The following register-domain command registers a domain, retrieving all parameter values from a JSON-formatted file.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains register-domain \
  --region us-east-1 \
  --cli-input-json file://register-domain.json
```

**Contents of register-domain.json:**

```json
{
  "DomainName": "example.com",
  "DurationInYears": 1,
  "AutoRenew": true,
  "AdminContact": {
    "FirstName": "Martha",
    "LastName": "Rivera",
    "ContactType": "PERSON",
    "OrganizationName": "Example",
    "AddressLine1": "1 Main Street",
    "City": "Anytown",
    "State": "WA",
    "CountryCode": "US",
    "ZipCode": "98101",
    "PhoneNumber": "+1.8005551212",
    "Email": "mrivera@example.com"
  },
  "RegistrantContact": {
```

Actions and scenarios 5522
"FirstName": "Li",
"LastName": "Juan",
"ContactType": "PERSON",
"OrganizationName": "Example",
"AddressLine1": "1 Main Street",
"City": "Anytown",
"State": "WA",
"CountryCode": "US",
"ZipCode": "98101",
"PhoneNumber": "+1.8005551212",
"Email": "ljuan@example.com"
},
"TechContact": {
  "FirstName": "Mateo",
  "LastName": "Jackson",
  "ContactType": "PERSON",
  "OrganizationName": "Example",
  "AddressLine1": "1 Main Street",

  "State": "WA",
  "CountryCode": "US",
  "ZipCode": "98101",
  "PhoneNumber": "+1.8005551212",
  "Email": "mjackson@example.com"
}
},
"PrivacyProtectAdminContact": true,
"PrivacyProtectRegistrantContact": true,
"PrivacyProtectTechContact": true
}

Output:

{
  "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see `get-operation-detail`.

For more information, see `Registering a New Domain` in the `Amazon Route 53 Developer Guide`.

For information about which top-level domains (TLDs) require values for `ExtraParams` and what the valid values are, see `ExtraParam` in the `Amazon Route 53 API Reference`. 
For API details, see RegisterDomain in AWS CLI Command Reference.

**renew-domain**

The following code example shows how to use renew-domain.

**AWS CLI**

**To renew a domain**

The following renew-domain command renews the specified domain for five years. To get the value for current-expiry-year, use the get-domain-detail command, and convert the value of ExpirationDate from Unix format.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains renew-domain \
    --region us-east-1 \
    --domain-name example.com \
    --duration-in-years 5 \
    --current-expiry-year 2020
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the operation succeeded, you can run get-operation-detail. For more information, see get-operation-detail.

The registry for each top-level domain (TLD), such as .com or .org, controls the maximum number of years that you can renew a domain for. To get the maximum renewal period for your domain, see the "Registration and Renewal Period" section for your TLD in Domains That You Can Register with Amazon Route 53 in the Amazon Route 53 Developer Guide.

For more information, see Renewing Registration for a Domain in the Amazon Route 53 Developer Guide.
For API details, see RenewDomain in AWS CLI Command Reference.

resend-contact-reachability-email

The following code example shows how to use resend-contact-reachability-email.

AWS CLI

To resend the confirmation email to the current email address for the registrant contact

The following resend-contact-reachability-email command resends the confirmation email to the current email address for the registrant contact for the example.com domain.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains resend-contact-reachability-email \
   --region us-east-1 \
   --domain-name example.com
```

Output:

```
{
   "domainName": "example.com",
   "emailAddress": "moliveira@example.com",
   "isAlreadyVerified": true
}
```

If the value of isAlreadyVerified is true, as in this example, the registrant contact has already confirmed that the specified email address is reachable.

For more information, see Resending Authorization and Confirmation Emails in the Amazon Route 53 Developer Guide.

For API details, see ResendContactReachabilityEmail in AWS CLI Command Reference.

retrieve-domain-auth-code

The following code example shows how to use retrieve-domain-auth-code.
AWS CLI

To get the authorization code for a domain so you can transfer the domain to another registrar

The following retrieve-domain-auth-code command gets the current authorization code for the example.com domain. You give this value to another domain registrar when you want to transfer the domain to that registrar.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains retrieve-domain-auth-code \
   --region us-east-1 \ 
   --domain-name example.com
```

Output:

```
{
   "AuthCode": )o!v3dJeXampLe"
}
```

For more information, see Transferring a Domain from Amazon Route 53 to Another Registrar in the Amazon Route 53 Developer Guide.

- For API details, see RetrieveDomainAuthCode in AWS CLI Command Reference.

transfer-domain

The following code example shows how to use transfer-domain.

AWS CLI

To transfer a domain to Amazon Route 53

The following transfer-domain command transfers a domain to Route 53, with the parameters provided by the JSON-formatted file C:\temp\transfer-domain.json.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.
aws route53domains transfer-domain \
   --region us-east-1 \
   --cli-input-json file://C:\temp\transfer-domain.json

Contents of transfer-domain.json:

```
{
   "DomainName": "example.com",
   "DurationInYears": 1,
   "Nameservers": [
      {
         "Name": "ns-2048.awsdns-64.com"
      },
      {
         "Name": "ns-2049.awsdns-65.net"
      },
      {
         "Name": "ns-2050.awsdns-66.org"
      },
      {
         "Name": "ns-2051.awsdns-67.co.uk"
      }
   ],
   "AuthCode": "\)o!v3dJeXampLe",
   "AutoRenew": true,
   "AdminContact": {
      "FirstName": "Martha",
      "LastName": "Rivera",
      "ContactType": "PERSON",
      "OrganizationName": "Example",
      "AddressLine1": "1 Main Street",
      "City": "Anytown",
      "State": "WA",
      "CountryCode": "US",
      "ZipCode": "98101",
      "PhoneNumber": "+1.8005551212",
      "Email": "mrivera@example.com"
   },
   "RegistrantContact": {
      "FirstName": "Li",
      "LastName": "Juan",
      "ContactType": "PERSON",
      "OrganizationName": "Example",
```

"Actions and scenarios"

5527
The following code example shows how to use `update-domain-contact-privacy`.

```
{
    "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see `get-operation-detail`.

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the Amazon Route 53 Developer Guide.

- For API details, see TransferDomain in AWS CLI Command Reference.

**update-domain-contact-privacy**

The following code example shows how to use `update-domain-contact-privacy`. 
AWS CLI

To update the privacy settings for the contacts for a domain

The following update-domain-contact-privacy command turns off privacy protection for the administrative contact for the example.com domain. This command runs only in the us-east-1 Region.

If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains update-domain-contact-privacy \
    --region us-east-1 \
    --domain-name example.com \
    --no-admin-privacy
```

Output:

```
{
    "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run get-operation-detail. For more information, see get-operation-detail.

For more information, see Enabling or Disabling Privacy Protection for Contact Information for a Domain in the Amazon Route 53 Developer Guide.

- For API details, see UpdateDomainContactPrivacy in AWS CLI Command Reference.

update-domain-contact

The following code example shows how to use update-domain-contact.

AWS CLI

To update the contact information for a domain

The following update-domain-contact command updates the contact information for a domain, getting the parameters from the JSON-formatted file C:\temp\update-domain-contact.json.
This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains update-domain-contact 
   --region us-east-1 
   --cli-input-json file://C:\temp\update-domain-contact.json
```

Contents of `update-domain-contact.json`:

```json
{
   "AdminContact": {
      "AddressLine1": "101 Main Street",
      "AddressLine2": "Suite 1a",
      "City": "Seattle",
      "ContactType": "COMPANY",
      "CountryCode": "US",
      "Email": "w.xiulan@example.com",
      "FirstName": "Wang",
      "LastName": "Xiulan",
      "OrganizationName": "Example",
      "PhoneNumber": "+1.8005551212",
      "State": "WA",
      "ZipCode": "98101"
   },
   "DomainName": "example.com",
   "RegistrantContact": {
      "AddressLine1": "101 Main Street",
      "AddressLine2": "Suite 1a",
      "City": "Seattle",
      "ContactType": "COMPANY",
      "CountryCode": "US",
      "Email": "w.xiulan@example.com",
      "FirstName": "Wang",
      "LastName": "Xiulan",
      "OrganizationName": "Example",
      "PhoneNumber": "+1.8005551212",
      "State": "WA",
      "ZipCode": "98101"
   },
   "TechContact": {
      "AddressLine1": "101 Main Street",
      "AddressLine2": "Suite 1a",
      "City": "Seattle",
```
To confirm that the operation succeeded, you can run `get-domain-detail`. For more information, see [Updating Contact Information for a Domain](#) in the Amazon Route 53 Developer Guide.

- For API details, see [UpdateDomainContact](#) in [AWS CLI Command Reference](#).

**update-domain-nameservers**

The following code example shows how to use `update-domain-nameservers`.

**AWS CLI**

To update the name servers for a domain

The following `update-domain-nameservers` command updates the name servers for a domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-nameservers \
   --region us-east-1 \
   --domain-name example.com \
   --nameservers Name=ns-1.awsdns-01.org Name=ns-2.awsdns-01.co.uk \
   Name=ns-3.awsdns-01.net Name=ns-4.awsdns-01.com
```
Output:

```json
{
   "OperationId": "f1691ec4-0e7a-489e-82e0-b19d3example"
}
```

To confirm that the operation succeeded, you can run `get-domain-detail`.

For more information, see Adding or Changing Name Servers and Glue Records for a Domain in the Amazon Route 53 Developer Guide.

- For API details, see `UpdateDomainNameservers` in AWS CLI Command Reference.

**update-tags-for-domain**

The following code example shows how to use `update-tags-for-domain`.

**AWS CLI**

**To add or update tags for a domain**

The following `update-tags-for-domain` command adds or updates two keys and the corresponding values for the example.com domain. To update the value for a key, just include the key and the new value. You can add or update tags in only one domain at a time.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `--region` parameter.

```
aws route53domains update-tags-for-domain \
   --region us-east-1 \
   --domain-name example.com \
   --tags-to-update "Key=key1,Value=value1" "Key=key2,Value=value2"
```

This command produces no output. To confirm that the tags were added or updated, you can run `list-tags-for-domain`.

For more information, see Tagging Amazon Route 53 Resources in the Amazon Route 53 Developer Guide.

- For API details, see `UpdateTagsForDomain` in AWS CLI Command Reference.
**view-billing**

The following code example shows how to use `view-billing`.

**AWS CLI**

**To get billing information for domain registration charges for the current AWS account**

The following `view-billing` command returns all the domain-related billing records for the current account for the period from January 1, 2018 (1514764800 in Unix time) and midnight on December 31, 2019 (1577836800 in Unix time).

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```bash
aws route53domains view-billing
   --region us-east-1
   --start-time 1514764800
   --end-time 1577836800
```

**Output:**

```json
{
   "BillingRecords": [
   {
      "DomainName": "example.com",
      "Operation": "RENEW_DOMAIN",
      "InvoiceId": "149962827",
      "BillDate": 1536618063.181,
      "Price": 12.0
   },
   {
      "DomainName": "example.com",
      "Operation": "RENEW_DOMAIN",
      "InvoiceId": "290913289",
      "BillDate": 1568162630.884,
      "Price": 12.0
   }
   ]
}
```

For more information, see [ViewBilling](https://docs.aws.amazon.com/Route53/latest/APIReference/what-you-can-do-with-route-53.html) in the *Amazon Route 53 API Reference*. 
Route 53 Resolver examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Resolver.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

associate-firewall-rule-group

The following code example shows how to use `associate-firewall-rule-group`.

**AWS CLI**

**To associate a firewall rule group with a VPC**

The following `associate-firewall-rule-group` example associates a DNS Firewall rule group with an Amazon VPC.

```
aws route53resolver associate-firewall-rule-group \\
  --name test-association \\
  --firewall-rule-group-id rslvr-frg-47f93271fexample \\
  --vpc-id vpc-31e92222 \\
  --priority 101
```

Output:
For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the Amazon Route 53 Developer Guide.

- For API details, see AssociateFirewallRuleGroup in AWS CLI Command Reference.

associate-resolver-endpoint-ip-address

The following code example shows how to use associate-resolver-endpoint-ip-address.

AWS CLI

To associate another IP address with a Resolver endpoint

The following associate-resolver-endpoint-ip-address example associates another IP address with an inbound Resolver endpoint. If you specify only a subnet ID and omit the IP address from the --ip-address parameter, Resolver chooses an IP address for you from among the available IP addresses in the specified subnet.

```
aws route53resolver associate-resolver-endpoint-ip-address \
  --resolver-endpoint-id rslvr-in-497098ad5example \
  --ip-address="SubnetId=subnet-12d8exam,Ip=192.0.2.118"
```

Output:
{
   "ResolverEndpoint": {
      "Id": "rslvr-in-497098ad5example",
      "CreatorRequestId": "AWSConsole.25.0123456789",
      "Name": "my-inbound-endpoint",
      "SecurityGroupIds": [
         "sg-05cd7b25d6example"
      ],
      "Direction": "INBOUND",
      "IpAddressCount": 3,
      "HostVPCId": "vpc-304bexam",
      "Status": "UPDATING",
      "StatusMessage": "Updating the Resolver Endpoint",
      "CreationTime": "2020-01-02T23:25:45.538Z",
      "ModificationTime": "2020-01-02T23:25:45.538Z"
   }
}

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the Amazon Route 53 Developer Guide.

- For API details, see AssociateResolverEndpointIpAddress in AWS CLI Command Reference.

**associate-resolver-rule**

The following code example shows how to use associate-resolver-rule.

**AWS CLI**

**To associate a Resolver rule with a VPC**

The following associate-resolver-rule example associates a Resolver rule with an Amazon VPC. After you run the command, Resolver starts to forward DNS queries to your network based on the settings in the rule, such as the domain name of the queries that are forwarded.

```bash
aws route53resolver associate-resolver-rule \
   --name my-resolver-rule-association \
   --resolver-rule-id rslvr-rr-42b60677c0example \
   --vpc-id vpc-304bexam
```
Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc5a8fa-ec2cc480d2ef07617example] Creating the association."
    }
}
```

For more information, see [Forwarding Outbound DNS Queries to Your Network](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/) in the *Amazon Route 53 Developer Guide*.

- For API details, see [AssociateResolverRule](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/associate-resolver-rule.html) in *AWS CLI Command Reference*.

### create-firewall-domain-list

The following code example shows how to use `create-firewall-domain-list`.

**AWS CLI**

**To create a Route 53 Resolver DNS Firewall domain list**

The following `create-firewall-domain-list` example creates a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```bash
aws route53resolver create-firewall-domain-list \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-d61cbb2cbexample",
    }
}
```
For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateFirewallDomainList](#) in *AWS CLI Command Reference*.

### create-firewall-rule-group

The following code example shows how to use `create-firewall-rule-group`.

**AWS CLI**

**To create a Firewall rule group**

The following `create-firewall-rule-group` example creates a DNS Firewall rule group.

```bash
aws route53resolver create-firewall-rule-group \
  --creator-request-id my-request-id \
  --name test
```

**Output:**

```json
{
   "FirewallRuleGroup": {
      "Id": "rslvr-frg-47f93271fexample",
      "Name": "test",
      "RuleCount": 0,
      "Status": "COMPLETE",
      "StatusMessage": "Created Firewall Rule Group",
      "OwnerId": "123456789012",
      "CreatorRequestId": "my-request-id",
   }
}
```
For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see CreateFirewallRuleGroup in AWS CLI Command Reference.

**create-firewall-rule**

The following code example shows how to use create-firewall-rule.

**AWS CLI**

**To create a firewall rule**

The following create-firewall-rule example creates a firewall rule in a DNS Firewall rule for domains listed in a DNS Firewall domain list.

```bash
aws route53resolver create-firewall-rule 
   --name allow-rule 
   --firewall-rule-group-id rslvr-frg-47f93271fexample 
   --firewall-domain-list-id rslvr-fdl-9e956e9ffexample 
   --priority 101 
   --action ALLOW
```

**Output:**

```json
{
   "FirewallRule": {
      "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
      "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
      "Name": "allow-rule",
      "Priority": 101,
      "Action": "ALLOW",
      "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
      "CreationTime": "2021-05-25T21:44:00.346093Z",
      "ModificationTime": "2021-05-25T21:44:00.346093Z"
   }
}
```
For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see CreateFirewallRule in AWS CLI Command Reference.

create-resolver-endpoint

The following code example shows how to use create-resolver-endpoint.

AWS CLI

To create an inbound Resolver endpoint

The following create-resolver-endpoint example creates an inbound Resolver endpoint. You can use the same command to create both inbound and outbound endpoints.

```
aws route53resolver create-resolver-endpoint --name my-inbound-endpoint --creator-request-id 2020-01-01-18:47 --security-group-ids "sg-f62bexam" --direction INBOUND --ip-addresses SubnetId=subnet-ba47exam,Ip=192.0.2.255 SubnetId=subnet-12d8exam,Ip=192.0.2.254
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304examp",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
```
To create an outbound Resolver endpoint

The following `create-resolver-endpoint` example creates an outbound resolver endpoint using the values in the JSON-formatted document `create-outbound-resolver-endpoint.json`.

```
aws route53resolver create-resolver-endpoint \
    --cli-input-json file://c:\temp\create-outbound-resolver-endpoint.json
```

Contents of `create-outbound-resolver-endpoint.json`:

```
{
    "CreatorRequestId": "2020-01-01-18:47",
    "Direction": "OUTBOUND",
    "IpAddresses": [
        {
            "Ip": "192.0.2.255",
            "SubnetId": "subnet-ba47exam"
        },
        {
            "Ip": "192.0.2.254",
            "SubnetId": "subnet-12d8exam"
        }
    ],
    "Name": "my-outbound-endpoint",
    "SecurityGroupIds": [ "sg-05cd7b25dexample" ],
    "Tags": [
        {
            "Key": "my-key-name",
            "Value": "my-key-value"
        }
    ]
}
```

For more information, see Resolving DNS Queries Between VPCs and Your Network in the Amazon Route 53 Developer Guide.

- For API details, see CreateResolverEndpoint in AWS CLI Command Reference.
create-resolver-rule

The following code example shows how to use create-resolver-rule.

AWS CLI

**To create a Resolver rule**

The following `create-resolver-rule` example creates a Resolver forwarding rule. The rule uses the outbound endpoint `rslvr-out-d5e5920e37example` to forward DNS queries for `example.com` to the IP addresses `10.24.8.75` and `10.24.8.156`.

```
aws route53resolver create-resolver-rule \
   --creator-request-id 2020-01-02-18:47 \
   --domain-name example.com \
   --name my-rule \n   --resolver-endpoint-id rslvr-out-d5e5920e37example \
   --rule-type FORWARD \n   --target-ips "Ip=10.24.8.75" "Ip=10.24.8.156"
```

**Output:**

```
{
   "ResolverRule": {
       "Status": "COMPLETE",
       "RuleType": "FORWARD",
       "ResolverEndpointId": "rslvr-out-d5e5920e37example",
       "Name": "my-rule",
       "DomainName": "example.com",
       "CreationTime": "2022-05-10T21:35:30.923187Z",
       "TargetIps": [
           {
               "Ip": "10.24.8.75",
               "Port": 53
           },
           {
               "Ip": "10.24.8.156",
               "Port": 53
           }
       ],
       "CreatorRequestId": "2022-05-10-16:33",
       "ModificationTime": "2022-05-10T21:35:30.923187Z",
   }
}
```
For API details, see [CreateResolverRule](#) in *AWS CLI Command Reference*.

### delete-firewall-domain-list

The following code example shows how to use `delete-firewall-domain-list`.

**AWS CLI**

**To delete a Route 53 Resolver DNS Firewall domain list**

The following `delete-firewall-domain-list` example deletes a Route 53 Resolver DNS Firewall domain list, named `test`, in your AWS account.

```bash
aws route53resolver delete-firewall-domain-list \
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

**Output:**

```json
{
  "FirewallDomainList": {
    "Id": "rslvr-fdl-9e956e9ffexample",
    "Name": "test",
    "DomainCount": 6,
    "Status": "DELETING",
    "StatusMessage": "Deleting the Firewall Domain List",
    "CreatorRequestId": "my-request-id",
    "ModificationTime": "2021-05-25T18:58:05.588024Z"
  }
}
```
For more information, see Managing your own domain lists in the Amazon Route 53 Developer Guide.

- For API details, see DeleteFirewallDomainList in AWS CLI Command Reference.

**delete-firewall-rule-group**

The following code example shows how to use delete-firewall-rule-group.

**AWS CLI**

**To delete a firewall rule group**

The following delete-firewall-rule-group example deletes a firewall rule group.

```bash
aws route53resolver delete-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```json
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "UPDATING",
        "StatusMessage": "Updating Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see DeleteFirewallRuleGroup in AWS CLI Command Reference.
delete-firewall-rule

The following code example shows how to use delete-firewall-rule.

AWS CLI

To delete a firewall rule

The following delete-firewall-rule example deletes a specified firewall rule.

```
aws route53resolver delete-firewall-rule \
   --firewall-rule-group-id rslvr-frg-47f93271fexample \
   --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
   "FirewallRule": {
      "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
      "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
      "Name": "allow-rule",
      "Priority": 102,
      "Action": "ALLOW",
      "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
      "CreationTime": "2021-05-25T21:44:00.346093Z",
      "ModificationTime": "2021-05-25T21:45:59.611600Z"
   }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see DeleteFirewallRule in AWS CLI Command Reference.

delete-resolver-endpoint

The following code example shows how to use delete-resolver-endpoint.

AWS CLI

To delete a Resolver endpoint

The following delete-resolver-endpoint example deletes the specified endpoint.
Important If you delete an inbound endpoint, DNS queries from your network are no longer forwarded to Resolver in the VPC that you specified in the endpoint. If you delete an outbound endpoint, Resolver stops forwarding DNS queries from your VPC to your network for rules that specify the deleted outbound endpoint.

aws route53resolver delete-resolver-endpoint \
   --resolver-endpoint-id rslvr-in-497098ad59example

Output:

```
{
   "ResolverEndpoint": {
      "Id": "rslvr-in-497098ad59example",
      "CreatorRequestId": "AWSConsole.25.157290example",
      "Name": "my-inbound-endpoint",
      "SecurityGroupIds": [
         "sg-05cd7b25d6example"
      ],
      "Direction": "INBOUND",
      "IpAddressCount": 5,
      "HostVPCId": "vpc-304bexam",
      "Status": "DELETING",
      "StatusMessage": "[Trace id: 1-5dc5b658-811b5be0922bbc382example] Deleting ResolverEndpoint.",
      "CreationTime": "2020-01-01T23:25:45.538Z",
      "ModificationTime": "2020-01-02T23:25:45.538Z"
   }
}
```

- For API details, see [DeleteResolverEndpoint](#) in AWS CLI Command Reference.

**delete-resolver-rule**

The following code example shows how to use delete-resolver-rule.

**AWS CLI**

To delete a Resolver rule

The following delete-resolver-rule example deletes the specified rule.
Note If a rule is associated with any VPCs, you must first disassociate the rule from the VPCs before you can delete it.

```
aws route53resolver delete-resolver-rule \
    --resolver-rule-id rslvr-rr-5b3809426bexample
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-5b3809426bexample",
        "CreatorRequestId": "2020-01-03-18:47",
        "DomainName": "zenith.example.com.",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5e05b-602e67b052cb74f05example] Deleting Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-resolver-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.50",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e3example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

- For API details, see [DeleteResolverRule](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/delete-resolver-rule.html) in [AWS CLI Command Reference](https).

**disassociate-firewall-rule-group**

The following code example shows how to use disassociate-firewall-rule-group.

**AWS CLI**

To disassociate a firewall rule group from a VPC
The following `disassociate-firewall-rule-group` example disassociates a DNS Firewall rule group from an Amazon VPC.

```bash
aws route53resolver disassociate-firewall-rule-group \
   --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```json
{
   "FirewallRuleGroupAssociation": {
      "Id": "rslvr-frgassoc-57e8873d7example",
      "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
      "VpcId": "vpc-31e92222",
      "Name": "test-association",
      "Priority": 103,
      "MutationProtection": "DISABLED",
      "Status": "DELETING",
      "StatusMessage": "Deleting the Firewall Rule Group Association",
      "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
      "ModificationTime": "2021-05-25T21:51:02.377887Z"
   }
}
```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/route53resolver-manage-rule-associations.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisassociateFirewallRuleGroup](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/disassociate-firewall-rule-group.html) in *AWS CLI Command Reference*.

**disassociate-resolver-endpoint-ip-address**

The following code example shows how to use `disassociate-resolver-endpoint-ip-address`.

### AWS CLI

**To disassociate an IP address from a Resolver endpoint**

The following `disassociate-resolver-endpoint-ip-address` example removes an IP address from a specified Resolver inbound or outbound endpoint.
**Note** An endpoint must have at least two IP addresses. If an endpoint currently has only two IP addresses and you want to replace one address with another address, you must first use `associate-resolver-endpoint-ip-address` to associate the new IP address. Then you can disassociate one of the original IP addresses from the endpoint.

```
aws route53resolver disassociate-resolver-endpoint-ip-address \
   --resolver-endpoint-id rslvr-in-f9ab8a03f1example \
   --ip-address="SubnetId=subnet-12d8a459,Ip=172.31.40.121"
```

Output:

```
{
   "ResolverEndpoint": {
      "Id": "rslvr-in-f9ab8a03f1example",
      "CreatorRequestId": "2020-01-01-18:47",
      "Name": "my-inbound-endpoint",
      "SecurityGroupIds": ["sg-f62bexam"],
      "Direction": "INBOUND",
      "IpAddressCount": 3,
      "HostVPCId": "vpc-304bexam",
      "Status": "UPDATING",
      "StatusMessage": "Updating the Resolver Endpoint",
      "CreationTime": "2020-01-01T23:02:29.583Z",
      "ModificationTime": "2020-01-05T23:02:29.583Z"
   }
}
```

- For API details, see [DisassociateResolverEndpointIpAddress](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/disassociate-resolver-endpoint-ip-address.html) in **AWS CLI Command Reference**.

## disassociate-resolver-rule

The following code example shows how to use `disassociate-resolver-rule`.

**AWS CLI**

To disassociate a Resolver rule from an Amazon VPC
The following `disassociate-resolver-rule` example removes the association between the specified Resolver rule and the specified VPC. You can disassociate a rule from a VPC in the following circumstances:

For DNS queries that originate in this VPC, you want Resolver to stop forwarding queries to your network for the domain name that is specified in the rule. You want to delete the forwarding rule. If a rule is currently associated with one or more VPCs, you must disassociate the rule from all VPCs before you can delete it.

```bash
aws route53resolver disassociate-resolver-rule
   --resolver-rule-id rslvr-rr-4955cb98ceexample
   --vpc-id vpc-304bexam
```

Output:

```
{
   "ResolverRuleAssociation": {
      "Id": "rslvr-rrassoc-322f4e8b9ceexample",
      "ResolverRuleId": "rslvr-rr-4955cb98ceexample",
      "Name": "my-resolver-rule-association",
      "VPCId": "vpc-304bexam",
      "Status": "DELETING",
      "StatusMessage": "[Trace id: 1-5dc5ffa2-a26c38004c1f94006example] Deleting Association"
   }
}
```

- For API details, see [DisassociateResolverRule](#) in [AWS CLI Command Reference](#).

#### get-firewall-config

The following code example shows how to use `get-firewall-config`.

**AWS CLI**

**To get a firewall config for a VPC**

The following `get-firewall-config` example retrieves the DNS Firewall behavior for the specified VPC.

```bash
aws route53resolver get-firewall-config
```
AWS Command Line Interface

--resource-id vpc-31e92222

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e9222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see [DNS Firewall VPC configuration](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/dns-firewall-vpc-configuration.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallConfig](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/get-firewall-config.html) in *AWS CLI Command Reference*.

**get-firewall-domain-list**

The following code example shows how to use `get-firewall-domain-list`.

**AWS CLI**

**To get a Route 53 Resolver DNS Firewall domain list**

The following `get-firewall-domain-list` example retrieves the domain list with the ID you specify.

```bash
aws route53resolver get-firewall-domain-list \ 
    --firewall-domain-list-id rslvr-fdl-42b60677cexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Name": "test",
    }
}
```
The following code example shows how to use `get-firewall-rule-group-association`.

**AWS CLI**

To get a firewall rule group association

The following `get-firewall-rule-group-association` example retrieves a firewall rule group association.

```
aws route53resolver get-firewall-rule-group-association \
  --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```json
{
  "FirewallRuleGroupAssociation": {
    "Id": "rslvr-frgassoc-57e8873d7example",
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "VpcId": "vpc-31e92222",
    "Name": "test-association",
    "Priority": 101,
    "MutationProtection": "DISABLED",
    "Status": "COMPLETE",
    "StatusMessage": "Finished rule group association update"
  }
}
```
For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the Amazon Route 53 Developer Guide.

- For API details, see GetFirewallRuleGroupAssociation in AWS CLI Command Reference.

get-firewall-rule-group-policy

The following code example shows how to use get-firewall-rule-group-policy.

AWS CLI

**To get an AWS IAM policy**

The following get-firewall-rule-group-policy example gets the AWS Identity and Access Management (AWS IAM) policy for sharing the specified rule group.

```
aws route53resolver get-firewall-rule-group-policy \
```

Output:

```
{
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see GetFirewallRuleGroupPolicy in AWS CLI Command Reference.
get-firewall-rule-group

The following code example shows how to use get-firewall-rule-group.

AWS CLI

To get a Firewall rule group

The following get-firewall-rule-group example retrieves information about a DNS Firewall rule group with the ID you provide.

```bash
aws route53resolver get-firewall-rule-group \
  --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```json
{
   "FirewallRuleGroup": {
      "Id": "rslvr-frg-47f93271fexample",
      "Name": "test",
      "RuleCount": 0,
      "Status": "COMPLETE",
      "StatusMessage": "Created Firewall Rule Group",
      "OwnerId": "123456789012",
      "CreatorRequestId": "my-request-id",
      "ShareStatus": "NOT_SHARED",
   }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see GetFirewallRuleGroup in AWS CLI Command Reference.

get-resolver-endpoint

The following code example shows how to use get-resolver-endpoint.
To get information about a Resolver endpoint

The following get-resolver-endpoint example displays details for the outbound specified endpoint. You can use get-resolver-endpoint for both inbound and outbound endpoints by specifying the applicable endpoint ID.

```bash
aws route53resolver get-resolver-endpoint \
    --resolver-endpoint-id rslvr-out-d5e5920e37example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-out-d5e5920e37example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Name": "my-outbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "OUTBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T23:50:50.979Z",
        "ModificationTime": "2020-01-02T23:50:50.979Z"
    }
}
```

For more information, see [Values That You Specify When You Create or Edit Inbound Endpoints](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetResolverEndpoint](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/get-resolver-endpoint.html) in *AWS CLI Command Reference*.

get-resolver-rule-association

The following code example shows how to use get-resolver-rule-association.
AWS CLI

To get information about the association between a Resolver rule and a VPC

The following get-resolver-rule-association example displays details about the association between a specified Resolver rule and a VPC. You associate a resolver rule and a VPC using associate-resolver-rule.

```bash
aws route53resolver get-resolver-rule-association \
   --resolver-rule-association-id rslvr-rrassoc-d61cbb2c8bexample
```

Output:

```json
{
   "ResolverRuleAssociation": {
      "Id": "rslvr-rrassoc-d61cbb2c8bexample",
      "ResolverRuleId": "rslvr-rr-42b60677c0example",
      "Name": "my-resolver-rule-association",
      "VPCId": "vpc-304bexam",
      "Status": "COMPLETE",
      "StatusMessage": ""
   }
}
```

- For API details, see [GetResolverRuleAssociation](#) in *AWS CLI Command Reference*.

**get-resolver-rule**

The following code example shows how to use get-resolver-rule.

AWS CLI

To get information about a Resolver rule

The following get-resolver-rule example displays details about the specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the ID of the outbound resolver endpoint that the rule is associated with.

```bash
aws route53resolver get-resolver-rule \
   --resolver-rule-id rslvr-rr-42b60677c0example
```
Output:

```json
{
   "ResolverRule": {
      "Id": "rslvr-rr-42b60677c0example",
      "CreatorRequestId": "2020-01-01-18:47",
      "DomainName": "example.com.",
      "Status": "COMPLETE",
      "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example] Successfully created Resolver Rule.",
      "RuleType": "FORWARD",
      "Name": "my-rule",
      "TargetIps": [
         {
            "Ip": "192.0.2.45",
            "Port": 53
         }
      ],
      "ResolverEndpointId": "rslvr-out-d5e5920e37example",
      "OwnerId": "111122223333",
      "ShareStatus": "NOT_SHARED"
   }
}
```

For more information, see [Values That You Specify When You Create or Edit Rules](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/resolver-creating-rules-values.html) in the *Amazon Route 53 Developer Guide*.

### import-firewall-domains

The following code example shows how to use `import-firewall-domains`.

#### AWS CLI

**To import domains into a domain list**

The following `import-firewall-domains` example imports a set of domains from a file into a DNS Firewall domain list that you specify.

```
aws route53resolver import-firewall-domains \
```
Output:

```json
{
  "Id": "rslvr-fdl-d61cbb2cbexample",
  "Name": "test",
  "Status": "IMPORTING",
  "StatusMessage": "Importing domains from provided file."
}
```

For more information, see [Managing your own domain lists](https://docs.aws.amazon.com/AmazonRoute53/latest/DeveloperGuide) in the Amazon Route 53 Developer Guide.

- For API details, see [ImportFirewallDomains](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_ImportFirewallDomains.html) in AWS CLI Command Reference.

### list-firewall-configs

The following code example shows how to use `list-firewall-configs`.

**AWS CLI**

**To list firewall configs**

The following `list-firewall-configs` example lists your DNS Firewall configurations.

```bash
aws route53resolver list-firewall-configs
```

Output:

```json
{
  "FirewallConfigs": [
    {
      "Id": "rslvr-fc-86016850cexample",
      "ResourceId": "vpc-31e92222",
      "OwnerId": "123456789012",
      "FirewallFailOpen": "DISABLED"
    }
  ]
}
```
For more information, see [DNS Firewall VPC configuration](#) in the [Amazon Route 53 Developer Guide](#).

- For API details, see [ListFirewallConfigs](#) in [AWS CLI Command Reference](#).

### list-firewall-domain-lists

The following code example shows how to use `list-firewall-domain-lists`.

**AWS CLI**

**To list all of Route 53 Resolver DNS Firewall domain lists**

The following `list-firewall-domain-lists` example lists all the domain lists.

```bash
aws route53resolver list-firewall-domain-lists
```

Output:

```json
{
    "FirewallDomainLists": [
    {
        "Id": "rslvr-fdl-2c46f2ecfexample",
        "Name": "AWSManagedDomainsMalwareDomainList",
        "CreatorRequestId": "AWSManagedDomainsMalwareDomainList",
        "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
    },
    {
        "Id": "rslvr-fdl-aa970e9e1example",
        "Name": "AWSManagedDomainsBotnetCommandandControl",
        "CreatorRequestId": "AWSManagedDomainsBotnetCommandandControl",
        "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
    },
    {
        "Id": "rslvr-fdl-42b60677cexample",
        "Name": "test",
        "CreatorRequestId": "my-request-id"
    }
}
```
For more information, see Route 53 Resolver DNS Firewall domain lists in the Amazon Route 53 Developer Guide.

- For API details, see ListFirewallDomainLists in AWS CLI Command Reference.

list-firewall-domains

The following code example shows how to use list-firewall-domains.

AWS CLI

To list domains in a domain list

The following list-firewall-domains example lists the domains in a DNS Firewall domain list that you specify.

```
aws route53resolver list-firewall-domains \
 --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample
```

Output:

```json
{
   "Domains": [
   "test1.com.",
   "test2.com.",
   "test3.com."
   ]
}
```

For more information, see Managing your own domain lists in the Amazon Route 53 Developer Guide.

- For API details, see ListFirewallDomains in AWS CLI Command Reference.

list-firewall-rule-group-associations

The following code example shows how to use list-firewall-rule-group-associations.
To list DNS Firewall rule group associations

The following `list-firewall-rule-group-associations` example lists your DNS Firewall rule group associations with Amazon VPCs.

```bash
aws route53resolver list-firewall-rule-group-associations
```

Output:

```json
{
  "FirewallRuleGroupAssociations": [
    {
      "Id": "rslvr-frgassoc-57e8873d7example",
      "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
      "VpcId": "vpc-31e92222",
      "Name": "test-association",
      "Priority": 101,
      "MutationProtection": "DISABLED",
      "Status": "UPDATING",
      "StatusMessage": "Creating Firewall Rule Group Association",
      "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
    }
  ]
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the Amazon Route 53 Developer Guide.

- For API details, see ListFirewallRuleGroupAssociations in AWS CLI Command Reference.

list-firewall-rule-groups

The following code example shows how to use `list-firewall-rule-groups`.

AWS CLI

To get a list of your Firewall rule groups
The following list-firewall-rule-groups example lists your DNS Firewall rule groups.

```
aws route53resolver list-firewall-rule-groups
```

Output:

```
{
  "FirewallRuleGroups": [
    {
      "Id": "rslvr-frg-47f93271fexample",
      "Name": "test",
      "OwnerId": "123456789012",
      "CreatorRequestId": "my-request-id",
      "ShareStatus": "NOT_SHARED"
    }
  ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see ListFirewallRuleGroups in AWS CLI Command Reference.

**list-firewall-rules**

The following code example shows how to use list-firewall-rules.

**AWS CLI**

*To list firewall rules*

The following list-firewall-rules example list all of your DNS Firewall rules within a firewall rule group.

```
aws route53resolver list-firewall-rules \
  --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
```
"FirewallRules": [  
  {  
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
    "Name": "allow-rule",
    "Priority": 101,
    "Action": "ALLOW",
    "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:44:00.346093Z",
    "ModificationTime": "2021-05-25T21:44:00.346093Z"
  }  
]  
}

For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see ListFirewallRules in AWS CLI Command Reference.

list-resolver-endpoint-ip-addresses

The following code example shows how to use list-resolver-endpoint-ip-addresses.

AWS CLI

To list IP addresses for a specified inbound or outbound endpoint

The following list-resolver-endpoint-ip-addresses example lists information about the IP addresses that are associated with the inbound endpoint rslvr-in-f9ab8a03f1example. You can also use list-resolver-endpoint-ip-addresses for outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver list-resolver-endpoint-ip-addresses \  
--resolver-endpoint-id rslvr-in-f9ab8a03f1example
```

Output:

```
{
  "MaxResults": 10,
  "IpAddresses": [  
    {  
      "IpId": "rni-1de60cdebfeexample",
    }
  ]
}
```
For more information about the values in the output, see Values That You Specify When You Create or Edit Inbound Endpoints, and Values That You Specify When You Create or Edit Outbound Endpoints, both in the Amazon Route 53 Developer Guide.

- For API details, see ListResolverEndpointIpAddresses in AWS CLI Command Reference.

**list-resolver-endpoints**

The following code example shows how to use list-resolver-endpoints.

**AWS CLI**

**To list Resolver endpoints in an AWS Region**

The following list-resolver-endpoints example lists the inbound and outbound Resolver endpoints that exist in the current account.

```
aws route53resolver list-resolver-endpoints
```

Output:

```
{
    "MaxResults": 10,
```
"ResolverEndpoints": [
    {
      "Id": "rslvr-in-497098ad59example",
      "CreatorRequestId": "2020-01-01-18:47",
      "Name": "my-inbound-endpoint",
      "SecurityGroupIds": [
        "sg-05cd7b25d6example"
      ],
      "Direction": "INBOUND",
      "IpAddressCount": 2,
      "HostVPCId": "vpc-304bexam",
      "Status": "OPERATIONAL",
      "StatusMessage": "This Resolver Endpoint is operational.",
      "CreationTime": "2020-01-01T23:25:45.538Z",
      "ModificationTime": "2020-01-01T23:25:45.538Z"
    },
    {
      "Id": "rslvr-out-d5e5920e37example",
      "CreatorRequestId": "2020-01-01-18:48",
      "Name": "my-outbound-endpoint",
      "SecurityGroupIds": [
        "sg-05cd7b25d6example"
      ],
      "Direction": "OUTBOUND",
      "IpAddressCount": 2,
      "HostVPCId": "vpc-304bexam",
      "Status": "OPERATIONAL",
      "StatusMessage": "This Resolver Endpoint is operational.",
      "CreationTime": "2020-01-01T23:50:50.979Z",
      "ModificationTime": "2020-01-01T23:50:50.979Z"
    }
  ]

- For API details, see [ListResolverEndpoints](#) in *AWS CLI Command Reference*.

**list-resolver-rule-associations**

The following code example shows how to use list-resolver-rule-associations.
AWS CLI

To list associations between Resolver rules and VPCs

The following list-resolver-rule-associations example lists the associations between resolver rules and VPCs in the current AWS account.

```bash
aws route53resolver list-resolver-rule-associations
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRuleAssociations": [
        {
            "Id": "rslvr-autodefined-assoc-vpc-304bexam-internet-resolver",
            "ResolverRuleId": "rslvr-autodefined-rr-internet-resolver",
            "Name": "System Rule Association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        },
        {
            "Id": "rslvr-rrassoc-d61cbb2c8bexample",
            "ResolverRuleId": "rslvr-rr-42b60677c0example",
            "Name": "my-resolver-rule-association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        }
    ]
}
```

For more information, see [How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network](https://docs.aws.amazon.com/Route53/latest/developerguide/resolver-forward-dns-vpc-to-network.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListResolverRuleAssociations](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/list-resolver-rule-associations.html) in *AWS CLI Command Reference*.

**list-resolver-rules**

The following code example shows how to use list-resolver-rules.
AWS CLI

To list Resolver rules

The following `list-resolver-rules` example lists all the Resolver rules in the current AWS account.

```
aws route53resolver list-resolver-rules
```

Output:

```
{
  "MaxResults": 30,
  "ResolverRules": [
    {
      "Id": "rslvr-autodefined-rr-internet-resolver",
      "CreatorRequestId": "",
      "DomainName": ".",
      "Status": "COMPLETE",
      "RuleType": "RECURSIVE",
      "Name": "Internet Resolver",
      "OwnerId": "Route 53 Resolver",
      "ShareStatus": "NOT_SHARED"
    },
    {
      "Id": "rslvr-rr-42b60677c0example",
      "CreatorRequestId": "2020-01-01-18:47",
      "DomainName": "example.com.",
      "Status": "COMPLETE",
      "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example] Successfully created Resolver Rule.",
      "RuleType": "FORWARD",
      "Name": "my-rule",
      "TargetIps": [
        {
          "Ip": "192.0.2.45",
          "Port": 53
        }
      ]
    }
  ]
}
```
For more information, see [How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListResolverRules](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/list-resolver-rules.html) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a Resolver resource**

The following `list-tags-for-resource` example lists the tags that are assigned to the specified Resolver rule.

```
aws route53resolver list-tags-for-resource \
```

**Output:**

```
{
    "Tags": [
        {
            "Key": "my-key-1",
            "Value": "my-value-1"
        },
        {
            "Key": "my-key-2",
            "Value": "my-value-2"
        }
    ]
}
```
For information about using tags for cost allocation, see [Using Cost Allocation Tags](#) in the *AWS Billing and Cost Management User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

**put-firewall-rule-group-policy**

The following code example shows how to use `put-firewall-rule-group-policy`.

**AWS CLI**

**To attach an AWS IAM policy to share a Firewall rule group policy**

The following `put-firewall-rule-group-policy` example attaches an AWS Identity and Access Management (AWS IAM) policy for sharing the rule group.

```
aws route53resolver put-firewall-rule-group-policy \\
"
```

Output:

```
{
   "ReturnValue": true
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [PutFirewallRuleGroupPolicy](#) in *AWS CLI Command Reference*.

**put-resolver-rule-policy**

The following code example shows how to use `put-resolver-rule-policy`.

**AWS CLI**

**To share a Resolver rule with another AWS account**

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [PutResolverRulePolicy](#) in *AWS CLI Command Reference*.
The following `put-resolver-rule-policy` example specifies a Resolver rule that you want to share with another AWS account, the account that you want to share the rule with, and the rule-related operations that you want the account to be able to perform on the rules.

**Note** You must run this command using credentials from the same account that created the rule.

```bash
code
aws route53resolver put-resolver-rule-policy \
   --region us-east-1 \
   --arn "arn:aws:route53resolver:us-east-1:111122223333:resolver-rule/rslvr-rr-42b60677c0example" \
   --resolver-rule-policy "{"Version": "2012-10-17", \
   "Statement": [ { \n   "Effect": "Allow", \
   "Principal": {"AWS": "444455556666" }, \
   "Action": [ "route53resolver:GetResolverRule", \
   "route53resolver:AssociateResolverRule", \
   "route53resolver:DisassociateResolverRule", \
   "route53resolver:ListResolverRules", \
   "route53resolver:ListResolverRuleAssociations" ], \
```

**Output:**

```
{
   "ReturnValue": true
}
```

After you run `put-resolver-rule-policy`, you can run the following two Resource Access Manager (RAM) commands. You must use the account that you want to share the rule with:

- `get-resource-share-invitations` returns the value `resourceShareInvitationArn`. You need this value to accept the invitation to use the shared rule. `accept-resource-share-invitation` accepts the invitation to use the shared rule.

For more information, see the following documentation:

- [get-resource-share-invitations](#)
- [accept-resource-share-invitation](#)
- [Sharing Forwarding Rules with Other AWS Accounts and Using Shared Rules](#) in the *Amazon Route 53 Developer Guide*

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To associate tags with a Resolver resource**

The following `tag-resource` example associates two tag key/value pairs with the specified Resolver rule.

```bash
aws route53resolver tag-resource \
  --tags "Key=my-key-1,Value=my-value-1" "Key=my-key-2,Value=my-value-2"
```

This command produces no output.

For API details, see [TagResource](https://aws.amazon.com/documentation/CLICommandReference) in AWS CLI Command Reference.

### untag-resource

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a Resolver resource**

The following `untag-resource` example removes two tags from the specified Resolver rule.

```bash
aws route53resolver untag-resource \
  --tag-keys my-key-1 my-key-2
```

This command produces no output. To confirm that the tags were removed, you can use `list-tags-for-resource`. 

---

**Actions and scenarios**

---

**5571**
For information about using tags for cost allocation, see Using Cost Allocation Tags in the AWS Billing and Cost Management User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-firewall-config**

The following code example shows how to use update-firewall-config.

**AWS CLI**

To update a firewall config

The following update-firewall-config example updates DNS Firewall configuration.

```
aws route53resolver update-firewall-config \
    --resource-id vpc-31e92222 \
    --firewall-fail-open DISABLED
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e92222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the Amazon Route 53 Developer Guide.

- For API details, see UpdateFirewallConfig in AWS CLI Command Reference.

**update-firewall-domains**

The following code example shows how to use update-firewall-domains.

**AWS CLI**

To update a domain list
The following update-firewall-domains example adds the domains to a domain list with the ID you provide.

```bash
aws route53resolver update-firewall-domains \
  --firewall-domain-list-id rslvr-fdl-42b60677cexampleb \
  --operation ADD \
  --domains test1.com test2.com test3.com
```

Output:

```json
{
  "Id": "rslvr-fdl-42b60677cexample",
  "Name": "test",
  "Status": "UPDATING",
  "StatusMessage": "Updating the Firewall Domain List"
}
```

For more information, see [Managing your own domain lists](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/managing-domains.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateFirewallDomains](https://docs.aws.amazon.com/cli/latest/reference/route53resolver/update-firewall-domains.html) in *AWS CLI Command Reference*.

**update-firewall-rule-group-association**

The following code example shows how to use update-firewall-rule-group-association.

**AWS CLI**

**To update a firewall rule group association**

The following update-firewall-rule-group-association example updates a firewall rule group association.

```bash
aws route53resolver update-firewall-rule-group-association \
  --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example \
  --priority 103
```

Output:

```json
{
  "FirewallRuleGroupAssociation": {
    "Id": "rslvr-frgassoc-57e8873d7example",
    ...
  }
}```
For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the Amazon Route 53 Developer Guide.

- For API details, see UpdateFirewallRuleGroupAssociation in AWS CLI Command Reference.

update-firewall-rule

The following code example shows how to use update-firewall-rule.

AWS CLI

To update a firewall rule

The following update-firewall-rule example updates a firewall rule with the parameters you specify.

```bash
aws route53resolver update-firewall-rule \
  --firewall-rule-group-id rslvr-frg-47f93271fexample \
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
  --priority 102
```

Output:

```json
{
  "FirewallRule": {
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
    "Name": "allow-rule",
    "Priority": 103,
    "MutationProtection": "DISABLED",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Firewall Rule Group Association Attributes",
    "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
    "ModificationTime": "2021-05-25T21:50:09.272569Z"
  }
}
```
For more information, see Managing rule groups and rules in DNS Firewall in the Amazon Route 53 Developer Guide.

- For API details, see UpdateFirewallRule in AWS CLI Command Reference.

update-resolver-endpoint

The following code example shows how to use update-resolver-endpoint.

AWS CLI

To update the name of a Resolver endpoint

The following update-resolver-endpoint example updates the name of a Resolver endpoint. Updating other values isn't supported.

```
aws route53resolver update-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-b5d45e32bdc45f09 \
    --name my-renamed-inbound-endpoint
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-b5d45e32bdc45f09",
        "CreatorRequestId": "2020-01-02-18:48",
        "Name": "my-renamed-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
    
```
"Status": "OPERATIONAL",
"StatusMessage": "This Resolver Endpoint is operational.",
"CreationTime": "2020-01-01T18:33:59.265Z",
"ModificationTime": "2020-01-08T18:33:59.265Z"
}  

• For API details, see UpdateResolverEndpoint in AWS CLI Command Reference.

update-resolver-rule

The following code example shows how to use update-resolver-rule.

AWS CLI

Example 1: To update settings Resolver endpoint

The following update-resolver-rule example updates the name of the rule, the IP addresses on your on-premises network that DNS queries are forwarded to, and the ID of the outbound Resolver endpoint that you're using to forward queries to your network.

**Note** Existing values for TargetIps are overwritten, so you must specify all the IP addresses that you want the rule to have after the update.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \ 
    --config Name="my-2nd-rule",TargetIps=[[Ip=192.0.2.45,Port=53], \ 
    {Ip=192.0.2.46,Port=53}],ResolverEndpointId=rslvr-out-7b89ed0d25example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-1247fa64f3example",
        "CreatorRequestId": "2020-01-02-18:47",
        "DomainName": "www.example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example] Successfully updated Resolver Rule.",
        "RuleType": "FORWARD",
    }
}
```
Example 2: To update settings Resolver endpoint using a file for `config` settings

You can alternatively include the config settings in a JSON file and then specify that file when you call `update-resolver-rule`.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config file://c:\temp\update-resolver-rule.json
```

Contents of `update-resolver-rule.json`.

```
{
    "Name": "my-2nd-rule",
    "TargetIps": [
        {
            "Ip": "192.0.2.45",
            "Port": 53
        },
        {
            "Ip": "192.0.2.46",
            "Port": 53
        }
    ],
    "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
    "OwnerId": "111122223333",
    "ShareStatus": "NOT_SHARED"
}
```
For more information, see Values That You Specify When You Create or Edit Rules in the Amazon Route 53 Developer Guide.

- For API details, see UpdateResolverRule in AWS CLI Command Reference.

Amazon S3 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**abort-multipart-upload**

The following code example shows how to use abort-multipart-upload.

**AWS CLI**

**To abort the specified multipart upload**

The following abort-multipart-upload command aborts a multipart upload for the key multipart/01 in the bucket my-bucket.

```bash
aws s3api abort-multipart-upload \
    --bucket my-bucket \
    --key multipart/01 \
    --upload-id
```

`dfRtDYU0WwCCcH43C3WfbkRONycyCpTJJuxu2i5GYkZljF.Yxwh6XG7Wfs2vC4to6HiV6Yj1x.cph0gtNBtJ8P3URCS`
The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see `AbortMultipartUpload` in *AWS CLI Command Reference*.

**complete-multipart-upload**

The following code example shows how to use `complete-multipart-upload`.

**AWS CLI**

The following command completes a multipart upload for the key `multipart/01` in the bucket `my-bucket`:

```shell
aws s3api complete-multipart-upload --multipart-upload file://mpustruct --bucket my-bucket --key 'multipart/01' --upload-id dfRtDYU0WwCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WFs2vC4to6H1v6Yjlx.cph0gtNbtJ8P3URCS
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

**mpustruct:**

```json
{
    "Parts": [
        {
            "ETag": "e868e0f4719e394144ef36531ee6824c",
            "PartNumber": 1
        },
        {
            "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
            "PartNumber": 2
        },
        {
            "ETag": "d0a0112e841abec9c9ec83406f0159c8",
            "PartNumber": 3
        }
    ]
}
```
The ETag value for each part is upload is output each time you upload a part using the upload-part command and can also be retrieved by calling list-parts or calculated by taking the MD5 checksum of each part.

Output:

```json
{
   "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
   "Bucket": "my-bucket",
   "Location": "https://my-bucket.s3.amazonaws.com/multipart%2F01",
   "Key": "multipart/01"
}
```

- For API details, see [CompleteMultipartUpload](https://awscli.amazonaws.com/v2/documentation/api/reference/) in *AWS CLI Command Reference*.

### copy-object

The following code example shows how to use copy-object.

**AWS CLI**

The following command copies an object from bucket-1 to bucket-2:

```bash
aws s3api copy-object --copy-source bucket-1/test.txt --key test.txt --bucket bucket-2
```

Output:

```json
{
   "CopyObjectResult": {
      "LastModified": "2015-11-10T01:07:25.000Z",
      "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\"
   },
   "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifMlkA"
}
```

- For API details, see [CopyObject](https://awscli.amazonaws.com/v2/documentation/api/reference/) in *AWS CLI Command Reference*. 
**cp**

The following code example shows how to use cp.

### AWS CLI

**Example 1: Copying a local file to S3**

The following cp command copies a single file to a specified bucket and key:

```bash
aws s3 cp test.txt s3://mybucket/test2.txt
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

**Example 2: Copying a local file to S3 with an expiration date**

The following cp command copies a single file to a specified bucket and key that expires at the specified ISO 8601 timestamp:

```bash
aws s3 cp test.txt s3://mybucket/test2.txt \
--expires 2014-10-01T20:30:00Z
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

**Example 3: Copying a file from S3 to S3**

The following cp command copies a single s3 object to a specified bucket and key:

```bash
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

**Example 4: Copying an S3 object to a local file**

The following cp command copies a single object to a specified file locally:
aws s3 cp s3://mybucket/test.txt test2.txt

Output:
download: s3://mybucket/test.txt to test2.txt

Example 5: Copying an S3 object from one bucket to another

The following cp command copies a single object to a specified bucket while retaining its original name:

aws s3 cp s3://mybucket/test.txt s3://mybucket2/

Output:
copy: s3://mybucket/test.txt to s3://mybucket2/test.txt

Example 6: Recursively copying S3 objects to a local directory

When passed with the parameter --recursive, the following cp command recursively copies all objects under a specified prefix and bucket to a specified directory. In this example, the bucket mybucket has the objects test1.txt and test2.txt:

aws s3 cp s3://mybucket . \
   --recursive

Output:
download: s3://mybucket/test1.txt to test1.txt
download: s3://mybucket/test2.txt to test2.txt

Example 7: Recursively copying local files to S3

When passed with the parameter --recursive, the following cp command recursively copies all files under a specified directory to a specified bucket and prefix while excluding some files by using an --exclude parameter. In this example, the directory myDir has the files test1.txt and test2.jpg:

aws s3 cp myDir s3://mybucket/ \

--recursive \
--exclude "*.jpg"

Output:

upload: myDir/test1.txt to s3://mybucket/test1.txt

Example 8: Recursively copying S3 objects to another bucket

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`:

```shell
aws s3 cp s3://mybucket/ s3://mybucket2/ \
  --recursive \
  --exclude "another/**"
```

Output:

```shell
copy: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
```

You can combine `--exclude` and `--include` options to copy only objects that match a pattern, excluding all others:

```shell
aws s3 cp s3://mybucket/logs/ s3://mybucket2/logs/ \
  --recursive \
  --exclude "*" \
  --include "*.log"
```

Output:

```shell
```

Example 9: Setting the Access Control List (ACL) while copying an S3 object

The following `cp` command copies a single object to a specified bucket and key while setting the ACL to `public-read-write`:
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt \
--acl public-read-write

Output:

copy: s3://mybucket/test.txt to s3://mybucket/test2.txt

Note that if you're using the --acl option, ensure that any associated IAM policies include the "s3:PutObjectAcl" action:

aws iam get-user-policy \
   --user-name myuser \
   --policy-name mypolicy

Output:

{
   "UserName": "myuser",
   "PolicyName": "mypolicy",
   "PolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
         {
            "Action": ["s3:PutObject", "s3:PutObjectAcl"],
            "Resource": ["arn:aws:s3:::mybucket/*"],
            "Effect": "Allow",
            "Sid": "Stmt1234567891234"
         }
      ]
   }
}

Example 10: Granting permissions for an S3 object

The following cp command illustrates the use of the --grants option to grant read access to all users identified by URI and full control to a specific user identified by their Canonical ID:
aws s3 cp file.txt s3://mybucket/ --grants read=uri=http://acs.amazonaws.com/groups/global/AllUsers
  full=id=79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be

Output:

upload: file.txt to s3://mybucket/file.txt

Example 11: Uploading a local file stream to S3

PowerShell may alter the encoding of or add a CRLF to piped input.

The following cp command uploads a local file stream from standard input to a specified bucket and key:

aws s3 cp - s3://mybucket/stream.txt

Example 12: Uploading a local file stream that is larger than 50GB to S3

The following cp command uploads a 51GB local file stream from standard input to a specified bucket and key. The --expected-size option must be provided, or the upload may fail when it reaches the default part limit of 10,000:

aws s3 cp - s3://mybucket/stream.txt --expected-size 54760833024

Example 13: Downloading an S3 object as a local file stream

PowerShell may alter the encoding of or add a CRLF to piped or redirected output.

The following cp command downloads an S3 object locally as a stream to standard output. Downloading as a stream is not currently compatible with the --recursive parameter:

aws s3 cp s3://mybucket/stream.txt -

Example 14: Uploading to an S3 access point

The following cp command uploads a single file (mydoc.txt) to the access point (myaccesspoint) at the key (mykey):
aws s3 cp mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey

Output:

Example 15: Downloading from an S3 access point

The following cp command downloads a single object (mykey) from the access point (myaccesspoint) to the local file (mydoc.txt):

aws s3 cp s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey mydoc.txt

Output:

- For API details, see Cp in AWS CLI Command Reference.

create-bucket

The following code example shows how to use create-bucket.

AWS CLI

Example 1: To create a bucket

The following create-bucket example creates a bucket named my-bucket:

```bash
aws s3api create-bucket
  --bucket my-bucket
  --region us-east-1
```

Output:

```json
{
```
"Location": "/my-bucket"
}

For more information, see Creating a bucket in the Amazon S3 User Guide.

**Example 2: To create a bucket with owner enforced**

The following create-bucket example creates a bucket named my-bucket that uses the bucket owner enforced setting for S3 Object Ownership.

```bash
classic create-bucket
  --bucket my-bucket 
  --region us-east-1 
  --object-ownership BucketOwnerEnforced
```

Output:

```json
{   "Location": "/my-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the Amazon S3 User Guide.

**Example 3: To create a bucket outside of the `us-east-1` region**

The following create-bucket example creates a bucket named my-bucket in the eu-west-1 region. Regions outside of us-east-1 require the appropriate LocationConstraint to be specified in order to create the bucket in the desired region.

```bash
classic create-bucket
  --bucket my-bucket 
  --region eu-west-1 
  --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```json
{   "Location": "http://my-bucket.s3.amazonaws.com/"
}
For more information, see Creating a bucket in the Amazon S3 User Guide.

- For API details, see CreateBucket in AWS CLI Command Reference.

create-multipart-upload

The following code example shows how to use create-multipart-upload.

AWS CLI

The following command creates a multipart upload in the bucket my-bucket with the key multipart/01:

```
aws s3api create-multipart-upload --bucket my-bucket --key 'multipart/01'
```

Output:

```
{
    "Bucket": "my-bucket",
    "UploadId": "dfRtDYU0WCCcH43C3WFbRQNycyCpTJJvxu2i5GYkZljlF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC",
    "Key": "multipart/01"
}
```

The completed file will be named 01 in a folder called multipart in the bucket my-bucket. Save the upload ID, key and bucket name for use with the upload-part command.

- For API details, see CreateMultipartUpload in AWS CLI Command Reference.

delete-bucket-analytics-configuration

The following code example shows how to use delete-bucket-analytics-configuration.

AWS CLI

```
aws s3api delete-bucket-analytics-configuration \
  --bucket my-bucket \
```

To delete an analytics configuration for a bucket

The following delete-bucket-analytics-configuration example removes the analytics configuration for the specified bucket and ID.
This command produces no output.

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

### delete-bucket-cors

**The following code example shows how to use `delete-bucket-cors`**.

**AWS CLI**

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-cors --bucket my-bucket
```

- For API details, see [DeleteBucketCors](#) in *AWS CLI Command Reference*.

### delete-bucket-encryption

**The following code example shows how to use `delete-bucket-encryption`**.

**AWS CLI**

**To delete the server-side encryption configuration of a bucket**

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption
   --bucket my-bucket
```

This command produces no output.

- For API details, see [DeleteBucketEncryption](#) in *AWS CLI Command Reference*.

### delete-bucket-intelligent-tiering-configuration

**The following code example shows how to use `delete-bucket-intelligent-tiering-configuration`**.

---

**Actions and scenarios**

---

5589
AWS CLI

To remove an S3 Intelligent-Tiering configuration on a bucket

The following delete-bucket-intelligent-tiering-configuration example removes an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api delete-bucket-intelligent-tiering-configuration \
   --bucket DOC-EXAMPLE-BUCKET \
   --id ExampleConfig
```

This command produces no output.

For more information, see Using S3 Intelligent-Tiering in the Amazon S3 User Guide.

• For API details, see DeleteBucketIntelligentTieringConfiguration in AWS CLI Command Reference.

delete-bucket-inventory-configuration

The following code example shows how to use delete-bucket-inventory-configuration.

AWS CLI

To delete the inventory configuration of a bucket

The following delete-bucket-inventory-configuration example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
   --bucket my-bucket \
   --id 1
```

This command produces no output.

• For API details, see DeleteBucketInventoryConfiguration in AWS CLI Command Reference.

delete-bucket-lifecycle

The following code example shows how to use delete-bucket-lifecycle.
AWS CLI

The following command deletes a lifecycle configuration from a bucket named my-bucket:

```bash
aws s3api delete-bucket-lifecycle --bucket my-bucket
```

- For API details, see `DeleteBucketLifecycle` in AWS CLI Command Reference.

delete-bucket-metrics-configuration

The following code example shows how to use delete-bucket-metrics-configuration.

AWS CLI

To delete a metrics configuration for a bucket

The following delete-bucket-metrics-configuration example removes the metrics configuration for the specified bucket and ID.

```bash
aws s3api delete-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

This command produces no output.

- For API details, see `DeleteBucketMetricsConfiguration` in AWS CLI Command Reference.

delete-bucket-ownership-controls

The following code example shows how to use delete-bucket-ownership-controls.

AWS CLI

To remove the bucket ownership settings of a bucket

The following delete-bucket-ownership-controls example removes the bucket ownership settings of a bucket.

```bash
aws s3api delete-bucket-ownership-controls \
    --bucket DOC-EXAMPLE-BUCKET
```

This command produces no output.
For more information, see Setting Object Ownership on an existing bucket in the Amazon S3 User Guide.

- For API details, see DeleteBucketOwnershipControls in AWS CLI Command Reference.

**delete-bucket-policy**

The following code example shows how to use delete-bucket-policy.

**AWS CLI**

The following command deletes a bucket policy from a bucket named my-bucket:

```
aws s3api delete-bucket-policy --bucket my-bucket
```

- For API details, see DeleteBucketPolicy in AWS CLI Command Reference.

**delete-bucket-replication**

The following code example shows how to use delete-bucket-replication.

**AWS CLI**

The following command deletes a replication configuration from a bucket named my-bucket:

```
aws s3api delete-bucket-replication --bucket my-bucket
```

- For API details, see DeleteBucketReplication in AWS CLI Command Reference.

**delete-bucket-tagging**

The following code example shows how to use delete-bucket-tagging.

**AWS CLI**

The following command deletes a tagging configuration from a bucket named my-bucket:

```
aws s3api delete-bucket-tagging --bucket my-bucket
```

- For API details, see DeleteBucketTagging in AWS CLI Command Reference.
**delete-bucket-website**

The following code example shows how to use `delete-bucket-website`.

**AWS CLI**

The following command deletes a website configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-website --bucket my-bucket
```

- For API details, see [DeleteBucketWebsite](#) in *AWS CLI Command Reference*.

**delete-bucket**

The following code example shows how to use `delete-bucket`.

**AWS CLI**

The following command deletes a bucket named `my-bucket`:

```
aws s3api delete-bucket --bucket my-bucket --region us-east-1
```

- For API details, see [DeleteBucket](#) in *AWS CLI Command Reference*.

**delete-object-tagging**

The following code example shows how to use `delete-object-tagging`.

**AWS CLI**

To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
   --bucket my-bucket \
   --key doc1.rtf
```

This command produces no output.

- For API details, see [DeleteObjectTagging](#) in *AWS CLI Command Reference*.
**delete-object**

The following code example shows how to use `delete-object`.

**AWS CLI**

The following command deletes an object named `test.txt` from a bucket named `my-bucket`:

```
aws s3api delete-object --bucket my-bucket --key test.txt
```

If bucket versioning is enabled, the output will contain the version ID of the delete marker:

```
{
   "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tND1WlGq",
   "DeleteMarker": true
}
```

For more information about deleting objects, see Deleting Objects in the Amazon S3 Developer Guide.

* For API details, see [DeleteObject](https://docs.aws.amazon.com/cli/latest/reference/s3api/delete-object.html) in AWS CLI Command Reference.

**delete-objects**

The following code example shows how to use `delete-objects`.

**AWS CLI**

The following command deletes an object from a bucket named `my-bucket`:

```
aws s3api delete-objects --bucket my-bucket --delete file://delete.json
```

delete.json is a JSON document in the current directory that specifies the object to delete:

```
{
   "Objects": [
      {
         "Key": "test1.txt"
      }
   ],
   "Quiet": false
}
```
Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAaQP01koHwzU",
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

- For API details, see [DeleteObjects](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/s3api/deleteobjects.html) in *AWS CLI Command Reference*.

**delete-public-access-block**

The following code example shows how to use `delete-public-access-block`.

**AWS CLI**

**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
   --bucket my-bucket
```

This command produces no output.

- For API details, see [DeletePublicAccessBlock](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/s3api/deletemultipart-upload-complete.html) in *AWS CLI Command Reference*.

**get-bucket-accelerate-configuration**

The following code example shows how to use `get-bucket-accelerate-configuration`.

**AWS CLI**

**To retrieve the accelerate configuration of a bucket**

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.
aws s3api get-bucket-accelerate-configuration \
   --bucket my-bucket

Output:

```json
{
   "Status": "Enabled"
}
```

- For API details, see [GetBucketAccelerateConfiguration](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-accelerate-configuration) in *AWS CLI Command Reference*.

### get-bucket-acl

The following code example shows how to use `get-bucket-acl`.

**AWS CLI**

The following command retrieves the access control list for a bucket named `my-bucket`:

```bash
aws s3api get-bucket-acl --bucket my-bucket
```

Output:

```json
{
   "Owner": {
      "DisplayName": "my-username",
      "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460dcd087d36c32"
   },
   "Grants": [
      {
         "Grantee": {
            "DisplayName": "my-username",
            "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460dcd087d36c32"
         },
         "Permission": "FULL_CONTROL"
      }
   ]
}
```

- For API details, see [GetBucketAcl](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-acl) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
get-bucket-analytics-configuration

The following code example shows how to use get-bucket-analytics-configuration.

**AWS CLI**

To retrieve the analytics configuration for a bucket with a specific ID

The following get-bucket-analytics-configuration example displays the analytics configuration for the specified bucket and ID.

```bash
aws s3api get-bucket-analytics-configuration \
   --bucket my-bucket \
   --id 1
```

Output:

```json
{
   "AnalyticsConfiguration": {
      "StorageClassAnalysis": {},
      "Id": "1"
   }
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in AWS CLI Command Reference.

get-bucket-cors

The following code example shows how to use get-bucket-cors.

**AWS CLI**

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named my-bucket:

```bash
aws s3api get-bucket-cors --bucket my-bucket
```

Output:

```json
{
   "CORSRules": [
      
```
"AllowedHeaders": [ "*" ],
"ExposeHeaders": [ "x-amz-server-side-encryption" ],
"AllowedMethods": [ "PUT", "POST", "DELETE" ],
"MaxAgeSeconds": 3000,
"AllowedOrigins": [ "http://www.example.com" ]},
{
  "AllowedHeaders": [ "Authorization" ],
  "MaxAgeSeconds": 3000,
  "AllowedMethods": [ "GET" ],
  "AllowedOrigins": [ "*" ]
}
}

- For API details, see GetBucketCors in AWS CLI Command Reference.

get-bucket-encryption

The following code example shows how to use get-bucket-encryption.

AWS CLI

To retrieve the server-side encryption configuration for a bucket

The following get-bucket-encryption example retrieves the server-side encryption configuration for the bucket my-bucket.
aws s3api get-bucket-encryption \
   --bucket my-bucket

Output:

```json
{
   "ServerSideEncryptionConfiguration": {
      "Rules": [
         {
            "ApplyServerSideEncryptionByDefault": {
               "SSEAlgorithm": "AES256"
            }
         }
      ]
   }
}
```

- For API details, see [GetBucketEncryption](#) in *AWS CLI Command Reference*.

**get-bucket-intelligent-tiering-configuration**

The following code example shows how to use `get-bucket-intelligent-tiering-configuration`.

**AWS CLI**

**To retrieve an S3 Intelligent-Tiering configuration on a bucket**

The following `get-bucket-intelligent-tiering-configuration` example retrieves an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```bash
aws s3api get-bucket-intelligent-tiering-configuration \
   --bucket DOC-EXAMPLE-BUCKET \
   --id ExampleConfig
```

Output:

```json
{
   "IntelligentTieringConfiguration": {
      "Id": "ExampleConfig2",
```
"Filter": {  
  "Prefix": "images"
},
"Status": "Enabled",
"Tierings": [  
  
  
},
  
  "Days": 180,
  "AccessTier": "DEEP_ARCHIVE_ACCESS"
}  
}  
]
}  
}

For more information, see Using S3 Intelligent-Tiering in the Amazon S3 User Guide.

- For API details, see GetBucketIntelligentTieringConfiguration in AWS CLI Command Reference.

get-bucket-inventory-configuration

The following code example shows how to use get-bucket-inventory-configuration.

AWS CLI

To retrieve the inventory configuration for a bucket

The following get-bucket-inventory-configuration example retrieves the inventory configuration for the specified bucket with ID 1.

```bash
aws s3api get-bucket-inventory-configuration \
   --bucket my-bucket \
   --id 1
```

Output:

```json
{
   "InventoryConfiguration": {
      "IsEnabled": true,
      "Destination": {
```
"S3BucketDestination": {
    "Format": "ORC",
    "Bucket": "arn:aws:s3:::my-bucket",
    "AccountId": "123456789012"
},
"IncludedObjectVersions": "Current",
"Id": "1",
"Schedule": {
    "Frequency": "Weekly"
}
}

• For API details, see GetBucketInventoryConfiguration in AWS CLI Command Reference.

get-bucket-lifecycle-configuration

The following code example shows how to use get-bucket-lifecycle-configuration.

**AWS CLI**

The following command retrieves the lifecycle configuration for a bucket named my-bucket:

```bash
aws s3api get-bucket-lifecycle-configuration --bucket my-bucket
```

**Output:**

```json
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        }
    ]
}
```
For API details, see **GetBucketLifecycleConfiguration** in *AWS CLI Command Reference*.

**get-bucket-lifecycle**

The following code example shows how to use `get-bucket-lifecycle`.

**AWS CLI**

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```bash
code
aws s3api get-bucket-lifecycle --bucket my-bucket
```

**Output:**

```json
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
            "Prefix": "logs/2015/",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
            }
        },
        {
            "Expiration": {
                "Date": "2016-01-01T00:00:00.000Z"
            }
        }
    ]
}
```
"ID": "Delete 2014 logs in 2016.",
"Prefix": "logs/2014/",
"Status": "Enabled"
}
]

• For API details, see GetBucketLifecycle in AWS CLI Command Reference.

get-bucket-location

The following code example shows how to use get-bucket-location.

AWS CLI

The following command retrieves the location constraint for a bucket named my-bucket, if a constraint exists:

```bash
aws s3api get-bucket-location --bucket my-bucket
```

Output:

```json
{
   "LocationConstraint": "us-west-2"
}
```

• For API details, see GetBucketLocation in AWS CLI Command Reference.

get-bucket-logging

The following code example shows how to use get-bucket-logging.

AWS CLI

To retrieve the logging status for a bucket

The following get-bucket-logging example retrieves the logging status for the specified bucket.

```bash
aws s3api get-bucket-logging \
```
--bucket my-bucket

Output:

```
{
   "LoggingEnabled": {
      "TargetPrefix": "",
      "TargetBucket": "my-bucket-logs"
   }
}
```

- For API details, see GetBucketLogging in AWS CLI Command Reference.

get-bucket-metrics-configuration

The following code example shows how to use get-bucket-metrics-configuration.

AWS CLI

**To retrieve the metrics configuration for a bucket with a specific ID**

The following get-bucket-metrics-configuration example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
   --bucket my-bucket \
   --id 123
```

Output:

```
{
   "MetricsConfiguration": {
      "Filter": {
         "Prefix": "logs"
      },
      "Id": "123"
   }
}
```

- For API details, see GetBucketMetricsConfiguration in AWS CLI Command Reference.
get-bucket-notification-configuration

The following code example shows how to use get-bucket-notification-configuration.

AWS CLI

The following command retrieves the notification configuration for a bucket named my-bucket:

```bash
aws s3api get-bucket-notification-configuration --bucket my-bucket
```

Output:

```
{
   "TopicConfigurations": [
   {
      "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
      "Events": [
         "s3:ObjectCreated:*"
      ]
   }
   ]
}
```

- For API details, see [GetBucketNotificationConfiguration](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-notification-configuration.html) in *AWS CLI Command Reference*.

get-bucket-notification

The following code example shows how to use get-bucket-notification.

AWS CLI

The following command retrieves the notification configuration for a bucket named my-bucket:

```bash
aws s3api get-bucket-notification --bucket my-bucket
```

Output:

```
{
}
```
"TopicConfiguration": {
    "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
    "Event": "s3:ObjectCreated:*",
    "Events": [
      "s3:ObjectCreated:*"
    ]
}

- For API details, see [GetBucketNotification](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-notification-configuration.html) in *AWS CLI Command Reference*.

**get-bucket-ownership-controls**

The following code example shows how to use `get-bucket-ownership-controls`.

**AWS CLI**

**To retrieve the bucket ownership settings of a bucket**

The following `get-bucket-ownership-controls` example retrieves the bucket ownership settings of a bucket.

```bash
aws s3api get-bucket-ownership-controls \
    --bucket DOC-EXAMPLE-BUCKET
```

Output:

```json
{
    "OwnershipControls": {
        "Rules": [
            {
                "ObjectOwnership": "BucketOwnerEnforced"
            }
        ]
    }
}
```

For more information, see [Viewing the Object Ownership setting for an S3 bucket](https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-object-ownership-setting.html) in the *Amazon S3 User Guide*.

- For API details, see [GetBucketOwnershipControls](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-ownership-controls.html) in *AWS CLI Command Reference*.
get-bucket-policy-status

The following code example shows how to use get-bucket-policy-status.

AWS CLI

To retrieve the policy status for a bucket indicating whether the bucket is public

The following get-bucket-policy-status example retrieves the policy status for the bucket my-bucket.

```bash
aws s3api get-bucket-policy-status \
  --bucket my-bucket
```

Output:

```
{
    "PolicyStatus": {
      "IsPublic": false
    }
}
```

- For API details, see [GetBucketPolicyStatus](#) in [AWS CLI Command Reference](#).

get-bucket-policy

The following code example shows how to use get-bucket-policy.

AWS CLI

The following command retrieves the bucket policy for a bucket named my-bucket:

```bash
aws s3api get-bucket-policy --bucket my-bucket
```

Output:

```
{
    "Policy": "{"Version":"2008-10-17","Statement":[{"Sid":null,"Effect":"Allow","Principal":"*","Action":"s3:GetObject","Resource":null}]
```
Get and put a bucket policy

The following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use put-bucket-policy to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```bash
aws s3api get-bucket-policy --bucket mybucket --query Policy --output text > policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```bash
aws s3api put-bucket-policy --bucket mybucket --policy file://policy.json
```

- For API details, see [GetBucketPolicy](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-bucket-policy.html) in *AWS CLI Command Reference*.

### get-bucket-replication

The following code example shows how to use `get-bucket-replication`.

**AWS CLI**

The following command retrieves the replication configuration for a bucket named `my-bucket`:

```bash
aws s3api get-bucket-replication --bucket my-bucket
```

Output:

```json
{
    "ReplicationConfiguration": {
        "Rules": [
            {
```
"Status": "Enabled",
"Prefix": "",
"Destination": {
  "Bucket": "arn:aws:s3:::my-bucket-backup",
  "StorageClass": "STANDARD"
},
"ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
}
},
"Role": "arn:aws:iam::123456789012:role/s3-replication-role"
}

• For API details, see GetBucketReplication in AWS CLI Command Reference.

get-bucket-request-payment

The following code example shows how to use get-bucket-request-payment.

AWS CLI

To retrieve the request payment configuration for a bucket

The following get-bucket-request-payment example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment
   --bucket my-bucket
```

Output:

```
{
   "Payer": "BucketOwner"
}
```

• For API details, see GetBucketRequestPayment in AWS CLI Command Reference.

get-bucket-tagging

The following code example shows how to use get-bucket-tagging.
The following command retrieves the tagging configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-tagging --bucket my-bucket
```

Output:

```json
{
  "TagSet": [
    {
      "Value": "marketing",
      "Key": "organization"
    }
  ]
}
```

For API details, see `GetBucketTagging` in AWS CLI Command Reference.

---

The following code example shows how to use `get-bucket-versioning`.

**AWS CLI**

The following command retrieves the versioning configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-versioning --bucket my-bucket
```

Output:

```json
{
  "Status": "Enabled"
}
```

For API details, see `GetBucketVersioning` in AWS CLI Command Reference.

---

The following code example shows how to use `get-bucket-website`.

**get-bucket-website**

The following code example shows how to use `get-bucket-website`.
**AWS CLI**

The following command retrieves the static website configuration for a bucket named `my-bucket`:

```shell
aws s3api get-bucket-website --bucket my-bucket
```

Output:

```json
{
   "IndexDocument": {
      "Suffix": "index.html"
   },
   "ErrorDocument": {
      "Key": "error.html"
   }
}
```

**get-object-acl**

The following code example shows how to use `get-object-acl`.

**AWS CLI**

The following command retrieves the access control list for an object in a bucket named `my-bucket`:

```shell
aws s3api get-object-acl --bucket my-bucket --key index.html
```

Output:

```json
{
   "Owner": {
      "DisplayName": "my-username",
      "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
   },
   "Grants": [
      {
         "Grantee": {

```
For API details, see GetObjectAcl in AWS CLI Command Reference.

get-object-attributes

The following code example shows how to use get-object-attributes.

AWS CLI

To retrieve metadata from an object without returning the object itself

The following get-object-attributes example retrieves metadata from the object doc1.rtf.

```
aws s3api get-object-attributes \
  --bucket my-bucket \
  --key doc1.rtf \
  --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
  "LastModified": "2022-03-15T19:37:31+00:00",
  "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
  "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
  "StorageClass": "STANDARD",
  "ObjectSize": 405
}
```
For more information, see `GetObjectAttributes` in the Amazon S3 API Reference.

- For API details, see `GetObjectAttributes` in *AWS CLI Command Reference*.

**get-object-legal-hold**

The following code example shows how to use `get-object-legal-hold`.

**AWS CLI**

*Retrieves the Legal Hold status of an object*

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```bash
aws s3api get-object-legal-hold \
   --bucket my-bucket-with-object-lock \
   --key doc1.rtf
```

Output:

```json
{
   "LegalHold": {
      "Status": "ON"
   }
}
```

- For API details, see `GetObjectLegalHold` in *AWS CLI Command Reference*.

**get-object-lock-configuration**

The following code example shows how to use `get-object-lock-configuration`.

**AWS CLI**

*To retrieve an object lock configuration for a bucket*

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```bash
aws s3api get-object-lock-configuration \
   --bucket my-bucket-with-object-lock
```
Output:

```json
{
    "ObjectLockConfiguration": {
        "ObjectLockEnabled": "Enabled",
        "Rule": {
            "DefaultRetention": {
                "Mode": "COMPLIANCE",
                "Days": 50
            }
        }
    }
}
```

- For API details, see [GetObjectLockConfiguration](#) in AWS CLI Command Reference.

get-object-retention

The following code example shows how to use get-object-retention.

AWS CLI

To retrieve the object retention configuration for an object

The following get-object-retention example retrieves the object retention configuration for the specified object.

```bash
aws s3api get-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```json
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see [GetObjectRetention](#) in AWS CLI Command Reference.
get-object-tagging

The following code example shows how to use get-object-tagging.

