNodes": 2,
    "PendingModifiedValues": {
      "MasterUserPassword": "\****"
    }
  },
  "ResponseMetadata": {
```

Actions and scenarios

5233
For API details, see CreateCluster in AWS CLI Command Reference.

create-event-subscription

The following code example shows how to use create-event-subscription.

AWS CLI

To create a notification subscription for an event

The following create-event-subscription example creates an event notification subscription.

```bash
aws redshift create-event-subscription \
    --subscription-name mysubscription \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNStopic \
    --source-type cluster \
    --source-ids mycluster
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
        "SourceType": "cluster",
        "SourceIdsList": [
            "mycluster"
        ],
        "EventCategoriesList": [],
        "Severity": "INFO",
        "Enabled": true,
        "Tags": []
    }
}
```
For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the Amazon Redshift Cluster Management Guide.

- For API details, see [CreateEventSubscription](#) in *AWS CLI Command Reference*.

create-hsm-client-certificate

The following code example shows how to use `create-hsm-client-certificate`.

**AWS CLI**

**To create an HSM client certificate**

The following `create-hsm-client-certificate` example generates an HSM client certificate that a cluster can use to connect to an HSM.

```bash
aws redshift create-hsm-client-certificate \ 
--hsm-client-certificate-identifier myhsmclientcert
```

**Output:**

```json
{
  "HsmClientCertificate": {
    "HsmClientCertificateIdentifier": "myhsmclientcert",
    "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----MIICEX
```

Actions and scenarios
5235
For more information, see Amazon Redshift API Permissions Reference in the Amazon Redshift Cluster Management Guide.

- For API details, see CreateHsmClientCertificate in AWS CLI Command Reference.

**create-hsm-configuration**

The following code example shows how to use create-hsm-configuration.

**AWS CLI**

**To create an HSM configuration**

The following create-hsm-configuration example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```bash
aws redshift create-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
    --description "My HSM connection"
    --hsm-ip-address 192.0.2.09
    --hsm-partition-name myhsmpartition /
    --hsm-partition-password A1b2c3d4 /
    --hsm-server-public-certificate myhsmclientcert
```

Output:

```json
{
    "HsmConfiguration": {
        "HsmConfigurationIdentifier": "myhsmconnection",
        "Description": "My HSM connection",
        "HsmIpAddress": "192.0.2.09",
        "HsmPartitionName": "myhsmpartition",
        "Tags": []
    }
}
```

- For API details, see CreateHsmConfiguration in AWS CLI Command Reference.

**create-snapshot-copy-grant**

The following code example shows how to use create-snapshot-copy-grant.

AWS CLI

**To create a snapshot copy grant**

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```bash
aws redshift create-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```json
{
    "SnapshotCopyGrant": {
        "SnapshotCopyGrantName": "mysnapshotcopygrantname",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/bPxRfih3yCo8nvbEXAMPLEKEY",
        "Tags": []
    }
}
```

For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see CreateSnapshotCopyGrant in AWS CLI Command Reference.

**create-snapshot-schedule**

The following code example shows how to use `create-snapshot-schedule`.

AWS CLI

**To create snapshot schedule**

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```bash
aws redshift create-snapshot-schedule \
    --schedule-definitions "rate(12 hours)" \
    --schedule-identifier mysnapshotschedule \
    --schedule-description "My schedule description"
```
Output:

```json
{
    "ScheduleDefinitions": [
        "rate(12 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see [Automated Snapshot Schedules](https://docs.aws.amazon.com/redshift/latest/mngguide/Auto-Snap-Sched.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateSnapshotSchedule](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-snapshot-schedule.html) in *AWS CLI Command Reference*.

### create-tags

The following code example shows how to use `create-tags`.

**AWS CLI**

**To create tags for a cluster**

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```bash
aws redshift create-tags \
  --tags "Key"="mytags","Value"="tag1"
```

This command does not produce any output.

For more information, see [Tagging Resources in Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/mngguide/Tagging.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateTags](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-tags.html) in *AWS CLI Command Reference*.

### delete-cluster-parameter-group

The following code example shows how to use `delete-cluster-parameter-group`.

**Actions and scenarios**

5238
AWS CLI

Delete a Cluster Parameter Group
This example deletes a cluster parameter group.
Command:

```
aws redshift delete-cluster-parameter-group --parameter-group-name myclusterparametergroup
```

• For API details, see DeleteClusterParameterGroup in AWS CLI Command Reference.

delete-cluster-security-group

The following code example shows how to use delete-cluster-security-group.

AWS CLI

Delete a Cluster Security Group
This example deletes a cluster security group.
Command:

```
aws redshift delete-cluster-security-group --cluster-security-group-name mysecuritygroup
```

• For API details, see DeleteClusterSecurityGroup in AWS CLI Command Reference.

delete-cluster-snapshot

The following code example shows how to use delete-cluster-snapshot.

AWS CLI

Delete a Cluster Snapshot
This example deletes a cluster snapshot.
Command:

```
aws redshift delete-cluster-snapshot --snapshot-identifier my-snapshot-id
```

• For API details, see DeleteClusterSnapshot in AWS CLI Command Reference.

delete-cluster-subnet-group

The following code example shows how to use delete-cluster-subnet-group.

AWS CLI

Delete a Cluster subnet Group
This example deletes a cluster subnet group.
Command:
aws redshift delete-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup

Result:

```json
{
   "ResponseMetadata": {
      "RequestId": "253fbff6-6993-11e2-bc3a-47431073908a"
   }
}
```

- For API details, see [DeleteClusterSubnetGroup](#) in [AWS CLI Command Reference](#).

**delete-cluster**

The following code example shows how to use `delete-cluster`.

**AWS CLI**

Delete a Cluster with No Final Cluster Snapshot

This example deletes a cluster, forcing data deletion so no final cluster snapshot is created. Command:

```bash
aws redshift delete-cluster --cluster-identifier mycluster --skip-final-cluster-snapshot
```

Delete a Cluster, Allowing a Final Cluster Snapshot

This example deletes a cluster, but specifies a final cluster snapshot. Command:

```bash
aws redshift delete-cluster --cluster-identifier mycluster --final-cluster-snapshot-identifier myfinalsnapshot
```

- For API details, see [DeleteCluster](#) in [AWS CLI Command Reference](#).

**delete-event-subscription**

The following code example shows how to use `delete-event-subscription`.

**AWS CLI**

To delete event subscription
The following `delete-event-subscription` example deletes the specified event notification subscription.

```bash
aws redshift delete-event-subscription \
   --subscription-name mysubscription
```

This command does not produce any output.

For more information, see [Subscribing to Amazon Redshift Event Notifications](https://docs.aws.amazon.com/redshift-cluster-management/latest/config-guide/guides/subscriptions.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteEventSubscription](https://docs.aws.amazon.com/cli/latest/reference/redshift/delete-event-subscription.html) in *AWS CLI Command Reference*.

### delete-hsm-client-certificate

The following code example shows how to use `delete-hsm-client-certificate`.

**AWS CLI**

**To delete HSM client certificate**

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```bash
aws redshift delete-hsm-client-certificate \
   --hsm-client-certificate-identifier myhsmclientcert
```

This command does not produce any output.

For more information, see [Amazon Redshift API Permissions Reference](https://docs.aws.amazon.com/redshift-cluster-management/latest/config-guide/guides/permissions.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteHsmClientCertificate](https://docs.aws.amazon.com/cli/latest/reference/redshift/delete-hsm-client-certificate.html) in *AWS CLI Command Reference*.

### delete-hsm-configuration

The following code example shows how to use `delete-hsm-configuration`.

**AWS CLI**

**To delete an HSM configuration**
The following `delete-hsm-configuration` example deletes the specified HSM configuration from the current AWS account.

```
aws redshift delete-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
```

This command does not produce any output.

- For API details, see `DeleteHsmConfiguration` in AWS CLI Command Reference.

**delete-scheduled-action**

The following code example shows how to use `delete-scheduled-action`.

**AWS CLI**

**To delete scheduled action**

The following `delete-scheduled-action` example deletes the specified scheduled action.

```
aws redshift delete-scheduled-action \
    --scheduled-action-name myscheduledaction
```

This command does not produce any output.

- For API details, see `DeleteScheduledAction` in AWS CLI Command Reference.

**delete-snapshot-copy-grant**

The following code example shows how to use `delete-snapshot-copy-grant`.

**AWS CLI**

**To delete snapshot copy grant**

The following `delete-snapshot-copy-grant` example deletes the specified snapshot copy grant.

```
aws redshift delete-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command does not produce any output.
For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see DeleteSnapshotCopyGrant in AWS CLI Command Reference.

**delete-snapshot-schedule**

The following code example shows how to use delete-snapshot-schedule.

**AWS CLI**

**To delete snapshot schedule**

The following delete-snapshot-schedule example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```
aws redshift delete-snapshot-schedule \
   --schedule-identifier mysnapshotschedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

- For API details, see DeleteSnapshotSchedule in AWS CLI Command Reference.

**delete-tags**

The following code example shows how to use delete-tags.

**AWS CLI**

**To delete tags from a cluster**

The following delete-tags example deletes the tags with the specified key names from the specified cluster.

```
aws redshift delete-tags \
   --tag-keys "clustertagkey" "clustertagvalue"
```

This command does not produce any output.
For more information, see Tagging Resources in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see DeleteTags in AWS CLI Command Reference.

**describe-account-attributes**

The following code example shows how to use describe-account-attributes.

**AWS CLI**

**To describe attributes of an AWS account**

The following describe-account-attributes example displays the attributes attached to the calling AWS account.

```
aws redshift describe-account-attributes
```

Output:

```
{
   "AccountAttributes": [
       {
           "AttributeName": "max-defer-maintenance-duration",
           "AttributeValues": [
               {
                   "AttributeValue": "45"
               }
           ]
       }
   ]
}
```

- For API details, see DescribeAccountAttributes in AWS CLI Command Reference.

**describe-cluster-db-revisions**

The following code example shows how to use describe-cluster-db-revisions.

**AWS CLI**

**To describe DB revisions for a cluster**
The following `describe-cluster-db-revisions` example displays the details of an array of ClusterDbRevision objects for the specified cluster.

```
aws redshift describe-cluster-db-revisions \
  --cluster-identifier mycluster
```

Output:

```
{
  "ClusterDbRevisions": [
    {
      "ClusterIdentifier": "mycluster",
      "CurrentDatabaseRevision": "11420",
      "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",
      "RevisionTargets": []
    }
  ]
}
```

- For API details, see [DescribeClusterDbRevisions](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-db-revisions.html) in AWS CLI Command Reference.

**describe-cluster-parameter-groups**

The following code example shows how to use `describe-cluster-parameter-groups`.

**AWS CLI**

Get a Description of All Cluster Parameter Groups

This example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.

```
aws redshift describe-cluster-parameter-groups
```

Result:

```
{
  "ParameterGroups": [
    {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
```
You can also obtain the same information in text format using the `--output text` option. Command:

```
aws redshift describe-cluster-parameter-groups --output text
```

Result:

```
redshift-1.0        My first cluster parameter group        myclusterparametergroup
RESPONSEMETADATA    9e665a36-64cc-11e2-8f7d-3b939af52818
```

**describe-cluster-parameters**

The following code example shows how to use `describe-cluster-parameters`.

**AWS CLI**

Retrieve the Parameters for a Specified Cluster Parameter Group

This example retrieves the parameters for the named parameter group. By default, the output is in JSON format. Command:

```
aws redshift describe-cluster-parameters --parameter-group-name myclusterparametergroup
```

Result:

```
{
    "Parameters": [
```
You can also obtain the same information in text format using the `--output text` option.

```
aws redshift describe-cluster-parameters --parameter-group-name myclusterparametergroup --output text
```

Result:

```
RESPONSEMETADATA   cdac40aa-64cc-11e2-9e70-918437dd236d
Sets the display format for date and time values.   string   True   engine-default  ISO, MDY    datestyle
Sets the number of digits displayed for floating-point values   integer   True   engine-default  -15-2      extra_float_digits
This parameter applies a user-defined label to a group of queries that are run during the same session.   string   True   engine-default  default query_group
require ssl for all databaseconnections   boolean   True   true,false    engine-default  false    require_ssl
```
For API details, see [DescribeClusterParameters](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-parameters.html) in *AWS CLI Command Reference*.

### describe-cluster-security-groups

The following code example shows how to use `describe-cluster-security-groups`.

**AWS CLI**

Get a Description of All Cluster Security Groups

This example returns a description of all cluster security groups for the account. By default, the output is in JSON format.

Command:

```bash
aws redshift describe-cluster-security-groups
```

Result:

```json
{
   "ClusterSecurityGroups": [
       {
           "OwnerId": "100447751468",
           "Description": "default",
           "ClusterSecurityGroupName": "default",
           "EC2SecurityGroups": [],
           "IPRanges": [
               {
                   "Status": "authorized",
                   "CIDRIP": "0.0.0.0/0"
               }
           ]
       },
       {
           "OwnerId": "100447751468",
           "Description": "This is my cluster security group",
           "ClusterSecurityGroupName": "mysecuritygroup",
           "EC2SecurityGroups": [],
           "IPRanges": []
       }
   ]
}
```
describe-cluster-snapshots

The following code example shows how to use `describe-cluster-snapshots`.

AWS CLI

Get a Description of All Cluster Snapshots

This example returns a description of all cluster snapshots for the account. By default, the output is in JSON format.

Command:

```
aws redshift describe-cluster-snapshots
```

Result:

```
{
   "Snapshots": [
       {
           "Status": "available",
           "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",
           "EstimatedSecondsToCompletion": -1,
           "AvailabilityZone": "us-east-1a",
           "ClusterVersion": "1.0",
           "MasterUsername": "adminuser",
           "Encrypted": false,
           "OwnerAccount": "111122223333",
           "BackupProgressInMegabytes": 20.0,
           "ElapsedTimeInSeconds": 0,
           "DBName": "dev",
           "CurrentBackupRateInMegabytesPerSecond": 0.0,
           "ActualIncrementalBackupSizeInMegabytes": 20.0
       }
   ]
}
```
"NumberOfNodes": "2",
  "SnapshotIdentifier": "cm:mycluster-2013-01-22-22-04-18"
},
{

  "SnapshotType": "manual",
  "Port": 5439,
  "SnapshotIdentifier": "my-snapshot-id"
}
(...remaining output omitted...)

- For API details, see [DescribeClusterSnapshots](#) in *AWS CLI Command Reference*.

**describe-cluster-subnet-groups**

The following code example shows how to use `describe-cluster-subnet-groups`.

**AWS CLI**

Get a Description of All Cluster Subnet Groups
This example returns a description of all cluster subnet groups. By default, the output is in JSON format.

**Command:**
aws redshift describe-cluster-subnet-groups

Result:

```
{
    "ClusterSubnetGroups": [
        {
            "Subnets": [
                {
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-763fdd1c",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    }
                }
            ],
            "VpcId": "vpc-7e3fdd14",
            "SubnetGroupStatus": "Complete",
            "Description": "My subnet group",
            "ClusterSubnetGroupName": "mysubnetgroup"
        }
    ],
    "ResponseMetadata": {
        "RequestId": "37fa8c89-6990-11e2-8f75-ab4018764c77"
    }
}
```

- For API details, see [DescribeClusterSubnetGroups](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-subnet-groups.html) in [AWS CLI Command Reference](https).

**describe-cluster-tracks**

The following code example shows how to use describe-cluster-tracks.

**AWS CLI**

**To describe cluster tracks**

The following describe-cluster-tracks example displays details of the available maintenance tracks.

```
aws redshift describe-cluster-tracks \
```
Output:

```
{
    "MaintenanceTracks": [
        {
            "MaintenanceTrackName": "current",
            "DatabaseVersion": "1.0.11420",
            "UpdateTargets": [
                {
                    "MaintenanceTrackName": "preview_features",
                    "DatabaseVersion": "1.0.11746",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        }
                    ]
                },
                {
                    "MaintenanceTrackName": "trailing",
                    "DatabaseVersion": "1.0.11116",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        },
                        {
                            "OperationName": "modify-cluster"
                        }
                    ]
                }
            ]
        }
    ]
}
```

For more information, see [Choosing Cluster Maintenance Tracks](https://docs.aws.amazon.com/redshift/latest/mgmt/choosing-cluster-maintenance-tracks.html) in the Amazon Redshift Cluster Management Guide.

- For API details, see [DescribeClusterTracks](https://docs.aws.amazon.com/cli-reference/index.html) in AWS CLI Command Reference.
**describe-cluster-versions**

The following code example shows how to use `describe-cluster-versions`.

**AWS CLI**

Get a Description of All Cluster Versions

This example returns a description of all cluster versions. By default, the output is in JSON format.

Command:

```bash
aws redshift describe-cluster-versions
```

Result:

```json
{
  "ClusterVersions": [
    {
      "ClusterVersion": "1.0",
      "Description": "Initial release",
      "ClusterParameterGroupFamily": "redshift-1.0"
    }
  ],
  "ResponseMetadata": {
    "RequestId": "16a53de3-64cc-11e2-bec0-17624ad140dd"
  }
}
```

- For API details, see [DescribeClusterVersions](https://docs.aws.amazon.com/cli/latest/reference/redshift.describe-cluster-versions.html) in *AWS CLI Command Reference*.

**describe-clusters**

The following code example shows how to use `describe-clusters`.

**AWS CLI**

Get a Description of All Clusters

This example returns a description of all clusters for the account. By default, the output is in JSON format.