AWS CLI

To retrieve the tags attached to an object

The following get-object-tagging example retrieves the values for the specified key from the specified object.

```bash
aws s3api get-object-tagging \
   --bucket my-bucket \
   --key doc1.rtf
```

Output:

```json
{
   "TagSet": [
      {
         "Value": "confidential",
         "Key": "designation"
      }
   ]
}
```

The following get-object-tagging example tries to retrieve the tag sets of the object doc2.rtf, which has no tags.

```bash
aws s3api get-object-tagging \
   --bucket my-bucket \
   --key doc2.rtf
```

Output:

```json
{
   "TagSet": []
}
```

The following get-object-tagging example retrieves the tag sets of the object doc3.rtf, which has multiple tags.
aws s3api get-object-tagging \
--bucket my-bucket \
--key doc3.rtf

Output:

```json
{
   "TagSet": [
      {
         "Value": "confidential",
         "Key": "designation"
      },
      {
         "Value": "finance",
         "Key": "department"
      },
      {
         "Value": "payroll",
         "Key": "team"
      }
   ]
}
```

- For API details, see [GetObjectTagging](https://docs.aws.amazon.com/CLI/latest/userguide/cli-aws-getobjecttagging.html) in *AWS CLI Command Reference*.

**get-object-torrent**

The following code example shows how to use `get-object-torrent`.

**AWS CLI**

The following command creates a torrent for an object in a bucket named *my-bucket*:

```bash
aws s3api get-object-torrent --bucket my-bucket --key large-video-file.mp4 large-video-file.torrent
```

The torrent file is saved locally in the current folder. Note that the output filename (large-video-file.torrent) is specified without an option name and must be the last argument in the command.

- For API details, see [GetObjectTorrent](https://docs.aws.amazon.com/CLI/latest/userguide/cli-aws-getobjecttorrent.html) in *AWS CLI Command Reference*.
**get-object**

The following code example shows how to use `get-object`.

**AWS CLI**

The following example uses the `get-object` command to download an object from Amazon S3:

```bash
aws s3api get-object --bucket text-content --key dir/my_images.tar.bz2 my_images.tar.bz2
```

Note that the `outfile` parameter is specified without an option name such as `--outfile`. The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```bash
aws s3api get-object --bucket text-content --key dir/my_data --range bytes=8888-9999 my_data_range
```

For more information about retrieving objects, see Getting Objects in the *Amazon S3 Developer Guide*.

- For API details, see [GetObject](https://docs.aws.amazon.com/cli/latest/reference/s3api/get-object.html) in *AWS CLI Command Reference*.

**get-public-access-block**

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```bash
aws s3api get-public-access-block --bucket my-bucket
```
Output:

```json
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see [GetPublicAccessBlock](https://awscli.amazonaws.com/v2/documentation/api/1.11.268/s3api.html#awscli.s3api.headbucket) in *AWS CLI Command Reference*.

**head-bucket**

The following code example shows how to use head-bucket.

**AWS CLI**

The following command verifies access to a bucket named *my-bucket*:

```
aws s3api head-bucket --bucket my-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see [HeadBucket](https://awscli.amazonaws.com/v2/documentation/api/1.11.268/s3api.html#awscli.s3api.headbucket) in *AWS CLI Command Reference*.

**head-object**

The following code example shows how to use head-object.

**AWS CLI**

The following command retrieves metadata for an object in a bucket named *my-bucket*:

```
aws s3api head-object --bucket my-bucket --key index.html
```
Output:

```json
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
}
```

- For API details, see [HeadObject](#) in *AWS CLI Command Reference*.

**list-bucket-analytics-configurations**

The following code example shows how to use `list-bucket-analytics-configurations`.

**AWS CLI**

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
   --bucket my-bucket
```

Output:

```json
{
    "AnalyticsConfigurationList": [
    {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
    ],
    "IsTruncated": false
}
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS CLI Command Reference*. 

Actions and scenarios 5619
list-bucket-intelligent-tiering-configurations

The following code example shows how to use list-bucket-intelligent-tiering-configurations.

AWS CLI

To retrieve all S3 Intelligent-Tiering configurations on a bucket

The following list-bucket-intelligent-tiering-configurations example retrieves all S3 Intelligent-Tiering configuration on a bucket.

```
aws s3api list-bucket-intelligent-tiering-configurations \
   --bucket DOC-EXAMPLE-BUCKET
```

Output:

```json
{
   "IsTruncated": false,
   "IntelligentTieringConfigurationList": [
       {
           "Id": "ExampleConfig",
           "Filter": {
               "Prefix": "images"
           },
           "Status": "Enabled",
           "Tierings": [
               {
                   "Days": 90,
                   "AccessTier": "ARCHIVE_ACCESS"
               },
               {
                   "Days": 180,
                   "AccessTier": "DEEP_ARCHIVE_ACCESS"
               }
           ]
       },
       {
           "Id": "ExampleConfig2",
           "Status": "Disabled",
           "Tierings": [
               {
                   "Days": 90,
                   "AccessTier": "ARCHIVE_ACCESS"
               },
               {
                   "Days": 180,
                   "AccessTier": "DEEP_ARCHIVE_ACCESS"
               }
           ]
       }
   ]
}
```
For more information, see [Using S3 Intelligent-Tiering](#) in the Amazon S3 User Guide.

- For API details, see [ListBucketIntelligentTieringConfigurations](#) in AWS CLI Command Reference.

**list-bucket-inventory-configurations**

The following code example shows how to use `list-bucket-inventory-configurations`.

**AWS CLI**

**To retrieve a list of inventory configurations for a bucket**

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.
aws s3api list-bucket-inventory-configurations \
   --bucket my-bucket

Output:

```json
{
   "InventoryConfigurationList": [
      {
         "IsEnabled": true,
         "Destination": {
            "S3BucketDestination": {
               "Format": "ORC",
               "Bucket": "arn:aws:s3:::my-bucket",
               "AccountId": "123456789012"
            }
         },
         "IncludedObjectVersions": "Current",
         "Id": "1",
         "Schedule": {
            "Frequency": "Weekly"
         }
      },
      {
         "IsEnabled": true,
         "Destination": {
            "S3BucketDestination": {
               "Format": "CSV",
               "Bucket": "arn:aws:s3:::my-bucket",
               "AccountId": "123456789012"
            }
         },
         "IncludedObjectVersions": "Current",
         "Id": "2",
         "Schedule": {
            "Frequency": "Daily"
         }
      }
   ],
   "IsTruncated": false
}
```

- For API details, see [ListBucketInventoryConfigurations](https://docs.aws.amazon.com/cli/latest/reference/s3api/list-bucket-inventory-configurations.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/s3api/list-bucket-inventory-configurations.html).
list-bucket-metrics-configurations

The following code example shows how to use list-bucket-metrics-configurations.

AWS CLI

To retrieve a list of metrics configurations for a bucket

The following list-bucket-metrics-configurations example retrieves a list of metrics configurations for the specified bucket.

```bash
aws s3api list-bucket-metrics-configurations \
--bucket my-bucket
```

Output:

```json
{
   "IsTruncated": false,
   "MetricsConfigurationList": [
      {
         "Filter": {
            "Prefix": "logs"
         },
         "Id": "123"
      },
      {
         "Filter": {
            "Prefix": "tmp"
         },
         "Id": "234"
      }
   ]
}
```

- For API details, see ListBucketMetricsConfigurations in AWS CLI Command Reference.

list-buckets

The following code example shows how to use list-buckets.
The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```bash
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see Working with Amazon S3 Buckets in the *Amazon S3 Developer Guide*.

- For API details, see `ListBuckets` in *AWS CLI Command Reference*.

### list-multipart-uploads

The following code example shows how to use `list-multipart-uploads`.

The following command lists all of the active multipart uploads for a bucket named `my-bucket`:

```bash
aws s3api list-multipart-uploads --bucket my-bucket
```

Output:

```json
{
   "Uploads": [ 
   {
      "Initiator": {
         "DisplayName": "username",
         "ID": "arn:aws:iam::0123456789012:user/username"
      },
      "Initiated": "2015-06-02T18:01:30.000Z",
      "UploadId": "dfRtDYU0WNCcH43C3WFbkRONyCyCpTJvju2i5GYkZljF.Yxwh6XG7WfS2vC4to6HlV6YjlX.cph0gtNBtJ8P3URC",
      "StorageClass": "STANDARD",
      "Key": "multipart/01",
      "Owner": {
         "DisplayName": "aws-account-name",
```
In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see [ListMultipartUploads](https://docs.aws.amazon.com/cli/latest/reference/s3api/list-multipart-uploads.html) in *AWS CLI Command Reference*.

### list-object-versions

The following code example shows how to use `list-object-versions`.

#### AWS CLI

The following command retrieves version information for an object in a bucket named `my-bucket`:

```bash
aws s3api list-object-versions --bucket my-bucket --prefix index.html
```

Output:

```
{
  "DeleteMarkers": [
    {
      "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd66068758875e7c86c5b672fe116bd438f46db45460ddcd036c32"
      },
      "IsLatest": true,
      "VersionId": "B2VsEK5saUNNHKcOAJj7hIE86RozToyq",
      "Key": "index.html",
      "LastModified": "2015-11-10T00:57:03.000Z"
    },
    {
      "Owner": {
        "DisplayName": "my-username",
        "ID": "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
      }
    }
  ],
  "CommonPrefixes": []
}
```
Actions and scenarios

5626
list-objects-v2

The following code example shows how to use list-objects-v2.

**AWS CLI**

To get a list of objects in a bucket

The following list-objects-v2 example lists the objects in the specified bucket.

```bash
aws s3api list-objects-v2 \
   --bucket my-bucket
```

Output:

```json
{
   "Contents": [
   {
   "LastModified": "2019-11-05T23:11:50.000Z",
   "ETag": "621503c373607d548b37c86c32f8778d992c"",
   "StorageClass": "STANDARD",
   "Key": "doc1.rtf",
   "Size": 391
   },
   {
   "LastModified": "2019-11-05T23:11:50.000Z",
   "ETag": "a2cecc36ab7c7fe3a71a273b9d45b1b5"",
   "StorageClass": "STANDARD",
   "Key": "doc2.rtf",
   }]
}
```
list-objects

The following code example shows how to use list-objects.

**AWS CLI**

The following example uses the list-objects command to display the names of all the objects in the specified bucket:

```bash
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size: Size}'
```

The example uses the --query argument to filter the output of list-objects down to the key value and size for each object

For more information about objects, see Working with Amazon S3 Objects in the *Amazon S3 Developer Guide*.

- For API details, see [ListObjectsV2](https://docs.aws.amazon.com/cli/latest/reference/s3api/list-objects-v2.html) in *AWS CLI Command Reference*. 

- For API details, see [ListObjects](https://docs.aws.amazon.com/cli/latest/reference/s3api/list-objects.html) in *AWS CLI Command Reference*.
**list-parts**

The following code example shows how to use `list-parts`.

**AWS CLI**

The following command lists all of the parts that have been uploaded for a multipart upload with key `multipart/01` in the bucket `my-bucket`:

```
aws s3api list-parts --bucket my-bucket --key 'multipart/01' --upload-id dfRtDYU0WwCchH43C3Wfkb0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7Wf2vC4to6HiV6Yjlx.cph0gtNBtJ3P3URCS...
```

Output:

```
{
  "Owner": {
    "DisplayName": "aws-account-name",
    "ID": "100719349fc3b66c7a4cd408092c3d7b51b3849939801fc248b"
  },
  "Initiator": {
    "DisplayName": "username",
    "ID": "arn:aws:iam::0123456789012:user/username"
  },
  "Parts": [
    {
      "LastModified": "2015-06-02T18:07:35.000Z",
      "PartNumber": 1,
      "ETag": "\"e868e0f4719e394144ef36531ee6b24\"",
      "Size": 5242880
    },
    {
      "LastModified": "2015-06-02T18:07:42.000Z",
      "PartNumber": 2,
      "ETag": "\"6bb2b12753d66fe86da4998aa33fff8b\"",
      "Size": 5242880
    },
    {
      "LastModified": "2015-06-02T18:07:47.000Z",
      "PartNumber": 3,
      "ETag": "\"d0a0112e841abec9c9ec83406f0159c8\"",
      "Size": 5242880
    }
  ]
}
```
"StorageClass": "STANDARD"
}

- For API details, see [ListParts](#) in *AWS CLI Command Reference*.

**ls**

The following code example shows how to use `ls`.

**AWS CLI**

**Example 1: Listing all user owned buckets**

The following `ls` command lists all of the bucket owned by the user. In this example, the user owns the buckets `mybucket` and `mybucket2`. The timestamp is the date the bucket was created, shown in your machine's time zone. This date can change when making changes to your bucket, such as editing its bucket policy. Note if `s3://` is used for the path argument `<S3Uri>`, it will list all of the buckets as well.

```
aws s3 ls
```

Output:

```
2013-07-11 17:08:50 mybucket
```

**Example 2: Listing all prefixes and objects in a bucket**

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. In this example, the user owns the bucket `mybucket` with the objects `test.txt` and `somePrefix/test.txt`. The `LastWriteTime` and `Length` are arbitrary. Note that since the `ls` command has no interaction with the local filesystem, the `s3://` URI scheme is not required to resolve ambiguity and may be omitted.

```
aws s3 ls s3://mybucket
```

Output:

```
PRE somePrefix/
```
Example 3: Listing all prefixes and objects in a specific bucket and prefix

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. However, there are no objects nor common prefixes under the specified bucket and prefix.

```bash
aws s3 ls s3://mybucket/noExistPrefix
```

Output:

None

Example 4: Recursively listing all prefixes and objects in a bucket

The following `ls` command will recursively list objects in a bucket. Rather than showing `PRE dirname/` in the output, all the content in a bucket will be listed in order.

```bash
aws s3 ls s3://mybucket \
   --recursive
```

Output:

```
2013-09-02 21:37:53         10 a.txt
2013-09-02 21:37:53    2863288 foo.zip
2013-09-02 21:32:57         23 foo/bar/.baz/a
2013-09-02 21:32:58         41 foo/bar/.baz/b
2013-09-02 21:32:57        281 foo/bar/.baz/c
2013-09-02 21:32:57         73 foo/bar/.baz/d
2013-09-02 21:32:57        452 foo/bar/.baz/e
2013-09-02 21:32:57        896 foo/bar/.baz/hooks/bar
2013-09-02 21:32:57        189 foo/bar/.baz/hooks/foo
2013-09-02 21:32:57         398 z.txt
```

Example 5: Summarizing all prefixes and objects in a bucket

The following `ls` command demonstrates the same command using the `--human-readable` and `--summarize` options. `--human-readable` displays file size in Bytes/MiB/KiB/GiB/TiB/PiB/EiB. `--summarize` displays the total number of objects and total size at the end of the result listing:
aws s3 ls s3://mybucket 
   --recursive 
   --human-readable 
   --summarize

Output:

<table>
<thead>
<tr>
<th>Date/Time</th>
<th>Size</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-09-02 21:37:53</td>
<td>10 Bytes</td>
<td>a.txt</td>
</tr>
<tr>
<td>2013-09-02 21:37:53</td>
<td>2.9 MiB</td>
<td>foo.zip</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>23 Bytes</td>
<td>foo/bar/.baz/a</td>
</tr>
<tr>
<td>2013-09-02 21:32:58</td>
<td>41 Bytes</td>
<td>foo/bar/.baz/b</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>281 Bytes</td>
<td>foo/bar/.baz/c</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>73 Bytes</td>
<td>foo/bar/.baz/d</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>452 Bytes</td>
<td>foo/bar/.baz/e</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>896 Bytes</td>
<td>foo/bar/.baz/hooks/bar</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>189 Bytes</td>
<td>foo/bar/.baz/hooks/foo</td>
</tr>
<tr>
<td>2013-09-02 21:32:57</td>
<td>398 Bytes</td>
<td>z.txt</td>
</tr>
</tbody>
</table>

Total Objects: 10
  Total Size: 2.9 MiB

Example 6: Listing from an S3 access point

The following `ls` command list objects from access point (myaccesspoint):

aws s3 ls s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/

Output:

<table>
<thead>
<tr>
<th>Date/Time</th>
<th>Size</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-07-25 17:06:27</td>
<td></td>
<td>PRE somePrefix/</td>
</tr>
<tr>
<td>2013-07-25 17:06:27</td>
<td>88</td>
<td>test.txt</td>
</tr>
</tbody>
</table>

• For API details, see `ls` in AWS CLI Command Reference.

mb

The following code example shows how to use `mb`.

AWS CLI

Example 1: Create a bucket
The following `mb` command creates a bucket. In this example, the user makes the bucket `mybucket`. The bucket is created in the region specified in the user's configuration file:

```
aws s3 mb s3://mybucket
```

Output:

```
make_bucket: s3://mybucket
```

**Example 2: Create a bucket in the specified region**

The following `mb` command creates a bucket in a region specified by the `--region` parameter. In this example, the user makes the bucket `mybucket` in the region `us-west-1`:

```
aws s3 mb s3://mybucket
  --region us-west-1
```

Output:

```
make_bucket: s3://mybucket
```

- For API details, see `Mb` in *AWS CLI Command Reference*.

**mv**

The following code example shows how to use `mv`.

**AWS CLI**

**Example 1: Move a local file to the specified bucket**

The following `mv` command moves a single file to a specified bucket and key.

```
aws s3 mv test.txt s3://mybucket/test2.txt
```

Output:

```
move: test.txt to s3://mybucket/test2.txt
```
Example 2: Move an object to the specified bucket and key

The following mv command moves a single s3 object to a specified bucket and key.

```bash
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Example 3: Move an S3 object to the local directory

The following mv command moves a single object to a specified file locally.

```bash
aws s3 mv s3://mybucket/test.txt test2.txt
```

Output:

```
move: s3://mybucket/test.txt to test2.txt
```

Example 4: Move an object with it's original name to the specified bucket

The following mv command moves a single object to a specified bucket while retaining its original name:

```bash
aws s3 mv s3://mybucket/test.txt s3://mybucket2/
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket2/test.txt
```

Example 5: Move all objects and prefixes in a bucket to the local directory

When passed with the parameter `--recursive`, the following mv command recursively moves all objects under a specified prefix and bucket to a specified directory. In this example, the bucket mybucket has the objects test1.txt and test2.txt.

```bash
aws s3 mv s3://mybucket .
```
--recursive

Output:

move: s3://mybucket/test1.txt to test1.txt
move: s3://mybucket/test2.txt to test2.txt

Example 6: Move all objects and prefixes in a bucket to the local directory, except `.jpg` files

When passed with the parameter `--recursive`, the following `mv` command recursively moves all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```bash
aws s3 mv myDir s3://mybucket/ \
   --recursive \
   --exclude "*.jpg"
```

Output:

move: myDir/test1.txt to s3://mybucket2/test1.txt

Example 7: Move all objects and prefixes in a bucket to the local directory, except specified prefix

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`.

```bash
aws s3 mv s3://mybucket/ s3://mybucket2/ \
   --recursive \
   --exclude "mybucket/another/"
```

Output:

move: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
Example 8: Move an object to the specified bucket and set the ACL

The following `mv` command moves a single object to a specified bucket and key while setting the ACL to `public-read-write`.

```bash
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt 
   --acl public-read-write
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Example 9: Move a local file to the specified bucket and grant permissions

The following `mv` command illustrates the use of the `--grants` option to grant read access to all users and full control to a specific user identified by their email address.

```bash
aws s3 mv file.txt s3://mybucket/ 
   --grants read=uri=http://acs.amazonaws.com/groups/global/AllUsers
   full=emailaddress=user@example.com
```

Output:

```
move: file.txt to s3://mybucket/file.txt
```

Example 10: Move a file to an S3 access point

The following `mv` command moves a single file named `mydoc.txt` to the access point named `myaccesspoint` at the key named `mykey`.

```bash
aws s3 mv mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
   myaccesspoint/mykey
```

Output:

```
   mykey
```

- For API details, see `Mv` in `AWS CLI Command Reference`. 
presign

The following code example shows how to use presign.

AWS CLI

Example 1: To create a pre-signed URL with the default one hour lifetime that links to an object in an S3 bucket

The following presign command generates a pre-signed URL for a specified bucket and key that is valid for one hour.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt
```

Output:

```
```

Example 2: To create a pre-signed URL with a custom lifetime that links to an object in an S3 bucket

The following presign command generates a pre-signed URL for a specified bucket and key that is valid for one week.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt \
   --expires-in 604800
```

Output:

```
```

For more information, see [Share an Object with Others](https://docs.aws.amazon.com/AmazonS3/latest/dev/sharingObjectsUsingURLs.html) in the S3 Developer Guide guide.

**put-bucket-accelerate-configuration**

The following code example shows how to use `put-bucket-accelerate-configuration`.

**AWS CLI**

To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```bash
aws s3api put-bucket-accelerate-configuration \
    --bucket my-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see `PutBucketAccelerateConfiguration` in *AWS CLI Command Reference*.

**put-bucket-acl**

The following code example shows how to use `put-bucket-acl`.

**AWS CLI**

This example grants full control to two AWS users (`user1@example.com` and `user2@example.com`) and read permission to everyone:

```bash
aws s3api put-bucket-acl --bucket MyBucket --grant-full-control \
    emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read \
    uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See [http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html](http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html) for details on custom ACLs (the s3api ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see `PutBucketAcl` in *AWS CLI Command Reference*.

**put-bucket-analytics-configuration**

The following code example shows how to use `put-bucket-analytics-configuration`.

---

**Actions and scenarios** 5638
AWS CLI

To sets an analytics configuration for the bucket

The following put-bucket-analytics-configuration example configures analytics for the specified bucket.

```bash
aws s3api put-bucket-analytics-configuration \
   --bucket my-bucket --id 1 \
   --analytics-configuration '{"Id": "1","StorageClassAnalysis": {}}'
```

This command produces no output.

- For API details, see [PutBucketAnalyticsConfiguration](https://docs.aws.amazon.com/cli/latest/reference/s3api/put-bucket-analytics-configuration.html) in *AWS CLI Command Reference*.

put-bucket-cors

The following code example shows how to use put-bucket-cors.

AWS CLI

The following example enables PUT, POST, and DELETE requests from `www.example.com`, and enables GET requests from any domain:

```bash
aws s3api put-bucket-cors --bucket MyBucket --cors-configuration file://cors.json

cors.json:
{
   "CORSRules": [
   {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
   },
   {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "AllowedMethods": ["GET"],
      "MaxAgeSeconds": 3000
   }
}
```
put-bucket-encryption

The following code example shows how to use put-bucket-encryption.

AWS CLI

To configure server-side encryption for a bucket

The following put-bucket-encryption example sets AES256 encryption as the default for the specified bucket.

```bash
aws s3api put-bucket-encryption \
   --bucket my-bucket \
   --server-side-encryption-configuration '{"Rules": [["ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}]]}'
```

This command produces no output.

• For API details, see PutBucketEncryption in AWS CLI Command Reference.

put-bucket-intelligent-tiering-configuration

The following code example shows how to use put-bucket-intelligent-tiering-configuration.

AWS CLI

To update an S3 Intelligent-Tiering configuration on a bucket

The following put-bucket-intelligent-tiering-configuration example updates an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket. The configuration will transition objects that have not been accessed under the prefix images to Archive Access after 90 days and Deep Archive Access after 180 days.

```bash
aws s3api put-bucket-intelligent-tiering-configuration \
   --bucket my-bucket \
   --bucket-intelligent-tiering-configuration \
   '{"Rules": [{"DefaultTier": "Archive", "TransitionConfigurations": [{"Days": 90, "Destination": "Archive"}, {"Days": 180, "Destination": "DeepArchive"}]}]}'
```
--bucket DOC-EXAMPLE-BUCKET \
--id "ExampleConfig" \
--intelligent-tiering-configuration file://intelligent-tiering-configuration.json

Contents of intelligent-tiering-configuration.json:

```json
{
    "Id": "ExampleConfig",
    "Status": "Enabled",
    "Filter": {
        "Prefix": "images"
    },
    "Tierings": [
        {
            "Days": 90,
            "AccessTier": "ARCHIVE_ACCESS"
        },
        {
            "Days": 180,
            "AccessTier": "DEEP_ARCHIVE_ACCESS"
        }
    ]
}
```

This command produces no output.

For more information, see [Setting Object Ownership on an existing bucket](https://docs.aws.amazon.com/AmazonS3/latest/userguide/setting-object-ownership.html) in the *Amazon S3 User Guide*.

**put-bucket-inventory-configuration**

The following code example shows how to use `put-bucket-inventory-configuration`.

**AWS CLI**

**Example 1: To set an inventory configuration for a bucket**

The following `put-bucket-inventory-configuration` example sets a weekly ORC-formatted inventory report for the bucket `my-bucket`. 
```bash
aws s3api put-bucket-inventory-configuration \
   --bucket my-bucket \
   --id 1 \
   --inventory-configuration '{"Destination": { "S3BucketDestination": 
   { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format": 
   "ORC" }}, "IsEnabled": true, "Id": "1", "IncludedObjectVersions": "Current", 
   "Schedule": { "Frequency": "Weekly" }}'
```

This command produces no output.

**Example 2: To set an inventory configuration for a bucket**

The following put-bucket-inventory-configuration example sets a daily CSV-formatted inventory report for the bucket `my-bucket`.

```bash
aws s3api put-bucket-inventory-configuration \
   --bucket my-bucket \
   --id 2 \
   --inventory-configuration '{"Destination": { "S3BucketDestination": 
   { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format": 
   "CSV" }}, "IsEnabled": true, "Id": "2", "IncludedObjectVersions": "Current", 
   "Schedule": { "Frequency": "Daily" }}'
```

This command produces no output.

- For API details, see [PutBucketInventoryConfiguration](#) in AWS CLI Command Reference.

**put-bucket-lifecycle-configuration**

The following code example shows how to use `put-bucket-lifecycle-configuration`.

**AWS CLI**

The following command applies a lifecycle configuration to a bucket named `my-bucket`:

```bash
aws s3api put-bucket-lifecycle-configuration --bucket my-bucket --lifecycle-configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```json
{
}
```
The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying Parameter Values in the AWS CLI User Guide.

- For API details, see `PutBucketLifecycleConfiguration` in AWS CLI Command Reference.

**put-bucket-lifecycle**

The following code example shows how to use `put-bucket-lifecycle`.

**AWS CLI**

The following command applies a lifecycle configuration to the bucket `my-bucket`:

```
aws s3api put-bucket-lifecycle --bucket my-bucket --lifecycle-configuration file://lifecycle.json
```
The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```json
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
            "Prefix": "logs/2015/",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
            }
        },
        {
            "Expiration": {
                "Date": "2016-01-01T00:00:00.000Z"
            },
            "ID": "Delete 2014 logs in 2016.",
            "Prefix": "logs/2014/",
            "Status": "Enabled"
        }
    ]
}
```

The first rule moves files to Amazon Glacier after sixty days. The second rule deletes files from Amazon S3 on the specified date. For information on acceptable timestamp formats, see Specifying Parameter Values in the AWS CLI User Guide.

Each rule in the above example specifies a policy (Transition or Expiration) and file prefix (folder name) to which it applies. You can also create a rule that applies to an entire bucket by specifying a blank prefix:

```json
{
    "Rules": [
        {
            "ID": "Move to Glacier after sixty days (all objects in bucket)",
            "Prefix": "",
            "Status": "Enabled",
            "Transition": {
                "Days": 60,
                "StorageClass": "GLACIER"
            }
        }
    ]
}
```
For API details, see `PutBucketLifecycle` in *AWS CLI Command Reference*.

**put-bucket-logging**

The following code example shows how to use `put-bucket-logging`.

**AWS CLI**

**Example 1: To set bucket policy logging**

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
   --bucket MyBucket \
   --policy file://policy.json
```

Contents of `policy.json`:

```
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Sid": "S3ServerAccessLogsPolicy",
      "Effect": "Allow",
      "Principal": {"Service": "logging.s3.amazonaws.com"},
      "Action": "s3:PutObject",
      "Resource": "arn:aws:s3:::MyBucket/Logs/**",
      "Condition": {
         "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
         "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
      }
   }
   ]
}
```

To apply the logging policy, use `put-bucket-logging`.
aws s3api put-bucket-logging \\  
  --bucket MyBucket \  
  --bucket-logging-status file://logging.json

Contents of logging.json:

{
   "LoggingEnabled": {
       "TargetBucket": "MyBucket",
       "TargetPrefix": "Logs/"
   }
}

The put-bucket-policy command is required to grant s3:PutObject permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the Amazon S3 User Guide.

Example 2: To set a bucket policy for logging access to only a single user

The following put-bucket-logging example sets the logging policy for MyBucket. The AWS user bob@example.com will have full control over the log files, and no one else has any access. First, grant S3 permission with put-bucket-acl.

aws s3api put-bucket-acl \\  
  --bucket MyBucket \  
  --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \  
  --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery

Then apply the logging policy using put-bucket-logging.

aws s3api put-bucket-logging \\  
  --bucket MyBucket \  
  --bucket-logging-status file://logging.json

Contents of logging.json:

{
   "LoggingEnabled": {
       "TargetBucket": "MyBucket",
       "TargetPrefix": "MyBucketLogs/"
   }
}
the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the Amazon S3 Developer Guide.

- For API details, see `PutBucketLogging` in AWS CLI Command Reference.

### put-bucket-metrics-configuration

The following code example shows how to use `put-bucket-metrics-configuration`.

**AWS CLI**

**To set a metrics configuration for a bucket**

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see `PutBucketMetricsConfiguration` in AWS CLI Command Reference.

### put-bucket-notification-configuration

The following code example shows how to use `put-bucket-notification-configuration`.
AWS CLI

To enable the specified notifications to a bucket

The following put-bucket-notification-configuration example applies a notification configuration to a bucket named my-bucket. The file notification.json is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

/aws s3api put-bucket-notification-configuration \
  --bucket my-bucket \
  --notification-configuration file://notification.json

Contents of notification.json:

```
{
    "TopicConfigurations": [
        {
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
    "Version": "2008-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
                "SNS:Publish"
            ],
            "Condition": {
```
"ArnLike": {
  "aws:SourceArn": "arn:aws:s3:::*:my-bucket"
}
]

- For API details, see `PutBucketNotificationConfiguration` in *AWS CLI Command Reference*.

**put-bucket-notification**

The following code example shows how to use `put-bucket-notification`.

**AWS CLI**

The applies a notification configuration to a bucket named `my-bucket`:

```bash
aws s3api put-bucket-notification --bucket my-bucket --notification-configuration file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```json
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```json
{
  "Version": "2008-10-17",
  "Id": "example-ID",
  "Statement": [
    {
      "Sid": "example-statement-ID",
      "Effect": "Allow",
      "Principal": {
```
"Service": "s3.amazonaws.com",
"Action": [
  "SNS:Publish"
],
"Condition": {
  "ArnLike": {
    "aws:SourceArn": "arn:aws:s3:*::*:my-bucket"
  }
}
]

For API details, see PutBucketNotification in AWS CLI Command Reference.

**put-bucket-ownership-controls**

The following code example shows how to use put-bucket-ownership-controls.

**AWS CLI**

**To update the bucket ownership settings of a bucket**

The following put-bucket-ownership-controls example updates the bucket ownership settings of a bucket.

```bash
aws s3api put-bucket-ownership-controls \
  --bucket DOC-EXAMPLE-BUCKET \
  --ownership-controls="Rules=[{ObjectOwnership=BucketOwnerEnforced}]"
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the Amazon S3 User Guide.

For API details, see PutBucketOwnershipControls in AWS CLI Command Reference.

**put-bucket-policy**

The following code example shows how to use put-bucket-policy.
This example allows all users to retrieve any object in *MyBucket* except those in the *MySecretFolder*. It also grants put and delete permission to the root user of the AWS account 1234-5678-9012:

```
aws s3api put-bucket-policy --bucket MyBucket --policy file://policy.json
```

```json
policy.json:
{
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::MyBucket/*"
    },
    {
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::MyBucket/MySecretFolder/*"
    },
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:root"
      },
      "Action": [
        "s3:DeleteObject",
        "s3:PutObject"
      ],
      "Resource": "arn:aws:s3:::MyBucket/*"
    }
  ]
}
```

- For API details, see [PutBucketPolicy](awscli_reference.html) in *AWS CLI Command Reference*.

**put-bucket-replication**

The following code example shows how to use `put-bucket-replication`.
AWS CLI

To configure replication for an S3 bucket

The following put-bucket-replication example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
   --bucket AWSDOC-EXAMPLE-BUCKET1 \
   --replication-configuration file://replication.json
```

Contents of replication.json:

```
{
   "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
   "Rules": [
      {
         "Status": "Enabled",
         "Priority": 1,
         "DeleteMarkerReplication": { "Status": "Disabled" },
         "Filter" : { "Prefix": ""},
         "Destination": {
            "Bucket": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2"
         }
      }
   ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetReplicationConfiguration",
            "s3:ListBucket",
            "s3:GetObject"
         ],
         "Resource": ["arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1/*"]
      }
   ]
}
```
Example trust relationship policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "s3.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```
This command produces no output.

For more information, see This is the topic title in the Amazon Simple Storage Service Console User Guide.

- For API details, see PutBucketReplication in AWS CLI Command Reference.

**put-bucket-request-payment**

The following code example shows how to use put-bucket-request-payment.

**AWS CLI**

**Example 1: To enable `requester pays` configuration for a bucket**

The following put-bucket-request-payment example enables requester pays for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \ 
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

**Example 2: To disable `requester pays` configuration for a bucket**

The following put-bucket-request-payment example disables requester pays for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \ 
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

- For API details, see PutBucketRequestPayment in AWS CLI Command Reference.

**put-bucket-tagging**

The following code example shows how to use put-bucket-tagging.
The following command applies a tagging configuration to a bucket named my-bucket:

```bash
aws s3api put-bucket-tagging --bucket my-bucket --tagging file://tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```json
{
    "TagSet": [
        {
            "Key": "organization",
            "Value": "marketing"
        }
    ]
}
```

Or apply a tagging configuration to `my-bucket` directly from the command line:

```bash
aws s3api put-bucket-tagging --bucket my-bucket --tagging
'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see `PutBucketTagging` in AWS CLI Command Reference.

**put-bucket-versioning**

The following code example shows how to use `put-bucket-versioning`.

**AWS CLI**

The following command enables versioning on a bucket named `my-bucket`:

```bash
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
Status=Enabled
```

The following command enables versioning, and uses an mfa code:

```bash
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
Status=Enabled --mfa "SERIAL 123456"
```
• For API details, see PutBucketVersioning in AWS CLI Command Reference.

**put-bucket-website**

The following code example shows how to use put-bucket-website.

**AWS CLI**

The applies a static website configuration to a bucket named my-bucket:

```bash
aws s3api put-bucket-website --bucket my-bucket --website-configuration file://website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```json
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

• For API details, see PutBucketWebsite in AWS CLI Command Reference.

**put-object-acl**

The following code example shows how to use put-object-acl.

**AWS CLI**

The following command grants full control to two AWS users (user1@example.com and user2@example.com) and read permission to everyone:

```bash
aws s3api put-object-acl --bucket MyBucket --key file.txt --grant-full-control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read uri=http://acs.amazonaws.com/groups/global/AllUsers
```
See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as put-object-acl, use the same shorthand argument notation).

- For API details, see PutObjectAcl in AWS CLI Command Reference.

**put-object-legal-hold**

The following code example shows how to use put-object-legal-hold.

**AWS CLI**

**To apply a Legal Hold to an object**

The following put-object-legal-hold example sets a Legal Hold on the object doc1.rtf.

```
aws s3api put-object-legal-hold \
   --bucket my-bucket-with-object-lock \
   --key doc1.rtf \
   --legal-hold Status=ON
```

This command produces no output.

- For API details, see PutObjectLegalHold in AWS CLI Command Reference.

**put-object-lock-configuration**

The following code example shows how to use put-object-lock-configuration.

**AWS CLI**

**To set an object lock configuration on a bucket**

The following put-object-lock-configuration example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
   --bucket my-bucket-with-object-lock \
   --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule": { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.
- For API details, see `PutObjectLockConfiguration` in *AWS CLI Command Reference*.

**put-object-retention**

The following code example shows how to use `put-object-retention`.

**AWS CLI**

**To set an object retention configuration for an object**

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```bash
aws s3api put-object-retention 
    --bucket my-bucket-with-object-lock 
    --key doc1.rtf 
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see `PutObjectRetention` in *AWS CLI Command Reference*.

**put-object-tagging**

The following code example shows how to use `put-object-tagging`.

**AWS CLI**

**To set a tag on an object**

The following `put-object-tagging` example sets a tag with the key `designation` and the value `confidential` on the specified object.

```bash
aws s3api put-object-tagging 
    --bucket my-bucket 
    --key doc1.rtf 
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" }]}'
```

This command produces no output.

The following `put-object-tagging` example sets multiple tags sets on the specified object.
This command produces no output.

- For API details, see `PutObjectTagging` in *AWS CLI Command Reference*.

### put-object

The following code example shows how to use `put-object`.

**AWS CLI**

The following example uses the `put-object` command to upload an object to Amazon S3:

```bash
aws s3api put-object --bucket text-content --key dir-1/my_images.tar.bz2 --body my_images.tar.bz2
```

The following example shows an upload of a video file (The video file is specified using Windows file system syntax.):

```bash
aws s3api put-object --bucket text-content --key dir-1/big-video-file.mp4 --body e:\media\videos\f-sharp-3-data-services.mp4
```

For more information about uploading objects, see Uploading Objects in the *Amazon S3 Developer Guide*.

- For API details, see `PutObject` in *AWS CLI Command Reference*.

### put-public-access-block

The following code example shows how to use `put-public-access-block`.

**AWS CLI**

To set the block public access configuration for a bucket
The following put-public-access-block example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
  --bucket my-bucket \
  --public-access-block-configuration
"BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=true"
```

This command produces no output.

### rb

The following code example shows how to use `rb`.

**AWS CLI**

**Example 1: Delete a bucket**

The following `rb` command removes a bucket. In this example, the user's bucket is `mybucket`. Note that the bucket must be empty in order to remove:

```
aws s3 rb s3://mybucket
```

Output:

```
remove_bucket: mybucket
```

**Example 2: Force delete a bucket**

The following `rb` command uses the `--force` parameter to first remove all of the objects in the bucket and then remove the bucket itself. In this example, the user's bucket is `mybucket` and the objects in `mybucket` are `test1.txt` and `test2.txt`:

```
aws s3 rb s3://mybucket \
  --force
```

Output:

```
delete: s3://mybucket/test1.txt
```
The following code example shows how to use `restore-object`.

**AWS CLI**

**To create a restore request for an object**

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```bash
aws s3api restore-object \
  --bucket my-glacier-bucket \
  --key doc1.rtf \
  --restore-request Days=10
```

This command produces no output.

- For API details, see `RestoreObject` in *AWS CLI Command Reference*.

The following code example shows how to use `rm`.

**AWS CLI**

**Example 1: Delete an S3 object**

The following `rm` command deletes a single S3 object:

```bash
aws s3 rm s3://mybucket/test2.txt
```

Output:

```
delete: s3://mybucket/test2.txt
```

- For API details, see `Rb` in *AWS CLI Command Reference*. 

- For API details, see `RestoreObject` in *AWS CLI Command Reference*.

- For API details, see `Rb` in *AWS CLI Command Reference*.

- For API details, see `RestoreObject` in *AWS CLI Command Reference*.
Example 2: Delete all contents in a bucket

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive`. In this example, the bucket `mybucket` contains the objects `test1.txt` and `test2.txt`:

```
aws s3 rm s3://mybucket \n  --recursive
```

Output:

```
delete: s3://mybucket/test1.txt
delete: s3://mybucket/test2.txt
```

Example 3: Delete all contents in a bucket, except `.jpg` files

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.jpg`:

```
aws s3 rm s3://mybucket/ \n  --recursive \n  --exclude "*.jpg"
```

Output:

```
delete: s3://mybucket/test1.txt
```

Example 4: Delete all contents in a bucket, except objects under the specified prefix

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding all objects under a particular prefix by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test.txt`:

```
aws s3 rm s3://mybucket/ \n  --recursive \n  --exclude "another"
```
--exclude "another/*"

Output:

delete: s3://mybucket/test1.txt

Example 5: Delete an object from an S3 access point

The following `rm` command deletes a single object (mykey) from the access point (myaccesspoint).

```
```

Output:

- For API details, see `Rm` in *AWS CLI Command Reference*.

**select-object-content**

The following code example shows how to use `select-object-content`.

**AWS CLI**

**To filter the contents of an Amazon S3 object based on an SQL statement**

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content
  --bucket my-bucket
  --key my-data-file.csv
  --expression "select * from s3object limit 100"
  --expression-type 'SQL'
  --input-serialization '{"CSV": {}, "CompressionType": "NONE"}'
  --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.
• For API details, see SelectObjectContent in AWS CLI Command Reference.

**sync**

The following code example shows how to use sync.

**AWS CLI**

**Example 1: Sync all local objects to the specified bucket**

The following `sync` command syncs objects from a local directory to the specified prefix and bucket by uploading the local files to S3. A local file will require uploading if the size of the local file is different than the size of the S3 object, the last modified time of the local file is newer than the last modified time of the S3 object, or the local file does not exist under the specified bucket and prefix. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `mybucket` contains no objects.

```
aws s3 sync . s3://mybucket
```

Output:

```
upload: test.txt to s3://mybucket/test.txt
upload: test2.txt to s3://mybucket/test2.txt
```

**Example 2: Sync all S3 objects from the specified S3 bucket to another bucket**

The following `sync` command syncs objects under a specified prefix and bucket to objects under another specified prefix and bucket by copying S3 objects. An S3 object will require copying if the sizes of the two S3 objects differ, the last modified time of the source is newer than the last modified time of the destination, or the S3 object does not exist under the specified bucket and prefix destination.

In this example, the user syncs the bucket `mybucket` to the bucket `mybucket2`. The bucket `mybucket` contains the objects `test.txt` and `test2.txt`. The bucket `mybucket2` contains no objects:

```
aws s3 sync s3://mybucket s3://mybucket2
```
Example 3: Sync all S3 objects from the specified S3 bucket to the local directory

The following `sync` command syncs files from the specified S3 bucket to the local directory by downloading S3 objects. An S3 object will require downloading if the size of the S3 object differs from the size of the local file, the last modified time of the S3 object is newer than the last modified time of the local file, or the S3 object does not exist in the local directory. Take note that when objects are downloaded from S3, the last modified time of the local file is changed to the last modified time of the S3 object. In this example, the user syncs the bucket `mybucket` to the current local directory. The bucket `mybucket` contains the objects `test.txt` and `test2.txt`. The current local directory has no files:

```
aws s3 sync s3://mybucket .
```

Example 4: Sync all local objects to the specified bucket and delete all files that do not match

The following `sync` command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--delete` parameter, any files existing under the specified prefix and bucket but not existing in the local directory will be deleted. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `mybucket` contains the object `test3.txt`:

```
aws s3 sync . s3://mybucket 
   --delete
```

Output:
upload: test2.txt to s3://mybucket/test2.txt
delete: s3://mybucket/test3.txt

**Example 5: Sync all local objects to the specified bucket except `.jpg` files**

The following sync command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the --exclude parameter, all files matching the pattern existing both in S3 and locally will be excluded from the sync. In this example, the user syncs the bucket mybucket to the local current directory. The local current directory contains the files test.jpg and test2.txt. The bucket mybucket contains the object test.jpg of a different size than the local test.jpg:

```
aws s3 sync . s3://mybucket \
   --exclude "*.jpg"
```

Output:

upload: test2.txt to s3://mybucket/test2.txt

**Example 6: Sync all local objects to the specified bucket except `.jpg` files**

The following sync command syncs files under a local directory to objects under a specified prefix and bucket by downloading S3 objects. This example uses the --exclude parameter flag to exclude a specified directory and S3 prefix from the sync command. In this example, the user syncs the local current directory to the bucket mybucket. The local current directory contains the files test.txt and another/test2.txt. The bucket mybucket contains the objects another/test5.txt and test1.txt:

```
aws s3 sync s3://mybucket/ . \
   --exclude "*another/*"
```

Output:

download: s3://mybucket/test1.txt to test1.txt

**Example 7: Sync all objects between buckets in different regions**

The following sync command syncs files between two buckets in different regions:
aws s3 sync s3://my-us-west-2-bucket s3://my-us-east-1-bucket \
--source-region us-west-2 \
--region us-east-1

Output:

download: s3://my-us-west-2-bucket/test1.txt to s3://my-us-east-1-bucket/test1.txt

Example 8: Sync to an S3 access point

The following sync command syncs the current directory to the access point (myaccesspoint):

Output:

- For API details, see Sync in AWS CLI Command Reference.

upload-part-copy

The following code example shows how to use upload-part-copy.

AWS CLI

To upload part of an object by copying data from an existing object as the data source

The following upload-part-copy example uploads a part by copying data from an existing object as a data source.

aws s3 api upload-part-copy \
--bucket my-bucket \
--key "Map_Data_June.mp4" \
--copy-source "my-bucket/copy_of_Map_Data_June.mp4" \
--part-number 1 \}
The following code example shows how to use `upload-part`.

**AWS CLI**

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket my-bucket --key 'multipart/01' --part-number 1 --body part01 --upload-id "dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7Wf52vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC"
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
   "ETag": "e868e0f4719e394144ef36531ee6824c"
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see [UploadPart](#) in *AWS CLI Command Reference*.
website

The following code example shows how to use website.

AWS CLI

**Configure an S3 bucket as a static website**

The following command configures a bucket named `my-bucket` as a static website. The index document option specifies the file in `my-bucket` that visitors will be directed to when they navigate to the website URL. In this case, the bucket is in the us-west-2 region, so the site would appear at `http://my-bucket.s3-website-us-west-2.amazonaws.com`.

All files in the bucket that appear on the static site must be configured to allow visitors to open them. File permissions are configured separately from the bucket website configuration.

```
aws s3 website s3://my-bucket/ \
  --index-document index.html \
  --error-document error.html
```

For information on hosting a static website in Amazon S3, see [Hosting a Static Website](#) in the [Amazon Simple Storage Service Developer Guide](#).

- For API details, see [Website](#) in [AWS CLI Command Reference](#).

Amazon S3 Control examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3 Control.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
Actions

create-access-point

The following code example shows how to use create-access-point.

AWS CLI

To create an access point

The following create-access-point example creates an access point named finance-ap for the bucket business-records in account 123456789012. Before running this example, replace the access point name, bucket name, and account number with appropriate values for your use case.

```
aws s3control create-access-point \
  --account-id 123456789012 \n  --bucket business-records \n  --name finance-ap
```

This command produces no output.

For more information, see Creating Access Points in the Amazon Simple Storage Service Developer Guide.

- For API details, see CreateAccessPoint in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.

AWS CLI

To create an Amazon S3 batch operations job

The following create-job example creates an Amazon S3 batch operations job to tag objects as confidential` in the bucket `employee-records.

```
aws s3control create-job \
```
--account-id 123456789012 \ 
--operation '{"S3PutObjectTagging": { "TagSet": [ { "Key": "confidential", "Value": "true" } ] }}' \ 
--manifest '{"Spec": {"S3BatchOperations_CSV_20180820", "Fields": [ { "Bucket", "Key" } ], "Location": { "ObjectArn": "arn:aws:s3:::employee-records-logs/inv-report/7a6a9be4-072c-407e-85a2-ec3e982f773.csv", "ETag": "69f52a4e9f7b97e987155d9c8f5880897" } }' \ 
--priority 42 \ 
--role-arn arn:aws:iam::123456789012:role/S3BatchJobRole

Output:

```
{
   "JobId": "93735294-df46-44d5-8638-6356f335324e"
}
```

- For API details, see CreateJob in AWS CLI Command Reference.

**delete-access-point-policy**

The following code example shows how to use delete-access-point-policy.

**AWS CLI**

**To delete an access point policy**

The following delete-access-point-policy example deletes the access point policy from the access point named finance-ap in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point-policy \ 
   --account-id 123456789012 \ 
   --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the Amazon Simple Storage Service Developer Guide.
• For API details, see [DeleteAccessPointPolicy](#) in *AWS CLI Command Reference*.

**delete-access-point**

The following code example shows how to use delete-access-point.

**AWS CLI**

**To delete an access point**

The following delete-access-point example deletes an access point named finance-ap in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point \
  --account-id 123456789012 \
  --name finance-ap
```

This command produces no output.

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

• For API details, see [DeleteAccessPoint](#) in *AWS CLI Command Reference*.

**delete-public-access-block**

The following code example shows how to use delete-public-access-block.

**AWS CLI**

**To delete block public access settings for an account**

The following delete-public-access-block example deletes block public access settings for the specified account.

```
aws s3control delete-public-access-block \
  --account-id 123456789012
```

This command produces no output.
describe-job

The following code example shows how to use `describe-job`.

AWS CLI

To describe an Amazon S3 batch operations job

The following `describe-job` provides configuration parameters and status for the specified batch operations job.

```bash
aws s3control describe-job \
  --account-id 123456789012 \
  --job-id 93735294-df46-44d5-8638-6356f335324e
```

Output:

```json
{
  "Job": {
    "TerminationDate": "2019-10-03T21:49:53.944Z",
    "JobId": "93735294-df46-44d5-8638-6356f335324e",
    "FailureReasons": [],
    "Manifest": {
      "Spec": {
        "Fields": [
          "Bucket",
          "Key"
        ],
        "Format": "S3BatchOperations_CSV_20180820"
      },
      "Location": {
        "ETag": "69f52a4e9f797e987155d9c8f5880897",
        "ObjectArn": "arn:aws:s3:::employee-records-logs/inv-report/7a6a9be4-072c-407e-85a2-ec3e982f773e.csv"
      }
    },
    "Operation": {
      "S3PutObjectTagging": {
        "TagSet": [
          
```
For API details, see [DescribeJob](https://docs.aws.amazon.com/cli/latest/reference/s3api/describe-job.html) in *AWS CLI Command Reference*.

### get-access-point-policy-status

The following code example shows how to use `get-access-point-policy-status`.

#### AWS CLI

**To retrieve the access point policy status**

The following `get-access-point-policy-status` example retrieves the access point policy status for the access point named `finance-ap` in account `123456789012`. The access point policy status indicates whether the access point's policy allows public access. Before running this example, replace the access point name and account number with appropriate values for your use case.
aws s3control get-access-point-policy-status \
   --account-id 123456789012 \
   --name finance-ap

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

For more information about when an access point policy is considered public, see [The Meaning of "Public"](The Meaning of "Public") in the [Amazon Simple Storage Service Developer Guide](Amazon Simple Storage Service Developer Guide).

- For API details, see [GetAccessPointPolicyStatus](GetAccessPointPolicyStatus) in [AWS CLI Command Reference](AWS CLI Command Reference).

get-access-point-policy

The following code example shows how to use `get-access-point-policy`.

AWS CLI

**To retrieve an access point policy**

The following `get-access-point-policy` example retrieves the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy \
   --account-id 123456789012 \
   --name finance-ap
```

Output:

```
{
```
For more information, see Managing Data Access with Amazon S3 Access Points in the Amazon Simple Storage Service Developer Guide.

- For API details, see GetAccessPointPolicy in AWS CLI Command Reference.

**get-access-point**

The following code example shows how to use get-access-point.

**AWS CLI**

To retrieve access point configuration details

The following get-access-point example retrieves the configuration details for the access point named finance-ap in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```bash
aws s3control get-access-point \
  --account-id 123456789012 \
  --name finance-ap
```

Output:

```json
{
    "Name": "finance-ap",
    "Bucket": "business-records",
    "NetworkOrigin": "Internet",
    "PublicAccessBlockConfiguration": {
        "BlockPublicAcls": false,
        "IgnorePublicAcls": false,
        "BlockPublicPolicy": false,
        "RestrictPublicBuckets": false
    },
    "CreationDate": "2020-01-01T00:00:00Z"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the Amazon Simple Storage Service Developer Guide.

- For API details, see GetAccessPoint in AWS CLI Command Reference.
get-multi-region-access-point-routes

The following code example shows how to use `get-multi-region-access-point-routes`.

**AWS CLI**

To query the current Multi-Region Access Point route configuration

The following `get-multi-region-access-point-routes` example returns the current routing configuration for the specified Multi-Region Access Point.

```bash
aws s3control get-multi-region-access-point-routes \
  --region Region \
  --account-id 111122223333 \
  --mrap MultiRegionAccessPoint_ARN
```

Output:

```json
{
    "Mrap": "arn:aws:s3::111122223333:accesspoint/0000000000000.mrap",
    "Routes": [
        {
            "Bucket": "DOC-EXAMPLE-BUCKET-1",
            "Region": "ap-southeast-2",
            "TrafficDialPercentage": 100
        },
        {
            "Bucket": "DOC-EXAMPLE-BUCKET-2",
            "Region": "us-west-1",
            "TrafficDialPercentage": 0
        }
    ]
}
```

- For API details, see [GetMultiRegionAccessPointRoutes](#) in *AWS CLI Command Reference*.

get-public-access-block

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

To list public block access settings for an account
The following `get-public-access-block` example displays the block public access settings for the specified account.

```bash
aws s3control get-public-access-block \
--account-id 123456789012
```

Output:

```json
{
   "PublicAccessBlockConfiguration": {
      "BlockPublicPolicy": true,
      "RestrictPublicBuckets": true,
      "IgnorePublicAcls": true,
      "BlockPublicAcls": true
   }
}
```

### list-access-points

The following code example shows how to use `list-access-points`.

**AWS CLI**

**Example 1: To retrieve a list of all access points for an account**

The following `list-access-points` example displays a list of all access points attached to buckets owned by account 123456789012.

```bash
aws s3control list-access-points \
--account-id 123456789012
```

Output:

```json
{
   "AccessPointList": [
      {
         "Name": "finance-ap",
         "NetworkOrigin": "Internet",
         "Actions": ["ListBuckets", "PutBucketsWebsiteConfiguration"],
         "RestrictPublicBuckets": true,
         "IgnorePublicAcls": true,
         "BlockPublicAcls": true
      }
   ]
}
```
Example 2: To retrieve a list of all access points for a bucket

The following `list-access-points` example retrieves a list of all access points attached to the bucket `external-docs` owned by account 123456789012.

```bash
aws s3control list-access-points \
  --account-id 123456789012 \ 
  --bucket external-docs
```

Output:

```json
{
  "AccessPointList": [
    {
      "Name": "customer-ap",
      "NetworkOrigin": "Internet",
      "Bucket": "external-docs"
    }
  ]
}
```
For more information, see [Managing Data Access with Amazon S3 Access Points](https://docs.aws.amazon.com/AmazonS3/latest/API/ManagingDataAccess.html) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [ListAccessPoints](https://docs.aws.amazon.com/cli/latest/reference/s3control/list-access-points.html) in *AWS CLI Command Reference*.

### list-jobs

The following code example shows how to use `list-jobs`.

#### AWS CLI

**To list an accounts Amazon S3 batch operations jobs**

The following `list-jobs` example lists all recent batch operations jobs for the specified account.

```bash
aws s3control list-jobs \
  --account-id 123456789012
```

**Output:**

```json
{
  "Jobs": [
    {
      "Operation": "S3PutObjectTagging",
      "ProgressSummary": {
        "NumberOfTasksFailed": 0,
        "NumberOfTasksSucceeded": 8,
        "TotalNumberOfTasks": 8
      },
    }
  ]
}
```
"Status": "Complete",
"JobId": "93735294-df46-44d5-8638-6356f335324e",
"Priority": 42
},
{
   "Operation": "S3PutObjectTagging",
   "ProgressSummary": {
      "NumberOfTasksFailed": 0,
      "NumberOfTasksSucceeded": 0,
      "TotalNumberOfTasks": 0
   },
   "CreationTime": "2019-10-03T21:46:07.084Z",
   "Status": "Failed",
   "JobId": "3f3c7619-02d3-4779-97f6-1d98dd313108",
   "Priority": 42
},
]
}

- For API details, see [ListJobs](https://docs.aws.amazon.com/cli/latest/reference/s3control/list-jobs.html) in *AWS CLI Command Reference*.

**put-access-point-policy**

The following code example shows how to use `put-access-point-policy`.

**AWS CLI**

**To set an access point policy**

The following `put-access-point-policy` example places the specified access point policy for the access point `finance-ap` in account `123456789012`. If the access point `finance-ap` already has a policy, this command replaces the existing policy with the one specified in this command. Before running this example, replace the account number, access point name, and policy statements with appropriate values for your use case.

```bash
aws s3control put-access-point-policy
   --account-id 123456789012
   --name finance-ap
   --policy file://ap-policy.json
```

**Contents of ap-policy.json:**

```
```
This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the Amazon Simple Storage Service Developer Guide.

- For API details, see PutAccessPointPolicy in AWS CLI Command Reference.

**put-public-access-block**

The following code example shows how to use put-public-access-block.

**AWS CLI**

To edit block public access settings for an account

The following put-public-access-block example toggles all block public access settings to true for the specified account.

```
aws s3control put-public-access-block \
  --account-id 123456789012 \
  --public-access-block-configuration '{"BlockPublicAcls": true, "IgnorePublicAcls": true, "BlockPublicPolicy": true, "RestrictPublicBuckets": true}'
```

This command produces no output.

- For API details, see PutPublicAccessBlock in AWS CLI Command Reference.
submit-multi-region-access-point-routes

The following code example shows how to use submit-multi-region-access-point-routes.

AWS CLI

To update your Multi-Region Access Point routing configuration

The following submit-multi-region-access-point-routes example updates the routing statuses of DOC-EXAMPLE-BUCKET-1 and DOC-EXAMPLE-BUCKET-2 in the ap-southeast-2 Region for your Multi-Region Access Point.

```bash
aws s3control submit-multi-region-access-point-routes \
   --region ap-southeast-2 \
   --account-id 111122223333 \
   --mrap MultiRegionAccessPoint_ARN \
   --route-updates Bucket=DOC-EXAMPLE-BUCKET-1,TrafficDialPercentage=100 \
                   Bucket=DOC-EXAMPLE-BUCKET-2,TrafficDialPercentage=0
```

This command produces no output.

- For API details, see SubmitMultiRegionAccessPointRoutes in AWS CLI Command Reference.

update-job-priority

The following code example shows how to use update-job-priority.

AWS CLI

To update the job priority of an Amazon S3 batch operations job

The following update-job-priority example updates the specified job to a new priority.

```bash
aws s3control update-job-priority \
   --account-id 123456789012 \
   --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
   --priority 52
```

Output:

```
{
   "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
```
For API details, see **UpdateJobPriority** in *AWS CLI Command Reference.*

**update-job-status**

The following code example shows how to use `update-job-status`.

**AWS CLI**

*To update the status of an Amazon S3 batch operations job*

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelled",
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Ready
```

Output:

```
{
    "Status": "Ready",
    "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```
The following update-job-status example cancels the specified job which is running.

```bash
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
  --requested-job-status Cancelled
```

Output::

```json
{
  "Status": "Cancelling",
  "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

- For API details, see [UpdateJobStatus](#) in *AWS CLI Command Reference*.

## S3 Glacier examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with S3 Glacier.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics
- [Actions](#)
AWS CLI

The following command deletes an in-progress multipart upload to a vault named my-vault:

```bash
aws glacier abort-multipart-upload --account-id - --vault-name my-vault
--upload-id 19gaRezEXAMPLES6RYyYdqtHOC_kGRCT03L9yetr220UmPtyKk-
OssZtLqyFu7sY1_1R7vgFuJV6NtcV5zpsJ
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI User Guide.

- For API details, see `AbortMultipartUpload` in AWS CLI Command Reference.

abort-vault-lock

The following code example shows how to use `abort-vault-lock`.

AWS CLI

**To abort an in-progress vault lock process**

The following `abort-vault-lock` example deletes a vault lock policy from the specified vault and resets the lock state of the vault lock to unlocked.

```bash
aws glacier abort-vault-lock
   --account-id -
   --vault-name MyVaultName
```

This command produces no output.

For more information, see **Abort Vault Lock (DELETE lock-policy)** in the Amazon Glacier API Developer Guide.

- For API details, see `AbortVaultLock` in AWS CLI Command Reference.
add-tags-to-vault

The following code example shows how to use add-tags-to-vault.

AWS CLI

The following command adds two tags to a vault named my-vault:

```bash
aws glacier add-tags-to-vault --account-id - --vault-name my-vault --tags
id=1234,date=july2015
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [AddTagsToVault](#) in [AWS CLI Command Reference](#).

complete-multipart-upload

The following code example shows how to use complete-multipart-upload.

AWS CLI

The following command completes multipart upload for a 3 MiB archive:

```bash
aws glacier complete-multipart-upload --archive-size 3145728 --checksum
9628195fcdcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67
--upload-id 19gaRezEXAMPLES6Ry5YYydqthHQC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`. The checksum parameter takes a SHA-256 tree hash of the archive in hexadecimal.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, including instructions on calculating a tree hash, see Using Amazon Glacier in the [AWS CLI User Guide](#).

- For API details, see [CompleteMultipartUpload](#) in [AWS CLI Command Reference](#).
complete-vault-lock

The following code example shows how to use complete-vault-lock.

**AWS CLI**

To complete an in-progress vault lock process

The following complete-vault-lock example completes the in-progress locking progress for the specified vault and sets the lock state of the vault lock to Locked. You get the value for the lock-id parameter when you run initiate-lock-process.

```
aws glacier complete-vault-lock \
   --account-id - \
   --vault-name MyVaultName \
   --lock-id 9QZgEXAMPLEPhvL6xEXAMPLE
```

This command produces no output.

For more information, see [Complete Vault Lock (POST lockId)](https://docs.aws.amazon.com/amazon-glacier/latest/dev/complete-vault-lock.html) in the *Amazon Glacier API Developer Guide*.

- For API details, see [CompleteVaultLock](https://docs.aws.amazon.com/cli/latest/reference/glacier/complete-vault-lock.html) in *AWS CLI Command Reference*.

create-vault

The following code example shows how to use create-vault.

**AWS CLI**

The following command creates a new vault named my-vault:

```
aws glacier create-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [CreateVault](https://docs.aws.amazon.com/cli/latest/reference/glacier/create-vault.html) in *AWS CLI Command Reference*.

delete-archive

The following code example shows how to use delete-archive.
AWS CLI

To delete an archive from a vault

The following delete-archive example removes the specified archive from example_vault.

```bash
aws glacier delete-archive \
  --account-id 111122223333 \
  --vault-name example_vault \
  --archive-id Sc0u9ZP8yaWkmh-XGlIvAVp1LhaLCGnNwNl5I5x9HqPIkX5mjc0DrId3Ln-Gi_k2HzmlIDZUz117KSdVMdMXLuFWi9PJUitxW073edQ43eT1MWkH0pd9zVSAuV_XXZBVhKhyGhJ7w
```

This command produces no output.

- For API details, see `DeleteArchive` in *AWS CLI Command Reference*.

delete-vault-access-policy

The following code example shows how to use delete-vault-access-policy.

AWS CLI

To remove the access policy of a vault

The following delete-vault-access-policy example removes the access policy for the specified vault.

```bash
aws glacier delete-vault-access-policy \
  --account-id 111122223333 \
  --vault-name example_vault
```

This command produces no output.

- For API details, see `DeleteVaultAccessPolicy` in *AWS CLI Command Reference*.

delete-vault-notifications

The following code example shows how to use delete-vault-notifications.

AWS CLI

To remove the SNS notifications for a vault
The following `delete-vault-notifications` example removes notifications sent by Amazon Simple Notification Service (Amazon SNS) for the specified vault.

```bash
aws glacier delete-vault-notifications \
  --account-id 111122223333 \
  --vault-name example_vault
```

This command produces no output.

- For API details, see `DeleteVaultNotifications` in *AWS CLI Command Reference*.

**delete-vault**

The following code example shows how to use `delete-vault`.

**AWS CLI**

The following command deletes a vault named `my-vault`:

```bash
aws glacier delete-vault --vault-name my-vault --account-id -
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see `DeleteVault` in *AWS CLI Command Reference*.

**describe-job**

The following code example shows how to use `describe-job`.

**AWS CLI**

The following command retrieves information about an inventory retrieval job on a vault named `my-vault`:

```bash
aws glacier describe-job --account-id - --vault-name my-vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5WXw4_Xql1NHS61ds04CnMW
```

Output:

```bash
{
```
The job ID can be found in the output of `aws glacier initiate-job` and `aws glacier list-jobs`. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [DescribeJob](https://docs.aws.amazon.com/cli/latest/reference/glacier/describe-job.html) in *AWS CLI Command Reference*.

### describe-vault

The following code example shows how to use `describe-vault`.

**AWS CLI**

The following command retrieves data about a vault named `my-vault`:

```
aws glacier describe-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [DescribeVault](https://docs.aws.amazon.com/cli/latest/reference/glacier/describe-vault.html) in *AWS CLI Command Reference*.

### get-data-retrieval-policy

The following code example shows how to use `get-data-retrieval-policy`.

**AWS CLI**

The following command gets the data retrieval policy for the in-use account:

```
aws glacier get-data-retrieval-policy --account-id -
```
Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see `GetDataRetrievalPolicy` in *AWS CLI Command Reference*.

### get-job-output

The following code example shows how to use `get-job-output`.

**AWS CLI**

The following command saves the output from a vault inventory job to a file in the current directory named `output.json`:

```bash
aws glacier get-job-output --account-id - --vault-name my-vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CNMW output.json
```

The `job-id` is available in the output of `aws glacier list-jobs`. Note that the output file name is a positional argument that is not prefixed by an option name. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

**Output:**

```json
{
    "status": 200,
    "acceptRanges": "bytes",
    "contentType": "application/json"
}
```
output.json:

```json
{"VaultARN":"arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault","InventoryDate":"2015-04-07T00:26:18Z","ArchiveList": [{"ArchiveId":"kKB7ymWJvP5whGP6ycSOAekp9ZYe__-zM_mw6k7G闹EiWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-AJVlu2ccmDSyDUMZwKbwbpAdGATGDIB3hH00bjbGehXTcApVud_wyDw","ArchiveDescription":"multipart upload test","CreationDate":"2015-04-06T22:24:34Z","Size":3145728,"SHA256TreeHash":"9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67"}]
}
```

- For API details, see [GetJobOutput](#) in *AWS CLI Command Reference*.

**get-vault-access-policy**

The following code example shows how to use `get-vault-access-policy`.

**AWS CLI**

To retrieve the access policy of a vault

The following `get-vault-access-policy` example retrieves the access policy for the specified vault.

```
aws glacier get-vault-access-policy 
   --account-id 111122223333 
   --vault-name example_vault
```

Output:

```json
{
   "policy": {
   
```

Actions and scenarios 5693
For API details, see `GetVaultAccessPolicy` in *AWS CLI Command Reference*.

**get-vault-lock**

The following code example shows how to use `get-vault-lock`.

**AWS CLI**

**To get the details of a vault lock**

The following `get-vault-lock` example retrieved the details about the lock for the specified vault.

```
aws glacier get-vault-lock \
  --account-id - \
  --vault-name MyVaultName
```

Output:

```
{
  "CreationDate": "2019-07-29T22:25:28.640Z"
}
```

For more information, see Get Vault Lock (GET lock-policy) in the *Amazon Glacier API Developer Guide*.

For API details, see `GetVaultLock` in *AWS CLI Command Reference*.

**get-vault-notifications**

The following code example shows how to use `get-vault-notifications`.

**AWS CLI**

The following command gets a description of the notification configuration for a vault named my-vault:
aws glacier get-vault-notifications --account-id - --vault-name my-vault

Output:

```json
{
   "vaultNotificationConfig": {
      "Events": [
         "InventoryRetrievalCompleted",
         "ArchiveRetrievalCompleted"
      ],
   }
}
```

If no notifications have been configured for the vault, an error is returned. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [GetVaultNotifications](https://docs.aws.amazon.com/cli/latest/reference/glacier/get-vault-notifications.html) in *AWS CLI Command Reference*.

**initiate-job**

The following code example shows how to use `initiate-job`.

**AWS CLI**

The following command initiates a job to get an inventory of the vault `my-vault`:

```bash
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters '{"Type": "inventory-retrieval"}"
```

Output:

```json
{
   "location": "/0123456789012/vaults/my-vault/jobs/zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW",
   "jobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW"
}
```
Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command initiates a job to retrieve an archive from the vault my-vault:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters file://job-archive-retrieval.json
```

`job-archive-retrieval.json` is a JSON file in the local folder that specifies the type of job, archive ID, and some optional parameters:

```json
{
    "Type": "archive-retrieval",
    "ArchiveId": "kKB7ymWJvP5whGP6ycS0Aekp9ZYe--zM_mw6k76ZFGEIWXQ- ybtRDvc2vkPSDtfKmQrl0IRQLSGsNuDr- AJVl1u2ccmDSyDUmZwKbwpaAGATGDiB3hH00b7bjbGehXTcApVud_wyDw",
    "Description": "Retrieve archive on 2015-07-17",
}
```

Archive IDs are available in the output of `aws glacier upload-archive` and `aws glacier get-job-output`.

Output:

```json
{
    "location": "/011685312445/vaults/mwunderl/jobs/17IL5-EkxyEY9W9s95fClzIbk205uLYaFdAY0i- azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzJyZJ059-8N9aHwAv",
    "jobId": "17IL5-Ekxy205uLYaFdAY0iEY9W9s95fClzIbk- azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzJyZJ059-8N9aHwAv"
}
```

See Initiate Job in the *Amazon Glacier API Reference* for details on the job parameters format.

- For API details, see [InitiateJob](https://docs.aws.amazon.com/cli/latest/reference/glacier/initiate-job.html) in *AWS CLI Command Reference*.

### initiate-multipart-upload

The following code example shows how to use `initiate-multipart-upload`.

```bash
```
AWS CLI

The following command initiates a multipart upload to a vault named `my-vault` with a part size of 1 MiB (1024 x 1024 bytes) per file:

```
aws glacier initiate-multipart-upload --account-id - --part-size 1048576 --vault-name my-vault --archive-description "multipart upload test"
```

The archive description parameter is optional. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

This command outputs an upload ID when successful. Use the upload ID when uploading each part of your archive with `aws glacier upload-multipart-part`. For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI User Guide.

- For API details, see `InitiateMultipartUpload` in AWS CLI Command Reference.

`initiate-vault-lock`

The following code example shows how to use `initiate-vault-lock`.

AWS CLI

To initiate the vault locking process

The following `initiate-vault-lock` example installs a vault lock policy on the specified vault and sets the lock state of the vault lock to InProgress. You must complete the process by calling `complete-vault-lock` within 24 hours to set the state of the vault lock to Locked.

```
aws glacier initiate-vault-lock \
   --account-id - \
   --vault-name MyVaultName \
   --policy file://vault_lock_policy.json
```

Contents of `vault_lock_policy.json`:

```
```

Actions and scenarios
The output is the vault lock ID that you can use to complete the vault lock process.

```
{
   "lockId": "9QZgEXAMPLEPhvL6xEXAMPLE"
}
```

For more information, see [Initiate Vault Lock (POST lock-policy)](https://docs.aws.amazon.com/amazon-glacier/latest/dev/initiate-vault-lock.html) in the *Amazon Glacier API Developer Guide*.

- For API details, see [InitiateVaultLock](https://docs.aws.amazon.com/cli/latest/reference/glacier/initiate-vault-lock.html) in *AWS CLI Command Reference*.

### list-jobs

The following code example shows how to use `list-jobs`.

**AWS CLI**

The following command lists in-progress and recently completed jobs for a vault named `my-vault`:

```
aws glacier list-jobs --account-id - --vault-name my-vault
```

**Output:**

```
{
   "JobList": [
   {
    "RetrievalByteRange": "0-3145727",
    "Completed": false,
    "SHA256TreeHash": "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
    "JobId": "17IL5-EkXyEY9Ws95fClzIbk205uLYaFdAY0i-azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJ059-8N9aHWav",
    "ArchiveId": "kKB7ymWJVpPSwhGP6yc5OAekp9ZYe-__m_mw6k76ZFGEIWQX-ybtRDvc2VkJPSDtfKmQrij0IRQLSGsNuDp-AJVlu2ccmDSyDUmZwkbwpAdGATGDiB3hH00bjbGehXTcApVud_wyDw",
   }
  ]
```
Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListJobs in AWS CLI Command Reference.

**list-multipart-uploads**

The following code example shows how to use list-multipart-uploads.

**AWS CLI**

The following command shows all of the in-progress multipart uploads for a vault named my-vault:

```bash
aws glacier list-multipart-uploads --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.
For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI User Guide.

- For API details, see ListMultipartUploads in AWS CLI Command Reference.

**list-parts**

The following code example shows how to use list-parts.

**AWS CLI**

The following command lists the uploaded parts for a multipart upload to a vault named my-vault:

```
aws glacier list-parts --account-id - --vault-name my-vault --upload-id "SYZi7qnL-YGqGwAm8Kn3BLP2ElCNvB-5961R09CSaPmPwkYGH0qeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D"
```

Output:

```
{
    "MultipartUploadId": "SYZi7qnL-YGqGwAm8Kn3BLP2ElCNvB-5961R09CSaPmPwkYGH0qeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D",
    "Parts": [
        {
            "RangeInBytes": "0-1048575",
            "SHA256TreeHash": "e1f2a7cd6e047350f69b9f8cfa60fa606fe2f02802097a9a026360a7edc1f553"
        },
        {
            "RangeInBytes": "1048576-2097151",
            "SHA256TreeHash": "43cf3061fb95796aed99a11a6aa3cd8f839eed15e655ab0a597126210636aee6"
        }
    ],
    "CreationDate": "2015-07-18T00:05:23.830Z",
    "PartSizeInBytes": 1048576
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.
For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI User Guide.

- For API details, see ListParts in AWS CLI Command Reference.

list-provisioned-capacity

The following code example shows how to use list-provisioned-capacity.

AWS CLI

To retrieve the provisioned capacity units

The following list-provisioned-capacity example retrieves details for any provisioned capacity units for the specified account.

```
aws glacier list-provisioned-capacity \
   --account-id 111122223333
```

Output:

```
{
   "ProvisionedCapacityList": [
      {
         "CapacityId": "HpASAuvfRFiVDb0jMfeIcr8K",
         "ExpirationDate": "2020-03-18T19:59:24.000Z",
         "StartDate": "2020-02-18T19:59:24.912Z"
      }
   ]
}
```

- For API details, see ListProvisionedCapacity in AWS CLI Command Reference.

list-tags-for-vault

The following code example shows how to use list-tags-for-vault.

AWS CLI

The following command lists the tags applied to a vault named my-vault:
aws glacier list-tags-for-vault --account-id - --vault-name my-vault

Output:

```
{
    "Tags": {
        "date": "july2015",
        "id": "1234"
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see `ListTagsForVault` in *AWS CLI Command Reference*.

**list-vaults**

The following code example shows how to use `list-vaults`.

**AWS CLI**

The following command lists the vaults in the default account and region:

```
aws glacier list-vaults --account-id -
```

Output:

```
{
    "VaultList": [
    {
        "SizeInBytes": 3178496,
        "LastInventoryDate": "2015-04-07T00:26:19.028Z",
        "VaultName": "my-vault",
        "NumberOfArchives": 1,
        "CreationDate": "2015-04-06T21:23:45.708Z"
    }
    ]
}
```
Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListVaults in AWS CLI Command Reference.

**purchase-provisioned-capacity**

The following code example shows how to use `purchase-provisioned-capacity`.

**AWS CLI**

*To purchase a provisioned capacity unit*

The following `purchase-provisioned-capacity` example purchases a provisioned capacity unit.

```
aws glacier purchase-provisioned-capacity \\
    --account-id 111122223333
```

Output:

```
{
    "capacityId": "HpASAuvfRFiVDbOjMfEIcr8K"
}
```

- For API details, see PurchaseProvisionedCapacity in AWS CLI Command Reference.

**remove-tags-from-vault**

The following code example shows how to use `remove-tags-from-vault`.

**AWS CLI**

The following command removes a tag with the key `date` from a vault named `my-vault`:

```
aws glacier remove-tags-from-vault --account-id - --vault-name my-vault --tag-keys date
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.
set-data-retrieval-policy

The following code example shows how to use `set-data-retrieval-policy`.

AWS CLI

The following command configures a data retrieval policy for the in-use account:

```bash
```

data-retrieval-policy.json is a JSON file in the current folder that specifies a data retrieval policy:

```json
{
   "Rules": [ 
      { 
         "Strategy": "BytesPerHour",
         "BytesPerHour": 10737418240
      }
   ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command sets the data retrieval policy to `FreeTier` using inline JSON:

```bash
aws glacier set-data-retrieval-policy --account-id - --policy '{"Rules": [{"Strategy": "FreeTier"}]}'
```

See Set Data Retrieval Policy in the *Amazon Glacier API Reference* for details on the policy format.

- For API details, see [SetDataRetrievalPolicy](#) in *AWS CLI Command Reference*.

set-vault-access-policy

The following code example shows how to use `set-vault-access-policy`.

- For API details, see [RemoveTagsFromVault](#) in *AWS CLI Command Reference*. 
AWS CLI

To set the access policy of a vault

The following `set-vault-access-policy` example attaches a permission policy to the specified vault.

```bash
aws glacier set-vault-access-policy \
    --account-id 111122223333 \ 
    --vault-name example_vault \ 
```

This command produces no output.

- For API details, see SetVaultAccessPolicy in AWS CLI Command Reference.

set-vault-notifications

The following code example shows how to use `set-vault-notifications`.

AWS CLI

The following command configures SNS notifications for a vault named `my-vault`:

```bash
aws glacier set-vault-notifications --account-id - --vault-name my-vault --vault-notification-config file://notificationconfig.json
```

`notificationconfig.json` is a JSON file in the current folder that specifies an SNS topic and the events to publish:

```json
{
    "Events": ["ArchiveRetrievalCompleted", "InventoryRetrievalCompleted"]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.
For API details, see `SetVaultNotifications` in *AWS CLI Command Reference*.

### upload-archive

The following code example shows how to use `upload-archive`.

**AWS CLI**

The following command uploads an archive in the current folder named `archive.zip` to a vault named `my-vault`:

```bash
aws glacier upload-archive --account-id - --vault-name my-vault --body archive.zip
```

**Output:**

```json
{
    "archiveId": "kKB7ymWJvPSwhGP6ycSOAekp9ZYe---zM_mw6k76ZFGEfWIWQX-ybtRDvc2VkJPSdKmqirj0IRQLSf6sNuDp-AJVLu2ccmDsyUmzKbwbpAdGATGDiB3hH00bzbGehXTcApVud_wyDw",
    "checksum": "969fb39823836d81f0cc028195fcdcbbe76cdde932d4646fa7de5f21e18aa67",
    "location": "/0123456789012/vaults/my-vault/archives/kKB7ymWJvPSwhGP6ycSOAekp9ZYe---zM_mw6k76ZFGEfWIWQX-ybtRDvc2VkJPSdKmqirj0IRQLSf6sNuDp-AJVLu2ccmDsyUmzKbwbpAdGATGDiB3hH00bzbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

To retrieve an uploaded archive, initiate a retrieval job with the `aws glacier initiate-job` command.

For API details, see `UploadArchive` in *AWS CLI Command Reference*.

### upload-multipart-part

The following code example shows how to use `upload-multipart-part`.

**AWS CLI**

The following command uploads the first 1 MiB (1024 x 1024 bytes) part of an archive:
Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The body parameter takes a path to a part file on the local filesystem. The range parameter takes an HTTP content range indicating the bytes that the part occupies in the completed archive. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI User Guide.

- For API details, see UploadMultipartPart in AWS CLI Command Reference.

### Secrets Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Secrets Manager.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- Actions
**Actions**

**batch-get-secret-value**

The following code example shows how to use `batch-get-secret-value`.

**AWS CLI**

**Example 1: To retrieve the secret value for a group of secrets listed by name**

The following `batch-get-secret-value` example gets the secret value secrets for three secrets.

```bash
aws secretsmanager batch-get-secret-value \
   --secret-id-list MySecret1 MySecret2 MySecret3
```

Output:

```json
{
   "SecretValues": [
      {
         "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-a1b2c3",
         "Name": "MySecret1",
         "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
         "SecretString": "{"username":"diego_ramirez","password":"EXAMPLE-PASSWORD","engine":"mysql","host":"secretsmanagertutorial.cluster.us-west-2.rds.amazonaws.com","port":3306,"dbClusterIdentifier":"secretsmanagertutorial"},",
         "VersionStages": ["AWSCURRENT"],
         "CreatedDate": "1523477145.729"
      },
      {
         "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-a1b2c3",
         "Name": "MySecret2",
         "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbb",
         "SecretString": "{"username":"akua_mansa","password":"EXAMPLE-PASSWORD"",",
         "VersionStages": [
```
For more information, see Retrieve a group of secrets in a batch in the AWS Secrets Manager User Guide.

Example 2: To retrieve the secret value for a group of secrets selected by filter

The following batch-get-secret-value example gets the secret value secrets in your account that have MySecret in the name. Filtering by name is case sensitive.

```bash
aws secretsmanager batch-get-secret-value \
  --filters Key="name",Values="MySecret"
```

Output:

```json
{
  "SecretValues": [
    {
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-a1b2c3",
      "Name": "MySecret1",
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
      "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
```
For more information, see Retrieve a group of secrets in a batch in the AWS Secrets Manager User Guide.

- For API details, see BatchGetSecretValue in AWS CLI Command Reference.

**cancel-rotate-secret**

The following code example shows how to use cancel-rotate-secret.
**AWS CLI**

**To turn off automatic rotation for a secret**

The following `cancel-rotate-secret` example turns off automatic rotation for a secret. To resume rotation, call `rotate-secret`.

```
aws secretsmanager cancel-rotate-secret \
  --secret-id MyTestSecret
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Rotate a secret](https://docs.aws.amazon.com/secretsmanager/latest/userguide/secretsmanager-glossary.html) in the [Secrets Manager User Guide](https://docs.aws.amazon.com/secretsmanager/latest/userguide/).

- For API details, see [CancelRotateSecret](https://docs.aws.amazon.com/cli/latest/reference/secretsmanager/cancel-rotate-secret.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/).

**create-secret**

The following code example shows how to use `create-secret`.

**AWS CLI**

**Example 1: To create a secret**

The following `create-secret` example creates a secret with two key-value pairs.

```
aws secretsmanager create-secret \
  --name MyTestSecret \
  --description "My test secret created with the CLI." \
  --secret-string "{"user":"diegor","password":"EXAMPLE-PASSWORD"}" \
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
}
```
Example 2: To create a secret from credentials in a JSON file

The following `create-secret` example creates a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the AWS CLI User Guide.

```
aws secretsmanager create-secret
    --name MyTestSecret
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
    "engine": "mysql",
    "username": "saanvis",
    "password": "EXAMPLE-PASSWORD",
    "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
    "dbname": "myDatabase",
    "port": "3306"
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a secret in the Secrets Manager User Guide.

- For API details, see CreateSecret in AWS CLI Command Reference.

**delete-resource-policy**

The following code example shows how to use `delete-resource-policy`.
AWS CLI

To delete the resource-based policy attached to a secret

The following delete-resource-policy example deletes the resource-based policy attached to a secret.

```bash
aws secretsmanager delete-resource-policy
   --secret-id MyTestSecret
```

Output:

```json
{
   "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
   "Name": "MyTestSecret"
}
```

For more information, see Authentication and access control in the Secrets Manager User Guide. For API details, see DeleteResourcePolicy in AWS CLI Command Reference.

delete-secret

The following code example shows how to use delete-secret.

AWS CLI

Example 1: To delete a secret

The following delete-secret example deletes a secret. You can recover the secret with restore-secret until the date and time in the DeletionDate response field. To delete a secret that is replicated to other regions, first remove its replicas with remove-regions-from-replication, and then call delete-secret.

```bash
aws secretsmanager delete-secret
   --secret-id MyTestSecret
   --recovery-window-in-days 7
```

Output:
For more information, see Delete a secret in the Secrets Manager User Guide.

Example 2: To delete a secret immediately

The following delete-secret example deletes a secret immediately without a recovery window. You can't recover this secret.

```bash
aws secretsmanager delete-secret \
  --secret-id MyTestSecret \
  --force-delete-without-recovery
```

Output:

```json
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret",
  "DeletionDate": 1508750180.309
}
```

For more information, see Delete a secret in the Secrets Manager User Guide.

- For API details, see DeleteSecret in AWS CLI Command Reference.

**describe-secret**

The following code example shows how to use describe-secret.

**AWS CLI**

To retrieve the details of a secret

The following describe-secret example shows the details of a secret.
aws secretsmanager describe-secret \
--secret-id MyTestSecret

Output:

```json
{
    "Name": "MyTestSecret",
    "Description": "My test secret",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE",
    "RotationEnabled": true,
    "RotationRules": {
        "AutomaticallyAfterDays": 2,
        "Duration": "2h",
        "ScheduleExpression": "cron(0 16 1,15 * ? *)"
    },
    "LastRotatedDate": 1525747253.72,
    "LastChangedDate": 1523477145.729,
    "LastAccessedDate": 1524572133.25,
    "Tags": [
        {
            "Key": "SecondTag",
            "Value": "AnotherValue"
        },
        {
            "Key": "FirstTag",
            "Value": "SomeValue"
        }
    ],
    "VersionIdsToStages": {
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [ "AWSPREVIOUS" ],
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [ "AWSCURRENT" ],
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333": [ "AWSENDING" ]
    }
}
```
For more information, see **Secret** in the *Secrets Manager User Guide*.

- For API details, see **DescribeSecret** in *AWS CLI Command Reference*.

### get-random-password

The following code example shows how to use `get-random-password`.

**AWS CLI**

**To generate a random password**

The following `get-random-password` example generates a random password 20 characters long that includes at least one uppercase letter, lowercase letter, number, and punctuation.

```bash
aws secretsmanager get-random-password \
  --require-each-included-type \
  --password-length 20
```

**Output:**

```json
{
   "RandomPassword": "EXAMPLE-PASSWORD"
}
```

For more information, see **Create and manage secrets** in the *Secrets Manager User Guide*.

- For API details, see **GetRandomPassword** in *AWS CLI Command Reference*.
get-resource-policy

The following code example shows how to use get-resource-policy.

AWS CLI

To retrieve the resource-based policy attached to a secret

The following get-resource-policy example retrieves the resource-based policy attached to a secret.

```
aws secretsmanager get-resource-policy \
   --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
    "Name": "MyTestSecret",
}
```

For more information, see Authentication and access control in the Secrets Manager User Guide.

- For API details, see GetResourcePolicy in AWS CLI Command Reference.

get-secret-value

The following code example shows how to use get-secret-value.

AWS CLI

Example 1: To retrieve the encrypted secret value of a secret

The following get-secret-value example gets the current secret value.

```
aws secretsmanager get-secret-value \
```
Output:

```json
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}",
    "VersionStages": [
        "AWSCURRENT"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see [Retrieve a secret](#) in the *Secrets Manager User Guide*.

**Example 2: To retrieve the previous secret value**

The following `get-secret-value` example gets the previous secret value:

```
aws secretsmanager get-secret-value
    --secret-id MyTestSecret
    --version-stage AWSPREVIOUS
```

Output:

```json
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"PREVIOUS-EXAMPLE-PASSWORD\"}",
    "VersionStages": [
        "AWSPREVIOUS"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see [Retrieve a secret](#) in the *Secrets Manager User Guide*. 
list-secret-version-ids

The following code example shows how to use list-secret-version-ids.

AWS CLI

To list all of the secret versions associated with a secret

The following list-secret-version-ids example gets a list of all of the versions of a secret.

```
aws secretsmanager list-secret-version-ids \
  --secret-id MyTestSecret
```

Output:

```
{
    "Versions": [
        {
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "VersionStages": [
                "AWSPREVIOUS"
            ],
            "LastAccessedDate": 1523477145.713,
            "CreatedDate": 1523477145.713
        },
        {
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "LastAccessedDate": 1523477145.713,
            "CreatedDate": 1523486221.391
        },
        {
            "CreatedDate": 1.51197446236E9,
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
        }
    ],
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
```
For more information, see Version in the Secrets Manager User Guide.

- For API details, see ListSecretVersionIds in AWS CLI Command Reference.

**list-secrets**

The following code example shows how to use list-secrets.

**AWS CLI**

**Example 1: To list the secrets in your account**

The following list-secrets example gets a list of the secrets in your account.

```bash
aws secretsmanager list-secrets
```

Output:

```
{
   "SecretList": [
      {
         "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
         "Name": "MyTestSecret",
         "LastChangedDate": 1523477145.729,
         "SecretVersionsToStages": {
            "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [ "AWSCURRENT" ]
        }
      },
      {
         "Name": "AnotherSecret",
         "LastChangedDate": 1523482025.685,
         "SecretVersionsToStages": {
            "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [ "AWSCURRENT"
```
Example 2: To filter the list of secrets in your account

The following `list-secrets` example gets a list of the secrets in your account that have Test in the name. Filtering by name is case sensitive.

```
aws secretsmanager list-secrets \
  --filter Key="name",Values="Test"
```

Output:

```
{
  "SecretList": [
    {
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
      "Name": "MyTestSecret",
      "LastChangedDate": 1523477145.729,
      "SecretVersionsToStages": {
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
          "AWSCURRENT"
        ]
      }
    }
  ]
}
```

Example 3: To list the secrets in your account managed by another service

The following `list-secrets` example returns the secrets in your account that are managed by Amazon RDS.

```
aws secretsmanager list-secrets \
```
--filter Key="owning-service",Values="rds"

Output:

```json
{
    "SecretList": [
        {
            "Name": "rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Tags": [
                {
                    "Key": "aws:rds:primaryDBClusterArn"
                },
                {
                    "Value": "rds",
                    "Key": "aws:secretsmanager:owningService"
                }
            ],
            "RotationRules": {
                "AutomaticallyAfterDays": 1
            },
            "LastChangedDate": 1673477781.275,
            "LastRotatedDate": 1673477781.26,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa": [
                    "AWSPREVIOUS"
                ],
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb": [
                    "AWSCURRENT",
                    "AWSPENDING"
                ]
            },
            "OwningService": "rds",
            "RotationEnabled": true,
            "CreatedDate": 1673467300.7,
            "LastAccessedDate": 1673395200.0,
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-a1b2c3",
            "Description": "Secret associated with primary RDS DB cluster:
        }
    ]
}
```
For more information, see [Secrets managed by other services](https://docs.aws.amazon.com/secretsmanager/latest/userguide/using-secrets-fromother-services.html) in the Secrets Manager User Guide.

- For API details, see [ListSecrets](https://docs.aws.amazon.com/cli/latest/reference/secretsmanager/list-secrets.html) in AWS CLI Command Reference.

### put-resource-policy

The following code example shows how to use `put-resource-policy`.

**AWS CLI**

To add a resource-based policy to a secret

```bash
aws secretsmanager put-resource-policy \
  --secret-id MyTestSecret \
  --resource-policy file://mypolicy.json \
  --block-public-policy
```

Contents of `mypolicy.json`:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:role/MyRole"
      },
      "Action": "secretsmanager:GetSecretValue",
      "Resource": "*
    }
  ]
}
```

Output:

```json
{
```
"ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
"Name": "MyTestSecret"
}

For more information, see Attach a permissions policy to a secret in the Secrets Manager User Guide.

• For API details, see PutResourcePolicy in AWS CLI Command Reference.

put-secret-value

The following code example shows how to use put-secret-value.

AWS CLI

Example 1: To store a new secret value in a secret

The following put-secret-value example creates a new version of a secret with two key-value pairs.

```bash
aws secretsmanager put-secret-value \
   --secret-id MyTestSecret \
   --secret-string "{"user":"diegor","password":"EXAMPLE-PASSWORD"}"
```

Output:

```json
{
   "Name": "MyTestSecret",
   "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "VersionStages": [
      "AWSCURRENT"
   ]
}
```

For more information, see Modify a secret in the Secrets Manager User Guide.

Example 2: To store a new secret value from credentials in a JSON file
The following put-secret-value example creates a new version of a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the AWS CLI User Guide.

```
aws secretsmanager put-secret-value \
  --secret-id MyTestSecret \
  --secret-string file://mycreds.json
```

Contents of mycreds.json:

```json
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```json
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "VersionStages": [
    "AWSCURRENT"
  ]
}
```

For more information, see Modify a secret in the Secrets Manager User Guide.

- For API details, see PutSecretValue in AWS CLI Command Reference.

remove-regions-from-replication

The following code example shows how to use remove-regions-from-replication.

AWS CLI

To delete a replica secret
The following remove-regions-from-replication example deletes a replica secret in eu-west-3. To delete a primary secret that is replicated to other regions, first delete the replicas and then call delete-secret.

```bash
aws secretsmanager remove-regions-from-replication \
   --secret-id MyTestSecret \
   --remove-replica-regions eu-west-3
```

Output:

```json
{
   "ReplicationStatus": []
}
```

For more information, see Delete a replica secret in the Secrets Manager User Guide.

- For API details, see RemoveRegionsFromReplication in AWS CLI Command Reference.

replicate-secret-to-regions

The following code example shows how to use replicate-secret-to-regions.

AWS CLI

To replicate a secret to another region

The following replicate-secret-to-regions example replicates a secret to eu-west-3. The replica is encrypted with the AWS managed key aws/secretsmanager.

```bash
aws secretsmanager replicate-secret-to-regions \
   --secret-id MyTestSecret \
   --add-replica-regions Region=eu-west-3
```

Output:

```json
{
   "ReplicationStatus": []
}
```
For more information, see Replicate a secret to another Region in the Secrets Manager User Guide.

- For API details, see ReplicateSecretToRegions in AWS CLI Command Reference.

**restore-secret**

The following code example shows how to use restore-secret.

**AWS CLI**

**To restore a previously deleted secret**

The following restore-secret example restores a secret that was previously scheduled for deletion.

```bash
aws secretsmanager restore-secret \
  --secret-id MyTestSecret
```

Output:

```
{
   "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
   "Name": "MyTestSecret"
}
```

For more information, see Delete a secret in the Secrets Manager User Guide.

- For API details, see RestoreSecret in AWS CLI Command Reference.

**rotate-secret**

The following code example shows how to use rotate-secret.
**AWS CLI**

**Example 1: To configure and start automatic rotation for a secret**

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every eight hours in a two hour window. The output shows the VersionId of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
  --secret-id MyTestDatabaseSecret \
  --rotation-lambda-arn arn:aws:lambda:us-west-2:123456789012:function:SecretsManagerTestRotationLambda \
  --rotation-rules "{"ScheduleExpression": "cron(0 8/8 * * ? *)", "Duration": "2h"}"
```

Output:

```
{
  "ARN": "aws:arn:secretsmanager:us-west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
  "Name": "MyTestDatabaseSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Rotate secrets](https://docs.aws.amazon.com/secretsmanager/latest/userguide/rotate-secrets.html) in the *Secrets Manager User Guide*.

**Example 2: To configure and start automatic rotation on a rotation interval**

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every 10 days. The output shows the VersionId of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
  --secret-id MyTestDatabaseSecret \
  --rotation-lambda-arn arn:aws:lambda:us-west-2:123456789012:function:SecretsManagerTestRotationLambda \
  --rotation-rules "{"ScheduleExpression": "rate(10 days)"}"
```

Output:

```
{
}
```
For more information, see [Rotate secrets](#) in the Secrets [Manager User Guide](#).

**Example 3: To rotate a secret immediately**

The following `rotate-secret` example starts an immediate rotation. The output shows the `VersionId` of the new secret version created by rotation. The secret must already have rotation configured.

```bash
aws secretsmanager rotate-secret \
  --secret-id MyTestDatabaseSecret
```

**Output:**

```json
{
  "ARN": "aws:arn:secretsmanager:us-west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
  "Name": "MyTestDatabaseSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Rotate secrets](#) in the Secrets [Manager User Guide](#).

- For API details, see [RotateSecret](#) in [AWS CLI Command Reference](#).

**stop-replication-to-replica**

The following code example shows how to use `stop-replication-to-replica`.

**AWS CLI**

**To promote a replica secret to a primary**

The following `stop-replication-to-replica` example removes the link between a replica secret to the primary. The replica secret is promoted to a primary secret in the replica region. You must call `stop-replication-to-replica` from within the replica region.
aws secretsmanager stop-replication-to-replica \\n   --secret-id MyTestSecret

Output:

{
   "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3"
}

For more information, see Promote a replica secret in the Secrets Manager User Guide.

- For API details, see StopReplicationToReplica in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**Example 1: To add a tag to a secret**

The following example shows how to attach a tag with shorthand syntax.

aws secretsmanager tag-resource \\n   --secret-id MyTestSecret \\n   --tags Key=FirstTag,Value=FirstValue

This command produces no output.

For more information, see Tag your secrets in the Secrets Manager User Guide.

**Example 2: To add multiple tags to a secret**

The following tag-resource example attaches two key-value tags to a secret.

aws secretsmanager tag-resource \\n   --secret-id MyTestSecret \\n   --tags "[{{"Key": "FirstTag", "Value": "FirstValue"}, {{"Key": "SecondTag", "Value": "SecondValue"}]}

Actions and scenarios
This command produces no output.

For more information, see Tag secrets in the Secrets Manager User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a secret

The following untag-resource example removes two tags from a secret. For each tag, both key and value are removed.

```bash
aws secretsmanager untag-resource \
--secret-id MyTestSecret \
--tag-keys '[ "FirstTag", "SecondTag"]'
```

This command produces no output.

For more information, see Tag secrets in the Secrets Manager User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-secret-version-stage

The following code example shows how to use update-secret-version-stage.

AWS CLI

Example 1: To revert a secret to the previous version

The following update-secret-version-stage example moves the AWSCURRENT staging label to the previous version of a secret, which reverts the secret to the previous version. To find the ID for the previous version, use list-secret-version-ids. For this example, the version with the AWSCURRENT label is a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 and the version with the AWSPREVIOUS label is a1b2c3d4-5678-90ab-cdef-EXAMPLE22222. In this example, you move the AWSCURRENT label from version 11111 to 22222. Because the AWSCURRENT
label is removed from a version, `update-secret-version-stage` automatically moves the AWSPREVIOUS label to that version (11111). The effect is that the AWSCURRENT and AWSPREVIOUS versions are swapped.

```bash
aws secretsmanager update-secret-version-stage \
  --secret-id MyTestSecret \
  --version-stage AWSCURRENT \
  --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
  --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Version](https://docs.aws.amazon.com/secretsmanager/latest/userguide/) in the *Secrets Manager User Guide*.

**Example 2: To add a staging label attached to a version of a secret**

The following `update-secret-version-stage` example adds a staging label to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the VersionStages response field for the affected version.

```bash
aws secretsmanager update-secret-version-stage \
  --secret-id MyTestSecret \
  --version-stage STAGINGLABEL1 \
  --move-to-version-id EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE
```

Output:

```json
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Version](https://docs.aws.amazon.com/secretsmanager/latest/userguide/) in the *Secrets Manager User Guide*. 
Example 3: To delete a staging label attached to a version of a secret

The following update-secret-version-stage example deletes a staging label that is attached to a version of a secret. You can review the results by running list-secret-version-ids and viewing the VersionStages response field for the affected version.

```bash
aws secretsmanager update-secret-version-stage \
  --secret-id MyTestSecret \
  --version-stage STAGINGLABEL1 \
  --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see Version in the Secrets Manager User Guide.

- For API details, see UpdateSecretVersionStage in AWS CLI Command Reference.

update-secret

The following code example shows how to use update-secret.

AWS CLI

Example 1: To update the description of a secret

The following update-secret example updates the description of a secret.

```bash
aws secretsmanager update-secret \
  --secret-id MyTestSecret \
  --description "This is a new description for the secret."
```

Output:

```json
{
}
```
"ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
   "Name": "MyTestSecret"}
}

For more information, see Modify a secret in the Secrets Manager User Guide.

**Example 2: To update the encryption key associated with a secret**

The following `update-secret` example updates the KMS key used to encrypt the secret value. The KMS key must be in the same region as the secret.

```
aws secretsmanager update-secret \
   --secret-id MyTestSecret \
   --kms-key-id arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE
```

Output:

```
{
   "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
   "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the Secrets Manager User Guide.

- For API details, see `UpdateSecret` in AWS CLI Command Reference.

**validate-resource-policy**

The following code example shows how to use `validate-resource-policy`.

**AWS CLI**

**To validate a resource policy**

The following `validate-resource-policy` example checks that a resource policy doesn't grant broad access to a secret. The policy is read from a file on disk. For more information, see Loading AWS CLI parameters from a file in the AWS CLI User Guide.

```
aws secretsmanager validate-resource-policy \
```
--resource-policy file://mypolicy.json

Contents of mypolicy.json:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
}
```

Output:

```json
{
    "PolicyValidationPassed": true,
    "ValidationErrors": []
}
```

For more information, see Permissions reference for Secrets Manager in the Secrets Manager User Guide.

- For API details, see ValidateResourcePolicy in AWS CLI Command Reference.

Security Hub examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Hub.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

- **Actions**

## Actions

### accept-administrator-invitation

The following code example shows how to use `accept-administrator-invitation`.

**AWS CLI**

```bash
aws securityhub accept-invitation \
   --administrator-id 123456789012 \
   --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see [Managing administrator and member accounts](https://aws.amazon.com/), see in the *AWS Security Hub User Guide*.
- For API details, see [AcceptAdministratorInvitation](https://aws.amazon.com/) in *AWS CLI Command Reference*.

### accept-invitation

The following code example shows how to use `accept-invitation`.

**AWS CLI**

```bash
To accept an invitation from an administrator account
```

The following `accept-invitation` example accepts the specified invitation from the specified administrator account.

```bash
aws securityhub accept-invitation \
   --administrator-id 123456789012 \
   --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see [Managing administrator and member accounts](https://aws.amazon.com/), see in the *AWS Security Hub User Guide*.
- For API details, see [AcceptAdministratorInvitation](https://aws.amazon.com/) in *AWS CLI Command Reference*. 
aws securityhub accept-invitation
   --master-id 123456789012 \
   --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb

This command produces no output.

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

• For API details, see AcceptInvitation in AWS CLI Command Reference.

batch-delete-automation-rules

The following code example shows how to use batch-delete-automation-rules.

AWS CLI

To delete automation rules

The following batch-delete-automation-rules example deletes the specified automation rule. You can delete one or more rules with a single command. Only the Security Hub administrator account can run this command.

aws securityhub batch-delete-automation-rules \
   --automation-rules-arns '["arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'

Output:

```json
{
   "ProcessedAutomationRules": [
      "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
   ],
   "UnprocessedAutomationRules": []
}
```

For more information, see Deleting automation rules in the AWS Security Hub User Guide.

• For API details, see BatchDeleteAutomationRules in AWS CLI Command Reference.
batch-disable-standards

The following code example shows how to use batch-disable-standards.

AWS CLI

To disable a standard

The following batch-disable-standards example disables the standard associated with the specified subscription ARN.

```
aws securityhub batch-disable-standards 
   --standards-subscription-arns "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
   "StandardsSubscriptions": [
      {
         "StandardsArn": "arn:aws:securityhub:eu-central-1::standards/pci-dss/v/3.2.1",
         "StandardsInput": {},
         "StandardsStatus": "DELETING",
         "StandardsSubscriptionArn": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1"
      }
   ]
}
```

For more information, see Disabling or enabling a security standard in the AWS Security Hub User Guide.

- For API details, see BatchDisableStandards in AWS CLI Command Reference.

batch-enable-standards

The following code example shows how to use batch-enable-standards.

AWS CLI

To enable a standard
The following `batch-enable-standards` example enables the PCI DSS standard for the requesting account.

```bash
aws securityhub batch-enable-standards \
   --standards-subscription-requests '{"StandardsArn":"arn:aws:securityhub:us-west-1::standards/pci-dss/v/3.2.1"}'
```

Output:

```json
{
   "StandardsSubscriptions": [
   {
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/v/3.2.1",
      "StandardsInput": {},
      "StandardsStatus": "PENDING",
      "StandardsSubscriptionArn": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1"
   }
   ]
}
```

For more information, see [Disabling or enabling a security standard](https://docs.aws.amazon.com/securityhub/latest/userguide/standards.html) in the *AWS Security Hub User Guide*.

- For API details, see [BatchEnableStandards](https://docs.aws.amazon.com/cli/latest/reference/securityhub/batch-enable-standards.html) in *AWS CLI Command Reference*.

### `batch-get-automation-rules`

The following code example shows how to use `batch-get-automation-rules`.

**AWS CLI**

**To get details for automation rules**

The following `batch-get-automation-rules` example gets details for the specified automation rule. You can get details for one or more automation rules with a single command.

```bash
aws securityhub batch-get-automation-rules \
   --automation-rules-arns '[["arn:aws:securityhub:us-east-1:123456789012:automation-rule/alb2c3d4-5678-90ab-cdef-EXAMPLE11111"]]
```
Output:

```json
{
    "Rules": [
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "Suppress informational findings",
            "Description": "Suppress GuardDuty findings with Informational severity",
            "IsTerminal": false,
            "Criteria": {
                "ProductName": [
                    {
                        "Value": "GuardDuty",
                        "Comparison": "EQUALS"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Value": "INFORMATIONAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "WorkflowStatus": [
                    {
                        "Value": "NEW",
                        "Comparison": "EQUALS"
                    }
                ],
                "RecordState": [
                    {
                        "Value": "ACTIVE",
                        "Comparison": "EQUALS"
                    }
                ]
            },
            "Actions": [
                {
                    "Type": "FINDING_FIELDS_UPDATE",
                    "FindingFieldsUpdate": {
                        "Note": {
                            "Actions and scenarios
                            5740
                        }
                    }
                }
            }
        }
    ]
}
```
Automatically suppress GuardDuty findings with Informational severity,

}
],
"UnprocessedAutomationRules": []
}

For more information, see Viewing automation rules in the AWS Security Hub User Guide.

- For API details, see BatchGetAutomationRules in AWS CLI Command Reference.

**batch-get-configuration-policy-associations**

The following code example shows how to use batch-get-configuration-policy-associations.

**AWS CLI**

**To get configuration association details for a batch of targets**

The following batch-get-configuration-policy-associations example retrieves association details for the specified targets. You can provide account IDs, organizational unit IDs, or the root ID for the target.

```
aws securityhub batch-get-configuration-policy-associations \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

**Output:**

```json
{
```
AWS Command Line Interface

User Guide for Version 2

"ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
"TargetId": "ou-6hi7-8j91kl2m",
"TargetType": "ORGANIZATIONAL_UNIT",
"AssociationType": "APPLIED",
"UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
"AssociationStatus": "SUCCESS",
"AssociationStatusMessage": "Association applied successfully on this target."
}

For more information, see Viewing Security Hub conﬁguration policies in the AWS Security Hub
User Guide.
• For API details, see BatchGetConﬁgurationPolicyAssociations in AWS CLI Command Reference.
batch-get-security-controls
The following code example shows how to use batch-get-security-controls.
AWS CLI
To get security control details
The following batch-get-security-controls example gets details for the security controls
ACM.1 and IAM.1 in the current AWS account and AWS Region.
aws securityhub batch-get-security-controls \
--security-control-ids '["ACM.1", "IAM.1"]'

Output:
{
"SecurityControls": [
{
"SecurityControlId": "ACM.1",
"Title": "Imported and ACM-issued certificates should be renewed after a
specified time period",
"Description": "This control checks whether an AWS Certificate Manager
(ACM) certificate is renewed within the specified time period. It checks both
imported certificates and certificates provided by ACM. The control fails if the
Actions and scenarios

5742


certificate isn't renewed within the specified time period. Unless you provide a custom parameter value for the renewal period, Security Hub uses a default value of 30 days.

"RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/remediation",
"SeverityRating": "MEDIUM",
"SecurityControlStatus": "ENABLED"
"UpdateStatus": "READY",
"Parameters": {
  "daysToExpiration": {
    "ValueType": CUSTOM,
    "Value": {
      "Integer": 15
    }
  }
},
"LastUpdateReason": "Updated control parameter"
},
{
  "SecurityControlId": "IAM.1",
  "Title": "IAM policies should not allow full \"*\" administrative privileges",
  "Description": "This AWS control checks whether the default version of AWS Identity and Access Management (IAM) policies (also known as customer managed policies) do not have administrator access with a statement that has \"Effect\": \"Allow\" with \"Action\": \"*\" over \"Resource\": \"*\". It only checks for the Customer Managed Policies that you created, but not inline and AWS Managed Policies.",
  "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/IAM.1/remediation",
  "SeverityRating": "HIGH",
  "SecurityControlStatus": "ENABLED"
  "UpdateStatus": "READY",
  "Parameters": {}
}
]
}

For more information, see Viewing details for a control in the AWS Security Hub User Guide.

- For API details, see BatchGetSecurityControls in AWS CLI Command Reference.
**batch-get-standards-control-associations**

The following code example shows how to use batch-get-standards-control-associations.

**AWS CLI**

**To get the enablement status of a control**

The following batch-get-standards-control-associations example identifies whether the specified controls are enabled in the specified standards.

```bash
aws securityhub batch-get-standards-control-associations
   --standards-control-association-ids '[["SecurityControlId": "Config.1", "StandardsArn": "arn:aws:securityhub:us-east-1:123456789012:ruleset/cis-aws-foundations-benchmark/v/1.2.0"],
                                           ["SecurityControlId": "IAM.6", "StandardsArn": "arn:aws:securityhub:us-east-1:123456789012:standards/aws-foundational-security-best-practices/v/1.0.0"]]
```

**Output:**

```json
{
   "StandardsControlAssociationDetails": [
       {
           "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0",
           "SecurityControlId": "Config.1",
           "AssociationStatus": "ENABLED",
           "RelatedRequirements": [
               "CIS AWS Foundations 2.5"
           ],
           "UpdatedAt": "2022-10-27T16:07:12.960000+00:00",
           "StandardsControlTitle": "Ensure AWS Config is enabled",
           "StandardsControlDescription": "AWS Config is a web service that performs configuration management of supported AWS resources within your account and delivers log files to you. The recorded information includes the configuration item (AWS resource), relationships between configuration items (AWS resources), and any configuration changes between resources. It is recommended to enable AWS Config in all regions.",
           "StandardsControlArns": [
               "arn:aws:securityhub:us-east-1:068873283051:security-control/Config.1"
           ]
       }
   ]
}
```
For more information, see [Enabling and disabling controls in specific standards](https://docs.aws.amazon.com/securityhub/latest/userguide/) in the [AWS Security Hub User Guide](https://docs.aws.amazon.com/securityhub/latest/userguide/).

### batch-import-findings

The following code example shows how to use `batch-import-findings`.

**AWS CLI**

**To update a finding**

The following `batch-import-findings` example updates a finding.

```
aws securityhub batch-import-findings \
```

--findings '}
  [{
    "AwsAccountId": "123456789012",
    "CreatedAt": "2020-05-27T17:05:54.832Z",
    "Description": "Vulnerability in a CloudTrail trail",
    "FindingProviderFields": {
      "Severity": {
        "Label": "LOW",
        "Original": "10"
      },
      "Types": [
        "Software and Configuration Checks/Vulnerabilities/CVE"
      ]
    },
    "GeneratorId": "TestGeneratorId",
    "Id": "Id1",
    "Resources": [
      {
        "Id": "arn:aws:cloudtrail:us-west-1:123456789012:trail/TrailName",
        "Partition": "aws",
        "Region": "us-west-1",
        "Type": "AwsCloudTrailTrail"
      }
    ],
    "SchemaVersion": "2018-10-08",
    "Title": "CloudTrail trail vulnerability",
    "UpdatedAt": "2020-06-02T16:05:54.832Z"
  }]
]

Output:

{
  "FailedCount": 0,
  "SuccessCount": 1,
  "FailedFindings": []
}

For more information, see Using BatchImportFindings to create and update findings in the AWS Security Hub User Guide.
• For API details, see `BatchImportFindings` in *AWS CLI Command Reference*.

### batch-update-automation-rules

The following code example shows how to use `batch-update-automation-rules`.

**AWS CLI**

**To update automation rules**

The following `batch-update-automation-rules` example updates the specified automation rule. You can update one or more rules with a single command. Only the Security Hub administrator account can run this command.

```bash
aws securityhub batch-update-automation-rules \
   --update-automation-rules-request-items '[
   { 
     "Actions": [{ 
       "Type": "FINDING_FIELDS_UPDATE", 
       "FindingFieldsUpdate": { 
         "Note": { 
           "Text": "Known issue that is a risk", 
           "UpdatedBy": "sechub-automation" 
         }, 
         "Workflow": { 
           "Status": "NEW" 
         } 
       }, 
       "Criteria": { 
         "SeverityLabel": [{ 
           "Value": "LOW", 
           "Comparison": "EQUALS" 
         }], 
         "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", 
         "RuleOrder": 1, 
         "RuleStatus": "DISABLED" 
       } 
   }]
```

**Actions and scenarios**

5747
Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

### batch-update-findings

The following code example shows how to use `batch-update-findings`.

#### AWS CLI

**Example 1: To update a finding**

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it.

```bash
aws securityhub batch-update-findings \
    --note '{"Text": "Known issue that is not a risk.", "UpdatedBy": "user1"}' \
    --severity '{"Label": "LOW"}' \
    --workflow '{"Status": "RESOLVED"}'
```

Output:

```
{
    "ProcessedFindings": [
    
```
For more information, see Using BatchUpdateFindings to update a finding in the AWS Security Hub User Guide.

Example 2: To update a finding using shorthand syntax

The following batch-update-findings example updates two findings to add a note, change the severity label, and resolve it using shorthand syntax.

```
aws securityhub batch-update-findings \
  --note Text="Known issue that is not a risk.",UpdatedBy="user1" \
  --severity Label="LOW" \
  --workflow Status="RESOLVED"
```

Output:

```
{
  "ProcessedFindings": [
    {
      "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
    },
    {
      "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
    }
  ],
  "UnprocessedFindings": []
}
```
For more information, see Using BatchUpdateFindings to update a finding in the AWS Security Hub User Guide.

- For API details, see BatchUpdateFindings in AWS CLI Command Reference.

batch-update-standards-control-associations

The following code example shows how to use batch-update-standards-control-associations.

AWS CLI

To update the enablement status of a control in enabled standards

The following batch-update-standards-control-associations example disables CloudTrail.1 in the specified standards.

```
aws securityhub batch-update-standards-control-associations \
```

This command produces no output when successful.

For more information, see Enabling and disabling controls in specific standards and Enabling and disabling controls in all standards in the AWS Security Hub User Guide.

- For API details, see BatchUpdateStandardsControlAssociations in AWS CLI Command Reference.
create-action-target

The following code example shows how to use create-action-target.

AWS CLI

To create a custom action

The following create-action-target example creates a custom action. It provides the name, description, and identifier for the action.

```bash
aws securityhub create-action-target \
   --name "Send to remediation" \
   --description "Action to send the finding for remediation tracking" \
   --id "Remediation"
```

Output:

```json
{
   "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the AWS Security Hub User Guide.

- For API details, see CreateActionTarget in AWS CLI Command Reference.

create-automation-rule

The following code example shows how to use create-automation-rule.

AWS CLI

To create an automation rule

The following create-automation-rule example creates an automation rule in the current AWS account and AWS Region. Security Hub filters your findings based on the specified criteria and applies the actions to matching findings. Only the Security Hub administrator account can run this command.

```bash
aws securityhub create-automation-rule \
```

Actions and scenarios
--actions '[[ "Type": "FINDING_FIELDS_UPDATE", "FindingFieldsUpdate": { "Severity": { "Label": "HIGH" }, "Note": { "Text": "Known issue that is a risk. Updated by automation rules", "UpdatedBy": "sechub-automation" } } ]]

--criteria '{ "SeverityLabel": [{ "Value": "INFORMATIONAL", "Comparison": "EQUALS" }]

--description "A sample rule"
--no-is-terminal
--rule-name "sample rule"
--rule-order 1
--rule-status "ENABLED"

Output:

{
   "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}

For more information, see Creating automation rules in the AWS Security Hub User Guide.

- For API details, see CreateAutomationRule in AWS CLI Command Reference.

create-configuration-policy

The following code example shows how to use create-configuration-policy.

AWS CLI

To create a configuration policy
The following `create-configuration-policy` example creates a configuration policy with the specified settings.

```bash
aws securityhub create-configuration-policy \
  --name "SampleConfigurationPolicy" \
  --description "SampleDescription" \
  --tags '{"Environment": "Prod"}'
```

Output:

```json
{
  "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "Name": "SampleConfigurationPolicy",
  "Description": "SampleDescription",
  "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
  "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
  "ConfigurationPolicy": {
    "SecurityHub": {
      "ServiceEnabled": true,
      "EnabledStandardIdentifiers": [
        "arn:aws:securityhub:eu-central-1::standards/aws-foundational-security-best-practices/v/1.0.0",
        "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0"
      ],
      "SecurityControlsConfiguration": {
        "DisabledSecurityControlIdentifiers": ["CloudTrail.2"],
        "SecurityControlCustomParameters": [
          {"SecurityControlId": "ACM.1", "Parameters": {
            "daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer": 15}}}}
        ]
      }
    }
  }
}
```
"daysToExpiration": {
    "ValueType": "CUSTOM",
    "Value": {
        "Integer": 15
    }
}

For more information, see Enabling finding aggregation in the AWS Security Hub User Guide.

- For API details, see CreateFindingAggregator in AWS CLI Command Reference.

create-insight

The following code example shows how to use create-insight.

AWS CLI

To create a custom insight

The following create-insight example creates a custom insight named Critical role findings that returns critical findings that are related to AWS roles.

```bash
aws securityhub create-insight \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}], \
        "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' \ 
    --group-by-attribute "ResourceId" \ 
    --name "Critical role findings"
```

Output:

```json
{
    "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Managing custom insights in the AWS Security Hub User Guide.

- For API details, see CreateInsight in AWS CLI Command Reference.

create-members

The following code example shows how to use create-members.
AWS CLI

To add accounts as member accounts

The following `create-members` example adds two accounts as member accounts to the requesting administrator account.

```bash
aws securityhub create-members \
   --account-details '[{"AccountId": "123456789111"}, {'AccountID": "123456789222"}]
```

Output:

```json
{
   "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see CreateMembers in AWS CLI Command Reference.

decline-invitations

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to be a member account

The following `decline-invitations` example declines an invitation to be a member account of the specified administrator account. The member account is the requesting account.

```bash
aws securityhub decline-invitations \
   --account-ids "123456789012"
```

Output:

```json
{
   "UnprocessedAccounts": []
}
```
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see DeclineInvitations in AWS CLI Command Reference.

delete-action-target

The following code example shows how to use delete-action-target.

AWS CLI

To delete a custom action

The following delete-action-target example deletes the custom action identified by the specified ARN.

```
aws securityhub delete-action-target \
```

Output:

```
{
   "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the AWS Security Hub User Guide.

- For API details, see DeleteActionTarget in AWS CLI Command Reference.

delete-configuration-policy

The following code example shows how to use delete-configuration-policy.

AWS CLI

To delete a configuration policy

The following delete-configuration-policy example deletes the specified configuration policy.
aws securityhub delete-configuration-policy \
  --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"

This command produces no output.

For more information, see Deleting and disassociating Security Hub configuration policies in the AWS Security Hub User Guide.

• For API details, see DeleteConfigurationPolicy in AWS CLI Command Reference.

delete-finding-aggregator

The following code example shows how to use delete-finding-aggregator.

AWS CLI

To stop finding aggregation

The following delete-finding-aggregator example stops finding aggregation. It is run from US East (Virginia), which is the aggregation Region.

aws securityhub delete-finding-aggregator \
  --region us-east-1 \
  --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000

This command produces no output.

For more information, see Stopping finding aggregation in the AWS Security Hub User Guide.

• For API details, see DeleteFindingAggregator in AWS CLI Command Reference.

delete-insight

The following code example shows how to use delete-insight.

AWS CLI

To delete a custom insight
The following delete-insight example deletes the custom insight with the specified ARN.

```bash
aws securityhub delete-insight \
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```json
{
  "InsightArn": "arn:aws:securityhub:eu-central-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Managing custom insights in the AWS Security Hub User Guide.

- For API details, see DeleteInsight in AWS CLI Command Reference.

**delete-invitations**

The following code example shows how to use delete-invitations.

**AWS CLI**

**To delete an invitation to be a member account**

The following delete-invitations example deletes an invitation to be a member account for the specified administrator account. The member account is the requesting account.

```bash
aws securityhub delete-invitations \
  --account-ids "123456789012"
```

Output:

```json
{
  "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.
delete-members

The following code example shows how to use delete-members.

**AWS CLI**

**To delete member accounts**

The following `delete-members` example deletes the specified member accounts from the requesting administrator account.

```bash
aws securityhub delete-members \
   --account-ids "123456789111" "123456789222"
```

Output:

```json
{
   "UnprocessedAccounts": []
}
```

For more information, see [Managing administrator and member accounts](https://docs.aws.amazon.com/securityhub/latest/userguide/administer-member-accounts.html) in the *AWS Security Hub User Guide*.

- For API details, see **DeleteMembers** in *AWS CLI Command Reference*.

---
describe-action-targets

The following code example shows how to use `describe-action-targets`.

**AWS CLI**

**To retrieve details about custom actions**

The following `describe-action-targets` example retrieves information about the custom action identified by the specified ARN.

```bash
aws securityhub describe-action-targets \
```
Output:

```json
{
   "ActionTargets": [
   {
   "Description": "Action to send the finding for remediation tracking",
   "Name": "Send to remediation"
   }
   ]
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the AWS Security Hub User Guide.

- For API details, see DescribeActionTargets in AWS CLI Command Reference.

**describe-hub**

The following code example shows how to use describe-hub.

**AWS CLI**

**To get information about a hub resource**

The following describe-hub example returns the subscription date for the specified hub resource. The hub resource is identified by its ARN.

```
aws securityhub describe-hub \
   --hub-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```json
{
   "SubscribedAt": "2019-11-19T23:15:10.046Z"
}
```

For more information, see AWS::SecurityHub::Hub in the AWS CloudFormation User Guide.

- For API details, see DescribeHub in AWS CLI Command Reference.
describe-organization-configuration

The following code example shows how to use describe-organization-configuration.

AWS CLI

To view how Security Hub is configured for an organization

The following describe-organization-configuration example returns information about the way an organization is configured in Security Hub. In this example, the organization uses central configuration. Only the Security Hub administrator account can run this command.

aws securityhub describe-organization-configuration

Output:

```
{
    "AutoEnable": false,
    "MemberAccountLimitReached": false,
    "AutoEnableStandards": "NONE",
    "OrganizationConfiguration": {
        "ConfigurationType": "LOCAL",
        "Status": "ENABLED",
        "StatusMessage": "Central configuration has been enabled successfully"
    }
}
```

For more information, see Managing accounts with AWS Organizations in the AWS Security Hub User Guide.

- For API details, see DescribeOrganizationConfiguration in AWS CLI Command Reference.

describe-products

The following code example shows how to use describe-products.

AWS CLI

To return information about available product integrations

The following describe-products example returns the available product integrations one at a time.
aws securityhub describe-products
   --max-results 1

Output:

```json
{
   "NextToken": "U2FsdGVkX18vvPlOqb7RDzWRWVFBJI46M0l1Ab+nZmRjRoRiZNoRiZgm13sdQEn30/pq/78dGs+KpgA+7HMPHO0qX33/zoRI+uIg/F9yLNhC0zOWzFudy36JcXLQj3RPNn/cD1SVkGA98qI3zPOSdGg=",
   "Products": [
      {
         "ProductName": "CrowdStrike Falcon",
         "CompanyName": "CrowdStrike",
         "Description": "CrowdStrike Falcon's single lightweight sensor unifies next-gen antivirus, endpoint detection and response, and 24/7 managed hunting, via the cloud."
         "Categories": [
            "Endpoint Detection and Response (EDR)",
            "AV Scanning and Sandboxing",
            "Threat Intelligence Feeds and Reports",
            "Endpoint Forensics",
            "Network Forensics"
         ],
         "IntegrationTypes": ["SEND_FINDINGS_TO_SECURITY_HUB"]
      },
      "MarketplaceUrl": "https://aws.amazon.com/marketplace/seller-profile?id=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "ActivationUrl": "https://falcon.crowdstrike.com/support/documentation",
   }
}
```
The following code example shows how to use `describe-standards-controls`.

**AWS CLI**

To request the list of controls in an enabled standard

The following `describe-standards-controls` example requests the list of controls in the requestor account's subscription to the PCI DSS standard. The request returns two controls at a time.

```bash
aws securityhub describe-standards-controls \
   --standards-subscription-arn "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1" \
   --max-results 2
```

**Output:**

```json
{
   "Controls": [
   {
   "ControlStatus": "ENABLED",

For more information, see Viewing details for controls in the AWS Security Hub User Guide.

- For API details, see DescribeStandardsControls in AWS CLI Command Reference.

describe-standards

The following code example shows how to use describe-standards.

AWS CLI

To return a list of available standards
The following `describe-standards` example returns the list of available standards.

```
aws securityhub describe-standards
```

Output:

```
{
   "Standards": [
   {
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/aws-foundational-security-best-practices/v/1.0.0",
      "Name": "AWS Foundational Security Best Practices v1.0.0",
      "Description": "The AWS Foundational Security Best Practices standard is a set of automated security checks that detect when AWS accounts and deployed resources do not align to security best practices. The standard is defined by AWS security experts. This curated set of controls helps improve your security posture in AWS, and cover AWS's most popular and foundational services.",
      "EnabledByDefault": true
   },
   {
      "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0",
      "Name": "CIS AWS Foundations Benchmark v1.2.0",
      "Description": "The Center for Internet Security (CIS) AWS Foundations Benchmark v1.2.0 is a set of security configuration best practices for AWS. This Security Hub standard automatically checks for your compliance readiness against a subset of CIS requirements.",
      "EnabledByDefault": true
   },
   {
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/v/3.2.1",
      "Name": "PCI DSS v3.2.1",
      "Description": "The Payment Card Industry Data Security Standard (PCI DSS) v3.2.1 is an information security standard for entities that store, process, and/or transmit cardholder data. This Security Hub standard automatically checks for your compliance readiness against a subset of PCI DSS requirements."
   }
   ]
}
```

- For API details, see DescribeStandards in AWS CLI Command Reference.

`disable-import-findings-for-product`

The following code example shows how to use `disable-import-findings-for-product`.

**AWS CLI**

**To stop receiving findings from a product integration**

The following `disable-import-findings-for-product` example disables the flow of findings for the specified subscription to a product integration.

```
aws securityhub disable-import-findings-for-product \
```

This command produces no output.

For more information, see Managing product integrations in the AWS Security Hub User Guide.
- For API details, see DisableImportFindingsForProduct in AWS CLI Command Reference.

`disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

**AWS CLI**

**To remove a Security Hub administrator account**

The following `disable-organization-admin-account` example revokes the specified account's assignment as a Security Hub administrator account for AWS Organizations.

```
aws securityhub disable-organization-admin-account \
--admin-account-id 777788889999
```

This command produces no output.
For more information, see Designating a Security Hub administrator account in the AWS Security Hub User Guide.

- For API details, see DisableOrganizationAdminAccount in AWS CLI Command Reference.

**disable-security-hub**

The following code example shows how to use disable-security-hub.

**AWS CLI**

**To disable AWS Security Hub**

The following disable-security-hub example disables AWS Security Hub for the requesting account.

```bash
aws securityhub disable-security-hub
```

This command produces no output.

For more information, see Disabling AWS Security Hub in the AWS Security Hub User Guide.

- For API details, see DisableSecurityHub in AWS CLI Command Reference.

**disassociate-from-administrator-account**

The following code example shows how to use disassociate-from-administrator-account.

**AWS CLI**

**To disassociate from an administrator account**

The following disassociate-from-administrator-account example disassociates the requesting account from its current administrator account.

```bash
aws securityhub disassociate-from-administrator-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.
disassociate-from-master-account

The following code example shows how to use disassociate-from-master-account.

AWS CLI

To disassociate from an administrator account

The following disassociate-from-master-account example disassociates the requesting account from its current administrator account.

```bash
aws securityhub disassociate-from-master-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see DisassociateFromMasterAccount in AWS CLI Command Reference.

disassociate-members

The following code example shows how to use disassociate-members.

AWS CLI

To disassociate member accounts

The following disassociate-members example disassociates the specified member accounts from the requesting administrator account.

```bash
aws securityhub disassociate-members \   --account-ids "123456789111" "123456789222"
```

This command produces no output.

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see DisassociateMembers in AWS CLI Command Reference.
**enable-import-findings-for-product**

The following code example shows how to use `enable-import-findings-for-product`.

**AWS CLI**

**To start receiving findings from a product integration**

The following `enable-import-findings-for-product` example enables the flow of findings from the specified product integration.

```
aws securityhub enable-import-findings-for-product \
```

Output:

```
{
  "ProductSubscriptionArn": "arn:aws:securityhub:us-east-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon"
}
```

- For API details, see [EnableImportFindingsForProduct](https://docs.aws.amazon.com/cli/latest/reference/securityhub/enable-import-findings-for-product.html) in *AWS CLI Command Reference*.

**enable-organization-admin-account**

The following code example shows how to use `enable-organization-admin-account`.

**AWS CLI**

**To designate an organization account as a Security Hub administrator account**

The following `enable-organization-admin-account` example designates the specified account as a Security Hub administrator account.

```
aws securityhub enable-organization-admin-account \
  --admin-account-id 777788889999
```

This command produces no output.
For more information, see Designating a Security Hub administrator account in the AWS Security Hub User Guide.

- For API details, see EnableOrganizationAdminAccount in AWS CLI Command Reference.

**enable-security-hub**

The following code example shows how to use enable-security-hub.

**AWS CLI**

To enable AWS Security Hub

The following enable-security-hub example enables AWS Security Hub for the requesting account. It configures Security Hub to enable the default standards. For the hub resource, it assigns the value Security to the tag Department.

```bash
aws securityhub enable-security-hub \
  --enable-default-standards \
  --tags '{"Department": "Security"}"
```

This command produces no output.

For more information, see Enabling Security Hub in the AWS Security Hub User Guide.

- For API details, see EnableSecurityHub in AWS CLI Command Reference.

**get-administrator-account**

The following code example shows how to use get-administrator-account.

**AWS CLI**

To retrieve information about an administrator account

The following get-administrator-account example retrieves information about the administrator account for the requesting account.

```bash
aws securityhub get-administrator-account
```

Output:
get-configuration-policy-association

The following code example shows how to use get-configuration-policy-association.

AWS CLI

To get configuration association details for a target

The following get-configuration-policy-association example retrieves association details for the specified target. You can provide an account ID, organizational unit ID, or the root ID for the target.

```bash
aws securityhub get-configuration-policy-association \
--target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```json
{
  "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
  "TargetId": "ou-6hi7-8j91kl2m",
  "TargetType": "ORGANIZATIONAL_UNIT",
  "AssociationType": "APPLIED",
  "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
  "AssociationStatus": "SUCCESS",
  "AssociationStatusMessage": "Association applied successfully on this target."
}
```
For more information, see Viewing Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see GetConfigurationPolicyAssociation in AWS CLI Command Reference.

get-configuration-policy

The following code example shows how to use get-configuration-policy.

AWS CLI

To view configuration policy details

The following get-configuration-policy example retrieves details about the specified configuration policy.

```
aws securityhub get-configuration-policy \
   --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/\n   a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
   "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/\n   a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "Id": "ce5ed1e7-9639-4e2f-9313-fa87fcef944b",
   "Name": "SampleConfigurationPolicy",
   "Description": "SampleDescription",
   "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
   "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
   "ConfigurationPolicy": {
      "SecurityHub": {
         "ServiceEnabled": true,
         "EnabledStandardIdentifiers": [
            "arn:aws:securityhub:eu-central-1::standards/aws-foundational-security-best-practices/v/1.0.0",
            "arn:aws:securityhub::ruleset/cis-aws-foundations-benchmark/v/1.2.0"
         ],
         "SecurityControlsConfiguration": {
            "DisabledSecurityControlIdentifiers": ["CloudTrail.2"]
         }
      }
   }
}
```
For more information, see Viewing Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see GetConfigurationPolicy in AWS CLI Command Reference.

get-enabled-standards

The following code example shows how to use get-enabled-standards.

AWS CLI

To retrieve information about an enabled standard

The following get-enabled-standards example retrieves information about the PCI DSS standard.

```bash
aws securityhub get-enabled-standards \
--standards-subscription-arn "arn:aws:securityhub:us-west-1:123456789012:subscription pci-dss/v/3.2.1"
```

Output:

```json
{
   "StandardsSubscriptions": [
      {
```

- For API details, see GetEnabledStandards in AWS CLI Command Reference.

get-finding-aggregator

The following code example shows how to use get-finding-aggregator.

AWS CLI

To retrieve the current finding aggregation configuration

The following get-finding-aggregator example retrieves the current finding aggregation configuration.

```bash
aws securityhub get-finding-aggregator \
   --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000
```

Output:

```json
{
   "FindingAggregationRegion": "us-east-1",
   "RegionLinkingMode": "SPECIFIED_REGIONS",
   "Regions": "us-west-1,us-west-2"
}
```

For more information, see Viewing the current finding aggregation configuration in the AWS Security Hub User Guide.
get-finding-history

The following code example shows how to use get-finding-history.

AWS CLI

To get finding history

The following get-finding-history example gets up to the last 90 days of history for the specified finding. In this example, the results are limited to two records of finding history.

```bash
aws securityhub get-finding-history \
   --finding-identifier Id="arn:aws:securityhub:us-east-1:123456789012:security-control/S3.17finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",ProductArn="arn:aws:securityhub:us-east-1::product/aws/securityhub"
```

Output:

```json
{
   "Records": [
   {
      "FindingIdentifier": {
         "Id": "arn:aws:securityhub:us-east-1:123456789012:security-control/S3.17finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
         "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/securityhub"
      },

For more information, see [Finding history](#) in the [AWS Security Hub User Guide](#).

- For API details, see [GetFindingHistory](#) in [AWS CLI Command Reference](#).
get-findings

The following code example shows how to use get-findings.

AWS CLI

Example 1: To return findings generated for a specific standard

The following get-findings example returns findings for the PCI DSS standard.

```bash
aws securityhub get-findings \
   --filters '{"GeneratorId":[{"Value": "pci-dss","Comparison":"PREFIX"}]}' \
   --max-items 1
```

Output:

```json
{
   "Findings": [
      {
         "SchemaVersion": "2018-10-08",
         "Id": "arn:aws:securityhub:eu-central-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",

**get-insight-results**

The following code example shows how to use `get-insight-results`:
AWS CLI

To retrieve the results for an insight

The following `get-insight-results` example returns the list of insight results for the insight with the specified ARN.

```bash
aws securityhub get-insight-results \
   --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```json
{
   "InsightResults": {
      "GroupByAttribute": "ResourceId",
      "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "ResultValues": [
         {
            "Count": 10,
            "GroupByAttributeValue": "AWS::::Account:123456789111"
         },
         {
            "Count": 3,
            "GroupByAttributeValue": "AWS::::Account:123456789222"
         }
      ]
   }
}
```

For more information, see [Viewing and taking action on insight results and findings](https://docs.aws.amazon.com/securityhub/latest/userguide/view-results.html) in the *AWS Security Hub User Guide*.

- For API details, see [GetInsightResults](https://docs.aws.amazon.com/cli/latest/reference/securityhub/get-insight-results.html) in *AWS CLI Command Reference*.

get-insights

The following code example shows how to use `get-insights`.
AWS CLI

To retrieve details about an insight

The following `get-insights` example retrieves the configuration details for the insight with the specified ARN.

```
aws securityhub get-insights \
  --insight-arns "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
  "Insights": [
    {
      "Filters": {
        "ResourceType": [
          {
            "Comparison": "EQUALS",
            "Value": "AwsIamRole"
          }
        ],
        "SeverityLabel": [
          {
            "Comparison": "EQUALS",
            "Value": "CRITICAL"
          }
        ],
        "GroupByAttribute": "ResourceId",
        "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "Critical role findings"
      }
    }
  ]
}
```

- For API details, see [GetInsights](https://docs.aws.amazon.com/cli/latest/reference/securityhub/get-insights.html) in *AWS CLI Command Reference*. 
get-invitations-count

The following code example shows how to use get-invitations-count.

AWS CLI

To retrieve the number of invitations that were not accepted

The following get-invitations-count example retrieves the number of invitations that the requesting account declined or did not respond to.

```
aws securityhub get-invitations-count
```

Output:

```json
{
   "InvitationsCount": 3
}
```

For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see GetInvitationsCount in AWS CLI Command Reference.

get-master-account

The following code example shows how to use get-master-account.

AWS CLI

To retrieve information about an administrator account

The following get-master-account example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-master-account
```

Output:

```json
{
```
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see GetMasterAccount in AWS CLI Command Reference.

get-members

The following code example shows how to use get-members.

AWS CLI

To retrieve information about selected member accounts

The following get-members example retrieves information about the specified member accounts.

```
aws securityhub get-members \
   --account-ids "444455556666" "777788889999"
```

Output:

```
{
   "Members": [
       {
           "AccountId": "123456789111",
           "AdministratorId": "123456789012",
           "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
           "MasterId": "123456789012",
           "MemberStatus": "ASSOCIATED",
           "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
       }
   ]
}
```
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see GetMembers in AWS CLI Command Reference.

get-security-control-definition

The following code example shows how to use get-security-control-definition.

AWS CLI

To get security control definition details

The following get-security-control-definition example retrieves definition details for a Security Hub security control. Details include the control title, description, Region availability, parameters, and other information.

```bash
aws securityhub get-security-control-definition --security-control-id ACM.1
```

Output:

```
{
   "SecurityControlDefinition": {
      "SecurityControlId": "ACM.1",
      "Title": "Imported and ACM-issued certificates should be renewed after a specified time period",
      "Description": "This control checks whether an AWS Certificate Manager (ACM) certificate is renewed within the specified time period. It checks both imported certificates and certificates provided by ACM. The control fails if the certificate isn't renewed within the specified time period. Unless you provide a
```

Actions and scenarios 5787
custom parameter value for the renewal period, Security Hub uses a default value of 30 days.

    "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/remediation",
    "SeverityRating": "MEDIUM",
    "CurrentRegionAvailability": "AVAILABLE",
    "ParameterDefinitions": {
      "daysToExpiration": {
        "Description": "Number of days within which the ACM certificate must be renewed",
        "ConfigurationOptions": {
          "Integer": {
            "DefaultValue": 30,
            "Min": 14,
            "Max": 365
          }
        }
      }
    }

For more information, see Custom control parameters in the AWS Security Hub User Guide.

- For API details, see GetSecurityControlDefinition in AWS CLI Command Reference.

**invite-members**

The following code example shows how to use invite-members.

**AWS CLI**

**To send invitations to member accounts**

The following invite-members example sends invitations to the specified member accounts.

```bash
aws securityhub invite-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```json
{
    "UnprocessedAccounts": []
}
```
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see InviteMembers in AWS CLI Command Reference.

list-automation-rules

The following code example shows how to use list-automation-rules.

AWS CLI

To view a list of automation rules

The following list-automation-rules example lists the automation rules for an AWS account. Only the Security Hub administrator account can run this command.

```bash
aws securityhub list-automation-rules \
   --max-results 3 \
   --next-token NULL
```

Output:

```json
{
   "AutomationRulesMetadata": [
      {
         "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "RuleStatus": "ENABLED",
         "RuleOrder": 1,
         "RuleName": "Suppress informational findings",
         "Description": "Suppress GuardDuty findings with Informational severity",
         "IsTerminal": false,
         "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
         "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
         "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
      },
      {
         "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
         "RuleStatus": "ENABLED",
         "RuleOrder": 2,
         "RuleName": "Suppress critical findings",
         "Description": "Suppress GuardDuty findings with Critical severity",
         "IsTerminal": true,
         "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
         "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
         "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
      }
   ]
}
```

list-configuration-policies

The following code example shows how to use `list-configuration-policies`.

**AWS CLI**

To list configuration policy summaries

The following `list-configuration-policies` example lists a summary of configuration policies for the organization.

```bash
aws securityhub list-configuration-policies \
--max-items 3
```

Output:
For more information, see Viewing Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see ListConfigurationPolicies in AWS CLI Command Reference.

list-configuration-policy-associations

The following code example shows how to use list-configuration-policy-associations.

AWS CLI

To list configuration associations
The following `list-configuration-policy-associations` example lists a summary of configuration associations for the organization. The response include associations with configuration policies and self-managed behavior.

```bash
aws securityhub list-configuration-policy-associations
   --association-type "APPLIED" \
   --max-items 4
```

Output:

```json
{
   "ConfigurationPolicyAssociationSummaries": [
   {
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TargetId": "r-1ab2",
      "TargetType": "ROOT",
      "AssociationType": "APPLIED",
      "UpdatedAt": "2023-11-28T19:26:49.417000+00:00",
      "AssociationStatus": "FAILED",
      "AssociationStatusMessage": "Policy association failed because 2 organizational units or accounts under this root failed."
   },
   {
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "TargetId": "ou-1ab2-c3de4f5g",
      "TargetType": "ORGANIZATIONAL_UNIT",
      "AssociationType": "APPLIED",
      "UpdatedAt": "2023-09-26T21:14:05.283000+00:00",
      "AssociationStatus": "FAILED",
      "AssociationStatusMessage": "One or more children under this target failed association."
   },
   {
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
      "TargetId": "ou-6hi7-8j91k12m",
      "TargetType": "ORGANIZATIONAL_UNIT",
      "AssociationType": "APPLIED",
      "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
      "AssociationStatus": "SUCCESS",
      "AssociationStatusMessage": "Association applied successfully on this target."
   }
   ]
}
```
For more information, see Viewing Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see ListConfigurationPolicyAssociations in AWS CLI Command Reference.

list-enabled-products-for-import

The following code example shows how to use list-enabled-products-for-import.

AWS CLI

To return the list of enabled product integrations

The following list-enabled-products-for-import example returns the list of subscription ARNS for the currently enabled product integrations.

```
aws securityhub list-enabled-products-for-import
```

Output:

```
{
}
```

For more information, see Managing product integrations in the AWS Security Hub User Guide.

- For API details, see ListEnabledProductsForImport in AWS CLI Command Reference.

list-finding-aggregators

The following code example shows how to use list-finding-aggregators.
To list the available widgets

The following `list-finding-aggregators` example returns the ARN of the finding aggregation configuration.

```
aws securityhub list-finding-aggregators
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000"
}
```

For more information, see [Viewing the current finding aggregation configuration](https://docs.aws.amazon.com/securityhub/latest/userguide/security-hub-view-current-aggregation-configuration.html) in the *AWS Security Hub User Guide*.

- For API details, see [ListFindingAggregators](https://docs.aws.amazon.com/cli/latest/reference/securityhub/list-finding-aggregators.html) in *AWS CLI Command Reference*.

list-invitations

The following code example shows how to use `list-invitations`.

**AWS CLI**

To display a list of invitations

The following `list-invitations` example retrieves the list of invitations sent to the requesting account.

```
aws securityhub list-invitations
```

Output:

```
{
    "Invitations": [
    {
        "AccountId": "123456789012",
```

Actions and scenarios
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see ListInvitations in AWS CLI Command Reference.

**list-members**

The following code example shows how to use list-members.

**AWS CLI**

To retrieve a list of member accounts

The following list-members example returns the list of member accounts for the requesting administrator account.

```
aws securityhub list-members
```

Output:

```json
{
  "Members": [
    {
      "AccountId": "123456789111",
      "AdministratorId": "123456789012",
      "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
      "MasterId": "123456789012",
      "MemberStatus": "ASSOCIATED",
      "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
    },
    {
      "AccountId": "123456789222",
      "AdministratorId": "123456789012",
      "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
      "MasterId": "123456789012",
      "MemberStatus": "ASSOCIATED",
      "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
    }
  ]
}
```
For more information, see Managing administrator and member accounts in the AWS Security Hub User Guide.

- For API details, see ListMembers in AWS CLI Command Reference.

list-organization-admin-accounts

The following code example shows how to use list-organization-admin-accounts.

AWS CLI

To list the designated Security Hub administrator accounts

The following list-organization-admin-accounts example lists the Security Hub administrator accounts for an organization.

aws securityhub list-organization-admin-accounts

Output:

```
{
    "AdminAccounts": [
        { "AccountId": "777788889999" },
        { "Status": "ENABLED" }
    ]
}
```

For more information, see Designating a Security Hub administrator account in the AWS Security Hub User Guide.

- For API details, see ListOrganizationAdminAccounts in AWS CLI Command Reference.

list-security-control-definitions

The following code example shows how to use list-security-control-definitions.
Example 1: To list all available security controls

The following `list-security-control-definitions` example lists the available security controls across all Security Hub standards. This example limits the results to three controls.

```bash
aws securityhub list-security-control-definitions \
  --max-items 3
```

Output:

```json
{
  "SecurityControlDefinitions": [
    {
      "SecurityControlId": "ACM.1",
      "Title": "Imported and ACM-issued certificates should be renewed after a specified time period",
      "Description": "This control checks whether an AWS Certificate Manager (ACM) certificate is renewed within the specified time period. It checks both imported certificates and certificates provided by ACM. The control fails if the certificate isn't renewed within the specified time period. Unless you provide a custom parameter value for the renewal period, Security Hub uses a default value of 30 days.",
      "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/remediation",
      "SeverityRating": "MEDIUM",
      "CurrentRegionAvailability": "AVAILABLE",
      "CustomizableProperties": [
        "Parameters"
      ]
    },
    {
      "SecurityControlId": "ACM.2",
      "Title": "RSA certificates managed by ACM should use a key length of at least 2,048 bits",
      "Description": "This control checks whether RSA certificates managed by AWS Certificate Manager use a key length of at least 2,048 bits. The control fails if the key length is smaller than 2,048 bits.",
      "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.2/remediation",
      "SeverityRating": "HIGH",
      "CurrentRegionAvailability": "AVAILABLE",
      "CustomizableProperties": [
        "Parameters"
      ]
    }
  ]
}
```
"CustomizableProperties": []
},
{
    "SecurityControlId": "APIGateway.1",
    "Title": "API Gateway REST and WebSocket API execution logging should be enabled",
    "Description": "This control checks whether all stages of an Amazon API Gateway REST or WebSocket API have logging enabled. The control fails if the 'loggingLevel' isn't 'ERROR' or 'INFO' for all stages of the API. Unless you provide custom parameter values to indicate that a specific log type should be enabled, Security Hub produces a passed finding if the logging level is either 'ERROR' or 'INFO'.",
    "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/APIGateway.1/remediation",
    "SeverityRating": "MEDIUM",

}

For more information, see Viewing details for a standard in the AWS Security Hub User Guide.

Example 2: To list available security controls for a specific standard

The following list-security-control-definitions example lists the available security controls for the CIS AWS Foundations Benchmark v1.4.0. This example limits the results to three controls.

```bash
aws securityhub list-security-control-definitions \
    --standards-arn "arn:aws:securityhub:us-east-1::standards/cis-aws-foundations-benchmark/v/1.4.0" \
    --max-items 3
```

Output:

```json
{
```
"SecurityControlDefinitions": [ 
{
 "SecurityControlId": "CloudTrail.1",
 "Title": "CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events",

}
list-standards-control-associations

The following code example shows how to use list-standards-control-associations.

AWS CLI

To get the enablement status of a control in each enabled standard

The following list-standards-control-associations example lists the enablement status of CloudTrail.1 in each enabled standard.

```bash
aws securityhub list-standards-control-associations \
   --security-control-id CloudTrail.1
```

Output:

```json
{
   "StandardsControlAssociationSummaries": [
      {
         "StandardsArn": "arn:aws:securityhub:us-east-2::standards/nist-800-53/v/5.0.0",

            "NIST.800-53.r5 SI-4(20)",
            "NIST.800-53.r5 SI-7(8)",
            "NIST.800-53.r5 SA-8(22)"
         ]
      }
   ]
}
```
CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events.

This AWS control checks that there is at least one multi-region AWS CloudTrail trail includes read and write management events.

AWS CloudTrail is a web service that records AWS API calls for your account and delivers log files to you. The recorded information includes the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service.

CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events.

This AWS control checks that there is at least one multi-region AWS CloudTrail trail includes read and write management events.

Alternative compensating controls are in place.
"StandardsArn": "arn:aws:securityhub:us-east-2::standards/cis-aws-foundations-benchmark/v/1.4.0",

    "StandardsControlTitle": "Ensure CloudTrail is enabled in all regions",
    "StandardsControlDescription": "AWS CloudTrail is a web service that records AWS API calls for your account and delivers log files to you. The recorded information includes the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service. CloudTrail provides a history of AWS API calls for an account, including API calls made via the Management Console, SDKs, command line tools, and higher-level AWS services (such as CloudFormation)."
  }
]
}

- For API details, see [ListStandardsControlAssociations](https://docs.aws.amazon.com/cli/latest/reference/securityhub/list-standards-control-associations.html) in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To retrieve the tags assigned to a resource**

The following `list-tags-for-resource` example returns the tags assigned to the specified hub resource.

```
aws securityhub list-tags-for-resource \
```

Output:
For more information, see AWS::SecurityHub::Hub in the AWS CloudFormation User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**start-configuration-policy-association**

The following code example shows how to use start-configuration-policy-association.

**AWS CLI**

**Example 1: To associate a configuration policy**

The following start-configuration-policy-association example associates the specified configuration policy with the specified organizational unit. A configuration may be associated with a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-association \
  --configuration-policy-identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
  --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

**Output:**

```
{
  "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
  "TargetId": "ou-6hi7-8j91kl2m",
  "TargetType": "ORGANIZATIONAL_UNIT",
  "AssociationType": "APPLIED",
  "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
  "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the AWS Security Hub User Guide.
Example 2: To associate a self-managed configuration

The following start-configuration-policy-association example associates a self-managed configuration with the specified account.

```bash
aws securityhub start-configuration-policy-association \
   --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
   --target '{"OrganizationalUnitId": "123456789012"}'
```

Output:

```json
{
    "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
    "TargetId": "123456789012",
    "TargetType": "ACCOUNT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see StartConfigurationPolicyAssociation in AWS CLI Command Reference.

start-configuration-policy-disassociation

The following code example shows how to use start-configuration-policy-disassociation.

**AWS CLI**

**Example 1: To disassociate a configuration policy**

The following start-configuration-policy-disassociation example disassociates a configuration policy from the specified organizational unit. A configuration may be disassociated from a target account, organizational unit, or the root.

```bash
aws securityhub start-configuration-policy-disassociation \
   --configuration-policy-identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
```
This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the AWS Security Hub User Guide.

Example 2: To disassociate a self-managed configuration

The following start-configuration-policy-disassociation example disassociates a self-managed configuration from the specified account.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"AccountId": "123456789012"}';
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the AWS Security Hub User Guide.

- For API details, see StartConfigurationPolicyDisassociation in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To assign a tag to a resource

The following tag-resource example assigns values for the Department and Area tags to the specified hub resource.

```
aws securityhub tag-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
    --tags '{"Department":"Operations", "Area":"USMidwest"}';
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the AWS CloudFormation User Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag value from a resource

The following untag-resource example removes the Department tag from the specified hub resource.

```
aws securityhub untag-resource \
   --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
   --tag-keys "Department"
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the AWS CloudFormation User Guide.
- For API details, see UntagResource in AWS CLI Command Reference.

update-action-target

The following code example shows how to use update-action-target.

AWS CLI

To update a custom action

The following update-action-target example updates the name of the custom action identified by the specified ARN.

```
aws securityhub update-action-target \
   --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/Remediation" \
   --name "Send to remediation"
```

This command produces no output.

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the AWS Security Hub User Guide.
update-configuration-policy

The following code example shows how to use update-configuration-policy.

AWS CLI

To update a configuration policy

The following update-configuration-policy example updates an existing configuration policy to use the specified settings.

```bash
aws securityhub update-configuration-policy \
  --identifier "arn:aws:securityhub:eu-central-1:508236694226:configuration-policy/09f37766-57d8-4ede-9d33-5d8b0fecf70e" \
  --name "SampleConfigurationPolicyUpdated" \
  --description "SampleDescriptionUpdated" \
  --configuration-policy '{"SecurityHub": {"ServiceEnabled": true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-central-1::standards/aws-foundational-security-best-practices/v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0"],"SecurityControlsConfiguration": {"DisabledSecurityControlIdentifiers": ["CloudWatch.1"], "SecurityControlCustomParameters": [{"SecurityControlId": "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer": 21}}}]}}}' \
  --updated-reason "Disabling CloudWatch.1 and changing parameter value"
```

Output:

```json
{
  "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
  "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
  "Name": "SampleConfigurationPolicyUpdated",
  "Description": "SampleDescriptionUpdated",
  "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
  "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
  "ConfigurationPolicy": {
    "SecurityHub": {
      "ServiceEnabled": true,
      "EnabledStandardIdentifiers": [
```
For more information, see Updating Security Hub configuration policies in the AWS Security Hub User Guide.

- For API details, see UpdateConfigurationPolicy in AWS CLI Command Reference.

**update-finding-aggregator**

The following code example shows how to use update-finding-aggregator.

**AWS CLI**

To update the current finding aggregation configuration

The following update-finding-aggregator example changes the finding aggregation configuration to link from selected Regions. It is run from US East (Virginia), which is the
aggregation Region. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```bash
aws securityhub update-finding-aggregator \
  --region us-east-1 \
  --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000 \n  --region-linking-mode SPECIFIED_REGIONS \
  --regions us-west-1,us-west-2
```

This command produces no output.

For more information, see [Updating the finding aggregation configuration](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateFindingAggregator](#) in *AWS CLI Command Reference*.

**update-insight**

The following code example shows how to use `update-insight`.

**AWS CLI**

**Example 1: To change the filter for a custom insight**

The following `update-insight` example changes the filters for a custom insight. The updated insight looks for findings with a high severity that are related to AWS roles.

```bash
aws securityhub update-insight \
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \n  --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}], "SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' \
  --name "High severity role findings"
```

**Example 2: To change the grouping attribute for a custom insight**

The following `update-insight` example changes the grouping attribute for the custom insight with the specified ARN. The new grouping attribute is the resource ID.

```bash
aws securityhub update-insight \
```
--insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \ 
--group-by-attribute "ResourceId" \ 
--name "Critical role findings"

Output:

```json
{
   "Insights": [
       {
           "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
           "Name": "Critical role findings",
           "Filters": {
               "SeverityLabel": [
                   {
                       "Value": "CRITICAL",
                       "Comparison": "EQUALS"
                   }
               ],
               "ResourceType": [
                   {
                       "Value": "AwsIamRole",
                       "Comparison": "EQUALS"
                   }
               ],
               "GroupByAttribute": "ResourceId"
           }
       }
   ]
}
```

For more information, see [Managing custom insights](#) in the AWS Security Hub User Guide.

- For API details, see [UpdateInsight](#) in AWS CLI Command Reference.

**update-organization-configuration**

The following code example shows how to use update-organization-configuration.
**AWS CLI**

**To update how Security Hub is configured for an organization**

The following update-organization-configuration example specifies that Security Hub should use central configuration to configure an organization. After running this command, the delegated Security Hub administrator can create and manage configuration policies to configure the organization. The delegated administrator can also use this command to switch from central to local configuration. If local configuration is the configuration type, the delegated administrator can choose whether to automatically enable Security Hub and default security standards in new organization accounts.

```bash
aws securityhub update-organization-configuration \
   --no-auto-enable \
   --organization-configuration '"
   "ConfigurationType": "CENTRAL"
"
```

This command produces no output.

For more information, see [Managing accounts with AWS Organizations](https://docs.aws.amazon.com/securityhub/latest/userguide/), in the [AWS Security Hub User Guide](https://docs.aws.amazon.com/securityhub/latest/userguide/).  

**update-security-control**

The following code example shows how to use update-security-control.

**AWS CLI**

**To update security control properties**

The following update-security-control example specifies custom values for a Security Hub security control parameter.

```bash
aws securityhub update-security-control \
   --security-control-id ACM.1 \
   --parameters '"
   "daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer": 
   15}}," 
   --last-update-reason "Internal compliance requirement"
```

This command produces no output.
For more information, see Custom control parameters in the AWS Security Hub User Guide.

- For API details, see UpdateSecurityControl in AWS CLI Command Reference.

update-security-hub-configuration

The following code example shows how to use update-security-hub-configuration.

AWS CLI

To update Security Hub configuration

The following update-security-hub-configuration example configures Security Hub to automatically enable new controls for enabled standards.

```bash
aws securityhub update-security-hub-configuration \
  --auto-enable-controls
```

This command produces no output.

For more information, see Enabling new controls automatically in the AWS Security Hub User Guide.

- For API details, see UpdateSecurityHubConfiguration in AWS CLI Command Reference.

update-standards-control

The following code example shows how to use update-standards-control.

AWS CLI

Example 1: To disable a control

The following update-standards-control example disables the PCI.AutoScaling.1 control.

```bash
aws securityhub update-standards-control \
  --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
  --control-status "DISABLED" \
  --disabled-reason "Not applicable for my service"
```

This command produces no output.
Example 2: To enable a control

The following `update-standards-control` example enables the PCI.AutoScaling.1 control.

```bash
aws securityhub update-standards-control \
  --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-
  dss/v/3.2.1/PCI.AutoScaling.1" \
  --control-status "ENABLED"
```

This command produces no output.

For more information, see [Disabling and enabling individual controls](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateStandardsControl](#) in *AWS CLI Command Reference*.

AWS Serverless Application Repository examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Serverless Application Repository.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

**put-application-policy**

The following code example shows how to use `put-application-policy`. 
**AWS CLI**

**Example 1: To share an application publicly**

The following `put-application-policy` shares an application publicly, so anyone can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
   --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-test-application \
   --statements Principals='*',Actions=Deploy
```

Output:

```
{
   "Statements": [
      {
         "Actions": [
            "Deploy"
         ],
         "Principals": [],
         "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
      }
   ]
}
```

**Example 2: To share an application privately**

The following `put-application-policy` shares an application privately, so only specific AWS accounts can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
   --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-test-application \
   --statements Principals=111111111111,222222222222,Actions=Deploy
```

Output:

```
{
   "Statements": [

```

Actions and scenarios

5814
For more information, see [Sharing an Application Through the Console](https://docs.aws.amazon.com/serverless-application-framework/latest/developer-guide/sharing-apps.html) in the *AWS Serverless Application Repository Developer Guide*

- For API details, see [PutApplicationPolicy](https://docs.aws.amazon.com/cli/latest/reference/servicecatalog/put-application-policy.html) in *AWS CLI Command Reference*.

### Service Catalog examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Catalog.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

### Actions

**accept-portfolio-share**

The following code example shows how to use `accept-portfolio-share`.
AWS CLI

### To accept a portfolio share

The following `accept-portfolio-share` example accepts an offer, made by another user, to share the specified portfolio.

```
aws servicecatalog accept-portfolio-share \\n  --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see [AcceptPortfolioShare](#) in *AWS CLI Command Reference*.

### associate-principal-with-portfolio

The following code example shows how to use `associate-principal-with-portfolio`.

**AWS CLI**

### To associate a principal with a portfolio

The following `associate-principal-with-portfolio` example associates a user with the specified portfolio.

```
aws servicecatalog associate-principal-with-portfolio \\n  --portfolio-id port-2s6abcdefwdh4 \\n  --principal-arn arn:aws:iam::123456789012:user/usertest \\n  --principal-type IAM
```

This command produces no output.

- For API details, see [AssociatePrincipalWithPortfolio](#) in *AWS CLI Command Reference*.

### associate-product-with-portfolio

The following code example shows how to use `associate-product-with-portfolio`.

**AWS CLI**

### To associate a product with a portfolio
The following `associate-product-with-portfolio` example associates the given product with the specified portfolio.

```bash
cat
aws servicecatalog associate-product-with-portfolio
   --product-id prod-3p5abcdef3oyk
   --portfolio-id port-2s6abcdef5wdh4
```

This command produces no output.

- For API details, see `AssociateProductWithPortfolio` in *AWS CLI Command Reference*.

### associate-tag-option-with-resource

The following code example shows how to use `associate-tag-option-with-resource`.

**AWS CLI**

**To associate a TagOption with a resource**

The following `associate-tag-option-with-resource` example associates the specified TagOption with the specified resource.

```bash
cat
aws servicecatalog associate-tag-option-with-resource
   --resource-id port-2s6abcdq5wdh4
   --tag-option-id tag-p3abc2pkp5qc
```

This command produces no output.

- For API details, see `AssociateTagOptionWithResource` in *AWS CLI Command Reference*.

### copy-product

The following code example shows how to use `copy-product`.

**AWS CLI**

**To copy a product**

The following `copy-product` example makes a copy of the specified product, using a JSON file to pass parameters.

```bash
cat
```
Contents of copy-product-input.json:

```
{
    "TargetProductName": "copy-of-myproduct",
    "CopyOptions": [
        "CopyTags"
    ]
}
```

Output:

```
{
    "CopyProductToken": "copyproduct-abc5defgkdji"
}
```

- For API details, see [CopyProduct](https://awscli.amazonaws.com/cliv2/docs/servicecatalog-copy_product.html) in *AWS CLI Command Reference*.

**create-portfolio-share**

The following code example shows how to use `create-portfolio-share`.

**AWS CLI**

**To share a portfolio with an account**

The following `create-portfolio-share` example shares the specified portfolio with the specified account.

```
aws servicecatalog create-portfolio-share \
    --portfolio-id port-2s6abcdef5wdh4 \
    --account-id 794123456789
```

This command produces no output.

- For API details, see [CreatePortfolioShare](https://awscli.amazonaws.com/cliv2/docs/servicecatalog_create_portfolio_share.html) in *AWS CLI Command Reference*.

**create-portfolio**

The following code example shows how to use `create-portfolio`.
AWS CLI

To create a portfolio

The following create-portfolio example creates a portfolio.

```bash
aws servicecatalog create-portfolio
    --provider-name my-provider
    --display-name my-portfolio
```

Output:

```
{
    "PortfolioDetail": {
        "ProviderName": "my-provider",
        "DisplayName": "my-portfolio",
        "CreatedTime": 1571337221.555,
        "Id": "port-2s6xmplq5wdh4"
    }
}
```

- For API details, see [CreatePortfolio](#) in *AWS CLI Command Reference*.

create-product

The following code example shows how to use create-product.

AWS CLI

To create a product

The following create-product example creates a product, using a JSON file to pass parameters.

```bash
aws servicecatalog create-product
    --cli-input-json file://create-product-input.json
```

Contents of create-product-input.json:
{  "AcceptLanguage": "en",  "Name": "test-product",  "Owner": "test-owner",  "Description": "test-description",  "Distributor": "test-distributor",  "SupportDescription": "test-support",  "SupportEmail": "test@amazon.com",  "SupportUrl": "https://aws.amazon.com",  "ProductType": "CLOUD_FORMATION_TEMPLATE",  "Tags": [  {    "Key": "region",    "Value": "us-east-1"  }  ],  "ProvisioningArtifactParameters": {  "Name": "test-version-name",  "Description": "test-version-description",  "Info": {    "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-us-west-1/my-cfn-template.template"  },  "Type": "CLOUD_FORMATION_TEMPLATE"  }}

Output:

{  "Tags": [  {    "Key": "region",    "Value": "us-east-1"  }  ],  "ProductViewDetail": {  "CreatedTime": 1576025036.0,  "ProductARN": "arn:aws:catalog:us-west-2:1234568542028:product/prod-3p5abcdef3oyk",  "Status": "CREATED",  "ProductViewSummary": {  "Type": "CLOUD_FORMATION_TEMPLATE"  }}

Actions and scenarios
For API details, see CreateProduct in AWS CLI Command Reference.

create-provisioning-artifact

The following code example shows how to use create-provisioning-artifact.

AWS CLI

To create a provisioning artifact

The following create-provisioning-artifact example creates a provisioning artifact, using a JSON file to pass parameters.