Command:

```bash
aws redshift describe-clusters
```

Result:

```json
{
}
```
You can also obtain the same information in text format using the `--output text` option.

```
--output text option.Command:
```
aws redshift describe-clusters --output text

Result:

dw.hs1.xlarge 1.0 true adminuser True us-east-1a 2013-01-22T21:59:29.559Z sat:03:30-sat:04:00 1 available mycluster dev 2 ENDPOINT 5439 mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com in-sync default.redshift-1.0 active default PENDINGMODIFIEDVALUES RESPONSEMETADATA 934281a8-64df-11e2-b07c-f7fbdd006c67

- For API details, see DescribeClusters in AWS CLI Command Reference.

describe-default-cluster-parameters

The following code example shows how to use describe-default-cluster-parameters.

AWS CLI

Get a Description of Default Cluster Parameters
This example returns a description of the default cluster parameters for the redshift-1.0 family. By default, the output is in JSON format. Command:

aws redshift describe-default-cluster-parameters --parameter-group-family redshift-1.0

Result:

{
  "DefaultClusterParameters": {
    "ParameterGroupFamily": "redshift-1.0",
    "Parameters": [
      {
        "Description": "Sets the display format for date and time values.",
        "DataType": "string",
        "IsModifiable": true,
        "Source": "engine-default",
        "ParameterValue": "ISO, MDY",
        "ParameterName": "datestyle"}...}
To see a list of valid parameter group families, use the describe-cluster-parameter-groups command.

describe-cluster-parameter-groups command.

- For API details, see DescribeDefaultClusterParameters in AWS CLI Command Reference.

describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories for a cluster

The following describe-event-categories example displays details for the event categories for a cluster.

aws redshift describe-event-categories \
    --source-type cluster

Output:

{

}
"EventCategoriesMapList": [
  {
    "SourceType": "cluster",
    "Events": [
      {
        "EventId": "REDSHIFT-EVENT-2000",
        "EventCategories": [
          "management"
        ],
        "EventDescription": "Cluster <cluster name> created at <time in UTC>.",
        "Severity": "INFO"
      },
      {
        "EventId": "REDSHIFT-EVENT-2001",
        "EventCategories": [
          "management"
        ],
        "EventDescription": "Cluster <cluster name> deleted at <time in UTC>.",
        "Severity": "INFO"
      },
      {
        "EventId": "REDSHIFT-EVENT-3625",
        "EventCategories": [
          "monitoring"
        ],
        "EventDescription": "The cluster <cluster name> can't be resumed with its previous elastic network interface <ENI id>. We will allocate a new elastic network interface and associate it with the cluster node.",
        "Severity": "INFO"
      }
    ]
  }
]

- For API details, see [DescribeEventCategories](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/events/describe-event-categories.html) in [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/latest/).

**describe-event-subscriptions**

The following code example shows how to use `describe-event-subscriptions`. 
**AWS CLI**

**To describe event subscriptions**

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```bash
aws redshift describe-event-subscriptions \
   --subscription-name mysubscription
```

**Output:**

```json
{
   "EventSubscriptionsList": [
      {
         "CustomerAwsId": "123456789012",
         "CustSubscriptionId": "mysubscription",
         "Status": "active",
         "SourceIdsList": [],
         "EventCategoriesList": [
            "management"
         ],
         "Severity": "ERROR",
         "Enabled": true,
         "Tags": []
      }
   ]
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](https://docs.aws.amazon.com/redshift/latest/cg/redshift-event-notifications.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeEventSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-event-subscriptions.html) in *AWS CLI Command Reference*.

**describe-events**

The following code example shows how to use `describe-events`.

---

**Actions and scenarios**
AWS CLI

Describe All Events

This example returns all events. By default, the output is in JSON format. Command:

```bash
aws redshift describe-events
```

Result:

```json
{
    "Events": [
        {
            "Date": "2013-01-22T19:17:03.640Z",
            "SourceIdentifier": "myclusterparametergroup",
            "Message": "Cluster parameter group myclusterparametergroup has been created."
        },
        {
            "SourceType": "cluster-parameter-group"
        },
        "ResponseMetadata": {
            "RequestId": "9f056111-64c9-11e2-9390-ff04f2c1e638"
        }
    }
}
```

You can also obtain the same information in text format using the `--output text` option. Command:

```bash
--output text
```

Option. Command:

```bash
aws redshift describe-events --output text
```

Result:

```
2013-01-22T19:17:03.640Z    myclusterparametergroup Cluster parameter group myclusterparametergroup has been created.    cluster-parameter-group
RESPONSEMETADATA    8e5fe765-64c9-11e2-bce3-e56f52e17
```

- For API details, see [DescribeEvents](#) in [AWS CLI Command Reference](#).
describe-hsm-client-certificates

The following code example shows how to use describe-hsm-client-certificates.

AWS CLI

To describe HSM client certificates

The following describe-hsm-client-certificates example displays details for the specified HSM client certificate.

```
aws redshift describe-hsm-client-certificates \
  --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
  "HsmClientCertificates": [
    {
      "HsmClientCertificateIdentifier": "myhsmclientcert",
      "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
EXAMPLECAFICCODg6m70Rwux0jANBgkqzhkiG9w0BAUFADBChiDELMAkGa1UEBhMC
VVMxCzAJBgNVBAEYERQHdWAQYDVQQHEwdTbW1hbmNlMjAwHhcNMDExMDQxMzYwMjAw
-----END CERTIFICATE-----
",
      "Tags": []
    }
  ]
}
```

For more information, see Amazon Redshift API Permissions Reference in the Amazon Redshift Cluster Management Guide.
describe-hsm-configurations

The following code example shows how to use describe-hsm-configurations.

AWS CLI

To describe HSM configurations

The following describe-hsm-configurations example displays details for the available HSM configurations for the calling AWS account.

```bash
aws redshift describe-hsm-configurations /
  --hsm-configuration-identifier myhsmconnection
```

Output:

```json
{
  "HsmConfigurations": [
    {
      "HsmConfigurationIdentifier": "myhsmconnection",
      "Description": "My HSM connection",
      "HsmIpAddress": "192.0.2.09",
      "HsmPartitionName": "myhsmpartition",
      "Tags": []
    }
  ]
}
```

• For API details, see DescribeHsmConfigurations in AWS CLI Command Reference.

describe-logging-status

The following code example shows how to use describe-logging-status.

AWS CLI

To describe logging status for a cluster

The following describe-logging-status example displays whether information, such as queries and connection attempts, is being logged for a cluster.
aws redshift describe-logging-status \\  
--cluster-identifier mycluster

Output:

{
   "LoggingEnabled": false
}

For more information, see Database Audit Logging in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeLoggingStatus in AWS CLI Command Reference.

describe-node-configuration-options

The following code example shows how to use describe-node-configuration-options.

AWS CLI

To describe node configuration options

The following describe-node-configuration-options example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

aws redshift describe-node-configuration-options \\  
--action-type restore-cluster \\  
--snapshot-identifier rs:mycluster-2019-12-09-16-42-43

Output:

{
   "NodeConfigurationOptionList": [ 
   {
      "NodeType": "dc2.large",
      "NumberOfNodes": 2,
      "EstimatedDiskUtilizationPercent": 19.61
   },
   {
      "NodeType": "dc2.large",
      },
For more information, see Purchasing Amazon Redshift Reserved Nodes in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeNodeConfigurationOptions in AWS CLI Command Reference.

describe-orderable-cluster-options

The following code example shows how to use describe-orderable-cluster-options.

AWS CLI

Describing All Orderable Cluster Options

This example returns descriptions of all orderable cluster options. By default, the output is in JSON format.

Command:

```
aws redshift describe-orderable-cluster-options
```

Result:

```
{
    "OrderableClusterOptions": [
        {
            "NodeType": "dw.hs1.8xlarge",
            "AvailabilityZones": [
                { "Name": "us-east-1a" },
                { "Name": "us-east-1b" },
                { "Name": "us-east-1c" } ]
        }
    ]
}
```
You can also obtain the same information in text format using the **--output text** option.

Command:

```bash
aws redshift describe-orderable-cluster-options --output text
```

Result:

```
dw.hs1.8xlarge      1.0     multi-node
us-east-1a
us-east-1b
us-east-1c
dw.hs1.xlarge       1.0     multi-node
us-east-1a
```
• For API details, see [DescribeOrderableClusterOptions](#) in *AWS CLI Command Reference*.

**describe-reserved-node-offerings**

The following code example shows how to use describe-reserved-node-offerings.

**AWS CLI**

Describe Reserved Node Offerings

This example shows all of the reserved node offerings that are available for purchase.

Command:

```bash
aws redshift describe-reserved-node-offerings
```

Result:

```json
{
  "ReservedNodeOfferings": [
    {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "UsagePrice": "",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": "",
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "Duration": 31536000,
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
    },
    {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.8xlarge",
      "UsagePrice": "",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": "",
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "Duration": 31536000,
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
    }
  ]
}
```
If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid `ReservedNodeOfferingId`.

```bash
aws redshift purchase-reserved-node-offering
```

using a valid `ReservedNodeOfferingId`.

`ReservedNodeOfferingId`.

- For API details, see [DescribeReservedNodeOfferings](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-reserved-nodes) in *AWS CLI Command Reference*.

### describe-reserved-nodes

The following code example shows how to use `describe-reserved-nodes`.

**AWS CLI**

Describe Reserved NodesThis example shows a reserved node offering that has been purchased.

```bash
aws redshift describe-reserved-nodes
```

Result:

```json
{
}
```
For API details, see `DescribeReservedNodes` in *AWS CLI Command Reference*.

**describe-resize**

The following code example shows how to use `describe-resize`.

**AWS CLI**

Describe Resize

This example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`. Command:

```
aws redshift describe-resize --cluster-identifier mycluster
```

Result:

```
{
  "Status": "NONE",
  "TargetClusterType": "multi-node",
}
```
"TargetNodeType": "dw.hs1.8xlarge",
"ResponseMetadata": {
    "RequestId": "9f52b0b4-7733-11e2-aa9b-318b2909bd27"
},
"TargetNumberOfNodes": "3"

**describe-scheduled-actions**

The following code example shows how to use `describe-scheduled-actions`.

**AWS CLI**

**To describe scheduled actions**

The following `describe-scheduled-actions` example displays details for any currently scheduled actions.

```bash
aws redshift describe-scheduled-actions
```

**Output:**

```json
{
    "ScheduledActions": [
        {
            "ScheduledActionName": "resizecluster",
            "TargetAction": {
                "ResizeCluster": {
                    "ClusterIdentifier": "mycluster",
                    "NumberOfNodes": 4,
                    "Classic": false
                }
            },
            "Schedule": "at(2019-12-10T00:07:00)",
            "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
            "State": "ACTIVE",
            "NextInvocations": [
                "2019-12-10T00:07:00Z"
            ]
        }
    ]
}
```
describe-snapshot-copy-grants

The following code example shows how to use describe-snapshot-copy-grants.

AWS CLI

To describe snapshot copy grants

The following describe-snapshot-copy-grants example displays details for the specified cluster snapshot copy grant.

```bash
aws redshift describe-snapshot-copy-grants \
  --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```json
{
  "SnapshotCopyGrants": [
    {
      "SnapshotCopyGrantName": "mysnapshotcopygrantname",
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/bPxRfih3yCo8nvbEXAMPLEKEY",
      "Tags": []
    }
  ]
}
```

For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeSnapshotCopyGrants in AWS CLI Command Reference.

describe-snapshot-schedules

The following code example shows how to use describe-snapshot-schedules.
AWS CLI

To describe snapshot schedules

The following describe-snapshot-schedules example displays details for the specified cluster snapshot schedule.

```bash
aws redshift describe-snapshot-schedules \
   --cluster-identifier mycluster \
   --schedule-identifier mysnapshotschedule
```

Output:

```json
{
   "SnapshotSchedules": [
      {
         "ScheduleDefinitions": [
            "rate(12 hours)"
         ],
         "ScheduleIdentifier": "mysnapshotschedule",
         "ScheduleDescription": "My schedule description",
         "Tags": [],
         "AssociatedClusterCount": 1,
         "AssociatedClusters": [
            {
              "ClusterIdentifier": "mycluster",
              "ScheduleAssociationState": "ACTIVE"
            }
         ]
      }
   ]
}
```

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeSnapshotSchedules in AWS CLI Command Reference.

describe-storage

The following code example shows how to use describe-storage.
AWS CLI

To describe storage

The following describe-storage example displays details about the backup storage and provisional storage sizes for the account.

```bash
code
aws redshift describe-storage
```

Output:

```json
{
    "TotalBackupSizeInMegaBytes": 193149.0,
    "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see Managing Snapshot Storage in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeStorage in AWS CLI Command Reference.

describe-table-restore-status

The following code example shows how to use describe-table-restore-status.

AWS CLI

To describe status of table restore requests from a cluster snapshot

The following describe-table-restore-status example displays details for table restore requests made for the specified cluster.

```bash
aws redshift describe-table-restore-status /
--cluster-identifier mycluster
```

Output:

```json
{
    "TableRestoreStatusDetails": [
        {
            "TableRestoreRequestId": "z116630-0e80-46f4-ba86-bd9670411ebd",
            "Status": "IN_PROGRESS",
        }
    ]
}
```
The following code example shows how to use `describe-tags`.

### AWS CLI

**To describe tags**

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```
aws redshift describe-tags \
    --tag-keys clustertagkey \
    --tag-values clustertagvalue
```

**Output:**

```
{
   "TaggedResources": [
       {
         "Tag": {
           "Key": "clustertagkey",
           "Value": "clustertagvalue"
         }
       }
   ]
}
```
For more information, see Tagging Resources in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeTags in AWS CLI Command Reference.

**disable-snapshot-copy**

The following code example shows how to use disable-snapshot-copy.

**AWS CLI**

**To disable snapshot copy for a cluster**

The following disable-snapshot-copy example disables the automatic copy of a snapshot for the specified cluster.

```bash
aws redshift disable-snapshot-copy \  --cluster-identifier mycluster
```

Output:

```
{
  "Cluster": {
    "ClusterIdentifier": "mycluster",
    "NodeType": "dc2.large",
    "ClusterStatus": "available",
    "ClusterAvailabilityStatus": "Available",
    "MasterUsername": "adminuser",
    "DBName": "dev",
    "Endpoint": {
      "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
      "Port": 5439
    },
    "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
    "AutomatedSnapshotRetentionPeriod": 3,
    "ManualSnapshotRetentionPeriod": -1,
  }
}
```
"ClusterSecurityGroups": [],
"VpcSecurityGroups": [
{
   "VpcSecurityGroupId": "sh-i9b431cd",

Actions and scenarios
For more information, see [Copying Snapshots to Another AWS Region](https://docs.aws.amazon.com/redshift/latest/mgmt-copy-snapshots-between-regions.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DisableSnapshotCopy](https://docs.aws.amazon.com/cli/latest/reference/redshift/disable-snapshot-copy.html) in *AWS CLI Command Reference*.

### enable-snapshot-copy

The following code example shows how to use `enable-snapshot-copy`.

#### AWS CLI

**To enable snapshot copy for a cluster**

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```bash
aws redshift enable-snapshot-copy \
    --cluster-identifier mycluster \
    --destination-region us-west-1
```

**Output:**

```json
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",

}
}

For more information, see [Copying Snapshots to Another AWS Region](https://docs.aws.amazon.com/redshift/latest/mngguide/sg-How-To-CopyingSnapshotsToAnotherRegion.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [EnableSnapshotCopy](https://docs.aws.amazon.com/cli/latest/reference/redshift/enable-snapshot-copy.html) in *AWS CLI Command Reference*.

**get-cluster-credentials**

The following code example shows how to use `get-cluster-credentials`.

**AWS CLI**

**To get cluster credentials for an AWS account**

The following `get-cluster-credentials` example retrieves temporary credentials that enable access to an Amazon Redshift database.

```bash
aws redshift get-cluster-credentials \
  --db-user adminuser --db-name dev \
  --cluster-identifier mycluster
```

**Output:**

```
{
  "DbUser": "IAM:adminuser",
  "DbPassword": "AMAFUyyuros/QjxPTtgzcsuQsqzIasdzJEN04aCtWDzXx109d6UmpkBtvEeqFly/EXAMPLE==",
  "Expiration": "2019-12-10T17:25:05.770Z"
}
```

For more information, see [Generating IAM Database Credentials Using the Amazon Redshift CLI or API](https://docs.aws.amazon.com/redshift/latest/mngguide/sg-How-To-IAM-DatabaseCredentials.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [GetClusterCredentials](https://docs.aws.amazon.com/cli/latest/reference/redshift/get-cluster-credentials.html) in *AWS CLI Command Reference*.
get-reserved-node-exchange-offerings

The following code example shows how to use get-reserved-node-exchange-offerings.

AWS CLI

To get reserved node exchange offerings

The following get-reserved-node-exchange-offerings example retrieves an array of DC2 ReservedNodeOfferings that match the specified DC1 reserved node.

```
aws redshift get-reserved-node-exchange-offerings \
  --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
  "ReservedNodeOfferings": [
    {
      "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
      "NodeType": "dc2.large",
      "Duration": 31536000,
      "FixedPrice": 0.0,
      "UsagePrice": 0.0,
      "CurrencyCode": "USD",
      "OfferingType": "All Upfront",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.0,
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "ReservedNodeOfferingType": "Regular"
    }
  ]
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the Amazon Redshift Cluster Management Guide.

- For API details, see GetReservedNodeExchangeOfferings in AWS CLI Command Reference.
**modify-cluster-iam-roles**

The following code example shows how to use `modify-cluster-iam-roles`.

### AWS CLI

**To modify the IAM role for a cluster**

The following `modify-cluster-iam-roles` example removes the specified AWS IAM role from the specified cluster.