```bash
aws servicecatalog create-provisioning-artifact \   --cli-input-json file://create-provisioning-artifact-input.json
```

Contents of create-provisioning-artifact-input.json:

```json
{
    "ProductId": "prod-nfi2abcdefghi",
    ...
}
```
"Parameters": {
  "Name": "test-provisioning-artifact",
  "Description": "test description",
  "Info": {
    "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-us-west-1/my-cfn-template.template",
    "Type": "CLOUD_FORMATION_TEMPLATE"
  }
}

Output:

{
  "Info": {
    "TemplateUrl": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-us-west-1/my-cfn-template.template",
    "Status": "CREATING",
    "ProvisioningArtifactDetail": {
      "Id": "pa-bb4abcdefwnaio",
      "Name": "test-provisioning-artifact",
      "Description": "test description",
      "Active": true,
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "CreatedTime": 1576022545.0
    }
  }
}

- For API details, see CreateProvisioningArtifact in AWS CLI Command Reference.

create-tag-option

The following code example shows how to use create-tag-option.

AWS CLI

To create a TagOption

The following create-tag-option example creates a TagOption.

aws servicecatalog create-tag-option
Output:

```
{
    "TagOptionDetail": {
        "Id": "tag-iabcdn4fzjjms",
        "Value": "name",
        "Active": true,
        "Key": "1234"
    }
}
```

- For API details, see CreateTagOption in AWS CLI Command Reference.

**delete-portfolio-share**

The following code example shows how to use delete-portfolio-share.

**AWS CLI**

**To stop sharing a portfolio with an account**

The following delete-portfolio-share example stops sharing the portfolio with the specified account.

```
aws servicecatalog delete-portfolio-share \
    --portfolio-id port-2s6abcdq5wdh4 \
    --account-id 123456789012
```

This command produces no output.

- For API details, see DeletePortfolioShare in AWS CLI Command Reference.

**delete-portfolio**

The following code example shows how to use delete-portfolio.

**AWS CLI**

**To delete a portfolio**
The following `delete-portfolio` example deletes the specified portfolio.

```bash
aws servicecatalog delete-portfolio \
   --id port-abcdlx4gox4do
```

This command produces no output.

- For API details, see `DeletePortfolio` in *AWS CLI Command Reference*.

### delete-product

The following code example shows how to use `delete-product`.

**AWS CLI**

**To delete a product**

The following `delete-product` example deletes the specified product.

```bash
aws servicecatalog delete-product \
   --id prod-abcdcek6yhbxi
```

This command produces no output.

- For API details, see `DeleteProduct` in *AWS CLI Command Reference*.

### delete-provisioning-artifact

The following code example shows how to use `delete-provisioning-artifact`.

**AWS CLI**

**To delete a provisioning artifact**

The following `delete-provisioning-artifact` example deletes the specified provisioning artifact.

```bash
aws servicecatalog delete-provisioning-artifact \
   --product-id prod-abc2uebuplcpw \
   --provisioning-artifact-id pa-pqabcddii7ouc
```

This command produces no output.
For API details, see `DeleteProvisioningArtifact` in `AWS CLI Command Reference`.

**delete-tag-option**

The following code example shows how to use `delete-tag-option`.

**AWS CLI**

**To delete a TagOption**

The following `delete-tag-option` example deletes the specified TagOption.

```
aws servicecatalog delete-tag-option \
  --id tag-iabcdn4fzjjms
```

This command produces no output.

For API details, see `DeleteTagOption` in `AWS CLI Command Reference`.

**describe-copy-product-status**

The following code example shows how to use `describe-copy-product-status`.

**AWS CLI**

**To describe the status of the copy product operation**

The following `describe-copy-product-status` example displays the current status of the specified asynchronous copy product operation.

```
aws servicecatalog describe-copy-product-status \
  --copy-product-token copyproduct-znn5tf5abcd3w
```

Output:

```
{
  "CopyProductStatus": "SUCCEEDED",
  "TargetProductId": "prod-os6hog7abcdt2"
}
```

For API details, see `DescribeCopyProductStatus` in `AWS CLI Command Reference`.
describe-portfolio

The following code example shows how to use describe-portfolio.

**AWS CLI**

**To describe a portfolio**

The following describe-portfolio example displays details for the specified portfolio.

```bash
aws servicecatalog describe-portfolio \
    --id port-2s6abcdq5wdh4
```

Output:

```json
{
    "TagOptions": [],
    "PortfolioDetail": {
        "Id": "port-2s6wuzyq5wdh4",
        "CreatedTime": 1571337221.555,
        "DisplayName": "my-portfolio",
        "ProviderName": "my-provider"
    },
    "Tags": []
}
```

- For API details, see [DescribePortfolio](https://docs.aws.amazon.com/cli/latest/reference/servicecatalog/describe-portfolio.html) in *AWS CLI Command Reference*.

**describe-product-as-admin**

The following code example shows how to use describe-product-as-admin.

**AWS CLI**

**To describe a product as an administrator**

The following describe-product-as-admin example displays details for the specified product using administrator privileges.

```bash
aws servicecatalog describe-product-as-admin \
    --id prod-2s6abcdq5wdh4
```
--id prod-abcdcek6yhbxi

Output:

```json
{
  "TagOptions": [],
  "ProductViewDetail": {
    "ProductViewSummary": {
      "SupportEmail": "test@amazon.com",
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "Distributor": "test-distributor",
      "ShortDescription": "test-description",
      "Owner": "test-owner",
      "Id": "prodview-wi3l2j4abc6vc",
      "SupportDescription": "test-support",
      "ProductId": "prod-abcdcek6yhbxi",
      "HasDefaultPath": false,
      "Name": "test-product3",
      "SupportUrl": "https://aws.amazon.com"
    },

    "Status": "CREATED"
  },
  "ProvisioningArtifactSummaries": [
    {
      "CreatedTime": 1577136715.0,
      "Description": "test-version-description",
      "ProvisioningArtifactMetadata": {
        "SourceProvisioningArtifactId": "pa-abcdxkkiv5fcm"
      },
      "Name": "test-version-name-3",
      "Id": "pa-abcdxkkiv5fcm"
    }
  ],
  "Tags": [
    {
      "Value": "iad",
      "Key": "region"
    }
  ]
}
```
describe-provisioned-product

The following code example shows how to use describe-provisioned-product.

**AWS CLI**

**To describe a provisioned product**

The following describe-provisioned-product example displays details for the specified provisioned product.

```bash
aws servicecatalog describe-provisioned-product \
  --id pp-dpom27bm4abcd
```

**Output:**

```json
{
  "ProvisionedProductDetail": {
    "Status": "ERROR",
    "CreatedTime": 1577222793.358,
    "Id": "pp-dpom27bm4abcd",
    "StatusMessage": "AmazonCloudFormationException Parameters: [KeyName] must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code: ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",

    "LastRecordId": "rec-tfuawdjozvxge",
    "Type": "CFN_STACK",
    "Name": "mytestppname3"
  },
  "CloudWatchDashboards": []
}
```

• For API details, see **DescribeProvisionedProduct** in *AWS CLI Command Reference*.

describe-provisioning-artifact

The following code example shows how to use describe-provisioning-artifact.
AWS CLI

To describe a provisioning artifact

The following describe-provisioning-artifact example displays details for the specified provisioning artifact.

```bash
aws servicecatalog describe-provisioning-artifact \
--provisioning-artifact-id pa-pcz347abcdcfm \
--product-id prod-abcdfl3syn2rg
```

Output:

```json
{
   "Info": {
      "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/myexampledevelopment-environment.template"
   },
   "ProvisioningArtifactDetail": {
      "Id": "pa-pcz347abcdcfm",
      "Active": true,
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "Description": "updated description",
      "CreatedTime": 1562097906.0,
      "Name": "updated name"
   },
   "Status": "AVAILABLE"
}
```

- For API details, see [DescribeProvisioningArtifact](http://awscli.amazonaws.com/v2/documentation/api/2017/06/14/servicecatalog.html#servicecatalog:DescribeProvisioningArtifact) in AWS CLI Command Reference.

describe-tag-option

The following code example shows how to use describe-tag-option.

AWS CLI

To describe a TagOption

The following describe-tag-option example displays details for the specified TagOption.

```bash
aws servicecatalog describe-tag-option \
```
--id tag-p3tej2abcd5qc

Output:

```
{
  "TagOptionDetail": {
    "Active": true,
    "Id": "tag-p3tej2abcd5qc",
    "Value": "value-3",
    "Key": "1234"
  }
}
```

- For API details, see [DescribeTagOption](#) in *AWS CLI Command Reference*.

### disassociate-principal-from-portfolio

The following code example shows how to use `disassociate-principal-from-portfolio`.

**AWS CLI**

**To disassociate a principal from a portfolio**

The following `disassociate-principal-from-portfolio` example disassociates the specified principal from the portfolio.

```
aws servicecatalog disassociate-principal-from-portfolio \
  --portfolio-id port-2s6abcdq5wdh4 \
  --principal-arn arn:aws:iam::123456789012:group/myendusers
```

This command produces no output.

- For API details, see [DisassociatePrincipalFromPortfolio](#) in *AWS CLI Command Reference*.

### disassociate-product-from-portfolio

The following code example shows how to use `disassociate-product-from-portfolio`.

**AWS CLI**

**To disassociate a product from a portfolio**
The following disassociate-product-from-portfolio example disassociates the specified product from the portfolio.

```
aws servicecatalog disassociate-product-from-portfolio
   --product-id prod-3p5abcdmu3oyk
   --portfolio-id port-2s6abcdq5wdh4
```

This command produces no output.

- For API details, see DisassociateProductFromPortfolio in AWS CLI Command Reference.

**disassociate-tag-option-from-resource**

The following code example shows how to use disassociate-tag-option-from-resource.

**AWS CLI**

To disassociate a TagOption from a resource

The following disassociate-tag-option-from-resource example disassociates the specified TagOption from the resource.

```
aws servicecatalog disassociate-tag-option-from-resource
   --resource-id port-2s6abcdq5wdh4
   --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see DisassociateTagOptionFromResource in AWS CLI Command Reference.

**list-accepted-portfolio-shares**

The following code example shows how to use list-accepted-portfolio-shares.

**AWS CLI**

To list accepted portfolio shares

The following list-accepted-portfolio-shares example lists all portfolios for which sharing was accepted by this account, including only the default Service Catalog portfolios.
aws servicecatalog list-accepted-portfolio-shares \
   --portfolio-share-type "AWS_SERVICECATALOG"

Output:

{
   "PortfolioDetails": [
   {
      "Description": "AWS Service Catalog Reference blueprints for often-used AWS services such as EC2, S3, RDS, VPC and EMR.",
      "CreatedTime": 1574456190.687,
      "ProviderName": "AWS Service Catalog",
      "DisplayName": "Reference Architectures",
      "Id": "port-d2abcd5dpkuma"
   },
   {
      "Description": "AWS well-architected blueprints for high reliability applications.",
      "CreatedTime": 1574461496.092,
      "ProviderName": "AWS Service Catalog",
      "DisplayName": "High Reliability Architectures",
      "Id": "port-abcdefaua7zpu"
   }
   ]
}

• For API details, see ListAcceptedPortfolioShares in AWS CLI Command Reference.

list-portfolio-access

The following code example shows how to use list-portfolio-access.

AWS CLI

To list accounts with access to a portfolio

The following list-portfolio-access example lists the AWS accounts that have access to the specified portfolio.
aws servicecatalog list-portfolio-access \ 
   --portfolio-id port-2s6abcdq5wdh4

Output:

{
   "AccountIds": [
      "123456789012"
   ]
}

• For API details, see ListPortfolioAccess in AWS CLI Command Reference.

list-portfolios-for-product

The following code example shows how to use list-portfolios-for-product.

AWS CLI

To list portfolios associated with a product

The following list-portfolios-for-product example lists the portfolios associated with the specified product.

aws servicecatalog list-portfolios-for-product \ 
   --product-id prod-abcdfz3syn2rg

Output:

{
   "PortfolioDetails": [
      {
         "CreatedTime": 1571337221.555,
         "Id": "port-2s6abcdq5wdh4",
         "DisplayName": "my-portfolio",
         "ProviderName": "my-provider"
      },
      {

Actions and scenarios 5833
list-portfolios

The following code example shows how to use `list-portfolios`.

AWS CLI

To list portfolios

The following `list-portfolios` example lists the Service Catalog portfolios in the current Region.

```
aws servicecatalog list-portfolios
```

Output:

```
{
   "PortfolioDetails": [
        {
            "CreatedTime": 1559665256.348,
            "Id": "port-5abcd3e5st4ei",
            "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/port-5abcd3e5st4ei",
            "DisplayName": "test",
            "ProviderName": "provider-name"
        }]
}
```

For API details, see [ListPortfoliosForProduct](https://docs.aws.amazon.com/cli/latest/reference/servicecatalog/list-portfolios-for-product.html) in *AWS CLI Command Reference*.

For API details, see [ListPortfolios](https://docs.aws.amazon.com/cli/latest/reference/servicecatalog/list-portfolios.html) in *AWS CLI Command Reference*.
list-principals-for-portfolio

The following code example shows how to use list-principals-for-portfolio.

AWS CLI

To list all principals for a portfolio

The following list-principals-for-portfolio example lists all principals for the specified portfolio.

```
aws servicecatalog list-principals-for-portfolio \
  --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
  "Principals": [
    {
      "PrincipalARN": "arn:aws:iam::123456789012:user/usertest",
      "PrincipalType": "IAM"
    }
  ]
}
```

For API details, see ListPrincipalsForPortfolio in AWS CLI Command Reference.

list-provisioning-artifacts

The following code example shows how to use list-provisioning-artifacts.

AWS CLI

To list all provisioning artifacts for a product

The following list-provisioning-artifacts example lists all provisioning artifacts for the specified product.

```
aws servicecatalog list-provisioning-artifacts \
  --product-id prod-nfi2abcdefgcpw
```

Output:
For API details, see ListProvisioningArtifacts in AWS CLI Command Reference.

list-resources-for-tag-option

The following code example shows how to use list-resources-for-tag-option.

AWS CLI

To list resources associated to a TagOption

The following list-resources-for-tag-option example lists the resources associated with the specified TagOption.

```bash
aws servicecatalog list-resources-for-tag-option \
   --tag-option-id tag-p3tej2abcd5qc
```

Output:

```json
{
   "ResourceDetails": [
      {
         "Id": "pa-bbb4zyxwmpaio",
         "Description": "test description",
         "Type": "CLOUD_FORMATION_TEMPLATE",
         "CreatedTime": 1576022545.0,
         "Active": true,
         "Name": "test-provisioning-artifact-2"
      }
   ]
}
```
- For API details, see ListResourcesForTagOption in AWS CLI Command Reference.

**list-tag-options**

The following code example shows how to use list-tag-options.

**AWS CLI**

The following list-tag-options example lists all values for TagOptions.

```bash
aws servicecatalog list-tag-options
```

**Output:**

```json
{
   "TagOptionDetails": [
       {
           "Value": "newvalue",
           "Active": true,
           "Id": "tag-iabcinn4fzjjms",
           "Key": "1234"
       },
       {
           "Value": "value1",
           "Active": true,
           "Id": "tag-e3abcdvmwvzy",
           "Key": "key"
       }
   ]
}
```

- For API details, see ListTagOptions in AWS CLI Command Reference.
**provision-product**

The following code example shows how to use provision-product.

**AWS CLI**

**To provision a product**

The following provision-product example provisions the specified product using the specified provisioning artifact.

```bash
aws servicecatalog provision-product \
    --product-id prod-abcdzf3syn2rg \
    --provisioning-artifact-id pa-abc347pcscdfm \
    --provisioned-product-name "mytestppname3"
```

Output:

```json
{
    "RecordDetail": {
        "RecordId": "rec-tfuawdabcdege",
        "CreatedTime": 1577222793.362,
        "ProvisionedProductId": "pp-abcd27bm4mlq",
        "PathId": "lpv2-abcdg3jp6t5k6",
        "RecordErrors": [],
        "ProductId": "prod-abcdzf3syn2rg",
        "UpdatedTime": 1577222793.362,
        "RecordType": "PROVISION_PRODUCT",
        "ProvisionedProductName": "mytestppname3",
        "ProvisioningArtifactId": "pa-pcz347abcdcfm",
        "RecordTags": [],
        "Status": "CREATED",
        "ProvisionedProductType": "CFN_STACK"
    }
}
```

- For API details, see [ProvisionProduct](#) in AWS CLI Command Reference.

**reject-portfolio-share**

The following code example shows how to use reject-portfolio-share.
AWS CLI

To reject a portfolio share

The following reject-portfolio-share example rejects the portfolio share for the given portfolio.

```bash
aws servicecatalog reject-portfolio-share \
   --portfolio-id port-2s6wuabcdeefghijk
```

This command produces no output.

- For API details, see `RejectPortfolioShare` in *AWS CLI Command Reference*.

scan-provisioned-products

The following code example shows how to use scan-provisioned-products.

AWS CLI

To list all available provisioned products

The following scan-provisioned-products example lists available provisioned products.

```bash
aws servicecatalog scan-provisioned-products
```

Output:

```json
{
   "ProvisionedProducts": [
   {
      "Status": "ERROR",
      "StatusMessage": "AmazonCloudFormationException Parameters: [KeyName] must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code: ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",
      "Id": "pp-abcd27bm4mlaq",
      "Type": "CFN_STACK",
      "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",
      "CreatedTime": 1577222793.358,
....
```
For API details, see `ScanProvisionedProducts` in *AWS CLI Command Reference*.

**search-products-as-admin**

The following code example shows how to use `search-products-as-admin`.

**AWS CLI**

To search products with administrator privileges

The following `search-products-as-admin` example searches for products with admin privileges, using a portfolio ID as a filter.

```
aws servicecatalog search-products-as-admin \n  --portfolio-id port-5abcd3e5st4ei
```

Output:

```
{
   "ProductViewDetails": [
      {
         "ProductViewSummary": {
            "Name": "my product",
            "Owner": "owner name",
            "Type": "CLOUDFORMATIONTemplate",
            "ProductId": "prod-abcdfz3syn2rg",
            "HasDefaultPath": false,
            "Id": "prodview-abcdmyuzv2dlu",
            "ShortDescription": "description"
         },
         "CreatedTime": 1562097906.0,
         "Status": "CREATED"
      }
   ]
}
```
• For API details, see SearchProductsAsAdmin in AWS CLI Command Reference.

**search-provisioned-products**

The following code example shows how to use search-provisioned-products.

**AWS CLI**

**To search provisioned products**

The following search-provisioned-products example searches for provisioned products matching the specified product ID, using a JSON file to pass parameters.

```bash
aws servicecatalog search-provisioned-products \
    --cli-input-json file://search-provisioned-products-input.json
```

Contents of `search-provisioned-products-input.json`:

```json
{
    "Filters": {
        "SearchQuery": [
            "prod-tcjvfz3syn2rg"
        ]
    }
}
```

Output:

```json
{
    "ProvisionedProducts": [
        {
            "ProvisioningArtifactId": "pa-pcz347abcdfcm",
            "Name": "mytestppname3",
            "CreatedTime": 1577222793.358,
            "Id": "pp-abcd27bm4mldq",
            "Status": "ERROR",
            "UserArn": "arn:aws:iam::123456789012:user/cliuser",
            "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName] must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code: ValidationException; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)"
        }
    ]
}
```
"Tags": [
  {
    "Key": "aws:servicecatalog:productArn"
  },

"Type": "CFN_STACK",
"LastRecordId": "rec-tfuawdabcdxge",
"ProductId": "prod-abcdfz3syn2rg"
]
],
"TotalResultsCount": 1
}

• For API details, see SearchProvisionedProducts in AWS CLI Command Reference.
update-portfolio

The following code example shows how to use update-portfolio.

AWS CLI

To update a portfolio

The following update-portfolio example updates the name of the specified portfolio.

```bash
aws servicecatalog update-portfolio \
    --id port-5abcd3e5st4ei \
    --display-name "New portfolio name"
```

Output:

```json
{
    "PortfolioDetail": {
        "DisplayName": "New portfolio name",
        "ProviderName": "provider",
        "Id": "port-5abcd3e5st4ei",
        "CreatedTime": 1559665256.348
    },
    "Tags": []
}
```

- For API details, see UpdatePortfolio in AWS CLI Command Reference.

update-product

The following code example shows how to use update-product.

AWS CLI

To update a product

The following update-product example updates the name and owner of the specified product.

```bash
aws servicecatalog update-product \
```
--id prod-os6abc7drqlt2 \
--name "New product name" \
--owner "Updated product owner"

Output:

```json
{
  "Tags": [
    {
      "Value": "iad",
      "Key": "region"
    }
  ],
  "ProductViewDetail": {
    "ProductViewSummary": {
      "Owner": "Updated product owner",
      "ProductId": "prod-os6abc7drqlt2",
      "Distributor": "test-distributor",
      "SupportUrl": "https://aws.amazon.com",
      "Name": "New product name",
      "ShortDescription": "test-description",
      "HasDefaultPath": false,
      "Id": "prodview-6abcdgrfhvidy",
      "SupportDescription": "test-support",
      "SupportEmail": "test@amazon.com",
      "Type": "CLOUDFORMATIONTEMPLATE"
    },
    "Status": "CREATED",
    "CreatedTime": 1577136255.0
  }
}
```

- For API details, see UpdateProduct in AWS CLI Command Reference.

`update-provisioning-artifact`

The following code example shows how to use update-provisioning-artifact.

**AWS CLI**

To update a provisioning artifact
The following `update-provisioning-artifact` example updates the name and description of the specified provisioning artifact, using a JSON file to pass parameters.

```bash
aws servicecatalog update-provisioning-artifact \
    --cli-input-json file://update-provisioning-artifact-input.json
```

Contents of `update-provisioning-artifact-input.json`:

```json
{
    "ProductId": "prod-abcdfz3syn2rg",
    "ProvisioningArtifactId": "pa-pcz347abcdfcm",
    "Name": "updated name",
    "Description": "updated description"
}
```

Output:

```json
{
    "Info": {
    },
    "Status": "AVAILABLE",
    "ProvisioningArtifactDetail": {
        "Active": true,
        "Description": "updated description",
        "Id": "pa-pcz347abcdfcm",
        "Name": "updated name",
        "Type": "CLOUDFORMATION_TEMPLATE",
        "CreatedTime": 1562097906.0
    }
}
```

- For API details, see [UpdateProvisioningArtifact](awscli/awscli GovCloud US) in [AWS CLI Command Reference](awscli/awscli GovCloud US).

**update-tag-option**

The following code example shows how to use `update-tag-option`.

**AWS CLI**

To update a TagOption
The following update-tag-option example updates the value of a TagOption, using the specified JSON file.

```bash
aws servicecatalog update-tag-option --cli-input-json file://update-tag-option-input.json
```

Contents of `update-tag-option-input.json`:

```json
{
    "Id": "tag-iabcdn4fzjjms",
    "Value": "newvalue",
    "Active": true
}
```

Output:

```json
{
    "TagOptionDetail": {
        "Value": "newvalue",
        "Key": "1234",
        "Active": true,
        "Id": "tag-iabcdn4fzjjms"
    }
}
```

- For API details, see [UpdateTagOption](#) in [AWS CLI Command Reference](#).

**Service Quotas examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Quotas.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
get-aws-default-service-quota

The following code example shows how to use get-aws-default-service-quota.

AWS CLI

To describe a default service quota

The following get-aws-default-service-quota example displays details for the specified quota.

```bash
aws service-quotas get-aws-default-service-quota \
   --service-code ec2 \
   --quota-code L-1216C47A
```

Output:

```json
{
   "Quota": {
      "ServiceCode": "ec2",
      "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
      "QuotaArn": "arn:aws:servicequotas:us-east-2::ec2/L-1216C47A",
      "QuotaCode": "L-1216C47A",
      "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z) instances",
      "Value": 5.0,
      "Unit": "None",
      "Adjustable": true,
      "GlobalQuota": false,
      "UsageMetric": {
         "MetricNamespace": "AWS/Usage",
         "MetricName": "ResourceCount",
         "MetricDimensions": {
            "Class": "Standard/OnDemand",
            "Resource": "vCPU",
            "Service": "EC2",
            "Type": "Resource"  
      
```
For API details, see [GetAwsDefaultServiceQuota](#) in *AWS CLI Command Reference*.

**get-requested-service-quota-change**

The following code example shows how to use `get-requested-service-quota-change`.

**AWS CLI**

To describe a service quota increase request

The following `get-requested-service-quota-change` example describes the specified quota increase request.

```
aws service-quotas get-requested-service-quota-change \
   --request-id d187537d15254312a9609aa51bbf7624u7W49tPO
```

Output:

```json
{
   "RequestedQuota": {
      "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
      "CaseId": "6780195351",
      "ServiceCode": "ec2",
      "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
      "QuotaCode": "L-20F13EBD",
      "QuotaName": "Running Dedicated c5n Hosts",
      "DesiredValue": 2.0,
      "Status": "CASE_OPENED",
      "Created": 1580446904.067,
      "LastUpdated": 1580446953.265,
      "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":\"arn:aws:iam::123456789012:root\"}",
      "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
      "GlobalQuota": false,
      "Unit": "None"
   }
}
```
• For API details, see `GetRequestedServiceQuotaChange` in *AWS CLI Command Reference*.

### get-service-quota

The following code example shows how to use `get-service-quota`.

**AWS CLI**

**To describe a service quota**

The following `get-service-quota` example displays details about the specified quota.

```
aws service-quotas get-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

**Output:**

```json
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z) instances",
        "Value": 1920.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}```
For API details, see `GetServiceQuota` in *AWS CLI Command Reference*.

### list-aws-default-service-quotas

The following code example shows how to use `list-aws-default-service-quotas`.

**AWS CLI**

**To list the default quotas for a service**

The following `list-aws-default-service-quotas` example lists the default values for the quotas for the specified service.

```bash
aws service-quotas list-aws-default-service-quotas --service-code xray
```

**Output:**

```json
{
    "Quotas": [
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-C6B6F05D",
            "QuotaCode": "L-C6B6F05D",
            "QuotaName": "Indexed annotations per trace",
            "Value": 50.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-D781C0FD",
            "QuotaCode": "L-D781C0FD",
            "QuotaName": "Segment document size",
            "Value": 64.0,
        }
    ]
}
```
"Unit": "Kilobytes",
"Adjustable": false,
"GlobalQuota": false
},
{
 "ServiceCode": "xray",
 "ServiceName": "AWS X-Ray",
 "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-998BFF16",
 "QuotaCode": "L-998BFF16",
 "QuotaName": "Trace and service graph retention in days",
 "Value": 30.0,
 "Unit": "None",
 "Adjustable": false,
 "GlobalQuota": false
}
}

For API details, see ListAwsDefaultServiceQuotas in AWS CLI Command Reference.

list-requested-service-quota-change-history-by-quota

The following code example shows how to use list-requested-service-quota-change-history-by-quota.

AWS CLI

To list your quota increase requests

The following list-requested-service-quota-change-history-by-quota example lists the quota increase requests for the specified quota.

```bash
aws service-quotas list-requested-service-quota-change-history-by-quota \
  --service-code ec2 \
  --quota-code L-20F13EBD
```

Output:

```json
{
 "RequestedQuotas": [
 {
  "Id": "d187537d15254312a9609aa51bbf7624u7W49tP0",
```
For API details, see `ListRequestedServiceQuotaChangeHistoryByQuota` in *AWS CLI Command Reference*.

### list-requested-service-quota-change-history

The following code example shows how to use `list-requested-service-quota-change-history`.

**AWS CLI**

**To list your quota increase requests**

The following `list-requested-service-quota-change-history` example lists the quota increase requests for the specified service.

```
aws service-quotas list-requested-service-quota-change-history \
   --service-code ec2
```

**Output:**

```
{
   "RequestedQuotas": [
```
• For API details, see ListRequestedServiceQuotaChangeHistory in AWS CLI Command Reference.

**list-service-quotas**

The following code example shows how to use list-service-quotas.

**AWS CLI**

**To list the quotas for a service**

The following list-service-quotas example displays details about the quotas for AWS CloudFormation.

```bash
aws service-quotas list-service-quotas \
  --service-code cloudformation
```

Output:

```json
{
  "Quotas": [
```
For API details, see ListServiceQuotas in AWS CLI Command Reference.

**list-services**

The following code example shows how to use list-services.

**AWS CLI**

**To list the available services**

The following command lists the services that are available in Service Quotas.

```
aws service-quotas list-services
```

Output:
You can add the `--query` parameter to filter the display to the information that you are interested in. The following example displays only the service codes.

```
aws service-quotas list-services \
   --query Services[*].ServiceCode
```

Output:

```
[  
   "AWSCloudMap",  
   "access-analyzer",  
   "acm",  
   "acm-pca",  
   "amplify",  
   "application-autoscaling",  
   ...truncated...  
   "xray"
]```
request-service-quota-increase

The following code example shows how to use request-service-quota-increase.

AWS CLI

To request a service quota increase

The following request-service-quota-increase example requests an increase in the specified service quota.

```
aws service-quotas request-service-quota-increase \
    --service-code ec2 \
    --quota-code L-20F13EBD \
    --desired-value 2
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "PENDING",
        "Created": 1580446904.067,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":\"arn:aws:iam::123456789012:root\"},",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

• For API details, see RequestServiceQuotaIncrease in AWS CLI Command Reference.
Amazon SES examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

delete-identity

The following code example shows how to use delete-identity.

AWS CLI

To delete an identity

The following example uses the delete-identity command to delete an identity from the list of identities verified with Amazon SES:

```
aws ses delete-identity --identity user@example.com
```

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the Amazon Simple Email Service Developer Guide.
- For API details, see DeletIdentity in AWS CLI Command Reference.

get-identity-dkim-attributes

The following code example shows how to use get-identity-dkim-attributes.
AWS CLI

To get the Amazon SES Easy DKIM attributes for a list of identities

The following example uses the get-identity-dkim-attributes command to retrieve the Amazon SES Easy DKIM attributes for a list of identities:

```bash
aws ses get-identity-dkim-attributes --identities "example.com" "user@example.com"
```

Output:

```json
{
   "DkimAttributes": {
      "example.com": {
         "DkimTokens": [
            "EXAMPLEjcs5xoyqytjsotsijas7236gr",
            "EXAMPLEjr76cvoc6mysspnioorxsn6ep",
            "EXAMPLEkbmkqkh1m2lyz77ppkulerz4k"
         ],
         "DkimEnabled": true,
         "DkimVerificationStatus": "Success"
      },
      "user@example.com": {
         "DkimEnabled": false,
         "DkimVerificationStatus": "NotStarted"
      }
   }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the Amazon Simple Email Service Developer Guide.

- For API details, see GetIdentityDkimAttributes in AWS CLI Command Reference.

get-identity-notification-attributes

The following code example shows how to use get-identity-notification-attributes.
To get the Amazon SES notification attributes for a list of identities

The following example uses the `get-identity-notification-attributes` command to retrieve the Amazon SES notification attributes for a list of identities:

```
aws ses get-identity-notification-attributes --identities "user1@example.com" "user2@example.com"
```

Output:

```
{
   "NotificationAttributes": {
       "user1@example.com": {
           "ForwardingEnabled": false,
           "DeliveryTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic"
       },
       "user2@example.com": {
           "ForwardingEnabled": true
       }
   }
}
```

This command returns the status of email feedback forwarding and, if applicable, the Amazon Resource Names (ARNs) of the Amazon SNS topics that bounce, complaint, and delivery notifications are sent to.

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about notifications, see Using Notifications With Amazon SES in the Amazon Simple Email Service Developer Guide.

- For API details, see `GetIdentityNotificationAttributes` in AWS CLI Command Reference.

get-identity-verification-attributes

The following code example shows how to use `get-identity-verification-attributes`.

AWS CLI

To get the Amazon SES verification status for a list of identities

The following example uses the `get-identity-verification-attributes` command to retrieve the Amazon SES verification status for a list of identities:

```
aws ses get-identity-verification-attributes --identities "user1@example.com" "user2@example.com"
```

Output:

```
{
   "VerificationAttributes": {
      "user1@example.com": {
         "VerificationStatus": "Success"
      },
      "user2@example.com": {
         "VerificationStatus": "Pending"
      }
   }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see `GetIdentityVerificationAttributes` in *AWS CLI Command Reference*.

get-send-quota

The following code example shows how to use `get-send-quota`.

AWS CLI

To get your Amazon SES sending limits

The following example uses the `get-send-quota` command to return your Amazon SES sending limits:
**aws ses get-send-quota**

Output:

```
{
   "Max24HourSend": 200.0,
   "SentLast24Hours": 1.0,
   "MaxSendRate": 1.0
}
```

Max24HourSend is your sending quota, which is the maximum number of emails that you can send in a 24-hour period. The sending quota reflects a rolling time period. Every time you try to send an email, Amazon SES checks how many emails you sent in the previous 24 hours. As long as the total number of emails that you have sent is less than your quota, your send request will be accepted and your email will be sent.

SentLast24Hours is the number of emails that you have sent in the previous 24 hours.

MaxSendRate is the maximum number of emails that you can send per second.

Note that sending limits are based on recipients rather than on messages. For example, an email that has 10 recipients counts as 10 against your sending quota.

For more information, see Managing Your Amazon SES Sending Limits in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetSendQuota](https://docs.aws.amazon.com/cli/latest/reference/ses/get-send-quota.html) in *AWS CLI Command Reference*.

### get-send-statistics

The following code example shows how to use `get-send-statistics`.

**AWS CLI**

**To get your Amazon SES sending statistics**

The following example uses the `get-send-statistics` command to return your Amazon SES sending statistics

```
aws ses get-send-statistics
```
Output:

```json
{
  "SendDataPoints": [
    {
      "Complaints": 0,
      "Timestamp": "2013-06-12T19:32:00Z",
      "DeliveryAttempts": 2,
      "Bounces": 0,
      "Rejects": 0
    },
    {
      "Complaints": 0,
      "Timestamp": "2013-06-12T00:47:00Z",
      "DeliveryAttempts": 1,
      "Bounces": 0,
      "Rejects": 0
    }
  ]
}
```

The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

In this example, there are only two data points because the only emails that the user sent in the last two weeks fell within two 15-minute intervals.

For more information, see Monitoring Your Amazon SES Usage Statistics in the Amazon Simple Email Service Developer Guide.

- For API details, see [GetSendStatistics](#) in AWS CLI Command Reference.

### list-identities

The following code example shows how to use `list-identities`.

**AWS CLI**

To list all identities (email addresses and domains) for a specific AWS account

The following example uses the `list-identities` command to list all identities that have been submitted for verification with Amazon SES:
aws ses list-identities

Output:

```
{
  "Identities": [
    "user@example.com",
    "example.com"
  ]
}
```

The list that is returned contains all identities regardless of verification status (verified, pending verification, failure, etc.).

In this example, email addresses *and* domains are returned because we did not specify the identity-type parameter.

For more information about verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [ListIdentities](https://docs.aws.amazon.com/cli/latest/reference/ses/list-identities.html) in *AWS CLI Command Reference*.

**send-email**

The following code example shows how to use `send-email`.

**AWS CLI**

**To send a formatted email using Amazon SES**

The following example uses the `send-email` command to send a formatted email:

```bash
aws ses send-email --from sender@example.com --destination file://destination.json --message file://message.json
```

Output:

```
{
  "MessageId": "EXAMPLEf3a5efcd1-51adec81-d2a4-4e3f-9fe2-5d85c1b23783-000000"
}
```
The destination and the message are JSON data structures saved in .json files in the current directory. These files are as follows:

destination.json:

```
{
    "ToAddresses": ["recipient1@example.com", "recipient2@example.com"],
    "CcAddresses": ["recipient3@example.com"],
    "BccAddresses": []
}
```

message.json:

```
{
    "Subject": {
        "Data": "Test email sent using the AWS CLI",
        "Charset": "UTF-8"
    },
    "Body": {
        "Text": {
            "Data": "This is the message body in text format.",
            "Charset": "UTF-8"
        },
        "Html": {
            "Data": "This message body contains HTML formatting. It can, for example, contain links like this one: <a class="ulink" href="http://docs.aws.amazon.com/ses/latest/DeveloperGuide" target="_blank">Amazon SES Developer Guide</a>.",
            "Charset": "UTF-8"
        }
    }
}
```

Replace the sender and recipient email addresses with the ones you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of each recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-email was successful.

If you don't receive the email, check your Junk box.
For more information on sending formatted email, see Sending Formatted Email Using the Amazon SES API in the Amazon Simple Email Service Developer Guide.

- For API details, see SendEmail in AWS CLI Command Reference.

**send-raw-email**

The following code example shows how to use send-raw-email.

**AWS CLI**

To send a raw email using Amazon SES

The following example uses the send-raw-email command to send an email with a TXT attachment:

```
aws ses send-raw-email --raw-message file://message.json
```

Output:

```
{
   "MessageId": "EXAMPLEf3f73d99b-c63fb06f-d263-41f8-a0fb-d0dc67d56c07-000000"
}
```

The raw message is a JSON data structure saved in a file named message.json in the current directory. It contains the following:

```
{
   "Data": "From: sender@example.com
To: recipient@example.com
Subject: Test email sent using the AWS CLI (contains an attachment)
MIME-Version: 1.0
Content-type: Multipart/Mixed; boundary="NextPart"

--NextPart
Content-Type: text/plain

This is the message body.

--NextPart
Content-Type: text/plain;
Content-Disposition: attachment; filename="attachment.txt"

This is the text in the attachment.

--NextPart--"
}
```

As you can see, "Data" is one long string that contains the entire raw email content in MIME format, including an attachment called attachment.txt.

Replace sender@example.com and recipient@example.com with the addresses you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted
production access to Amazon SES, you must also verify the email address of the recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the Amazon Simple Email Service Developer Guide.

The Message ID in the output indicates that the call to send-raw-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending raw email, see Sending Raw Email Using the Amazon SES API in the Amazon Simple Email Service Developer Guide.

• For API details, see SendRawEmail in AWS CLI Command Reference.

set-identity-dkim-enabled

The following code example shows how to use set-identity-dkim-enabled.

AWS CLI

To enable or disable Easy DKIM for an Amazon SES verified identity

The following example uses the set-identity-dkim-enabled command to disable DKIM for a verified email address:

aws ses set-identity-dkim-enabled --identity user@example.com --no-dkim-enabled

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the Amazon Simple Email Service Developer Guide.

• For API details, see SetIdentityDkimEnabled in AWS CLI Command Reference.

set-identity-feedback-forwarding-enabled

The following code example shows how to use set-identity-feedback-forwarding-enabled.

AWS CLI

To enable or disable bounce and complaint email feedback forwarding for an Amazon SES verified identity

•
The following example uses the `set-identity-feedback-forwarding-enabled` command to enable a verified email address to receive bounce and complaint notifications by email:

```bash
aws ses set-identity-feedback-forwarding-enabled --identity user@example.com --forwarding-enabled
```

You are required to receive bounce and complaint notifications via either Amazon SNS or email feedback forwarding, so you can only disable email feedback forwarding if you select an Amazon SNS topic for both bounce and complaint notifications.

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see `SetIdentityFeedbackForwardingEnabled` in *AWS CLI Command Reference*.

**set-identity-notification-topic**

The following code example shows how to use `set-identity-notification-topic`.

**AWS CLI**

To set the Amazon SNS topic to which Amazon SES will publish bounce, complaint, and/or delivery notifications for a verified identity

The following example uses the `set-identity-notification-topic` command to specify the Amazon SNS topic to which a verified email address will receive bounce notifications:

```bash
aws ses set-identity-notification-topic --identity user@example.com --notification-type Bounce --sns-topic arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic
```

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see `SetIdentityNotificationTopic` in *AWS CLI Command Reference*.

**verify-domain-dkim**

The following code example shows how to use `verify-domain-dkim`.

**AWS CLI**

To generate a verified domain's DKIM tokens for DKIM signing with Amazon SES
The following example uses the `verify-domain-dkim` command to generate DKIM tokens for a domain that has been verified with Amazon SES:

```bash
aws ses verify-domain-dkim --domain example.com
```

Output:

```
{
  "DkimTokens": [
    "EXAMPLEq76owjnks3ln1uwg65scbemvw",
    "EXAmPLEi3dnsj67hstzaj673klariwx2",
    "EXAMPLEwfbtcukvimehexktmdtaz6naj"
  ]
}
```

To set up DKIM, you must use the returned DKIM tokens to update your domain's DNS settings with CNAME records that point to DKIM public keys hosted by Amazon SES. For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see `VerifyDomainDkim` in *AWS CLI Command Reference*.

### verify-domain-identity

The following code example shows how to use `verify-domain-identity`.

**AWS CLI**

**To verify a domain with Amazon SES**

The following example uses the `verify-domain-identity` command to verify a domain:

```bash
aws ses verify-domain-identity --domain example.com
```

Output:

```
{
  "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeuz1q1/wwvjuEXAMPLE"
}
```
To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see Verifying Domains in Amazon SES in the Amazon Simple Email Service Developer Guide.

- For API details, see VerifyDomainIdentity in AWS CLI Command Reference.

verify-email-identity

The following code example shows how to use verify-email-identity.

AWS CLI

To verify an email address with Amazon SES

The following example uses the verify-email-identity command to verify an email address:

```
aws ses verify-email-identity --email-address user@example.com
```

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After verify-email-identity is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see Verifying Email Addresses in Amazon SES in the Amazon Simple Email Service Developer Guide.

- For API details, see VerifyEmailIdentity in AWS CLI Command Reference.

Shield examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Shield.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

Actions

**associate-drt-log-bucket**

The following code example shows how to use `associate-drt-log-bucket`.

**AWS CLI**

**To authorize the DRT to access an Amazon S3 bucket**

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account:

```
aws shield associate-drt-log-bucket \
  --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [AssociateDrtLogBucket](#) in *AWS CLI Command Reference*.

**associate-drt-role**

The following code example shows how to use `associate-drt-role`.

**AWS CLI**

**To authorize the DRT to mitigate potential attacks on your behalf**
The following associate-drt-role example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role 
   --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the AWS Shield Advanced Developer Guide.

- For API details, see AssociateDrtRole in AWS CLI Command Reference.

create-protection

The following code example shows how to use create-protection.

**AWS CLI**

To enable AWS Shield Advanced protection for a single AWS resource

The following create-protection example enables Shield Advanced protection for the specified AWS CloudFront distribution.

```
aws shield create-protection 
   --name "Protection for CloudFront distribution" 
   --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FX0WY8
```

Output:

```json
{
   "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Specify Your Resources to Protect in the AWS Shield Advanced Developer Guide.

- For API details, see CreateProtection in AWS CLI Command Reference.

create-subscription

The following code example shows how to use create-subscription.
AWS CLI

**To enable AWS Shield Advanced protection for an account**

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see [Getting Started with AWS Shield Advanced](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [CreateSubscription](#) in *AWS CLI Command Reference*.

**delete-protection**

The following code example shows how to use `delete-protection`.

**AWS CLI**

**To remove AWS Shield Advanced protection from an AWS resource**

The following `delete-protection` example removes the specified AWS Shield Advanced protection.

```
aws shield delete-protection \
   --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Removing AWS Shield Advanced from an AWS Resource](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteProtection](#) in *AWS CLI Command Reference*.

**describe-attack**

The following code example shows how to use `describe-attack`.
AWS CLI

To retrieve a detailed description of an attack

The following describe-attack example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the list-attacks command.

```
aws shield describe-attack --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attack": {
        "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "SubResources": [
            {
                "Type": "IP",
                "Id": "192.0.2.2",
                "AttackVectors": [
                    {
                        "VectorType": "SYN_FLOOD",
                        "VectorCounters": [
                            {
                                "Name": "SYN_FLOOD_BPS",
                                "Max": 982184.0,
                                "Average": 982184.0,

For more information, see Reviewing DDoS Incidents in the AWS Shield Advanced Developer Guide.

- For API details, see DescribeAttack in AWS CLI Command Reference.

**describe-drt-access**

The following code example shows how to use describe-drt-access.

**AWS CLI**

To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf

The following describe-drt-access example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```
{
  "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
  "LogBucketList": [
    "flow-logs-for-website-lb"
  ]
}
```

For more information, see Authorize the DDoS Response Team in the AWS Shield Advanced Developer Guide.
For API details, see DescribeDrtAccess in AWS CLI Command Reference.

describe-emergency-contact-settings

The following code example shows how to use describe-emergency-contact-settings.

AWS CLI

To retrieve emergency e-mail addresses that you have on file with the DRT

The following describe-emergency-contact-settings example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```bash
aws shield describe-emergency-contact-settings
```

Output:

```json
{
    "EmergencyContactList": [
        {
            "EmailAddress": "ops@example.com"
        },
        {
            "EmailAddress": "ddos-notifications@example.com"
        }
    ]
}
```

For more information, see How AWS Shield Works<https://docs.aws.amazon.com/waf/latest/developerguide/ddos-overview.html> in the AWS Shield Advanced Developer Guide.

For API details, see DescribeEmergencyContactSettings in AWS CLI Command Reference.

describe-protection

The following code example shows how to use describe-protection.

AWS CLI

To retrieve the details for an AWS Shield Advanced protection
The following describe-protection example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the list-protections command.

```
aws shield describe-protection \
   --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
   "Protection": {
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Name": "1.2.3.4",
      "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/eipalloc-0ac1537af40742a6d"
   }
}
```

For more information, see Specify Your Resources to Protect in the AWS Shield Advanced Developer Guide.

- For API details, see DescribeProtection in AWS CLI Command Reference.

**describe-subscription**

The following code example shows how to use describe-subscription.

**AWS CLI**

To retrieve the details of the AWS Shield Advanced protection for the account

The following describe-subscription example displays details about the Shield Advanced protection provided for the account:

```
aws shield describe-subscription
```

Output:

```
{
   "Subscription": {
      "StartTime": 1534368978.0,
   }
}
```
For more information, see [How AWS Shield Works](https://aws.amazon.com/shield/advanced-developer-guide/) in the AWS Shield Advanced Developer Guide.

- For API details, see [DescribeSubscription](https://docs.aws.amazon.com/cli/latest/reference/shield/subscribe.html) in AWS CLI Command Reference.

**disassociate-drt-log-bucket**

The following code example shows how to use disassociate-drt-log-bucket.

**AWS CLI**

To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following disassociate-drt-log-bucket example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.
aws shield disassociate-drt-log-bucket \
  --log-bucket flow-logs-for-website-lb

This command produces no output.

For more information, see Authorize the DDoS Response Team in the AWS Shield Advanced Developer Guide.
- For API details, see DisassociateDrtLogBucket in AWS CLI Command Reference.

disassociate-drt-role

The following code example shows how to use disassociate-drt-role.

AWS CLI

To remove the authorization for DRT to mitigate potential attacks on your behalf

The following disassociate-drt-role example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

aws shield disassociate-drt-role

This command produces no output.

For more information, see Authorize the DDoS Response Team in the AWS Shield Advanced Developer Guide.
- For API details, see DisassociateDrtRole in AWS CLI Command Reference.

get-subscription-state

The following code example shows how to use get-subscription-state.

AWS CLI

To retrieve the current state of the account's AWS Shield Advanced subscription

The following get-subscription-state example retrieves the state of the Shield Advanced protection for the account.

aws shield get-subscription-state
Output:

```json
{
  "SubscriptionState": "ACTIVE"
}
```

For more information, see [How AWS Shield Works](#) in the [AWS Shield Advanced Developer Guide](#).

- For API details, see [GetSubscriptionState](#) in [AWS CLI Command Reference](#).

### list-attacks

The following code example shows how to use `list-attacks`.

**AWS CLI**

**To retrieve attack summaries from AWS Shield Advanced**

The following `list-attacks` example retrieves summaries of attacks for the specified AWS CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
  --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
  --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```json
{
  "AttackSummaries": [
    {
      "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/E1PXMP22ZVFAOR",
      "StartTime": 1529280000.0,
      "EndTime": 1529449200.0,
      "AttackVectors": [
        {
          "VectorType": "SYN_FLOOD"
        }
      ]
    }
  ]
}
```
The following code example shows how to use `list-protections`.

**AWS CLI**

To retrieve protection summaries from AWS Shield Advanced

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```bash
aws shield list-protections
```

Output:

```json
{
   "Protections": [
       {
           "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
           "Name": "Protection for CloudFront distribution",
           "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/E198WC25FXOWY8"
       }
   ]
}
```

For more information, see [Specify Your Resources to Protect](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [ListProtections](#) in *AWS CLI Command Reference*.

---

**update-emergency-contact-settings**

The following code example shows how to use `update-emergency-contact-settings`.

```bash
aws shield update-emergency-contact-settings
```
AWS CLI

**To define the emergency e-mail addresses that are on file with the DRT**

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \
   --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-notifications@example.com
```

This command produces no output.

For more information, see [How AWS Shield Works](https://aws.amazon.com/documentation/shield/) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateEmergencyContactSettings](https://docs.aws.amazon.com/cli/latest/reference/shield/update-emergency-contact-settings.html) in *AWS CLI Command Reference*.

**update-subscription**

The following code example shows how to use `update-subscription`.

AWS CLI

**To modify the account's AWS Shield Advanced subscription**

The following `update-subscription` example enables auto-renewal of the AWS Shield Advanced subscription for the account.

```
aws shield update-subscription \
   --auto-renew ENABLED
```

This command produces no output.

For more information, see [How AWS Shield Works](https://aws.amazon.com/documentation/shield/) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateSubscription](https://docs.aws.amazon.com/cli/latest/reference/shield/update-subscription.html) in *AWS CLI Command Reference*.

**Signer examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Signer.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**cancel-signing-profile**

The following code example shows how to use cancel-signing-profile.

**AWS CLI**

To delete a signing profile

The following cancel-signing-profile example removes an existing signing profile from AWS Signer.

```bash
aws signer cancel-signing-profile \
--profile-name MyProfile1
```

This command produces no output.

- For API details, see [CancelSigningProfile](#) in *AWS CLI Command Reference*.

**describe-signing-job**

The following code example shows how to use describe-signing-job.

**AWS CLI**

To display details about a signing job
The following describe-signing-job example displays details about the specified signing job.

```bash
aws signer describe-signing-job \
  --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```json
{
   "status": "Succeeded",
   "completedAt": 1568412037,
   "platformId": "AmazonFreeRTOS-Default",
   "signingMaterial": {
      "certificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
   },

```

- For API details, see [DescribeSigningJob](#) in [AWS CLI Command Reference](#).

### get-signing-platform

The following code example shows how to use get-signing-platform.
AWS CLI

To display details about a signing platform

The following get-signing-platform example displays details about the specified signing platform.

```
aws signer get-signing-platform \
   --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
   "category": "AWS",
   "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
   "target": "SHA1-RSA-TISHA1",
   "platformId": "AmazonFreeRTOS-TI-CC3220SF",
   "signingConfiguration": {
      "encryptionAlgorithmOptions": {
         "defaultValue": "RSA",
         "allowedValues": ["RSA"
      ]
   },
   "hashAlgorithmOptions": {
      "defaultValue": "SHA1",
      "allowedValues": ["SHA1"
   ]
  },
  "maxSizeInMB": 16,
  "partner": "AmazonFreeRTOS",
  "signingImageFormat": {
     "defaultFormat": "JSONEmbedded",
     "supportedFormats": ["JSONEmbedded"
  ]
  }
}
```

• For API details, see GetSigningPlatform in AWS CLI Command Reference.
get-signing-profile

The following code example shows how to use `get-signing-profile`.

**AWS CLI**

**To display details about a signing profile**

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \
   --profile-name MyProfile3
```

Output:

```
{
   "platformId": "AmazonFreeRTOS-TI-CC3220SF",
   "profileName": "MyProfile3",
   "status": "Active",
   "signingMaterial": {
      "certificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
   }
}
```

- For API details, see [GetSigningProfile](https://docs.aws.amazon.com/cli/latest/reference/signer/get-signing-profile.html) in *AWS CLI Command Reference*.

list-signing-jobs

The following code example shows how to use `list-signing-jobs`.

**AWS CLI**

**To list all signing jobs**

The following `list-signing-jobs` example displays details about all signing jobs for the account.

```
aws signer list-signing-jobs
```
In this example, two jobs are returned, one successful, and one failed.

```json
{
  "jobs": [
    {
      "status": "Succeeded",
      "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
      },
      "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
      "source": {
        "s3": {
          "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOp9B_M4",
          "bucketName": "signer-source",
          "key": "MyCode.rb"
        }
      },
      "signedObject": {
        "s3": {
          "bucketName": "signer-destination",
          "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
        }
      },
      "createdAt": 1568412036
    },
    {
      "status": "Failed",
      "source": {
        "s3": {
          "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOp9B_M4",
          "bucketName": "signer-source",
          "key": "MyOtherCode.rb"
        }
      },
      "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
      },
      "createdAt": 1568402690,
      "jobId": "74d9825e-22fc-4a0d-b962-0123456789abc"
    }
  ]
}```
list-signing-platforms

The following code example shows how to use list-signing-platforms.

AWS CLI

To list all signing platforms

The following list-signing-platforms example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
  "platforms": [
    {
      "category": "AWS",
      "displayName": "AWS IoT Device Management SHA256-ECDSA",
      "target": "SHA256-ECDSA",
      "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
      "signingConfiguration": {
        "encryptionAlgorithmOptions": {
          "defaultValue": "ECDSA",
          "allowedValues": ["ECDSA"
        ]
      },
      "hashAlgorithmOptions": {
        "defaultValue": "SHA256",
        "allowedValues": ["SHA256"
      ]
      }]
    },
    "maxSizeInMB": 2048,
    "partner": "AWSIoTDeviceManagement",
  }
```
"signingImageFormat": {
  "defaultFormat": "JSONDetached",
  "supportedFormats": [
    "JSONDetached"
  ]
},
{
  "category": "AWS",
  "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
  "target": "SHA1-RSA-TI-SSH",
  "platformId": "AmazonFreeRTOS-TI-CC3220SF",
  "signingConfiguration": {
    "encryptionAlgorithmOptions": {
      "defaultValue": "RSA",
      "allowedValues": [
        "RSA"
      ]
    },
    "hashAlgorithmOptions": {
      "defaultValue": "SHA1",
      "allowedValues": [
        "SHA1"
      ]
    }
  },
  "maxSizeInMB": 16,
  "partner": "AmazonFreeRTOS",
  "signingImageFormat": {
    "defaultFormat": "JSONEmbedded",
    "supportedFormats": [
      "JSONEmbedded"
    ]
  }
},
{
  "category": "AWS",
  "displayName": "Amazon FreeRTOS SHA256-ECDSA",
  "target": "SHA256-ECDSA",
  "platformId": "AmazonFreeRTOS-Default",
  "signingConfiguration": {
    "encryptionAlgorithmOptions": {
      "defaultValue": "ECDSA",
      "allowedValues": [
        "ECDSA"
      ]
    }
  }
}
For API details, see ListSigningPlatforms in AWS CLI Command Reference.

list-signing-profiles

The following code example shows how to use list-signing-profiles.

AWS CLI

To list all signing profiles

The following list-signing-profiles example displays details about all signing profiles for the account.

aws signer list-signing-profiles

Output:

```json
{
   "profiles": [
   
```
• For API details, see ListSigningProfiles in AWS CLI Command Reference.

put-signing-profile

The following code example shows how to use put-signing-profile.

AWS CLI

To create a signing profile

The following put-signing-profile example creates a signing profile using the specified certificate and platform.

```
aws signer put-signing-profile \
    --profile-name MyProfile6 \
    --signing-material certificateArn=arn:aws:acm:us-west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
    --platform AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
"arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"

- For API details, see PutSigningProfile in AWS CLI Command Reference.

**start-signing-job**

The following code example shows how to use start-signing-job.

**AWS CLI**

**To start a signing job**

The following start-signing-job example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination.

```bash
aws signer start-signing-job \
  --source 's3={bucketName=signer-source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4}' \
  --destination 's3={bucketName=signer-destination,prefix=signed-}' \
  --profile-name MyProfile7
```

The output is the ID of the signing job.

```
{
  "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

- For API details, see StartSigningJob in AWS CLI Command Reference.

**Snowball examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Snowball.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**get-snowball-usage**

The following code example shows how to use `get-snowball-usage`.

**AWS CLI**

To get information about the Snowball service limit for your account

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```bash
aws snowball get-snowball-usage
```

Output:

```
{
    "SnowballLimit": 1,
    "SnowballsInUse": 0
}
```

FOR more information, see [AWS Snowball Edge Limits](https://docs.aws.amazon.com/snowball/latest/edge/limits.html) in the [AWS Snowball Developer Guide](https://docs.aws.amazon.com/snowball/latest/edge/snowball-developer-guide.html).

**list-jobs**

The following code example shows how to use `list-jobs`.

**AWS CLI**

To list the current Snowball jobs in your account
The following list-jobs example displays an array of JobListEntry objects. In this example, a single job is listed.

```bash
aws snowball list-jobs
```

Output:

```json
{
  "JobListEntries": [
    {
      "CreationDate": 2016-09-27T14:50Z,
      "Description": "Important Photos 2016-08-11",
      "IsMaster": TRUE,
      "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
      "JobState": "Complete",
      "JobType": "IMPORT",
      "SnowballType": "EDGE"
    }
  ]
}
```

For more information, see [Jobs for AWS Snowball Edge devices](https://docs.aws.amazon.com/snowball/latest/edge-devices/jobs.html) in the *AWS Snowball Developer Guide*.

- For API details, see [ListJobs](https://docs.aws.amazon.com/cli/latest/reference/snowball/list-jobs.html) in *AWS CLI Command Reference*.

### Amazon SNS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SNS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- **Actions**
- **Scenarios**

Actions

**add-permission**

The following code example shows how to use `add-permission`.

**AWS CLI**

To add a permission to a topic

The following add-permission example adds the permission for AWS account 987654321098 to use the Publish action with the specified topic under AWS account 123456789012.

```
aws sns add-permission
   --label Publish-Permission
   --aws-account-id 987654321098
   --action-name Publish
```

This command produces no output.

- For API details, see [AddPermission](#) in [AWS CLI Command Reference](#).

**check-if-phone-number-is-opted-out**

The following code example shows how to use `check-if-phone-number-is-opted-out`.

**AWS CLI**

To check SMS message opt-out for a phone number

The following check-if-phone-number-is-opted-out example checks whether the specified phone number is opted out of receiving SMS messages from the current AWS account.

```
aws sns check-if-phone-number-is-opted-out
```
---phone-number +1555550100

Output:

```
{
  "isOptedOut": false
}
```

- For API details, see [CheckIfPhoneNumberIsOptedOut](#) in *AWS CLI Command Reference*.

### confirm-subscription

The following code example shows how to use `confirm-subscription`.

#### AWS CLI

**To confirm a subscription**

The following `confirm-subscription` command completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The `--token` parameter comes from the confirmation message sent to the notification endpoint specified in the subscribe call.

```
aws sns confirm-subscription \\
  --token 2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d0cce1f
```

Output:

```
{
  "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
}
```

- For API details, see [ConfirmSubscription](#) in *AWS CLI Command Reference*.

### create-platform-application

The following code example shows how to use `create-platform-application`. 

---
AWS CLI

To create a platform application

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \
   --name MyApplication \
   --platform GCM \
   --attributes PlatformCredential=EXAMPLEabcd12345jk1m67890stuv12345bcdef
```

Output:

```
{
}
```

• For API details, see [CreatePlatformApplication](#) in *AWS CLI Command Reference*.

create-topic

The following code example shows how to use `create-topic`.

AWS CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
   --name my-topic
```

Output:

```
{
   "ResponseMetadata": {
      "RequestId": "1469e8d7-1642-564e-b85d-a19b4b341f83"
   },
```
}

For more information, see Using the AWS Command Line Interface with Amazon SQS and Amazon SNS in the AWS Command Line Interface User Guide.

- For API details, see CreateTopic in AWS CLI Command Reference.

**delete-endpoint**

The following code example shows how to use delete-endpoint.

**AWS CLI**

**To delete a platform application endpoint**

The following delete-endpoint example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \
```

This command produces no output.

- For API details, see DeleteEndpoint in AWS CLI Command Reference.

**delete-platform-application**

The following code example shows how to use delete-platform-application.

**AWS CLI**

**To delete a platform application**

The following delete-platform-application example deletes the specified platform application.

```
aws sns delete-platform-application \
```
This command produces no output.

- For API details, see `DeletePlatformApplication` in *AWS CLI Command Reference*.

### delete-topic

The following code example shows how to use `delete-topic`.

**AWS CLI**

**To delete an SNS topic**

The following `delete-topic` example deletes the specified SNS topic.

```bash
aws sns delete-topic \
```

This command produces no output.

- For API details, see `DeleteTopic` in *AWS CLI Command Reference*.

### get-endpoint-attributes

The following code example shows how to use `get-endpoint-attributes`.

**AWS CLI**

**To list platform application endpoint attributes**

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```bash
aws sns get-endpoint-attributes \
```

Output:

```json
{
    "Attributes": {
```
For API details, see `GetEndpointAttributes` in *AWS CLI Command Reference*.

### `get-platform-application-attributes`

The following code example shows how to use `get-platform-application-attributes`.

**AWS CLI**

**To list the platform application attributes**

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```bash
aws sns get-platform-application-attributes \
```

**Output:**

```json
{
    "Attributes": {
        "Enabled": "true",
        "SuccessFeedbackSampleRate": "100"
    }
}
```

For API details, see `GetPlatformApplicationAttributes` in *AWS CLI Command Reference*.

### `get-sms-attributes`

The following code example shows how to use `get-sms-attributes`.

**AWS CLI**

**To list the default SMS message attributes**
The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
    "attributes": {
        "DefaultSenderID": "MyName"
    }
}
```

### get-subscription-attributes

The following code example shows how to use `get-subscription-attributes`.

**AWS CLI**

**To retrieve subscription attributes for a topic**

The following `get-subscription-attributes` displays the attributes of the specified subscription. You can get the subscription-arn from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
    --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
```

Output:

```
{
    "Attributes": {
        "Endpoint": "my-email@example.com",
        "Protocol": "email",
        "RawMessageDelivery": "false",
        "ConfirmationWasAuthenticated": "false",
        "Owner": "123456789012",
```

For API details, see GetSubscriptionAttributes in AWS CLI Command Reference.

get-topic-attributes

The following code example shows how to use get-topic-attributes.

AWS CLI

To retrieve the attributes of a topic

The following get-topic-attributes example displays the attributes for the specified topic.

```bash
aws sns get-topic-attributes 
```

Output:

```
{
  "Attributes": {
    "SubscriptionsConfirmed": "1",
    "DisplayName": "my-topic",
    "SubscriptionsDeleted": "0",
    "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":{
    \"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear \"},\"disableSubscriptionOverrides\":false}}",
    "Owner": "123456789012",
    "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",\n    \"Statement\":{{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal \\
    \":{\"AWS\":\"*\"},\"Action\":{\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic \\
    \",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\", \\
    \"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"], \\
    {\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}],
    "SubscriptionsPending": "0"
  }
}
list-endpoints-by-platform-application

The following code example shows how to use list-endpoints-by-platform-application.

AWS CLI

To list the endpoints for a platform application

The following list-endpoints-by-platform-application example lists the endpoints and endpoint attributes for the specified platform application.

```bash
aws sns list-endpoints-by-platform-application \
```

Output:

```json
{
   "Endpoints": [
      {
         "Attributes": {
            "Token": "EXAMPLE12345...",
            "Enabled": "true"
         },
      }
   ]
}
```

For API details, see ListEndpointsByPlatformApplication in AWS CLI Command Reference.

list-phone-numbers-opted-out

The following code example shows how to use list-phone-numbers-opted-out.
**AWS CLI**

**To list SMS message opt-outs**

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```json
{
   "phoneNumbers": [
      "+15555550100"
   ]
}
```

- For API details, see [ListPhoneNumbersOptedOut](#) in AWS CLI Command Reference.

**list-platform-applications**

The following code example shows how to use `list-platform-applications`.

**AWS CLI**

**To list platform applications**

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```json
{
   "PlatformApplications": [
      {
         "Attributes": {
            "SuccessFeedbackSampleRate": "100",
            "Enabled": "true"
         }
      }
   ]
}
```
- For API details, see **ListPlatformApplications** in *AWS CLI Command Reference*.

### list-subscriptions-by-topic

The following code example shows how to use list-subscriptions-by-topic.

**AWS CLI**

**To list the subscriptions associated with a topic**

The following list-subscriptions-by-topic retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
```

**Output:**

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```
list-subscriptions

The following code example shows how to use list-subscriptions.

AWS CLI

To list your SNS subscriptions

The following list-subscriptions example displays a list of the SNS subscriptions in your AWS account.

```bash
aws sns list-subscriptions
```

Output:

```json
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```

- For API details, see [ListSubscriptions](#) in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a topic
The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
```

Output:

```
{
    "Tags": [
        {
            "Key": "Team",
            "Value": "Alpha"
        }
    ]
}
```

- For API details, see `ListTagsForResource` in *AWS CLI Command Reference*.

**list-topics**

The following code example shows how to use `list-topics`.

**AWS CLI**

**To list your SNS topics**

The following `list-topics` example lists all of SNS topics in your AWS account.

```
aws sns list-topics
```

Output:

```
{
    "Topics": [
        {
        }
    ]
}
```
For API details, see ListTopics in AWS CLI Command Reference.

**opt-in-phone-number**

The following code example shows how to use opt-in-phone-number.

**AWS CLI**

**To opt-in for SMS messages**

The following opt-in-phone-number example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \
    --phone-number +15555550100
```

This command produces no output.

For API details, see OptInPhoneNumber in AWS CLI Command Reference.

**publish**

The following code example shows how to use publish.

**AWS CLI**

**Example 1: To publish a message to a topic**

The following publish example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \
    --message file://message.txt
```

**Contents of message.txt:**

```
Hello World
Second Line
```

**Output:**
Example 2: To publish an SMS message to a phone number

The following publish example publishes the message Hello world! to the phone number +1-555-555-0100.

```bash
aws sns publish \
    --message "Hello world!" \
    --phone-number +1-555-555-0100
```

Output:

```json
{
    "MessageId": "123a45b6-7890-12c3-45d6-333322221111"
}
```

- For API details, see Publish in AWS CLI Command Reference.

put-data-protection-policy

The following code example shows how to use put-data-protection-policy.

AWS CLI

To set data protection policy

Example 1: To deny publishers from publishing messages with CreditCardNumber

The following put-data-protection-policy example denies publishers from publishing messages with CreditCardNumber.

```bash
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-east-1:123456789012:mytopic \
    --data-protection-policy "{"Name":"data_protection_policy","Description":"Example data protection policy","Version":"2021-06-01","Statement": [{"DataDirection":"Inbound","Principal": ["*"] ,"DataIdentifier": ["arn:aws:dataprotection::aws:data-identifier/CreditCardNumber"]}]
```

Actions and scenarios 5912
This command produces no output.

Example 2: To load parameters from a file

The following put-data-protection-policy loads parameters from a file.

```
aws sns put-data-protection-policy \
    --data-protection-policy file://policy.json
```

This command produces no output.

remove-permission

The following code example shows how to use remove-permission.

AWS CLI

To remove a permission from a topic

The following remove-permission example removes the permission Publish-Permission from the specified topic.

```
aws sns remove-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission
```

This command produces no output.

- For API details, see [RemovePermission](https://docs.aws.amazon.com/cli/latest/reference/sns/remove-permission.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/userguide/).  

set-endpoint-attributes

The following code example shows how to use set-endpoint-attributes.

AWS CLI

To set endpoint attributes

The following set-endpoint-attributes example disables the specified platform application endpoint.
aws sns set-endpoint-attributes \
   --attributes Enabled=false

Output:

```json
{
   "Attributes": {
       "Enabled": "false",
       "Token": "EXAMPLE12345..."
   }
}
```

- For API details, see [SetEndpointAttributes](https://docs.aws.amazon.com/cli/latest/reference/sns/set-endpoint-attributes.html) in *AWS CLI Command Reference*.

**set-platform-application-attributes**

The following code example shows how to use `set-platform-application-attributes`.

**AWS CLI**

To set platform application attributes

The following `set-platform-application-attributes` example sets the EventDeliveryFailure attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```bash
aws sns set-platform-application-attributes \
```

This command produces no output.

- For API details, see [SetPlatformApplicationAttributes](https://docs.aws.amazon.com/cli/latest/reference/sns/set-platform-application-attributes.html) in *AWS CLI Command Reference*.

**set-sms-attributes**

The following code example shows how to use `set-sms-attributes`.

Actions and scenarios
AWS CLI

To set SMS message attributes

The following set-sms-attributes example sets the default sender ID for SMS messages to MyName.

```bash
aws sns set-sms-attributes \
  --attributes DefaultSenderID=MyName
```

This command produces no output.

- For API details, see SetSMSAttributes in AWS CLI Command Reference.

set-subscription-attributes

The following code example shows how to use set-subscription-attributes.

AWS CLI

To set subscription attributes

The following set-subscription-attributes example sets the RawMessageDelivery attribute to an SQS subscription.

```bash
aws sns set-subscription-attributes \
  --attribute-name RawMessageDelivery \
  --attribute-value true
```

This command produces no output.

The following set-subscription-attributes example sets a FilterPolicy attribute to an SQS subscription.

```bash
aws sns set-subscription-attributes \
  --attribute-name FilterPolicy \
```
This command produces no output.

The following set-subscription-attributes example removes the FilterPolicy attribute from an SQS subscription.

```bash
aws sns set-subscription-attributes \
  --subscription-arn arn:aws:sns:us-east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
  --attribute-name FilterPolicy \
  --attribute-value "{}"
```

This command produces no output.

- For API details, see `SetSubscriptionAttributes` in AWS CLI Command Reference.

**set-topic-attributes**

The following code example shows how to use set-topic-attributes.

**AWS CLI**

To set an attribute for a topic

The following set-topic-attributes example sets the DisplayName attribute for the specified topic.

```bash
aws sns set-topic-attributes \
  --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
  --attribute-name DisplayName \
  --attribute-value MyTopicDisplayName
```

This command produces no output.

- For API details, see `SetTopicAttributes` in AWS CLI Command Reference.

**subscribe**

The following code example shows how to use subscribe.
AWS CLI

To subscribe to a topic

The following subscribe command subscribes an email address to the specified topic.

```bash
aws sns subscribe \
--topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
--protocol email \
--notification-endpoint my-email@example.com
```

Output:

```json
{
  "SubscriptionArn": "pending confirmation"
}
```

- For API details, see Subscribe in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

AWS CLI

To add a tag to a topic

The following tag-resource example adds a metadata tag to the specified Amazon SNS topic.

```bash
aws sns tag-resource \
--tags Key=Team,Value=Alpha
```

This command produces no output.

- For API details, see TagResource in AWS CLI Command Reference.

**unsubscribe**

The following code example shows how to use unsubscribe.
AWS CLI

To unsubscribe from a topic

The following unsubscribe example deletes the specified subscription from a topic.

```
aws sns unsubscribe \\
   --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-topic:8a21d249-4329-4871-acc6-7be709c6ea7f
```

This command produces no output.

- For API details, see [Unsubscribe](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a topic

The following untag-resource example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \\
   --tag-keys Team
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Scenarios

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

AWS CLI

To create a platform application endpoint
The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \
   --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/MyApplication \ 
   --token EXAMPLE12345...
```

Output:

```
{
}
```

Amazon SQS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SQS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*add-permission*

The following code example shows how to use `add-permission`. 
AWS CLI

To add a permission to a queue

This example enables the specified AWS account to send messages to the specified queue.

Command:

```
aws sqs add-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue --aws-account-ids 12345EXAMPLE --actions SendMessage
```

Output:

None.

- For API details, see AddPermission in AWS CLI Command Reference.

cancel-message-move-task

The following code example shows how to use cancel-message-move-task.

AWS CLI

To cancel a message move task

The following cancel-message-move-task example cancels the specified message move task.

```
aws sqs cancel-message-move-task \
   --task-handle AQEB6nR4...HzlvZQ==
```

Output:

```
{
   "ApproximateNumberOfMessagesMoved": 102
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the Developer Guide.
For API details, see CancelMessageMoveTask in AWS CLI Command Reference.

**change-message-visibility-batch**

The following code example shows how to use change-message-visibility-batch.

**AWS CLI**

To change multiple messages' timeout visibilities as a batch

This example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```bash
```

Input file (change-message-visibility-batch.json):

```json
[
  {
    "Id": "FirstMessage",
    "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
    "VisibilityTimeout": 36000
  },
  {
    "Id": "SecondMessage",
    "ReceiptHandle": "AQEBkTUH...HifSnw==",
    "VisibilityTimeout": 36000
  }
]
```

Output:

```json
{
  "Successful": [
    {
      "Id": "SecondMessage"
    },
    {
```

Actions and scenarios

5921
change-message-visibility

The following code example shows how to use change-message-visibility.

AWS CLI

To change a message's timeout visibility

This example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```bash
aws sqs change-message-visibility --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBTpyI...t6HyQg== --visibility-timeout 36000
```

Output:

None.

create-queue

The following code example shows how to use create-queue.

AWS CLI

To create a queue

This example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.
Command:

```
aws sqs create-queue --queue-name MyQueue --attributes file://create-queue.json
```

Input file (create-queue.json):

```
{
   "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"},
   "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
   "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see CreateQueue in AWS CLI Command Reference.

delete-message-batch

The following code example shows how to use delete-message-batch.

**AWS CLI**

To delete multiple messages as a batch

This example deletes the specified messages.

Command:

```
```

Input file (delete-message-batch.json):

```
[
   {
      "Id": "FirstMessage",
      "ReceiptHandle": "AQEB1mg1...Z4GuLw=="
   }
]
```
Output:

```json
{
   "Successful": [
      {
         "Id": "FirstMessage"
      },
      {
         "Id": "SecondMessage"
      }
   ]
}
```

- For API details, see [DeleteMessageBatch](https://docs.aws.amazon.com/cli/latest/reference/sqs/delete-message-batch.html) in *AWS CLI Command Reference*.

**delete-message**

The following code example shows how to use delete-message.

**AWS CLI**

**To delete a message**

This example deletes the specified message.

**Command:**

```bash
aws sqs delete-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBRXTo...q2doVA==
```

**Output:**

None.

- For API details, see [DeleteMessage](https://docs.aws.amazon.com/cli/latest/reference/sqs/delete-message.html) in *AWS CLI Command Reference*.
delete-queue

The following code example shows how to use delete-queue.

AWS CLI

To delete a queue

This example deletes the specified queue.

Command:

```bash
aws sqs delete-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewerQueue
```

Output:

None.

- For API details, see `DeleteQueue` in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/sqs/delete-queue.html).

get-queue-attributes

The following code example shows how to use get-queue-attributes.

AWS CLI

To get a queue's attributes

This example gets all of the specified queue's attributes.

Command:

```bash
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All
```

Output:

```json
{
   "Attributes": {
      "ApproximateNumberOfMessagesNotVisible": "0",
   ...
```
This example gets only the specified queue's maximum message size and visibility timeout attributes.

**Command:**

```bash
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attribute-names MaximumMessageSize VisibilityTimeout
```

**Output:**

```
{
   "Attributes": {
      "VisibilityTimeout": "30",
      "MaximumMessageSize": "262144"
   }
}
```

- For API details, see [GetQueueAttributes](https://docs.aws.amazon.com/cli/latest/reference/sqs/get-queue-attributes.html) in *AWS CLI Command Reference*.

---

### get-queue-url

The following code example shows how to use `get-queue-url`.

**AWS CLI**

To get a queue URL
This example gets the specified queue's URL.

Command:

```
aws sqs get-queue-url --queue-name MyQueue
```

Output:

```
{
   "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see GetQueueUrl in AWS CLI Command Reference.

**list-dead-letter-source-queues**

The following code example shows how to use list-dead-letter-source-queues.

**AWS CLI**

**To list dead letter source queues**

This example lists the queues that are associated with the specified dead letter source queue.

Command:

```
aws sqs list-dead-letter-source-queues --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
   "queueUrls": [
      "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
   ]
}
```

- For API details, see ListDeadLetterSourceQueues in AWS CLI Command Reference.
list-message-move-tasks

The following code example shows how to use list-message-move-tasks.

AWS CLI

To list the message move tasks

The following list-message-move-tasks example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \
   --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \
   --max-results 2
```

Output:

```
{
   "Results": [
      {
         "TaskHandle": "AQEB6nR4...HzlvZQ==",
         "Status": "RUNNING",
         "MaxNumberOfMessagesPerSecond": 50,
         "ApproximateNumberOfMessagesMoved": 203,
         "ApproximateNumberOfMessagesToMove": 30,
         "StartedTimestamp": 1442428276921
      },
      {
         "Status": "COMPLETED",
         "ApproximateNumberOfMessagesMoved": 29,
         "ApproximateNumberOfMessagesToMove": 0,
         "StartedTimestamp": 1342428272093
      }
   ]
}
```

For more information, see [Amazon SQS API permissions: Actions and resource reference](https://docs.aws.amazon.com/sqs/latest/developerguide/sqs-api-actions.html) in the *Developer Guide*. 
list-queue-tags

The following code example shows how to use list-queue-tags.

AWS CLI

To list all cost allocation tags for a queue

The following list-queue-tags example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{
    "Tags": {
        "Team": "Alpha"
    }
}
```

For more information, see Listing Cost Allocation Tags in the Amazon Simple Queue Service Developer Guide.

- For API details, see ListQueueTags in AWS CLI Command Reference.

list-queues

The following code example shows how to use list-queues.

AWS CLI

To list queues

This example lists all queues.

Command:

```
aws sqs list-queues
```
Output:

```json
{
   "QueueUrls": [
      "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
      "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
   ]
}
```

This example lists only queues that start with "My".

Command:

```bash
aws sqs list-queues --queue-name-prefix My
```

Output:

```json
{
   "QueueUrls": [
      "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
      "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
   ]
}
```

- For API details, see [ListQueues](#) in *AWS CLI Command Reference*.

### purge-queue

The following code example shows how to use `purge-queue`.

**AWS CLI**

- **To purge a queue**

  This example deletes all messages in the specified queue.

  Command:
To receive a message

This example receives up to 10 available messages, returning all available attributes.

Command:

```bash
aws sqs receive-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All --message-attribute-names All --max-number-of-messages 10
```

Output:

```json
{
   "Messages": [
      {
         "Body": "My first message.",
         "ReceiptHandle": "AQEBzbVv...fqNzFw==",
         "MD5OfBody": "1000f835...a35411fa",
         "MD5OfMessageAttributes": "9424c491...26bc3ae7",
         "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
         "Attributes": {
            "ApproximateFirstReceiveTimestamp": "1442428276921",
            "SenderId": "AIDAIAZKMSNQ7EXAMPLE",
            "ApproximateReceiveCount": "5",
            "SentTimestamp": "1442428276921"
         },
         "MessageAttributes": {
```
This example receives the next available message, returning only the SenderId and SentTimestamp attributes as well as the PostalCode message attribute.

Command:

```bash
aws sqs receive-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names SenderId SentTimestamp --message-attribute-names PostalCode
```

Output:

```json
{
   "Messages": [
      {
         "Body": "My first message.",
         "ReceiptHandle": "AQEB6nR4...Hz1vZQ==",
         "MD5ofBody": "1000f835...a35411fa",
         "MD5ofMessageAttributes": "b8e89563...e088e74f",
         "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
         "Attributes": {
            "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
            "SentTimestamp": "1442428276921"
         },
         "MessageAttributes": {
            "PostalCode": {
               "DataType": "String",
               "StringValue": "ABC123"
            }
         }
      }
   ]
}
```
The following code example shows how to use `remove-permission`.

**AWS CLI**

*To remove a permission*

This example removes the permission with the specified label from the specified queue.

**Command:**

```bash
aws sqs remove-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue
```

**Output:**

None.

*For API details, see [RemovePermission](https://awscli.amazonaws.com/v2/documentation/api/index.html) in AWS CLI Command Reference.*

The following code example shows how to use `send-message-batch`.

**AWS CLI**

*To send multiple messages as a batch*

This example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

**Command:**

```bash
```
Input file (send-message-batch.json):

[  
  {  
    "Id": "FuelReport-0001-2015-09-16T140731Z",  
    "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",  
    "DelaySeconds": 10,  
    "MessageAttributes": {  
      "SellerName": {  
        "DataType": "String",  
        "StringValue": "Example Store"  
      },

   ]
}
```

- For API details, see [SendMessageBatch](#) in *AWS CLI Command Reference*.

**send-message**

The following code example shows how to use send-message.

**AWS CLI**

To send a message
This example sends a message with the specified message body, delay period, and message attributes, to the specified queue.

Command:

```
aws sqs send-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --message-body "Information about the largest city in Any Region." --delay-seconds 10 --message-attributes file://send-message.json
```

Input file (send-message.json):

```json
{
    "City": {
        "DataType": "String",
        "StringValue": "Any City"
    },
    "Greeting": {
        "DataType": "Binary",
        "BinaryValue": "Hello, World!"
    },
    "Population": {
        "DataType": "Number",
        "StringValue": "1250800"
    }
}
```

Output:

```json
{
    "MD5OfMessageBody": "51b0a325...39163aa0",
    "MD5OfMessageAttributes": "00484c68...59e48f06",
    "MessageId": "da68f62c-0c07-4bee-bf5f-7e856EXAMPLE"
}
```

- For API details, see [SendMessage](https://docs.aws.amazon.com/cli/latest/reference/sqs/send-message.html) in AWS CLI Command Reference.