```bash
aws redshift modify-cluster-iam-roles \
  --cluster-identifier mycluster \
  --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

**Output:**

```json
{
  "Cluster": {
    "ClusterIdentifier": "mycluster",
    "NodeType": "dc2.large",
    "ClusterStatus": "available",
    "ClusterAvailabilityStatus": "Available",
    "MasterUsername": "adminuser",
    "DBName": "dev",
    "Endpoint": {
      "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
      "Port": 5439
    },
    "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
    "AutomatedSnapshotRetentionPeriod": 3,
    "ManualSnapshotRetentionPeriod": -1,
    "ClusterSecurityGroups": [],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sh-f9b731sd",
        "Status": "active"
      }
    ],
    "ClusterParameterGroups": [
      {
        "ParameterGroupName": "default.redshift-1.0",
        "ParameterApplyStatus": "in-sync"
      }
    ]
  }
}
```
For more information, see Using Identity-Based Policies (IAM Policies) for Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifyClusterIamRoles in AWS CLI Command Reference.
**modify-cluster-maintenance**

The following code example shows how to use `modify-cluster-maintenance`.

**AWS CLI**

**To modify cluster maintenance**

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```
aws redshift modify-cluster-maintenance \
   --cluster-identifier mycluster \
   --defer-maintenance \
   --defer-maintenance-duration 30
```

**Output:**

```
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "available",

modify-cluster-parameter-group

The following code example shows how to use modify-cluster-parameter-group.

AWS CLI

Modify a parameter in a parameter group

The following modify-cluster-parameter-group example modifies the wlm_json_configuration parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```bash
aws redshift modify-cluster-parameter-group \
  --parameter-group-name myclusterparametergroup \
  --parameters file://modify_pg.json
```

Contents of modify_pg.json:

```
[
  {
    "ParameterName": "wlm_json_configuration",
    "ParameterValue": "[{"user_group":"example_user_group1","query_group":"example_query_group1","query_concurrency":7},{"query_concurrency":5}]"
  }
]
```

Output:

```
{
  "ParameterGroupStatus": "Your parameter group has been updated but changes won't get applied until you reboot the associated Clusters.",
  "ParameterGroupName": "myclusterparametergroup",
  "ResponseMetadata": {
    "RequestId": "09974cc0-64cd-11e2-bea9-49e0ce183f07"
  }
}
```
modify-cluster-snapshot-schedule

The following code example shows how to use modify-cluster-snapshot-schedule.

AWS CLI

To modify cluster snapshot schedule

The following modify-cluster-snapshot-schedule example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \
   --cluster-identifier mycluster \
   --schedule-identifier mysnapshotschedule \
   --disassociate-schedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

modify-cluster-snapshot

The following code example shows how to use modify-cluster-snapshot.

AWS CLI

To modify cluster snapshot

The following modify-cluster-snapshot example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \
   --snapshot-identifier mycluster-2019-11-06-16-32 \
   --manual-snapshot-retention-period 10
```

Output:
For more information, see [Amazon Redshift Snapshots](https://docs.aws.amazon.com/redshift/latest/userguide/redshift-snapshots.html) in the *[Amazon Redshift Cluster Management Guide](https://docs.aws.amazon.com/redshift/latest/userguide/).*

- For API details, see [ModifyClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/redshift/modify-cluster-snapshot.html) in *[AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/redshift/).*
modify-cluster-subnet-group

The following code example shows how to use modify-cluster-subnet-group.

AWS CLI

Modify the Subnets in a Cluster Subnet Group

This example shows how to modify the list of subnets in a cache subnet group. By default, the output is in JSON format.

Command:

```bash
aws redshift modify-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup --subnet-ids subnet-763fdd1 subnet-ac830e9
```

Result:

```json
{
  "ClusterSubnetGroup": {
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-763fdd1c",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-ac830e9",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1b"
        }
      }
    ],
    "VpcId": "vpc-7e3fdd14",
    "SubnetGroupStatus": "Complete",
    "Description": "My subnet group",
    "ClusterSubnetGroupName": "mysubnetgroup"
  },
  "ResponseMetadata": {
    "RequestId": "8da93e89-8372-f936-93a8-873918938197a"
  }
}
```

- For API details, see [ModifyClusterSubnetGroup](#) in *AWS CLI Command Reference.*
**modify-cluster**

The following code example shows how to use `modify-cluster`.

**AWS CLI**

Associate a Security Group with a Cluster
This example shows how to associate a cluster security group with the specified cluster.

Command:

```bash
aws redshift modify-cluster --cluster-identifier mycluster --cluster-security-groups mysecuritygroup
```

Modify the Maintenance Window for a Cluster
This shows how to change the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM.

Command:

```bash
aws redshift modify-cluster --cluster-identifier mycluster --preferred-maintenance-window Sun:23:15-Mon:03:15
```

Change the Master Password for the Cluster
This example shows how to change the master password for a cluster.

Command:

```bash
aws redshift modify-cluster --cluster-identifier mycluster --master-user-password A1b2c3d4
```

- For API details, see [ModifyCluster](#) in *AWS CLI Command Reference*.

**modify-event-subscription**

The following code example shows how to use `modify-event-subscription`.

**AWS CLI**

**To modify event subscription**

The following `modify-event-subscription` example disables the specified event notification subscription.

```bash
aws redshift modify-event-subscription \
   --subscription-name mysubscription \
   --no-enabled
```
Output:

```json
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "Status": "active",
        "SourceIdsList": [],
        "EventCategoriesList": [
            "management"
        ],
        "Severity": "ERROR",
        "Enabled": false,
        "Tags": []
    }
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](https://docs.aws.amazon.com/redshift/latest/mgmt/subscribing-to-redshift-event-notifications.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyEventSubscription](https://docs.aws.amazon.com/cli/latest/reference/redshift/modify-event-subscription.html) in *AWS CLI Command Reference*.

**modify-scheduled-action**

The following code example shows how to use `modify-scheduled-action`.

**AWS CLI**

To modify scheduled action

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```bash
aws redshift modify-scheduled-action
  --scheduled-action-name myscheduledaction
  --scheduled-action-description "My scheduled action"
```

Output:

```json
{
}
```
"ScheduledActionName": "myscheduledaction",
"TargetAction": {
   "ResizeCluster": {
      "ClusterIdentifier": "mycluster",
      "NumberOfNodes": 2,
      "Classic": false
   }
},
"Schedule": "at(2019-12-25T00:00:00)",
"IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
"ScheduledActionDescription": "My scheduled action",
"State": "ACTIVE",
"NextInvocations": [
   "2019-12-25T00:00:00Z"
]
}

- For API details, see [ModifyScheduledAction](https://docs.aws.amazon.com/cli/latest/reference/redshift/modify-scheduled-action.html) in *AWS CLI Command Reference*.

**modify-snapshot-copy-retention-period**

The following code example shows how to use `modify-snapshot-copy-retention-period`.

**AWS CLI**

**To modify snapshot copy retention period**

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```
aws redshift modify-snapshot-copy-retention-period \
   --cluster-identifier mycluster \
   --retention-period 15
```

**Output:**

```json
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "available",
```
"ClusterAvailabilityStatus": "Available",
"MasterUsername": "adminuser",
"DBName": "dev",
"Endpoint": {
  "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
  "Port": 5439
},
"ClusterCreateTime": "2019-12-05T18:44:36.991Z",
"AutomatedSnapshotRetentionPeriod": 3,
"ManualSnapshotRetentionPeriod": -1,
"ClusterSecurityGroups": [],
"VpcSecurityGroups": [
  {
    "VpcSecurityGroupId": "sh-a1a123ab",
    "Status": "active"
  }
],
"ClusterParameterGroups": [
  {
    "ParameterGroupName": "default.redshift-1.0",
    "ParameterApplyStatus": "in-sync"
  }
],
"ClusterSubnetGroupName": "default",
"VpcId": "vpc-b1fet7t9",
"AvailabilityZone": "us-west-2f",
"PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
"PendingModifiedValues": {
  "NodeType": "dc2.large",
  "NumberOfNodes": 2,
  "ClusterType": "multi-node"
},
"ClusterVersion": "1.0",
"AllowVersionUpgrade": true,
"NumberOfNodes": 4,
"PubliclyAccessible": false,
"Encrypted": false,
"ClusterSnapshotCopyStatus": {
  "DestinationRegion": "us-west-1",
  "RetentionPeriod": 15,
  "ManualSnapshotRetentionPeriod": -1
},
"Tags": [
"Key": "mytags",
 "Value": "tag1"
},
"EnhancedVpcRouting": false,
"IamRoles": [],

 }
],
"NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z"
]

For more information, see Snapshot Schedule Format in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifySnapshotCopyRetentionPeriod in AWS CLI Command Reference.

modify-snapshot-schedule

The following code example shows how to use modify-snapshot-schedule.

AWS CLI

To modify snapshot schedule

The following modify-snapshot-schedule example modifies the rate of the specified snapshot schedule to every 10 hours.

```
aws redshift modify-snapshot-schedule \
    --schedule-identifier mysnapshotschedule \
    --schedule-definitions "rate(10 hours)"
```

Output:

```
{
 "ScheduleDefinitions": [ 
```
For more information, see Snapshot Schedule Format in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifySnapshotSchedule in AWS CLI Command Reference.

**purchase-reserved-node-offering**

The following code example shows how to use purchase-reserved-node-offering.

**AWS CLI**

Purchase a Reserved Node

This example shows how to purchase a reserved node offering. The reserved-node-offering-id is obtained by calling describe-reserved-node-offerings.

Command:

```bash
aws redshift purchase-reserved-node-offering --reserved-node-offering-id ceb6a579-cf4c-4343-be8b-d832c45ab51c
```

Result:

```json
{
   "ReservedNode": {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
      "UsagePrice": "",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": "",
            "RecurringChargeFrequency": "Hourly"
         }
      ],
      "NodeCount": 1,
   }
}
```
"State": "payment-pending",
"StartTime": "2013-02-13T17:08:39.051Z",
"Duration": 31536000,
"ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
},
"ResponseMetadata": {
  "RequestId": "01bda7bf-7600-11e2-b605-2568d7396e7f"
}
}

- For API details, see [PurchaseReservedNodeOffering](#) in [AWS CLI Command Reference](#).

### reboot-cluster

The following code example shows how to use reboot-cluster.

**AWS CLI**

Reboot a Cluster

This example reboots a cluster. By default, the output is in JSON format.

Command:

```bash
aws redshift reboot-cluster --cluster-identifier mycluster
```

Result:

```json
{
  "Cluster": {
    "NodeType": "dw.hs1.xlarge",
    "Endpoint": {
      "Port": 5439,
      "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
    },
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
  
```
• For API details, see RebootCluster in AWS CLI Command Reference.

reset-cluster-parameter-group

The following code example shows how to use reset-cluster-parameter-group.

AWS CLI

Reset Parameters in a Parameter Group
This example shows how to reset all of the parameters in a parameter group. Command:

```bash
aws redshift reset-cluster-parameter-group --parameter-group-name myclusterparametergroup --reset-all-parameters
```

• For API details, see ResetClusterParameterGroup in AWS CLI Command Reference.

resize-cluster

The following code example shows how to use resize-cluster.
To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```bash
aws redshift resize-cluster \
   --cluster-identifier mycluster \
   --cluster-type multi-node \
   --node-type dc2.large \
   --number-of-nodes 6 \
   --classic
```

Output:

```json
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "resizing",
      "ClusterAvailabilityStatus": "Modifying",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "Endpoint": {
         "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
         "Port": 5439
      },

}
For more information, see Resizing a Cluster in the Amazon Redshift Cluster Management Guide.

- For API details, see ResizeCluster in AWS CLI Command Reference.

```
restore-from-cluster-snapshot
```

The following code example shows how to use restore-from-cluster-snapshot.

**AWS CLI**

**Restore a Cluster From a Snapshot**

This example restores a cluster from a snapshot.

Command:

```bash
aws redshift restore-from-cluster-snapshot --cluster-identifier mycluster-clone --snapshot-identifier my-snapshot-id
```

Result:

```json
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
            "ParameterApplyStatus": "in-sync",
            "ParameterGroupName": "default.redshift-1.0"
         }
      ],
      "ClusterSecurityGroups": [
         {
            "Status": "active",
            "ClusterSecurityGroupName": "default"
         }
      ],
      "AllowVersionUpgrade": true,
      "VpcSecurityGroups": [],
      "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
      "AutomatedSnapshotRetentionPeriod": 1,
      "ClusterStatus": "creating",
      "ClusterIdentifier": "mycluster-clone",
      "DBName": "dev",
      "NumberOfNodes": 2,
```

```
For API details, see `RestoreFromClusterSnapshot` in *AWS CLI Command Reference*.

**restore-table-from-cluster-snapshot**

The following code example shows how to use `restore-table-from-cluster-snapshot`.

### AWS CLI

**To restore table from a cluster snapshot**

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```bash
```

**Output:**

```json
{
    "TableRestoreStatus": {
        "TableRestoreRequestId": "a123a12b-abc1-1a1a-a123-a1234ab12345",
        "Status": "PENDING",
        "RequestTime": "2019-12-20T00:20:16.402Z",
        "ClusterIdentifier": "mycluster",
        "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
        "SourceDatabaseName": "dev",
        "SourceSchemaName": "public",
        "SourceTableName": "mytable",
        "TargetDatabaseName": "dev",
        "TargetSchemaName": "public",
        "TargetTableName": "mytable-clone"
    }
}
```
For more information, see [Restoring a Table from a Snapshot](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [RestoreTableFromClusterSnapshot](#) in *AWS CLI Command Reference*.

**revoke-cluster-security-group-ingress**

The following code example shows how to use `revoke-cluster-security-group-ingress`.

**AWS CLI**

Revoke Access from an EC2 Security Group

This example revokes access to a named Amazon EC2 security group.

Command:

```bash
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-owner-id 1234567890
```

Revoking Access to a CIDR range

This example revokes access to a CIDR range.

Command:

```bash
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see [RevokeClusterSecurityGroupIngress](#) in *AWS CLI Command Reference*.

**revoke-snapshot-access**

The following code example shows how to use `revoke-snapshot-access`.

**AWS CLI**

Revoke the Authorization of an AWS Account to Restore a Snapshot

This example revokes the authorization of the AWS account `444455556666` to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.

Command:
aws redshift revoke-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 44455556666

Result:

```
{
  "Snapshot": {
    "Status": "available",
    "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
    "EstimatedSecondsToCompletion": 0,
    "AvailabilityZone": "us-east-1a",
    "ClusterVersion": "1.0",

**rotate-encryption-key**

The following code example shows how to use rotate-encryption-key.

**AWS CLI**

To rotate encryption key for a cluster
The following `rotate-encryption-key` example rotates the encryption key for the specified cluster.

```bash
aws redshift rotate-encryption-key \
--cluster-identifier mycluster
```

Output:

```json
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "rotating-keys",
      "ClusterAvailabilityStatus": "Modifying",

   }
}
```
For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see RotateEncryptionKey in AWS CLI Command Reference.

**Amazon Rekognition examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**
**Actions**

**compare-faces**

The following code example shows how to use `compare-faces`.

For more information, see [Comparing faces in images](#).

**AWS CLI**

To compare faces in two images

The following `compare-faces` command compares faces in two images stored in an Amazon S3 bucket.

```
aws rekognition compare-faces \
    --source-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"source.jpg"}}' \
    --target-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"target.jpg"}}'
```

Output:

```
{
    "UnmatchedFaces": [],
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {

```
create-collection

The following code example shows how to use create-collection.

For more information, see Creating a collection.

AWS CLI

To create a collection

The following create-collection command creates a collection with the specified name.

```
aws rekognition create-collection \
  --collection-id "MyCollection"
```

Output:

```
{
  "FaceModelVersion": "4.0",
  "StatusCode": 200
}
```

For more information, see Creating a Collection in the Amazon Rekognition Developer Guide.
- For API details, see CreateCollection in AWS CLI Command Reference.

create-stream-processor

The following code example shows how to use create-stream-processor.

AWS CLI

To create a new stream processor

The following create-stream-processor example creates a new stream processor with the specified configuration.

```
aws rekognition create-stream-processor --name my-stream-processor\ 
```
Output:

```json
{
}
```

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [CreateStreamProcessor](#) in *AWS CLI Command Reference*.

### delete-collection

The following code example shows how to use `delete-collection`.

For more information, see [Deleting a collection](#).

### AWS CLI

#### To delete a collection

The following `delete-collection` command deletes the specified collection.

```
aws rekognition delete-collection \
    --collection-id MyCollection
```

Output:

```json
{
    "StatusCode": 200
}
```

For more information, see [Deleting a Collection](#) in the *Amazon Rekognition Developer Guide*. 
delete-faces

The following code example shows how to use delete-faces.

For more information, see Deleting faces from a collection.

AWS CLI

To delete faces from a collection

The following delete-faces command deletes the specified face from a collection.