**set-queue-attributes**

The following code example shows how to use set-queue-attributes.
AWS CLI

**To set queue attributes**

This example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

Command:

```bash
```

Input file (set-queue-attributes.json):

```json
{
    "DelaySeconds": "10",
    "MaximumMessageSize": "131072",
    "MessageRetentionPeriod": "259200",
    "ReceiveMessageWaitTimeSeconds": "20",
    "RedrivePolicy": "{"deadLetterTargetArn":"arn:aws:sqs:us-east-1:80398EXAMPLE:MyDeadLetterQueue","maxReceiveCount":"1000"}",
    "VisibilityTimeout": "60"
}
```

Output:

None.

- For API details, see [SetQueueAttributes](https://docs.aws.amazon.com/cli/latest/reference/sqs/set-queue-attributes.html) in *AWS CLI Command Reference*.

**start-message-move-task**

The following code example shows how to use `start-message-move-task`.

AWS CLI

*Example 1: To start a message move task*
The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \\
```

Output:

```
{
   "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see This is the topic title in the Name of your guide.

Example 2: *To start a message move task with a maximum rate*

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \\
   --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \\
   --max-number-of-messages-per-second 50
```

Output:

```
{
   "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the Developer Guide.

- For API details, see StartMessageMoveTask in AWS CLI Command Reference.

**tag-queue**

The following code example shows how to use `tag-queue`.

```python
```
**AWS CLI**

**To add cost allocation tags to a queue**

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```bash
aws sqs tag-queue \
   --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
   --tags Priority=Highest
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the Amazon Simple Queue Service Developer Guide.

- For API details, see TagQueue in AWS CLI Command Reference.

**untag-queue**

The following code example shows how to use `untag-queue`.

**AWS CLI**

**To remove cost allocation tags from a queue**

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```bash
aws sqs untag-queue \
   --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
   --tag-keys "Priority"
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the Amazon Simple Queue Service Developer Guide.

- For API details, see UntagQueue in AWS CLI Command Reference.
Storage Gateway examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Storage Gateway.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**describe-gateway-information**

The following code example shows how to use `describe-gateway-information`.

**AWS CLI**

**To describe a gateway**

The following `describe-gateway-information` command returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id sgw-12A3456B in account 123456789012:

```bash
```

This command outputs a JSON block that contains metadata about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

- For API details, see [DescribeGatewayInformation](/aws/cli/latest/reference/storagegateway/describe-gateway-information.html) in *AWS CLI Command Reference*. 
list-file-shares

The following code example shows how to use list-file-shares.

AWS CLI

To list file shares

The following command-name example lists the available widgets in your AWS account.

```bash
aws storagegateway list-file-shares \
  --gateway-arn arn:aws:storagegateway:us-east-1:209870788375:gateway/sgw-FB02E292
```

Output:

```
{
   "FileShareInfoList": [
   {
       "FileShareType": "NFS",
       "FileShareId": "share-2FA12345",
       "FileShareStatus": "AVAILABLE",
       "GatewayARN": "arn:aws:storagegateway:us-east-1:111122223333:gateway/sgw-FB0AAAAA"
   }
   ],
   "Marker": null
}
```

For more information, see [ListFileShares](https://docs.aws.amazon.com/AWSService/latest/APIReference/awsservicenames.html) in the *AWS Storage Gateway Service API Reference*.
- For API details, see [ListFileShares](https://docs.aws.amazon.com/AWSService/latest/APIReference/awsservicenames.html) in *AWS CLI Command Reference*.

list-gateways

The following code example shows how to use list-gateways.

AWS CLI

To list gateways for an account

The following list-gateways command lists all the gateways defined for an account:
aws storagegateway list-gateways

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).
- For API details, see ListGateways in AWS CLI Command Reference.

list-volumes

The following code example shows how to use list-volumes.

AWS CLI

To list the volumes configured for a gateway

The following list-volumes command returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This example specifies a gateway with the id sgw-12A3456B in account 123456789012:

```
aws storagegateway list-volumes --gateway-arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.
- For API details, see ListVolumes in AWS CLI Command Reference.

refresh-cache

The following code example shows how to use refresh-cache.

AWS CLI

To refresh the file share cache

The following refresh-cache example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \\
```
Output:

```json
{
  "NotificationId": "4954d4b1-abcd-ef01-1234-97950a7d3483"
}
```

For more information, see [ListFileShares](https://docs.aws.amazon.com/storagegateway/latest/userguide/API_ListFileShares.html) in the AWS Storage Gateway Service API Reference.

- For API details, see [RefreshCache](https://docs.aws.amazon.com/cli/latest/reference/storagegateway/refresh-cache.html) in AWS CLI Command Reference.

## AWS STS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS STS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**assume-role-with-saml**

The following code example shows how to use `assume-role-with-saml`.

**AWS CLI**

To get short-term credentials for a role authenticated with SAML
The following `assume-role-with-saml` command retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```bash
aws sts assume-role-with-saml
  --role-arn arn:aws:iam::123456789012:role/TestSaml
  --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test
  --saml-assertion
  "VERYLONGENCODEDASSERTIONEXAMPLExzYW1sOkF1ZGllbmNlPm3sYW5rPC9zYW1sOkF1ZGllbmNlPjwvc2FtbDp8d

For more information, see [Requesting Temporary Security Credentials](https://docs.aws.amazon.com/iam/latest/UserGuide/iam-create-account-saml.html) in the AWS IAM User Guide.

- For API details, see [AssumeRoleWithSaml](https://docs.aws.amazon.com/cli/latest/reference/sts/assume-role-with-saml.html) in AWS CLI Command Reference.
assume-role-with-web-identity

The following code example shows how to use assume-role-with-web-identity.

AWS CLI

To get short-term credentials for a role authenticated with Web Identity (OAuth 2.0)

The following assume-role-with-web-identity command retrieves a set of short-term credentials for the IAM role app1. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```bash
aws sts assume-role-with-web-identity \
  --duration-seconds 3600 \
  --role-session-name "app1" \
  --provider-id "www.amazon.com" \
  --policy-arns "arn:aws:iam::123456789012:policy/q=webidentitydemopolicy1","arn:aws:iam::123456789012:policy/webidentitydemopolicy2" \
  --role-arn arn:aws:iam::123456789012:role/FederatedWebIdentityRole \
  --web-identity-token "Atzaj7CIQEj87LjAsAhRFRiXvWpUXuRvQ9PZL3GMFcYevyvUwUFAHAZwZXXXXXXXXJnrulxKDHwy87oGKPznh0D6bEQZTSCzyoCDtkqjG7nPbni016GGvuS5g5vPRuXwES3VYFmlw17WT17jn-Pcb6GM-buCgHhFo2TQxod27L9CqnOLio7N3gZAGpsp6n1-AJB0CJckcyXe2c6uD0srOJeZ1KUm2eTDVMf8IehDVI01rQ0nTV6KzzAI30Y87Vd_cVMQ"
```

Output:

```json
{
    "SubjectFromWebIdentityToken": "amzn1.account.AF6RH07KZU5XRVQJGXK6HB56KR2A",
    "Audience": "client.549884153186846423.1548@apps.example.com",
    "AssumedRoleUser": {
        "Arn": "arn:aws:sts::123456789012:assumed-role/FederatedWebIdentityRole/app1",
        "AssumedRoleId": "AROACLKWSDQRAOEXAMPLE:app1"
    }
    "Credentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtncFEMI/K7MDEng/bPxRfiCyZEXmplekey",
        "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4B1CFFxWNE1OPTgk5TthT+FvwqnKwRcOIrfrRh3c/LTo6UDdyJw00vEVPvLXCrrrUtdnniCEXAMPLE/"
    }
}````
For more information, see [Requesting Temporary Security Credentials](#) in the [AWS IAM User Guide](#).

- For API details, see [AssumeRoleWithWebIdentity](#) in [AWS CLI Command Reference](#).

**assume-role**

The following code example shows how to use `assume-role`.

**AWS CLI**

**To assume a role**

The following `assume-role` command retrieves a set of short-term credentials for the IAM role `s3-access-example`.

```
aws sts assume-role \
  --role-arn arn:aws:iam::123456789012:role/xaccounts3access \
  --role-session-name s3-access-example
```

**Output:**

```
{
  "AssumedRoleUser": {
    "AssumedRoleId": "AROA3XFRBF535PLBIFPI4:s3-access-example",
    "Arn": "arn:aws:sts::123456789012:assumed-role/xaccounts3access/s3-access-example"
  },
  "Credentials": {
    "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
    "SessionToken": "AQoXdzELDDY/////////
weAoAK1wvxJY12r2IrDFT21vAzTcn3zHoZ7YNtpiQLF0MqZye/qwjjzP2iEXAMPLEbw/
m3hsj8VBTkPOR9j9M5sgP+w9IZWZnU+LWhm+
+a5fDi2oTGUycdg9ueXQ4mtCHIHfi4citgqq2Tgco40Yq14IiO4Vb2Dyaux0eYFNebHtY1FVgAu
+j7Indz3LU0aTWk1WKIjHmmMCIOtKtyYp/k7kUg7moeEYKsitwQIi6Gj+nyzM
```
The output of the command contains an access key, secret key, and session token that you can use to authenticate to AWS.

For AWS CLI use, you can set up a named profile associated with a role. When you use the profile, the AWS CLI will call assume-role and manage credentials for you. For more information, see Use an IAM role in the AWS CLI in the AWS CLI User Guide.

- For API details, see AssumeRole in AWS CLI Command Reference.

decode-authorization-message

The following code example shows how to use decode-authorization-message.

AWS CLI

To decode an encoded authorization message returned in response to a request

The following decode-authorization-message example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```bash
aws sts decode-authorization-message \
  --encoded-message EXAMPLEWodyRNrt1QARDip-eTA6t6Dr1UhHhPQrLBW_1Ab15pAKx19mPDlexYcGBreyIKQC18GBIPbKDr3dFDkwqe07e2NMk5j_hmzAIChJN-8oy3EwiOjau7BMjOTwW0tPHphV_Zaz87yENdipr745EjQwrD5LaoL3vN8_5Zfa9U8MKDgVh1gjzJFUiqoubv78V1RbHNYnK44Eppou3FZjwYStsfvTu3GHs3-6rLribG09jZ0ktVf6vyxlfZLyedr4P2hC1wty9tArCvvGzIAUNmARQJ2VWxPXiogqoQzJWP5pwe_mAyqhONLw-r1566C_90onj9A80sNrH1I-tIiNd7tgNTYzDuPQYD2FMDBnp82V9eVmYgtPp5NIEspuf3fOHanFuBZgENxQZ2d1HxJGMYtYayzZrRXjiq_SFX9zeBFaoPIb8LmmKVBLpIB0iFhU9sEHPqKHVPi6jdxXqKaZaFGvVYmV0iuQdNQKuyk0p067POFrZECLjj0tNPBOZCcuEEXAMPLE
```

Output:

```json
{
  "DecodedMessage": {
    "allowed": false,
    "explicitDeny": true,
    "matchedStatements": {
      "items": [{
        "statementId": "VisualEditor0",
        "effect": "DENY",
        "principals":
      }]
    }
  }
}
```
For more information, see [Policy evaluation logic](#) in the [AWS IAM User Guide](#).

- For API details, see [DecodeAuthorizationMessage](#) in [AWS CLI Command Reference](#).

**get-caller-identity**

The following code example shows how to use `get-caller-identity`.

**AWS CLI**

To get details about the current IAM identity

The following `get-caller-identity` command displays information about the IAM identity used to authenticate the request. The caller is an IAM user.
aws sts get-caller-identity

Output:

```
{
    "UserId": "AIDASAMPLEUSERID",
    "Account": "123456789012",
    "Arn": "arn:aws:iam::123456789012:user/DevAdmin"
}
```

**get-federation-token**

The following code example shows how to use get-federation-token.

**AWS CLI**

**To return a set of temporary security credentials using IAM user access key credentials**

The following get-federation-token example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the GetFederationToken operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
    --name Bob \
    --policy file://myfile.json \
    --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
    --duration-seconds 900
```

**Contents of myfile.json:**

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:Describe*",
            "Resource": "*"
        }
    ]
}
```
"Resource": "*

  },
  "PackedPolicySize": 36
}
For more information, see Requesting Temporary Security Credentials in the AWS IAM User Guide.

- For API details, see GetFederationToken in AWS CLI Command Reference.

going-session-token

The following code example shows how to use get-session-token.

**AWS CLI**

**To get a set of short term credentials for an IAM identity**

The following get-session-token command retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```bash
aws sts get-session-token
   --duration-seconds 900
   --serial-number "YourMFADeviceSerialNumber"
   --token-code 123456
```

Output:

```json
{
   "Credentials": {
      "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
      "SecretAccessKey": "wJalrXUttnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
      "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4BlCFFxWNE1OPTgk5TthT+FwqnKwRcOiFRh3c/LTo6UDdyJw0OvEVPvLXCrIrrUtdnmiCEXAMPLE/ IvU1dYUg2RVAJBanLhiHb4IgRmpRV3zrkuWJoq5s8IZZaIvzBXiA2R4olgkBN9bkUDNCJiBeb/ AXlBBko7b15fjrBs2+cTQtpZ3C1WFXG8C5zqx37wn0E49mRl/+0tkIKG07fAE",
      "Expiration": "2020-05-19T18:06:10+00:00"
   }
}
```

For more information, see Requesting Temporary Security Credentials in the AWS IAM User Guide.

- For API details, see GetSessionToken in AWS CLI Command Reference.
AWS Support examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Support.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**add-attachments-to-set**

The following code example shows how to use *add-attachments-to-set*.

**AWS CLI**

**To add an attachment to a set**

The following *add-attachments-to-set* example adds an image to a set that you can then specify for a support case in your AWS account.

```
aws support add-attachments-to-set \
   --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE" \
   --attachments fileName=troubleshoot-screenshot.png,data=base64-encoded-string
```

**Output:**

```json
{
   "attachmentSetId": "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE",
}
```
"expiryTime": "2020-05-14T17:04:40.790+0000"
}

For more information, see Case management in the AWS Support User Guide.
- For API details, see AddAttachmentsToSet in AWS CLI Command Reference.

add-communication-to-case

The following code example shows how to use add-communication-to-case.

AWS CLI

To add communication to a case

The following add-communication-to-case example adds communications to a support case in your AWS account.

```bash
aws support add-communication-to-case \
  --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
  --communication-body "I'm attaching a set of images to this case." \
  --cc-email-addresses "myemail@example.com" \
  --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQ1Br70-G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE"
```

Output:

```json
{
  "result": true
}
```

For more information, see Case management in the AWS Support User Guide.
- For API details, see AddCommunicationToCase in AWS CLI Command Reference.

create-case

The following code example shows how to use create-case.

AWS CLI

To create a case
The following `create-case` example creates a support case for your AWS account.

```bash
aws support create-case
   --category-code "using-aws"
   --cc-email-addresses "myemail@example.com"
   --communication-body "I want to learn more about an AWS service."
   --issue-type "technical"
   --language "en"
   --service-code "general-info"
   --severity-code "low"
   --subject "Question about my account"
```

Output:

```json
{
   "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47"
}
```

For more information, see [Case management](Case management) in the [AWS Support User Guide](AWS Support User Guide).

- For API details, see [CreateCase](CreateCase) in [AWS CLI Command Reference](AWS CLI Command Reference).

**describe-attachment**

The following code example shows how to use `describe-attachment`.

**AWS CLI**

**To describe an attachment**

The following `describe-attachment` example returns information about the attachment with the specified ID.

```bash
aws support describe-attachment
   --attachment-id "attachment-KBnjRNrePd9D6Jx0-Mm00xZuDEaL2JAj_0-gJv9qqDooTipsz3V1Nb19rcfkZneeQeDPgp8X1iVJyHH7UuhZDdNeqGoduZsPrAhymakqlc60-iJjL5HqyYGiT1FG8EXAMPLE"
```

Output:

```json
{
   "attachment": {
```

Actions and scenarios
For more information, see Case management in the AWS Support User Guide.

- For API details, see DescribeAttachment in AWS CLI Command Reference.

**describe-cases**

The following code example shows how to use describe-cases.

**AWS CLI**

**To describe a case**

The following describe-cases example returns information about the specified support case in your AWS account.

```bash
aws support describe-cases \
  --display-id "1234567890" \
  --after-time "2020-03-23T21:31:47.774Z" \
  --include-resolved-cases \
  --language "en" \
  --no-include-communications \
  --max-item 1
```

**Output:**

```json
{
  "cases": [
    {
      "status": "resolved",
      "ccEmailAddresses": [],
      "timeCreated": "2020-03-23T21:31:47.774Z",
      "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
      "severityCode": "low",
      "language": "en",
      "categoryCode": "using-aws",
      "serviceCode": "general-info",
      "submittedBy": "myemail@example.com",
      "displayId": "1234567890",
```
For more information, see [Case management](#) in the [AWS Support User Guide](#).

- For API details, see [DescribeCases](#) in [AWS CLI Command Reference](#).

### describe-communications

The following code example shows how to use describe-communications.

#### AWS CLI

**To describe the latest communication for a case**

The following describe-communications example returns the latest communication for the specified support case in your AWS account.

```
aws support describe-communications \
--case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
--after-time "2020-03-23T21:31:47.774Z" \
--max-item 1
```

**Output:**

```
{
    "communications": [
        {
            "body": "I want to learn more about an AWS service. ",
            "attachmentSet": [],
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "timeCreated": "2020-05-12T23:12:35.000Z",
            "submittedBy": "Amazon Web Services"
        }
    ],
    "NextToken": "eyJuZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQEXAMPLE=="
}
```

For more information, see [Case management](#) in the [AWS Support User Guide](#).

- For API details, see [DescribeCommunications](#) in [AWS CLI Command Reference](#).
describe-services

The following code example shows how to use describe-services.

AWS CLI

To list AWS services and service categories

The following describe-services example lists the available service categories for requesting general information.

```bash
aws support describe-services \
   --service-code-list "general-info"
```

Output:

```json
{
   "services": [
   {
      "code": "general-info",
      "name": "General Info and Getting Started",
      "categories": [
      {"code": "charges",
       "name": "How Will I Be Charged?"},
      {"code": "gdpr-queries",
       "name": "Data Privacy Query"},
      {"code": "reserved-instances",
       "name": "Reserved Instances"},
      {"code": "resource",
       "name": "Where is my Resource?"},
      {"code": "using-aws",
       "name": "Using AWS & Services"}
      ]
   }
   ]
}
```
For more information, see [Case management](#) in the [AWS Support User Guide](#).

- For API details, see [DescribeServices](#) in [AWS CLI Command Reference](#).

**describe-severity-levels**

The following code example shows how to use `describe-severity-levels`.

**AWS CLI**

**To list the available severity levels**

The following `describe-severity-levels` example lists the available severity levels for a support case.

```bash
aws support describe-severity-levels
```

**Output:**

```json
{
    "severityLevels": [
        {
            "code": "low",
            "name": "Low"
        },
        {
            "code": "normal",
            "name": "Normal"
        }
    ]
}
```
For more information, see Choosing a severity in the AWS Support User Guide.

- For API details, see DescribeSeverityLevels in AWS CLI Command Reference.

describe-trusted-advisor-check-refresh-statuses

The following code example shows how to use describe-trusted-advisor-check-refresh-statuses.

AWS CLI

To list the refresh statuses of AWS Trusted Advisor checks

The following describe-trusted-advisor-check-refresh-statuses example lists the refresh statuses for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-refresh-statuses \
  --check-id "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
  "statuses": [
    {
      "checkId": "Pfx0RwqBli",
      "name": "Normal",
      "code": "high",
      "name": "High",
      "code": "urgent",
      "name": "Urgent",
      "code": "critical",
      "name": "Critical"
    }
  ]
}
```
For more information, see [AWS Trusted Advisor](https://aws.amazon.com/trustedadvisor/) in the [AWS Support User Guide](https://docs.aws.amazon.com/sUPPORT/latest/ug/index.html).

### describe-trusted-advisor-check-result

The following code example shows how to use `describe-trusted-advisor-check-result`.

**AWS CLI**

**To list the results of an AWS Trusted Advisor check**

The following `describe-trusted-advisor-check-result` example lists the results of the IAM Use check.

```
aws support describe-trusted-advisor-check-result \ 
   --check-id "zXckfM1nI3"
```

**Output:**

```json
{
   "result": {
      "checkId": "zXckfM1nI3",
      "timestamp": "2020-05-13T21:38:05Z",
      "status": "ok",
      "resourcesSummary": {
         "resourcesProcessed": 1,
         "resourcesFlagged": 0,
         "resourcesIgnored": 0,
         "resourcesSuppressed": 0
      }
   }
}
```
For more information, see [AWS Trusted Advisor](https://aws.amazon.com/trustedadvisor/) in the *AWS Support User Guide*.

- For API details, see [DescribeTrustedAdvisorCheckResult](https://docs.aws.amazon.com/cli/latest/reference/support/describe-trusted-advisor-check-results.html) in *AWS CLI Command Reference*.

describe-trusted-advisor-check-summaries

The following code example shows how to use `describe-trusted-advisor-check-summaries`.

**AWS CLI**

To list the summaries of AWS Trusted Advisor checks

The following `describe-trusted-advisor-check-summaries` example lists the results for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-summaries \
--check-ids "Pfx0RwqBli" "zXckfM1nI3"
```

Output:

```
{
    "summaries": [
        {
            "checkId": "Pfx0RwqBli",
            "timestamp": "2020-05-13T21:38:12Z",
```
"status": "ok",
"hasFlaggedResources": true,
"resourcesSummary": {
    "resourcesProcessed": 44,
    "resourcesFlagged": 0,
    "resourcesIgnored": 0,
    "resourcesSuppressed": 0
},
"categorySpecificSummary": {
    "costOptimizing": {
        "estimatedMonthlySavings": 0.0,
        "estimatedPercentMonthlySavings": 0.0
    }
}
},
{
    "checkId": "zXCkfM1nI3",
    "timestamp": "2020-05-13T21:38:05Z",
    "status": "ok",
    "hasFlaggedResources": true,
    "resourcesSummary": {
        "resourcesProcessed": 1,
        "resourcesFlagged": 0,
        "resourcesIgnored": 0,
        "resourcesSuppressed": 0
    },
    "categorySpecificSummary": {
        "costOptimizing": {
            "estimatedMonthlySavings": 0.0,
            "estimatedPercentMonthlySavings": 0.0
        }
    }
}
]}

For more information, see AWS Trusted Advisor in the AWS Support User Guide.

- For API details, see DescribeTrustedAdvisorCheckSummaries in AWS CLI Command Reference.

describe-trusted-advisor-checks

The following code example shows how to use describe-trusted-advisor-checks.
AWS CLI

To list the available AWS Trusted Advisor checks

The following describe-trusted-advisor-checks example lists the available Trusted Advisor checks in your AWS account. This information includes the check name, ID, description, category, and metadata. Note that the output is shortened for readability.

```
aws support describe-trusted-advisor-checks \
   --language "en"
```

Output:

```
{
   "checks": [
      {
         "id": "zXCKfM1nI3",
         "name": "IAM Use",
         "description": "Checks for your use of AWS Identity and Access Management (IAM). You can use IAM to create users, groups, and roles in AWS, and you can use permissions to control access to AWS resources. Alert Criteria: Yellow: No IAM users have been created for this account. Recommended Action: Create one or more IAM users and groups in your account. You can then create additional users whose permissions are limited to perform specific tasks in your AWS environment. For more information, see <a href="https://docs.aws.amazon.com/IAM/latest/UserGuide/IAMGettingStarted.html" target="_blank">Getting Started</a>. Additional Resources: What Is IAM?"
         "category": "security",
         "metadata": []
      }
   ]
}
```

For more information, see [AWS Trusted Advisor](https://aws.amazon.com/trustedadvisor/) in the [AWS Support User Guide](https).

- For API details, see [DescribeTrustedAdvisorChecks](https://docs.aws.amazon.com/cli/latest/reference/support/describe-trusted-advisor-checks.html) in [AWS CLI Command Reference](https).

refresh-trusted-advisor-check

The following code example shows how to use refresh-trusted-advisor-check.
AWS CLI

To refresh an AWS Trusted Advisor check

The following `refresh-trusted-advisor-check` example refreshes the Amazon S3 Bucket Permissions Trusted Advisor check in your AWS account.

```bash
aws support refresh-trusted-advisor-check \
   --check-id "Pfx0RwqBli"
```

Output:

```
{
   "status": {
      "checkId": "Pfx0RwqBli",
      "status": "enqueued",
      "millisUntilNextRefreshable": 3599992
   }
}
```

resolve-case

The following code example shows how to use `resolve-case`.

AWS CLI

To resolve a support case

The following `resolve-case` example resolves a support case in your AWS account.

```bash
aws support resolve-case \
   --case-id "case-12345678910-2013-c4c1d2bf33c5cf47"
```

Output:

```
{
   "finalCaseStatus": "resolved",
}
```
For more information, see Case management in the AWS Support User Guide.
- For API details, see ResolveCase in AWS CLI Command Reference.

Amazon SWF examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SWF.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

count-closed-workflow-executions

The following code example shows how to use count-closed-workflow-executions.

AWS CLI

Counting Closed Workflow Executions

You can use swf count-closed-workflow-executions to retrieve the number of closed workflow executions for a given domain. You can specify filters to count specific classes of executions.

The --domain and either --close-time-filter or --start-time-filter arguments are required. All other arguments are optional.
aws swf count-closed-workflow-executions \
   --domain DataFrobtzz \
   --close-time-filter "{"latestDate": 1377129600, "oldestDate": 1370044800 }"

Output:

{  
   "count": 2,  
   "truncated": false
}

If "truncated" is true, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the --close-time-filter or --start-time-filter values to narrow the time range that is searched. Each of these is mutually exclusive: You can specify only one of these in a request. Use the --close-status-filter, --execution-filter, --tag-filter or --type-filter arguments to further filter the results. However, these arguments are also mutually exclusive.

See Also [CountClosedWorkflowExecutions](https://aws.amazon.com) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [CountClosedWorkflowExecutions](https://aws.amazon.com) in *AWS CLI Command Reference*.

count-open-workflow-executions

The following code example shows how to use count-open-workflow-executions.

AWS CLI

**Counting Open Workflow Executions**

You can use swf count-open-workflow-executions to retrieve the number of open workflow executions for a given domain. You can specify filters to count specific classes of executions.

The --domain and --start-time-filter arguments are required. All other arguments are optional.
aws swf count-open-workflow-executions \
  --domain DataFrobtzz \
  --start-time-filter "{ "latestDate" : 1377129600, "oldestDate" : 1370044800 }"

Output:

{
  "count": 4,
  "truncated": false
}

If "truncated" is true, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

- modify the --start-time-filter values to narrow the time range that is searched.
- use the --close-status-filter, --execution-filter, --tag-filter or --type-filter arguments to further filter the results. Each of these is mutually exclusive: You can specify only one of these in a request.

For more information, see CountOpenWorkflowExecutions in the Amazon Simple Workflow Service API Reference.

- For API details, see CountOpenWorkflowExecutions in AWS CLI Command Reference.

deprecate-domain

The following code example shows how to use deprecate-domain.

AWS CLI

Deprecating a Domain

To deprecate a domain (you can still see it, but cannot create new workflow executions or register types on it), use swf deprecate-domain. It has a sole required parameter, --name, which takes the name of the domain to deprecate.

aws swf deprecate-domain \
As with `register-domain`, no output is returned. If you use `list-domains` to view the registered domains, however, you will see that the domain has been deprecated and no longer appears in the returned data.

```bash
aws swf list-domains \
   --registration-status REGISTERED
   { 
     "domainInfos": [ 
       { 
         "status": "REGISTERED", 
         "name": "DataFrobotz"
       }, 
       { 
         "status": "REGISTERED", 
         "name": "erontest"
       }
     ]
   }
```

If you use `--registration-status DEPRECATED` with `list-domains`, you will see your deprecated domain.

```bash
aws swf list-domains \
   --registration-status DEPRECATED
   { 
     "domainInfos": [ 
       { 
         "status": "DEPRECATED", 
         "name": "MyNeatNewDomain"
       }
     ]
   }
```

You can still use `describe-domain` to get information about a deprecated domain.

```bash
aws swf describe-domain \
   --name MyNeatNewDomain
   { 
     "domainInfo": {
```
The following code example shows how to use describe-domain.

**AWS CLI**

### Getting Information About a Domain

To get detailed information about a particular domain, use the `swf describe-domain` command. There is one required parameter: `--name`, which takes the name of the domain you want information about.

```
aws swf describe-domain \
   --name DataFrobotz
   {
      "domainInfo": {
         "status": "REGISTERED",
         "name": "DataFrobotz"
      },
      "configuration": {
         "workflowExecutionRetentionPeriodInDays": "1"
      }
   }
```

You can also use describe-domain to get information about deprecated domains.

```
aws swf describe-domain \
   --name MyNeatNewDomain
   {
      "domainInfo": {
         "status": "DEPRECATED",
         "name": "MyNeatNewDomain"
      },
      "configuration": {
         "workflowExecutionRetentionPeriodInDays": "0"
      }
   }
```

See Also [DeprecateDomain](#) in the Amazon Simple Workflow Service API Reference

- For API details, see [DeprecateDomain](#) in AWS CLI Command Reference.
See Also DescribeDomain in the Amazon Simple Workflow Service API Reference

- For API details, see DescribeDomain in AWS CLI Command Reference.

list-activity-types

The following code example shows how to use list-activity-types.

AWS CLI

Listing Activity Types

To get a list of the activity types for a domain, use swf list-activity-types. The --domain and --registration-status arguments are required.

aws swf list-activity-types \
   --domain DataFrobtzz \
   --registration-status REGISTERED

Output:

```json
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        }
    ]
}
```
You can use the --name argument to select only activity types with a particular name:

```bash
aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --name "send-subscription-success"
```
To retrieve results in pages, you can set the `--maximum-page-size` argument. If more results are returned than will fit in a page of results, a "nextPageToken" will be returned in the result set:

```
aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --maximum-page-size 2
```

Output:

```
{
  "nextPageToken": "AAAAKgAAAAEAAAAAA1Gp1BelJq+PmHvAnDxJYbup8+0R4LVtbXLDi7QNY7C30pHo95z06D/GuFz10yC73um8Q1tOPJ/gC/aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/o5kdsuWMSBkHhgaZjgw3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGyqIYUM1tarkiqpSY1ZVveBasBvlvyU/WGAaqehiD7/JzLT/wWNNUM0d+Nhe",
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.451,
      "activityType": {
        "version": "1",
        "name": "confirm-user-email"
      },
      "description": "subscribe confirm-user-email activity"
    }
  ]
}
```
You can pass the nextPageToken value to the next call to `list-activity-types` in the `--next-page-token` argument, retrieving the next page of results:

```
aws swf list-activity-types \
   --domain DataFrobtzz \ 
   --registration-status REGISTERED \ 
   --maximum-page-size 2 \ 
   --next-page-token "AAAAKgAAAAAEAAAAA1Gp1BelJq 
   +PmHvAnDxJybupb8+0R4LVtbXLDI7QNY7C30pHo9Sz06D/GuFz1oyC73umBQ1t0PJ/gC/ 
   aYpzDMqUIWIA1T9W0s2DryyZX40C/6Lhk9/ 
   o5kdsuWMSBkhHgazjgpw3WJINIFJFdaSmxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVeBasBv1vyU 
   WGAAqehiDz7/JzLT/wWNNUM0d+Nhe"
```

Output:

```
{
   "nextPageToken": "AAAAKgAAAAAEAAAAA1Gp1BelJq +PmHvAnDxJybupb8+0R4LVtbXLDI7QNY7C30pHo9Sz06D/GuFz1oyC73umBQ1t0PJ/gC/ 
   aYpzDMqUIWIA1T9W0s2DryyZX40C/6Lhk9/ 
   o5kdsuWMSBkhHgazjgpw3WJINIFJFdaSmxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVeBasBv1vyU 
   WGAAqehiDz7/JzLT/wWNNUM0d+Nhe",
   "typeInfos": [
      {
         "status": "REGISTERED",
         "creationDate": 1371454149.871,
         "activityType": {
            "version": "1",
            "name": "get-subscription-info"
         },
         "description": "subscribe get-subscription-info activity"
      }
   ]
}
```
If there are still more results to return, "nextPageToken" will be returned with the results. When there are no more pages of results to return, "nextPageToken" will not be returned in the result set.

You can use the --reverse-order argument to reverse the order of the returned results. This also affects paged results.

```bash/aws swf list-activity-types \
   --domain DataFrobtzz \
   --registration-status REGISTERED \
   --maximum-page-size 2 \
   --reverse-order
```

Output:

```
{
   "nextPageToken": "AAAAKgAAAAEA4AAAAAAAwXcpu5ePSyQkrC8WMbmSrenuZC2ZkIXQYBPB/b9xIOVkj+bMEFhGj0KmmJ4rF7iddhjf7UMYCsfGkEn7mk+yMcuVc1jxDwM80EH46bcmcLmYNQihiMDmWocpr7To6/R7Cz0St1gkFayxOidJXEiQW0zdNfQaIWAAnF/cwio88x1kz1fQzmdE335oYGMPQIrUqkPq7pMEW0q01K5eDN97NzFydZZ/rlcLDWPZhUjY",
   "typeInfos": [{
      "status": "REGISTERED",
      "creationDate": 1371454150.085,
      "activityType": {
         "version": "1",
         "name": "subscribe-user-sns"
      },
      "description": "subscribe subscribe-user-sns activity"
   }]
}
```
See Also ListActivityTypes in the Amazon Simple Workflow Service API Reference

- For API details, see ListActivityTypes in AWS CLI Command Reference.

**list-domains**

The following code example shows how to use list-domains.

**AWS CLI**

**Example 1: To list your registered domains**

The following list-domains command example lists the REGISTERED SWF domains that you have registered for your account.

```
aws swf list-domains \
   --registration-status REGISTERED
```

Output:

```
{
   "domainInfos": [
      {
         "status": "REGISTERED",
         "name": "DataFrobotz"
      },
      {
         "status": "REGISTERED",
         "name": "erontest"
      }
   ]
}
```
Example 2: To list your deprecated domains

The following list-domains command example lists the DEPRECATED SWF domains that you have registered for your account. Deprecated domains are domains that can not register new workflows or activities, but that can still be queried.

```bash
aws swf list-domains \
   --registration-status DEPRECATED
```

Output:

```json
{
   "domainInfos": [
      {
         "status": "DEPRECATED",
         "name": "MyNeatNewDomain"
      }
   ]
}
```

Example 3: To list the first page of registered domains

The following list-domains command example lists the first page REGISTERED SWF domains that you have registered for your account using the --maximum-page-size option.

```bash
aws swf list-domains \
   --registration-status REGISTERED \
   --maximum-page-size 1
```

Output:

```json
{
   "domainInfos": [
```

For more information, see ListDomains in the Amazon Simple Workflow Service API Reference.
Example 4: To list the specified single page of registered domains

The following list-domains command example lists the first page REGISTERED SWF domains that you have registered for your account using the --maximum-page-size option.

When you make the call again, this time supplying the value of nextPageToken in the --next-page-token argument, you'll get another page of results.

```
aws swf list-domains \
  --registration-status REGISTERED \
  --maximum-page-size 1 \
  --next-page-token "AAAAKgAAAAEAAAAAAAAA2QJKNtidVgd49TTeNwYcpD+QKT2ynuEibbcQWe2QKrslMge63gp50Mg2GpcpoKtttL4OCXFp98Xif557it+wSZUsvUDtImjDLvguyuyyFdiIZtvIxIKEOPm3k2r40jAGaFsG0uVbrKljvla7wdU7FYH30lNCP8b7PBj9SBkUyGoiAghET74P93AuVIIkdKg"
```

Output:

```
{
  "domainInfos": [
    {
      "status": "REGISTERED",
      "name": "erontest"
    }
  ]
}
```

When there are no further pages of results to retrieve, nextPageToken will not be returned in the results.

For more information, see ListDomains in the Amazon Simple Workflow Service API Reference
For API details, see ListDomains in AWS CLI Command Reference.

**list-workflow-types**

The following code example shows how to use list-workflow-types.

**AWS CLI**

**Listing Workflow Types**

To get a list of the workflow types for a domain, use swf list-workflow-types. The --domain and --registration-status arguments are required. Here's a simple example.

```bash
aws swf list-workflow-types \
   --domain DataFrobtzz \
   --registration-status REGISTERED
```

Output:

```
{
   "typeInfos": [
      {
         "status": "REGISTERED",
         "creationDate": 1371454149.598,
         "description": "DataFrobtzz subscribe workflow",
         "workflowType": {
            "version": "v3",
            "name": "subscribe"
         }
      }
   ]
}
```

As with list-activity-types, you can use the --name argument to select only workflow types with a particular name, and use the --maximum-page-size argument in coordination with --next-page-token to page results. To reverse the order in which results are returned, use --reverse-order.

See Also ListWorkflowTypes in the Amazon Simple Workflow Service API Reference

- For API details, see ListWorkflowTypes in AWS CLI Command Reference.
register-domain

The following code example shows how to use register-domain.

AWS CLI

Registering a Domain

You can use the AWS CLI to register new domains. Use the swf register-domain command. There are two required parameters, --name, which takes the domain name, and --workflow-execution-retention-period-in-days, which takes an integer to specify the number of days to retain workflow execution data on this domain, up to a maximum period of 90 days (for more information, see the SWF FAQ <https://aws.amazon.com/swf/faqs/#retain_limit>). Workflow execution data will not be retained after the specified number of days have passed.

```
aws swf register-domain \
   --name MyNeatNewDomain \
   --workflow-execution-retention-period-in-days 0
   ""
```

When you register a domain, nothing is returned (""), but you can use swf list-domains or swf describe-domain to see the new domain.

```
aws swf list-domains \
   --registration-status REGISTERED
   {
   "domainInfos": [ 
   { 
   "status": "REGISTERED", 
   "name": "DataFrobotz"
   },
   { 
   "status": "REGISTERED", 
   "name": "MyNeatNewDomain"
   },
   { 
   "status": "REGISTERED", 
   "name": "erontest"
   }
   ]
   }
```
Using `swf describe-domain`:

```
aws swf describe-domain --name MyNeatNewDomain
{
    "domainInfo": {
        "status": "REGISTERED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

See Also `RegisterDomain` in the *Amazon Simple Workflow Service API Reference*

- For API details, see `RegisterDomain` in *AWS CLI Command Reference*.

`register-workflow-type`

The following code example shows how to use `register-workflow-type`.

**AWS CLI**

**Registering a Workflow Type**

To register a Workflow type with the AWS CLI, use the `swf register-workflow-type` command.

```
aws swf register-workflow-type \
   --domain DataFrobtzz \
   --name "MySimpleWorkflow" \
   --workflow-version "v1"
```

If successful, the command produces no output.

On an error (for example, if you try to register the same workflow type twice, or specify a domain that doesn't exist) you will get a response in JSON.

```
{
    "message": "WorkflowType=[name=MySimpleWorkflow, version=v1]",
    "__type": "com.amazonaws.swf.base.model#TypeAlreadyExistsFault"
}
```
The --domain, --name and --workflow-version are required. You can also set the workflow description, timeouts, and child workflow policy.

For more information, see RegisterWorkflowType in the Amazon Simple Workflow Service API Reference

- For API details, see RegisterWorkflowType in AWS CLI Command Reference.

Systems Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Systems Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

Example 1: To add tags to a maintenance window

The following add-tags-to-resource example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
--resource-type "MaintenanceWindow" \
```
This command produces no output.

**Example 2: To add tags to a parameter**

The following `add-tags-to-resource` example adds two tags to the specified parameter.

```bash
aws ssm add-tags-to-resource
   --resource-type "Parameter" \
   --resource-id "My-Parameter" \
   --tags '[["Key":"Region","Value":"East"],{"Key":"Environment","Value":"Production"}]'
```

This command produces no output.

**Example 3: To add tags to an SSM document**

The following `add-tags-to-resource` example adds a tag to the specified document.

```bash
aws ssm add-tags-to-resource
   --resource-type "Document" \
   --resource-id "My-Document" \
   --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see [Tagging Systems Manager resources](https://docs.aws.amazon.com/systems-manager/latest/userguide/sequence-storage-managed.html) in the *AWS Systems Manager User Guide*.

- For API details, see [AddTagsToResource](https://docs.aws.amazon.com/cli/latest/reference/ssm/add-tags-to-resource.html) in *AWS CLI Command Reference*.

**associate-ops-item-related-item**

The following code example shows how to use `associate-ops-item-related-item`.

**AWS CLI**

**To associate a related item**

The following `associate-ops-item-related-item` example associates a related item to the OpsItem.
aws ssm associate-ops-item-related-item \
  --ops-item-id "oi-649fExample" \
  --association-type "RelatesTo" \
  --resource-type "AWS::SSMIncidents::IncidentRecord" \
  --resource-uri "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/c2bde883-f7d5-343a-b13a-bf5fe9ea689f"

Output:

```json
{
   "AssociationId": "61d7178d-a30d-4bc5-9b4e-a9e74EXAMPLE"
}
```

For more information, see [Working with Incident Manager incidents in OpsCenter](#) in the [AWS Systems Manager User Guide](#).

- For API details, see [AssociateOpsItemRelatedItem](#) in [AWS CLI Command Reference](#).

### cancel-command

The following code example shows how to use `cancel-command`.

**AWS CLI**

**Example 1: To cancel a command for all instances**

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```bash
aws ssm cancel-command \
  --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

This command produces no output.

**Example 2: To cancel a command for specific instances**

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```bash
aws ssm cancel-command \
  --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```
This command produces no output.

For more information, see Tagging Systems Manager Parameters in the AWS Systems Manager User Guide.

- For API details, see CancelCommand in AWS CLI Command Reference.

cancel-maintenance-window-execution

The following code example shows how to use cancel-maintenance-window-execution.

AWS CLI

To cancel a maintenance window execution

This cancel-maintenance-window-execution example stops the specified maintenance window execution that is already in progress.

```
aws ssm cancel-maintenance-window-execution \
   --window-execution-id j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE
```

Output:

```
{
   "WindowExecutionId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see CancelMaintenanceWindowExecution in AWS CLI Command Reference.

create-activation

The following code example shows how to use create-activation.

AWS CLI

To create a managed instance activation
The following create-activation example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the AWS Systems Manager User Guide.

- For API details, see CreateActivation in AWS CLI Command Reference.

**create-association-batch**

The following code example shows how to use create-association-batch.

**AWS CLI**

**To create multiple associations**

This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

Command:

```
aws ssm create-association-batch --entries "Name=AWS-UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
    "Successful": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0"})
```
"InstanceId": "i-1234567890abcdef0",
"AssociationVersion": "1",
"Date": 1550504725.007,
"LastUpdateAssociationDate": 1550504725.007,
"Status": {
    "Date": 1550504725.007,
    "Name": "Associated",
    "Message": "Associated with AWS-UpdateSSMAgent"
},
"Overview": {
    "Status": "Pending",
    "DetailedStatus": "Creating"
},
"DocumentVersion": "$DEFAULT",
"AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
"Targets": [
    {
        "Key": "InstanceIds",
        "Values": [
            "i-1234567890abcdef0"
        ]
    }
],
{
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-9876543210abcdef0",
    "AssociationVersion": "1",
    "Date": 1550504725.057,
    "LastUpdateAssociationDate": 1550504725.057,
    "Status": {
        "Date": 1550504725.057,
        "Name": "Associated",
        "Message": "Associated with AWS-UpdateSSMAgent"
    },
    "Overview": {
        "Status": "Pending",
        "DetailedStatus": "Creating"
    },
    "DocumentVersion": "$DEFAULT",
    "AssociationId": "9c9f7f20-5154-4fed-a83e-0123456789ab",
    "Targets": [
        {
            "Key": "InstanceIds",
            "Values": [
                "i-9876543210abcdef0"
            ]
        }
    ]
}
• For API details, see CreateAssociationBatch in AWS CLI Command Reference.

create-association

The following code example shows how to use create-association.

AWS CLI

Example 1: To associate a document using instance IDs

This example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
   --instance-id "i-0cb2b964d3e14fd9f" \
   --name "AWS-UpdateSSMAgent"
```

Output:

```
{
   "AssociationDescription": {
      "Status": {
         "Date": 1487875500.33,
         "Message": "Associated with AWS-UpdateSSMAgent",
         "Name": "Associated"
      },
      "Name": "AWS-UpdateSSMAgent",
      "InstanceId": "i-0cb2b964d3e14fd9f",
      "Overview": {
         "Status": "Pending",
         "DetailedStatus": "Creating"
      },
      "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
   }
}
```
Example 2: To associate a document using targets

This example associates a configuration document with an instance, using targets.

```bash
aws ssm create-association \
   --name "AWS-UpdateSSMAgent" \
   --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```json
{
   "AssociationDescription": {
      "Status": {
         "Date": 1487875500.33,
         "Message": "Associated with AWS-UpdateSSMAgent",
         "Name": "Associated"
      },
      "Name": "AWS-UpdateSSMAgent",
      "InstanceId": "i-0cb2b964d3e14fd9f",
      "Overview": {
         "Status": "Pending",
         "DetailedStatus": "Creating"
      },
      "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
      "DocumentVersion": "$DEFAULT",
      "LastUpdateAssociationDate": 1487875500.33,
```
For more information, see [CreateAssociation](https://docs.aws.amazon.com/systems-manager/latest/APIReference/API_CreateAssociation.html) in the *AWS Systems Manager API Reference*.

**Example 3: To create an association that runs only once**

This example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```bash
aws ssm create-association \
  --name "AWS-UpdateSSMAgent" \
  --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
  --schedule-expression "at(2020-05-14T15:55:00)" \
  --apply-only-at-cron-interval
```

**Output:**

```json
{
  "AssociationDescription": {
    "Status": {
      "Date": 1487875500.33,
      "Message": "Associated with AWS-UpdateSSMAgent",
      "Name": "Associated"
    },
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-0cb2b964d3e14fd9f",
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
  }
}
```
For more information, see CreateAssociation in the AWS Systems Manager API Reference or Reference: Cron and rate expressions for Systems Manager in the AWS Systems Manager User Guide.

- For API details, see CreateAssociation in AWS CLI Command Reference.

create-document

The following code example shows how to use create-document.

AWS CLI

To create a document

The following create-document example creates a Systems Manager document.

```
aws ssm create-document \
   --content file://exampleDocument.yml \
   --name "Example" \
   --document-type "Automation" \
   --document-format YAML
```

Output:

```
{
   "DocumentDescription": {
      "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
      "HashType": "Sha256",
```
"Name": "Example",
"Owner": "29884EXAMPLE",
"CreatedDate": 1583256349.452,
"Status": "Creating",
"DocumentVersion": "1",
"Description": "Document Example",
"Parameters": [
  {
    "Name": "AutomationAssumeRole",
    "Type": "String",
    "Description": "(Required) The ARN of the role that allows Automation to perform the actions on your behalf. If no role is specified, Systems Manager Automation uses your IAM permissions to execute this document.",
    "DefaultValue": ""
  },
  {
    "Name": "InstanceId",
    "Type": "String",
    "Description": "(Required) The ID of the Amazon EC2 instance.",
    "DefaultValue": ""
  }
],
"PlatformTypes": [
  "Windows",
  "Linux"
],
"DocumentType": "Automation",
"SchemaVersion": "0.3",
"LatestVersion": "1",
"DefaultVersion": "1",
"DocumentFormat": "YAML",
"Tags": []
}

For more information, see Creating Systems Manager Documents in the AWS Systems Manager User Guide.

- For API details, see CreateDocument in AWS CLI Command Reference.

create-maintenance-window

The following code example shows how to use create-maintenance-window.
AWS CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
    --schedule "rate(5 minutes)" \
    --duration 2 --cutoff 1 \
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
}
```
For more information, see [Maintenance Windows](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateMaintenanceWindow](#) in *AWS CLI Command Reference*.

**create-ops-item**

The following code example shows how to use `create-ops-item`.

**AWS CLI**

**To create an OpsItems**

The following `create-ops-item` example uses the `/aws/resources` key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
  --title "EC2 instance disk full" \
  --description "Log clean up may have failed which caused the disk to be full" \
  --priority 2 \ 
  --source ec2 \ 
  --operational-data '{"/aws/resources":{"Value": ["arn:aws:dynamodb:us-west-2:12345678:table/OpsItems"]},"Type":"SearchableString"}' \ 
```

**Output:**

```
{
  "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see [Creating OpsItems](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateOpsItem](#) in *AWS CLI Command Reference*.

**create-patch-baseline**

The following code example shows how to use `create-patch-baseline`.

```
Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```bash
aws ssm create-patch-baseline \
   --name "Windows-Production-Baseline-AutoApproval" \
   --operating-system "WINDOWS" \
   --approval-rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important,Moderate]}, {Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},ApproveAfterDays=7}],ApproveUntilDate=2020-07-07"]" \
   --description "Baseline containing all updates approved for Windows Server production systems"
```

Output:

```
{
   "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```bash
aws ssm create-patch-baseline \
   --name "Windows-Production-Baseline-AutoApproval" \
   --operating-system "WINDOWS" \
   --approval-rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important,Moderate]}, {Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},ApproveUntilDate=2020-07-07}],ApproveUntilDate=2020-07-07"]" \
   --description "Baseline containing all updates approved for Windows Server production systems"
```

Output:
Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```bash
aws ssm create-patch-baseline \
   --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```json
{
   "Name": "Amazon-Linux-2017.09-Production-Baseline",
   "Description": "My approval rules patch baseline for Amazon Linux 2017.09 instances",
   "OperatingSystem": "AMAZON_LINUX",
   "Tags": [
      {
         "Key": "Environment",
         "Value": "Production"
      }
   ],
   "ApprovalRules": {
      "PatchRules": [
         {
            "ApproveAfterDays": 7,
            "EnableNonSecurity": true,
            "PatchFilterGroup": {
               "PatchFilters": [
                  {
                     "Key": "SEVERITY",
                     "Values": [
                        "Important",
                        "Critical"
                     ]
                  }
               ]
            }
         }
      ]
   }
}
```
Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```bash
aws ssm create-patch-baseline \
   --name "Amazon-Linux-2017.09-Alpha-Baseline" \
   --description "My custom approve/reject patch baseline for Amazon Linux 2017.09 instances" \
   --operating-system "AMAZON_LINUX"
```
For more information, see Create a Custom Patch Baseline in the AWS Systems Manager User Guide.

- For API details, see CreatePatchBaseline in AWS CLI Command Reference.

create-resource-data-sync

The following code example shows how to use create-resource-data-sync.

AWS CLI

To create a resource data sync

This example creates a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm create-resource-data-sync --sync-name "ssm-resource-data-sync" --s3-destination "BucketName=ssm-bucket,Prefix=inventory,SyncFormat=JsonSerDe,Region=us-east-1"
```

- For API details, see CreateResourceDataSync in AWS CLI Command Reference.

delete-activation

The following code example shows how to use delete-activation.

AWS CLI

To delete a managed instance activation

The following delete-activation example deletes a managed instance activation.

```
aws ssm delete-activation \
   --activation-id "aa673477-d926-42c1-8757-1358cEXAMPLE"
```
This command produces no output.

For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the AWS Systems Manager User Guide.

- For API details, see DeleteAssociation in AWS CLI Command Reference.

**delete-association**

The following code example shows how to use delete-association.

**AWS CLI**

**Example 1: To delete an association using the association ID**

The following delete-association example deletes the association for the specified association ID. There is no output if the command succeeds.

```bash
aws ssm delete-association \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the AWS Systems Manager User Guide.

**Example 2: To delete an association**

The following delete-association example deletes the association between an instance and a document. There is no output if the command succeeds.

```bash
aws ssm delete-association \
  --instance-id "i-1234567890abcdef0" \
  --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the AWS Systems Manager User Guide.

- For API details, see DeleteAssociation in AWS CLI Command Reference.
**delete-document**

The following code example shows how to use `delete-document`.

**AWS CLI**

**To delete a document**

The following `delete-document` example deletes a Systems Manager document.

```bash
aws ssm delete-document \\
--name "Example"
```

This command produces no output.

For more information, see [Creating Systems Manager Documents](https://docs.aws.amazon.com/systems-manager/latest/userguide/creating-systems-manager-documents.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteDocument](https://docs.aws.amazon.com/cli/latest/reference/ssm/delete-document.html) in *AWS CLI Command Reference*.

**delete-inventory**

The following code example shows how to use `delete-inventory`.

**AWS CLI**

**To delete a custom inventory type**

This example deletes a custom inventory schema.

Command:

```bash
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option "DeleteSchema"
```

Output:

```json
{
  "DeletionId": "d72ac9e8-1f60-4d40-b1c6-bf8c78c68c4d",
  "TypeName": "Custom:RackInfo",
  "DeletionSummary": {
    "TotalCount": 1,
    "Count": 1
  }
}
```
To disable a custom inventory type

This example disables a custom inventory schema.

Command:

```bash
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option "DisableSchema"
```

Output:

```json
{
   "DeletionId": "6961492a-8163-44ec-aa1e-923364dd0850",
   "TypeName": "Custom:RackInformation",
   "DeletionSummary": {
      "TotalCount": 0,
      "RemainingCount": 0,
      "SummaryItems": []
   }
}
```

- For API details, see [DeleteInventory](#) in [AWS CLI Command Reference](#).

delete-maintenance-window

The following code example shows how to use delete-maintenance-window.

AWS CLI

To delete a maintenance window
This delete-maintenance-window example removes the specified maintenance window.

```bash
aws ssm delete-maintenance-window \
   --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```json
{
   "WindowId":"mw-1a2b3c4d5e6f7g8h9"
}
```

For more information, see [Delete a Maintenance Window (AWS CLI)](https://docs.aws.amazon.com/systems-manager/latest/userguide/commands-delete-maintenance-window.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteMaintenanceWindow](https://docs.aws.amazon.com/cli/latest/reference/ssm/delete-maintenance-window.html) in *AWS CLI Command Reference*.

---

**delete-parameter**

The following code example shows how to use `delete-parameter`.

**AWS CLI**

**To delete a parameter**

The following `delete-parameter` example deletes the specified single parameter.

```bash
aws ssm delete-parameter \
   --name "MyParameter"
```

This command produces no output.

For more information, see [Working with Parameter Store](https://docs.aws.amazon.com/systems-manager/latest/userguide/working-with-parameter-store.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteParameter](https://docs.aws.amazon.com/cli/latest/reference/ssm/delete-parameter.html) in *AWS CLI Command Reference*.

---

**delete-parameters**

The following code example shows how to use `delete-parameters`.

---

*Actions and scenarios*
AWS CLI

To delete a list of parameters

The following delete-parameters example deletes the specified parameters.

```bash
aws ssm delete-parameters \
  --names "MyFirstParameter" "MySecondParameter" "MyInvalidParameterName"
```

Output:

```json
{
  "DeletedParameters": [
    "MyFirstParameter",
    "MySecondParameter"
  ],
  "InvalidParameters": [
    "MyInvalidParameterName"
  ]
}
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteParameters](#) in *AWS CLI Command Reference*.

delete-patch-baseline

The following code example shows how to use delete-patch-baseline.

AWS CLI

To delete a patch baseline

The following delete-patch-baseline example deletes the specified patch baseline.

```bash
aws ssm delete-patch-baseline \
  --baseline-id "pb-045f10b4f382baeda"
```

Output:
For more information, see Update or Delete a Patch Baseline (Console) in the AWS Systems Manager User Guide.

- For API details, see DeletePatchBaseline in AWS CLI Command Reference.

**delete-resource-data-sync**

The following code example shows how to use `delete-resource-data-sync`.

**AWS CLI**

To delete a resource data sync

This example deletes a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm delete-resource-data-sync --sync-name "ssm-resource-data-sync"
```

- For API details, see DeleteResourceDataSync in AWS CLI Command Reference.

**deregister-managed-instance**

The following code example shows how to use `deregister-managed-instance`.

**AWS CLI**

To deregister a managed instance

The following deregister-managed-instance example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance
   --instance-id "mi-08ab247cdfEXAMPLE"
```

This command produces no output.
For more information, see [Deregistering Managed Instances in a Hybrid Environment](https://docs.aws.amazon.com/systemsmanager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterManagedInstance](https://docs.aws.amazon.com/cli/latest/reference/ssm/deregister-managed-instance.html) in *AWS CLI Command Reference*.

### deregister-patch-baseline-for-patch-group

The following code example shows how to use `deregister-patch-baseline-for-patch-group`.

**AWS CLI**

**To deregister a patch group from a patch baseline**

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```bash
aws ssm deregister-patch-baseline-for-patch-group \
--patch-group "Production" \
--baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```json
{
    "PatchGroup": "Production",
    "BaselineId": "pb-0ca44a362fEXAMPLE"
}
```

For more information, see [Add a Patch Group to a Patch Baseline](https://docs.aws.amazon.com/systemsmanager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterPatchBaselineForPatchGroup](https://docs.aws.amazon.com/cli/latest/reference/ssm/deregister-patch-baseline-for-patch-group.html) in *AWS CLI Command Reference*.

### deregister-target-from-maintenance-window

The following code example shows how to use `deregister-target-from-maintenance-window`.

**AWS CLI**

**To remove a target from a maintenance window**
The following deregister-target-from-maintenance-window example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
  --window-id "mw-ab12cd34ef56gh78" \
  --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
  "WindowId":"mw-ab12cd34ef56gh78",
  "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see [Update a Maintenance Window (AWS CLI)](https://docs.aws.amazon.com/systems-manager/latest/userguide/update-maintenance-window.html) in the AWS Systems Manager User Guide.

deregister-task-from-maintenance-window

The following code example shows how to use deregister-task-from-maintenance-window.

**AWS CLI**

**To remove a task from a maintenance window**

The following deregister-task-from-maintenance-window example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
  --window-id "mw-ab12cd34ef56gh78" \
  --window-task-id "1a2b3c4d-1a2b-1a2b-1a2b3c4d5e6c"
```

Output:

```
{
  "WindowTaskId":"1a2b3c4d-1a2b-1a2b-1a2b3c4d5e6c",
  "WindowId":"mw-ab12cd34ef56gh78"
}
```
For more information, see [Systems Manager Maintenance Windows Tutorials (AWS CLI)](aws.amazon.com/systemsmanager/basics/maintenance-windows) in the [AWS Systems Manager User Guide](https://docs.aws.amazon.com/systemsmanager/latest/userguide/).  

**describe-activations**

The following code example shows how to use describe-activations.

**AWS CLI**

**To describe activations**

The following describe-activations example lists details about the activations in your AWS account.

```bash
aws ssm describe-activations
```

**Output:**

```json
{
    "ActivationList": [
        {
            "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
            "ActivationId": "3ee0322b-f62d-40eb-b672-13ebfEXAMPLE",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        }
    ]
}
```
For more information, see [Step 4: Create a Managed-Instance Activation for a Hybrid Environment](https://aws.amazon.com/systems-manager/) in the [AWS Systems Manager User Guide](https://docs.aws.amazon.com/systems-manager/latest/userguide/)

- For API details, see `DescribeActivations` in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-activations.html).

### describe-association-execution-targets

The following code example shows how to use `describe-association-execution-targets`.

**AWS CLI**

**To get details of an association execution**

The following `describe-association-execution-targets` example describes the specified association execution.

```bash
aws ssm describe-association-execution-targets \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
  --execution-id "7abb6378-a4a5-4f10-8312-0123456789ab"
```

**Output:**

```json
{
   "AssociationExecutionTargets": [
      {
         "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
         "AssociationVersion": "1",
         "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
         "ResourceId": "i-1234567890abcdef0",
         "ResourceType": "ManagedInstance",
         "Status": "Success",
         "DetailedStatus": "Success",
         "LastExecutionDate": 1550505538.497,
         "OutputSource": {
            "OutputSourceId": "97fff367-fc5a-4299-aed8-0123456789ab",
            "OutputSourceType": "RunCommand"
         }
      }
   ]
}
```
For more information, see [Viewing association histories](https://docs.aws.amazon.com/systems-manager/latest/userguide/associations-view-history.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAssociationExecutionTargets](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-association-executions.html) in *AWS CLI Command Reference*.

### describe-association-executions

The following code example shows how to use `describe-association-executions`.

**AWS CLI**

**Example 1: To get details of all executions for an association**

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
   --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

**Output:**

```json
{
   "AssociationExecutions": [
      {
         "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
         "AssociationVersion": "1",
         "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
         "Status": "Success",
         "DetailedStatus": "Success",
         "CreatedTime": 1550505827.119,
         "ResourceCountByStatus": "{Success=1}"
      },
      {
         "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
         "AssociationVersion": "1",
         "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
         "Status": "Success",
         "DetailedStatus": "Success",
         "CreatedTime": 1550505827.119,
         "ResourceCountByStatus": "{Success=1}"
      },
      ...
```
Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
   --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
   --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see [Viewing association histories](https://docs.aws.amazon.com/systems-manager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAssociationExecutions](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-association-executions.html) in *AWS CLI Command Reference*.
describe-association

The following code example shows how to use describe-association.

AWS CLI

Example 1: To get details of an association

The following describe-association example describes the association for the specified association ID.

```
aws ssm describe-association \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```json
{
  "AssociationDescription": {
    "Name": "AWS-GatherSoftwareInventory",
    "AssociationVersion": "1",
    "Date": 1534864780.995,
    "LastUpdateAssociationDate": 1543235759.81,
    "Overview": {
      "Status": "Success",
      "AssociationStatusAggregatedCount": {
        "Success": 2
      }
    },
    "DocumentVersion": "$DEFAULT",
    "Parameters": {
      "applications": ["Enabled"],
      "awsComponents": ["Enabled"],
      "customInventory": ["Enabled"],
      "files": [
        ""
      ],
      "instanceDetailedInformation": [
```
"Enabled"
],
"networkConfig": [
  "Enabled"
],
"services": [
  "Enabled"
],
"windowsRegistry": [
  ""
],
"windowsRoles": [
  "Enabled"
],
"windowsUpdates": [
  "Enabled"
]
},
"AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
"Targets": [
  {
    "Key": "InstanceIds",
    "Values": [
      "*
    ]
  }
],
"ScheduleExpression": "rate(24 hours)",
"LastExecutionDate": 1550501886.0,
"LastSuccessfulExecutionDate": 1550501886.0,
"AssociationName": "Inventory-Association"
}

For more information, see Editing and creating a new version of an association in the AWS Systems Manager User Guide.

Example 2: To get details of an association for a specific instance and document

The following describe-association example describes the association between an instance and a document.

aws ssm describe-association \
Output:

```json
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487876122.564,
            "Message": " Associated with AWS-UpdateSSMAgent",
            "Name": " Associated"
        },
        "Name": " AWS-UpdateSSMAgent",

                    "i-1234567890abcdef0"
                ],
                "Key": " InstanceIds"
            }
        ]
    }
}
```

For more information, see [Editing and creating a new version of an association](#) in the [AWS Systems Manager User Guide](#).

- For API details, see [DescribeAssociation](#) in [AWS CLI Command Reference](#).
describe-automation-executions

The following code example shows how to use describe-automation-executions.

AWS CLI

To describe an automation execution

The following describe-automation-executions example displays details about an Automation execution.

aws ssm describe-automation-executions \
  --filters Key=ExecutionId,Values=73c8ef8-f4ee-4a05-820c-e354fEXAMPLE

Output:

```
{
    "AutomationExecutionMetadataList": [
        {
            "AutomationExecutionId": "73c8ef8-f4ee-4a05-820c-e354fEXAMPLE",
            "DocumentName": "AWS-StartEC2Instance",
            "DocumentVersion": "1",
            "AutomationExecutionStatus": "Success",
            "ExecutionStartTime": 1583737233.748,
            "ExecutionEndTime": 1583737234.719,
            "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/OrchestrationService",
            "LogFile": "",
            "Outputs": {},
            "Mode": "Auto",
            "Targets": [],
            "ResolvedTargets": {
                "ParameterValues": [],
                "Truncated": false
            },
            "AutomationType": "Local"
        }
    ]
}
```

For more information, see Running a Simple Automation Workflow in the AWS Systems Manager User Guide.
describe-automation-step-executions

The following code example shows how to use describe-automation-step-executions.

AWS CLI

Example 1: To describe all steps for an automation execution

The following describe-automation-step-executions example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "running",
                "InstanceIds": "["i-0cb99161f6EXAMPLE"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
            "OverriddenParameters": {}  
        }
    ]
}
```

Example 2: To describe a specific step for an automation execution
The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```bash
aws ssm describe-automation-step-executions \
  --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
  --filters Key=StepExecutionId,Values=95e70479-cf20-4d80-8018-7e4e2EXAMPLE
```

- For API details, see [DescribeAutomationStepExecutions](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-automation-step-executions.html) in *AWS CLI Command Reference*.

### describe-available-patches

The following code example shows how to use `describe-available-patches`.

**AWS CLI**

**To get available patches**

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```bash
aws ssm describe-available-patches \
  --filters "Key=PRODUCT,Values=WindowsServer2019" \n  "Key=MSRC_SEVERITY,Values=Critical"
```

**Output:**

```json
{
  "Patches": [
    {
      "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
      "ReleaseDate": 1544047205.0,
      "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems (KB4470788)",
      "Description": "Install this update to resolve issues in Windows. For a complete listing of the issues that are included in this update, see the associated Microsoft Knowledge Base article for more information. After you install this item, you may have to restart your computer.",
      "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
      "Vendor": "Microsoft"
    }
  ]
}
```
To get details of a specific patch

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
    --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
```
"Patches": [
    {
        "Id": "680861e3-fb75-432e-818e-d72e5f2be719",
        "ReleaseDate": 1546970408.0,
        "Title": "2019-01 Security Update for Adobe Flash Player for Windows Server 2016 for x64-based Systems (KB4480979)",
        "Description": "A security issue has been identified in a Microsoft software product that could affect your system. You can help protect your system by installing this update from Microsoft. For a complete listing of the issues that are included in this update, see the associated Microsoft Knowledge Base article. After you install this update, you may have to restart your system."
        "ContentUrl": "https://support.microsoft.com/en-us/kb/4480979",
        "Vendor": "Microsoft",
        "ProductFamily": "Windows",
        "Product": "WindowsServer2016",
        "Classification": "SecurityUpdates",
        "MsrcSeverity": "Critical",
        "KbNumber": "KB4480979",
        "MsrcNumber": "",
        "Language": "All"
    }
]
Output:

```json
{
  "AccountIds": [
    "all"
  ],
  "AccountSharingInfoList": [
    {
      "AccountId": "all",
      "SharedDocumentVersion": "$DEFAULT"
    }
  ]
}
```

For more information, see [Share a Systems Manager Document](https://docs.aws.amazon.com/systemsmanager/latest/userguide/share-document-example.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeDocumentPermission](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-document-permission.html) in *AWS CLI Command Reference*.

### describe-document

The following code example shows how to use `describe-document`.

**AWS CLI**

To display details of a document

The following `describe-document` example displays details about a Systems Manager document in your AWS account.

```bash
aws ssm describe-document \--name "Example"
```

Output:

```json
{
  "Document": {
    "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
    "HashType": "Sha256",
    "Name": "Example",
```
"Owner": "29884EXAMPLE",
"CreatedDate": 1583257938.266,
"Status": "Active",
"DocumentVersion": "1",
"Description": "Document Example",
"Parameters": [
{
   "Name": "AutomationAssumeRole",
   "Type": "String",
   "Description": "(Required) The ARN of the role that allows Automation to perform the actions on your behalf. If no role is specified, Systems Manager Automation uses your IAM permissions to execute this document.",
   "DefaultValue": ""
},
{
   "Name": "InstanceId",
   "Type": "String",
   "Description": "(Required) The ID of the Amazon EC2 instance.",
   "DefaultValue": ""
}]
],
"PlatformTypes": [
   "Windows",
   "Linux"
],
"DocumentType": "Automation",
"SchemaVersion": "0.3",
"LatestVersion": "1",
"DefaultVersion": "1",
"DocumentFormat": "YAML",
"Tags": []
}]

For more information, see Creating Systems Manager Documents in the AWS Systems Manager User Guide.

- For API details, see DescribeDocument in AWS CLI Command Reference.

describe-effective-instance-associations

The following code example shows how to use describe-effective-instance-associations.
AWS CLI

To get details of the effective associations for an instance

The following describe-effective-instance-associations example retrieves details about the effective associations for an instance.

Command:

```
aws ssm describe-effective-instance-associations --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    "schemaVersion": "1.2",
    "description": "Update the Amazon SSM Agent to the latest version or specified version.\",\n    "parameters": {\n        "version": {\n            "default": "",
            "description": "(Optional) A specific version of the Amazon SSM Agent to install. If not specified, the agent will be updated to the latest version.\",\n            "type": "String\",
            "default": "false",
            "description": "(Optional) Allow the Amazon SSM Agent service to be downgraded to an earlier version. If set to false, the service can be upgraded to newer versions only (default). If set to true, specify the earlier version.\",\n            "type": "String",
            "allowedValues": [\n                "true",
                "false"
            ],\n            "runtimeConfig": {\n                "aws:updateSsmAgent": {\n                    "properties": {\n                        "agentName": "amazon-ssm-agent",
                        "source": "https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json",
                        "allowDowngrade": "{ allowDowngrade }",
                        "targetVersion": "{{ version }}"
                    }
                }
            }
        }
    },
    "runtimeConfig": {\n        "aws:updateSsmAgent": {\n            "properties": {\n                "agentName": "amazon-ssm-agent",
                "source": "https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json",
                "allowDowngrade": "{ allowDowngrade }",
                "targetVersion": "{{ version }}"
            }
        }
    }
}

"AssociationVersion": "1"
}
```

- For API details, see [DescribeEffectiveInstanceAssociations](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-effective-instance-associations.html) in *AWS CLI Command Reference.*
describe-effective-patches-for-patch-baseline

The following code example shows how to use describe-effective-patches-for-patch-baseline.

AWS CLI

Example 1: To get all patches defined by a custom patch baseline

The following describe-effective-patches-for-patch-baseline example returns the patches defined by a custom patch baseline in the current AWS account. Note that for a custom baseline, only the ID is required for --baseline-id.

```
aws ssm describe-effective-patches-for-patch-baseline \
  --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
  "EffectivePatches": [
    {
      "Patch": {
        "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
        "ReleaseDate": 1544047205.0,
        "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems (KB4470788)",
        "Description": "Install this update to resolve issues in Windows. For a complete listing of the issues that are included in this update, see the associated Microsoft Knowledge Base article for more information. After you install this item, you may have to restart your computer.,
        "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
        "Vendor": "Microsoft",
        "ProductFamily": "Windows",
        "Product": "WindowsServer2019",
        "Classification": "SecurityUpdates",
        "MsrcSeverity": "Critical",
        "KbNumber": "KB4470788",
        "MsrcNumber": "",
        "Language": "All"
      },
      "PatchStatus": {
        "DeploymentStatus": "APPROVED",
      }
    }
  ]
}
```
Example 2: To get all patches defined by an AWS managed patch baseline

The following describe-effective-patches-for-patch-baseline example returns the patches defined by an AWS managed patch baseline. Note that for an AWS managed baseline, the complete baseline ARN is required for --baseline-id

```bash
aws ssm describe-effective-patches-for-patch-baseline
```
describe-instance-associations-status

The following code example shows how to use `describe-instance-associations-status`.

**AWS CLI**

**To describe the status of an instance's associations**

This example shows details of the associations for an instance.

**Command:**

```
aws ssm describe-instance-associations-status --instance-id "i-1234567890abcdef0"
```

**Output:**

```
{
  "InstanceAssociationStatusInfos": [
    {
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "Name": "AWS-GatherSoftwareInventory",
      "DocumentVersion": "1",
      "AssociationVersion": "1",
      "InstanceId": "i-1234567890abcdef0",
      "ExecutionDate": 1550501886.0,
      "Status": "Success",
      "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0 timedout, 0 skipped. ",
      "AssociationName": "Inventory-Association"
    },
    {
      "AssociationId": "5c5a31f6-6dae-46f9-944c-0123456789ab",
      "Name": "AWS-GatherSoftwareInventory",
      "DocumentVersion": "1",
      "AssociationVersion": "1",
      "InstanceId": "i-1234567890abcdef0",
      "ExecutionDate": 1550501886.0,
      "Status": "Success",
      "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0 timedout, 0 skipped. ",
      "AssociationName": "Inventory-Association"
    }
  ]
}
```
For API details, see **DescribeInstanceAssociationsStatus** in *AWS CLI Command Reference*.

### describe-instance-information

The following code example shows how to use `describe-instance-information`.

#### AWS CLI

**Example 1: To describe managed instance information**

The following `describe-instance-information` example retrieves details of each of your managed instances.

```bash
aws ssm describe-instance-information
```

**Example 2: To describe information about a specific managed instance**

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```bash
aws ssm describe-instance-information
   --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

**Example 3: To describe information about managed instances with a specific tag key**

The following `describe-instance-information` example shows details for managed instances that have the tag key `DEV`.

```bash
aws ssm describe-instance-information
   --filters "Key=Tags,Values=DEV"
```
--filters "Key=tag-key,Values=DEV"

Output:

```json
{
  "InstanceInformationList": [
    {
      "InstanceId": "i-028ea792daEXAMPLE",
      "PingStatus": "Online",
      "LastPingDateTime": 1582221233.421,
      "AgentVersion": "2.3.842.0",
      "IsLatestVersion": true,
      "PlatformType": "Linux",
      "PlatformName": "SLES",
      "PlatformVersion": "15.1",
      "ResourceType": "EC2Instance",
      "IPAddress": "192.0.2.0",
      "ComputerName": "ip-198.51.100.0.us-east-2.compute.internal",
      "AssociationStatus": "Success",
      "LastAssociationExecutionDate": 1582220806.0,
      "LastSuccessfulAssociationExecutionDate": 1582220806.0,
      "AssociationOverview": {
        "DetailedStatus": "Success",
        "InstanceAssociationStatusAggregatedCount": {
          "Success": 2
        }
      }
    }
  ]
}
```

For more information, see [Managed Instances](https://docs.aws.amazon.com/systems-manager/latest/userguide/Managed-Instances.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeInstanceInformation](https://docs.aws.amazon.com/cli/latest/reference/systems-manager/describe-instance-information.html) in *AWS CLI Command Reference*.

### describe-instance-patch-states-for-patch-group

The following code example shows how to use `describe-instance-patch-states-for-patch-group`.

**AWS CLI**

**Example 1: To get the instance states for a patch group**
The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
   --patch-group "Production"
```

Output:

```
{
   "InstancePatchStates": [
   {
      "InstanceId": "i-02573cafcfEXAMPLE",
      "PatchGroup": "Production",
      "BaselineId": "pb-0c10e65780EXAMPLE",
      "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
      "OwnerInformation": "",
      "InstalledCount": 32,
      "InstalledOtherCount": 1,
      "InstalledPendingRebootCount": 0,
      "InstalledRejectedCount": 0,
      "MissingCount": 2,
      "FailedCount": 0,
      "UnreportedNotApplicableCount": 2671,
      "NotApplicableCount": 400,
      "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
      "OperationEndTime": "2021-08-04T11:04:21.555000-07:00",
      "Operation": "Scan",
      "RebootOption": "NoReboot",
      "CriticalNonCompliantCount": 0,
      "SecurityNonCompliantCount": 1,
      "OtherNonCompliantCount": 0
   },
   {
      "InstanceId": "i-0471e04240EXAMPLE",
      "PatchGroup": "Production",
      "BaselineId": "pb-09ca3fb51fEXAMPLE",
      "SnapshotId": "05d8ffb0-1bbe-4812-ba2d-d9b7bEXAMPLE",
      "OwnerInformation": "",
      "InstalledCount": 32,
      "InstalledOtherCount": 1,
      "InstalledPendingRebootCount": 0,
      "InstalledRejectedCount": 0,
      "MissingCount": 2,
```
Example 2: To get the instance states for a patch group with more than five missing patches

The following describe-instance-patch-states-for-patch-group example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```bash
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=MissingCount,Type=GreaterThan,Values=5 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 46,
            "InstalledOtherCount": 4,
            "InstalledPendingRebootCount": 1,
            "InstalledRejectedCount": 1,
            "MissingCount": 7,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 232,
            "NotApplicableCount": 654,
```
Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following describe-instance-patch-states-for-patch-group example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

aws ssm describe-instance-patch-states-for-patch-group \
   --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \n   --patch-group "Production"

Output:

{
   "InstancePatchStates": [
      {
         "InstanceId": "i-02573cafcfEXAMPLE",
         "BaselineId": "pb-0c10e65780EXAMPLE",
         "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
         "PatchGroup": "Production",
         "OwnerInformation": "",
         "InstalledCount": 32,
         "InstalledOtherCount": 1,
         "InstalledPendingRebootCount": 4,
         "InstalledRejectedCount": 0,
         "MissingCount": 2,
         "FailedCount": 0,

         "NotApplicableCount": 212,
         "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
         "OperationEndTime": "2021-08-06T11:04:21.555000-07:00",
      }
   ]
}
For more information, see [Understanding patch compliance state values](https://docs.aws.amazon.com/systems-manager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeInstancePatchStatesForPatchGroup](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-instance-patch-states.html) in *AWS CLI Command Reference*.

### describe-instance-patch-states

The following code example shows how to use describe-instance-patch-states.

**AWS CLI**

**To get the patch summary states for instances**

This describe-instance-patch-states example gets the patch summary states for an instance.

```bash
aws ssm describe-instance-patch-states \
  --instance-ids "i-1234567890abcdef0"
```

**Output:**

```json
{
  "InstancePatchStates": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PatchGroup": "my-patch-group",
      "BaselineId": "pb-0713accee01234567",
      "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
      "CriticalNonCompliantCount": 2,
      "SecurityNonCompliantCount": 2,
      "OtherNonCompliantCount": 1,
    }
  ]
}
```
For more information, see [About Patch Compliance](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeInstancePatchStates](#) in *AWS CLI Command Reference*.

describe-instance-patches

The following code example shows how to use describe-instance-patches.

**AWS CLI**

**Example 1: To get the patch state details for an instance**

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```bash
aws ssm describe-instance-patches \
   --instance-id "i-1234567890abcdef0"
```

Output:

```json
{
   "Patches": [
      {
         "Title": "2019-01 Security Update for Adobe Flash Player for Windows Server 2016 for x64-based Systems (KB4480979)",
         ...
      }
   ]
}
```
Example 2: To get a list of patches in the Missing state for an instance

The following describe-instance-patches example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```
For more information, see About Patch Compliance States in the AWS Systems Manager User Guide.

Example 3: To get a list of patches installed since a specified InstalledTime for an instance

The following describe-instance-patches example retrieves information about patches installed since a specified time for the specified instance by combining the use of --filters and --query.

```bash
aws ssm describe-instance-patches \
  --instance-id "i-1234567890abcdef0" \
  --filters Key=State,Values=Installed \
  --query "Patches[?InstalledTime >= `2023-01-01T16:00:00`]"
```

Output:

```json
{
  "Patches": [
    {
      "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for x64-based Systems (KB5023702)",
      "KBId": "KB5023702",
      "Classification": "SecurityUpdates",
      "Severity": "Critical",
      "State": "Installed",
      "InstalledTime": "2023-03-16T11:00:00+00:00"
    },
    ...
  ],
  "NextToken": "--token string truncated--"
}
```

- For API details, see DescribeInstancePatches in AWS CLI Command Reference.

**describe-inventory-deletions**

The following code example shows how to use describe-inventory-deletions.
AWS CLI

To get inventory deletions

This example retrieves details for inventory deletion operations.

Command:

```bash
aws ssm describe-inventory-deletions
```

Output:

```
{
  "InventoryDeletions": [
    {
      "DeletionId": "6961492a-8163-44ec-aa1e-01234567850",
      "TypeName": "Custom:RackInformation",
      "DeletionStartTime": 1550254911.0,
      "LastStatus": "InProgress",
      "LastStatusMessage": "The Delete is in progress",
      "DeletionSummary": {
        "TotalCount": 0,
        "RemainingCount": 0,
        "SummaryItems": []
      },
      "LastStatusUpdateTime": 1550254911.0
    },
    {
      "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
      "TypeName": "Custom:RackInformation",
      "DeletionStartTime": 1550254859.0,
      "LastStatus": "InProgress",
      "LastStatusMessage": "The Delete is in progress",
      "DeletionSummary": {
        "TotalCount": 1,
        "RemainingCount": 1,
        "SummaryItems": [
          {
            "Version": "1.0",
            "Count": 1,
            "RemainingCount": 1
          }
        ]
      }
    }
  ]
}
```
To get details of a specific inventory deletion

This example retrieves details for a specific inventory deletion operation.

Command:

```
aws ssm describe-inventory-deletions --deletion-id "d72ac9e8-1f60-4d40-b1c6-987654321c4d"
```

Output:

```
{
   "InventoryDeletions": [
      {
         "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
         "TypeName": "Custom:RackInfo",
         "DeletionStartTime": 1550254859.0,
         "LastStatus": "InProgress",
         "LastStatusMessage": "The Delete is in progress",
         "DeletionSummary": {
            "TotalCount": 1,
            "RemainingCount": 1,
            "SummaryItems": [
               {
                  "Version": "1.0",
                  "Count": 1,
                  "RemainingCount": 1
               }
            ]
         },
         "LastStatusUpdateTime": 1550254859.0
      }
   ]
}
```

For API details, see [DescribeInventoryDeletions](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-inventory-deletions.html) in *AWS CLI Command Reference*. 
**describe-maintenance-window-execution-task-invocations**

The following code example shows how to use `describe-maintenance-window-execution-task-invocations`.