```bash
aws rekognition delete-faces \
   --collection-id MyCollection \
   --face-ids '["0040279c-0178-436e-b70a-e61b074e96b0"]'
```

Output:

```
{
   "DeletedFaces": [
      "0040279c-0178-436e-b70a-e61b074e96b0"
   ]
}
```

For more information, see Deleting Faces from a Collection in the Amazon Rekognition Developer Guide.

- For API details, see DeleteFaces in AWS CLI Command Reference.

delete-stream-processor

The following code example shows how to use delete-stream-processor.

AWS CLI

To delete a stream processor

The following delete-stream-processor command deletes the specified stream processor.

```bash
aws rekognition delete-stream-processor \
```
This command produces no output.

For more information, see Working with Streaming Videos in the Amazon Rekognition Developer Guide.

- For API details, see DeleteStreamProcessor in AWS CLI Command Reference.

**describe-collection**

The following code example shows how to use describe-collection.

For more information, see Describing a collection.

**AWS CLI**

*To describe a collection*

The following describe-collection example displays the details about the specified collection.

```
aws rekognition describe-collection \
   --collection-id MyCollection
```

Output:

```
{
   "FaceCount": 200,
   "CreationTimestamp": 1569444828.274,
   "FaceModelVersion": "4.0"
}
```

For more information, see Describing a Collection in the Amazon Rekognition Developer Guide.

- For API details, see DescribeCollection in AWS CLI Command Reference.

**describe-stream-processor**

The following code example shows how to use describe-stream-processor.
AWS CLI

To get information about a stream processor

The following `describe-stream-processor` command displays details about the specified stream processor.

```bash
aws rekognition describe-stream-processor \
   --name my-stream-processor
```

Output:

```json
{
   "Status": "STOPPED",
   "Name": "my-stream-processor",
   "LastUpdateTimestamp": 1532449292.712,
   "Settings": {
      "FaceSearch": {
         "FaceMatchThreshold": 80.0,

   "Input": {
      "KinesisVideoStream": {
      }
   },
   "CreationTimestamp": 1532449292.712
}
```

For more information, see [Working with Streaming Videos](amazon-rekognition-developer-guide) in the [Amazon Rekognition Developer Guide](amazon-rekognition-developer-guide).
• For API details, see DescribeStreamProcessor in AWS CLI Command Reference.

detect-faces

The following code example shows how to use detect-faces.

For more information, see Detecting faces in an image.

AWS CLI

To detect faces in an image

The following detect-faces command detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \ 
    --attributes "ALL"
```

Output:

```

detect-labels

The following code example shows how to use detect-labels.

For more information, see Detecting labels in an image.

AWS CLI

To detect a label in an image

The following detect-labels example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \
   --image '{"S3Object":{"Bucket":bucket,"Name":image}}'
```

Output:

```
{
   "Labels": [
   {
      "Instances": [],
      "Confidence": 99.15271759033203,
      "Parents": [

The following code example shows how to use `detect-moderation-labels`.

For more information, see Detecting inappropriate images.

AWS CLI

To detect unsafe content in an image

The following `detect-moderation-labels` command detects unsafe content in the specified image stored in an Amazon S3 bucket.

```bash
aws rekognition detect-moderation-labels 
    --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

Output:

```json
{
    "ModerationModelVersion": "3.0",
    "ModerationLabels": [
        {
            "Confidence": 97.29618072509766,
            "ParentName": "Violence",
            "Name": "Weapon Violence"
        },
        {
            "Confidence": 97.29618072509766,
            "ParentName": "",
```
For more information, see Detecting Unsafe Images in the Amazon Rekognition Developer Guide.

- For API details, see DetectModerationLabels in AWS CLI Command Reference.

detect_text

The following code example shows how to use detect_text.

For more information, see Detecting text in an image.

AWS CLI

To detect text in an image

The following detect-text command detects text in the specified image.

```
aws rekognition detect-text \
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'
```

Output:

```
{
  "TextDetections": [

• For API details, see DetectText in AWS CLI Command Reference.

disassociate-faces

The following code example shows how to use disassociate-faces.

AWS CLI

    aws rekognition disassociate-faces --face-ids list-of-face-ids
    --user-id user-id --collection-id collection-name --region region-name

• For API details, see DisassociateFaces in AWS CLI Command Reference.

get-celebrity-info

The following code example shows how to use get-celebrity-info.

AWS CLI

    To get information about a celebrity
The following `get-celebrity-info` command displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```bash
aws rekognition get-celebrity-info --id nnnnnnn
```

Output:

```json
{
   "Name": "Celeb A",
   "Urls": [
      "www.imdb.com/name/aaaaaaaaa"
   ]
}
```

For more information, see [Getting Information About a Celebrity](https://docs.aws.amazon.com/AmazonRekognition/latest/APIReference/API_GetCelebrityInfo.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [GetCelebrityInfo](https://docs.aws.amazon.com/cli/latest/reference/rekognition/get-celebrity-info.html) in *AWS CLI Command Reference*.

### get-celebrity-recognition

The following code example shows how to use `get-celebrity-recognition`.

**AWS CLI**

**To get the results of a celebrity recognition operation**

The following `get-celebrity-recognition` command displays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```bash
aws rekognition get-celebrity-recognition \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```json
{
   "NextToken": "3D01C1x1CiT31VsRDkA03IybLb/h5AtDWSGuhYi+NlF1JwwPtAkuKzDhL2rV3GcwmNt77+12",

**get-face-search**

The following code example shows how to use get-face-search.

**AWS CLI**

**To get the results of a face search operation**

The following get-face-search command displays the results of a face search operation that you started previously by calling start-face-search.

```bash
aws rekognition get-face-search  \
   --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```json
{
   "Persons": [
      {
         "Timestamp": 467,
         "FaceMatches": [],
         "Person": {

            "Name": "School"
          }
        ],
        "Name": "Classroom"
      }
    }
  ],
```
For more information, see [Detecting Labels in a Video](#) in the [Amazon Rekognition Developer Guide](#).

- For API details, see [GetLabelDetection](#) in [AWS CLI Command Reference](#).

get-person-tracking

The following code example shows how to use get-person-tracking.

AWS CLI

**To get the results of a people pathing operation**

The following get-person-tracking command displays the results of a people pathing operation that you started previously by calling start-person-tracking.

```
aws rekognition get-person-tracking  
   --job-id 1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
   "Persons": [
   {
      "Timestamp": 500,
      "Person": {
         "BoundingBox": {
```

Actions and scenarios

5348
For more information, see People Pathing in the Amazon Rekognition Developer Guide.

- For API details, see GetPersonTracking in AWS CLI Command Reference.

**index-faces**

The following code example shows how to use index-faces.

For more information, see Adding faces to a collection.
AWS CLI

To add faces to a collection

The following `index-faces` command adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \
    --image '{"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}}' \
    --collection-id MyCollection \
    --max-faces 1 \
    --quality-filter "AUTO" \
    --detection-attributes "ALL" \
    --external-image-id "MyPicture.jpg"
```

Output:

```

For more information, see Adding Faces to a Collection in the Amazon Rekognition Developer Guide.

- For API details, see IndexFaces in AWS CLI Command Reference.

**list-collections**

The following code example shows how to use list-collections.

For more information, see Listing collections.

**AWS CLI**

**To list the available collections**

The following list-collections command lists the available collections in the AWS account.

```
aws rekognition list-collections
```

Output:

```
{
    "FaceModelVersions": [
        "2.0",
        "3.0",
        "3.0",
        "3.0",
        "4.0",
```
For more information, see [Listing Collections](#) in the Amazon Rekognition Developer Guide.

- For API details, see [ListCollections](#) in [AWS CLI Command Reference](#).

### list-faces

The following code example shows how to use `list-faces`.

For more information, see [Listing faces in a collection](#).

**AWS CLI**

**To list the faces in a collection**

The following `list-faces` command lists the faces in the specified collection.

```bash
aws rekognition list-faces \
   --collection-id MyCollection
```

**Output:**

```
{
   "FaceModelVersion": "3.0",
   "CollectionIds": [ 
      "MyCollection1",
      "MyCollection2",
      "MyCollection3",
      "MyCollection4",
      "MyCollection5",
      "MyCollection6",
      "MyCollection7",
      "MyCollection8",
      "MyCollection9",
      "MyCollection10"
   ]
}
```

5359
**list-stream-processors**

The following code example shows how to use `list-stream-processors`.

**AWS CLI**

To list the stream processors in your account

The following `list-stream-processors` command lists the stream processors in your account and the state of each.

```bash
aws rekognition list-stream-processors
```

Output:

```json
{
  "StreamProcessors": [
    {
      "Status": "STOPPED",
      "Name": "my-stream-processor"
    }
  ]
}
```

For more information, see [Working with Streaming Videos](https://docs.aws.amazon.com/AmazonRekognition/latest/devguide/stream-processors.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [ListStreamProcessors](https://docs.aws.amazon.com/cli/latest/reference/rekognition/list-stream-processors.html) in *AWS CLI Command Reference*.

**recognize-celebrities**

The following code example shows how to use `recognize-celebrities`.

For more information, see [Recognizing celebrities in an image](https://docs.aws.amazon.com/AmazonRekognition/latest/devguide/recognize-celebrity.html).

**AWS CLI**

To recognize celebrities in an image

The following `recognize-celebrities` command recognizes celebrities in the specified image stored in an Amazon S3 bucket.
aws rekognition recognize-celebrities \
   --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"

Output:

For more information, see Recognizing Celebrities in an Image in the Amazon Rekognition Developer Guide.

- For API details, see RecognizeCelebrities in AWS CLI Command Reference.

search-faces-by-image

The following code example shows how to use search-faces-by-image.

For more information, see Searching for a face (image).

AWS CLI

To search for faces in a collection that match the largest face in an image.

The following search-faces-by-image command searches for faces in a collection that match the largest face in the specified image:

```
aws rekognition search-faces-by-image \
--image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePerson.jpg"}}' \
--collection-id MyFaceImageCollection
```

```json
{
    "SearchedFaceBoundingBox": {
        "Width": 0.18562500178813934,
        "Top": 0.1618015021085739,
        "Left": 0.5575000047683716,
        "Height": 0.24770642817020416
    },
    "SearchedFaceConfidence": 99.993408203125,
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {
                    "Width": 0.18562500178813934,
                    "Top": 0.1618019938468933,
                    "Left": 0.5575000047683716,
                    "Height": 0.24770642817020416
                }
            }
        }
    ]
}
```

For more information, see [Searching for a Face Using Its Face ID](https://docs.aws.amazon.com/rekognition/latest/dg/searching-by-face-id.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [SearchFaces](https://docs.aws.amazon.com/cli/latest/reference/rekognition/search-faces.html) in *AWS CLI Command Reference*.

### start-celebrity-recognition

The following code example shows how to use start-celebrity-recognition.

#### AWS CLI

**To start the recognition of celebrities in a stored video**

The following `start-celebrity-recognition` command starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

**Output:**
The following code example shows how to use start-content-moderation.

**AWS CLI**

To start the recognition of unsafe content in a stored video

The following start-content-moderation command starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```bash
aws rekognition start-content-moderation \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```json
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Unsafe Stored Videos in the Amazon Rekognition Developer Guide.

- For API details, see StartContentModeration in AWS CLI Command Reference.

**start-face-detection**

The following code example shows how to use start-face-detection.

**AWS CLI**

To detect faces in a video
The following `start-face-detection` command starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-face-detection
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Detecting Faces in a Stored Video](https://docs.aws.amazon.com/rekognition/latest/dg/detecting-faces-in-stored-video.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartFaceDetection](https://docs.aws.amazon.com/cli/latest/reference/rekognition/start-face-detection.html) in *AWS CLI Command Reference*.

**start-face-search**

The following code example shows how to use `start-face-search`.

**AWS CLI**

**To search for faces in a collection that match faces detected in a video**

The following `start-face-search` command starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```
aws rekognition start-face-search \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
   --collection-id collection
```

Output:

```
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Searching Stored Videos for Faces](https://docs.aws.amazon.com/rekognition/latest/dg/searching-stored-videos-for-faces.html) in the *Amazon Rekognition Developer Guide*. 
start-label-detection

The following code example shows how to use start-label-detection.

AWS CLI

To detect objects and scenes in a video

The following start-label-detection command starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Labels in a Video in the Amazon Rekognition Developer Guide.

• For API details, see StartLabelDetection in AWS CLI Command Reference.

start-person-tracking

The following code example shows how to use start-person-tracking.

AWS CLI

To start the pathing of people in a stored video

The following start-person-tracking command starts a job to track the paths that people take in the specified video file stored in an Amazon S3 bucket:

```
aws rekognition start-person-tracking \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```
Start a Stream Processor

## start-stream-processor

The following code example shows how to use `start-stream-processor`.

### AWS CLI

**To start a stream processor**

The following `start-stream-processor` command starts the specified video stream processor.

```
aws rekognition start-stream-processor \
  --name my-stream-processor
```

This command produces no output.

For more information, see [Working with Streaming Videos](https://docs.aws.amazon.com/rekognition/latest/devguide/stream-processing.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartStreamProcessor](https://docs.aws.amazon.com/cli/latest/reference/rekognition/start-stream-processor.html) in *AWS CLI Command Reference*.

Stop a Running Stream Processor

## stop-stream-processor

The following code example shows how to use `stop-stream-processor`.

### AWS CLI

**To stop a running stream processor**

The following `stop-stream-processor` command stops the specified running stream processor.

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [People Pathing](https://docs.aws.amazon.com/rekognition/latest/devguide/person-tracking.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartPersonTracking](https://docs.aws.amazon.com/cli/latest/reference/rekognition/start-person-tracking.html) in *AWS CLI Command Reference*.
This command produces no output.

For more information, see Working with Streaming Videos in the Amazon Rekognition Developer Guide.

- For API details, see StopStreamProcessor in AWS CLI Command Reference.

AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

accept-resource-share-invitation

The following code example shows how to use accept-resource-share-invitation.

AWS CLI

To accept a resource share invitation

The following accept-resource-share-invitation example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.
aws ram accept-resource-share-invitation \
   --resource-share-invitation-arn arn:aws:ram:us-west-2:11111111111:resource-share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE

Output:

```
{
   "resourceShareInvitation": {
      "resourceShareInvitationArn": "arn:aws:ram:us-west-2:11111111111:resource-share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE",
      "resourceShareName": "MyLicenseShare",
      "resourceShareArn": "arn:aws:ram:us-west-2:11111111111:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
      "senderAccountId": "11111111111",
      "receiverAccountId": "22222222222",
      "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",
      "status": "ACCEPTED"
   }
}
```

- For API details, see AcceptResourceShareInvitation in AWS CLI Command Reference.

**associate-resource-share-permission**

The following code example shows how to use associate-resource-share-permission.

**AWS CLI**

To associate a RAM managed permission with a resource share

The following associate-resource-share-permission example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

aws ram associate-resource-share-permission \
   --permission-arn arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite \
   --replace \
For API details, see `AssociateResourceSharePermission` in `AWS CLI Command Reference`.

**associate-resource-share**

The following code example shows how to use `associate-resource-share`.

**AWS CLI**

**Example 1: To associate a resource with a resource share**

The following `associate-resource-share` example adds a license configuration to the specified resource share.

```
aws ram associate-resource-share \
  --resource-share arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
```

**Output:**

```
{
   "resourceShareAssociations": [
      {
         "associationType": "RESOURCE",
         "status": "ASSOCIATING",
         "external": false
      }
   ]
}
```
Example 2: To associate a principal with a resource share

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```bash
aws ram associate-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \ 
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE
```

Output:

```json
{
    "resourceShareAssociations": [
        {
            "status": "ASSOCIATING",
            "associationType": "PRINCIPAL",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE",
            "external": false,
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE"
        }
    ]
}
```

- For API details, see `AssociateResourceShare` in *AWS CLI Command Reference*.

create-resource-share

The following code example shows how to use `create-resource-share`.

AWS CLI

Example 1: To create a resource share

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```bash
aws ram create-resource-share \
```
--name MyNewResourceShare

Output:

```
{
    "resourceShare": {
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1634586271.302,
        "lastUpdatedTime": 1634586271.302
    }
}
```

**Example 2: To create a resource share with AWS accounts as principals**

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (222222222222). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --principals 222222222222
```

**Example 3: To create a resource share restricted to your AWS Organization**

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --no-allow-external-principals \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE
```

Output:
For API details, see [CreateResourceShare](#) in **AWS CLI Command Reference**.

**delete-resource-share**

The following code example shows how to use `delete-resource-share`.

**AWS CLI**

**To delete a resource share**

The following `delete-resource-share` example deletes the specified resource share.

```
aws ram delete-resource-share \
   --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

The following output indicates success:

```
{
   "returnValue": true
}
```

For API details, see [DeleteResourceShare](#) in **AWS CLI Command Reference**.

**disassociate-resource-share-permission**

The following code example shows how to use `disassociate-resource-share-permission`.

```
AWS CLI

To remove a RAM managed permission for a resource type from a resource share

The following disassociate-resource-share-permission example removes the RAM managed permission for Glue databases from the specified resource share.

```
aws ram disassociate-resource-share-permission \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \ 
    --permission-arn arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see DisassociateResourceSharePermission in AWS CLI Command Reference.

disassociate-resource-share

The following code example shows how to use disassociate-resource-share.

AWS CLI

To remove a resource from a resource share

The following disassociate-resource-share example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```
aws ram disassociate-resource-share \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE \ 
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{

}
```
For API details, see DisassociateResourceShare in AWS CLI Command Reference.

enable-sharing-with-aws-organization

The following code example shows how to use enable-sharing-with-aws-organization.

AWS CLI

To enable resource sharing across AWS Organizations

The following enable-sharing-with-aws-organization example enables resource sharing across your organization and organizational units.

```bash
aws ram enable-sharing-with-aws-organization
```

The following output indicates success.

```json
{
   "returnValue": true
}
```

For API details, see EnableSharingWithAwsOrganization in AWS CLI Command Reference.

get-permission

The following code example shows how to use get-permission.

AWS CLI

To retrieve the details for a RAM managed permission
The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```bash
aws ram get-permission \
   --permission-arn arn:aws:ram::aws:permission/ 
AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```json
{
   "permission": {
      "arn": "arn:aws:ram::aws:permission/ 
AWSRAMPermissionGlueTableReadWriteForDatabase",
      "version": "2",
      "defaultVersion": true,
      "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
      "resourceType": "glue:Database",
      "permission": "{\"Effect\":\"Allow\",\"Action\":\"glue:GetTable",
      \"glue:UpdateTable\", \"glue:DeleteTable\", \"glue:BatchDeleteTable",
      \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions",
      \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition",
      \"glue:BatchCreatePartition\", \"glue:CreatePartition\", \"glue:UpdatePartition",
      \"glue:BatchDeletePartition\", \"glue:DeletePartition\", \"glue:GetTables\",
      \"glue:SearchTables\"}",
      "creationTime": 1624912434.431,
      "lastUpdatedTime": 1624912434.431,
      "isResourceTypeDefault": false
   }
}
```

- For API details, see [GetPermission](#) in *AWS CLI Command Reference*.

**get-resource-policies**

The following code example shows how to use `get-resource-policies`.

**AWS CLI**

**To get the policies for a resource**

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.
aws ram get-resource-policies \

Output:

```json
{
   "policies": [
      {
         "Version": "2008-10-17",
         "Statement": [
            {
               "Sid": "RamStatement1",
               "Effect": "Allow",
               "Principal": {"AWS": []},
               "Action": ["ec2:RunInstances",
                          "ec2:CreateNetworkInterface",
                          "ec2:DescribeSubnets"],
            }
         ]
      }
   ]
}
```

• For API details, see [GetResourcePolicies](#) in *AWS CLI Command Reference*.

**get-resource-share-associations**

The following code example shows how to use `get-resource-share-associations`.

**AWS CLI**

**Example 1: To list all resource associations for all resource types**

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```
aws ram get-resource-share-associations \
   --association-type RESOURCE
```

Output:

```json
{
   "resourceShareAssociations": [
      {
         "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
```

**Actions and scenarios** 5388
"resourceShareName": "MySubnetShare",
"associationType": "RESOURCE",
"status": "ASSOCIATED",
"creationTime": 1565303590.973,
"lastUpdatedTime": 1565303591.695,
"external": false
},
{
"resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/8167bdfe-4480-4a01-8632-315e0EXAMPLE",
"associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
"resourceShareName": "MyLicenseShare",
"associationType": "RESOURCE",
"status": "ASSOCIATED",
"creationTime": 1632342958.457,
"lastUpdatedTime": 1632342958.907,
"external": false
}
}

Example 2: To list principal associations for a resource share

The following get-resource-share-associations example lists only the principal
associations for only the specified resource share.

```bash
aws ram get-resource-share-associations
--resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE
--association-type PRINCIPAL
```

Output:

```json
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "resourceShareName": "MyNewResourceShare",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
```
For API details, see [GetResourceShareAssociations](https://docs.aws.amazon.com/cli/latest/reference/ram/get-resource-share-associations) in *AWS CLI Command Reference*.

### get-resource-share-invitations

The following code example shows how to use `get-resource-share-invitations`.

#### AWS CLI

**To list your resource share invitations**

The following `get-resource-share-invitations` example lists your current resource share invitations.

```bash
aws ram get-resource-share-invitations
```

**Output:**

```json
{
    "resourceShareInvitations": [
        {
            "resourceShareName": "project-resource-share",
            "senderAccountId": "111111111111",
            "receiverAccountId": "222222222222",
            "invitationTimestamp": 1565312166.258,
            "status": "PENDING"
        }
    ]
}
```
For API details, see [GetResourceShareInvitations](#) in *AWS CLI Command Reference*.

### get-resource-shares

The following code example shows how to use `get-resource-shares`.

**AWS CLI**

**Example 1: To list resource shares you own and share with others**

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```bash
aws ram get-resource-shares \
   --resource-owner SELF
```

**Output:**

```json
{
   "resourceShares": [
   {
   "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/3ab63985-99d9-1cd2-7d24-75e93EXAMPLE",
   "name": "my-resource-share",
   "owningAccountId": "123456789012",
   "allowExternalPrincipals": false,
   "status": "ACTIVE",
   "tags": [
   {
      "key": "project",
      "value": "lima"
   }
   ]
   "creationTime": 1565295733.282,
   "lastUpdatedTime": 1565295733.282
   },
   {
   "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
   }]
}
```
Example 2: To list resource shares owned by others and shared with you

The following `get-resource-shares` example lists the resource shares that others created and shared with you. In this example, there are none.

```bash
aws ram get-resource-shares \
   --resource-owner OTHER-ACCOUNTS
```

Output:

```json
{
   "resourceShares": []
}
```

- For API details, see [GetResourceShares](#) in [AWS CLI Command Reference](#).

**list-pending-invitation-resources**

The following code example shows how to use `list-pending-invitation-resources`.

**AWS CLI**

**To list the resources that are available in a pending resource share**

The following `list-pending-invitation-resources` example lists all of the resources that are in the resource share associated with the specified invitation.

```bash
aws ram list-pending-invitation-resources \
   --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```
Output:

```json
{
    "resources": [
        {
            "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-04a555b0eEXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "creationTime": 1634676051.269,
            "lastUpdatedTime": 1634676052.07,
            "status": "AVAILABLE",
            "type": "ec2:Subnet"
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "status": "AVAILABLE",
            "type": "license-manager:LicenseConfiguration"
        }
    ]
}
```

- For API details, see [ListPendingInvitationResources](https://docs.aws.amazon.com/cli/latest/reference/ram/list-pending-invitation-resources.html) in [AWS CLI Command Reference](https).

### list-permissions

The following code example shows how to use `list-permissions`.

#### AWS CLI

**To list the available RAM managed permissions**

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
  --resource-type glue:Database
```
Output:

```json
{
   "permissions": [
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionGlueDatabase",
         "version": "1",
         "defaultVersion": true,
         "name": "AWSRAMDefaultPermissionGlueDatabase",
         "resourceType": "glue:Database",
         "creationTime": 1592007820.935,
         "lastUpdatedTime": 1592007820.935,
         "isResourceTypeDefault": true
      },
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
         "version": "2",
         "defaultVersion": true,
         "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
         "resourceType": "glue:Database",
         "creationTime": 1624912413.323,
         "lastUpdatedTime": 1624912413.323,
         "isResourceTypeDefault": false
      },
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite",
         "version": "2",
         "defaultVersion": true,
         "name": "AWSRAMPermissionGlueDatabaseReadWrite",
         "resourceType": "glue:Database",
         "creationTime": 1624912417.4,
         "lastUpdatedTime": 1624912417.4,
         "isResourceTypeDefault": false
      },
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMPermissionGlueTableReadWriteForDatabase",
         "version": "2",
         "defaultVersion": true,
         "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
         "resourceType": "glue:Database",
         "creationTime": 1624912417.4,
         "lastUpdatedTime": 1624912417.4,
         "isResourceTypeDefault": false
      }
   ]
}
```
The following `list-permissions` example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```
{
   "permissions": [
        {
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264861.085,
            "lastUpdatedTime": 1623264861.085,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionAppMesh",
            "resourceType": "appmesh:Mesh",
            "creationTime": 1589307188.584,
            "lastUpdatedTime": 1589307188.584,
            "isResourceTypeDefault": true
        },
        ...TRUNCATED FOR BREVITY...
        {
            "arn": "arn:aws:ram::aws:permission/AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "version": "1",
```
For API details, see ListPermissions in AWS CLI Command Reference.

list-principals

The following code example shows how to use list-principals.

AWS CLI

To list principals with access to a resource

The following list-principals example displays a list of the principals that can access resources of the specified type through any resource shares.

```
aws ram list-principals \
  --resource-type ec2:Subnet
```

Output:

```
{
   "principals": [
      {
         "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-zEXAMPLE",
         "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b50f-7e2a-420d-6f5d3EXAMPLE",
         "creationTime": 1565298209.737,
         "lastUpdatedTime": 1565298211.019,
         "external": false
      }
   ]
}
```
list-resource-share-permissions

The following code example shows how to use list-resource-share-permissions.

**AWS CLI**

**To list all of the RAM managed permissions currently attached to a resource share**

The following list-resource-share-permissions example lists all of the RAM managed permissions that are attached to the specified resource share.

```
aws ram list-resource-share-permissions \\
```

Output:

```
{
    "permissions": [
    {
        "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionLicenseConfiguration",
        "version": "1",
        "resourceType": "license-manager:LicenseConfiguration",
        "status": "ASSOCIATED",
        "lastUpdatedTime": 1632342984.234
    },
    {
        "arn": "arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite",
        "version": "2",
        "resourceType": "glue:Database",
        "status": "ASSOCIATED",
        "lastUpdatedTime": 1632512462.297
    }
    ]
}
```

• For API details, see ListResourceSharePermissions in AWS CLI Command Reference.
**list-resource-types**

The following code example shows how to use `list-resource-types`.

**AWS CLI**

**To list the resource types that are supported by AWS RAM**

The following `list-resource-types` example lists all of the resource types currently supported by AWS RAM.

```bash
aws ram list-resource-types
```

Output:

```json
{
   "resourceTypes": [
   {
      "resourceType": "route53resolver:FirewallRuleGroup",
      "serviceName": "route53resolver"
   },
   {
      "resourceType": "ec2:LocalGatewayRouteTable",
      "serviceName": "ec2"
   },
   ...
   "resourceType": "ec2:Subnet",
   "serviceName": "ec2"
   },
   ...
   "resourceType": "ec2:TransitGatewayMulticastDomain",
   "serviceName": "ec2"
   ]
}
```

- For API details, see [ListResourceTypes](#) in *AWS CLI Command Reference*.

**list-resources**

The following code example shows how to use `list-resources`.
AWS CLI

To list the resources associated with a resource share

The following list-resources example lists all resources in the specified resource share that are of the specified resource type.

```bash
aws ram list-resources \
  --resource-type ec2:Subnet \
  --resource-owner SELF \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```json
{
  "resources": [
    {
      "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1f4e15235",
      "type": "ec2:Subnet",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1565301545.023,
      "lastUpdatedTime": 1565301545.947
    }
  ]
}
```

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

promote-resource-share-created-from-policy

The following code example shows how to use promote-resource-share-created-from-policy.

AWS CLI

To promote a resource-policy based resource share to full functionality in AWS RAM
The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```
aws ram promote-resource-share-created-from-policy \\
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see `PromoteResourceShareCreatedFromPolicy` in *AWS CLI Command Reference*.

### reject-resource-share-invitation

The following code example shows how to use `reject-resource-share-invitation`.

**AWS CLI**

**To reject a resource share invitation**

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```
aws ram reject-resource-share-invitation \\
```

Output:

```
"resourceShareInvitations": [
    {
        "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
        "resourceShareName": "project-resource-share",
```

Actions and scenarios
"senderAccountId": "111111111111",
"receiverAccountId": "222222222222",
"invitationTimestamp": 1565319592.463,
"status": "REJECTED"
]

- For API details, see [RejectResourceShareInvitation](https://docs.aws.amazon.com/cli/latest/reference/ram/reject-resource-share-invitation.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a resource share**

The following `tag-resource` example adds a tag key `project` and associated value `lima` to the specified resource share.

```bash
aws ram tag-resource \
  --tags key=project,value=lima \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/ram/tag-resource.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a resource share**

The following `untag-resource` example removes the `project` tag key and associated value from the specified resource share.
aws ram untag-resource \
  --tag-keys project \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE

This command produces no output.

- For API details, see UntagResource in AWS CLI Command Reference.

update-resource-share

The following code example shows how to use update-resource-share.

AWS CLI

To update a resource share

The following update-resource-share example changes the specified resource share to allow external principals that are not in an AWS Organization.

aws ram update-resource-share \
  --allow-external-principals \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
        "name": "my-resource-share",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1565295733.282,
        "lastUpdatedTime": 1565303080.023
    }
}
```

- For API details, see UpdateResourceShare in AWS CLI Command Reference.
Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

**associate-default-view**

The following code example shows how to use associate-default-view.

**AWS CLI**

To set a Resource Explorer view as the default for its AWS Region

The following associate-default-view example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```bash
aws resource-explorer-2 associate-default-view \
```

Output:

```json
{
   "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```
For more information, see Setting a default view in an AWS Region in the AWS Resource Explorer Users Guide.

• For API details, see AssociateDefaultView in AWS CLI Command Reference.

**batch-get-view**

The following code example shows how to use `batch-get-view`.

**AWS CLI**

To retrieve details about multiple Resource Explorer views

The following batch-get-view example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the --view-arn parameter.

```bash
aws resource-explorer-2 batch-get-view \\
    --view-arns arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222, \\
    arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```json
{
    "Views": [
        {
            "Filters": {
                "FilterString": "service:ec2"
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
        },
        {

Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
"Errors": []

For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

• For API details, see BatchGetView in AWS CLI Command Reference.

create-index

The following code example shows how to use create-index.

AWS CLI

To turn on Resource Explorer in an AWS Region by creating an index

The following create-index example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random client-token parameter value and includes it in the call to AWS if you don't specify a value.

```
aws resource-explorer-2 create-index \
    --region us-east-1
```

Output:

```
After you create a local index, you can convert it into the aggregator index for the account by running the `update-index-type` command.

For more information, see Turning on Resource Explorer in an AWS Region to index your resources in the AWS Resource Explorer Users Guide.

- For API details, see `CreateIndex` in AWS CLI Command Reference.

### create-view

The following code example shows how to use `create-view`.

#### AWS CLI

**Example 1: To create an unfiltered view for the index in an AWS Region**

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
   --view-name My-Main-View \ 
   --included-properties Name=tags \ 
   --region us-east-1
```

**Output:**

```json
{
   "View": {
      "Filters": {
         "FilterString": ""
      },
      "IncludedProperties": [
         {
            "Name": "tags"
         }
      ]
   }
}
```
Example 2: To create a view that returns only resources associated with Amazon EC2

The following `create-view` creates a view in AWS Region `us-east-1` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```bash
aws resource-explorer-2 create-view \
   --view-name My-EC2-Only-View \
   --included-properties Name=tags \
   --filters FilterString="service:ec2" \ 
   --region us-east-1
```

Output:

```json
{
   "View": {
      "Filters": {
         "FilterString": "service:ec2"
      },
      "IncludedProperties": [
         {
            "Name": "tags"
         }
      ],
      "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
      "Owner": "123456789012",
      "Scope": "arn:aws:iam::123456789012:root",
      "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
   }
}
```
For more information, see Creating views for search in the AWS Resource Explorer Users Guide.

• For API details, see CreateView in AWS CLI Command Reference.

delete-index

The following code example shows how to use delete-index.

AWS CLI

To turn off Resource Explorer in an AWS Region by deleting its index

The following delete-index example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

aws resource-explorer-2 delete-index \
   --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222 \
   --region us-west-2

Output:

{}

"State": "DELETING"

For more information about deleting an index, see Turning off AWS Resource Explorer in an AWS Region in the AWS Resource Explorer Users Guide.

• For API details, see DeleteIndex in AWS CLI Command Reference.

delete-view

The following code example shows how to use delete-view.

AWS CLI

To delete a Resource Explorer view
The following delete-view example deletes a view specified by its ARN.

```
aws resource-explorer-2 delete-view \\
```

Output:

```
{
   "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see [Deleting views](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-cluster-management.html) in the *AWS Aurora Serverless User Guide*.

- For API details, see [DeleteView](https://docs.aws.amazon.com/cli/latest/reference/resource-explorer-2/delete-view.html) in *AWS CLI Command Reference*.

**disassociate-default-view**

The following code example shows how to use disassociate-default-view.

**AWS CLI**

**To remove the default Resource Explorer view for an AWS Region**

The following disassociate-default-view removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see [Setting a default view in an AWS Region](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-cluster-management.html) in the *AWS Aurora Serverless User Guide*.

- For API details, see [DisassociateDefaultView](https://docs.aws.amazon.com/cli/latest/reference/resource-explorer-2/disassociate-default-view.html) in *AWS CLI Command Reference*.

**get-default-view**

The following code example shows how to use get-default-view.
AWS CLI

To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```bash
aws resource-explorer-2 get-default-view
```

Output:

```json
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/default-view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the AWS Resource Explorer Users Guide.

- For API details, see `GetDefaultView` in AWS CLI Command Reference.

get-index

The following code example shows how to use `get-index`.

AWS CLI

Example 1: To retrieve the details for a Resource Explorer aggregator index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```bash
aws resource-explorer-2 get-index \
    --region us-east-1
```

Output:

```json
{
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "CreatedTime": "2022-07-12T18:59:10.503000+00:00",
}
```
Example 2: To retrieve the details for a Resource Explorer local index

The following get-index example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```
aws resource-explorer-2 get-index \n--region us-west-2
```

Output:

```
{
   "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
   "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
   "ReplicatingTo": [
      "us-west-2"
   ],
   "State": "ACTIVE",
   "Tags": {},
   "Type": "LOCAL"
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the AWS Resource Explorer Users Guide.