**AWS CLI**

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```bash
aws ssm describe-maintenance-window-execution-task-invocations \
   --window-execution-id "518d5565-5969-4cca-8f0e-da3b2a638355" \
   --task-id "ac0c6ae1-daa3-4a89-832e-d384503b6586"
```

Output:

```json
{
   "WindowExecutionTaskInvocationIdentities": [
   {
      "Status": "SUCCESS",
      "Parameters": "{\"documentName\":\"AWS-RunShellScript\",\"instanceIds\":\"i-0000293fffd8c57862\"},\"parameters\":{\"commands\":[\"df\"],\"maxConcurrency\":\"1\",\"maxErrors\":\"1\"},
      "InvocationId": "e274b6e1-fe56-4e32-bd2a-8073c6381d8b",
      "StartTime": 1487692834.723,
      "EndTime": 1487692834.871,
      "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2a638355",
      "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d384503b6586"
   }
   ]
}
```

For more information, see [View Information About Tasks and Task Executions (AWS CLI)](https://docs.aws.amazon.com/systems-manager/latest/userguide/using-ssm-aws-cli.html) in the AWS Systems Manager User Guide.

- For API details, see [DescribeMaintenanceWindowExecutionTaskInvocations](https://docs.aws.amazon.com/systems-manager/latest/api/endpoint-reference-api.html) in AWS CLI Command Reference.
**describe-maintenance-window-execution-tasks**

The following code example shows how to use `describe-maintenance-window-execution-tasks`.

**AWS CLI**

**To list all tasks associated with a maintenance window execution**

The following `ssm describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```bash
aws ssm describe-maintenance-window-execution-tasks \
   --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```json
{
   "WindowExecutionTaskIdentities": [
       {
           "Status": "SUCCESS",
           "TaskArn": "AWS-RunShellScript",
           "StartTime": 1487692834.684,
           "TaskType": "RUN_COMMAND",
           "EndTime": 1487692835.005,
           "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
           "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
       }
   ]
}
```

For more information, see [View Information About Tasks and Task Executions (AWS CLI)](https://docs.aws.amazon.com/AWSSystemManager/latest/ug/cli-cli-ref.html) in the [AWS Systems Manager User Guide](https).

- For API details, see [DescribeMaintenanceWindowExecutionTasks](https://docs.aws.amazon.com/AWSSystemManager/latest/ug/sms-ssl-api-ref.html) in [AWS CLI Command Reference](https).

**describe-maintenance-window-executions**

The following code example shows how to use `describe-maintenance-window-executions`. 
AWS CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```bash
aws ssm describe-maintenance-window-executions \
  --window-id "mw-ab12cd34eEXAMPLE"
```

Output:

```
{
  "WindowExecutions": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191abEXAMPLE",
      "Status": "IN_PROGRESS",
      "StartTime": "2021-08-04T11:00:00.000000-07:00"
    },
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowExecutionId": "ff75b750-4834-4377-8f61-b3cadEXAMPLE",
      "Status": "SUCCESS",
      "StartTime": "2021-08-03T11:00:00.000000-07:00",
      "EndTime": "2021-08-03T11:37:21.450000-07:00"
    },
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
      "Status": "FAILED",
      "StatusDetails": "One or more tasks in the orchestration failed.",
      "StartTime": "2021-08-02T11:00:00.000000-07:00",
      "EndTime": "2021-08-02T11:22:36.190000-07:00"
    }
  ]
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

Actions and scenarios

6037
aws ssm describe-maintenance-window-executions \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"

Output:

```json
{
  "WindowExecutions": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
      "Status": "FAILED",
      "StatusDetails": "One or more tasks in the orchestration failed.",
      "StartTime": "2021-08-02T11:00:00.000000-07:00",
      "EndTime": "2021-08-02T11:22:36.190000-07:00"
    }
  ]
}
```

**Example 3: To list all executions for a maintenance window after a specified date**

The following describe-maintenance-window-executions example lists all of the executions for the specified maintenance window after the specified date.

aws ssm describe-maintenance-window-executions \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"

Output:

```json
{
  "WindowExecutions": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
      "Status": "IN_PROGRESS",
      "StartTime": "2021-08-04T11:00:00.000000-07:00"
    }
  ]
}
```
For more information, see View information about tasks and task executions (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see DescribeMaintenanceWindowExecutions in AWS CLI Command Reference.

describe-maintenance-window-schedule

The following code example shows how to use describe-maintenance-window-schedule.

AWS CLI

**Example 1: To list upcoming executions for a maintenance window**

The following describe-maintenance-window-schedule example lists all upcoming executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-ab12cd34eEXAMPLE
```

Output:

```
{
   "ScheduledWindowExecutions": [
       {
           "WindowId": "mw-ab12cd34eEXAMPLE",
           "Name": "My-First-Maintenance-Window",
           "ExecutionTime": "2020-02-19T16:00Z"
       },
       {
           "WindowId": "mw-ab12cd34eEXAMPLE",
           "Name": "My-First-Maintenance-Window",
           "ExecutionTime": "2020-02-26T16:00Z"
       },
       ...
   ]
}
```

**Example 2: To list all upcoming executions for a maintenance window before a specified date**

The following describe-maintenance-window-schedule example lists all upcoming executions for the specified maintenance window that occur before the specified date.
Example 3: To list all upcoming executions for a maintenance window after a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur after the specified date.

```bash
aws ssm describe-maintenance-window-schedule
--window-id mw-0ecb1226dd7b2e9a6
--filters "Key=ScheduledAfter,Values=2020-02-15T06:00:00Z"
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see DescribeMaintenanceWindowSchedule in AWS CLI Command Reference.

describe-maintenance-window-targets

The following code example shows how to use `describe-maintenance-window-targets`.

AWS CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```bash
aws ssm describe-maintenance-window-targets
--window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```json
{
   "Targets": [
      {
         "ResourceType": "INSTANCE",
         "OwnerInformation": "Single instance",
         "WindowId": "mw-06cf17cbefEXAMPLE",
         "Targets": [
            {
```
Example 2: To list all targets for a maintenance window matching a specific owner information value

This `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
   --window-id "mw-0ecb1226ddEXAMPLE" \
   --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```json
{
   "Targets": [
      {
         "WindowId": "mw-0ecb1226ddEXAMPLE",
         "WindowTargetId": "da89dccc-37ff9c-481d-ba2b-edcb7d0057f9",
         "Targets": [
            {
               "Values": [
                  "i-0000293fffdEXAMPLE",
                  "i-0cb2964d3EXAMPLE"
               ],
               "Key": "InstanceIds"
            }
         ],
         "WindowTargetId": "e078a987-2866-47be-bedd-d9cf4EXAMPLE"
      }
   ]
}
```
For more information, see View Information About Maintenance Windows (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see DescribeMaintenanceWindowTargets in AWS CLI Command Reference.

describe-maintenance-window-tasks

The following code example shows how to use describe-maintenance-window-tasks.

AWS CLI

Example 1: To list all tasks for a maintenance window

The following describe-maintenance-window-tasks example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
   --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
   "Tasks": [
      {
         "WindowId": "mw-06cf17cbefEXAMPLE",
         "WindowTaskId": "018b31c3-2d77-4b9e-bd48-c91edEXAMPLE",
         "TaskArn": "AWS-RebootEC2Instance",
         "TaskParameters": {}
      }
   ]
}
```
"Type": "AUTOMATION",
"Description": "Restarting EC2 Instance for maintenance",
"MaxConcurrency": "1",
"MaxErrors": "1",
"Name": "My-Automation-Example-Task",
"Priority": 0,
"ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
"Targets": [
  {
    "Key": "WindowTargetIds",
    "Values": [
      "da89d3c3-7f9c-481d-ba2b-edcb7EXAMPLE"
    ]
  }
],
{
  "WindowId": "mw-06cf17cbe9EXAMPLE",
  "WindowTaskId": "1943dee0-0a17-4978-9bf4-3cc2fEXAMPLE",
  "TaskArn": "AWS-DisableS3BucketPublicReadWrite",
  "TaskParameters": {},
  "Type": "AUTOMATION",

      "Key": "WindowTargetIds",
      "Values": [
        "da89d3c3-7f9c-481d-ba2b-edcb7EXAMPLE"
      ]
    }
  ]
}
Example 2: To list all tasks for a maintenance window that invokes the AWS-RunPowerShellScript command document

The following describe-maintenance-window-tasks example lists all of the tasks for the specified maintenance window that invokes the AWS-RunPowerShellScript command document.

```bash
aws ssm describe-maintenance-window-tasks \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```json
{
  "Tasks": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",

      "MaxConcurrency": "1",
      "MaxErrors": "1",
      "Name": "MyTask"
    }
  ]
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3
The following describe-maintenance-window-tasks example lists all of the tasks for the specified maintenance window that have a Priority of 3.

```bash
aws ssm describe-maintenance-window-tasks \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --filters "Key=Priority,Values=3"
```

Output:

```json
{
  "Tasks": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
      "TaskArn": "AWS-RunPowerShellScript",
      "Type": "RUN_COMMAND",
      "Targets": [
        {
          "Key": "WindowTargetIds",
          "Values": [
            "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
          ]
        }
      ],
      "TaskParameters": {},
      "Priority": 3,

          ]
        }
      ]
    }
  ]
}
```
Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command

This describe-maintenance-window-tasks example lists all of the tasks for the specified maintenance window that have a Priority of 1 and use Run Command.

```bash
aws ssm describe-maintenance-window-tasks \
   --window-id "mw-ab12cd34eEXAMPLE" \
   --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"
```

Output:

```json
{
   "Tasks": [
   {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
      "TaskArn": "AWS-RunPowerShellScript",
      "Type": "RUN_COMMAND",
      "Targets": [
      {
         "Key": "WindowTargetIds",
         "Values": [
            "da89dcd3-7f9c-481d-ba2b-edcb7EXAMPLE"
         ]
      }
      ],
      "TaskParameters": {},
      "Priority": 1,
   }
   ]
}
```
For more information, see View information about maintenance windows (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see DescribeMaintenanceWindowTasks in AWS CLI Command Reference.

**describe-maintenance-windows-for-target**

The following code example shows how to use describe-maintenance-windows-for-target.

**AWS CLI**

**To list all maintenance windows associated with a specific instance**

The following describe-maintenance-windows-for-target example lists the maintenance windows that have targets or tasks associated with the specified instance.

```bash
aws ssm describe-maintenance-windows-for-target \
  --targets Key=InstanceIds,Values=i-1234567890EXAMPLE \
  --resource-type INSTANCE
```

**Output:**

```json
{
  "WindowIdentities": [
    {
      "WindowId": "mw-0c5ed765acEXAMPLE",
      "Name": "My-First-Maintenance-Window"
    }
  ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the AWS Systems Manager User Guide.
describe-maintenance-windows

The following code example shows how to use describe-maintenance-windows.

AWS CLI

Example 1: To list all maintenance windows

The following describe-maintenance-windows example lists all maintenance windows in your AWS account in the current Region.

```bash
aws ssm describe-maintenance-windows
```

Output:

```json
{
  "WindowIdentities": [
    {
      "WindowId": "mw-0ecb1226ddEXAMPLE",
      "Name": "MyMaintenanceWindow-1",
      "Enabled": true,
      "Duration": 2,
      "Cutoff": 1,
      "Schedule": "rate(180 minutes)",
      "NextExecutionTime": "2020-02-12T23:19:20.596Z"
    },
    {
      "WindowId": "mw-03eb9db428EXAMPLE",
      "Name": "MyMaintenanceWindow-2",
      "Enabled": true,
      "Duration": 3,
      "Cutoff": 1,
      "Schedule": "rate(7 days)",
      "NextExecutionTime": "2020-02-17T23:22:00.956Z"
    }
  ]
}
```

Example 2: To list all enabled maintenance windows

For API details, see DescribeMaintenanceWindowsForTarget in AWS CLI Command Reference.
The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```bash
aws ssm describe-maintenance-windows \
   --filters "Key=Enabled,Values=true"
```

**Example 3: To list maintenance windows matching a specific name**

This `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```bash
aws ssm describe-maintenance-windows \
   --filters "Key=Name,Values=MyMaintenanceWindow"
```

For more information, see [View Information About Maintenance Windows (AWS CLI)](https://docs.aws.amazon.com/systems-manager/latest/userguide/ops-items-maintenance-windows.html) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindows](https://docs.aws.amazon.com/cli/latest/reference/ssm/describe-maintenance-windows.html) in *AWS CLI Command Reference*.

---

**describe-ops-items**

The following code example shows how to use `describe-ops-items`.

**AWS CLI**

**To list a set of OpsItems**

The following `describe-ops-items` example displays a list of all open OpsItems in your AWS account.

```bash
aws ssm describe-ops-items \
   --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

**Output:**

```json
{
   "OpsItemSummaries": [
      {
         "CreatedBy": "arn:aws:sts::11122333444:assumed-role/OpsItem-CWE-Role/fbf77cbe264a33509569f23e4EXAMPLE",

### describe-parameters

The following code example shows how to use `describe-parameters`.

#### AWS CLI

**Example 1: To list all parameters**

The following `describe-parameters` example lists all parameters in the current AWS account and Region.

```
aws ssm describe-parameters
```

**Output:**

```
{
   "Parameters": [
      {
         "Name": "MySecureStringParameter",
         "Type": "SecureString",
         "KeyId": "alias/aws/ssm",
         "LastModifiedDate": 1582155479.205,
         "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/Admin/Richard-Roe-Managed",
         "Description": "This is a SecureString parameter",
         "Version": 2,
         "Tier": "Advanced",
      }
```
"Policies": [
    {
        "PolicyText": "{\"Type\":\"Expiration\",\"Version\":\"1.0\",\n\"Attributes\":{\"Timestamp\":\"2020-07-07T22:30:00Z\"}}",
        "PolicyType": "Expiration",
        "PolicyStatus": "Pending"
    },
    {
        "PolicyText": "{\"Type\":\"ExpirationNotification\",\"Version\":\"1.0\",\n\"Attributes\":{\"Before\":\"12\",\"Unit\":\"Hours\"}}",
        "PolicyType": "ExpirationNotification",
        "PolicyStatus": "Pending"
    }
],
{
    "Name": "MyStringListParameter",
    "Type": "StringList",
    "LastModifiedDate": 1582154764.222,
    "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
    "Description": "This is a StringList parameter",
    "Version": 1,
    "Tier": "Standard",
    "Policies": []
},
{
    "Name": "MyStringParameter",
    "Type": "String",
    "LastModifiedDate": 1582154711.976,
    "LastModifiedUser": "arn:aws:iam::111222333444:user/Alejandro-Rosalez",
    "Description": "This is a String parameter",
    "Version": 1,
    "Tier": "Standard",
    "Policies": []
},
{
    "Name": "latestAmi",
    "Type": "String",
    "LastModifiedDate": 1580862415.521,
    "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/lambda-ssm-role/Automation-UpdateSSM-Param",
    "Version": 3,
    "Tier": "Standard",
    "Policies": []
}
Example 2: To list all parameters matching specific metadata

This describe-parameters example lists all parameters matching a filter.

```shell
aws ssm describe-parameters --filters "Key=Type,Values=StringList"
```

Output:

```json
{
   "Parameters": [
   {
      "Name": "MyStringListParameter",
      "Type": "StringList",
      "LastModifiedDate": 1582154764.222,
      "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
      "Description": "This is a StringList parameter",
      "Version": 1,
      "Tier": "Standard",
      "Policies": []
   }
   ]
}
```

For more information, see Searching for Systems Manager Parameters in the AWS Systems Manager User Guide.

- For API details, see DescribeParameters in AWS CLI Command Reference.

describe-patch-baselines

The following code example shows how to use describe-patch-baselines.

AWS CLI

Example 1: To list all patch baselines

The following describe-patch-baselines example retrieves details for all patch baselines in your account in the current Region.
Example 2: To list all patch baselines provided by AWS

The following describe-patch-baselines example lists all patch baselines provided by AWS.

```bash
aws ssm describe-patch-baselines
--filters "Key=OWNER,Values=[AWS]"
```
Example 3: To list all patch baselines that you own

The following describe-patch-baselines example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \\
  --filters "Key=OWNER,Values=[Self]"
```

For more information, see About Predefined and Custom Patch Baselines in the AWS Systems Manager User Guide.

- For API details, see DescribePatchBaselines in AWS CLI Command Reference.

describe-patch-group-state

The following code example shows how to use describe-patch-group-state.

AWS CLI

To get the state of a patch group

The following describe-patch-group-state example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \\
  --patch-group "Production"
```

Output:

```
{
  "Instances": 21,
  "InstancesWithCriticalNonCompliantPatches": 1,
  "InstancesWithFailedPatches": 2,
  "InstancesWithInstalledOtherPatches": 3,
  "InstancesWithInstalledPatches": 21,
  "InstancesWithInstalledPendingRebootPatches": 2,
  "InstancesWithInstalledRejectedPatches": 1,
  "InstancesWithMissingPatches": 3,
  "InstancesWithNotApplicablePatches": 4,
  "InstancesWithOtherNonCompliantPatches": 1,
  "InstancesWithSecurityNonCompliantPatches": 1,
}```
For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html> and Understanding patch compliance state values in the AWS Systems Manager User Guide.

- For API details, see DescribePatchGroupState in AWS CLI Command Reference.

describe-patch-groups

The following code example shows how to use describe-patch-groups.

AWS CLI

To display patch group registrations

The following describe-patch-groups example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```json
{
    "Mappings": [ 
    {
        "PatchGroup": "Production",
        "BaselineIdentity": { 
        "BaselineId": "pb-0123456789abcdef0",
        "BaselineName": "ProdPatching",
        "OperatingSystem": "WINDOWS",
        "BaselineDescription": "Patches for Production",
        "DefaultBaseline": false
        }
    },
    {
        "PatchGroup": "Development",
        "BaselineIdentity": { 
        "BaselineId": "pb-0713accee01234567",
        "BaselineName": "DevPatching",
        "OperatingSystem": "WINDOWS",
        "BaselineDescription": "Patches for Development",
```
For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html> and Add a Patch Group to a Patch Baseline in the AWS Systems Manager User Guide.

- For API details, see DescribePatchGroups in AWS CLI Command Reference.

**describe-patch-properties**

The following code example shows how to use describe-patch-properties.

**AWS CLI**

**To list the Amazon Linux patch availability**

The following describe-patch-properties example displays a list of the Amazon Linux products for which patches are available in your AWS account.

```bash
aws ssm describe-patch-properties \
  --operating-system AMAZON_LINUX \
  --property PRODUCT
```

Output:

```json
{
  "Properties": [
    {
      "Name": "AmazonLinux2012.03"
    },
    {
      "Name": "AmazonLinux2012.09"
    },
    {
      "Name": "AmazonLinux2013.03"
    },
    {
      "Name": "AmazonLinux2013.03"
    }
  ]
}
```
For more information, see About Patch Baselines in the AWS Systems Manager User Guide.

- For API details, see DescribePatchProperties in AWS CLI Command Reference.

describe-sessions

The following code example shows how to use describe-sessions.

AWS CLI

Example 1: To list all active Session Manager sessions
This `describe-sessions` example retrieves a list of the active sessions created most recently (both connected and disconnected sessions) over the past 30 days that were started by the specified user. This command returns only results for connections to targets initiated using Session Manager. It does not list connections made through other means, such as Remote Desktop Connections or SSH.

```bash
aws ssm describe-sessions \
   --state "Active" \
   --filters "key=Owner,value=arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-Rodriguez"
```

Output:

```json
{
   "Sessions": [
      {
       "SessionId": "John-07a16060613c408b5",
       "Target": "i-1234567890abcdef0",
       "Status": "Connected",
       "StartDate": 1550676938.352,
       "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-Rodriguez",
       "OutputUrl": {}
      },
      {
       "SessionId": "John-01edf534b8b56e8eb",
       "Target": "i-9876543210abcdef0",
       "Status": "Connected",
       "StartDate": 1550676842.194,
       "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-Rodriguez",
       "OutputUrl": {}
      }
   ]
}
```

**Example 2: To list all terminated Session Manager sessions**

This `describe-sessions` example retrieves a list of the most recently terminated sessions from the past 30 days for all users.

```bash
aws ssm describe-sessions \
```

---

**Actions and scenarios**

6059
Output:

```
{
   "Sessions": [
   {
      "SessionId": "Mary-Major-0022b1eb2b0d9e3bd",
      "Target": "i-1234567890abcdef0",
      "Status": "Terminated",
      "StartDate": 1550520701.256,
      "EndDate": 1550521931.563,
      "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Mary-Major"
   },
   {
      "SessionId": "Jane-Roe-0db53f487931ed9d4",
      "Target": "i-9876543210abcdef0",
      "Status": "Terminated",
      "StartDate": 1550161369.149,
      "EndDate": 1550162580.329,
      "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Jane-Roe"
   },
   ...  
   ],
   "NextToken": "--token string truncated--"
}
```

For more information, see View Session History in the AWS Systems Manager User Guide.

- For API details, see DescribeSessions in AWS CLI Command Reference.

**disassociate-ops-item-related-item**

The following code example shows how to use disassociate-ops-item-related-item.

**AWS CLI**

**To delete a related item association**

The following disassociate-ops-item-related-item example deletes the association between the OpsItem and a related item.
The following code example shows how to use `get-automation-execution`.

**AWS CLI**

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```bash
aws ssm get-automation-execution \
   --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecution": {
        "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
        "DocumentName": "AWS-StartEC2Instance",

    "ParameterValues": [],
    "Truncated": false
}
}

**get-calendar-state**

The following code example shows how to use get-calendar-state.
AWS CLI

Example 1: To get the current state of a change calendar

This `get-calendar-state` example returns the state of a calendar at the current time. Because the example doesn't specify a time, the current state of the calendar is reported.

```bash
aws ssm get-calendar-state 
   --calendar-names "MyCalendar"
```

Output:

```json
{
   "State": "OPEN",
   "AtTime": "2020-02-19T22:28:51Z",
   "NextTransitionTime": "2020-02-24T21:15:19Z"
}
```

Example 2: To get the state of a change calendar at a specified time

This `get-calendar-state` example returns the state of a calendar at the specified time.

```bash
aws ssm get-calendar-state 
   --calendar-names "MyCalendar" 
   --at-time "2020-07-19T21:15:19Z"
```

Output:

```json
{
   "State": "CLOSED",
   "AtTime": "2020-07-19T21:15:19Z"
}
```

For more information, see [Get the State of the Change Calendar](https://docs.aws.amazon.com/systems-manager/latest/userguide/get-calendar-state.html) in the AWS Systems Manager User Guide.

- For API details, see [GetCalendarState](https://docs.aws.amazon.com/cli/latest/reference/ssm/get-calendar-state.html) in AWS CLI Command Reference.

get-command-invocation

The following code example shows how to use `get-command-invocation`.

Actions and scenarios
AWS CLI

To display the details of a command invocation

The following get-command-invocation example lists all the invocations of the specified command on the specified instance.

```bash
aws ssm get-command-invocation \
   --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
   --instance-id "i-1234567890abcdef0"
```

Output:

```
{
   "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",
   "InstanceId": "i-1234567890abcdef0",
   "Comment": "b48291dd-ba76-43e0-b9df-13e11ddaac26:6960febb-2907-4b59-8e1a-d6ce8EXAMPLE",
   "DocumentName": "AWS-UpdateSSMAgent",
   "DocumentVersion": "",
   "PluginName": "aws:updateSsmAgent",
   "ResponseCode": 0,
   "ExecutionStartDateTime": "2020-02-19T18:18:03.419Z",
   "ExecutionElapsedTime": "PT0.091S",
   "ExecutionEndDateTime": "2020-02-19T18:18:03.419Z",
   "Status": "Success",
   "StatusDetails": "Success",
   "StandardOutputContent": "Updating amazon-ssm-agent from 2.3.842.0 to latest
amazon-ssm-agent 2.3.842.0 has already been installed, update skipped"
,"StandardOutputUrl": "",
   "StandardErrorContent": "",
   "StandardErrorUrl": "",
   "CloudWatchOutputConfig": {
      "CloudWatchLogGroupName": "",
      "CloudWatchOutputEnabled": false
   }
}
```

For more information, see Understanding Command Statuses in the AWS Systems Manager User Guide.
For API details, see GetCommandInvocation in AWS CLI Command Reference.

get-connection-status

The following code example shows how to use get-connection-status.

AWS CLI

To display the connection status of a managed instance

This get-connection-status example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \\
   --target i-1234567890abcdef0
```

Output:

```
{
   "Target": "i-1234567890abcdef0",
   "Status": "connected"
}
```

For API details, see GetConnectionStatus in AWS CLI Command Reference.

get-default-patch-baseline

The following code example shows how to use get-default-patch-baseline.

AWS CLI

Example 1: To display the default Windows patch baseline

The following get-default-patch-baseline example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:
Example 2: To display the default patch baseline for Amazon Linux

The following get-default-patch-baseline example retrieves details for the default patch baseline for Amazon Linux.

```bash
aws ssm get-default-patch-baseline \
   --operating-system AMAZON_LINUX
```

Output:

```
{
   "BaselineId": "pb-047c6eb9c8fc12345",
   "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html> and Set an Existing Patch Baseline as the Default in the AWS Systems Manager User Guide.

- For API details, see `GetDefaultPatchBaseline` in AWS CLI Command Reference.

get-deployable-patch-snapshot-for-instance

The following code example shows how to use get-deployable-patch-snapshot-for-instance.

**AWS CLI**

**To retrieve the current snapshot for the patch baseline an instance uses**

The following get-deployable-patch-snapshot-for-instance example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the Access Key and Secret Key fields empty.
Tip: Use uuidgen to generate a snapshot-id.

```bash
aws ssm get-deployable-patch-snapshot-for-instance \   --instance-id "i-1234567890abcdef0" \   --snapshot-id "521c3536-930c-4aa9-950e-01234567abcd"
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0",
   "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
   "Product": "AmazonLinux2018.03",
   "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-east-1.s3.amazonaws.com/ed85194ef27214f5984f28b4d664d14f7313568feda7d4b6ac6c10ad1f729d7e7-773304212436/AMAZON_LINUX-521c3536-930c-4aa9-950e-01234567abcd?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20190215T164031Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-Credential=AKIAJ5C56P35AEBRX2Q%2F20190215%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Signature=efaaaf6e3878e77f48a6697e015efdbda9c426b09c5822055075c062f6ad2149"
}
```

For more information, see Parameter name: Snapshot ID in the AWS Systems Manager User Guide.

- For API details, see GetDeployablePatchSnapshotForInstance in AWS CLI Command Reference.

**get-document**

The following code example shows how to use get-document.

**AWS CLI**

### To get document content

The following get-document example displays the content of a Systems Manager document.

```bash
aws ssm get-document \   --name "AWS-RunShellScript"
```

Output:
For more information, see AWS Systems Manager Documents in the AWS Systems Manager User Guide.

- For API details, see GetDocument in AWS CLI Command Reference.

get-inventory-schema

The following code example shows how to use get-inventory-schema.

AWS CLI

To view your inventory schema

This example returns a list of inventory type names for the account.

Command:
aws ssm get-inventory-schema

Output:

```
{
  "Schemas": [
    {
      "TypeName": "AWS:AWSComponent",
      "Version": "1.0",
      "Attributes": [
        {
          "Name": "Name",
          "DataType": "STRING"
        },
        {
          "Name": "ApplicationType",
          "DataType": "STRING"
        },
        {
          "Name": "Publisher",
          "DataType": "STRING"
        },
        {
          "Name": "Version",
          "DataType": "STRING"
        },
        {
          "Name": "InstalledTime",
          "DataType": "STRING"
        },
        {
          "Name": "Architecture",
          "DataType": "STRING"
        },
        {
          "Name": "URL",
          "DataType": "STRING"
        }
      ]
    },
    ...
  ],
  "NextToken": "--token string truncated--"
}
```
To view the inventory schema for a specific inventory type

This example return the inventory schema for a the AWS:AWSComponent inventory type.

Command:

```bash
aws ssm get-inventory-schema --type-name "AWS:AWSComponent"
```

- For API details, see [GetInventorySchema](#) in [AWS CLI Command Reference](#).

get-inventory

The following code example shows how to use get-inventory.

AWS CLI

To view your inventory

This example gets the custom metadata for your inventory.

Command:

```bash
aws ssm get-inventory
```

Output:

```json
{
    "Entities": [
        {
            "Data": {
                "AWS:InstanceInformation": {
                    "Content": [
                        {
                            "ComputerName": "ip-172-31-44-222.us-west-2.compute.internal",
                            "InstanceId": "i-0cb2b964d3e14fd9f",
                            "IpAddress": "172.31.44.222",
                            "AgentType": "amazon-ssm-agent",
                            "ResourceType": "EC2Instance",
                            "AgentVersion": "2.0.672.0",
                            "PlatformVersion": "2016.09",
                        }
                    ]
                }
            }
        }
    ]
}
```
For API details, see [GetInventory](https://aws.amazon.com/cli) in AWS CLI Command Reference.

**get-maintenance-window-execution-task-invocation**

The following code example shows how to use `get-maintenance-window-execution-task-invocation`.

**AWS CLI**

To get information about a maintenance window task invocation

The following `get-maintenance-window-execution-task-invocation` example lists information about the specified task invocation that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task-invocation \
   --window-execution-id "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE" \
   --task-id "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE" \
   --invocation-id "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE"
```

Output:

```
{
   "Status": "SUCCESS",
   "Parameters": 
   "{"comment":"","documentName":"AWS-RunPowerShellScript","instanceIds":["i-1234567890EXAMPLE"],
   "maxConcurrency":"1","maxErrors":"1","parameters":{"executionTimeout":"3600","workingDirectory":[]},
   "commands":["echo Hello"],"timeoutSeconds":600",
```
get-maintenance-window-execution-task

The following code example shows how to use get-maintenance-window-execution-task.

AWS CLI

To get information about a maintenance window task execution

The following get-maintenance-window-execution-task example lists information about
a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
```

Output:

```
{
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
    "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE",
    "TaskArn": "AWS-RunPatchBaseline",
    "ServiceRole": "arn:aws:iam::111222333444:role/aws-service-role/ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "Type": "RUN_COMMAND",
    "TaskParameters": [
        {
            "BaselineOverride": {
                "Actions and scenarios": 6072
            }
        }
    ]
}
```
For more information, see View information about tasks and task executions (AWS CLI) in the
AWS Systems Manager User Guide.
get-maintenance-window-execution

The following code example shows how to use get-maintenance-window-execution.

AWS CLI

To get information about a maintenance window task execution

The following get-maintenance-window-execution example lists information about a task executed as part of the specified maintenance window execution.

```bash
aws ssm get-maintenance-window-execution \
--window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```json
{
    "Status": "SUCCESS",
    "TaskIds": [
        "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the AWS Systems Manager User Guide.

get-maintenance-window-task

The following code example shows how to use get-maintenance-window-task.

AWS CLI

To get information about a maintenance window task

For API details, see GetMaintenanceWindowExecution in AWS CLI Command Reference.
The following `get-maintenance-window-task` example retrieves details about the specified maintenance window task.

```
aws ssm get-maintenance-window-task \\
   --window-id mw-0c5ed765acEXAMPLE \\
   --window-task-id 0e842a8d-2d44-4886-bb62-af8dcEXAMPLE
```

Output:

```
{
   "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
   "MaxErrors": "1",
   "TaskArn": "AWS-RunPowerShellScript",
   "MaxConcurrency": "1",
   "WindowTaskId": "0e842a8d-2d44-4886-bb62-af8dcEXAMPLE",
   "TaskParameters": {},
   "Priority": 1,
   "TaskInvocationParameters": {
      "RunCommand": {
         "Comment": "",
         "TimeoutSeconds": 600,
         "Parameters": {
            "commands": ["echo Hello"],
            "executionTimeout": ["3600"],
            "workingDirectory": [""
         ]
      }
   },
   "WindowId": "mw-0c5ed765acEXAMPLE",
   "TaskType": "RUN_COMMAND",
   "Targets": [
      {
         "Values": [
            "84c818da-b619-4d3d-9651-946f3EXAMPLE"
         ],
         "Key": "WindowTargetIds"
      }
   ]
}
```
For more information, see View Information About Maintenance Windows (AWS CLI) in the AWS Systems Manager User Guide.

• For API details, see GetMaintenanceWindowTask in AWS CLI Command Reference.

get-maintenance-window

The following code example shows how to use get-maintenance-window.

AWS CLI

To get information about a maintenance window

The following get-maintenance-window example retrieves details about the specified maintenance window.

```bash
aws ssm get-maintenance-window \
  --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```json
{
  "AllowUnassociatedTargets": true,
  "CreatedDate": 1515006912.957,
  "Cutoff": 1,
  "Duration": 6,
  "Enabled": true,
  "ModifiedDate": 2020-01-01T10:04:04.099Z,
  "Name": "My-Maintenance-Window",
  "Schedule": "rate(3 days)",
  "WindowId": "mw-03eb9db428EXAMPLE",
  "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (AWS CLI) in the AWS Systems Manager User Guide.

• For API details, see GetMaintenanceWindow in AWS CLI Command Reference.
**get-ops-item**

The following code example shows how to use get-ops-item.

### AWS CLI

**To view information about an OpsItem**

The following get-ops-item example displays details about the specified OpsItem.

```bash
aws ssm get-ops-item \
   --ops-item-id oi-0b725EXAMPLE
```

**Output:**

```
{
   "OpsItem": {
      "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/fbf77cbe264a33509569f23e4EXAMPLE",
      "CreatedTime": "2019-12-04T15:52:16.793000-08:00",
      "Description": "CloudWatch Event Rule SSMOpsItems-EC2-instance-terminated was triggered. Your EC2 instance has terminated. See below for more details.",
      "LastModifiedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/fbf77cbe264a33509569f23e4EXAMPLE",
      "LastModifiedTime": "2019-12-04T15:52:16.793000-08:00",
      "Notifications": [],
      "RelatedOpsItems": [],
      "Status": "Open",
      "OpsItemId": "oi-0b725EXAMPLE",
      "Title": "EC2 instance terminated",
      "Source": "EC2",
      "OperationalData": {
         "/aws/automations": {
            "Value": "[ { "automationType": "AWS:SSM:Automation", "automationId": "AWS-CreateManagedWindowsInstance" }, { "automationType": "AWS:SSM:Automation", "automationId": "AWS-CreateManagedLinuxInstance" } ]",

         },
         "/aws/dedup": {
            "Value": "SSMOpsItems-EC2-instance-terminated",
            "Type": "SearchableString"
         },
         "/aws/resources": {
```

**Actions and scenarios**

6077
For more information, see [Working with OpsItems](https://docs.aws.amazon.com/systems-manager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [GetOpsItem](https://docs.aws.amazon.com/cli/latest/reference/ssm/get-ops-item.html) in *AWS CLI Command Reference*.

### get-ops-summary

The following code example shows how to use `get-ops-summary`.

**AWS CLI**

**To view a summary of all OpsItems**

The following `get-ops-summary` example displays a summary of all OpsItems in your AWS account.

```
aws ssm get-ops-summary
```

**Output:**

```
{
    "Entities": [
        {
            "Id": "oi-4309fEXAMPLE",
            "Data": {
                "AWS:OpsItem": {

                }
            }
        }
    ]
}
```

        }

    }

}
For more information, see Working with OpsItems in the AWS Systems Manager User Guide.

- For API details, see GetOpsSummary in AWS CLI Command Reference.

get-parameter-history

The following code example shows how to use get-parameter-history.

AWS CLI

To get a value history for a parameter

The following get-parameter-history example lists the history of changes for the specified parameter, including its value.
```bash
aws ssm get-parameter-history
   --name "MyStringParameter"
```

Output:

```json
{
   "Parameters": [
      {
         "Name": "MyStringParameter",
         "Type": "String",
         "LastModifiedDate": 1582154711.976,
         "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
         "Description": "This is the first version of my String parameter",
         "Value": "Veni",
         "Version": 1,
         "Labels": [],
         "Tier": "Standard",
         "Policies": []
      },
      {
         "Name": "MyStringParameter",
         "Type": "String",
         "LastModifiedDate": 1582156093.471,
         "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
         "Description": "This is the second version of my String parameter",
         "Value": "Vidi",
         "Version": 2,
         "Labels": [],
         "Tier": "Standard",
         "Policies": []
      },
      {
         "Name": "MyStringParameter",
         "Type": "String",
         "LastModifiedDate": 1582156117.545,
         "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
         "Description": "This is the third version of my String parameter",
         "Value": "Vici",
         "Version": 3,
         "Labels": [],
         "Tier": "Standard",
         "Policies": []
      }
   ]
}
```
For more information, see Working with parameter versions in the AWS Systems Manager User Guide.

- For API details, see GetParameterHistory in AWS CLI Command Reference.

get-parameter

The following code example shows how to use get-parameter.

AWS CLI

Example 1: To display the value of a parameter

The following get-parameter example lists the value for the specified single parameter.

```bash
aws ssm get-parameter \
   --name "MyStringParameter"
```

Output:

```
{
   "Parameter": {
      "Name": "MyStringParameter",
      "Type": "String",
      "Value": "Veni",
      "Version": 1,
      "LastModifiedDate": 1530018761.888,
      "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
   
   "DataType": "text"
```

For more information, see Working with Parameter Store in the AWS Systems Manager User Guide.

Example 2: To decrypt the value of a SecureString parameter

The following get-parameter example decrypts the value of the specified SecureString parameter.
aws ssm get-parameter \
  --name "MySecureStringParameter" \
  --with-decryption

Output:

{
  "Parameter": {
    "Name": "MySecureStringParameter",
    "Type": "SecureString",
    "Value": "16679b88-310b-4895-a943-e0764EXAMPLE",
    "Version": 2,
    "LastModifiedDate": 1582155479.205,
    "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MySecureStringParameter"
  }
  "DataType": "text"
}

For more information, see Working with Parameter Store in the AWS Systems Manager User Guide.

**Example 3: To display the value of a parameter using labels**

The following get-parameter example lists the value for the specified single parameter with a specified label.

aws ssm get-parameter \
  --name "MyParameter:label"

Output:

{
  "Parameter": {
    "Name": "MyParameter",
    "Type": "String",
    "Value": "parameter version 2",
    "Version": 2,
    "Selector": ":label",
    "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
  }
  "DataType": "text"
For more information, see [Working with parameter labels](#) in the AWS Systems Manager User Guide.

**Example 4: To display the value of a parameter using versions**

The following `get-parameter` example lists the value for the specified single parameter version.

```bash
aws ssm get-parameter \
  --name "MyParameter:2"
```

**Output:**

```json
{
  "Parameter": {
    "Name": "MyParameter",
    "Type": "String",
    "Value": "parameter version 2",
    "Version": 2,
    "Selector": ":2",
    "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
    "DataType": "text"
  }
}
```

For more information, see [Working with parameter labels](#) in the AWS Systems Manager User Guide.

- For API details, see [GetParameter](#) in AWS CLI Command Reference.

**get-parameters-by-path**

The following code example shows how to use `get-parameters-by-path`.

**AWS CLI**

- To list parameters in a specific path
The following `get-parameters-by-path` example lists the parameters within the specified hierarchy.

```bash
aws ssm get-parameters-by-path \
   --path "/site/newyork/department/"
```

Output:

```json
{
   "Parameters": [
      {
         "Name": "/site/newyork/department/marketing",
         "Type": "String",
         "Value": "Floor 2",
         "Version": 1,
         "LastModifiedTime": 1530018761.888,
         "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/department/marketing"
      },
      {
         "Name": "/site/newyork/department/infotech",
         "Type": "String",
         "Value": "Floor 3",
         "Version": 1,
         "LastModifiedTime": 1530018823.429,
         "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/department/infotech"
      },
      ...
   ]
}
```

For more information, see [Working with parameter hierarchies](https://docs.aws.amazon.com/systems-manager/latest/userguide/install-linux-cli.html) in the AWS Systems Manager User Guide.

**get-parameters**

The following code example shows how to use get-parameters.
Example 1: To list the values for a parameter

The following get-parameters example lists the values for the three specified parameters.

```
aws ssm get-parameters \\
   --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
   "Parameters": [
   {
      "Name": "MyStringListParameter",
      "Type": "StringList",
      "Value": "alpha,beta,gamma",
      "Version": 1,
      "LastModifiedDate": 1582154764.222,
      "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringListParameter"
   },
   {
      "Name": "MyStringParameter",
      "Type": "String",
      "Value": "Vici",
      "Version": 3,
      "LastModifiedDate": 1582156117.545,
      "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
   }
   ],
   "InvalidParameters": ["MyInvalidParameterName"

```

For more information, see [Working with Parameter Store](#) in the [AWS Systems Manager User Guide](#).

Example 2: To list names and values of multiple parameters using the `--query` option
The following `get-parameters` example lists the names and values for the specified parameters.

```bash
aws ssm get-parameters \
   --names MyStringParameter MyStringListParameter \
   --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[ 
  {
    "Name": "MyStringListParameter",
    "Value": "alpha,beta,gamma"
  },
  {
    "Name": "MyStringParameter",
    "Value": "Vidi"
  }
]
```

For more information, see [Working with Parameter Store](#) in the AWS Systems Manager User Guide.

**Example 3: To display the value of a parameter using labels**

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```bash
aws ssm get-parameter \
   --name "MyParameter:label"
```

Output:

```
{
   "Parameters": [
    {
      "Name": "MyLabelParameter",
      "Type": "String",
      "Value": "parameter by label",
      "Version": 1,
      "Selector": ":label",
      "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
```
For more information, see Working with parameter labels in the AWS Systems Manager User Guide.

- For API details, see GetParameters in AWS CLI Command Reference.

get-patch-baseline-for-patch-group

The following code example shows how to use get-patch-baseline-for-patch-group.

**AWS CLI**

To display the patch baseline for a patch group

The following get-patch-baseline-for-patch-group example retrieves details about the patch baseline for the specified patch group.

```bash
aws ssm get-patch-baseline-for-patch-group \
--patch-group "DEV"
```

Output:

```json
{
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
}
```
For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html> and Add a Patch Group to a Patch Baseline in the AWS Systems Manager User Guide.

- For API details, see GetPatchBaselineForPatchGroup in AWS CLI Command Reference.

get-patch-baseline

The following code example shows how to use get-patch-baseline.

**AWS CLI**

**To display a patch baseline**

The following get-patch-baseline example retrieves the details for the specified patch baseline.

```bash
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

**Output:**

```json
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                }
            }
        ]
    }
}
```
For more information, see [About Patch Baselines](#) in the [AWS Systems Manager User Guide](#).

- For API details, see [GetPatchBaseline](#) in [AWS CLI Command Reference](#).

**get-service-setting**

The following code example shows how to use `get-service-setting`.

**AWS CLI**

**To retrieve the service setting for Parameter Store throughput**

The following `get-service-setting` This example retrieves the current service setting for Parameter Store throughput in the specified region.

```
aws ssm get-service-setting \
  --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:
For more information, see Increasing Parameter Store Throughput in the AWS Systems Manager Users Guide.

- For API details, see GetServiceSetting in AWS CLI Command Reference.

**label-parameter-version**

The following code example shows how to use label-parameter-version.

**AWS CLI**

**Example 1: To add a label to latest version of a parameter**

The following label-parameter-version example adds a label to the latest version of the specified parameter.

```bash
aws ssm label-parameter-version \
--name "MyStringParameter" \
--labels "ProductionReady"
```

Output:

```json
{
   "InvalidLabels": [],
   "ParameterVersion": 3
}
```

For more information, see Working with parameter labels in the AWS Systems Manager User Guide.
Example 2: To add a label to a specific version of a parameter

The following `label-parameter-version` example adds a label to the specified version of a parameter.

```
aws ssm label-parameter-version \
   --name "MyStringParameter" \ 
   --labels "ProductionReady" \ 
   --parameter-version "2" --labels "DevelopmentReady"
```

For more information, see [Working with parameter labels](https://docs.aws.amazon.com/systems-manager/latest/userguide/working-with-parameter-labels.html) in the *AWS Systems Manager User Guide*.

list-association-versions

The following code example shows how to use `list-association-versions`.

**AWS CLI**

**To list all versions of an association for a specific association ID**

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
   --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
   "AssociationVersions": [ 
      {
         "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
         "AssociationVersion": "1",
         "CreatedDate": 1550505536.726,
         "Name": "AWS-UpdateSSMAgent",
         "Parameters": {
            "allowDowngrade": [ 
               "false"
            ],
```

Actions and scenarios 6092
"version": [ 
  ""
],
"Targets": [
  {
    "Key": "InstanceIds",
    "Values": [

    ]
  },
  "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
  "AssociationName": "UpdateSSMAgent"
}
]

For more information, see [Working with associations in Systems Manager](AWS Systems Manager User Guide) in the AWS Systems Manager User Guide.

- For API details, see [ListAssociationVersions](AWS CLI Command Reference).

### list-associations

The following code example shows how to use list-associations.

**AWS CLI**

**Example 1: To list your associations for a specific instance**

The following list-associations example lists all associations with the AssociationName, UpdateSSMAgent.

```bash
aws ssm list-associations /
   --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```json
{
  "Associations": [
    {
      "Name": "AWS-UpdateSSMAgent",
```
"InstanceId": "i-1234567890abcdef0",
"AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
"AssociationVersion": "1",
"Targets": [
    {
        "Key": "InstanceIds",
        "Values": [
            "i-016648b75dd622dab"
        ]
    }
],
"Overview": {
    "Status": "Pending",
    "DetailedStatus": "Associated",
    "AssociationStatusAggregatedCount": {
        "Pending": 1
    }
},
"ScheduleExpression": "cron(0 00 12 ? * SUN *)",
"AssociationName": "UpdateSSMAgent"
]

For more information, see Working with associations in Systems Manager in the Systems Manager User Guide.

Example 2: To list your associations for a specific document

The following list-associations example lists all associations for the specified document.

```bash
aws ssm list-associations /
--association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```json
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
```
"Targets": [ 
  { 
    "Key": "InstanceIds",
    "Values": [ 
      "i-1234567890abcdef0"
    ]
  }
],

"AssociationName": "UpdateSSMAgent"
},
{
  "Name": "AWS-UpdateSSMAgent",
  "InstanceId": "i-9876543210abcdef0",
  "AssociationId": "fbc07ef7-b985-4684-b82b-0123456789ab",
  "AssociationVersion": "1",
  "Targets": [ 
    { 
      "Key": "InstanceIds",
      "Values": [ 
        "i-9876543210abcdef0"
      ]
    }
  ],
  "LastExecutionDate": 1550507531.0,
  "Overview": { 
    "Status": "Success",
    "AssociationStatusAggregatedCount": { 
      "Success": 1
    }
  }
}
For more information, see Working with associations in Systems Manager in the Systems Manager User Guide.

- For API details, see ListAssociations in AWS CLI Command Reference.

list-command-invocations

The following code example shows how to use list-command-invocations.

AWS CLI

To list the invocations of a specific command

The following list-command-invocations example lists all the invocations of a command.

```bash
aws ssm list-command-invocations \
   --command-id "ef7fd8d8-9b57-4151-a15c-db9a12345678" \
   --details
```

Output:

```json
{
   "CommandInvocations": [
      {
         "CommandId": "ef7fd8d8-9b57-4151-a15c-db9a12345678",

- For API details, see ListCommandInvocations in AWS CLI Command Reference.

list-commands

The following code example shows how to use list-commands.

AWS CLI

Example 1: To get the status of a specific command
The following list-commands example retrieves and displays the status of the specified command.

```bash
aws ssm list-commands 
   --command-id "0831e1a8-a1ac-4257-a1fd-c831bEXAMPLE"
```

**Example 2: To get the status of commands requested after a specific date**

The following list-commands example retrieves the details of commands requested after the specified date.

```bash
aws ssm list-commands 
   --filter "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

**Example 3: To list all commands requested in an AWS account**

The following list-commands example lists all commands requested by users in the current AWS account and Region.

```bash
aws ssm list-commands
```

**Output:**

```json
{
   "Commands": [
      {
         "CommandId": "8bee3135-398c-4d31-99b6-e42d2EXAMPLE",

list-compliance-items

The following code example shows how to use list-compliance-items.

AWS CLI

To list compliance items for a specific instance

This example lists all compliance items for the specified instance.

Command:

```bash
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types "ManagedInstance"
```

Output:

```json
{
  "ComplianceItems": [
    {
      "ComplianceType": "Association",
      "ResourceType": "ManagedInstance",
      "ResourceId": "i-1234567890abcdef0",
      "Id": "8dfe3659-4309-493a-8755-0123456789ab",
      "Title": "",
      "Status": "COMPLIANT",
      "Severity": "UNSPECIFIED",
      "ExecutionSummary": {
        "ExecutionTime": 1550408470.0
      },
      "Details": {
        "DocumentName": "AWS-GatherSoftwareInventory",
        "DocumentVersion": "1"
      }
    },
    {
      "ComplianceType": "Association",
      "ResourceType": "ManagedInstance",
```
To list compliance items for a specific instance and association ID

This example lists all compliance items for the specified instance and association ID.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types "ManagedInstance" --filters "Key=ComplianceType,Values=Association,Type=EQUAL" "Key=Id,Values=e4c2ed6d-516f-41aa-aa2a-0123456789ab,Type=EQUAL"
```

To list compliance items for a instance after a specific date and time

This example lists all compliance items for an instance after the specified date and time.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types "ManagedInstance" --filters "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

- For API details, see ListComplianceItems in AWS CLI Command Reference.

**list-compliance-summaries**

The following code example shows how to use list-compliance-summaries.
To list compliance summaries for all compliance types

This example lists compliance summaries for all compliance types in your account.

Command:

```
aws ssm list-compliance-summaries
```

Output:

```
{
  "ComplianceSummaryItems": [
    {
      "ComplianceType": "Association",
      "CompliantSummary": {
        "CompliantCount": 2,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,
          "UnspecifiedCount": 2
        }
      },
      "NonCompliantSummary": {
        "NonCompliantCount": 0,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,
          "UnspecifiedCount": 0
        }
      }
    },
    {
      "ComplianceType": "Patch",
      "CompliantSummary": {
        "CompliantCount": 1,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,
          "UnspecifiedCount": 0
        }
      }
    }
  ]
}
```
To list compliance summaries for a specific compliance type

This example lists the compliance summary for the Patch compliance type.

Command:

```bash
aws ssm list-compliance-summaries --filters
   "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see [ListComplianceSummaries](#) in *AWS CLI Command Reference*.

`list-document-metadata-history`

The following code example shows how to use `list-document-metadata-history`.

**AWS CLI**

Example: To view approval history and status for a change template
The following `list-document-metadata-history` example returns the approval history for the specified Change Manager change template.

```bash
aws ssm list-document-metadata-history \
    --name MyChangeManageTemplate \
    --metadata DocumentReviews
```

Output:

```json
{
    "Name": "MyChangeManagerTemplate",
    "DocumentVersion": "1",
    "Author": "arn:aws:iam::111222333444::user/JohnDoe",
    "Metadata": {
        "ReviewerResponse": [
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T12:01:19.274000-07:00",
                "ReviewStatus": "APPROVED",
                "Comment": [
                    {
                        "Type": "COMMENT",
                        "Content": "I approve this template version"
                    }
                ],
                "Reviewer": "arn:aws:iam::111222333444::user/ShirleyRodriguez"
            },
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T11:58:28.025000-07:00",
                "ReviewStatus": "PENDING"
            }
        ]
    }
}
```

For more information, see [Reviewing and approving or rejecting change templates](https://docs.aws.amazon.com/systems-manager/latest/userguide/change-manager-approve-reject-change-templates.html) in the *AWS Systems Manager User Guide*.

- For API details, see [ListDocumentMetadataHistory](https://docs.aws.amazon.com/cli/latest/reference/ssm/list-document-metadata-history.html) in *AWS CLI Command Reference*. 

Actions and scenarios
list-document-versions

The following code example shows how to use list-document-versions.

AWS CLI

To list document versions

The following list-document-versions example lists all versions for a Systems Manager document.

```bash
aws ssm list-document-versions \
   --name "Example"
```

Output:

```
{
   "DocumentVersions": [
      {
         "Name": "Example",
         "DocumentVersion": "1",
         "CreatedDate": 1583257938.266,
         "IsDefaultVersion": true,
         "DocumentFormat": "YAML",
         "Status": "Active"
      }
   ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the AWS Systems Manager User Guide.

- For API details, see ListDocumentVersions in AWS CLI Command Reference.

list-documents

The following code example shows how to use list-documents.

AWS CLI

Example 1: To list documents
The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```bash
aws ssm list-documents 
  --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```json
{
   "DocumentIdentifiers": [
     {
       "Name": "Example",
       "Owner": "29884EXAMPLE",
       "PlatformTypes": [
         "Windows",
         "Linux"
       ],
       "DocumentVersion": "1",
       "DocumentType": "Automation",
       "SchemaVersion": "0.3",
       "DocumentFormat": "YAML",
       "Tags": [
         {
           "Key": "DocUse",
           "Value": "Testing"
         }
       ]
     }
   ]
}
```

For more information, see [AWS Systems Manager Documents](https://docs.aws.amazon.com/systems-manager/latest/userguide/) in the *AWS Systems Manager User Guide*.

**Example 2: To list shared documents**

The following `list-documents` example lists shared documents, including private shared documents not owned by AWS.

```bash
aws ssm list-documents 
  --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```
For more information, see [AWS Systems Manager Documents](https://docs.aws.amazon.com/systemsmanager/latest/dg/system-manager-documents.html) in the *AWS Systems Manager User Guide*.

- For API details, see [ListDocuments](https://docs.aws.amazon.com/cli/latest/reference/ssm/list-documents.html) in *AWS CLI Command Reference*.

### list-inventory-entries

The following code example shows how to use `list-inventory-entries`.

**AWS CLI**

**Example 1: To view specific inventory type entries for an instance**

This following `list-inventory-entries` example lists the inventory entries for the AWS:Application inventory type on a specific instance.

```bash
aws ssm list-inventory-entries \
  --instance-id "i-1234567890abcdef0" \
  --type-name "AWS:Application"
```

Output:
Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```bash
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \ 
    --type-name "Custom:RackInfo"
```

Output:

```json
{
    "TypeName": "Custom:RackInfo",
    "InstanceId": "i-1234567890abcdef0",
    "SchemaVersion": "1.0",
    "CaptureTime": "2021-05-22T10:01:01Z",
    "Entries": [
        {
            "RackLocation": "Bay B/Row C/Rack D/Shelf E"
        }
    ]
}
```
The following code example shows how to use `list-ops-item-related-items`.

**AWS CLI**

To list the related-item resources of an OpsItem

The following `list-ops-item-related-items` example lists the related-item resources of an OpsItem.

```bash
aws ssm list-ops-item-related-items \
   --ops-item-id "oi-f99f2EXAMPLE"
```

Output:

```
{
   "Summaries": [
      {
         "OpsItemId": "oi-f99f2EXAMPLE",
         "AssociationId": "e2036148-ccc8-490e-ac2a-390e5EXAMPLE",
         "ResourceType": "AWS::SSMIncidents::IncidentRecord",
         "AssociationType": "IsParentOf",
         "ResourceUri": "arn:aws:ssm-incidents::111122223333:incident-record/example-response/64bd9b45-1d0e-2622-840d-03a87a1451fa",
         "CreatedBy": {
            "Arn": "arn:aws:sts::111122223333:assumed-role/AWSServiceRoleForIncidentManager/IncidentResponse"
         },
         "CreatedTime": "2021-08-11T18:47:14.994000+00:00",
         "LastModifiedBy": {
            "Arn": "arn:aws:sts::111122223333:assumed-role/AWSServiceRoleForIncidentManager/IncidentResponse"
         },
         "LastModifiedTime": "2021-08-11T18:47:14.994000+00:00"
      }
   ]
}
```

- For API details, see [ListInventoryEntries](#) in *AWS CLI Command Reference*. 

list-ops-item-related-items

The following code example shows how to use `list-ops-item-related-items`.
For more information, see Working with Incident Manager incidents in OpsCenter in the AWS Systems Manager User Guide.

- For API details, see ListOpsItemRelatedItems in AWS CLI Command Reference.

list-resource-compliance-summaries

The following code example shows how to use list-resource-compliance-summaries.

**AWS CLI**

**To list resource-level compliance summary counts**

This example lists resource-level compliance summary counts.

**Command:**

```bash
aws ssm list-resource-compliance-summaries
```

**Output:**

```json
{
    "ResourceComplianceSummaryItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Status": "COMPLIANT",
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550509273.0
            },
            "CompliantSummary": {
                "CompliantCount": 2,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                }
            }
        }
    ]
}
```
"UnspecifiedCount": 2
},
"NonCompliantSummary": {
    "NonCompliantCount": 0,
    "SeveritySummary": {
        "CriticalCount": 0,
        "HighCount": 0,
        "MediumCount": 0,
        "LowCount": 0,
        "InformationalCount": 0,
        "UnspecifiedCount": 0
    }
}
}
,"ComplianceType": "Patch",
"ResourceType": "ManagedInstance",
"ResourceId": "i-9876543210abcdef0",
"Status": "COMPLIANT",
"OverallSeverity": "UNSPECIFIED",
"ExecutionSummary": {
    "ExecutionTime": 1550248550.0,
    "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
    "ExecutionType": "Command"
},
"CompliantSummary": {
    "CompliantCount": 397,
    "SeveritySummary": {
        "CriticalCount": 0,
        "HighCount": 0,
        "MediumCount": 0,
        "LowCount": 0,
        "InformationalCount": 0,
        "UnspecifiedCount": 397
    }
}
,"NonCompliantSummary": {
    "NonCompliantCount": 0,
    "SeveritySummary": {
        "CriticalCount": 0,
        "HighCount": 0,
        "MediumCount": 0,
        "LowCount": 0,

To list resource-level compliance summaries for a specific compliance type

This example lists resource-level compliance summaries for the Patch compliance type.

Command:

```bash
aws ssm list-resource-compliance-summaries --filters
"Key=ComplianceType,Values=Patch,Type=EQUAL"
```

list-resource-data-sync

The following code example shows how to use list-resource-data-sync.

AWS CLI

To list your resource data sync configurations

This example retrieves information about your resource data sync configurations.

```bash
aws ssm list-resource-data-sync
```

Output:

```
{
  "ResourceDataSyncItems": [
    {
      "SyncName": "MyResourceDataSync",
      "S3Destination": {
        "BucketName": "ssm-resource-data-sync",
        "SyncFormat": "JsonSerDe",
        "Region": "us-east-1"
      }
    }
  ]
}
```
For API details, see [ListResourceDataSync](https://docs.aws.amazon.com/cli/latest/reference/ssm/list-resource-data-sync.html) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```bash
aws ssm list-tags-for-resource \
  --resource-type "PatchBaseline" \
  --resource-id "pb-0123456789abcdef0"
```

**Output:**

```json
{
  "TagList": [
    {
      "Key": "Environment",
      "Value": "Production"
    },
    {
      "Key": "Region",
      "Value": "EMEA"
    }
  ]
}
```

For more information, see [Tagging AWS Resources](https://docs.aws.amazon.com/ssm/latest/media/known-solutions/tagging-aws-resources.html) in the *AWS General Reference*.
modify-document-permission

The following code example shows how to use modify-document-permission.

AWS CLI

To modify document permissions

The following modify-document-permission example shares a Systems Manager document publicly.

```bash
aws ssm modify-document-permission \\
   --name "Example" \\
   --permission-type "Share" \\
   --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the AWS Systems Manager User Guide.

For API details, see ModifyDocumentPermission in AWS CLI Command Reference.

put-compliance-items

The following code example shows how to use put-compliance-items.

AWS CLI

To register a compliance type and compliance details to a designated instance

This example registers the compliance type Custom:AVCheck to the specified managed instance. There is no output if the command succeeds.

Command:

```bash
aws ssm put-compliance-items --resource-id "i-1234567890abcdef0" --resource-type "ManagedInstance" --compliance-type "Custom:AVCheck" --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" --items "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```
• For API details, see `PutComplianceItems` in *AWS CLI Command Reference*.

**put-inventory**

The following code example shows how to use `put-inventory`.

**AWS CLI**

To assign customer metadata to an instance

This example assigns rack location information to an instance. There is no output if the command succeeds.

Command (Linux):

```bash
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
  '[["TypeName": "Custom:RackInfo","SchemaVersion": "1.0","CaptureTime":
    "2019-01-22T10:01:01Z","Content":[["RackLocation": "Bay B/Row C/Rack D/Shelf E"]]]]'
```

Command (Windows):

```bash
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
  "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Content=[{"RackLocation='Bay B/Row C/Rack D/Shelf F'}]"
```

• For API details, see `PutInventory` in *AWS CLI Command Reference*.

**put-parameter**

The following code example shows how to use `put-parameter`.

**AWS CLI**

**Example 1: To change a parameter value**

The following `put-parameter` example changes the value of the specified parameter.

```bash
aws ssm put-parameter \
  --name "MyStringParameter" \
  --type "String" \
  --value "Vici"
```
--overwrite

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the AWS Systems Manager User Guide.

**Example 2: To create an advanced parameter**

The following put-parameter example creates an advanced parameter.

```
aws ssm put-parameter  
  --name "MyAdvancedParameter"  
  --description "This is an advanced parameter"  
  --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat [truncated]"  
  --type "String"  
  --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the AWS Systems Manager User Guide.

**Example 3: To convert a standard parameter to an advanced parameter**

Actions and scenarios
The following `put-parameter` example converts a existing standard parameter into an advanced parameter.

```bash
aws ssm put-parameter \\
   --name "MyConvertedParameter" \\
   --value "abc123" \\
   --type "String" \\
   --tier Advanced \\
   --overwrite
```

Output:

```plaintext
{
   "Version": 2,
   "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers' <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>__, and Working with parameter policies in the AWS Systems Manager User Guide.

**Example 4: To create a parameter with a policy attached**

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```bash
aws ssm put-parameter \\
   --name "/Finance/Payroll/q2accesskey" \\
   --value "P@sSwW)rd" \\
   --type "SecureString" \\
   --tier Advanced \\
   --policies 
   "[{"Type":"Expiration","Version":"1.0","Attributes": {{"Timestamp":"2020-06-30T00:00:00.000Z"}},{"Type":"ExpirationNotification","Version":"1.0","Attributes":{{"Before":"5","Unit":"Days"}},{"Type":"NoChangeNotification","Version":"1.0","Attributes":{{"After":"60","Unit ":"Days"}}}]"
```

Output:

```plaintext
{
}
```
For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>__, and Working with parameter policies in the AWS Systems Manager User Guide.

**Example 5: To add a policy to an existing parameter**

The following put-parameter example attaches a policy to an existing advanced parameter.

```bash
aws ssm put-parameter \
   --name "/Finance/Payroll/q2accesskey" \
   --value "N3wP@sSwW)r"d" \
   --type "SecureString" \
   --tier Advanced \
   --policies "[{{"Type":"Expiration","Version":"1.0","Attributes":{{"Timestamp":"2020-06-30T00:00:00.000Z"}},{{"Type":"ExpirationNotification","Version":"1.0","Attributes":{"Before":"5","Unit":"Days"}},{{"Type":"NoChangeNotification","Version":"1.0","Attributes":{{"After":"60","Unit":"Days"}}}]]"
   --overwrite
```

Output:

```
{
   "Version": 2,
   "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>__, and Working with parameter policies in the AWS Systems Manager User Guide.

- For API details, see **PutParameter** in AWS CLI Command Reference.

**register-default-patch-baseline**

The following code example shows how to use register-default-patch-baseline.
AWS CLI

To set the default patch baseline

The following register-default-patch-baseline example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```bash
aws ssm register-default-patch-baseline \
   --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
   "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following register-default-patch-baseline example registers the default patch baseline provided by AWS for CentOS as the default patch baseline.

```bash
aws ssm register-default-patch-baseline \
   --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/pb-0574b43a65ea646ed"
```

Output:

```
{
   "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the AWS Systems Manager User Guide.

- For API details, see RegisterDefaultPatchBaseline in AWS CLI Command Reference.

register-patch-baseline-for-patch-group

The following code example shows how to use register-patch-baseline-for-patch-group.

AWS CLI

To register a patch baseline for a patch group
The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```bash
aws ssm register-patch-baseline-for-patch-group \
  --baseline-id "pb-045f10b4f382baeda" \
  --patch-group "Production"
```

Output:

```json
{
  "BaselineId": "pb-045f10b4f382baeda",
  "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group [https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html](https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html) and Add a Patch Group to a Patch Baseline in the AWS Systems Manager User Guide.

- For API details, see RegisterPatchBaselineForPatchGroup in AWS CLI Command Reference.

**register-target-with-maintenance-window**

The following code example shows how to use `register-target-with-maintenance-window`.

AWS CLI

**Example 1: To register a single target with a maintenance window**

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```bash
aws ssm register-target-with-maintenance-window \
  --window-id "mw-ab12cd34ef56gh78" \
  --target "Key=InstanceIds,Values=i-0000293fffd8c57862" \
  --owner-information "Single instance" \
  --resource-type "INSTANCE"
```

Output:

```json
{
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```
Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```bash
aws ssm register-target-with-maintenance-window \
--window-id "mw-ab12cd34ef56gh78" \ 
--target "Key=InstanceIds,Values=i-0000293fffd8c57862,i-0cb2b964d3e14fd9f" \ 
--owner-information "Two instances in a list" \ 
--resource-type "INSTANCE"
```

Output:

```json
{
   "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```bash
aws ssm register-target-with-maintenance-window \
--window-id "mw-06cf17cbe6b4bf4f" \ 
--targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \ 
--owner-information "Production Web Servers" \ 
--resource-type "INSTANCE"
```

Output:

```json
{
   "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.
aws ssm register-target-with-maintenance-window \
   --window-id "mw-0c50858d01EXAMPLE" \
   --resource-type "INSTANCE" \
   --target "Key=tag-key,Values=Name,Instance-Type,CostCenter"

Output:

```
{
   "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 5: To register targets using a resource group name

The following register-target-with-maintenance-window example register a specified resource group, regardless of the type of resources it contains.

aws ssm register-target-with-maintenance-window \
   --window-id "mw-0c50858d01EXAMPLE" \
   --resource-type "RESOURCE_GROUP" \
   --target "Key=resource-groups:Name,Values=MyResourceGroup"

Output:

```
{
   "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see RegisterTargetWithMaintenanceWindow in AWS CLI Command Reference.

register-task-with-maintenance-window

The following code example shows how to use register-task-with-maintenance-window.

**AWS CLI**

Example 1: To register an Automation task with a maintenance window
The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```bash
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::111222333444:role/SSM --task-type AUTOMATION \
    --task-invocation-parameters "{"Automation":{"DocumentVersion":"$LATEST","Parameters":{"InstanceId":["{{RESOURCE_ID}}"]}}}" \
    --priority 0 \
    --max-concurrency 1 \
    --max-errors 1 \
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

**Example 2: To register a Lambda task with a Maintenance Window**

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```bash
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-east-1:111222333444:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::111222333444:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{}"Lambda":{"Payload":"{"InstanceId":","{{RESOURCE_ID}}"},"targetType":"{{TARGET_TYPE}}"}},"Qualifier":"$LATEST"'} \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example"
```

Actions and scenarios 6126
--description "My Lambda Example"

Output:

```
{
   "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

**Example 3: To register a Run Command task with a maintenance window**

The following register-task-with-maintenance-window example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
   --window-id "mw-082dcd7649dee04e4" \
   --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
   --service-role-arn "arn:aws:iam::111222333444:role/SSM" \
   --task-type "RUN_COMMAND" \
   --name "SSMInstallPowerShellModule" \
   --task-arn "AWS-InstallPowerShellModule" \
   --max-concurrency 1 \
   --max-errors 1 \
   --priority 10
```

Output:

```
{
   "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

**Example 4: To register a Step Functions task with a maintenance window**

Actions and scenarios
The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```bash
aws ssm register-task-with-maintenance-window \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=12347414-69c3-49f8-95b8-ed2dcEXAMPLE \
    --task-arn arn:aws:states:us-east-1:111222333444:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::111222333444:role/MaintenanceWindows \
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters "{"StepFunctions":"Input":{"InstanceId":"{{RESOURCE_ID}}"}}" \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see [Register a Task with the Maintenance Window (AWS CLI)](https://docs.aws.amazon.com/systemsmanager/latest/userguide/registration-update-maintenance-windows.html) in the AWS Systems Manager User Guide.

**Example 5: To register a task using a maintenance windows target ID**

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```bash
aws ssm register-task-with-maintenance-window \
    --targets "Key=WindowTargetIds,Values=350d44e6-28cc-44e2-951f-4b2c9EXAMPLE" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::111222333444:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters "{"commands":["Values":["df"]}]" \
    --max-concurrency 1 \
```

Actions and scenarios 6128
Output:

```json
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see RegisterTaskWithMaintenanceWindow in AWS CLI Command Reference.

### remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

**AWS CLI**

**To remove a tag from a patch baseline**

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
  --resource-type "PatchBaseline" \
  --resource-id "pb-0123456789abcdef0" \
  --tag-keys "Region"
```

This command produces no output.

For more information, see Tagging AWS Resources in the AWS General Reference.

- For API details, see RemoveTagsFromResource in AWS CLI Command Reference.

### reset-service-setting

The following code example shows how to use `reset-service-setting`.

**AWS CLI**

**To reset the service setting for Parameter Store throughput**
The following `reset-service-setting` example resets the service setting for Parameter Store throughput in the specified region to no longer use increased throughput.

```bash
aws ssm reset-service-setting \
   --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:

```json
{
   "ServiceSetting": {
      "SettingId": "/ssm/parameter-store/high-throughput-enabled",
      "SettingValue": "false",
      "LastModifiedDate": 1555532818.578,
      "LastModifiedUser": "System",
      "Status": "Default"
   }
}
```

For more information, see [Increasing Parameter Store Throughput](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-increase-throughput.html) in the *AWS Systems Manager User Guide*.

- For API details, see [ResetServiceSetting](https://docs.aws.amazon.com/cli/latest/reference/ssm/reset-service-setting.html) in *AWS CLI Command Reference*.

### resume-session

The following code example shows how to use `resume-session`.

**AWS CLI**

**To resume a Session Manager session**

This `resume-session` example resumes a Session Manager session with an instance after it has been disconnected. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```bash
aws ssm resume-session \
   --session-id Mary-Major-07a16060613c408b5
```
For more information, see Install the Session Manager Plugin for the AWS CLI in the AWS Systems Manager User Guide.

- For API details, see ResumeSession in AWS CLI Command Reference.

**send-automation-signal**

The following code example shows how to use send-automation-signal.

**AWS CLI**

**To send a signal to an automation execution**

The following send-automation-signal example sends an Approve signal to an Automation execution.

```
aws ssm send-automation-signal \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --signal-type "Approve"
```

This command produces no output.

For more information, see Running an Automation Workflow with Approvers in the AWS Systems Manager User Guide.

- For API details, see SendAutomationSignal in AWS CLI Command Reference.
**send-command**

The following code example shows how to use send-command.

**AWS CLI**

**Example 1: To run a command on one or more remote instances**

The following send-command example runs an echo command on a target instance.

```bash
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
    --comment "echo HelloWorld"
```

**Output:**

```
{
    "Command": {
        "CommandId": "92853adf-ba41-4cd6-9a88-142d1EXAMPLE",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "echo HelloWorld",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo HelloWorld"
            ],
        },
        "InstanceIds": [
            "i-0f00f008a2dcbefe2"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
    }
}
```
"DeliveryTimedOutCount": 0,
"ServiceRole": "",
"NotificationConfig": {
    "NotificationArn": "",
    "NotificationEvents": [],
    "NotificationType": ""
  },
"CloudWatchOutputConfig": {
    "CloudWatchLogGroupName": "",
    "CloudWatchOutputEnabled": false
  }
}
}

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

Example 2: To get IP information about an instance

The following send-command example retrieves the IP information about an instance.

```bash
aws ssm send-command \
   --instance-ids "i-1234567890abcdef0" \
   --document-name "AWS-RunShellScript" \
   --comment "IP config" \
   --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

Example 3: To run a command on instances with specific tags

The following send-command example runs a command on instances that have the tag key "ENV" and the value "Dev".

```bash
aws ssm send-command \
   --targets "Key=tag:ENV,Values=Dev" \
   --document-name "AWS-RunShellScript" \
   --parameters "commands=ifconfig"
```

See example 1 for sample output.
For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

Example 4: To run a command that sends SNS notifications

The following send-command example runs a command that sends SNS notifications for all notification events and the Command notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-east-1:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

Example 5: To run a command that outputs to S3 and CloudWatch

The following send-command example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-config "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

Example 6: To run commands on multiple instances with different tags
The following send-command example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
  --document-name "AWS-RunPowerShellScript" \
  --parameters commands=["echo helloWorld"] \
  --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

**Example 7: To target multiple instances with the same tag key**

The following send-command example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
  --document-name "AWS-RunPowerShellScript" \
  --parameters commands=["echo helloWorld"] \
  --targets Key=tag:Env,Values=Dev,Test
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the AWS Systems Manager User Guide.

**Example 8: To run a command that uses a shared document**

The following send-command example runs a shared document on a target instance.

```
aws ssm send-command \
  --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

See example 1 for sample output.

For more information, see Using shared SSM documents in the AWS Systems Manager User Guide.

- For API details, see SendCommand in AWS CLI Command Reference.
**start-associations-once**

The following code example shows how to use `start-associations-once`.

**AWS CLI**

**To run an association immediately and only one time**

The following `start-associations-once` example run the specified association immediately and only once. There is no output if the command succeeds.

```
aws ssm start-associations-once \
   --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see [Viewing association histories](https://docs.aws.amazon.com/systemsmanager/latest/userguide/) in the *AWS Systems Manager User Guide*.

- For API details, see [StartAssociationsOnce](https://docs.aws.amazon.com/cli/latest/reference/ssm/start-associations-once.html) in *AWS CLI Command Reference*.

**start-automation-execution**

The following code example shows how to use `start-automation-execution`.

**AWS CLI**

**Example 1: To execute an automation document**

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
   --document-name "AWS-UpdateLinuxAmi" \
   --parameters "AutomationAssumeRole=arn:aws:iampolicy::123456789012:role/SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
   "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see [Running an Automation Workflow Manually](https://docs.aws.amazon.com/systemsmanager/latest/userguide/) in the *AWS Systems Manager User Guide*. 

---

Actions and scenarios 6136
Example 2: To run a shared automation document

The following start-automation-execution example runs a shared Automation document.

```
aws ssm start-automation-execution
```

Output:

```
{
   "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Using shared SSM documents in the AWS Systems Manager User Guide.

- For API details, see StartAutomationExecution in AWS CLI Command Reference.

start-change-request-execution

The following code example shows how to use start-change-request-execution.

AWS CLI

Example 1: To start a change request

The following start-change-request-execution example starts a change request with minimal options specified.

```
aws ssm start-change-request-execution
   --change-request-name MyChangeRequest
   --document-name AWS-HelloWorldChangeTemplate
   --runbooks "["DocumentName": "AWS-HelloWorld","Parameters":
   {%"AutomationAssumeRole": [{"arn:aws:iam:us-east-2:1112223233444:role/
MyChangeManagerAssumeRole"]}]"
   --parameters
   Approver="JohnDoe",ApproverType="IamUser",ApproverSnsTopicArn="arn:aws:sns:us-
east-2:1112223233444:MyNotificationTopic"
```

Output:

```
{
}
```
Example 2: To start a change request using an external JSON file

The following `start-automation-execution` example starts a change request with multiple options specified in a JSON file.

```bash
aws ssm start-change-request-execution \
  --cli-input-json file://MyChangeRequest.json
```

Contents of `MyChangeRequest.json`:

```json
{
    "ChangeRequestName": "MyChangeRequest",
    "DocumentName": "AWS-HelloWorldChangeTemplate",
    "DocumentVersion": "$DEFAULT",
    "ScheduledTime": "2021-12-30T03:00:00",
    "ScheduledEndTime": "2021-12-30T03:05:00",
    "Tags": [
        {
            "Key": "Purpose",
            "Value": "Testing"
        }
    ],
    "Parameters": {
        "Approver": [
            "JohnDoe"
        ],
        "ApproverType": [
            "IamUser"
        ],
        "ApproverSnsTopicArn": [
            "arn:aws:sns:us-east-2:111222333444::MyNotificationTopic"
        ]
    },
    "Runbooks": [
        {
            "DocumentName": "AWS-HelloWorld",
            "DocumentVersion": "1",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Parameters": {
```

6138
"AutomationAssumeRole": [
    "arn:aws:iam::111222333444:role/MyChangeManagerAssumeRole"
  ]
}
]
"ChangeDetails": "### Document Name: HelloWorldChangeTemplate

## What does this document do?
This change template demonstrates the feature set available for creating change templates for Change Manager. This template starts a Runbook workflow for the Automation document called AWS-HelloWorld.

## Input Parameters
* ApproverSnsTopicArn: (Required) Amazon Simple Notification Service ARN for approvers.
* Approver: (Required) The name of the approver to send this request to.
* ApproverType: (Required) The type of reviewer.

## Output Parameters
This document has no outputs.

```json
Output:
{
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}
```

For more information, see [Creating change requests](https://docs.aws.amazon.com/systems-manager/latest/userguide/creating-change-requests.html) in the *AWS Systems Manager User Guide*.

- For API details, see [StartChangeRequestExecution](https://docs.aws.amazon.com/cli/latest/reference/ssm/start-change-request-execution.html) in *AWS CLI Command Reference*.

### start-session

The following code example shows how to use `start-session`.

**AWS CLI**

#### Example 1: To start a Session Manager session

This `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```bash
aws ssm start-session --target "i-1234567890abcdef0"
```
Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

**Example 2: To start a Session Manager session using SSH**

This start-session example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcaEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see [Start a Session](#) and [Install the Session Manager Plugin for the AWS CLI](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StartSession](#) in *AWS CLI Command Reference*.

---

### stop-automation-execution

The following code example shows how to use `stop-automation-execution`.

**AWS CLI**

**To stop an automation execution**

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution
  --automation-execution-id "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
```

This command produces no output.

For more information, see [Running an Automation Workflow Manually](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StopAutomationExecution](#) in *AWS CLI Command Reference*.
**terminate-session**

The following code example shows how to use `terminate-session`.

**AWS CLI**

**To end a Session Manager session**

This `terminate-session` example permanently ends a session that was created by the user "Shirley-Rodriguez" and closes the data connection between the Session Manager client and SSM Agent on the instance.

```bash
aws ssm terminate-session \
   --session-id "Shirley-Rodriguez-07a16060613c408b5"
```

Output:

```json
{
   "SessionId": "Shirley-Rodriguez-07a16060613c408b5"
}
```

For more information, see [Terminate a Session](https://docs.aws.amazon.com/systems-manager/latest/userguide/session-manager-sessions-terminating.html) in the *AWS Systems Manager User Guide*.

- For API details, see [TerminateSession](https://docs.aws.amazon.com/cli/latest/reference/ssm/terminate-session.html) in *AWS CLI Command Reference*.

**unlabel-parameter-version**

The following code example shows how to use `unlabel-parameter-version`.

**AWS CLI**

**To delete parameter labels**

The following `unlabel-parameter-version` example deletes the specified labels from the given parameter version.

```bash
aws ssm unlabel-parameter-version \
   --name "parameterName" \
   --parameter-version "version" \
   --labels "label_1" "label_2" "label_3"
```
For more information, see Delete parameter labels (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see UnlabelParameterVersion in AWS CLI Command Reference.

update-association-status

The following code example shows how to use update-association-status.

AWS CLI

To update the association status

The following update-association-status example updates the association status of the association between an instance and a document.

```bash
aws ssm update-association-status \
   --name "AWS-UpdateSSMAgent" \
   --instance-id "i-1234567890abcdef0" \
   --association-status "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additional-Config-Needed"
```

Output:

```json
{
   "AssociationDescription": {
      "Name": "AWS-UpdateSSMAgent",
      "InstanceId": "i-1234567890abcdef0",
      "AssociationVersion": "1",
      "Date": 1550507529.604,
      "RemovedLabels": [

- For API details, see UpdateAssociationStatus in AWS CLI Command Reference.

update-association

The following code example shows how to use update-association.

AWS CLI

Example 1: To update a document association

The following update-association example updates an association with a new document version.
aws ssm update-association \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
  --document-version "\$LATEST"

Output:

```
{
  "AssociationDescription": {
    "Name": "AWS-UpdateSSMAgent",
    "AssociationVersion": "2",
    "Date": 1550508093.293,
    "LastUpdateAssociationDate": 1550508106.596,
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "DocumentVersion": "$LATEST",
    "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
    "Targets": [
      {
        "Key": "tag:Name",
        "Values": ["Linux"
      ]
    ],
    "LastExecutionDate": 1550508094.879,
    "LastSuccessfulExecutionDate": 1550508094.879
  }
}
```

For more information, see Editing and creating a new version of an association in the AWS Systems Manager User Guide.

Example 2: To update the schedule expression of an association

The following update-association example updates the schedule expression for the specified association.

```
aws ssm update-association \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
```
--schedule-expression "cron(0 0 0/4 1/1 * ? *)"

Output:

```
{
   "AssociationDescription": {
      "Name": "AWS-HelloWorld",
      "AssociationVersion": "2",
      "Date": "2021-02-08T13:54:19.203000-08:00",
      "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
      "Overview": {
         "Status": "Pending",
         "DetailedStatus": "Creating"
      },
      "DocumentVersion": "$DEFAULT",
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "Targets": [
         {
            "Key": "aws:NoOpAutomationTag",
            "Values": [
               "AWS-NoOpAutomationTarget-Value"
            ]
         }
      ],
      "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
      "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
      "ApplyOnlyAtCronInterval": false
   }
}
```

For more information, see Editing and creating a new version of an association in the AWS Systems Manager User Guide.