- For API details, see GetIndex in AWS CLI Command Reference.

**get-view**

The following code example shows how to use get-view.
AWS CLI

To retrieve details about a Resource Explorer view

The following `get-view` example displays the details about a view specified by its ARN.

```
aws resource-explorer-2 get-view \
```

Output:

```
{
   "Tags" : {},
   "View" : {
      "Filters" : {
         "FilterString" : "service:ec2"
      },
      "IncludedProperties" : [
         {
            "Name" : "tags"
         }
      ],
      "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",
      "Owner" : "123456789012",
      "Scope" : "arn:aws:iam::123456789012:root",
   }
}
```

For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see `GetView` in AWS CLI Command Reference.

list-indexes

The following code example shows how to use `list-indexes`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes
The following list-indexes example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```bash
aws resource-explorer-2 list-indexes
```

Output:

```json
{
    "Indexes": [
        {
            "Region": "us-west-2",
            "Type": "AGGREGATOR"
        },
        {
            "Region": "us-east-1",
            "Type": "LOCAL"
        },
        {
            "Region": "us-east-2",
            "Type": "LOCAL"
        },
        {
            "Region": "us-west-1",
            "Type": "LOCAL"
        }
    ]
}
```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the AWS Resource Explorer Users Guide.

- For API details, see [ListIndexes](#) in AWS CLI Command Reference.
list-supported-resource-types

The following code example shows how to use list-supported-resource-types.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following list-supported-resource-types example lists all of the resource types currently supported by &AREXlong;. The example response includes a NextToken value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \  
--max-items 10
```

Output:

```
{
  "ResourceTypes": [
    {
      "ResourceType": "cloudfront:cache-policy",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudfront:distribution",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudfront:function",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudfront:origin-access-identity",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudfront:origin-request-policy",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudfront:realtime-log-config",
      "Service": "cloudfront"
    }
  ]
}```
To get the next part of the output, call the operation again, and pass the previous call's NextToken response value as the value for --starting-token. Repeat until NextToken is absent from the response.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10  \
    --starting-token eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiO1iAxMH0=
```

Output:

```
{
    "ResourceTypes": [
        
        
],
    "NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiO1iAxMH0="
}
```
For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the AWS Resource Explorer Users Guide.

- For API details, see [ListSupportedResourceTypes](#) in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.
AWS CLI

To list the tags attached to a Resource Explorer view or index

The following list-tags-for-resource example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```bash
aws resource-explorer-2 list-tags-for-resource \
```

Output:

```json
{
    "Tags": {
        "application": "MainCorpApp",
        "department": "1234"
    }
}
```

For more information about tagging views, see Tagging views for access control in the AWS Resource Explorer Users Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

list-views

The following code example shows how to use list-views.

AWS CLI

To list the Resource Explorer views available in an AWS Region

The following list-views example lists all of the views available in the Region in which you invoke the operation.

```bash
aws resource-explorer-2 list-views
```

Output:
For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see ListViews in AWS CLI Command Reference.

**search**

The following code example shows how to use search.

**AWS CLI**

**Example 1: To search using the default view**

The following search example displays all resources in the specified that are associated with the service. The search uses the default view for the Region. The example response includes a NextToken value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
--query-string "service:iam"
```

**Output:**

```
{
   "Count": {
      "Complete": true,
      "TotalResources": 55
   },
   "NextToken": "AG9V0EF1KLEXAMPLEOhJHVwoSChEXAMPLERSXiEpNrgsEXAMPLE...b0CmOFOryHEXAMPLE",
   "Resources": [
```
Example 2: To search using a specified view

The following search example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```
aws resource-explorer-2 search \
   -- query-string "*" \
```

Output:

```
HTTP/1.1 200 OK
Date: Tue, 01 Nov 2022 20:00:59 GMT
Content-Type: application/json
Content-Length: <PayloadSizeBytes>

{
```
"Resources": [
    {
        "LastReportedAt": "2022-07-21T18:52:02Z",
        "OwningAccountId": "123456789012",
        "Properties": [
            {
                "Data": [
                    {
                        "Key": "Department",
                        "Value": "AppDevelopment"
                    },
                    {
                        "Key": "Environment",
                        "Value": "Production"
                    }
                ],
                "LastReportedAt": "2021-11-15T14:48:29Z",
                "Name": "tags"
            }
        ],
        "Region": "us-east-1",
        "ResourceType": "ec2:network-acl",
        "Service": "ec2"
    },
    {
        "Arn": "arn:aws:ec2:us-east-1:123456789012:subnet/subnet-1a2b3c4d",
        "LastReportedAt": "2022-07-21T21:22:23Z",
        "OwningAccountId": "123456789012",
        "Properties": [
            {
                "Data": [
                    {
                        "Key": "Department",
                        "Value": "AppDevelopment"
                    },
                    {
                        "Key": "Environment",
                        "Value": "Production"
                    }
                ],
                "LastReportedAt": "2021-07-29T19:02:39Z",
                "Name": "tags"
            }
        ],
        "Region": "us-east-1",
        "ResourceType": "ec2:subnet",
        "Service": "ec2"
    },
    {
        "Arn": "arn:aws:ec2:us-east-1:123456789012:dhcp-options/dopt-1a2b3c4d",
        "LastReportedAt": "2022-07-21T06:08:53Z",
        "OwningAccountId": "123456789012",
        "Properties": [
            {
                "Data": [
                    {
                        "Key": "Department",
                        "Value": "AppDevelopment"
                    },
                    {
                        "Key": "Environment",
                        "Value": "Production"
                    }
                ],
                "LastReportedAt": "2021-07-29T19:02:39Z",
                "Name": "tags"
            }
        ],
        "Region": "us-east-1",
        "ResourceType": "ec2:dhcp-options",
        "Service": "ec2"
    }
]
The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a Resource Explorer view**

The following `tag-resource` example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```
aws resource-explorer-2 tag-resource \\
  --tags environment=production
```

This command produces no output.
For more information, see Tagging views for access control in the AWS Resource Explorer Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a Resource Explorer view

The following untag-resource example removes any tag with the key name "environment" from the view with the specified ARN.

    aws resource-explorer-2 untag-resource \
      --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
      --tag-keys environment

This command produces no output.

For more information, see Tagging views for access control in the AWS Resource Explorer Users Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-index-type

The following code example shows how to use update-index-type.

AWS CLI

To change the type of a Resource Explorer index

The following update-index-type example converts the specified index from type local to type aggregator to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

    aws resource-explorer-2 update-index-type \

--arn arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90abcdef-fedc-EXAMPLE11111 \
--type aggregator \
--region us-east-1

Output:

}

For more information about changing an index's type, see Turning on cross-Region search by creating an aggregator index in the AWS Resource Explorer Users Guide.

- For API details, see UpdateIndexType in AWS CLI Command Reference.

update-view

The following code example shows how to use update-view.

AWS CLI

Example 1: To update the IncludedProperties field for a Resource Explorer view

The following update-view example updates the specified view by adding `tags` to the optional `IncludedProperties`. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

aws resource-explorer-2 update-view \
--included-properties Name=tags \
--view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222

Output:

{  

Example 2: To update the filters attached to a view

The following update-view example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```
aws resource-explorer-2 update-view \
  --filters FilterString="service:ec2" \
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
  "View": {
    "Filters": {
      "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
    "Owner": "123456789012",
    "Scope": "arn:aws:iam::123456789012:root",
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
  }
}
```
For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see UpdateView in AWS CLI Command Reference.

Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

create-group

The following code example shows how to use create-group.

**AWS CLI**

**Example 1: To create a tag-based resource group**

The following create-group example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key **Name**, and the value **WebServers**. The group name is **tbq-WebServer**. The query is in a separate JSON file that is passed to the command.

```
aws resource-groups create-group \
  --name tbq-WebServer \
  --resource-query file://query.json
```
Contents of query.json:

{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["WebServers"]}]}
}

Output:

{
    "Group": {
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["WebServers"]}]}
    }
}

Example 2: To create a CloudFormation stack-based resource group

The following create-group example creates an AWS CloudFormation stack-based resource group named sampleCFNstackgroup. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
  --name cbq-CFNstackgroup \
  --resource-query file://query.json
```

Contents of query.json:

{
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::AllSupported"], "StackIdentifier": "arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz"}
}
Output:

```
{
    "Group": {
        "Name": "cbq-CFNstackgroup"
    },
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{"ResourceTypeFilters": ["AWS::AllSupported"], "StackIdentifier": "arn:aws:cloudformation:us-east-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz"}
    }
}
```

For more information, see [Create Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

### delete-group

The following code example shows how to use `delete-group`.

**AWS CLI**

**To update the description for a resource group**

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "Name": "tbq-WebServer"
    }
}
```
For more information, see [Delete Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

### get-group-query

The following code example shows how to use get-group-query.

**AWS CLI**

**To get the query attached to a resource group**

The following get-group-query example displays query attached to the specified resource group.

```bash
aws resource-groups get-group-query \
  --group-name tbq-WebServer
```

**Output:**

```json
{
  "GroupQuery": {
    "GroupName": "tbq-WebServer",
    "ResourceQuery": {
      "Type": "TAG_FILTERS_1_0",
      "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}
    }
  }
}
```

- For API details, see [GetGroupQuery](#) in *AWS CLI Command Reference*.

### get-group

The following code example shows how to use get-group.

**AWS CLI**

**To get information about a resource group**
The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```bash
aws resource-groups get-group \
  --group-name tbq-WebServer
```

Output:

```json
{
  "Group": {
    "Name": "tbq-WebServer",
    "Description": "A tag-based query resource group of WebServers."
  }
}
```

- For API details, see [GetGroup](#) in *AWS CLI Command Reference*.

**get-tags**

The following code example shows how to use `get-tags`.

**AWS CLI**

**To retrieve the tags attached to a resource group**

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```bash
aws resource-groups get-tags \
```

Output:

```json
{
  "Tags": {
    "QueryType": "tags",
    "QueryResources": "ec2-instances"
  }
}
```
For API details, see GetTags in AWS CLI Command Reference.

**list-group-resources**

The following code example shows how to use list-group-resources.

**AWS CLI**

**To list all of the resources in a resource group**

Example 1: The following list-resource-groups example lists all of the resources that are part of the specified resource group.

```bash
aws resource-groups list-group-resources \
   --group-name tbq-WebServer
```

Output:

```json
{
   "ResourceIdentifiers": [
      {
         "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-09f77fa38c12345ab",
         "ResourceType": "AWS::EC2::Instance"
      }
   ]
}
```

Example 2: The following example lists all of the resources in the group that also have a 'resource-type' of the 'AWS::EC2::Instance'.

```bash
aws resource-groups list-group-resources --group-name tbq-WebServer --filters Name=resource-type,Values=AWS::EC2::Instance
```

For API details, see ListGroupResources in AWS CLI Command Reference.

**list-groups**

The following code example shows how to use list-groups.
AWS CLI

To list the available resource groups

The following list-groups example displays a list of all of the resource groups.

```
aws resource-groups list-groups
```

Output:

```
{
    "GroupIdentifiers": [
        {
            "GroupName": "tbq-WebServer",
        },
        {
            "GroupName": "cbq-CFNStackQuery",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-CFNStackQuery"
        }
    ],
    "Groups": [
        {
            "Name": "tbq-WebServer"
        },
        {
            "Name": "cbq-CFNStackQuery"
        }
    ]
}
```

- For API details, see ListGroups in AWS CLI Command Reference.

list-resource-groups

The following code example shows how to use list-resource-groups.
AWS CLI

To list all of the resources in a resource group

The following list-resource-groups example lists all of the resources that are part of the specified resource group.

```bash
aws resource-groups list-group-resources \
   --group-name tbq-WebServer
```

Output:

```json
{
   "ResourceIdentifiers": [
       {
         "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-09f77fa38c12345ab",
         "ResourceType": "AWS::EC2::Instance"
       }
   ]
}
```

• For API details, see ListResourceGroups in AWS CLI Command Reference.

put-group-configuration

The following code example shows how to use put-group-configuration.

AWS CLI

To attach a service configuration to a resource group

Example 1: The following put-group-configuration example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the C5 or M5 families.

```bash
aws resource-groups put-group-configuration \
   --group MyTestGroup \
   --configuration file://config.json
```

Contents of config.json:
This command produces no output if successful.

For more information, see Service configurations for resource groups in the Resource Groups API Reference Guide.

- For API details, see PutGroupConfiguration in AWS CLI Command Reference.

**search-resources**

The following code example shows how to use search-resources.

**AWS CLI**

To find resources that match a query
The following search-resources example retrieves a list of all AWS resources that match the specified query.

```bash
aws resource-groups search-resources \
   --resource-query file://query.json
```

Contents of `query.json`:

```json
{
   "Type": "TAG_FILTERS_1_0",
   "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Patch Group", "Values": ["Dev"]}]}
}
```

Output:

```json
{
    "ResourceIdentifiers": [
        {
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

- For API details, see [SearchResources](https://docs.aws.amazon.com/cli/latest/reference/resource-groups/search-resources.html) in *AWS CLI Command Reference*.

### tag

The following code example shows how to use tag.

**AWS CLI**

**To attach a tag to a resource group**

The following tag example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```bash
aws resource-groups tag \
   --tags QueryType=tags,QueryResources=ec2-instances \
```
The following code example shows how to use untag.

**AWS CLI**

**To remove tags from a resource group**

The following `untags` example removes any tag with the specified key from the resource group itself, not its members.

```
aws resource-groups untag \
  --keys QueryType
```

Output:

```
{
  "Keys": [
    "QueryType"
  ]
}
```

For more information, see [Manage tags](#) in the [AWS Resource Groups User Guide](#).

- For API details, see [Untag](#) in [AWS CLI Command Reference](#).
**update-group-query**

The following code example shows how to use `update-group-query`.

**AWS CLI**

**Example 1: To update the query for a tag-based resource group**

The following `update-group-query` example updates the query attached to the specified tag-based resource group.

```bash
aws resource-groups update-group-query \
   --group-name tbq-WebServer \
   --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":"{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters":[{"Key":"Name", "Values":["WebServers"]}]}}' 
```

Output:

```json
{
  "Group": {
    "Name": "tbq-WebServer"
  },
  "ResourceQuery": {
    "Type": "TAG_FILTERS_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters":[{"Key":"Name", "Values":["WebServers"]}]"
  }
}
```

For more information, see [Update Groups](https://docs.aws.amazon.com/AWSResourceGroups/latest/UserGuide/update-groups.html) in the *AWS Resource Groups User Guide*.

**Example 2: To update the query for a CloudFormation stack-based resource group**

The following `update-group-query` example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```bash
aws resource-groups update-group-query \
   --group-name cbq-CFNstackgroup \
   --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query": "{"ResourceTypeFilters": ["AWS::AllSupported"], "StackIdentifier": ""]}"
```

**Actions and scenarios**
For more information, see **Update Groups** in the *AWS Resource Groups User Guide*.  
- For API details, see **UpdateGroupQuery** in *AWS CLI Command Reference*.

### update-group

The following code example shows how to use `update-group`.

**AWS CLI**

**To update the description for a resource group**

The following `update-group` example updates the description for the specified resource group.

```bash
code
aws resource-groups update-group \
   --group-name tbq-WebServer \
   --description "Resource group for all web server resources."
```

**Output:**

```json
{
   "Group": {
    
   }
}
```
For more information, see Update Groups in the AWS Resource Groups User Guide.

- For API details, see UpdateGroup in AWS CLI Command Reference.

Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

get-resources

The following code example shows how to use get-resources.

AWS CLI

To get a list of tagged resources

The following get-resources example displays a list of resources in the account that are tagged with the specified key name and value.
aws resourcegroupstaggingapi get-resources \
--tag-filters Key=Environment,Values=Production \
--tags-per-page 100

Output:

```
{
  "ResourceTagMappingList": [
    {
      "Tags": [
        {
          "Key": "Environment",
          "Value": "Production"
        }
      ]
    }
  ]
}
```

For more information, see [GetResources](#) in the [Resource Groups Tagging API Reference](#).

- For API details, see [GetResources](#) in [AWS CLI Command Reference](#).

### get-tag-keys

The following code example shows how to use get-tag-keys.

**AWS CLI**

**To get a list of all tag keys**

The following get-tag-keys example retrieves the list of all tag key names used by resources in the account.

```
aws resourcegroupstaggingapi get-tag-keys
```

Output:

```
{
```
"TagKeys": [  "Environment",  "CostCenter",  "Department" ]
}

For more information, see [GetTagKeys](https://docs.aws.amazon.com/cli/latest/reference/resource-group-tagging-api/get-tag-keys.html) in the Resource Groups Tagging API Reference.

### get-tag-values

The following code example shows how to use `get-tag-values`.

**AWS CLI**

**To get a list of all tag values**

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the

```
aws resourcegroupstaggingapi get-tag-values \  
   --key=Environment
```

**Output:**

```json
{
   "TagValues": [  "Alpha",  "Gamma",  "Production"
   ]
}
```

For more information, see [GetTagValues](https://docs.aws.amazon.com/cli/latest/reference/resource-group-tagging-api/get-tag-values.html) in the Resource Groups Tagging API Reference.

- For API details, see [GetTagValues](https://docs.aws.amazon.com/cli/latest/reference/resource-group-tagging-api/get-tag-values.html) in AWS CLI Command Reference.