- For API details, see UpdateAssociation in AWS CLI Command Reference.

update-document-default-version

The following code example shows how to use update-document-default-version.

AWS CLI

To update the default version of a document
The following `update-document-default-version` example updates the default version of a Systems Manager document.

```bash
aws ssm update-document-default-version \
  --name "Example" \ 
  --document-version "2"
```

Output:

```
{
  "Description": {
    "Name": "Example",
    "DefaultVersion": "2"
  }
}
```

For more information, see [Writing SSM Document Content](https://docs.aws.amazon.com/AWSServerManager/latest/UIReference/home.html) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateDocumentDefaultVersion](https://docs.aws.amazon.com/AWSServerManager/latest/UIReference/API_UpdateDocumentDefaultVersion.html) in *AWS CLI Command Reference*.

### `update-document-metadata`

The following code example shows how to use `update-document-metadata`.

#### AWS CLI

**Example: To approve the latest version of a change template**

The following `update-document-metadata` provides an approval for the latest version of a change template that has been submitted for review.

```bash
aws ssm update-document-metadata \
  --name MyChangeManagerTemplate \
  --document-reviews 'Action=Approve,Comment= [{Type=Comment,Content=Approved!}]'
```

This command produces no output.

For more information, see [Reviewing and approving or rejecting change templates](https://docs.aws.amazon.com/AWSServerManager/latest/UIReference/ResourcePackReference.html) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateDocumentMetadata](https://docs.aws.amazon.com/AWSServerManager/latest/UIReference/API_UpdateDocumentMetadata.html) in *AWS CLI Command Reference*.
update-document

The following code example shows how to use update-document.

AWS CLI

To create a new version of a document

The following update-document example creates a new version of a document when run on a Windows computer. The document specified by --document must be in JSON format. Note that file:// must be referenced followed by the path of the content file. Because of the $ at the beginning of the --document-version parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version:

```bash
aws ssm update-document \
   --name "RunShellScript" \
   --content "file://RunShellScript.json" \
   --document-version "$LATEST"
```

Linux/Mac version:

```bash
aws ssm update-document \
   --name "RunShellScript" \
   --content "file://RunShellScript.json" \
   --document-version '$LATEST'
```

Output:

```json
{
   "DocumentDescription": {
      "Status": "Updating",
      "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
      "Name": "RunShellScript",
      "Parameters": [
         {
            "Type": "StringList",
            "Name": "commands",
            "Description": "(Required) Specify a shell script or a command to run."
         }
      ]
   }
}
```
update-maintenance-window-target

The following code example shows how to use update-maintenance-window-target.

AWS CLI

To update a maintenance window target

The following update-maintenance-window-target example updates only the name of a maintenance window target.

```
aws ssm update-maintenance-window-target \
   --window-id "mw-0c5ed765acEXAMPLE" \
   --window-target-id "57e8344e-fe64-4023-8191-6bf05EXAMPLE" \
   --name "NewName" \
   --no-replace
```

Output:

```
{
   "Description": "",
   "OwnerInformation": "",
   "WindowTargetId": "57e8344e-fe64-4023-8191-6bf05EXAMPLE",
```
API calls

update-maintenance-window-task

The following code example shows how to use update-maintenance-window-task.

AWS CLI

To update a maintenance window task

The following update-maintenance-window-task example updates the service role for a maintenance window task.

```bash
aws ssm update-maintenance-window-task \    --window-id "mw-0c5ed765acEXAMPLE" \    --window-task-id "23d3809e-9fbe-4ddf-b49d7EXAMPLE" \    --service-role-arn "arn:aws:iam::111222333444:role/aws-service-role/ssm.amazonaws.com/AWSServiceRoleForAmazonSSM"
```

Output:

```json
{
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",
    "TaskArn": "AWS-UpdateEC2Config",
    "MaxConcurrency": "1",
    "WindowTaskId": "23d3809e-9fbe-4ddf-b49d7EXAMPLE",
}
```
"TaskParameters": {},
"Priority": 1,
"TaskInvocationParameters": {
  "RunCommand": {
    "TimeoutSeconds": 600,
    "Parameters": {
      "allowDowngrade": [false]
    }
  }
},
"WindowId": "mw-0c5ed765acEXAMPLE",
"Description": "UpdateEC2Config",
"Targets": [
  {
    "Values": [
      "57e8344e-fe64-4023-8191-6bf05EXAMPLE"
    ],
    "Key": "WindowTargetIds"
  }
],
"Name": "UpdateEC2Config"

For more information, see Update a Maintenance Window (AWS CLI) in the AWS Systems Manager User Guide.

- For API details, see UpdateMaintenanceWindowTask in AWS CLI Command Reference.

update-maintenance-window

The following code example shows how to use update-maintenance-window.

AWS CLI

Example 1: To update a maintenance window

The following update-maintenance-window example updates the name of a maintenance window.

```bash
aws ssm update-maintenance-window
--window-id "mw-1a2b3c4d5e6f7g8h9"
```
Output:

```json
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

**Example 2: To disable a maintenance window**

The following `update-maintenance-window` example disables a maintenance window.

```bash
aws ssm update-maintenance-window \\
   --window-id "mw-1a2b3c4d5e6f7g8h9" \\
   --no-enabled
```

**Example 3: To enable a maintenance window**

The following `update-maintenance-window` example enables a maintenance window.

```bash
aws ssm update-maintenance-window \\
   --window-id "mw-1a2b3c4d5e6f7g8h9" \\
   --enabled
```

For more information, see [Update a Maintenance Window (AWS CLI)](https://docs.aws.amazon.com/systemsmanager/latest/userguide/ssm-update-maintenance-window.html) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateMaintenanceWindow](https://docs.aws.amazon.com/cli/latest/reference/ssm/update-maintenance-window.html) in *AWS CLI Command Reference*.

**update-managed-instance-role**

The following code example shows how to use `update-managed-instance-role`.

**AWS CLI**

To update the IAM role of a managed instance
The following update-managed-instance-role example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see [Step 4: Create an IAM Instance Profile for Systems Manager](https://aws.amazon.com/documentation/systems-manager/) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateManagedInstanceRole](https://aws.amazon.com/documentation/systems-manager/API-Reference/) in *AWS CLI Command Reference*.

**update-ops-item**

The following code example shows how to use update-ops-item.

**AWS CLI**

**To update an OpsItem**

The following update-ops-item example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
```

Output:

```
This command produces no output.
```

For more information, see [Working with OpsItems](https://aws.amazon.com/documentation/systems-manager/) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateOpsItem](https://aws.amazon.com/documentation/systems-manager/API-Reference/) in *AWS CLI Command Reference*. 
**update-patch-baseline**

The following code example shows how to use `update-patch-baseline`.

**AWS CLI**

**Example 1: To update a patch baseline**

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```bash
aws ssm update-patch-baseline \
   --baseline-id "pb-0123456789abcdef0" \
   --rejected-patches "KB2032276" "MS10-048" \
   --approved-patches "KB2124261"
```

Output:

```json
{
   "BaselineId": "pb-0123456789abcdef0",
   "Name": "WindowsPatching",
   "OperatingSystem": "WINDOWS",
   "GlobalFilters": {
      "PatchFilters": []
   },
   "ApprovalRules": {
      "PatchRules": [
         {
            "PatchFilterGroup": {
               "PatchFilters": [
                  {
                     "Key": "PRODUCT",
                     "Values": [
                        "WindowsServer2016"
                     ]
                  }
               ]
            },
            "ComplianceLevel": "CRITICAL",
            "ApproveAfterDays": 0,
            "EnableNonSecurity": false
         }
      ]
   }
}
```
Example 2: To rename a patch baseline

The following update-patch-baseline example renames the specified patch baseline.

```bash
aws ssm update-patch-baseline \
  --baseline-id "pb-0713accee01234567" \
  --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

For more information, see Update or Delete a Patch Baseline <https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html> in the AWS Systems Manager User Guide.

- For API details, see UpdatePatchBaseline in AWS CLI Command Reference.

update-resource-data-sync

The following code example shows how to use update-resource-data-sync.

AWS CLI

To update a resource data sync

The following update-resource-data-sync example updates a SyncFromSource resource data sync.
aws ssm update-resource-data-sync \
   --sync-name exampleSync \
   --sync-type SyncFromSource \
   --sync-source '{"SourceType":"SingleAccountMultiRegions", "SourceRegions":['us-east-1", "us-west-2"]}'

This command produces no output.

For more information, see Setting Up Systems Manager Explorer to Display Data from Multiple Accounts and Regions in the AWS Systems Manager User Guide.

- For API details, see UpdateResourceDataSync in AWS CLI Command Reference.

update-service-setting

The following code example shows how to use update-service-setting.

AWS CLI

To update the service setting for Parameter Store throughput

The following update-service-setting example updates the current service setting for Parameter Store throughput in the specified region to use increased throughput.

aws ssm update-service-setting \
   --setting-id arn:aws:ssm:us-east-1:123456789012:servicestore/ssm/parameter-store/high-throughput-enabled \
   --setting-value true

This command produces no output.

For more information, see Increasing Parameter Store Throughput in the AWS Systems Manager User Guide.

- For API details, see UpdateServiceSetting in AWS CLI Command Reference.

Amazon Textract examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Textract.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**analyze-document**

The following code example shows how to use `analyze-document`.

**AWS CLI**

**To analyze text in a document**

The following `analyze-document` example shows how to analyze text in a document.

**Linux/macOS:**

```
aws textract analyze-document \
  --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
  --feature-types '[@TABLES,"FORMS"]'
```

**Windows:**

```
aws textract analyze-document \
  --document "\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}" \
  --feature-types "\[@TABLES\",\"FORMS\"]" \
  --region region-name
```

**Output:**

```
{
  "Blocks": [  
```
Actions and scenarios
For more information, see Analyzing Document Text with Amazon Textract in the *Amazon Textract Developers Guide*.

- For API details, see `AnalyzeDocument` in *AWS CLI Command Reference*.

**detect-document-text**

The following code example shows how to use `detect-document-text`.

**AWS CLI**

**To detect text in a document**

The following `detect-document-text` The following example shows how to detect text in a document.

Linux/macOS:

```bash
aws textract detect-document-text \
  --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}'
```

Windows:

```bash
aws textract detect-document-text \
  --document "{\"S3Object\":{"Bucket":"bucket","Name":"document\"}}" \ 
  --region region-name
```

Output:

```json

                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {
                    "Type": "CHILD",
                    "Ids": [
                        "75966e64-81c2-4540-9649-d66ec341cd8f",
                        "75966e64-81c2-4540-9649-d66ec341cd8f"
                    ]
                }
            ]
        }
    ]
}
```
For more information, see Detecting and Analyzing Text in Multi-Page Documents in the Amazon Textract Developers Guide

- For API details, see GetDocumentAnalysis in AWS CLI Command Reference.

get-document-text-detection

The following code example shows how to use `get-document-text-detection`.

AWS CLI

To get the results of asynchronous text detection in a multi-page document

The following `get-document-text-detection` example shows how to get the results of asynchronous text detection in a multi-page document.

```bash
aws textract get-document-text-detection \
    --job-id 57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9 \
    --max-results 1000
```

Output

```json
{
  "Blocks": [
    {
```
Actions and scenarios
The following code example shows how to use `start-document-analysis`.

**AWS CLI**

**To start analyzing text in a multi-page document**

The following `start-document-analysis` example shows how to start asynchronous analysis of text in a multi-page document.

**Linux/macOS:**

```bash
aws textract start-document-analysis \
   --document-location '{}"S3Object":{"Bucket":"bucket","Name":"document"}{}' \
   --feature-types '["TABLES","FORMS"]' \
   --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

**Windows:**

```bash
aws textract start-document-analysis \
   --document-location "{"S3Object":{"Bucket":"bucket","Name":"document"}}" \
   --feature-types "["TABLES","FORMS"]" \
   --region region-name \
   --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

**Output:**

```json
{
   "JobId": "df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b"
}
```
For more information, see Detecting and Analyzing Text in Multi-Page Documents in the Amazon Textract Developers Guide

- For API details, see StartDocumentAnalysis in AWS CLI Command Reference.

**start-document-text-detection**

The following code example shows how to use start-document-text-detection.

**AWS CLI**

To start detecting text in a multi-page document

The following start-document-text-detection example shows how to start asynchronous detection of text in a multi-page document.

**Linux/macOS:**

```
aws textract start-document-text-detection \
   --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
   --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleARN"
```

**Windows:**

```
aws textract start-document-text-detection \
   --document-location "{"S3Object":{"Bucket":"bucket","Name":"document"}}" \
   --region region-name \
   --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleARN"
```

**Output:**

```
{
   "JobId": "57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9"
}
```

For more information, see Detecting and Analyzing Text in Multi-Page Documents in the Amazon Textract Developers Guide

- For API details, see StartDocumentTextDetection in AWS CLI Command Reference.
Amazon Transcribe examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

create-language-model

The following code example shows how to use create-language-model.

AWS CLI

Example 1: To create a custom language model using both training and tuning data.

The following create-language-model example creates a custom language model. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```bash
aws transcribe create-language-model \
  --language-code language-code \
  --base-model-name base-model-name \
  --model-name cli-clm-example \
  --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-training-data",TuningDataS3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-
```
Example 2: To create a custom language model using only training data.

The following `create-language-model` example transcribes your audio file. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For `language-code`, enter a valid language code. For `base-model-name`, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For `model-name`, specify the name that you want to call the custom language model.

```bash
aws transcribe create-language-model \
  --language-code en-US \
  --base-model-name base-model-name \
  --model-name cli-clm-example \
  --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-For-Training-Data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-permissions-to-create-a-custom-language-model"
```

Output:

```json
{
  "LanguageCode": "language-code",
  "BaseModelName": "base-model-name",
  "ModelName": "cli-clm-example",
  "InputDataConfig": {
    "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-with-permissions-to-create-a-custom-language-model"
  },
  "ModelStatus": "IN_PROGRESS"
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](https://aws.amazon.com/transcribe/guides/developer/) in the *Amazon Transcribe Developer Guide*.
create-medical-vocabulary

The following code example shows how to use create-medical-vocabulary.

AWS CLI

To create a medical custom vocabulary

The following create-medical-vocabulary example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-medical-vocabulary \
  --vocabulary-name cli-medical-vocab-example \
  --language-code language-code \
```

Output:

```json
{
    "VocabularyName": "cli-medical-vocab-example",
    "LanguageCode": "language-code",
}
```
For more information, see Medical Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see CreateMedicalVocabulary in AWS CLI Command Reference.

**create-vocabulary-filter**

The following code example shows how to use create-vocabulary-filter.

**AWS CLI**

**To create a vocabulary filter**

The following create-vocabulary-filter example creates a vocabulary filter that uses a text file that contains a list of words that you wouldn't want to appear in a transcription. For language-code, specify the language code corresponding to the language of your vocabulary filter. For vocabulary-filter-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of the text file. For vocabulary-filter-name, specify the name of your vocabulary filter.

```bash
aws transcribe create-vocabulary-filter \
  --language-code language-code \
  --vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/vocabulary-filter.txt \
  --vocabulary-filter-name cli-vocabulary-filter-example
```

Output:

```json
{
  "VocabularyFilterName": "cli-vocabulary-filter-example",
  "LanguageCode": "language-code"
}
```

For more information, see Filtering Unwanted Words in the Amazon Transcribe Developer Guide.

- For API details, see CreateVocabularyFilter in AWS CLI Command Reference.

**create-vocabulary**

The following code example shows how to use create-vocabulary.
AWS CLI

To create a custom vocabulary

The following create-vocabulary example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-vocabulary \
    --language-code language-code \
    --vocabulary-name cli-vocab-example \
    --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/the-text-file-for-the-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-vocab-example",
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see CreateVocabulary in AWS CLI Command Reference.

delete-language-model

The following code example shows how to use delete-language-model.

AWS CLI

To delete a custom language model

The following delete-language-model example deletes a custom language model.

```
aws transcribe delete-language-model \
    --model-name model-name
```
This command produces no output.

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the Amazon Transcribe Developer Guide.

• For API details, see DeleteLanguageModel in AWS CLI Command Reference.

delete-medical-transcription-job

The following code example shows how to use delete-medical-transcription-job.

AWS CLI

To delete a medical transcription job

The following delete-medical-transcription-job example deletes a medical transcription job.

```
aws transcribe delete-medical-transcription-job \
   --medical-transcription-job-name medical-transcription-job-name
```

This command produces no output.

For more information, see DeleteMedicalTranscriptionJob in the Amazon Transcribe Developer Guide.

• For API details, see DeleteMedicalTranscriptionJob in AWS CLI Command Reference.

delete-medical-vocabulary

The following code example shows how to use delete-medical-vocabulary.

AWS CLI

To delete a medical custom vocabulary

The following delete-medical-vocabulary example deletes a medical custom vocabulary. For vocabulary-name, specify the name of the medical custom vocabulary.

```
aws transcribe delete-vocabulary \
   --vocabulary-name medical-custom-vocabulary-name
```
This command produces no output.

For more information, see Medical Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see DeleteMedicalVocabulary in AWS CLI Command Reference.

**delete-transcription-job**

The following code example shows how to use delete-transcription-job.

**AWS CLI**

To delete one of your transcription jobs

The following delete-transcription-job example deletes one of your transcription jobs.

```
aws transcribe delete-transcription-job \
   --transcription-job-name your-transcription-job
```

This command produces no output.

For more information, see DeleteTranscriptionJob in the Amazon Transcribe Developer Guide.

- For API details, see DeleteTranscriptionJob in AWS CLI Command Reference.

**delete-vocabulary-filter**

The following code example shows how to use delete-vocabulary-filter.

**AWS CLI**

To delete a vocabulary filter

The following delete-vocabulary-filter example deletes a vocabulary filter.

```
aws transcribe delete-vocabulary-filter \
   --vocabulary-filter-name vocabulary-filter-name
```

This command produces no output.

For more information, see Filtering Unwanted Words in the Amazon Transcribe Developer Guide.

- For API details, see DeleteVocabularyFilter in AWS CLI Command Reference.
**delete-vocabulary**

The following code example shows how to use `delete-vocabulary`.

**AWS CLI**

**To delete a custom vocabulary**

The following `delete-vocabulary` example deletes a custom vocabulary.

```
aws transcribe delete-vocabulary
   --vocabulary-name vocabulary-name
```

This command produces no output.

For more information, see [Custom Vocabularies](https://docs.aws.amazon.com/AmazonTranscribe/latest/developerguide/creating-vocabulary.html) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteVocabulary](https://docs.aws.amazon.com/cli/latest/reference/transcribe/delete-vocabulary.html) in *AWS CLI Command Reference*.

**describe-language-model**

The following code example shows how to use `describe-language-model`.

**AWS CLI**

**To get information about a specific custom language model**

The following `describe-language-model` example gets information about a specific custom language model. For example, under `BaseModelName` you can see whether your model is trained using a NarrowBand or WideBand model. Custom language models with a NarrowBand base model can transcribe audio with a sample rate less than 16 kHz. Language models using a WideBand base model can transcribe audio with a sample rate greater than 16 kHz. The `S3Uri` parameter indicates the Amazon S3 prefix you've used to access the training data to create the custom language model.

```
aws transcribe describe-language-model
   --model-name cli-clm-example
```

Output:

```
{
```
get-medical-transcription-job

The following code example shows how to use get-medical-transcription-job.

AWS CLI

To get information about a specific medical transcription job

The following get-medical-transcription-job example gets information about a specific medical transcription job. To access the transcription results, use the TranscriptFileUri parameter. If you've enabled additional features for the transcription job, you can see them in the Settings object. The Specialty parameter shows the medical specialty of the provider. The Type parameter indicates whether the speech in the transcription job is of a medical conversation, or a medical dictation.

```bash
aws transcribe get-medical-transcription-job \
   --medical-transcription-job-name vocabulary-dictation-medical-transcription-job
```

Output:
For more information, see [Batch Transcription](https://docs.aws.amazon.com/AmazonTranscribe/latest/DeveloperGuide/batch-transcribe.html) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetMedicalTranscriptionJob](https://docs.aws.amazon.com/awscli/latest/awspythonref/services/medical-transcribe-get-medical-transcription-job.html) in *AWS CLI Command Reference*.

**get-medical-vocabulary**

The following code example shows how to use `get-medical-vocabulary`.

**AWS CLI**

**To get information about a medical custom vocabulary**

The following `get-medical-vocabulary` example gets information on a medical custom vocabulary. You can use the `VocabularyState` parameter to see the processing state of the vocabulary. If it's READY, you can use it in the `StartMedicalTranscriptionJob` operation.
aws transcribe get-medical-vocabulary \
   --vocabulary-name medical-vocab-example

Output:

{
   "VocabularyName": "medical-vocab-example",
   "LanguageCode": "en-US",
   "VocabularyState": "READY",
   "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",
   "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
medical-custom-vocabulary"
}

For more information, see Medical Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see GetMedicalVocabulary in AWS CLI Command Reference.

get-transcription-job

The following code example shows how to use get-transcription-job.

AWS CLI

To get information about a specific transcription job

The following get-transcription-job example gets information about a specific transcription job. To access the transcription results, use the TranscriptFileUri parameter. Use the MediaFileUri parameter to see which audio file you transcribed with this job. You can use the Settings object to see the optional features you've enabled in the transcription job.

aws transcribe get-transcription-job \
   --transcription-job-name your-transcription-job

Output:

{
   "TranscriptionJob": {
      "TranscriptionJobName": "your-transcription-job",
      ...
"TranscriptionJobStatus": "COMPLETED",
"LanguageCode": "language-code",
"MediaSampleRateHertz": 48000,
"MediaFormat": "mp4",
"Media": {
          "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
        },
"Transcript": {
          "TranscriptFileUri": "https://Amazon-S3-file-location-of-transcription-output"
        },
"StartTime": "2020-09-18T22:27:23.970000+00:00",
"CreationTime": "2020-09-18T22:27:23.948000+00:00",
"CompletionTime": "2020-09-18T22:28:21.197000+00:00",
"Settings": {
          "ChannelIdentification": false,
          "ShowAlternatives": false
        },
"IdentifyLanguage": true,
"IdentifiedLanguageScore": 0.8672199249267578
}
}

For more information, see Getting Started (AWS Command Line Interface) in the Amazon Transcribe Developer Guide.

- For API details, see GetTranscriptionJob in AWS CLI Command Reference.

get-vocabulary-filter

The following code example shows how to use get-vocabulary-filter.

AWS CLI

To get information about a vocabulary filter

The following get-vocabulary-filter example gets information about a vocabulary filter. You can use the DownloadUri parameter to get the list of words you used to create the vocabulary filter.

```
aws transcribe get-vocabulary-filter \
  --vocabulary-filter-name testFilter
```
Output:

```json
{
    "VocabularyFilterName": "testFilter",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00",
    "DownloadUri": "https://Amazon-S3-location-to-download-your-vocabulary-filter"
}
```

For more information, see Filter Unwanted Words in the Amazon Transcribe Developer Guide.

- For API details, see GetVocabularyFilter in AWS CLI Command Reference.

**get-vocabulary**

The following code example shows how to use get-vocabulary.

**AWS CLI**

**To get information about a custom vocabulary**

The following get-vocabulary example gets information on a previously created custom vocabulary.

```bash
aws transcribe get-vocabulary \
    --vocabulary-name cli-vocab-1
```

Output:

```json
{
    "VocabularyName": "cli-vocab-1",
    "LanguageCode": "language-code",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:22:32.836000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-custom-vocabulary"
}
```

For more information, see Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see GetVocabulary in AWS CLI Command Reference.
list-language-models

The following code example shows how to use `list-language-models`.

**AWS CLI**

To list your custom language models

The following list-language-models example lists the custom language models associated with your AWS account and Region. You can use the S3Uri and TuningDataS3Uri parameters to find the Amazon S3 prefixes you've used as your training data, or your tuning data. The BaseModelName tells you whether you've used a NarrowBand, or WideBand model to create a custom language model. You can transcribe audio with a sample rate of less than 16 kHz with a custom language model using a NarrowBand base model. You can transcribe audio 16 kHz or greater with a custom language model using a WideBand base model. The ModelStatus parameter shows whether you can use the custom language model in a transcription job. If the value is COMPLETED, you can use it in a transcription job.

```
aws transcribe list-language-models
```

Output:

```
{
   "Models": [
       {
           "ModelName": "cli-clm-2",
           "CreateTime": "2020-09-25T17:57:38.504000+00:00",
           "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
           "LanguageCode": "language-code",
           "BaseModelName": "WideBand",
           "ModelStatus": "IN_PROGRESS",
           "UpgradeAvailability": false,
           "InputDataConfig": {
               "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
               "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-tuning-data/",
               "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-used-to-create-the-custom-language-model"
           }
       },
       {
           "ModelName": "cli-clm-1",
           "CreateTime": "2020-09-25T17:16:01.835000+00:00",
           "LastModifie
```
For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [ListLanguageModels](#) in *AWS CLI Command Reference*.

**list-medical-transcription-jobs**

The following code example shows how to use `list-medical-transcription-jobs`.

**AWS CLI**

To list your medical transcription jobs

The following `list-medical-transcription-jobs` example lists the medical transcription jobs associated with your AWS account and Region. To get more information about a particular
transcription job, copy the value of a MedicalTranscriptionJobName parameter in the transcription output, and specify that value for the MedicalTranscriptionJobName option of the get-medical-transcription-job command. To see more of your transcription jobs, copy the value of the NextToken parameter, run the list-medical-transcription-jobs command again, and specify that value in the --next-token option.

```
aws transcribe list-medical-transcription-jobs
```

Output:

```
{
   "NextToken": "3/PlblzkiGhzjER3KHuQt2fmbPLF7cDYafjFMeoGn440N/

  "OutputLocationType": "CUSTOMER_BUCKET",
  "Specialty": "PRIMARYCARE",
  "Type": "CONVERSATION"
For more information, see https://docs.aws.amazon.com/transcribe/latest/dg/batch-med-transcription.html in the Amazon Transcribe Developer Guide.

- For API details, see ListMedicalTranscriptionJobs in AWS CLI Command Reference.

list-medical-vocabularies

The following code example shows how to use list-medical-vocabularies.

AWS CLI

To list your medical custom vocabularies

The following list-medical-vocabularies example lists the medical custom vocabularies associated with your AWS account and Region. To get more information about a particular transcription job, copy the value of a MedicalTranscriptionJobName parameter in the transcription output, and specify that value for the MedicalTranscriptionJobName option of the get-medical-transcription-job command. To see more of your transcription jobs, copy the value of the NextToken parameter, run the list-medical-transcription-jobs command again, and specify that value in the --next-token option.

aws transcribe list-medical-vocabularies

Output:

```json
{
"Vocabularies": [
{
    "VocabularyName": "cli-medical-vocab-2",
    "LanguageCode": "en-US",
    "LastModifiedTime": "2020-09-21T21:44:59.521000+00:00",
    "VocabularyState": "READY"
},
{
    "VocabularyName": "cli-medical-vocab-1",
```
For more information, see Medical Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see ListMedicalVocabularies in AWS CLI Command Reference.

list-transcription-jobs

The following code example shows how to use list-transcription-jobs.

AWS CLI

To list your transcription jobs

The following list-transcription-jobs example lists the transcription jobs associated with your AWS account and Region.

```
aws transcribe list-transcription-jobs
```

Output:

```
{
   "NextToken": "NextToken",
   "TranscriptionJobSummaries": [
      {
         "TranscriptionJobName": "speak-id-job-1",
         "CreationTime": "2020-08-17T21:06:15.391000+00:00",
         "StartTime": "2020-08-17T21:06:15.416000+00:00",
         "CompletionTime": "2020-08-17T21:07:05.098000+00:00",
         "LanguageCode": "language-code",
         "TranscriptionJobStatus": "COMPLETED",
         "OutputLocationType": "SERVICE_BUCKET"
      },
      {
         "TranscriptionJobName": "job-1",
         "CreationTime": "2020-08-17T20:50:24.207000+00:00",
         "StartTime": "2020-08-17T20:50:24.230000+00:00",
```
For more information, see Getting Started (AWS Command Line Interface) in the Amazon Transcribe Developer Guide.

- For API details, see ListTranscriptionJobs in AWS CLI Command Reference.

list-vocabularies

The following code example shows how to use list-vocabularies.
AWS CLI

To list your custom vocabularies

The following `list-vocabularies` example lists the custom vocabularies associated with your AWS account and Region.

```
aws transcribe list-vocabularies
```

Output:

```json
{
"NextToken": "NextToken",
"Vocabularies": [

{
"VocabularyName": "ards-test-1",
"LanguageCode": "language-code",
"LastModifiedTime": "2020-04-27T22:00:27.330000+00:00",
"VocabularyState": "READY"
},

{
"VocabularyName": "sample-test",
"LanguageCode": "language-code",
"LastModifiedTime": "2020-04-24T23:04:11.044000+00:00",
"VocabularyState": "READY"
},

{
"VocabularyName": "CRLF-to-LF-test-3-1",
"LanguageCode": "language-code",
"LastModifiedTime": "2020-04-24T22:12:22.277000+00:00",
"VocabularyState": "READY"
},

{
"VocabularyName": "CRLF-to-LF-test-2",
"LanguageCode": "language-code",
"LastModifiedTime": "2020-04-24T21:53:50.455000+00:00",
"VocabularyState": "READY"
},

{
"VocabularyName": "CRLF-to-LF-1-1",
"LanguageCode": "language-code",
"LastModifiedTime": "2020-04-24T21:39:33.356000+00:00",
"VocabularyState": "READY"
}
}
```
For more information, see Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see ListVocabularies in AWS CLI Command Reference.

list-vocabulary-filters

The following code example shows how to use list-vocabulary-filters.

AWS CLI

To list your vocabulary filters

The following list-vocabulary-filters example lists the vocabulary filters associated with your AWS account and Region.

```bash
aws transcribe list-vocabulary-filters
```

Output:

```json
{
   "NextToken": "NextToken": [
      {
         "VocabularyFilterName": "testFilter",
         "LanguageCode": "language-code",
         "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00"
      },
      {
         "VocabularyFilterName": "testFilter2",
         "LanguageCode": "language-code",
         "LastModifiedTime": "2020-05-21T23:29:35.174000+00:00"
      },
      {
         "VocabularyFilterName": "filter2",
         "LanguageCode": "language-code",
         "LastModifiedTime": "2020-05-08T20:18:26.426000+00:00"
      },
      {
         "VocabularyFilterName": "filter-review",
```
For more information, see Filtering Unwanted Words in the Amazon Transcribe Developer Guide.

- For API details, see ListVocabularyFilters in AWS CLI Command Reference.

### start-medical-transcription-job

The following code example shows how to use start-medical-transcription-job.

**AWS CLI**

**Example 1: To transcribe a medical dictation stored as an audio file**

The following start-medical-transcription-job example transcribes an audio file. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```json
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName": "DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    }
}
```
For more information, see Batch Transcription Overview in the Amazon Transcribe Developer Guide.

**Example 2: To transcribe a clinician-patient dialogue stored as an audio file**

The following start-medical-transcription-job example transcribes an audio file containing a clinician-patient dialogue. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysecondfile.json
```

**Contents of mysecondfile.json:**

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
        "LanguageCode": "language-code",
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION",
        "OutputBucketName": "DOC-EXAMPLE-BUCKET",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        }
    }
}
```
Output:

```json
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-conversation-medical-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:19:49.965000+00:00",
        "CreationTime": "2020-09-20T23:19:49.941000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see [Batch Transcription Overview](https://docs.aws.amazon.com/AmazonTranscribe/latest/developerguide/BatchTranscriptionOverview.html) in the [Amazon Transcribe Developer Guide](https://docs.aws.amazon.com/AmazonTranscribe/latest/developerguide/).

**Example 3: To transcribe a multichannel audio file of a clinician-patient dialogue**

The following `start-medical-transcription-job` example transcribes the audio from each channel in the audio file and merges the separate transcriptions from each channel into a single transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```bash
aws transcribe start-medical-transcription-job \
   --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```json
{
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName": "DOC-EXAMPLE-BUCKET",
    "Media": {
```
"MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
},
"Settings":{
  "ChannelIdentification": true
}
}

Output:

{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-20T23:46:44.081000+00:00",
    "CreationTime": "2020-09-20T23:46:44.053000+00:00",
    "Settings": {
      "ChannelIdentification": true
    },
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION"
  }
}

For more information, see Channel Identification in the Amazon Transcribe Developer Guide.

Example 4: To transcribe an audio file of a clinician-patient dialogue and identify the speakers in the transcription output

The following start-medical-transcription-job example transcribes an audio file and labels the speech of each speaker in the transcription output. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://myfourthfile.json
```

Contents of myfourthfile.json:
For more information, see **Identifying Speakers** in the *Amazon Transcribe Developer Guide*.

**Example 5: To transcribe a medical conversation stored as an audio file with up to two transcription alternatives**
The following `start-medical-transcription-job` example creates up to two alternative transcriptions from a single audio file. Every transcriptions has a level of confidence associated with it. By default, Amazon Transcribe returns the transcription with the highest confidence level. You can specify that Amazon Transcribe return additional transcriptions with lower confidence levels. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
   --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
   "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-job",
   "LanguageCode": "language-code",
   "Specialty": "PRIMARYCARE",
   "Type": "CONVERSATION",
   "OutputBucketName": "DOC-EXAMPLE-BUCKET",
   "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
   },
   "Settings":{
      "ShowAlternatives": true,
      "MaxAlternatives": 2
   }
}
```

Output:

```
{
   "MedicalTranscriptionJob": {
      "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-job",
      "TranscriptionJobStatus": "IN_PROGRESS",
      "LanguageCode": "language-code",
      "Media": {
         "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
      },
      "StartTime": "2020-09-21T19:09:18.199000+00:00",
      "CreationTime": "2020-09-21T19:09:18.171000+00:00"
   }
}
```
Example 6: To transcribe an audio file of a medical dictation with up to two alternative transcriptions

The following `start-medical-transcription-job` example transcribes an audio file and uses a vocabulary filter to mask any unwanted words. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
  "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "DICTATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  },
  "Settings":{
    "ShowAlternatives": true,
    "MaxAlternatives": 2
  }
}
```

Output:

```
{
```
For more information, see Alternative Transcriptions in the Amazon Transcribe Developer Guide.

Example 7: To transcribe an audio file of a medical dictation with increased accuracy by using a custom vocabulary

The following start-medical-transcription-job example transcribes an audio file and uses a medical custom vocabulary you've previously created to increase the transcription accuracy. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-transcription-job \\
   --cli-input-json file://myseventhfile.json
```

Contents of mysixthfile.json:

```
{
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName": "DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    }
}
```
Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "Settings": {
            "VocabularyName": "cli-medical-vocab-1"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see [Medical Custom Vocabularies](https://docs.aws.amazon.com/AmazonTranscribe/latest/developerguide/MedicalCustomVocabularies.html) in the *Amazon Transcribe Developer Guide*.

- For API details, see [StartMedicalTranscriptionJob](https://docs.aws.amazon.com/cli/latest/reference/transcribe/start-medical-transcription-job.html) in *AWS CLI Command Reference*.

**start-transcription-job**

The following code example shows how to use `start-transcription-job`.

**AWS CLI**

**Example 1: To transcribe an audio file**

The following `start-transcription-job` example transcribes your audio file.

```
aws transcribe start-transcription-job \
```
Contents of myfile.json:

```json
{
    "TranscriptionJobName": "cli-simple-transcription-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
    }
}
```

For more information, see Getting Started (AWS Command Line Interface) in the Amazon Transcribe Developer Guide.

Example 2: To transcribe a multi-channel audio file

The following start-transcription-job example transcribes your multi-channel audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of mysecondfile.json:

```json
{
    "TranscriptionJobName": "cli-channelid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
    },
    "Settings":{
        "ChannelIdentification":true
    }
}
```

Output:

```
{
```
"TranscriptionJob": {
  "TranscriptionJobName": "cli-channelid-job",
  "TranscriptionJobStatus": "IN_PROGRESS",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
  },
  "StartTime": "2020-09-17T16:07:56.817000+00:00",
  "CreationTime": "2020-09-17T16:07:56.784000+00:00",
  "Settings": {
    "ChannelIdentification": true
  }
}

For more information, see Transcribing Multi-Channel Audio in the Amazon Transcribe Developer Guide.

Example 3: To transcribe an audio file and identify the different speakers

The following start-transcription-job example transcribes your audio file and identifies the speakers in the transcription output.

aws transcribe start-transcription-job \
  --cli-input-json file://mythirdfile.json

Contents of mythirdfile.json:

{
  "TranscriptionJobName": "cli-speakerid-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
  },
  "Settings": {
    "ShowSpeakerLabels": true,
    "MaxSpeakerLabels": 2
  }
}
Output:

```
{
   "TranscriptionJob": {
      "TranscriptionJobName": "cli-speakerid-job",
      "TranscriptionJobStatus": "IN_PROGRESS",
      "LanguageCode": "the-language-of-your-transcription-job",
      "Media": {
         "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
      },
      "StartTime": "2020-09-17T16:22:59.696000+00:00",
      "CreationTime": "2020-09-17T16:22:59.676000+00:00",
      "Settings": {
         "ShowSpeakerLabels": true,
         "MaxSpeakerLabels": 2
      }
   }
}
```

For more information, see [Identifying Speakers](#) in the *Amazon Transcribe Developer Guide*.

**Example 4: To transcribe an audio file and mask any unwanted words in the transcription output**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
   --cli-input-json file://myfourthfile.json
```

**Contents of myfourthfile.json:**

```
{
   "TranscriptionJobName": "cli-filter-mask-job",
   "LanguageCode": "the-language-of-your-transcription-job",
   "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
   },
   "Settings": {
```
Output:

```json
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-mask-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "mask"
        }
    }
}
```

For more information, see [Filtering Transcriptions](https://docs.aws.amazon.com/AmazonTranscribe/latest/DeveloperGuide/filtering.html) in the *Amazon Transcribe Developer Guide*.

**Example 5: To transcribe an audio file and remove any unwanted words in the transcription output**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
  --cli-input-json file://myfifthfile.json
```

**Contents of myfifthfile.json:**

```json
{
    "TranscriptionJobName": "cli-filter-remove-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
```
Example 6: To transcribe an audio file with increased accuracy using a custom vocabulary

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
   --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
   "TranscriptionJob": {
      "TranscriptionJobName": "cli-filter-remove-job",
      "TranscriptionJobStatus": "IN_PROGRESS",
      "LanguageCode": "the-language-of-your-transcription-job",
      "Media": {
         "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
      },
      "StartTime": "2020-09-18T16:36:18.568000+00:00",
      "CreationTime": "2020-09-18T16:36:18.547000+00:00",
      "Settings": {
         "VocabularyFilterName": "your-vocabulary-filter",
         "VocabularyFilterMethod": "remove"
      }
   }
}
```

For more information, see Filtering Transcriptions in the Amazon Transcribe Developer Guide.
"TranscriptionJobName": "cli-vocab-job",
"LanguageCode": "the-language-of-your-transcription-job",
"Media": {
  "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
},
"Settings":{
  "VocabularyName": "your-vocabulary"
}
}

Output:

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-vocab-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-name.file-extension"
    },
    "StartTime": "2020-09-18T16:36:18.568000+00:00",
    "CreationTime": "2020-09-18T16:36:18.547000+00:00",
    "Settings": {
      "VocabularyName": "your-vocabulary"
    }
  }
}

For more information, see Filter Transcriptions in the Amazon Transcribe Developer Guide.

Example 7: To identify the language of an audio file and transcribe it

The following start-transcription-job example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
  --cli-input-json file://myseventhfile.json
```

Contents of myseventhfile.json:
For more information, see [Identifying the Language](#) in the *Amazon Transcribe Developer Guide*.

**Example 8: To transcribe an audio file with personally identifiable information redacted**

The following `start-transcription-job` example transcribes your audio file and redacts any personally identifiable information in the transcription output.

```
aws transcribe start-transcription-job \\
    --cli-input-json file://myeighthfile.json
```

**Contents of myeighthfile.json:**

```json
{
    "TranscriptionJobName": "cli-redaction-job",
    "LanguageCode": "language-code",
    "Media": {
```

Actions and scenarios
"MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
},
"ContentRedaction": {
  "RedactionOutput":"redacted",
  "RedactionType":"PII"
}

Output:

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-redaction-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "StartTime": "2020-09-25T23:49:13.195000+00:00",
    "CreationTime": "2020-09-25T23:49:13.176000+00:00",
    "ContentRedaction": {
      "RedactionType": "PII",
      "RedactionOutput": "redacted"
    }
  }
}

For more information, see Automatic Content Redaction in the Amazon Transcribe Developer Guide.

Example 9: To generate a transcript with personally identifiable information (PII) redacted and an unredacted transcript

The following start-transcription-job example generates two transcriptions of your audio file, one with the personally identifiable information redacted, and the other without any redactions.

```bash
aws transcribe start-transcription-job \
  --cli-input-json file://myninthfile.json
```

Contents of myninthfile.json:
Output:

```json
{
   "TranscriptionJob": {
       "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
       "TranscriptionJobStatus": "IN_PROGRESS",
       "LanguageCode": "language-code",
       "Media": {
           "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
       },
       "StartTime": "2020-09-25T23:59:47.677000+00:00",
       "CreationTime": "2020-09-25T23:59:47.653000+00:00",
       "ContentRedaction": {
           "RedactionType": "PII",
           "RedactionOutput": "redacted_and_unredacted"
       }
   }
}
```

For more information, see [Automatic Content Redaction](https://docs.aws.amazon.com/AmazonTranscribe/latest/developerguide/automatic-content-redaction-overview.html) in the *Amazon Transcribe Developer Guide*.

**Example 10: To use a custom language model you've previously created to transcribe an audio file.**

The following `start-transcription-job` example transcribes your audio file with a custom language model you've previously created.

```bash
aws transcribe start-transcription-job \
```
--cli-input-json file://mytenthfile.json

Contents of mytenthfile.json:

```json
{
    "TranscriptionJobName": "cli-clm-2-job-1",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
    },
    "ModelSettings": {
        "LanguageModelName": "cli-clm-2"
    }
}
```

Output:

```json
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-clm-2-job-1",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
        },
        "StartTime": "2020-09-28T17:56:01.835000+00:00",
        "CreationTime": "2020-09-28T17:56:01.801000+00:00",
        "ModelSettings": {
            "LanguageModelName": "cli-clm-2"
        }
    }
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](https://aws.amazon.com/about-aws/whats-new) in the [Amazon Transcribe Developer Guide](https://aws.amazon.com/about-aws/whats-new).

**update-medical-vocabulary**

The following code example shows how to use `update-medical-vocabulary`. 
AWS CLI

To update a medical custom vocabulary with new terms.

The following update-medical-vocabulary example replaces the terms used in a medical custom vocabulary with the new ones. Prerequisite: to replace the terms in a medical custom vocabulary, you need a file with new terms.

```
aws transcribe update-medical-vocabulary \
  --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/medical-custom-vocabulary.txt \
  --vocabulary-name medical-custom-vocabulary \
  --language-code language
```

Output:

```
{
    "VocabularyName": "medical-custom-vocabulary",
    "LanguageCode": "en-US",
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see UpdateMedicalVocabulary in AWS CLI Command Reference.

update-vocabulary-filter

The following code example shows how to use update-vocabulary-filter.

AWS CLI

To replace the words in a vocabulary filter

The following update-vocabulary-filter example replaces the words in a vocabulary filter with new ones. Prerequisite: To update a vocabulary filter with the new words, you must have those words saved as a text file.

```
aws transcribe update-vocabulary-filter \
```
--vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/your-text-file-to-update-your-vocabulary-filter.txt \
--vocabulary-filter-name vocabulary-filter-name

Output:

```
{
   "VocabularyFilterName": "vocabulary-filter-name",
   "LanguageCode": "language-code",
   "LastModifiedTime": "2020-09-23T18:40:35.139000+00:00"
}
```

For more information, see Filtering Unwanted Words in the Amazon Transcribe Developer Guide.

- For API details, see UpdateVocabularyFilter in AWS CLI Command Reference.

**update-vocabulary**

The following code example shows how to use `update-vocabulary`.

**AWS CLI**

**To update a custom vocabulary with new terms.**

The following `update-vocabulary` example overwrites the terms used to create a custom vocabulary with the new ones that you provide. Prerequisite: to replace the terms in a custom vocabulary, you need a file with new terms.

```
aws transcribe update-vocabulary \
   --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/custom-vocabulary.txt \
   --vocabulary-name custom-vocabulary \
   --language-code language-code
```

Output:

```
{
   "VocabularyName": "custom-vocabulary",
   "LanguageCode": "language",
   "VocabularyState": "PENDING"
}
```
For more information, see Custom Vocabularies in the Amazon Transcribe Developer Guide.

- For API details, see UpdateVocabulary in AWS CLI Command Reference.

Amazon Translate examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Translate.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

import-terminology

The following code example shows how to use import-terminology.

AWS CLI

To import a custom terminology from a file

The following import-terminology example creates a terminology called MyTestTerminology from the test-terminology.csv file:

```bash
aws translate import-terminology \
  --name MyTestTerminology \
```
Contents of test-terminology.csv:

en,fr,es,zh Hello world!,Bonjour tout le monde!,Hola Mundo!,????
Amazon,Amazon,Amazon,Amazon,Amazon

Output:

```json
{
    "TerminologyProperties": {
        "SourceLanguageCode": "en",
        "Name": "MyTestTerminology",
        "TargetLanguageCodes": [
            "fr",
            "es",
            "zh"
        ],
        "SizeBytes": 97,
        "LastUpdatedAt": 1571089500.851,
        "CreatedAt": 1571089500.851,
        "TermCount": 6,
        "Description": "Creating a test terminology in AWS Translate"
    }
}
```

- For API details, see [importTerminology](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/translate/import-terminology.html) in *AWS CLI Command Reference*.

**Trusted Advisor examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Trusted Advisor.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

get-organization-recommendation

The following code example shows how to use get-organization-recommendation.

AWS CLI

To get an organization recommendation

The following get-organization-recommendation example gets an organization recommendation by its identifier.

```
aws trustedadvisor get-organization-recommendation \
```

Output:

```
{
    "organizationRecommendation": {
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "name": "Lambda Runtime Deprecation Warning",
        "description": "One or more lambdas are using a deprecated runtime",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved"
    }
}
```
The following code example shows how to use `get-recommendation`.

**AWS CLI**

To get a recommendation

The following `get-recommendation` example gets a recommendation by its identifier.

```bash
aws trustedadvisor get-recommendation \
--recommendation-identifier
arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-bbb7-491a-833b-5773e9589578
```

Output:

```json
{
    "recommendation": {
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "description": "Enable multi-factor authentication",
    }
}
```
For more information, see [Get started with the Trusted Advisor API](https://docs.aws.amazon.com/trustedadvisor/latest/APIReference/GettingStarted.html) in the *AWS Trusted Advisor User Guide*.

- For API details, see [GetRecommendation](https://docs.aws.amazon.com/cli/latest/reference/trustedadvisor/get-recommendation.html) in *AWS CLI Command Reference*.

### list-checks

The following code example shows how to use `list-checks`.

#### AWS CLI

**To list Trusted Advisor checks**

The following `list-checks` example lists all Trusted Advisor checks.

```
aws trustedadvisor list-checks
```
Output:

```json
{
    "checkSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::check/1iG5NDGVre",
            "awsServices": ["EC2"],
            "description": "Checks security groups for rules that allow unrestricted access to a resource. Unrestricted access increases opportunities for malicious activity (hacking, denial-of-service attacks, loss of data)",
            "id": "1iG5NDGVre",
            "metadata": {
                "0": "Region",
                "1": "Security Group Name",
                "2": "Security Group ID",
                "3": "Protocol",
                "4": "Port",
                "5": "Status",
                "6": "IP Range"
            },
            "name": "Security Groups - Unrestricted Access",

For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

- For API details, see ListChecks in AWS CLI Command Reference.

list-organization-recommendation-accounts

The following code example shows how to use list-organization-recommendation-accounts.

AWS CLI

To list organization recommendation accounts

The following list-organization-recommendation-accounts example lists all account recommendation summaries for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-accounts \
   --organization-recommendation-identifier arn:aws:trustedadvisor::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5
```

Output:
For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

- For API details, see ListOrganizationRecommendationAccounts in AWS CLI Command Reference.

`list-organization-recommendation-resources`

The following code example shows how to use `list-organization-recommendation-resources`.

**AWS CLI**

**To list organization recommendation resources**

The following `list-organization-recommendation-resources` example lists all resources for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-resources \
   --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/5a694939-2e54-45a2-ae72-730598fa89d0
```

Output:

```
{
   "organizationRecommendationResourceSummaries": [
   
   ],
   "nextToken": "REDACTED"
}
```
"arn": "arn:aws:trustedadvisor::000000000000:recommendation-resource/5a694939-2e54-45a2-ae72-730598fa89d0/bb38affc0ce0681d9a6cd13f30238ba03a8f63dfe7a379dc403c619119d86af",

For more information, see [Get started with the Trusted Advisor API](https://docs.aws.amazon.com/trustedadvisor/latest/userguide/get-started-with-trusted-advisor-api.html) in the *AWS Trusted Advisor User Guide*.

- For API details, see [ListOrganizationRecommendationResources](https://docs.aws.amazon.com/cli/latest/reference/trustedadvisor/list-organization-recommendations.html) in *AWS CLI Command Reference*.

**list-organization-recommendations**

The following code example shows how to use `list-organization-recommendations`.

**AWS CLI**

**Example 1: To list organization recommendations**
The following `list-organization-recommendations` example lists all organization recommendations and does not include a filter.

```
aws trustedadvisor list-organization-recommendations
```

Output:

```json
{
  "organizationRecommendationSummaries": [
    {
      "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": [
        "lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
      "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
      "lifecycleStage": "resolved",
      "pillars": [
        "security"
      ],
      "resourcesAggregates": {
        "errorCount": 0,
        "okCount": 0,
        "warningCount": 0
      },
      "source": "ta_check",
      "status": "warning",
      "type": "priority"
    },
    {
      "arn": "arn:aws:trustedadvisor:::organization-recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": [
        "lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
      "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "lifecycleStage": "resolved",
      "pillars": [
        "security"
      ]
    }
  ]
}
```
For more information, see [Get started with the Trusted Advisor API](https://docs.aws.amazon.com/trustedadvisor/latest/APIReference/index.html) in the *AWS Trusted Advisor User Guide*.

**Example 2: To list organization recommendations with a filter**

The following `list-organization-recommendations` example filters and returns a max of one organization recommendation that is a part of the "security" pillar.

```
aws trustedadvisor list-organization-recommendations \
   --pillar security \
   --max-items 100
```

**Output:**

```json
{
   "organizationRecommendationSummaries": [{
      "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": ["lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
      "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
      "lifecycleStage": "resolved",
      "pillars": ["security"
      ],
      "resourcesAggregates": {
```
For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

Example 3: To list organization recommendations with a pagination token

The following list-organization-recommendations example uses the "nextToken" returned from a previous request to fetch the next page of organization recommendations.

```
aws trustedadvisor list-organization-recommendations \
   --pillar security \
   --max-items 100 \
   --starting-token <next-token>
```

Output:

```
{
   "organizationRecommendationSummaries": [{
      "arn": "arn:aws:trustedadvisor:::organization-recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": [ 
         "lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
      "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "lifecycleStage": "resolved",
      "pillars": [ 
         "security"
      ],
      "resourcesAggregates": { 
         "errorCount": 0,
         "okCount": 0,
         "warningCount": 0
      },
      "source": "ta_check",
      "status": "warning",
      "type": "priority"
   }],
   "nextToken": "REDACTED"
}
```
For more information, see [Get started with the Trusted Advisor API](https://docs.aws.amazon.com/trustedadvisor/latest/userguide/get-started-with-trusted-advisor-api.html) in the **AWS Trusted Advisor User Guide**.

- For API details, see [ListOrganizationRecommendations](https://docs.aws.amazon.com/cli/latest/reference/trustedadvisor/list-organization-recommendations.html) in **AWS CLI Command Reference**.

### list-recommendation-resources

The following code example shows how to use `list-recommendation-resources`.

**AWS CLI**

**To list recommendation resources**

The following `list-recommendation-resources` example lists all resources for a recommendation by its identifier.

```bash
aws trustedadvisor list-recommendation-resources \      
   --recommendation-identifier       
   arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-bbb7-491a-833b-5773e9589578
```

**Output:**

```json
{
   "recommendationResourceSummaries": [
      {
          "arn": "arn:aws:trustedadvisor::000000000000:recommendation-resource/55fa4d2e-bbb7-491a-833b-5773e9589578/18959a1f9173cffe8e706e9d9bde28bba36cd602a6b2cb86c8b61252835236010",

          "metadata": {
              "0": "14",
```
Actions and scenarios
For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

- For API details, see ListRecommendationResources in AWS CLI Command Reference.

**list-recommendations**

The following code example shows how to use list-recommendations.

**AWS CLI**

**Example 1: To list recommendations**

The following list-recommendations example lists all recommendations and does not include a filter.

```
aws trustedadvisor list-recommendations
```
Output:

```json
{
   "recommendationSummaries": [
      {
         "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-bbb7-491a-833b-5773e9589578",
         "name": "MFA Recommendation",
         "awsServices": ["iam"],
         "checkArn": "arn:aws:trustedadvisor::check/7DAFEmoDos",
         "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
         "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
         "pillarSpecificAggregates": {
            "costOptimizing": {
               "estimatedMonthlySavings": 0.0,
               "estimatedPercentMonthlySavings": 0.0
            }
         },
         "pillars": ["security"],
         "resourcesAggregates": {
            "errorCount": 1,
            "okCount": 0,
            "warningCount": 0
         },
         "source": "ta_check",
         "status": "error",
         "type": "standard"
      },
      {
         "arn": "arn:aws:trustedadvisor::000000000000:recommendation/8b602b6f-452d-4cb2-8a9e-c7650955d9cd",
         "name": "RDS clusters quota warning",
         "awsServices": ["rds"],
         "checkArn": "arn:aws:trustedadvisor::check/gjqMBn6pjz",
         "id": "8b602b6f-452d-4cb2-8a9e-c7650955d9cd",
         "lastUpdatedAt": "2023-11-01T15:58:17.397Z",
         "pillarSpecificAggregates": {
```
For more information, see [Get started with the Trusted Advisor API](https://docs.aws.amazon.com/trusted-advisor/latest/userguide/get-started-trusted-advisor-api.html) in the *AWS Trusted Advisor User Guide*.

**Example 2: To list recommendations with a filter**

The following `list-recommendations` example lists recommendations and includes a filter.

```
aws trustedadvisor list-recommendations \
    --aws-service iam \
    --max-items 100
```

**Output:**

```json
{
    "recommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "awsServices": ["iam"],
        "checkArn": "arn:aws:trustedadvisor::check/7DAFEmoDos",
```
For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

Example 3: To list recommendations with a pagination token

The following list-recommendations example uses the "nextToken" returned from a previous request to fetch the next page of filtered Recommendations.

```
aws trustedadvisor list-recommendations \
  --aws-service rds \
  --max-items 100 \
  --starting-token <next-token>
```

Output:

```
{
  "recommendationSummaries": [
    "arn": "arn:aws:trustedadvisor::0000000000:recommendation/8b602b6f-452d-4cb2-8a9e-c/7650955d9cd",
```
For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

- For API details, see ListRecommendations in AWS CLI Command Reference.

update-organization-recommendation-lifecycle

The following code example shows how to use update-organization-recommendation-lifecycle.

AWS CLI

To update an organization recommendation lifecycle

The following update-organization-recommendation-lifecycle example updates the lifecycle of an organization recommendation by its identifier.
aws trustedadvisor update-organization-recommendation-lifecycle \
  --organization-recommendation-identifier arn:aws:trustedadvisor::organization-recommendation/96b5e5ca-7930-444c-90c6-06d386128100 \
  --lifecycle-stage dismissed \
  --update-reason-code not_applicable

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

• For API details, see UpdateOrganizationRecommendationLifecycle in AWS CLI Command Reference.

update-recommendation-lifecycle

The following code example shows how to use update-recommendation-lifecycle.

AWS CLI

To update a recommendation lifecycle

The following update-recommendation-lifecycle example updates the lifecycle of a recommendation by its identifier.

aws trustedadvisor update-recommendation-lifecycle \
  --recommendation-identifier \
  arn:aws:trustedadvisor::000000000000:recommendation/861c9c6e-f169-405a-8b59-537a8caccd7a \
  --lifecycle-stage resolved \
  --update-reason-code valid_business_case

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the AWS Trusted Advisor User Guide.

• For API details, see UpdateRecommendationLifecycle in AWS CLI Command Reference.
Verified Permissions examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Verified Permissions.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- *Actions*

Actions

create-identity-source

The following code example shows how to use `create-identity-source`.

**AWS CLI**

To create an identity source

The following `create-identity-source` example creates an identity source that lets you reference identities stored in the specified Amazon Cognito user pool. Those identities are available in Verified Permissions as entities of type `User`.

```bash
aws verifiedpermissions create-identity-source \
   --configuration file://config.txt \
   --principal-entity-type "User" \
   --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```json
{
```
"cognitoUserPoolConfiguration": {
  "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_1a2b3c4d5",
  "clientIds": ["a1b2c3d4e5f6g7h8i9j0kalbmc"]
}
}

Output:

{"createdDate": "2023-05-19T20:30:28.214829+00:00",
 "identitySourceId": "ISEXAMPLEabcdefg111111",
 "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
 "policyStoreId": "PSEXAMPLEabcdefg111111"
}

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the Amazon Verified Permissions User Guide.

- For API details, see CreateIdentitySource in AWS CLI Command Reference.

create-policy-store

The following code example shows how to use create-policy-store.

AWS CLI

To create a policy store

The following create-policy-store example creates a policy store in the current AWS Region.

```
aws verifiedpermissions create-policy-store \
  --validation-settings "mode=STRICT"
```

Output:

```
{"arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg111111",
 "createdDate": "2023-05-16T17:41:29.103459+00:00",
}
For more information about policy stores, see Amazon Verified Permissions policy stores in the Amazon Verified Permissions User Guide.

- For API details, see CreatePolicyStore in AWS CLI Command Reference.

create-policy-template

The following code example shows how to use create-policy-template.

AWS CLI

Example 1: To create a policy template

The following create-policy-template example creates a policy template with a statement that contains a placeholder for the principal.

```
aws verifiedpermissions create-policy-template \
  --definition file://template1.txt \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file template1.txt:

```java
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```json
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```
For more information about policy templates, see Amazon Verified Permissions policy templates in the Amazon Verified Permissions User Guide.

- For API details, see CreatePolicyTemplate in AWS CLI Command Reference.

create-policy

The following code example shows how to use create-policy.

AWS CLI

**Example 1: To create a static policy**

The following create-policy example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \
   --definition file://definition1.txt \
   --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file definition1.txt:

```
{
   "static": {
      "description": "Grant everyone of janeFriends UserGroup access to the vacationFolder Album",
      "statement": "permit(principal in UserGroup::"janeFriends";, action, resource in Album::"vacationFolder") ;"
   }
}
```

Output:

```
{
   "createdDate": "2023-06-12T20:33:37.382907+00:00",
   "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
   "policyId": "SPEXAMPLEabcdefg111111",
   "policyStoreId": "PSEXAMPLEabcdefg111111",
   "policyType": "STATIC",
   "principal": {
      "entityId": "janeFriends",
      "entityType": "UserGroup"
   }
}
```
Example 2: To create a static policy that grants access to a resource to everyone

The following create-policy example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
  --definition file://definition2.txt \ 
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file definition2.txt:

```
{
  "static": {
    "description": "Grant everyone access to the publicFolder Album",
    "statement": "permit(principal, action, resource in Album::"publicFolder")"
  }
}
```

Output:

```
{
  "createdDate": "2023-06-12T20:39:44.975897+00:00",
  "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
  "policyId": "PbfR73F8oh5MMfr9uRtFDB",
  "policyStoreId": "PSEXAMPLEabcdefg222222",
  "policyType": "STATIC",
  "resource": {
    "entityId": "publicFolder",
    "entityType": "Album"
  }
}
```

Example 3: To create a template-linked policy that is associated with the specified template
The following create-policy example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \\
    --definition file://definition.txt \\
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of definition.txt:

```
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    },
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the Amazon Verified Permissions User Guide.

- For API details, see CreatePolicy in AWS CLI Command Reference.
**delete-identity-source**

The following code example shows how to use `delete-identity-source`.

**AWS CLI**

**To delete an identity source**

The following `delete-identity-source` example deletes the identity source that has the specified Id.

```
aws verifiedpermissions delete-identity-source \
  --identity-source-id ISEXAMPLEabcdefg111111 \
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](https://docs.aws.amazon.com/verifiedpermissions/latest/userguide/using-identity-providers.html) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeleteIdentitySource](https://docs.aws.amazon.com/cli/latest/reference/verifiedpermissions/delete-identity-source.html) in *AWS CLI Command Reference*.

**delete-policy-store**

The following code example shows how to use `delete-policy-store`.

**AWS CLI**

**To delete a policy store**

The following `delete-policy-store` example deletes the policy store that has the specified Id.

```
aws verifiedpermissions delete-policy-store \
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy stores, see [Amazon Verified Permissions policy stores](https://docs.aws.amazon.com/verifiedpermissions/latest/userguide/amazon-verified-permissions-policy-stores.html) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicyStore](https://docs.aws.amazon.com/cli/latest/reference/verifiedpermissions/delete-policy-store.html) in *AWS CLI Command Reference*. 
delete-policy-template

The following code example shows how to use delete-policy-template.

AWS CLI

To delete a policy template

The following delete-policy-template example deletes the policy template that has the specified Id.

```
aws verifiedpermissions delete-policy \
  --policy-template-id PTEXAMPLEabcdefg111111 \
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy templates, see [Amazon Verified Permissions policy templates](https://docs.aws.amazon.com/verified-permissions/latest/userguide/amazon-verified-permissions-policy-templates.html) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicyTemplate](https://docs.aws.amazon.com/cli/latest/reference/verifiedpermissions/delete-policy-template.html) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a static or template-linked policy

The following delete-policy example deletes the policy that has the specified Id.

```
aws verifiedpermissions delete-policy \
  --policy-id SPEXAMPLEabcdefg111111 \
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policies, see [Amazon Verified Permissions policies](https://docs.aws.amazon.com/verified-permissions/latest/userguide/amazon-verified-permissions-policies.html) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicy](https://docs.aws.amazon.com/cli/latest/reference/verifiedpermissions/delete-policy.html) in *AWS CLI Command Reference*.
get-identity-source

The following code example shows how to use get-identity-source.

AWS CLI

To retrieve details about an identity source

The following get-identity-source example displays the details for the identity source with the specified Id.

```
aws verifiedpermissions get-identity-source \
    --identity-source ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T22:27:49.150035+00:00",
    "details": {
        "clientIds": ["a1b2c3d4e5f6g7h8i9j0kalbmc"],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_1a2b3c4d5"
    },
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "principalEntityType": "User"
}
```

get-policy-store

The following code example shows how to use get-policy-store.
AWS Command Line Interface

**AWS CLI**

**To retrieve details about a policy store**

The following `get-policy-store` example displays the details for the policy store with the specified Id.

```
aws verifiedpermissions get-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg111111",
    "createdAt": "2023-06-05T20:16:46.225598+00:00",
    "lastUpdatedDate": "2023-06-08T20:40:23.173691+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "validationSettings": { "mode": "OFF" }
}
```

For more information about policy stores, see [Amazon Verified Permissions policy stores](https://docs.aws.amazon.com/verifiedpermissions/latest/userguide/policy-stores.html) in the *Amazon Verified Permissions User Guide*.

**get-policy-template**

The following code example shows how to use `get-policy-template`.

**AWS CLI**

**To retrieve details about a policy template**

The following `get-policy-template` example displays the details for the policy template with the specified ID.

```
aws verifiedpermissions get-policy-template \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```
For more information about policy templates, see Amazon Verified Permissions policy templates in the Amazon Verified Permissions User Guide.

- For API details, see GetPolicyTemplate in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve details about a policy

The following get-policy example displays the details for the policy with the specified ID.

```
aws verifiedpermissions get-policy \
   --policy-id PSEXAMPLEabcdefg111111 \
   --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
   "createdDate": "2023-06-12T20:33:37.382907+00:00",
   "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
   "policyStoreId": "PSEXAMPLEabcdefg111111",
   "policyTemplateId": "PTEXAMPLEabcdefg111111",
   "statement": "permit(\n   principal in ?principal,\n   action == Action::"view",\n   resource == Photo::"VacationPhoto94.jpg"\n   )"
}
```
get-schema

The following code example shows how to use get-schema.

AWS CLI

To retrieve the schema in a policy store

The following get-schema example displays the details of the schema in the specified policy store.

```bash
aws verifiedpermissions get-schema \
--policy-store-id PSEXAMPLEabcdefg11111
```

Output:

```json
{
    "policyStoreId": "PSEXAMPLEabcdefg11111",
    "schema": "{"MySampleNamespace":{"entityTypes":{"Employee":{"shape ":{"attributes":{"jobLevel":{"type":"Long"},"name":{"type":"String "}},"type":"Record"}},"actions":{"remoteAccess":{"appliesTo":
    {"principalTypes":[]}}}}}},{"actions":{"remoteAccess":{"appliesTo":
    {"principalTypes":[]}}}}",
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
}
```
For more information about schema, see Policy store schema in the Amazon Verified Permissions User Guide.

- For API details, see GetSchema in AWS CLI Command Reference.

is-authorized-with-token

The following code example shows how to use is-authorized-with-token.

AWS CLI

Example 1: To request an authorization decision for a user request (allow)

The following is-authorized-with-token example requests an authorization decision for a user who was authenticated by Amazon Cognito. The request uses the identity token provided by Cognito rather than the access token. In this example, the specified information store is configured to return principals as entities of type CognitoUser.

```
aws verifiedpermissions is-authorized-with-token \
   --action actionId="View",actionType="Action" \
   --resource entityId="vacationPhoto94.jpg",entityType="Photo" \
   --policy-store-id PSEXAMPLEabcdefg11111111 \n   --identity-token "AbCdE12345...long.string...54321EdCbA"
```

The policy store contains a policy with the following statement that accepts identities from the specified Cognito user pool and application Id.

```
permit(
    principal == CognitoUser:"us-east-1_1a2b3c4d5|a1b2c3d4e5f6g7h8i9j0kalbmc",
    action,
    resource == Photo:"VacationPhoto94.jpg"
);
```

Output:

```
{
   "decision":"Allow",
```
For more information about using identities from a Cognito user pool, see Using Amazon Verified Permissions with identity providers in the Amazon Verified Permissions User Guide.

• For API details, see isAuthorizedWithToken in AWS CLI Command Reference.

**is-authorized**

The following code example shows how to use `is-authorized`.

**AWS CLI**

**Example 1: To request an authorization decision for a user request (allow)**

The following `is-authorized` example requests an authorization decision for a principal of type User named Alice, who wants to perform the updatePhoto operation, on a resource of type Photo named VacationPhoto94.jpg.

The response shows that the request is allowed by one policy.

```
aws verifiedpermissions is-authorized \
   --principal entityType=User,entityId=alice \
   --action actionType=Action,actionId=view \
   --resource entityType=Photo,entityId=VacationPhoto94.jpg \
   --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
   "decision": "ALLOW",
   "determiningPolicies": [
   {
      "policyId": "SPEXAMPLEabcdefg111111"
   }
   ],
   "errors": []
}
```
Example 2: To request an authorization decision for a user request (deny)

The following example is the same as the previous example, except that the principal is User::"Bob". The policy store doesn't contain any policy that allows that user access to Album::"alice_folder".

The output indicates that the Deny was implicit because the list of DeterminingPolicies is empty.

```
aws verifiedpermissions create-policy \
   --definition file://definition2.txt \
   --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
   "decision": "DENY",
   "determiningPolicies": [],
   "errors": []
}
```

For more information, see the Amazon Verified Permissions User Guide.

- For API details, see IsAuthorized in AWS CLI Command Reference.

list-identity-sources

The following code example shows how to use list-identity-sources.

AWS CLI

To list the available identity sources

The following list-identity-sources example lists all identity sources in the specified policy store.

```
aws verifiedpermissions list-identity-sources \
```
Output:

```
{
  "identitySources": [
    {
      "createdDate": "2023-06-12T22:27:49.150035+00:00",
      "details": {
        "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_1a2b3c4d5"
      },
      "identitySourceId": "ISEXAMPLEabcdefg111111",
      "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
      "policyStoreId": "PSEXAMPLEabcdefg111111",
      "principalEntityType": "User"
    }
  ]
}
```

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](https://docs.aws.amazon.com/verifiedpermissions/latest/userguide/using-identity-provider.html) in the *Amazon Verified Permissions User Guide*.

- For API details, see [ListIdentitySources](https://docs.aws.amazon.com/cli/latest/reference/verifiedpermissions/list-identity-sources.html) in *AWS CLI Command Reference*.

### list-policies

The following code example shows how to use `list-policies`.

**AWS CLI**

```
aws verifiedpermissions list-policies \
  --policy-store-id PSEXAMPLEabcdefg111111
```

**To list the available policies**

The following `list-policies` example lists all policies in the specified policy store.
Output:

```json
{
    "policies": [
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone of janeFriends UserGroup access to the vacationFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
            "policyId": "SPEXAMPLEabcdefg111111",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "principal": {
                "entityId": "janeFriends",
                "entityType": "UserGroup"
            },
            "resource": {
                "entityId": "vacationFolder",
                "entityType": "Album"
            }
        },
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone access to the publicFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
            "policyId": "SPEXAMPLEabcdefg222222",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "resource": {
                "entityId": "publicFolder",
                "entityType": "Album"
            }
        },
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone access to the publicFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
            "policyId": "SPEXAMPLEabcdefg333333",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "resource": {
                "entityId": "publicFolder",
                "entityType": "Album"
            }
        }
    ]
}
```
For more information about policies, see Amazon Verified Permissions policies in the Amazon Verified Permissions User Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

list-policy-stores

The following code example shows how to use list-policy-stores.

AWS CLI

To list the available policy stores

The following list-policy-stores example lists all policy stores in the AWS Region. All commands for Verified Permissions except create-policy-store and list-policy-stores require that you specify the Id of the policy store you want to work with.

aws verifiedpermissions list-policy-stores

Output:

```
"policyStores": [
    {
        "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg111111",
        "createdDate": "2023-06-05T20:16:46.225598+00:00",
        "policyStoreId": "PSEXAMPLEabcdefg111111"
    },
    {
        "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg222222",
        "createdDate": "2023-06-08T18:09:37.364356+00:00",
        "policyStoreId": "PSEXAMPLEabcdefg222222"
    },
    {
        "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg333333",
        "createdDate": "2023-06-08T18:09:46.920600+00:00",
        "policyStoreId": "PSEXAMPLEabcdefg333333"
    }
]}

For more information about policy stores, see Amazon Verified Permissions policy stores in the Amazon Verified Permissions User Guide.

- For API details, see ListPolicyStores in AWS CLI Command Reference.

list-policy-templates

The following code example shows how to use list-policy-templates.

AWS CLI

To list the available policy templates

The following list-policy-templates example lists all policy templates in the specified policy store.

```bash
aws verifiedpermissions list-policy-templates \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:
The following code example shows how to use `put-schema`.

**AWS CLI**

**To save a schema to a policy store**

The following `put-schema` example creates or replaces the schema in the specified policy store.

The `cedarJson` parameter in the input file takes a string representation of a JSON object. It contains embedded quotation marks (" ) within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character ( \ ) and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

```bash
call verifiespermissions put-schema --definition file://schema.txt --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `schema.txt`:

```json
{
    "cedarJson": "\"MySampleNamespace\": {\"actions\": {\"remoteAccess\": {```
"appliesTo": {"principalTypes": ["Employee"]}, "entityTypes": {
  "Employee": {"shape": {"attributes": {"jobLevel": {"type": "Long"}, "name": {"type": "String"}}, "type": "Record"}}}
}

Output:

```json
{
  "policyStoreId": "PSEXAMPLEabcdefg111111",
  "namespaces": ["MySampleNamespace"],
  "createdDate": "2023-06-14T17:47:13.999885+00:00",
  "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see [Policy store schema](https://aws.amazon.com/documentation/service-documentation) in the *Amazon Verified Permissions User Guide*.

- For API details, see [PutSchema](https://aws.amazon.com/documentation/service-documentation) in *AWS CLI Command Reference*.

**update-identity-source**

The following code example shows how to use `update-identity-source`.

**AWS CLI**

**To update an identity source**

The following `update-identity-source` example modifies the specified identity source by providing a new Cognito user pool configuration and changing the entity type returned by the identity source.

```bash
aws verifiedpermissions update-identity-source
  --identity-source-id ISEXAMPLEabcdefg111111 \
  --update-configuration file://config.txt \
  --principal-entity-type "Employee" \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```json
{
```
"cognitoUserPoolConfiguration": {
    "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_1a2b3c4d5",
    "clientIds": ["a1b2c3d4e5f6g7h8i9j0kalbmc"]
  }
}

Output:

{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
  }

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the Amazon Verified Permissions User Guide.

• For API details, see UpdateIdentitySource in AWS CLI Command Reference.

update-policy-store

The following code example shows how to use update-policy-store.

AWS CLI

To update a policy store

The following update-policy-store example modifies a policy store by changing its validation setting.

aws verifiedpermissions update-policy-store \
  --validation-settings "mode=STRICT" \
  --policy-store-id PSEXAMPLEabcdefg111111

Output:

{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
For more information about policy stores, see Amazon Verified Permissions policy stores in the Amazon Verified Permissions User Guide.

- For API details, see UpdatePolicyStore in AWS CLI Command Reference.

**update-policy-template**

The following code example shows how to use update-policy-template.

**AWS CLI**

**Example 1: To update a policy template**

The following update-policy-template example modifies the specified template-linked policy to replace its policy statement.

```bash
aws verifiedpermissions update-policy-template \
   --policy-template-id PTEXAMPLEabcdefg111111 \ 
   --statement file://template1.txt \ 
   --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `template1.txt`:

```plaintext
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```json
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```
For more information about policy templates, see Amazon Verified Permissions policy templates in the Amazon Verified Permissions User Guide.

- For API details, see UpdatePolicyTemplate in AWS CLI Command Reference.

**update-policy**

The following code example shows how to use update-policy.

**AWS CLI**

**Example 1: To create a static policy**

The following create-policy example creates a static policy with a policy scope that specifies both a principal and a resource.

```bash
aws verifiedpermissions create-policy \
--definition file://definition.txt \
--policy-store-id PSEXAMPLEabcdefg111111
```

The statement parameter takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\") and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

Contents of file definition.txt:

```json
{
    "static": {
        "description": "Grant everyone of janeFriends UserGroup access to the vacationFolder Album",
        "statement": "permit(principal in UserGroup:":"janeFriends", action, resource in Album:":"vacationFolder") ;"
    }
}
```

Output:
Example 2: To create a static policy that grants access to a resource to everyone

The following create-policy example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
   --definition file://definition2.txt \n   --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition2.txt`:

```json
{
   "static": {
      "description": "Grant everyone access to the publicFolder Album",
      "statement": "permit(principal, action, resource in Album::"publicFolder")";
   }
}
```

Output:

```json
{
   "createdDate": "2023-06-12T20:39:44.975897+00:00",
   "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
   "policyId": "PbfR73F8oh5MMfr9uRtFDB",
}
```
Example 3: To create a template-linked policy that is associated with the specified template

The following create-policy example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \
  --definition file://definition2.txt \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of definition3.txt:

```json
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
}
```

Output:

```json
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    }
}
```
For more information about policies, see Amazon Verified Permissions policies in the Amazon Verified Permissions User Guide.

- For API details, see UpdatePolicy in AWS CLI Command Reference.

VPC Lattice examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with VPC Lattice.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**create-listener**

The following code example shows how to use `create-listener`.

**AWS CLI**

To create a listener

The following `create-listener` example creates an HTTPS listener with a default rule that forwards traffic to the specified VPC Lattice target group.
aws vpc-lattice create-listener \
   --name my-service-listener \
   --protocol HTTPS \
   --port 443 \
   --service-identifier svc-0285b53b2eEXAMPLE \
   --default-action file:///listener-config.json

Contents of listener-config.json:

```
{
   "forward": {
      "targetGroups": [
         {
            "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE"
         }
      ]
   }
}
```

Output:

```
{
   "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE/listener/listener-07cc7fb0abEXAMPLE",
   "defaultAction": {
      "forward": {
         "targetGroups": [
            {
               "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE",
               "weight": 100
            }
         ]
      }
   },
   "id": "listener-07cc7fb0abEXAMPLE",
   "name": "my-service-listener",
   "port": 443,
   "protocol": "HTTPS",
   "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE",
   "serviceId": "svc-0285b53b2eEXAMPLE"
}
```
create-service-network-service-association

The following code example shows how to use create-service-network-service-association.

AWS CLI

To create a service association

The following create-service-network-service-association example associates the specified service with the specified service network.

```sh
aws vpc-lattice create-service-network-service-association
   --service-identifier svc-0285b53b2eEXAMPLE
   --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```json
{
   "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkserviceassociation/snsa-0e16955a8cEXAMPLE",
   "createdBy": "123456789012",
   "dnsEntry": {
      "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-svcs.us-east-2.on.aws",
      "hostedZoneId": "Z09127221KTH2CEXAMPLE"
   },
   "id": "snsa-0e16955a8cEXAMPLE",
   "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the Amazon VPC Lattice User Guide.

- For API details, see CreateServiceNetworkServiceAssociation in AWS CLI Command Reference.

create-service-network-vpc-association

The following code example shows how to use create-service-network-vpc-association.
**AWS CLI**

**To create a VPC association**

The following `create-service-network-vpc-association` example associates the specified VPC with the specified service network. The specified security group controls which resources in the VPC can access the service network and its services.

```
aws vpc-lattice create-service-network-vpc-association \
  --vpc-identifier vpc-0a1b2c3d4eEXAMPLE \
  --service-network-identifier sn-080ec7dc93EXAMPLE \
  --security-group-ids sg-0aee16bc6cEXAMPLE
```

Output:

```
{
  "createdBy": "123456789012",
  "id": "snva-0821fc8631EXAMPLE",
  "securityGroupIds": [
    "sg-0aee16bc6cEXAMPLE"
  ],
  "status": "CREATE_IN_PROGRESS"
}
```

For more information, see [Manage VPC associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateServiceNetworkVpcAssociation](#) in *AWS CLI Command Reference*.

**create-service-network**

The following code example shows how to use `create-service-network`.

**AWS CLI**

**To create a service network**

The following `create-service-network` example creates a service network with the specified name.

```
aws vpc-lattice create-service-network \
```

--name my-service-network

Output:

```
{
    sn-080ec7dc93EXAMPLE",
    "authType": "NONE",
    "id": "sn-080ec7dc93EXAMPLE",
    "name": "my-service-network"
}
```

For more information, see Service networks in the Amazon VPC Lattice User Guide.

- For API details, see CreateServiceNetwork in AWS CLI Command Reference.

create-service

The following code example shows how to use create-service.

AWS CLI

To create a service

The following create-service example creates a service with the specified name.

```
aws vpc-lattice create-service \
    --name my-lattice-service
```

Output:

```
{
    svc-0285b53b2eEXAMPLE",
    "authType": "NONE",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.1a2b3c4.vpc-lattice-
        svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "CREATE_IN_PROGRESS"
}
```
For more information, see Services in VPC Lattice in the Amazon VPC Lattice User Guide.

- For API details, see CreateService in AWS CLI Command Reference.

create-target-group

The following code example shows how to use create-target-group.

AWS CLI

Example 1: To create a target group of type INSTANCE

The following create-target-group example creates a target group with the specified name, type, and configuration.

```bash
aws vpc-lattice create-target-group "--name my-lattice-target-group-instance" "--type INSTANCE" "--config file://tg-config.json"
```

Contents of tg-config.json:

```json
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```json
{
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "unhealthyThresholdCount": 3
        }
    }
}
```
Example 2: To create a target group of type IP

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```bash
aws vpc-lattice create-target-group \
  --name my-lattice-target-group-ip \
  --type IP \
  --config file://tg-config.json
```

Contents of `tg-config.json`:

```json
{
  "ipAddressType": "IPV4",
  "port": 443,
  "protocol": "HTTPS",
  "protocolVersion": "HTTP1",
  "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```json
{
}
```
Example 3: To create a target group of type LAMBDA

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```bash
aws vpc-lattice create-target-group \   --name my-lattice-target-group-lambda \   --type LAMBDA
```

Output:

```json
{
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "ipAddressType": "IPV4",
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-ip",
    "status": "CREATE_IN_PROGRESS",
    "type": "IP"
}
```
Example 4: To create a target group of type ALB

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```bash
aws vpc-lattice create-target-group \
  --name my-lattice-target-group-alb \
  --type ALB \
  --config file://tg-config.json
```

Contents of `tg-config.json`:

```json
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```json
{
    "config": {
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-alb",
    "status": "CREATE_IN_PROGRESS",
    "type": "ALB"
}
```
For more information, see Target groups in the Amazon VPC Lattice User Guide.

- For API details, see CreateTargetGroup in AWS CLI Command Reference.

**delete-auth-policy**

The following code example shows how to use delete-auth-policy.