### tag-resources

The following code example shows how to use `tag-resources`.

Actions and scenarios
### AWS CLI

**To attach a tag to a resource**

The following `tag-resources` example tags the specified resource with a key name and value.

```bash
aws resourcegroupstaggingapi tag-resources
   --resource-arn-list arn:aws:s3:::MyProductionBucket
   --tags Environment=Production,CostCenter=1234
```

Output:

```json
{
   "FailedResourcesMap": {}
}
```

**untag-resources**

The following code example shows how to use `untag-resources`.

### AWS CLI

**To remove a tag from a resource**

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```bash
aws resourcegroupstaggingapi untag-resources
   --resource-arn-list arn:aws:s3:::awsexamplebucket
   --tag-keys Environment CostCenter
```

Output:

```json
{
   "FailedResourcesMap": {}
}
```
For more information, see UnTagResources in the Resource Groups Tagging API Reference.

- For API details, see UnTagResources in AWS CLI Command Reference.

**AWS RoboMaker examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RoboMaker.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-describe-simulation-job**

The following code example shows how to use batch-describe-simulation-job.

**AWS CLI**

**To batch describe simulation jobs**

The following batch-describe-simulation-job example retrieves details for the three specified simulation jobs.

**Command:**

```bash
aws robomaker batch-describe-simulation-job \
arwn:aws:robomaker:us-west-2:11111111111:simulation-job/sim-p0cpdrwng2n \
arwn:aws:robomaker:us-west-2:11111111111:simulation-job/sim-g8h6tglmblgw
```
Output:

```json
{
  "jobs": [
    {

cancel-simulation-job

The following code example shows how to use cancel-simulation-job.

AWS CLI

To cancel a simulation job

The following cancel-simulation-job example cancels the specified simulation job.

```bash
aws robomaker cancel-simulation-job \
```
create-deployment-job

The following code example shows how to use create-deployment-job.

**AWS CLI**

**To create a deployment job**

This example creates a deployment job for fleet MyFleet. It includes an environment variable named "ENVIRONMENT". It also attaches a tag named "Region".

Command:

```bash
aws robomaker create-deployment-job --deployment-config
    concurrentDeploymentPercentage=20,failureThresholdPercentage=25
    --tags Region=West
    --deployment-application-configs
        applicationVersion=1,launchConfig={environmentVariables={ENVIRONMENT=Beta},launchFile=await_commands.launch,packageName=voice_interaction_robot}
```

Output:

```json
{
    "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/sim-0974h36s4v0t",
    "status": "Pending",
    "deploymentApplicationConfigs": [
        {
            "applicationVersion": "1",
            "launchConfig": {
                "packageName": "voice_interaction_robot",
                "launchFile": "await_commands.launch",
                "environmentVariables": {
                    "ENVIRONMENT": "Beta"
                }
            }
        }
    ]
}
```
• For API details, see CreateDeploymentJob in AWS CLI Command Reference.

create-fleet

The following code example shows how to use create-fleet.

AWS CLI

To create a fleet

This example creates a fleet. It attaches a tag named Region.

Command:

```
aws robomaker create-fleet --name MyFleet --tags Region=East
```

Output:

```
{
    "name": "MyFleet",
    "createdAt": 1550771394.0,
    "tags": {
        "Region": "East"
    }
}
```

• For API details, see CreateFleet in AWS CLI Command Reference.
create-robot-application-version

The following code example shows how to use create-robot-application-version.

AWS CLI

To create a robot application version

This example creates a robot application version.

Command:

```bash
```

Output:

```json
{
    "name": "MyRobotApplication",
    "version": "1",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-robot-application.tar.gz",
            "etag": "f8cf5526f1c6e7b3a72c3ed3f79c5493-70",
            "architecture": "ARMHF"
        }
    ],
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    },
    "lastUpdatedAt": 1551201873.0,
    "revisionId": "9986bb8d-a695-4ab4-8810-9f4a74d1aa00",
    "tags": {}  
}
```

- For API details, see CreateRobotApplicationVersion in AWS CLI Command Reference.
**create-robot-application**

The following code example shows how to use `create-robot-application`.

**AWS CLI**

**To create a robot application**

This example creates a robot application.

**Command:**

```bash
aws robomaker create-robot-application --name MyRobotApplication --sources s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-software-suite name=ROS,version=Kinetic
```

**Output:**

```json
{
   "name": "MyRobotApplication",
   "version": "$LATEST",
   "sources": [
      {
         "s3Bucket": "my-bucket",
         "s3Key": "my-robot-application.tar.gz",
         "architecture": "ARMHF"
      }
   ],
   "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
   },
   "lastUpdatedAt": 1551201873.0,
   "revisionId": "1f3cb539-9239-4841-a656-d3efcffa07e1",
   "tags": {}
}
```

- For API details, see `CreateRobotApplication` in *AWS CLI Command Reference*. 
create-robot

The following code example shows how to use create-robot.

AWS CLI

To create a robot

This example creates a robot. It uses the ARMHF architecture. It also attaches a tag named Region.

Command:

```
aws robomaker create-robot --name MyRobot --architecture ARMHF --greengrass-group-id 0f728a3c-7dbf-4a3e-976d-d16a8360caba --tags Region=East
```

Output:

```
{
    "name": "MyRobot",
    "createdAt": 1550772325.0,
    "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
    "architecture": "ARMHF",
    "tags": {
        "Region": "East"
    }
}
```

- For API details, see CreateRobot in AWS CLI Command Reference.

create-simulation-application-version

The following code example shows how to use create-simulation-application-version.

AWS CLI

To create a simulation application version

This example creates a robot application version.

Command:

Output:

```json
{
  "name": "MyRobotApplication",
  "version": "1",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "etag": "00d8a94ff113856688c4fce618ae0f45-94",
      "architecture": "X86_64"
    }
  ],
  "simulationSoftwareSuite": {
    "name": "Gazebo",
    "version": "7"
  },
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "renderingEngine": {
    "name": "OGRE",
    "version": "1.x"
  },
  "lastUpdatedAt": 1551203853.0,
  "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
  "tags": {}
}
```

- For API details, see [CreateSimulationApplicationVersion](https://docs.aws.amazon.com/cli/latest/reference/robomaker/create-simulation-application-version.html) in *AWS CLI Command Reference*.

create-simulation-application

The following code example shows how to use create-simulation-application.
AWS CLI

To create a simulation application

This example creates a simulation application.

Command:

```
aws robomaker create-simulation-application --name MyRobotApplication --sources s3Bucket=my-bucket,s3Key=my-simulation-application.tar.gz,architecture=ARMHF --robot-software-suite name=ROS,version=Kinetic --simulation-software-suite name=Gazebo,version=7 --rendering-engine name=OGRE,version=1.x
```

Output:

```
{
    "name": "MyRobotApplication",
    "version": "$LATEST",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-simulation-application.tar.gz",
            "architecture": "X86_64"
        }
    ],
    "simulationSoftwareSuite": {
        "name": "Gazebo",
        "version": "7"
    },
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    },
    "renderingEngine": {
        "name": "OGRE",
        "version": "1.x"
    },
    "lastUpdatedAt": 1551203301.0,
    "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
    "tags": {}
}
```
create-simulation-job

The following code example shows how to use create-simulation-job.

AWS CLI

To create a simulation job

This example creates a simulation job. It uses a robot application and a simulation application.

Command:

```
aws robomaker create-simulation-job --max-job-duration-in-seconds 3600 --iam-role arn:aws:iam::111111111111:role/
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-w7m68wpr05h8",
  "status": "Pending",
  "lastUpdatedAt": 1551213837.0,
  "failureBehavior": "Fail",
  "clientRequestToken": "b283ccce-e468-43ee-8642-be76a9d69f15",
  "maxJobDurationInSeconds": 3600,
  "simulationTimeMillis": 0,
  "iamRole": "arn:aws:iam::111111111111:role/MySimulationRole",
  "robotApplications": [
    {
      "applicationVersion": "$LATEST",
      "launchConfig": {
        "packageName": "hello_world_robot",
        "launchFile": "rotate.launch"
      }
    }
  ]
}```
For API details, see CreateSimulationJob in AWS CLI Command Reference.

delete-fleet

The following code example shows how to use delete-fleet.

AWS CLI

To delete a fleet

This example deletes a fleet.

Command:

```bash
```

For API details, see DeleteFleet in AWS CLI Command Reference.

delete-robot-application

The following code example shows how to use delete-robot-application.
AWS CLI

To delete a robot application

This example deletes a robot application.

Command:

```
```

- For API details, see [DeleteRobotApplication](#) in *AWS CLI Command Reference*.

delete-robot

The following code example shows how to use delete-robot.

AWS CLI

To delete a robot

This example deletes a robot.

Command:

```
```

- For API details, see [DeleteRobot](#) in *AWS CLI Command Reference*.

delete-simulation-application

The following code example shows how to use delete-simulation-application.

AWS CLI

To delete a simulation application

This example deletes a simulation application.

Command:

• For API details, see `DeleteSimulationApplication` in *AWS CLI Command Reference*.

deregister-robot

The following code example shows how to use `deregister-robot`.

AWS CLI

To deregister a robot from a fleet

This example deregisters a robot from a fleet.

Command:

```bash
```

Output:

```
{
}
```

• For API details, see `DeregisterRobot` in *AWS CLI Command Reference*.

describe-deployment-job

The following code example shows how to use `describe-deployment-job`.

AWS CLI

To describe a deployment job

The following `describe-deployment-job` example retrieves the details about the specified deployment job.
aws robomaker describe-deployment-job \

Output:

```json
{
  "status": "InProgress",
  "deploymentConfig": {
    "concurrentDeploymentPercentage": 20,
    "failureThresholdPercentage": 25
  },
  "deploymentApplicationConfigs": [
    {
      "applicationVersion": "1",
      "launchConfig": {
        "packageName": "hello_world_robot",
        "launchFile": "rotate.launch"
      }
    }
  ],
  "createdAt": 1551218369.0,
  "robotDeploymentSummary": [
    {
      "deploymentStartTime": 1551218376.0,
      "status": "Deploying",
      "progressDetail": {}
    }
  ],
  "tags": {}
}
```

- For API details, see [DescribeDeploymentJob](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-deployment-job.html) in *AWS CLI Command Reference*. 

Actions and scenarios
**describe-fleet**

The following code example shows how to use `describe-fleet`.

**AWS CLI**

**To describe a fleet**

The following `describe-fleet` example retrieves the details for the specified fleet.

```
aws robomaker describe-fleet \
```

**Output:**

```
{
   "name": "MyFleet",
   "robots": [
      {
         "createdAt": 1540834232.0
      },
      {
         "createdAt": 1540829698.0
      }
   ],
   "createdAt": 1539894765.0,
   "lastDeploymentStatus": "Succeeded",
   "lastDeploymentTime": 1551218369.0,
   "tags": {}
}
```

- For API details, see [DescribeFleet](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-fleet.html) in *AWS CLI Command Reference*. 
describe-robot-application

The following code example shows how to use describe-robot-application.

AWS CLI

To describe a robot application

This example describes a robot application.

Command:

```
```

Output:

```
{
   "name": "MyRobotApplication",
   "version": "$LATEST",
   "sources": [
      {
         "s3Bucket": "my-bucket",
         "s3Key": "my-robot-application.tar.gz",
         "architecture": "X86_64"
      }
   ],
   "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
   },
   "revisionId": "e72efe0d-f44f-4333-b604-f6fa5c6bb50b",
   "lastUpdatedAt": 1551203485.0,
   "tags": {}  
}
```

- For API details, see DescribeRobotApplication in AWS CLI Command Reference.

describe-robot

The following code example shows how to use describe-robot.
AWS CLI

To describe a robot

This example describes a robot.

Command:

```bash
```

Output:

```json
{
    "name": "MyRobot",
    "status": "Available",
    "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
    "createdAt": 1550772325.0,
    "architecture": "ARMHF",
    "tags": {
        "Region": "East"
    }
}
```

- For API details, see [DescribeRobot](#) in AWS CLI Command Reference.

describe-simulation-application

The following code example shows how to use describe-simulation-application.

AWS CLI

To describe a simulation application

This example describes a simulation application.

Command:

```bash
```
Output:

```json
{
  "name": "MySimulationApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
  "simulationSoftwareSuite": {
    "name": "Gazebo",
    "version": "7"
  },
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "renderingEngine": {
    "name": "OGRE",
    "version": "1.x"
  },
  "revisionId": "783674ab-b7b8-42d9-b01f-9373907987e5",
  "lastUpdatedAt": 1551203427.0,
  "tags": {}  
}
```

- For API details, see [DescribeSimulationApplication](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-simulation-application.html) in *AWS CLI Command Reference*.

**describe-simulation-job**

The following code example shows how to use `describe-simulation-job`.

**AWS CLI**

**To describe a simulation job**

This example describes a simulation job.
Command:

```
```

Output:

```
{
    "status": "Running",
    "lastUpdatedAt": 1551219349.0,
    "failureBehavior": "Continue",
    "clientRequestToken": "a19ec4b5-e50d-3591-33da-c2e593c60615",
    "outputLocation": {
        "s3Bucket": "my-output-bucket",
        "s3Prefix": "output"
    },
    "maxJobDurationInSeconds": 3600,
    "simulationTimeMillis": 0,
    "iamRole": "arn:aws:iam::111111111111:role/MySimulationRole",
    "robotApplications": [
        {
            "applicationVersion": "$LATEST",
            "launchConfig": {
                "packageName": "hello_world_robot",
                "launchFile": "rotate.launch"
            }
        }
    ],
    "simulationApplications": [
        {
            "applicationVersion": "$LATEST",
            "launchConfig": {
                "packageName": "hello_world_simulation",
                "launchFile": "empty_world.launch"
            }
        }
    ],
    "tags": {}
• For API details, see DescribeSimulationJob in AWS CLI Command Reference.

**list-deployment-jobs**

The following code example shows how to use list-deployment-jobs.

**AWS CLI**

**To list deployment jobs**

The following list-deployment-jobs example retrieves a list of deployment jobs.

```
aws robomaker list-deployment-jobs
```

**Output:**

```json
{
   "deploymentJobs": [
   {
      "status": "InProgress",
      "deploymentApplicationConfigs": [
      {
         "applicationVersion": "1",
         "launchConfig": {
         "packageName": "hello_world_robot",
         "launchFile": "rotate.launch",
         "environmentVariables": {
         "ENVIRONMENT": "Desert"
         }
         }
      }
   ],
   "deploymentConfig": {
   "concurrentDeploymentPercentage": 20,
```

```
For API details, see [ListDeploymentJobs](#) in *AWS CLI Command Reference*.

**list-fleets**

The following code example shows how to use `list-fleets`.

**AWS CLI**

**To list fleets**

This example lists fleets. A maximum of 20 fleets will be returned.
Command:

```
aws robomaker list-fleets --max-items 20
```

Output:

```
{
  "fleetDetails": [
    {
      "name": "Trek",
      "createdAt": 1539894765.0,
      "lastDeploymentStatus": "Failed",
      "lastDeploymentTime": 1544719763.0
    }
  ]
}
```

**list-robot-applications**

The following code example shows how to use `list-robot-applications`.

**AWS CLI**

**To list robot applications**

This example lists robot applications. Results are limited to 20 robot applications.

Command:

```
aws robomaker list-robot-applications --max-results 20
```

Output:

```
{
```
For API details, see [ListRobotApplications](#) in *AWS CLI Command Reference*.

**list-robots**

The following code example shows how to use list-robots.

**AWS CLI**

**To list robots**

This example lists robots. A maximum of 20 robots will be returned.

Command:

```
aws robomaker list-robots --max-results 20
```

Output:
For API details, see ListRobots in AWS CLI Command Reference.
list-simulation-applications

The following code example shows how to use list-simulation-applications.

AWS CLI

To list simulation applications

This example lists simulation applications. A maximum of 20 simulation applications will be returned.

Command:

```
aws robomaker list-simulation-applications --max-results 20
```

Output:

```
{
  "simulationApplicationSummaries": [
    {
      "name": "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq",
      "version": "$LATEST",
      "lastUpdatedAt": 1548959170.0
    },
    {
      "name": "RoboMakerHelloWorldSimulation",
      "version": "$LATEST",
      "lastUpdatedAt": 1546541198.0
    },
    {
      "name": "RoboMakerObjectTrackerSimulation",
      "version": "$LATEST",
      "lastUpdatedAt": 1545847405.0
    },
    {
      "name": "RoboMakerVoiceInteractionSimulation",
```
For API details, see ListSimulationApplications in AWS CLI Command Reference.

list-simulation-jobs

The following code example shows how to use list-simulation-jobs.

AWS CLI

To list simulation jobs

This example lists simulation jobs.

Command:

aws robomaker list-simulation-jobs

Output:

```json
{
  "simulationJobSummaries": [
    {
    }
  ]
}
```
"lastUpdatedAt": 1548959178.0,
"status": "Completed",
"simulationApplicationNames": [
    "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq"
],
"robotApplicationNames": [
  null
],
},
{
  "lastUpdatedAt": 1543514088.0,
  "status": "Canceled",
  "simulationApplicationNames": [
    "AWSRoboMakerPersonDetection-1543513948280_T8rHW2_Lu"
],
  "robotApplicationNames": [
    "AWSRoboMakerPersonDetection-1543513948280_EYaMT0mYb"
  ]
},
{
  "lastUpdatedAt": 1543508858.0,
  "status": "Canceled",
  "simulationApplicationNames": [
    "AWSRoboMakerCloudWatch-1543504747391_lFF9ZQyx6"
],
  "robotApplicationNames": [
    "AWSRoboMakerCloudWatch-1543504747391_axbYa3S3K"
  ]
},
{
  "lastUpdatedAt": 1543504862.0,
  "status": "Completed",
  "simulationApplicationNames": [
    "AWSRoboMakerCloudWatch-1543504747391_lFF9ZQyx6"
],
  "robotApplicationNames": [
    "AWSRoboMakerCloudWatch-1543504747391_axbYa3S3K"
  ]
}
The following code example shows how to use \texttt{list-tags-for-resource}.

**AWS CLI**

**To list tags for a resource**

This example lists tags for an AWS RoboMaker resource.

Command:

Output:

```
{
    "tags": {
        "Region": "North",
        "Stage": "Initial"
    }
}
```

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**register-robot**

The following code example shows how to use register-robot.

**AWS CLI**

**To register a robot**

This example registers a robot to a fleet.

Command:

```
```

Output:

```
{
}
```

- For API details, see RegisterRobot in AWS CLI Command Reference.
**restart-simulation-job**

The following code example shows how to use `restart-simulation-job`.

**AWS CLI**

**To restart a simulation**

This example restarts a simulation.

Command:

```bash
```

- For API details, see [RestartSimulationJob](https://docs.aws.amazon.com/cli/latest/reference/robomaker/restart-simulation-job.html) in *AWS CLI Command Reference*.

**sync-deployment-job**

The following code example shows how to use `sync-deployment-job`.

**AWS CLI**

**To sync a deployment job**

This example synchronizes a deployment job.

Command:

```bash
```

Output:

```
{
    "arn": "arn:aws:robomaker:us-west-2:11111111111:deployment-job/deployment-0ccxs3t1fms",
    "status": "Pending",
    "deploymentConfig": {
        "concurrentDeploymentPercentage": 20,
```

Actions and scenarios

5474
For API details, see `SyncDeploymentJob` in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

*To tag a resource*

This example tags a resource. It attaches two tags: Region and Stage.

Command:

```
```

For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

*To untag a resource*
This example removes a tag from a resource. It removes the Region tag.

Command:

```
```

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

**update-robot-application**

The following code example shows how to use `update-robot-application`.

**AWS CLI**

To update a robot application

This example updates a robot application.

Command:

```
```

Output:

```
{
   "name": "MyRobotApplication",
   "version": "$LATEST",
   "sources": [
      {
         "s3Bucket": "my-bucket",
         "s3Key": "my-robot-application.tar.gz",
         "architecture": "X86_64"
      }
   ],
   "robotSoftwareSuite": {
```
The following code example shows how to use `update-simulation-application`.

**AWS CLI**

**To update a simulation application**

This example updates a simulation application.

**Command:**

```bash
```

**Output:**

```json
{
  "name": "MySimulationApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
}
```
For API details, see [UpdateSimulationApplication](#) in *AWS CLI Command Reference*.

### Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

`change-resource-record-sets`

The following code example shows how to use `change-resource-record-sets`. 
AWS CLI

**To create, update, or delete a resource record set**

The following `change-resource-record-sets` command creates a resource record set using the `hosted-zone-id` Z1R8UBAEXAMPLE and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`:

```bash
code
aws route53 change-resource-record-sets --hosted-zone-id Z1R8UBAEXAMPLE --change-batch file://C:\awscli\route53\change-resource-record-sets.json
```

For more information, see POST ChangeResourceRecordSets in the *Amazon Route 53 API Reference*.

The configuration in the JSON file depends on the kind of resource record set you want to create:

BasicWeightedAliasWeighted AliasLatencyLatency AliasFailoverFailover Alias

**Basic Syntax:**

```json
{
   "Comment": "optional comment about the changes in this change batch request",
   "Changes": [
      {
         "Action": "CREATE"|"DELETE"|"UPSERT",
         "ResourceRecordSet": {
            "Name": "DNS domain name",

            "SetIdentifier": "unique description for this resource record set",
            "Failover": "PRIMARY" | "SECONDARY",
            "TTL": time to live in seconds,
            "ResourceRecords": [
               {
                  "Value": "applicable value for the record type"
               },
               {...}
            ],
            "HealthCheckId": "ID of an Amazon Route 53 health check"
         }
      },
      {...}
   ]
}
```

Failover Alias Syntax:

```json
{
   "Comment": "optional comment about the changes in this change batch request",
   "Changes": [
      {
         "Action": "CREATE"|"DELETE"|"UPSERT",
         "ResourceRecordSet": {
            "Name": "DNS domain name",
            "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
            "SetIdentifier": "unique description for this resource record set",
            "Failover": "PRIMARY" | "SECONDARY",
            "AliasTarget": {
               "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone"
            }
         }
      }
   ]
}
```
"DNSName": "DNS domain name for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or another resource record set in this hosted zone",
   "EvaluateTargetHealth": true|false
 },
   "HealthCheckId": "optional ID of an Amazon Route 53 health check"
 },
 {...}
]

• For API details, see ChangeResourceRecordSets in AWS CLI Command Reference.

change-tags-for-resource

The following code example shows how to use change-tags-for-resource.

AWS CLI

The following command adds a tag named owner to a healthcheck resource specified by ID:

aws route53 change-tags-for-resource --resource-type healthcheck --resource-id 6233434j-18c1-34433-ba8e-3443434 --add-tags Key=owner,Value=myboss

The following command removes a tag named owner from a hosted zone resource specified by ID:

aws route53 change-tags-for-resource --resource-type hostedzone --resource-id Z1523434445 --remove-tag-keys owner

• For API details, see ChangeTagsForResource in AWS CLI Command Reference.

create-health-check

The following code example shows how to use create-health-check.

AWS CLI

To create a health check
The following `create-health-check` command creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`:

```
aws route53 create-health-check --caller-reference 2014-04-01-18:47 --health-check-config file://C:\awscli\route53\create-health-check.json
```

**JSON syntax:**

```json
{
    "IPAddress": "IP address of the endpoint to check",
    "Port": port on the endpoint to check--required when Type is "TCP",
    "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
    "ResourcePath": "path of the file that you want Amazon Route 53 to request--all Types except TCP",
    "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types except TCP",
    "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource",
    "RequestInterval": 10 | 30,
    "FailureThreshold": integer between 1 and 10
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Amazon Route 53 Health Checks and DNS Failover in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateHealthCheck](https://docs.aws.amazon.com/cli/latest/reference/route53/create-health-check.html) in *AWS CLI Command Reference*.

**create-hosted-zone**

The following code example shows how to use `create-hosted-zone`.

**AWS CLI**

**To create a hosted zone**

The following `create-hosted-zone` command adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks:
aws route53 create-hosted-zone --name example.com --caller-reference 2014-04-01-18:47 --hosted-zone-config Comment="command-line version"

For more information, see Working with Hosted Zones in the Amazon Route 53 Developer Guide.

- For API details, see CreateHostedZone in AWS CLI Command Reference.

delete-health-check

The following code example shows how to use delete-health-check.

AWS CLI

To delete a health check

The following delete-health-check command deletes the health check with a health-check-id of e75b48d9-547a-4c3d-88a5-ae4002397608:

aws route53 delete-health-check --health-check-id e75b48d9-547a-4c3d-88a5-ae4002397608

- For API details, see DeleteHealthCheck in AWS CLI Command Reference.

delete-hosted-zone

The following code example shows how to use delete-hosted-zone.

AWS CLI

To delete a hosted zone

The following delete-hosted-zone command deletes the hosted zone with an id of Z36KTIQEXAMPLE:

aws route53 delete-hosted-zone --id Z36KTIQEXAMPLE

- For API details, see DeleteHostedZone in AWS CLI Command Reference.

get-change

The following code example shows how to use get-change.
AWS CLI

To get the status of a change to resource record sets

The following get-change command gets the status and other information about the change-resource-record-sets request that has an Id of /change/CWPIK4URU2I5S:

```
aws route53 get-change --id /change/CWPIK4URU2I5S
```

- For API details, see GetChange in AWS CLI Command Reference.

get-health-check

The following code example shows how to use get-health-check.

AWS CLI

To get information about a health check

The following get-health-check command gets information about the health check that has a health-check-id of 02ec8401-9879-4259-91fa-04e66d094674:

```
aws route53 get-health-check --health-check-id 02ec8401-9879-4259-91fa-04e66d094674
```

- For API details, see GetHealthCheck in AWS CLI Command Reference.

get-hosted-zone

The following code example shows how to use get-hosted-zone.

AWS CLI

To get information about a hosted zone

The following get-hosted-zone command gets information about the hosted zone with an id of Z1R8UBAEXAMPLE:

```
aws route53 get-hosted-zone --id Z1R8UBAEXAMPLE
```
list-health-checks

The following code example shows how to use list-health-checks.

AWS CLI

To list the health checks associated with the current AWS account

The following list-health-checks command lists detailed information about the first 100 health checks that are associated with the current AWS account:

```bash
aws route53 list-health-checks
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list health checks one at a time, use the following command:

```bash
aws route53 list-health-checks --max-items 1
```

To view the next health check, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

```bash
aws route53 list-health-checks --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

For API details, see ListHealthChecks in AWS CLI Command Reference.

list-hosted-zones-by-name

The following code example shows how to use list-hosted-zones-by-name.

AWS CLI

The following command lists up to 100 hosted zones ordered by domain name:

```bash
aws route53 list-hosted-zones-by-name
```
The following command lists hosted zones ordered by name, beginning with www.example.com:

```
aws route53 list-hosted-zones-by-name --dns-name www.example.com
```

Output:

```
{
   "HostedZones": [
   {
   "ResourceRecordSetCount": 2,
   "CallerReference": "test20150527-2",
   "Config": {
   "Comment": "test2",
   "PrivateZone": false
   },
   "Id": "/hostedzone/Z119WBBTVP5WFX",
   "Name": "2.example.com."
   },
   {
   "ResourceRecordSetCount": 2,
   "CallerReference": "test20150527-1",
   "Config": {
   "Comment": "test",
   "PrivateZone": false
   },
   "Id": "/hostedzone/Z3P5QSUBK4P0TI",
   "Name": "www.example.com."
   }
   ],
   "IsTruncated": false,
   "MaxItems": "100"
}
```
For API details, see ListHostedZonesByName in AWS CLI Command Reference.

list-hosted-zones

The following code example shows how to use list-hosted-zones.

AWS CLI

To list the hosted zones associated with the current AWS account

The following list-hosted-zones command lists summary information about the first 100 hosted zones that are associated with the current AWS account:

aws route53 list-hosted-zones

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list hosted zones one at a time, use the following command:

aws route53 list-hosted-zones --max-items 1

To view information about the next hosted zone, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

aws route53 list-hosted-zones --max-items 1 --starting-token Z3M3LMPEXAMPLE

For API details, see ListHostedZones in AWS CLI Command Reference.
list-query-logging-configs

The following code example shows how to use list-query-logging-configs.

AWS CLI

To list query logging configurations

The following list-query-logging-configs example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone Z10X3WQEXAMPLE.

```bash
aws route53 list-query-logging-configs 
  --hosted-zone-id Z10X3WQEXAMPLE
```

Output:

```json
{
    "QueryLoggingConfigs": [
    {
        "Id": "964ff34e-ae03-4f06-80a2-9683ceexample",
        "HostedZoneId": "Z10X3WQEXAMPLE",
    }
    ]
}
```

For more information, see Logging DNS queries in the Amazon Route 53 Developer Guide.
- For API details, see ListQueryLoggingConfigs in AWS CLI Command Reference.

list-resource-record-sets

The following code example shows how to use list-resource-record-sets.

AWS CLI

To list the resource record sets in a hosted zone

The following list-resource-record-sets command lists summary information about the first 100 resource record sets in a specified hosted zone.
If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list resource record sets one at a time, use the following command:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the --query parameter to filter them out. For example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --query "ResourceRecordSets[?Name == 'example.domain.']"
```

• For API details, see ListResourceRecordSets in AWS CLI Command Reference.

Route 53 domain registration examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
Actions

check-domain-availability

The following code example shows how to use check-domain-availability.

AWS CLI

To determine whether you can register a domain name with Route 53

The following check-domain-availability command returns information about whether the domain name example.com is available to be registered using Route 53.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains check-domain-availability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Availability": "UNAVAILABLE"
}
```

Route 53 supports a large number of top-level domains (TLDs), such as .com and .jp, but we don’t support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, check-domain-availability returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see [Domains That You Can Register with Amazon Route 53](#) in the [Amazon Route 53 Developer Guide](#). For more information about registering domains with Amazon Route 53, see [Registering a New Domain](#) in the [Amazon Route 53 Developer Guide](#).

- For API details, see [CheckDomainAvailability](#) in [AWS CLI Command Reference](#).
**check-domain-transferability**

The following code example shows how to use check-domain-transferability.

**AWS CLI**

To determine whether a domain can be transferred to Route 53

The following check-domain-transferability command returns information about whether you can transfer the domain name example.com to Route 53.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains check-domain-transferability \
   --region us-east-1 \
   --domain-name example.com
```

Output:

```json
{
   "Transferability": {
       "Transferable": "UNTRANSFERABLE"
   }
}
```

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the Amazon Route 53 Developer Guide.

- For API details, see CheckDomainTransferability in AWS CLI Command Reference.

**delete-tags-for-domain**

The following code example shows how to use delete-tags-for-domain.

**AWS CLI**

To delete tags for a domain

The following delete-tags-for-domain command deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.
This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains delete-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run `list-tags-for-domain`. For more information, see [Tagging Amazon Route 53 Resources](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/tagging-resource-tags.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteTagsForDomain](https://docs.aws.amazon.com/cli/latest/reference/route53domains/delete-tags-for-domain.html) in *AWS CLI Command Reference*.

**disable-domain-auto-renew**

The following code example shows how to use `disable-domain-auto-renew`.

**AWS CLI**

To disable automatic renewal of a domain

The following `disable-domain-auto-renew` command configures Route 53 to *not* automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains disable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run `get-domain-detail`. If automatic renewal is disabled, the value of `AutoRenew` is `False`. For more information about automatic renewal, see [Renewing Registration for a Domain](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisableDomainAutoRenew](https://docs.aws.amazon.com/cli/latest/reference/route53domains/disable-domain-auto-renew.html) in *AWS CLI Command Reference*.
disable-domain-transfer-lock

The following code example shows how to use disable-domain-transfer-lock.

AWS CLI

To disable the transfer lock on a domain

The following disable-domain-transfer-lock command removes the transfer lock on the domain example.com so that the domain can be transferred to another registrar. This command changes the clientTransferProhibited status.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains disable-domain-transfer-lock
    --region us-east-1
    --domain-name example.com
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail. When the transfer lock is disabled, the value of StatusList does not include clientTransferProhibited.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the Amazon Route 53 Developer Guide.

- For API details, see DisableDomainTransferLock in AWS CLI Command Reference.

enable-domain-auto-renew

The following code example shows how to use enable-domain-auto-renew.

AWS CLI

To enable automatic renewal of a domain
The following `enable-domain-auto-renew` command configures Route 53 to automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```bash
aws route53domains enable-domain-auto-renew \
  --region us-east-1 \
  --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run `get-domain-detail`. If automatic renewal is enabled, the value of `AutoRenew` is `True`.

For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the Amazon Route 53 Developer Guide.>

- For API details, see `EnableDomainAutoRenew` in AWS CLI Command Reference.

`enable-domain-transfer-lock`

The following code example shows how to use `enable-domain-transfer-lock`.

**AWS CLI**

**To enable the transfer lock on a domain**

The following `enable-domain-transfer-lock` command locks the specified domain so that it can't be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```bash
aws route53domains enable-domain-transfer-lock \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```json
{
```
To confirm that the transfer lock has been changed, you can run `get-domain-detail`. When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the Amazon Route 53 Developer Guide.

- For API details, see `EnableDomainTransferLock` in AWS CLI Command Reference.

---

**get-contact-reachability-status**

The following code example shows how to use `get-contact-reachability-status`.

**AWS CLI**

**To determine whether the registrant contact has responded to a confirmation email**

The following `get-contact-reachability-status` command returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-contact-reachability-status \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "status": "DONE"
}
```

For more information, see Resending Authorization and Confirmation Emails in the Amazon Route 53 Developer Guide.

- For API details, see `GetContactReachabilityStatus` in AWS CLI Command Reference.
get-domain-detail

The following code example shows how to use get-domain-detail.

AWS CLI

To get detailed information about a specified domain

The following get-domain-detail command displays detailed information about the specified domain.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains get-domain-detail \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```json
{
  "DomainName": "example.com",
  "Nameservers": [
    {
      "Name": "ns-2048.awsdns-64.com",
      "GlueIps": []
    },
    {
      "Name": "ns-2049.awsdns-65.net",
      "GlueIps": []
    },
    {
      "Name": "ns-2050.awsdns-66.org",
      "GlueIps": []
    },
    {
      "Name": "ns-2051.awsdns-67.co.uk",
      "GlueIps": []
    }
  ],
  "AutoRenew": true,
  "AdminContact": {
    "FirstName": "Saanvi",
    "LastName": "Gupta"
  }
}
```
"LastName": "Sarkar",
"ContactType": "COMPANY",
"OrganizationName": "Example",
"AddressLine1": "123 Main Street",
"City": "Anytown",
"State": "WA",