**AWS CLI**

**To delete an auth policy**

The following delete-auth-policy example deletes the auth policy for the specified service.

```
aws vpc-lattice delete-auth-policy \
   --resource-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Auth policies in the Amazon VPC Lattice User Guide.

- For API details, see DeleteAuthPolicy in AWS CLI Command Reference.

**delete-listener**

The following code example shows how to use delete-listener.

**AWS CLI**

**To delete a listener**

The following delete-listener example deletes the specified listener.

```
aws vpc-lattice delete-listener \ 
   --listener-identifier listener-07cc7fb0abEXAMPLE \ 
   --service-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Listeners in the Amazon VPC Lattice User Guide.

- For API details, see DeleteListener in AWS CLI Command Reference.
**delete-service-network-service-association**

The following code example shows how to use `delete-service-network-service-association`.

**AWS CLI**

**To delete a service association**

The following `delete-service-network-service-association` example disassociates the specified service association.

```bash
aws vpc-lattice delete-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

**Output:**

```json
{
    "id": "snsa-031fabb4d8EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see [Manage service associations](https://docs.aws.amazon.com/vpc-lattice/latest/userguide/service-network-management.html) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteServiceNetworkServiceAssociation](https://docs.aws.amazon.com/cli/latest/reference/vpc-lattice/delete-service-network-service-association.html) in *AWS CLI Command Reference*.

**delete-service-network-vpc-association**

The following code example shows how to use `delete-service-network-vpc-association`.

**AWS CLI**

**To delete a VPC association**

The following `delete-service-network-vpc-association` example disassociates the specified VPC association.

```bash
aws vpc-lattice delete-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```
Output:

```
{
  "id": "snva-0821fc8631EXAMPLE",
  "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the Amazon VPC Lattice User Guide.

- For API details, see DeleteServiceNetworkVpcAssociation in AWS CLI Command Reference.

**delete-service-network**

The following code example shows how to use delete-service-network.

**AWS CLI**

**To delete a service network**

The following delete-service-network example deletes the specified service network.

```
aws vpc-lattice delete-service-network \
  --service-network-identifier sn-080ec7dc93EXAMPLE
```

This command produces no output.

For more information, see Service networks in the Amazon VPC Lattice User Guide.

- For API details, see DeleteServiceNetwork in AWS CLI Command Reference.

**delete-service**

The following code example shows how to use delete-service.

**AWS CLI**

**To delete a service**

The following delete-service example deletes the specified service.
The following code example shows how to use `delete-service`.

```bash
aws vpc-lattice delete-service
   --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```json
{
   "id": "svc-0285b53b2eEXAMPLE",
   "name": "my-lattice-service",
   "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the Amazon VPC Lattice User Guide.

- For API details, see DeleteService in AWS CLI Command Reference.

---

**delete-target-group**

The following code example shows how to use `delete-target-group`.

AWS CLI

To delete a target group

The following delete-target-group example deletes the specified target group.

```bash
aws vpc-lattice delete-target-group
   --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```json
{
   "id": "tg-0eaa4b9ab4EXAMPLE",
   "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Target groups in the Amazon VPC Lattice User Guide.

- For API details, see DeleteTargetGroup in AWS CLI Command Reference.
### deregister-targets

The following code example shows how to use deregister-targets.

**AWS CLI**

**To deregister a target**

The following `deregister-targets` example deregisters the specified target from the specified target group.

```bash
aws vpc-lattice deregister-targets \
  --targets i-07dd579bc5EXAMPLE \
  --target-group-identifier tg-0ea4b9ab4EXAMPLE
```

**Output:**

```json
{
  "successful": [
    {
      "id": "i-07dd579bc5EXAMPLE",
      "port": 443
    }
  ],
  "unsuccessful": []
}
```

For more information, see [Register targets](https://aws.amazon.com/documentation/vpc-lattice/example/) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeregisterTargets](https://aws.amazon.com/documentation/vpc-lattice/api-reference/) in *AWS CLI Command Reference*.

### get-auth-policy

The following code example shows how to use get-auth-policy.

**AWS CLI**

**To get information about an auth policy**

The following `get-auth-policy` example gets information about the auth policy for the specified service.
aws vpc-lattice get-auth-policy
   --resource-identifier svc-0285b53b2eEXAMPLE

Output:

```json
{
   "createdAt": "2023-06-07T03:51:20.266Z",
   "lastUpdatedAt": "2023-06-07T04:39:27.082Z",
   "policy": "{"Version":"2012-10-17","Statement":[{"Effect":"Allow",
   "Principal":{"AWS":"arn:aws:iam::123456789012:role/my-clients"},
   }",
   "state": "Active"
}
```

For more information, see Auth policies in the Amazon VPC Lattice User Guide.

- For API details, see GetAuthPolicy in AWS CLI Command Reference.

**get-listener**

The following code example shows how to use get-listener.

**AWS CLI**

**To get information about a service listener**

The following get-listener example gets information about the specified listener for the specified service.

```bash
aws vpc-lattice get-listener
   --listener-identifier listener-0ccf55918cEXAMPLE
   --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```json
{
   "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
   "createdAt": "2023-05-07T05:08:45.192Z",
   "defaultAction": {
```
"forward": {
  "targetGroups": [
    {
      "targetGroupIdentifier": "tg-0ff213abb6EXAMPLE",
      "weight": 1
    }
  ]
},
"id": "listener-0ccf55918cEXAMPLE",
"lastUpdatedAt": "2023-05-07T05:08:45.192Z",
"name": "http-80",
"port": 80,
"protocol": "HTTP",
"serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE",
"serviceId": "svc-0285b53b2eEXAMPLE"
}

For more information, see Define routing in the Amazon VPC Lattice User Guide.

- For API details, see GetListener in AWS CLI Command Reference.

get-service-network-service-association

The following code example shows how to use get-service-network-service-association.

AWS CLI

To get information about a service association

The following get-service-network-service-association example gets information about the specified service association.

```
aws vpc-lattice get-service-network-service-association \
    --service-network-service-association-identifier sns-031fabb4d8EXAMPLE
```

Output:

```
{
}
For more information, see Manage service associations in the Amazon VPC Lattice User Guide.

For API details, see GetServiceNetworkServiceAssociation in AWS CLI Command Reference.

get-service-network-vpc-association

The following code example shows how to use get-service-network-vpc-association.

AWS CLI

To get information about a VPC association

The following get-service-network-vpc-association example gets information about the specified VPC association.

```
aws vpc-lattice get-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
}
```
For more information, see Manage VPC associations in the Amazon VPC Lattice User Guide.

- For API details, see GetServiceNetworkVpcAssociation in AWS CLI Command Reference.

get-service-network

The following code example shows how to use get-service-network.

**AWS CLI**

To get information about a service network

The following get-service-network example gets information about the specified service network.

```bash
aws vpc-lattice get-service-network \
  --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```json
{
  "authType": "AWS_IAM",
  "createdAt": "2023-05-05T15:26:08.417Z",
  "id": "sn-080ec7dc93EXAMPLE",
  "lastUpdatedAt": "2023-05-05T15:26:08.417Z",
  "securityGroupIds": []
}
```
For more information, see Service networks in the Amazon VPC Lattice User Guide.

- For API details, see GetServiceNetwork in AWS CLI Command Reference.

get-service

The following code example shows how to use get-service.

AWS CLI

To get information about a service

The following get-service example gets information about the specified service.

```
aws vpc-lattice get-service \
   --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
        svc-0285b53b2eEXAMPLE",
   "authType": "AWS_IAM",
   "createdAt": "2023-05-05T21:35:29.339Z",
   "dnsEntry": {
      "domainName": "my-lattice-service-0285b53b2eEXAMPLE.
        7d67968.vpc-lattice-svcs.us-east-2.on.aws",
      "hostedZoneId": "Z09127221KTH2CFUOHIZH"
   },
   "id": "svc-0285b53b2eEXAMPLE",
   "lastUpdatedAt": "2023-05-05T21:35:29.339Z",
   "name": "my-lattice-service",
   "status": "ACTIVE"
}
```

For more information, see Services in the Amazon VPC Lattice User Guide.

- For API details, see GetService in AWS CLI Command Reference.
get-target-group

The following code example shows how to use get-target-group.

AWS CLI

To get information about a target group

The following get-target-group example gets information about the specified target group, which has a target type of INSTANCE.

```bash
aws vpc-lattice get-target-group \
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
  "config": {
    "healthCheck": {
      "enabled": true,
      "healthCheckIntervalSeconds": 30,
      "healthCheckTimeoutSeconds": 5,
      "healthyThresholdCount": 5,
      "matcher": {
        "httpCode": "200"
      },
      "path": "/",
      "protocol": "HTTPS",
      "protocolVersion": "HTTP1",
      "unhealthyThresholdCount": 2
    },
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
  },
  "createdAt": "2023-05-06T04:41:04.122Z",
  "id": "tg-0eaa4b9ab4EXAMPLE",
  "lastUpdatedAt": "2023-05-06T04:41:04.122Z",
  "name": "my-target-group",
  "serviceArns": [
```
For more information, see Target groups in the Amazon VPC Lattice User Guide.

- For API details, see GetTargetGroup in AWS CLI Command Reference.

**list-listeners**

The following code example shows how to use list-listeners.

**AWS CLI**

**To list service listeners**

The following list-listeners example lists the listeners for the specified service.

```bash
aws vpc-lattice list-listeners \     
   --service-identifier svc-0285b53b2eEXAMPLE
```

**Output:**

```json
{
   "items": [
      {
         "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
         "createdAt": "2023-05-07T05:08:45.192Z",
         "id": "listener-0ccf55918cEXAMPLE",
         "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
         "name": "http-80",
         "port": 80,
         "protocol": "HTTP"
      }
   ]
}
```

For more information, see Define routing in the Amazon VPC Lattice User Guide.
• For API details, see ListListeners in AWS CLI Command Reference.

list-service-network-service-associations

The following code example shows how to use list-service-network-service-associations.

AWS CLI

To list service associations

The following list-service-network-service-associations example lists the service associations for the specified service network. The --query option scopes the output to the IDs of the service associations.

```
aws vpc-lattice list-service-network-service-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snsa-031fabb4d8EXAMPLE",
    "snsa-0e16955a8cEXAMPLE"
]
```

For more information, see Manage service associations in the Amazon VPC Lattice User Guide.

• For API details, see ListServiceNetworkServiceAssociations in AWS CLI Command Reference.

list-service-network-vpc-associations

The following code example shows how to use list-service-network-vpc-associations.

AWS CLI

To list VPC associations

The following list-service-network-vpc-associations example lists the VPC associations for the specified service network. The --query option scopes the output to the IDs of the VPC associations.
aws vpc-lattice list-service-network-vpc-associations \
   --service-network-identifier sn-080ec7dc93EXAMPLE \
   --query items[*].id

Output:

[ "snva-0821fc8631EXAMPLE", "snva-0c5dcb60d6EXAMPLE"
]

For more information, see Manage VPC associations in the Amazon VPC Lattice User Guide.

- For API details, see ListServiceNetworkVpcAssociations in AWS CLI Command Reference.

list-service-networks

The following code example shows how to use list-service-networks.

AWS CLI

To list your service networks

The following list-service-networks example lists the service networks owned or shared with the calling account. The --query option scopes the results to the Amazon Resource Names (ARN) of the service networks.

aws vpc-lattice list-service-networks \
   --query items[*].arn

Output:

]

For more information, see Service networks in the Amazon VPC Lattice User Guide.

- For API details, see ListServiceNetworks in AWS CLI Command Reference.
**list-services**

The following code example shows how to use `list-services`.

**AWS CLI**

**To list your services**

The following `list-services` example lists the services owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the services.

```
aws vpc-lattice list-services \
  --query items[*].arn
```

Output:

```
[                                      
  "arn:aws:vpc-lattice:us-east-2:111122223333:service/svc-0b8ac96550EXAMPLE"
]
```

For more information, see [Services](#) in the *Amazon VPC Lattice User Guide*.
- For API details, see [ListServices](#) in *AWS CLI Command Reference*.

**list-target-groups**

The following code example shows how to use `list-target-groups`.

**AWS CLI**

**To list your target groups**

The following `list-target-groups` example lists the target groups with a target type of LAMBDA.

```
aws vpc-lattice list-target-groups \
  --target-group-type LAMBDA
```

Output:
For more information, see Target groups in the Amazon VPC Lattice User Guide.

- For API details, see ListTargetGroups in AWS CLI Command Reference.

list-targets

The following code example shows how to use list-targets.

AWS CLI

To list the targets for a target group

The following list-targets example lists the targets for the specified target group.

```
aws vpc-lattice list-targets \
   --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```json
{
   "items": [
      {
         "id": "i-07dd579bc5EXAMPLE",
      }
   ]
}
```
The following code example shows how to use `put-auth-policy`.

**AWS CLI**

To create an auth policy for a service

The following `put-auth-policy` example grants access to requests from any authenticated principal that uses the specified IAM role. The resource is the ARN of the service to which the policy is attached.

```
aws vpc-lattice put-auth-policy \
   --resource-identifier svc-0285b53b2eEXAMPLE \
   --policy file://auth-policy.json
```

Contents of `auth-policy.json`:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "AWS": "arn:aws:iam::123456789012:role/my-clients"
         }
      }
   ]
}
```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListTargets](#) in *AWS CLI Command Reference*.

**put-auth-policy**
"Action": "vpc-lattice-svcs:Invoke",
}
]
}

Output:

{
}

For more information, see Auth policies in the Amazon VPC Lattice User Guide.

- For API details, see PutAuthPolicy in AWS CLI Command Reference.

**register-targets**

The following code example shows how to use register-targets.

**AWS CLI**

**To register a target**

The following register-targets example registers the specified targets with the specified target group.

```
aws vpc-lattice register-targets \
  --targets id=i-047b3c9078EXAMPLE id=i-07dd579bc5EXAMPLE \
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
  "successful": [
    {
      "id": "i-07dd579bc5EXAMPLE",
```
AWS WAF Classic examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**put-logging-configuration**

The following code example shows how to use put-logging-configuration.

```json
{
    "port": 443,
}
"
"

"unsuccessful": [
    {
        "failureCode": "UnsupportedTarget",
        "failureMessage": "Instance targets must be in the same VPC as their target group",
        "id": "i-047b3c9078EXAMPLE",
        "port": 443
    }
]
```

For more information, see [Register targets](#) in the Amazon VPC Lattice User Guide.

- For API details, see [RegisterTargets](#) in AWS CLI Command Reference.
To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with CloudFront.

```bash
aws waf put-logging-configuration
```

Output:

```json
{
   "LoggingConfiguration": {
      "LogDestinationConfigs": [
      ]
   }
}
```

- For API details, see `PutLoggingConfiguration` in `AWS CLI Command Reference`.

**update-byte-match-set**

The following code example shows how to use `update-byte-match-set`.

**AWS CLI**

**To update a byte match set**

The following `update-byte-match-set` command deletes a ByteMatchTuple object (filter) in a ByteMatchSet:

```bash
aws waf update-byte-match-set --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```
For more information, see Working with String Match Conditions in the AWS WAF developer guide.

- For API details, see UpdateByteMatchSet in AWS CLI Command Reference.

**update-ip-set**

The following code example shows how to use update-ip-set.

**AWS CLI**

To update an IP set

The following update-ip-set command updates an IPSet with an IPv4 address and deletes an IPv6 address:

```bash
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
   --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1
   --updates
   Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSetDescriptor={Type="IPV6",Value="1111:0000:0000:0000:0000:0000:0000:0111/128"}
```

Alternatively you can use a JSON file to specify the input. For example:

```bash
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
   --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1
   --updates file://change.json
```

Where content of the JSON file is:

```json
[
   {
      "Action": "INSERT",
      "IPSetDescriptor":
      {
         "Type": "IPV4",
         "Value": "12.34.56.78/16"
      }
   },
   {
      "Action": "DELETE",
      "IPSetDescriptor":
   }
]
```
For more information, see Working with IP Match Conditions in the AWS WAF developer guide.

- For API details, see `UpdateIpSet` in AWS CLI Command Reference.

**update-rule**

The following code example shows how to use `update-rule`.

**AWS CLI**

**To update a rule**

The following `update-rule` command deletes a Predicate object in a rule:

```bash
aws waf update-rule --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}
```

For more information, see Working with Rules in the AWS WAF developer guide.

- For API details, see `UpdateRule` in AWS CLI Command Reference.

**update-size-constraint-set**

The following code example shows how to use `update-size-constraint-set`.

**AWS CLI**

**To update a size constraint set**

The following `update-size-constraint-set` command deletes a SizeConstraint object (filters) in a size constraint set:

```bash
aws waf update-size-constraint-set --size-constraint-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```
update-sql-injection-match-set

The following code example shows how to use `update-sql-injection-match-set`.

**AWS CLI**

**To update a SQL Injection Match Set**

The following `update-sql-injection-match-set` command deletes a SqlInjectionMatchTuple object (filters) in a SQL injection match set:

```
aws waf update-sql-injection-match-set --sql-injection-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_DECODE"}
```

For more information, see Working with SQL Injection Match Conditions in the *AWS WAF* developer guide.

- For API details, see [UpdateSqlInjectionMatchSet](#) in *AWS CLI Command Reference*.

update-web-acl

The following code example shows how to use `update-web-acl`.

**AWS CLI**

**To update a web ACL**

The following `update-web-acl` command deletes an ActivatedRule object in a WebACL.

```
aws waf update-web-acl --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
```
Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-Example",Action={Type="ALLOW"},Type="REGULAR"}'

Output:

```
{
  "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see [Working with Web ACLs](https://docs.aws.amazon.com/waf/latest/developerguide/working-with-web-acls.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateWebAcl](https://docs.aws.amazon.com/cli/latest/reference/waf/update-web-acl.html) in *AWS CLI Command Reference*.

### update-xss-match-set

The following code example shows how to use `update-xss-match-set`.

**AWS CLI**

**To update an XSSMatchSet**

The following `update-xss-match-set` command deletes an XssMatchTuple object (filters) in an XssMatchSet:

```
aws waf update-xss-match-set --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_DECODE"}
```

For more information, see Working with Cross-site Scripting Match Conditions in the *AWS WAF* developer guide.

- For API details, see [UpdateXssMatchSet](https://docs.aws.amazon.com/cli/latest/reference/waf/update-xss-match-set.html) in *AWS CLI Command Reference*.

### AWS WAF Classic Regional examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic Regional.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- **Actions**

Actions

**associate-web-acl**

The following code example shows how to use `associate-web-acl`.

**AWS CLI**

To associate a web ACL with a resource

The following `associate-web-acl` command associates a web ACL, specified by the web-acl-id, with a resource, specified by the resource-arn. The resource ARN can refer to either an application load balancer or an API Gateway:

```bash
aws waf-regional associate-web-acl \
  --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
  --resource-arn 12cs345-67cd-890b-1cd2-c3a4567d89f1
```

For more information, see [Working with Web ACLs](https://docs.aws.amazon.com/waf/latest/developerguide/waf-regional.html) in the AWS WAF Developer Guide.
- For API details, see [AssociateWebAcl](https://docs.aws.amazon.com/cli/latest/reference/waf-regional/associate-web-acl.html) in AWS CLI Command Reference.

**put-logging-configuration**

The following code example shows how to use `put-logging-configuration`.

**AWS CLI**

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with ALB/APIGateway in Region us-east-1.
aws waf-regional put-logging-configuration \
  --region us-east-1

Output:

```json
{
  "LoggingConfiguration": {
  }
}
```

- For API details, see [PutLoggingConfiguration](#) in *AWS CLI Command Reference*.

### update-byte-match-set

The following code example shows how to use `update-byte-match-set`.

**AWS CLI**

**To update a byte match set**

The following `update-byte-match-set` command deletes a `ByteMatchTuple` object (filter) in a `ByteMatchSet`. Because the `updates` value has embedded double quotes, you must surround the value with single quotes.

```bash
aws waf-regional update-byte-match-set \
  --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \ 
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \ 
  --updates 'Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TextTransformation="NONE",PositionalConstraint="CONTAINS"}'
```
For more information, see Working with String Match Conditions in the AWS WAF Developer Guide.

- For API details, see UpdateByteMatchSet in AWS CLI Command Reference.

update-ip-set

The following code example shows how to use update-ip-set.

AWS CLI

To update an IP set

The following update-ip-set command updates an IPSet with an IPv4 address and deletes an IPv6 address. Get the value for change-token by running the get-change-token command. Because the value for updates includes embedded double-quotes, you must surround the value with single quotes.

```bash
aws waf update-ip-set \
   --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
   --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
   --updates
   'Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSetDescriptor={Type="IPV6",Value="1111:0000:0000:0000:0000:0000:0000:0111/128"}'
```

Alternatively you can use a JSON file to specify the input. For example:

```bash
aws waf-regional update-ip-set \
   --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
   --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \n   --updates file://change.json
```

Content of the change.json

```json
[
   {
      "Action": "INSERT",
      "IPSetDescriptor": {
         "Type": "IPV4",
         "Value": "12.34.56.78/16"
      }
   },
]
```
For more information, see `Working with IP Match Conditions` in the *AWS WAF Developer Guide*.

- For API details, see `UpdateIpSet` in *AWS CLI Command Reference*.

**update-rule**

The following code example shows how to use `update-rule`.

**AWS CLI**

**To update a rule**

The following `update-rule` command deletes a Predicate object in a rule. Because the `updates` value has embedded double quotes, you must surround the entire value with single quotes.

```bash
aws waf-regional update-rule \    
  --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \    
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \    
  --updates   
    'Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}'
```

For more information, see `Working with Rules` in the *AWS WAF Developer Guide*.

- For API details, see `UpdateRule` in *AWS CLI Command Reference*.

**update-size-constraint-set**

The following code example shows how to use `update-size-constraint-set`.

**AWS CLI**

**To update a size constraint set**
The following `update-size-constraint-set` command deletes a SizeConstraint\` object (filters) in a size constraint set. Because the updates value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-size-constraint-set \
    --size-constraint-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates 'Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE",ComparisonOperator="GT",Size=0}'
```

For more information, see [Working with Size Constraint Conditions](https://docs.aws.amazon.com/waf/latest/developerguide/waf-wafv2-working-with-size-constraint-conditions.html) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateSizeConstraintSet](https://docs.aws.amazon.com/waf/latest/APIReference/API_UpdateSizeConstraintSet.html) in *AWS CLI Command Reference*.

**update-sql-injection-match-set**

The following code example shows how to use `update-sql-injection-match-set`.

**AWS CLI**

**To update a SQL Injection Match Set**

The following `update-sql-injection-match-set` command deletes a SqlInjectionMatchTuple object (filters) in a SQL injection match set. Because the updates value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-sql-injection-match-set --sql-injection-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates 'Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_DECODE"}'
```

For more information, see [Working with SQL Injection Match Conditions](https://docs.aws.amazon.com/waf/latest/developerguide/waf-wafv2-working-with-sql-injection-match-conditions.html) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateSqlInjectionMatchSet](https://docs.aws.amazon.com/waf/latest/APIReference/API_UpdateSqlInjectionMatchSet.html) in *AWS CLI Command Reference*.

**update-web-acl**

The following code example shows how to use `update-web-acl`.

**Actions and scenarios**

6295
AWS CLI

To update a web ACL

The following update-web-acl command deletes an ActivatedRule object in a WebACL. Because the updates value contains embedded double quotes, you must surround the entire value in single quotes.

```bash
aws waf-regional update-web-acl
    --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1
    --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-Example"},Action={Type="ALLOW"},Type="ALLOW"'
```

For more information, see Working with Web ACLs in the AWS WAF Developer Guide.

- For API details, see UpdateWebAcl in AWS CLI Command Reference.

update-xss-match-set

The following code example shows how to use update-xss-match-set.

AWS CLI

To update an XSSMatchSet

The following update-xss-match-set command deletes an XssMatchTuple object (filters) in an XssMatchSet. Because the updates value contains embedded double quotes, you must surround the entire value with single quotes.

```bash
aws waf-regional update-xss-match-set
    --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1
    --updates 'Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_DECODE"}'
```

For more information, see Working with Cross-site Scripting Match Conditions in the AWS WAF Developer Guide.

- For API details, see UpdateXssMatchSet in AWS CLI Command Reference.
AWS WAFV2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAFV2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

associate-web-acl

The following code example shows how to use associate-web-acl.

AWS CLI

To associate a web ACL with a regional AWS resource

The following associate-web-acl example associates the specified web ACL with an Application Load Balancer.

```bash
aws wafv2 associate-web-acl \
  --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a \
  --region us-west-2
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
check-capacity

The following code example shows how to use check-capacity.

AWS CLI

To obtain the capacity used by a set of rules

The following check-capacity retrieves the capacity requirements for a rule set that contains a rate-based rule statement, and an AND rule statement that contains nested rules.

```bash
aws wafv2 check-capacity \
   --scope REGIONAL \
   --rules file://waf-rule-list.json \
   --region us-west-2
```

Contents of file://waf-rule-list.json:

```json
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    }
                ]
            }
        }
    }
]
```
"GeoMatchStatement": {
    "CountryCodes": [
        "US",
        "IN"
    ]
},
"Action": {
    "Allow": {
    }
},
"VisibilityConfig": {
    "SampledRequestsEnabled": true,
    "CloudWatchMetricsEnabled": true,
    "MetricName": "basic-rule"
}
],
{
    "Name": "rate-rule",
    "Priority": 1,
    "Statement": {
        "RateBasedStatement": {
            "Limit": 1000,
            "AggregateKeyType": "IP"
        }
    },
    "Action": {
        "Block": {
        }
    },
    "VisibilityConfig": {
        "SampledRequestsEnabled": true,
        "CloudWatchMetricsEnabled": true,
        "MetricName": "rate-rule"
    }
}
Output:

```json
{
    "Capacity":15
}
```

For more information, see [AWS WAF Web ACL Capacity Units (WCU)](https://aws.amazon.com/waf) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [CheckCapacity](https://docs.aws.amazon.com/cli/latest/reference/wafv2/check-capacity.html) in *AWS CLI Command Reference*.

### create-ip-set

The following code example shows how to use `create-ip-set`.

**AWS CLI**

**To create an IP set for use in your web ACLs and rule groups**

The following `create-ip-set` command creates an IP set with a single address range specification.

```
aws wafv2 create-ip-set \
    --name testip \
    --scope REGIONAL \
    --ip-address-version IPV4 \
    --addresses 198.51.100.0/16
```

Output:

```json
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"
        "Name":"testip",
        "LockToken":"447e55ac-0000-0000-0000-86b67c17f8b5",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
```
create-regex-pattern-set

The following code example shows how to use create-regex-pattern-set.

AWS CLI

To create a regex pattern set for use in your web ACLs and rule groups

The following create-regex-pattern-set command creates a regex pattern set with two regex patterns specified.

```
aws wafv2 create-regex-pattern-set \
   --name regexPatterSet01 \
   --scope REGIONAL \
   --description 'Test web-acl' \
   --regular-expression-list '[["RegexString": "/[0-9]*/"},{"RegexString": "/[a-z]*/"]']
```

Output:

```
{
   "Summary":{
      "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
      "Description":"Test web-acl",
      "Name":"regexPatterSet01",
      "LockToken":"0bc01e21-03c9-4b98-9433-6229cbf1ef1c",
      "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
   }
}
```

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see CreateIpSet in AWS CLI Command Reference.

Actions and scenarios
create-rule-group

The following code example shows how to use `create-rule-group`.

**AWS CLI**

To create a custom rule group for use in your web ACLs

The following `create-rule-group` command creates a custom rule group for regional use. The rule statements for the group are provided in a JSON-formatted file.

```bash
aws wafv2 create-rule-group \
  --name "TestRuleGroup" \
  --scope REGIONAL \
  --capacity 250 \
  --rules file://waf-rule.json \
  --visibility-config
  SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestRuleGroupMetrics \
  --region us-west-2
```

Contents of file://waf-rule.json:

```json
[
  {
    "Name":"basic-rule",
    "Priority":0,
    "Statement":{
      "AndStatement":{
        "Statements":[
          "ByteMatchStatement":{
            "SearchString":"example.com",
            "FieldToMatch":{
              "SingleHeader":{
                "Name":"host"
              }
            }
          },
          "TextTransformations":[
            "Priority":0,
            "Type":"LOWERCASE"
          ]
        ]
      }
    }
  }
]
```
Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestRuleGroup",
        "LockToken":"7b3bcec2-374e-4c5a-b2b9-563bf47249f0",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing Your Own Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
create-web-acl

The following code example shows how to use `create-web-acl`.

AWS CLI

**To create a web ACL**

The following `create-web-acl` command creates a web ACL for regional use. The rule statements for the web ACL are provided in a JSON-formatted file.

```
aws wafv2 create-web-acl \
  --name TestWebAcl \
  --scope REGIONAL \
  --default-action Allow={} \
  --visibility-config
  SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestWebAclMetrics \
  --rules file://waf-rule.json \
  --region us-west-2
```

Contents of file://waf-rule.json:

```
[
  {
    "Name":"basic-rule",
    "Priority":0,
    "Statement":{
      "AndStatement":{
        "Statements":[
          {
            "ByteMatchStatement":{
              "SearchString":"example.com",
              "FieldToMatch":{
                "SingleHeader":{
                  "Name":"host"
                }
              }\n            }
          }
        ]
      }
    }
  }
]```
"Priority":0,
"Type":"LOWERCASE"
],
"PositionalConstraint":"EXACTLY"
},
{
"GeoMatchStatement":{
"CountryCodes":[
"US",
"IN"
]
}
}
],
"Action":{
"Allow":{
}
},
"VisibilityConfig":{
"SampledRequestsEnabled":true,
"CloudWatchMetricsEnabled":true,
"MetricName":"basic-rule"
}
]
}
]
}
},
"Action":{
"Allow":{
}
},
"VisibilityConfig":{
"SampledRequestsEnabled":true,
"CloudWatchMetricsEnabled":true,
"MetricName":"basic-rule"
}
]
}
]
}
},
"Action":{
"Allow":{
}
},
"VisibilityConfig":{
"SampledRequestsEnabled":true,
"CloudWatchMetricsEnabled":true,
"MetricName":"basic-rule"
}
]
}
}
}

**Output:**

```json
{
  "Summary":{
    "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description":"
    "Name":"TestWebAcl",
    "LockToken":"2294b3a1-eb60-4aa0-a86f-a3ae04329de9",
    "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  }
}
```
For more information, see Managing and Using a Web Access Control List (Web ACL) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see CreateWebAcl in AWS CLI Command Reference.

delete-ip-set

The following code example shows how to use delete-ip-set.

AWS CLI

To delete an IP set

The following delete-ip-set deletes the specified IP set. This call requires an ID, which you can obtain from the call, list-ip-sets, and a lock token, which you can obtain from the calls, list-ip-sets and get-ip-set.

```
aws wafv2 delete-ip-set \\
  --name test1 \\
  --scope REGIONAL \\
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \\
  --lock-token 46851772-db6f-459d-9385-49428812e357
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteIpSet in AWS CLI Command Reference.

delete-logging-configuration

The following code example shows how to use delete-logging-configuration.

AWS CLI

To disable logging for a web ACL

The following delete-logging-configuration removes any logging configuration from the specified web ACL.

```
aws wafv2 delete-logging-configuration 
```
This command produces no output.

For more information, see Logging Web ACL Traffic Information in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteLoggingConfiguration in AWS CLI Command Reference.

delete-regex-pattern-set

The following code example shows how to use delete-regex-pattern-set.

AWS CLI

To delete a regex pattern set

The following delete-regex-pattern-set updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, list-regex-pattern-sets, and a lock token, which you can obtain from the call list-regex-pattern-sets or the call get-regex-pattern-set.

```
aws wafv2 delete-regex-pattern-set
  --name regexPatterSet01
  --scope REGIONAL
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
  --lock-token 0bc01e21-03c9-4b98-9433-6229cbf1ef1c
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteRegexPatternSet in AWS CLI Command Reference.

delete-rule-group

The following code example shows how to use delete-rule-group.

AWS CLI

To delete a custom rule group

```
```
The following delete-rule-group deletes the specified custom rule group. This call requires an ID, which you can obtain from the call, list-rule-groups, and a lock token, which you can obtain from the call list-rule-groups or the call get-rule-group.

```
aws wafv2 delete-rule-group \
  --name TestRuleGroup \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0
```

This command produces no output.

For more information, see Managing Your Own Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteRuleGroup in AWS CLI Command Reference.

delete-web-acl

The following code example shows how to use delete-web-acl.

AWS CLI

To delete a web ACL

The following delete-web-acl deletes the specified web ACL from your account. A web ACL can only be deleted when it's not associated with any resources. This call requires an ID, which you can obtain from the call, list-web-acls, and a lock token, which you can obtain from the call list-web-acls or the call get-web-acl.

```
aws wafv2 delete-web-acl \
  --name test \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --lock-token ebab4ed2-155e-4c9a-9efb-e4c45665b1f5
```

This command produces no output.

For more information, see Managing and Using a Web Access Control List (Web ACL) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteWebAcl in AWS CLI Command Reference.
describe-managed-rule-group

The following code example shows how to use describe-managed-rule-group.

AWS CLI

To retrieve the description for a managed rule group

The following describe-managed-rule-group retrieves the description for an AWS managed rule group.

```bash
aws wafv2 describe-managed-rule-group \
   --vendor-name AWS \
   --name AWSManagedRulesCommonRuleSet \
   --scope REGIONAL
```

Output:

```json
{
   "Capacity": 700,
   "Rules": [
      {
         "Name": "NoUserAgent_HEADER",
         "Action": {
            "Block": {}
         }
      },
      {
         "Name": "UserAgent_BadBots_HEADER",
         "Action": {
            "Block": {}
         }
      },
      {
         "Name": "SizeRestrictions_QUERYSTRING",
         "Action": {
            "Block": {}
         }
      },
      {
         "Name": "SizeRestrictions_Cookie_HEADER",
         "Action": {
            "Block": {}
         }
      }
   ]
}
```

Actions and scenarios

6310
"Name": "CrossSiteScripting_COOKIE",
"Action": {
    "Block": {}
}
},
{
    "Name": "CrossSiteScripting_QUERYARGUMENTS",
    "Action": {
        "Block": {}
    }
}
],
{
    "Name": "CrossSiteScripting_BODY",
    "Action": {
        "Block": {}
    }
}
],
{
    "Name": "CrossSiteScripting_URIPATH",
    "Action": {
        "Block": {}
    }
}
]

For more information, see Managed Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DescribeManagedRuleGroup in AWS CLI Command Reference.

disassociate-web-acl

The following code example shows how to use disassociate-web-acl.

AWS CLI

To disassociate a web ACL from a regional AWS resource

The following disassociate-web-acl example removes any existing web ACL association from the specified Application Load Balancer.

```bash
aws wafv2 disassociate-web-acl
```
--resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a \ 
--region us-west-2

This command produces no output.

For more information, see [Associating or Disassociating a Web ACL with an AWS Resource](#) in the [AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide](#).

- For API details, see [DisassociateWebAcl](#) in [AWS CLI Command Reference](#).

---

**get-ip-set**

The following code example shows how to use `get-ip-set`.

**AWS CLI**

**To retrieve a specific IP set**

The following `get-ip-set` retrieves the IP set with the specified name, scope, and ID. You can get the ID for an IP set from the commands `create-ip-set` and `list-ip-sets`.

```
aws wafv2 get-ip-set \ 
  --name testip \ 
  --scope REGIONAL \ 
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Output:**

```
{
    "IPSet":{
        "Description":"
        "Name":"testip",
        "IPAddressVersion":"IPV4",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "Addresses":[
            "192.0.2.0/16"
        ],
        "LockToken":"447e55ac-2396-4c6d-b9f9-86b67c17f8b5"
    }
  }
```
For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetIpSet in AWS CLI Command Reference.

get-logging-configuration

The following code example shows how to use get-logging-configuration.

AWS CLI

To retrieve the logging configurations for a web ACL

The following get-logging-configuration retrieves the logging configuration for the specified web ACL.

```bash
aws wafv2 get-logging-configuration \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --region us-west-2
```

Output:

```json
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RedactedFields":[
            {
                "Method":{
                }
            }
        ],
        "LogDestinationConfigs":[
        ]
    }
}
```
For more information, see [Logging Web ACL Traffic Information](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetLoggingConfiguration](#) in *AWS CLI Command Reference*.

### get-rate-based-statement-managed-keys

The following code example shows how to use `get-rate-based-statement-managed-keys`.

**AWS CLI**

**To retrieve a list of IP addresses that are blocked by a rate-based rule**

The following `get-rate-based-statement-managed-keys` retrieves the IP addresses currently blocked by a rate-based rule that's being used for a regional application.

```bash
aws wafv2 get-rate-based-statement-managed-keys \
    --scope REGIONAL \
    --web-acl-name testwebacl2 \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-name ratebasedtest
```

**Output:**

```json
{
    "ManagedKeysIPV4":{
        "IPAddressVersion":"IPV4",
        "Addresses":[
            "198.51.100.0/32"
        ]
    },
    "ManagedKeysIPV6":{
        "IPAddressVersion":"IPV6",
        "Addresses":[]
    }
}
```

For more information, see [Rate-Based Rule Statement](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetRateBasedStatementManagedKeys](#) in *AWS CLI Command Reference*.  

---

**Actions and scenarios**

6315
**get-regex-pattern-set**

The following code example shows how to use `get-regex-pattern-set`.

**AWS CLI**

**To retrieve a specific regex pattern set**

The following `get-regex-pattern-set` retrieves the regex pattern set with the specified name, scope, region, and ID. You can get the ID for a regex pattern set from the commands `create-regex-pattern-set` and `list-regex-pattern-sets`.

```
aws wafv2 get-regex-pattern-set  
   --name regexPatterSet01  
   --scope REGIONAL  
   --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  
   --region us-west-2
```

Output:

```
{
   "RegexPatternSet":{
      "Description":"Test web-acl",
      "RegularExpressionList": [
         {
            "RegexString":"/[0-9]*/"
         },
         {
            "RegexString":"/[a-z]*/"
         }
      ],
      "Name":"regexPatterSet01",
      "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/regexpatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
   },
   "LockToken":"c8abf33f-b6fc-46ae-846e-42f994d57b29"
}
```

For more information, see [IP Sets and Regex Pattern Sets](https://aws.amazon.com/documentation/waf/latest/developerguide/ip-set-and-pattern-set-tutorial.html) in the **AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide**.

- For API details, see [GetRegexPatternSet](https://docs.aws.amazon.com/cli/latest/reference/wafv2/get-regex-pattern-set.html) in **AWS CLI Command Reference**.
get-rule-group

The following code example shows how to use get-rule-group.

AWS CLI

To retrieve a specific custom rule group

The following get-rule-group retrieves the custom rule group with the specified name, scope, and ID. You can get the ID for a rule group from the commands create-rule-group and list-rule-groups.

```
aws wafv2 get-rule-group \
  --name ff \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "RuleGroup":{
    "Capacity":1,
    "Description":"
    "Rules":[
      {
        "Priority":0,
        "Action":{
          "Block":{
        }
      
      
      },
    "VisibilityConfig":{
      "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"jj"
    },
    "Name":"jj",
    "Statement":{
      "SizeConstraintStatement":{
        "ComparisonOperator":"LE",
    "TextTransformations":[
      {
        "Priority":0,
      
      
      }
    ]
    
    
    
```
For more information, see Managing Your Own Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetRuleGroup in AWS CLI Command Reference.

get-sampled-requests

The following code example shows how to use get-sampled-requests.

AWS CLI

To retrieve a sample of web requests for a web ACL

The following get-sampled-requests retrieves the sampled web requests for the specified web ACL, rule metric, and time frame.

aws wafv2 get-sampled-requests \
--web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
--rule-metric-name AWS-AWSManagedRulesSQLiRuleSet
--scope=REGIONAL
--time-window StartTime=2020-02-12T20:00Z,EndTime=2020-02-12T21:10Z
--max-items 100

Output:

```json
{
    "TimeWindow": {
        "EndTime": 1581541800.0,
        "StartTime": 1581537600.0
    },
    "SampledRequests": [
        {
            "Action": "BLOCK",
            "Timestamp": 1581541799.564,
            "RuleNameWithinRuleGroup": "AWS#AWSManagedRulesSQLiRuleSet#SQLi_BODY",
            "Request": {
                "Country": "US",
                "URI": "/",
                "Headers": [
                    {
                        "Name": "Host",
                        "Value": "alb-test-1EXAMPLE1.us-east-1.elb.amazonaws.com"
                    },
                    {
                        "Name": "Content-Length",
                        "Value": "7456"
                    },

- For API details, see [GetSampledRequests](#) in [AWS CLI Command Reference](#).

get-web-acl-for-resource

The following code example shows how to use `get-web-acl-for-resource`.

AWS CLI

**To retrieve the web ACL that's associated with an AWS resource**

The following `get-web-acl-for-resource` retrieves the JSON for the web ACL that's associated with the specified resource.
aws wafv2 get-web-acl-for-resource \
--resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a

Output:

```json
{
    "WebACL": {
        "Capacity": 3,
        "Description": "",
        "Rules": [
            {
                "Priority": 1,
                "Action": {
                    "Block": {}
                },
                "VisibilityConfig": {
                    "SampledRequestsEnabled": true,
                    "CloudWatchMetricsEnabled": true,
                    "MetricName": "testrule01"
                },
                "Name": "testrule01",
                "Statement": {
                    "AndStatement": {
                        "Statements": [
                            {
                                "ByteMatchStatement": {
                                    "PositionalConstraint": "EXACTLY",
                                    "TextTransformations": [
                                        {
                                            "Priority": 0,
                                            "Type": "NONE"
                                        }
                                    ],
                                    "SearchString": "dGVzdHN0cmluZw==",
                                    "FieldToMatch": {
                                        "UriPath": {}
                                    }
                                }
                            }
                        ]
                    }
                }
            }
        ]
    }
}
```
For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetWebAclForResource in AWS CLI Command Reference.
**get-web-acl**

The following code example shows how to use `get-web-acl`.

**AWS CLI**

**To retrieve a web ACL**

The following `get-web-acl` retrieves the web ACL with the specified name, scope, and ID. You can get the ID for a web ACL from the commands `create-web-acl` and `list-web-acls`.

```
aws wafv2 get-web-acl \
  --name test01 \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "WebACL":{
    "Capacity":3,
    "Description":"
    "Rules":[
      {
        "Priority":1,
        "Action":{
          "Block":{
        },
      },
    },
    "VisibilityConfig":{
      "SampledRequestsEnabled":true,
      "CloudWatchMetricsEnabled":true,
      "MetricName":"testrule01"
    },
    "Name":"testrule01",
    "Statement":{
      "AndStatement":{
        "Statements":[
          {
            "ByteMatchStatement":{
              "PositionalConstraint":"EXACTLY",
              "TextTransformations":[
            ]
          }
        ]
      }
    }

```
{
    "Priority":0,
    "Type":"NONE"
},
"SearchString":"dGVzdHN0cmluZw==",
"FieldToMatch":{
    "UriPath":{
    }
},
"SizeConstraintStatement":{
    "ComparisonOperator":"EQ",
    "TextTransformations":[
    {
        "Priority":0,
        "Type":"NONE"
    },
    "FieldToMatch":{
        "QueryString":{
        }
    },
    "Size":0
    ]
},
"VisibilityConfig":{
    "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"test01"
},
"DefaultAction":{
    "Allow":{
    }
}
For more information, see Managing and Using a Web Access Control List (Web ACL) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetWebAcl in AWS CLI Command Reference.

### list-available-managed-rule-groups

The following code example shows how to use list-available-managed-rule-groups.

**AWS CLI**

**To retrieve the managed rule groups**

The following list-available-managed-rule-groups returns the list of all managed rule groups that are currently available for use in your web ACLs.

```bash
aws wafv2 list-available-managed-rule-groups \
   --scope REGIONAL
```

**Output:**

```
{
   "ManagedRuleGroups": [ 
   {
     "VendorName": "AWS",
     "Name": "AWSManagedRulesCommonRuleSet",
     "Description": "Contains rules that are generally applicable to web applications. This provides protection against exploitation of a wide range of vulnerabilities, including those described in OWASP publications and common Common Vulnerabilities and Exposures (CVE)."
   },
   {
     "VendorName": "AWS",
     "Name": "AWSManagedRulesAdminProtectionRuleSet",
   }
}
```
"Description": "Contains rules that allow you to block external access to exposed admin pages. This may be useful if you are running third-party software or would like to reduce the risk of a malicious actor gaining administrative access to your application."
},
{
  "VendorName": "AWS",
  "Name": "AWSManagedRulesKnownBadInputsRuleSet",
  "Description": "Contains rules that allow you to block request patterns that are known to be invalid and are associated with exploitation or discovery of vulnerabilities. This can help reduce the risk of a malicious actor discovering a vulnerable application."
},
{
  "VendorName": "AWS",
  "Name": "AWSManagedRulesSQLiRuleSet",
  "Description": "Contains rules that allow you to block request patterns associated with exploitation of SQL databases, like SQL injection attacks. This can help prevent remote injection of unauthorized queries."
},
{
  "VendorName": "AWS",
  "Name": "AWSManagedRulesLinuxRuleSet",
  "Description": "Contains rules that block request patterns associated with exploitation of vulnerabilities specific to Linux, including LFI attacks. This can help prevent attacks that expose file contents or execute code for which the attacker should not have had access."
},
{
  "VendorName": "AWS",
  "Name": "AWSManagedRulesUnixRuleSet",
  "Description": "Contains rules that block request patterns associated with exploiting vulnerabilities specific to POSIX/POSIX-like OS, including LFI attacks. This can help prevent attacks that expose file contents or execute code for which access should not been allowed."
},
{
  "VendorName": "AWS",
  "Name": "AWSManagedRulesWindowsRuleSet",
  "Description": "Contains rules that block request patterns associated with exploiting vulnerabilities specific to Windows, (e.g., PowerShell commands). This can help prevent exploits that allow attacker to run unauthorized commands or execute malicious code."}
For more information, see Managed Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListAvailableManagedRuleGroups in AWS CLI Command Reference.

**list-ip-sets**

The following code example shows how to use list-ip-sets.

**AWS CLI**

**To retrieve a list of IP sets**

The following list-ip-sets retrieves all IP sets for the account that have regional scope.

```
aws wafv2 list-ip-sets 
   --scope REGIONAL
```
Output:

```json
{
    "IPSets": [
        {
            "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description": "",
            "Name": "testip",
            "LockToken": "0674c84b-0304-47fe-8728-c6bff46af8fc",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ],
    "NextMarker": "testip"
}
```

For more information, see [IP Sets and Regex Pattern Sets] in the [AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide].

- For API details, see [ListIpSets] in [AWS CLI Command Reference].

### list-logging-configurations

The following code example shows how to use `list-logging-configurations`.

**AWS CLI**

**To retrieve a list of all logging configurations for a region**

The following `list-logging-configurations` retrieves the all logging configurations for web ACLs that are scoped for regional use in the us-west-2 region.

```bash
aws wafv2 list-logging-configurations \
    --scope REGIONAL \
    --region us-west-2
```

Output:

```json
{
    "LoggingConfigurations": [
        
```

---

**Actions and scenarios**

6330
For more information, see [Logging Web ACL Traffic Information](https://docs.aws.amazon.com/waf/latest/developerguide/logging-web-acl-traffic-information.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListLoggingConfigurations](https://docs.aws.amazon.com/waf/latest/APIReference/API_ListLoggingConfigurations.html) in *AWS CLI Command Reference*.

**list-regex-pattern-sets**

The following code example shows how to use `list-regex-pattern-sets`.
AWS CLI

To retrieve a list of regex pattern sets

The following `list-regex-pattern-sets` retrieves all regex pattern sets for the account that are defined in the region `us-west-2`.

```bash
aws wafv2 list-regex-pattern-sets \
  --scope REGIONAL \
  --region us-west-2
```

Output:

```json
{
   "NextMarker":"regexPatterSet01",
   "RegexPatternSets":[
      {
         "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "Description":"Test web-acl",
         "Name":"regexPatterSet01",
         "LockToken":"f17743f7-0000-0000-0000-19a8b93bfb01",
         "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      }
   ]
}
```

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListRegexPatternSets in AWS CLI Command Reference.

**list-resources-for-web-acl**

The following code example shows how to use `list-resources-for-web-acl`.

AWS CLI

To retrieve the resources associated with a web ACL

The following `list-resources-for-web-acl` retrieves the API Gateway REST API resources that are currently associated with the specified web ACL in the region `us-west-2`. 
aws wafv2 list-resources-for-web-acl \
   --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --resource-type API_GATEWAY \
   --region us-west-2

Output:

```
{
   "ResourceArns": [
      "arn:aws:apigateway:us-west-2::/restapis/EXAMPLE111/stages/testing"
   ]
}
```

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListResourcesForWebAcl in AWS CLI Command Reference.

**list-rule-groups**

The following code example shows how to use list-rule-groups.

**AWS CLI**

To retrieve a list of custom rule groups

The following list-rule-groups retrieves all custom rule groups that are defined for the account for the specified scope and region location.

```
aws wafv2 list-rule-groups \
   --scope REGIONAL \
   --region us-west-2
```

Output:

```
{
   "RuleGroups": [
      
   ]
}
```

```
"ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```
For more information, see Managing Your Own Rule Groups in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListRuleGroups in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To retrieve all tags for an AWS WAF resource**

The following list-tags-for-resource retrieves the list of all tag key, value pairs for the specified web ACL.

```bash
aws wafv2 list-tags-for-resource \
--resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/testwebacl2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Output:**

```json
{
  "NextMarker": "",
  "TagInfoForResource": {
    
  }
}
```
For more information, see [Getting Started with AWS WAF](https://docs.aws.amazon.com/waf/latest/developerguide/getting-started-with-aws-waf.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.  
- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/wafv2/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### list-web-acls

The following code example shows how to use `list-web-acls`.

**AWS CLI**

**To retrieve the web ACLs for a scope**

The following `list-web-acls` retrieves all web ACLs that are defined for the account for the specified scope.

```
aws wafv2 list-web-acls
    --scope REGIONAL
```

**Output:**

```
{
    "NextMarker":"Testt",
    "WebACLs": [ 
    
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/Testt/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"sssss",
            "Name":"Testt",
            "LockToken":"7f36cb30-74ef-4cff-8cd4-a77e1aba1746",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```
For more information, see Managing and Using a Web Access Control List (Web ACL) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListWebAcls in AWS CLI Command Reference.

**put-logging-configuration**

The following code example shows how to use put-logging-configuration.

**AWS CLI**

**To add a logging configuration to a web ACL**

The following put-logging-configuration adds the Amazon Kinesis Data Firehose logging configuration aws-waf-logs-custom-transformation to the specified web ACL, with no fields redacted from the logs.

```
aws wafv2 put-logging-configuration \
    --region us-west-2
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LogDestinationConfigs":[
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutLoggingConfiguration in AWS CLI Command Reference.
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to an AWS WAF resource**

The following `tag-resource` example adds a tag with a key of `Name` and value set to `AWSWAF` to the specified web ACL.

```
aws wafv2 tag-resource \
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --tags Key=Name,Value=AWSWAF
```

This command produces no output.

For more information, see [Getting Started with AWS WAF](https://docs.aws.amazon.com/waf/latest/dg/getting-started.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/wafv2/tag-resource.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from an AWS WAF resource**

The following `untag-resource` example removes the tag with the key `KeyName` from the specified web ACL.

```
aws wafv2 untag-resource \
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --tag-keys "KeyName"
```

This command produces no output.

For more information, see [Getting Started with AWS WAF](https://docs.aws.amazon.com/waf/latest/dg/getting-started.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*. 
For API details, see UntagResource in AWS CLI Command Reference.

**update-ip-set**

The following code example shows how to use update-ip-set.

**AWS CLI**

**To modify the settings for an existing IP set**

The following update-ip-set updates the settings for the specified IP set. This call requires an ID, which you can obtain from the call, list-ip-sets, and a lock token which you can obtain from the calls, list-ip-sets and get-ip-set. This call also returns a lock token that you can use for a subsequent update.

```bash
aws wafv2 update-ip-set \
   --name testip \
   --scope REGIONAL \
   --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --addresses 198.51.100.0/16 \
   --lock-token 447e55ac-2396-4c6d-b9f9-86b67c17f8b5
```

Output:

```json
{
   "NextLockToken": "0674c84b-0304-47fe-8728-c6bff46af8fc"
}
```

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see UpdateIpSet in AWS CLI Command Reference.

**update-regex-pattern-set**

The following code example shows how to use update-regex-pattern-set.

**AWS CLI**

**To modify the settings for an existing regex pattern set**
The following `update-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token which you can obtain from the calls, `list-regex-pattern-sets` and `get-regex-pattern-set`. This call also returns a lock token that you can use for a subsequent update.

```bash
aws wafv2 update-regex-pattern-set \
   --name ExampleRegex \
   --scope REGIONAL \
   --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --regular-expression-list RegexString="^.+$" \n   --lock-token ed207e9c-82e9-4a77-aadd-81e6173ab7eb
```

Output:

```json
{
   "NextLockToken": "12ebc73e-fa68-417d-a9b8-2bdd761a4fa5"
}
```

For more information, see IP Sets and Regex Pattern Sets in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see UpdateRegexPatternSet in AWS CLI Command Reference.

`update-rule-group`

The following code example shows how to use `update-rule-group`.

**AWS CLI**

**To update a custom rule group**

The following `update-rule-group` changes the visibility configuration for an existing custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token which you can obtain from the calls, `list-rule-groups` and `get-rule-group`. This call also returns a lock token that you can use for a subsequent update.

```bash
aws wafv2 update-rule-group \
   --name TestRuleGroup \
   --scope REGIONAL \
   --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```
The following code example shows how to use `update-web-acl`.

**AWS CLI**

To update a web ACL

The following `update-web-acl` changes settings for an existing web ACL. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token and other settings, which you can obtain from the call `get-web-acl`. This call also returns a lock token that you can use for a subsequent update.

```bash
aws wafv2 update-web-acl \
  --name TestWebAcl \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --lock-token 2294b3a1-0000-0000-0000-a3ae04329de9 \
  --default-action Block={} \
  --visibility-config SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=NewMetricTestWebAcl \
  --rules file://waf-rule.json \
  --region us-west-2
```
Output:

```
{
  "NextLockToken": "714a0cfe-0000-0000-0000-2959c8b9a684"
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see UpdateWebAcl in AWS CLI Command Reference.

### Amazon WorkDocs examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkDocs.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

- **abort-document-version-upload**

The following code example shows how to use abort-document-version-upload.

**AWS CLI**

**To stop a document version upload**

This example stops a previously initiated document version upload.
Command:

```
aws workdocs abort-document-version-upload --document-id feaba64d4efdf271c2521b60a2a44a8f057e84beaabbbe22f01267313209835f2 --version-id 1536773972914-ddb67663e782e7ce8455ebc962217cf9f9e47b5a9a702e5c84dccc417da9313
```

Output:

None

- For API details, see [AbortDocumentVersionUpload](#) in *AWS CLI Command Reference*.

activate-user

The following code example shows how to use `activate-user`.

**AWS CLI**

**To activate a user**

This example activates an inactive user.

Command:

```
aws workdocs activate-user --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```json
{
    "User": {
        "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "Username": "exampleUser",
        "EmailAddress": "exampleUser@site.awsapps.com",
        "GivenName": "Example",
        "Surname": "User",
        "OrganizationId": "d-926726012c",
        "RootFolderId": "75f67c183aa1217409ac87576a45c03a5df5e6d8c51c35c01669970538e86cd0",
        "RecycleBinFolderId": "642b7d3e60b14204534f3df7b1959e01b5d170f8c2707f410e40a8149120a57",
        "Status": "ACTIVE",
    }
}
```
add-resource-permissions

The following code example shows how to use add-resource-permissions.

**AWS CLI**

To add permissions for a resource

This example adds permissions to the resource for the specified principals.

Command:

```bash
aws workdocs add-resource-permissions --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --principals Id=anonymous,Type=ANONYMOUS,Role=VIEWER
```

Output:

```json
{
   "ShareResults": [
      {
         "PrincipalId": "anonymous",
         "Role": "VIEWER",
         "Status": "SUCCESS",
         "ShareId": "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
         "StatusMessage": ""
      }
   ]
}
```

- For API details, see [ActivateUser](https://awscli.amazonaws.com/v2/documentation/api/reference/index.html) in *AWS CLI Command Reference*. 
create-comment

The following code example shows how to use create-comment.

**AWS CLI**

**To add a new comment**

This example adds a new comment to the specified document version.

**Command:**

```
aws workdocs create-comment --document-id 15df51e0335cfc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --text "This is a comment."
```

**Output:**

```

  }
}
```

- For API details, see [AddResourcePermissions](#) in *AWS CLI Command Reference*.
create-custom-metadata

The following code example shows how to use create-custom-metadata.

AWS CLI

To create custom metadata

This example creates custom metadata for the specified document.

Command:

```bash
aws workdocs create-custom-metadata --resource-id d90d93c1fe44bad0c8471e973ebaab339000401a95e777cfa58e977d2983b65 --custom-metadata KeyName1=example,KeyName2=example2
```

Output:

None

• For API details, see CreateCustomMetadata in AWS CLI Command Reference.

create-folder

The following code example shows how to use create-folder.

AWS CLI

To create a folder

This example creates a folder.

Command:

```bash
aws workdocs create-folder --name documents --parent-folder-id 1ece93e5fe75315c7407c49679188b4fd9da87ddb2a588e67b7fdaf4a98fde678
```
Output:

```json
{
   "Metadata": {
      "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
      "Name": "documents",
      "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "ParentFolderId": "1ece93e5fe75315c7407c4967918b4fd9da87d4bb2a588e67b7fdaf4a98fde678",

      "ModifiedTimestamp": 1534450467.622,
      "ResourceState": "ACTIVE",
      "Signature": "",
      "Size": 0,
      "LatestVersionSize": 0
   }
}
```

- For API details, see [CreateFolder](#) in AWS CLI Command Reference.

### create-labels

The following code example shows how to use `create-labels`.

**AWS CLI**

**To create labels**

This example creates a series of labels for a document.

**Command:**

```bash
aws workdocs create-labels --resource-id d90d93c1fe44b0dc8471e973eb73a3baeb339090401a95e777c77af58e977d2983b65 --labels "documents" "examples" "my_documents"
```

**Output:**

None

- For API details, see [CreateLabels](#) in AWS CLI Command Reference.
create-notification-subscription

The following code example shows how to use create-notification-subscription.

AWS CLI

To create a notification subscription

The following create-notification-subscription example configures a notification subscription for the specified Amazon WorkDocs organization.

```
aws workdocs create-notification-subscription \\
    --organization-id d-123456789c \\
    --protocol HTTPS \\
    --subscription-type ALL \\
    --notification-endpoint "https://example.com/example"
```

Output:

```
{
    "Subscription": {
        "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
        "EndPoint": "https://example.com/example",
        "Protocol": "HTTPS"
    }
}
```

For more information, see Subscribe to Notifications in the Amazon WorkDocs Developer Guide.
- For API details, see CreateNotificationSubscription in AWS CLI Command Reference.

create-user

The following code example shows how to use create-user.

AWS CLI

To create a new user

This example creates a new user in a Simple AD or Microsoft AD directory.

Command:
aws workdocs create-user --organization-id d-926726012c --username exampleUser2 --email-address exampleUser2@site.awsapps.com --given-name example2Name --surname example2Surname --password examplePa$$w0rd

Output:

```
{
  "User": {
    "Id": "S-1-1-11-1111111111-222222222-3333333333-3333&d-926726012c",
    "Username": "exampleUser2",
    "EmailAddress": "exampleUser2@site.awsapps.com",
    "GivenName": "example2Name",
    "Surname": "example2Surname",
    "OrganizationId": "d-926726012c",
    "RootFolderId": "35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
    "RecycleBinFolderId": "9858c3e9ed42c460d9d9aadb4c69fde998070dd46e5e985bd08e6169ea249ff",
    "Status": "ACTIVE",
    "Type": "MINIMALUSER",
    "CreatedTimestamp": 1535478836.584,
    "ModifiedTimestamp": 1535478836.584,
    "Storage": {
      "StorageUtilizedInBytes": 0,
      "StorageRule": {
        "StorageAllocatedInBytes": 0,
        "StorageType": "QUOTA"
      }
    }
  }
}
```

- For API details, see [CreateUser](#) in [AWS CLI Command Reference](#).

**deactivate-user**

The following code example shows how to use deactivate-user.

**AWS CLI**

To deactivate a user
This example deactivates an active user.

Command:

```
aws workdocs deactivate-user --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see `DeactivateUser` in *AWS CLI Command Reference*.

**delete-comment**

The following code example shows how to use `delete-comment`.

**AWS CLI**

**To delete a specified comment from a document version**

This example deletes the specified comment from the specified document version.

Command:

```
aws workdocs delete-comment --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --comment-id 1534799058197-c7f5c84de9115875bbca93e0367b9ecac609541d461636b760849b88b1609dd5
```

Output:

```
None
```

- For API details, see `DeleteComment` in *AWS CLI Command Reference*.

**delete-custom-metadata**

The following code example shows how to use `delete-custom-metadata`.
AWS CLI

To delete custom metadata from a resource

This example deletes all custom metadata from the specified resource.

Command:

```
aws workdocs delete-custom-metadata --resource-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e77cffa58e977d2983b65 --delete-all
```

Output:

```
None
```

- For API details, see [DeleteCustomMetadata](https://docs.aws.amazon.com/cli/latest/reference/workdocs/delete-custom-metadata.html) in *AWS CLI Command Reference*.

delete-document

The following code example shows how to use delete-document.

AWS CLI

To delete a document

This example deletes the specified document.

Command:

```
aws workdocs delete-document --document-id
b83ed5e5b167b65ef69de9d597627ff1a0d4f07a45e67f1fab7d26b54427de0a
```

Output:

```
None
```

- For API details, see [DeleteDocument](https://docs.aws.amazon.com/cli/latest/reference/workdocs/delete-document.html) in *AWS CLI Command Reference*.

delete-folder-contents

The following code example shows how to use delete-folder-contents.
AWS CLI

To delete the contents of a folder

This example deletes the contents of the specified folder.

Command:

```
aws workdocs delete-folder-contents --folder-id
26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

None

- For API details, see [DeleteFolderContents](https://awscli.amazonaws.com/v2/documentation/api/awscli-command-reference/deletefoldercontents.html) in *AWS CLI Command Reference*.

delete-folder

The following code example shows how to use delete-folder.

AWS CLI

To delete a folder

This example deletes the specified folder.

Command:

```
aws workdocs delete-folder --folder-id
26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

None

- For API details, see [DeleteFolder](https://awscli.amazonaws.com/v2/documentation/api/awscli-command-reference/deletefolder.html) in *AWS CLI Command Reference*.

delete-labels

The following code example shows how to use delete-labels.
AWS CLI

To delete labels

This example deletes the specified labels from a document.

Command:

```bash
aws workdocs delete-labels --resource-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --labels "documents" "examples"
```

Output:

None

- For API details, see DeleteLabels in AWS CLI Command Reference.

delete-notification-subscription

The following code example shows how to use delete-notification-subscription.

AWS CLI

To delete a notification subscription

The following delete-notification-subscription example deletes the specified notification subscription.

```bash
aws workdocs delete-notification-subscription \   --subscription-id 123ab4c5-678d-901e-f23g-45h6789j0123 \   --organization-id d-123456789c
```

This command produces no output.

For more information, see Subscribe to Notifications in the Amazon WorkDocs Developer Guide.

- For API details, see DeleteNotificationSubscription in AWS CLI Command Reference.

delete-user

The following code example shows how to use delete-user.
AWS CLI

To delete a user

This example deletes a user.

Command:

```bash
aws workdocs delete-user --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

None

- For API details, see [DeleteUser](https://docs.aws.amazon.com/cli/latest/reference/workdocs/delete-user.html) in *AWS CLI Command Reference*.

describe-activities

The following code example shows how to use `describe-activities`.

AWS CLI

To get a list of user activities

This example returns a list of the latest user activities for the specified organization, with a limit set for the latest two activities.

Command:

```bash
aws workdocs describe-activities --organization-id d-926726012c --limit 2
```

Output:

```
{
   "UserActivities": [
       {
           "Type": "DOCUMENT_VERSION_DOWNLOADED",
           "TimeStamp": 1534800122.17,
   
```
• For API details, see [DescribeActivities](#) in [AWS CLI Command Reference](#).
describe-comments

The following code example shows how to use describe-comments.

AWS CLI

To list all comments for a specified document version

This example lists all the comments for the specified document version.

Command:

```
aws workdocs describe-comments --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920
```

Output:

```json
{
    "Comments": [
        {
            "CommentId": "1534799058197-c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
            "ThreadId": "1534799058197-c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
            "Text": "This is a comment.",
            "Contributor": {
                "Username": "arn:aws:iam::123456789123:user/exampleUser",
                "Type": "USER"
            },
            "CreatedTimestamp": 1534799058.197,
            "Status": "PUBLISHED",
            "Visibility": "PUBLIC"
        }
    ]
}
```

- For API details, see [DescribeComments](https://docs.aws.amazon.com/cli/latest/reference/workdocs/describe-comments.html) in *AWS CLI Command Reference*.

describe-document-versions

The following code example shows how to use describe-document-versions.
**AWS CLI**

**To retrieve a document's versions**

This example retrieves the document versions for the specified document, including initialized versions and a URL for the source document.

Command:

```
aws workdocs describe-document-versions --document-id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields SOURCE
```

Output:

```
{
    "DocumentVersions": [
        {
            "Id": "1534452029587-15e129dfc187505c407588df255be83de2920d733859f1d2762411d22a83e3ef",

```
• For API details, see DescribeDocumentVersions in AWS CLI Command Reference.

**describe-folder-contents**

The following code example shows how to use describe-folder-contents.

**AWS CLI**

To describe the contents of a folder

This example describes all the active contents of the specified folder, including its documents and subfolders, sorted by date in ascending order.

Command:

```
aws workdocs describe-folder-contents --folder-id 1ece93e5fe75315c7407c4967918b4fd9da87dd2a588e67b7fdaf4a98fde678 --sort DATE --order ASCENDING --type ALL
```
Output:

```json
{
  "Folders": [
    {
      "Id": "50893c0af679524d1a0e0651130ed6073e1a05f95bd12c42dcde5d35634ed08",

      }
    }
  ]
}
```
describe-groups

The following code example shows how to use describe-groups.

**AWS CLI**

To retrieve a list of groups

The following describe-groups example lists the groups associated with the specified Amazon WorkDocs organization.

```bash
aws workdocs describe-groups \
   --search-query "e" \ 
   --organization-id d-123456789c
```

Output:

```
{
   "Groups": [
      {
         "Id": "S-1-1-1122222222-2222233333-3333334444-4444&d-123456789c",
         "Name": "Example Group 1"
      },
      {
         "Id": "S-1-1-1122222222-2222233333-3333334444-5555&d-123456789c",
         "Name": "Example Group 2"
      }
   ]
}
```

For more information, see [Getting Started with Amazon WorkDocs](https://docs.aws.amazon.com/workdocs/latest/adg/getting-started.html) in the *Amazon WorkDocs Administration Guide*.

- For API details, see [DescribeGroups](https://docs.aws.amazon.com/cli/latest/reference/workdocs/describe-groups.html) in *AWS CLI Command Reference*. 
**describe-notification-subscriptions**

The following code example shows how to use `describe-notification-subscriptions`.

**AWS CLI**

**To retrieve a list of notification subscriptions**

The following `describe-notification-subscriptions` example retrieves the notification subscriptions for the specified Amazon WorkDocs organization.

```
aws workdocs describe-notification-subscriptions \
   --organization-id d-123456789c
```

Output:

```
{
    "Subscriptions": [
        {
            "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
            "EndPoint": "https://example.com/example",
            "Protocol": "HTTPS"
        }
    ]
}
```

For more information, see [Subscribe to Notifications](https://docs.aws.amazon.com/WorkDocs/latest/DeveloperGuide/subscribe-notify.html) in the *Amazon WorkDocs Developer Guide*.

- For API details, see [DescribeNotificationSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/workdocs/describe-notification-subscriptions.html) in *AWS CLI Command Reference*.

**describe-resource-permissions**

The following code example shows how to use `describe-resource-permissions`.

**AWS CLI**

**To get a list of permissions for a resource**

This example returns a list of the permissions for the specified resource (document or folder).

Command:
aws workdocs describe-resource-permissions --resource-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3

Output:

```
{
  "Principals": [
    {
      "Id": "anonymous",
      "Type": "ANONYMOUS",
      "Roles": [
        {
          "Role": "VIEWER",
          "Type": "DIRECT"
        }
      ]
    },
    {
      "Id": "S-1-1-111111111-222222222-333333333-3333&d-926726012c",
      "Type": "USER",
      "Roles": [
        {
          "Role": "OWNER",
          "Type": "DIRECT"
        }
      ]
    },
    {
      "Id": "d-926726012c",
      "Type": "ORGANIZATION",
      "Roles": [
        {
          "Role": "VIEWER",
          "Type": "INHERITED"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeResourcePermissions](https://docs.aws.amazon.com/cli/latest/reference/workdocs/describe-resource-permissions.html) in *AWS CLI Command Reference*. 
describe-users

The following code example shows how to use describe-users.

AWS CLI

To retrieve details for specified users

This example retrieves details for all the users in the specified organization.

Command:

```
aws workdocs describe-users --organization-id d-926726012c
```

Output:

```json
{
   "Users": [
       {
           "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
           "Username": "example1User",
           "OrganizationId": "d-926726012c",
           "RootFolderId": "3c0e3f849dd20a9771d937b9bbcc97e18796150ae56c26d64a4fa0320a2dedc9",
           "RecycleBinFolderId": "c277f4c4d647be1f5147b3184ffa96e1e2bf708278b696cacba68ba13b91f4fe",
           "Status": "INACTIVE",
           "Type": "USER",
           "CreatedTimestamp": 1535478999.452,
           "ModifiedTimestamp": 1535478999.452
       },
       {
           "Id": "S-1-1-11-1111111111-2222222222-3333333333-4444&d-926726012c",
           "Username": "example2User",
           "EmailAddress": "example2User@site.awsapps.com",
           "GivenName": "example2Name",
           "Surname": "example2Surname",
           "OrganizationId": "d-926726012c",
           "RootFolderId": "35b886cb17198cbd547655e58b025dff0cf34aead638be52009567e23dc67390",

           "Status": "ACTIVE",
           "Type": "MINIMALUSER",
```

Actions and scenarios 6362
For API details, see DescribeUsers in AWS CLI Command Reference.

**get-document-path**

The following code example shows how to use get-document-path.

**AWS CLI**

To retrieve a document's path information

This example retrieves the path information (hierarchy from the root folder) for the specified document, and includes the names of the parent folders.

Command:

```
aws workdocs get-document-path --document-id d90d93c1fe44bad0c8471e973ebab339090401a95e777cfa58e977d2983b65 --fields NAME
```

Output:

```
{
   "Path": {
     "Components": [
       {
         "Id": "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
         "Name": "/"
       },
       {
         "Id": "1ece93e5fe75315c7407c4967918b4fd9da87d8beb2a588e67b7fda4a98fde678",
         "Name": "Top Level Folder"
       },
       {
         "Id": "d90d93c1fe44bad0c8471e973ebab339090401a95e777cfa58e977d2983b65",
         "Name": "Top Level Folder"
       }
     ]
   }
}
```
For API details, see GetDocumentPath in AWS CLI Command Reference.

get-document-version

The following code example shows how to use get-document-version.

AWS CLI

To retrieve version metadata for a specified document

This example retrieves version metadata for the specified document, including a source URL and custom metadata.

Command:

```
aws workdocs get-document-version --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --fields SOURCE --include-custom-metadata
```

Output:

```
{
  "Metadata": {
    "Id": "1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920",
    "Name": "exampleDoc",
    "ContentType": "application/vnd.openxmlformats-officedocument.wordprocessingml.document",
    "Size": 11537,
    "Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
    "Status": "ACTIVE",
    "CreatedTimestamp": 1521672507.741,
    "ModifiedTimestamp": 1534451113.504,
    "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "Source": {
```

Actions and scenarios
For API details, see GetDocumentVersion in AWS CLI Command Reference.

get-document

The following code example shows how to use get-document.

AWS CLI

To retrieve document details

This example retrieves the details of the specified document.

Command:

```
aws workdocs get-document --document-id
d90d93c1fe44bad0c8471e973ebba339090401a95e777cfa58e977d2983b65
```

Output:

```
{
  "Metadata": {
    "Id": "d90d93c1fe44bad0c8471e973ebba339090401a95e777cfa58e977d2983b65",
    "CreatorId": "S-1-1-11-111111111111-2222222222-3333333333-3333&d-926726012c",
    "ParentFolderId": "1ece93e5fe75315c7407c4967918b4fdd9da87dd2a588e67b7fda64a98fde678",
    "CreatedTimestamp": 1529005196.082,
    "ModifiedTimestamp": 1534452483.01,
    "LatestVersionMetadata": {
      "Id": "1534452029587-15e129dfe187505c407588df255be83de2920d733859f1d2762411d22a83e3ef",
      "Name": "exampleDoc.docx",
```
• For API details, see GetDocument in AWS CLI Command Reference.

get-folder-path

The following code example shows how to use get-folder-path.

AWS CLI

To retrieve path information for a folder

This example retrieves the path information (hierarchy from the root folder) for the specified folder, and includes the names of the parent folders.

Command:

```bash
aws workdocs get-folder-path --folder-id 50893c0af679524d1a0e0651130ed6073e1a05f95bd12c42dcde5d35634ed08 --fields NAME
```

Output:

```json
{
  "Path": {
    "Components": [
      {
        "Id": "a43d29cb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
        "Name": "/"
      },
      {
```
get-folder

The following code example shows how to use get-folder.

AWS CLI

To retrieve the metadata for a folder

This example retrieves the metadata for the specified folder.

Command:

```bash
aws workdocs get-folder --folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```json
{
  "Metadata": {
    "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
    "Name": "exampleFolder",
    "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "ParentFolderId": "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
    "CreatedTimestamp": 1534450467.622,
    "ModifiedTimestamp": 1534451113.504,
    "ResourceState": "ACTIVE",
  }
}
```
For more information, see **GetFolder** in *AWS CLI Command Reference*.

**get-resources**

The following code example shows how to use `get-resources`.

**AWS CLI**

To retrieve shared resources

The following `get-resources` example retrieves the resources shared with the specified Amazon WorkDocs user.

```shell
aws workdocs get-resources \
  --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333" \n  --collection-type SHARED_WITH_ME
```

Output:

```json
{
  "Folders": [],
  "Documents": []
}
```

For more information, see [Sharing Files and Folders](https://docs.amazonworkdocs.com/en_US/latest/user-guide/sharing-files-and-folders.html) in the *Amazon WorkDocs User Guide*.

For API details, see **GetResources** in *AWS CLI Command Reference*.

**initiate-document-version-upload**

The following code example shows how to use `initiate-document-version-upload`.

**AWS CLI**

To initiate a document version upload
The following *initiate-document-upload* example creates a new document object and version object.

```
aws workdocs initiate-document-version-upload \
  --name exampledocname \
  --parent-folder-id
eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189
```

Output:

```
{
  "Metadata": {
    "Id": "feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2",
    "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",

### remove-all-resource-permissions

The following code example shows how to use `remove-all-resource-permissions`.

**AWS CLI**

To remove all permissions from a specified resource

This example removes all permissions from the specified resource.

Command:

```bash
aws workdocs remove-all-resource-permissions --resource-id 1ece93e5fe75315c7407c4967918b4fd9da87dd2a588e67b7fdaf4a98fde678
```

Output:

None

For API details, see [RemoveAllResourcePermissions](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/workdocs/removeallresourcepermissions.html) in *AWS CLI Command Reference*.

### remove-resource-permission

The following code example shows how to use `remove-resource-permission`.

**AWS CLI**

To remove permissions from a resource

This example removes permissions from the resource for the specified principal.

Command:

```bash
aws workdocs remove-resource-permission --resource-id 1ece93e5fe75315c7407c4967918b4fd9da87dd2a588e67b7fdaf4a98fde678 --principal-id anonymous
```
For API details, see RemoveResourcePermission in AWS CLI Command Reference.

**update-document-version**

The following code example shows how to use update-document-version.

**AWS CLI**

To change a document version status to Active

This example changes the status of the document version to Active.

Command:

```bash
aws workdocs update-document-version --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dc903be982d3 --version-id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --version-status ACTIVE
```

Output:

None

For API details, see UpdateDocumentVersion in AWS CLI Command Reference.

**update-document**

The following code example shows how to use update-document.

**AWS CLI**

To update a document

This example updates a document's name and parent folder.

Command:
aws workdocs update-document --document-id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --name updatedDoc --parent-folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08

Output:

None

- For API details, see UpdateDocument in AWS CLI Command Reference.

**update-folder**

The following code example shows how to use `update-folder`.

**AWS CLI**

**To update a folder**

This example updates a folder's name and parent folder.

**Command:**

```
aws workdocs update-folder --folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 --name exampleFolder1 --parent-folder-id lece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

None

- For API details, see UpdateFolder in AWS CLI Command Reference.

**update-user**

The following code example shows how to use `update-user`.

**AWS CLI**

**To update a user**
This example updates the time zone for the specified user.

Command:

```bash
aws workdocs update-user --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c" --time-zone-id "America/Los_Angeles"
```

Output:

```json
{
   "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser",
      "EmailAddress": "exampleUser@site.awsapps.com",
      "GivenName": "Example",
      "Surname": "User",
      "OrganizationId": "d-926726012c",
      "RootFolderId": "c5eceb5e1a2d1d460c9d1af8330ae117fc8d39bb1d3ed6acd0992d5ff192d986",
      "RecycleBinFolderId": "6ca20102926ad15f04b1d248d6d2e44f2449944eda5c758f9a1e9df6a6b7fa66",
      "Status": "ACTIVE",
      "Type": "USER",
      "TimeZoneId": "America/Los_Angeles",
      "Storage": {
         "StorageUtilizedInBytes": 0,
         "StorageRule": {
            "StorageAllocatedInBytes": 53687091200,
            "StorageType": "QUOTA"
         }
      }
   }
}
```

- For API details, see [UpdateUser](http://docs.aws.amazon.com/cli/latest/index.html#updateuser) in *AWS CLI Command Reference*.

**Amazon WorkMail examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

**Actions**

associate-delegate-to-resource

The following code example shows how to use associate-delegate-to-resource.

**AWS CLI**

To add a delegate to a resource

The following associate-delegate-to-resource command adds a delegate to a resource.

```
aws workmail associate-delegate-to-resource \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [AssociateDelegateToResource](https://docs.aws.amazon.com/cli/latest/reference/workmail/associate-delegate-to-resource.html) in *AWS CLI Command Reference*.

associate-member-to-group

The following code example shows how to use associate-member-to-group.

**AWS CLI**

To add a member to a group
The following associate-member-to-group command adds the specified member to a group.

```bash
aws workmail associate-member-to-group \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --group-id S-1-1-11-1222222222-2222333333-3333344444-4444 \
   --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [AssociateMemberToGroup](#) in *AWS CLI Command Reference*.

---

**create-alias**

The following code example shows how to use create-alias.

**AWS CLI**

**To create an alias**

The following create-alias command creates an alias for the specified entity (user or group).

```bash
aws workmail create-alias \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-11-1222222222-2222333333-3333344444-4444 \
   --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

---

**create-group**

The following code example shows how to use create-group.

**AWS CLI**

**To create a new group**

The following create-group command creates a new group for the specified organization.

```bash
aws workmail create-group \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
```
--name exampleGroup1

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444"
}
```

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

**create-resource**

The following code example shows how to use `create-resource`.

**AWS CLI**

To create a new resource

The following `create-resource` command creates a new resource (meeting room) for the specified organization.

```
aws workmail create-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleRoom1 \
    --type ROOM
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251f9e92c"
}
```

- For API details, see [CreateResource](#) in *AWS CLI Command Reference*.

**create-user**

The following code example shows how to use `create-user`.

**AWS CLI**

To create a new user
The following `create-user` command creates a new user.

```bash
aws workmail create-user \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --name exampleName \
  --display-name exampleDisplayName \
  --password examplePa$$w0rd
```

Output:

```json
{
  "UserId": "S-1-1-1-1111111111-2222222222-3333333333-3333"
}
```

- For API details, see [CreateUser](https://docs.aws.amazon.com/cli/latest/reference/workmail/create-user.html) in *AWS CLI Command Reference*.

### delete-access-control-rule

The following code example shows how to use `delete-access-control-rule`.

**AWS CLI**

**To delete an access control rule**

The following `delete-access-control-rule` example deletes the specified access control rule from the specified Amazon WorkMail organization.

```bash
aws workmail delete-access-control-rule \
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
  --name "myRule"
```

This command produces no output.

For more information, see [Working with Access Control Rules](https://docs.aws.amazon.com/workmail/latest/adminguide/working-with-access-control-rules.html) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [DeleteAccessControlRule](https://docs.aws.amazon.com/cli/latest/reference/workmail/delete-access-control-rule.html) in *AWS CLI Command Reference*.

### delete-alias

The following code example shows how to use `delete-alias`.
AWS CLI

To delete an alias

The following delete-alias command deletes the alias for the specified entity (user or group).

```bash
aws workmail delete-alias \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
   --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see `DeleteAlias` in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use delete-group.

AWS CLI

To delete an existing group

The following delete-group command deletes an existing group from Amazon WorkMail.

```bash
aws workmail delete-group \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

This command produces no output.

- For API details, see `DeleteGroup` in *AWS CLI Command Reference*.

delete-mailbox-permissions

The following code example shows how to use delete-mailbox-permissions.

AWS CLI

To delete mailbox permissions
The following delete-mailbox-permissions command deletes mailbox permissions that were previously granted to a user or group. The entity represents the user that owns the mailbox, and the grantee represents the user or group for whom to delete permissions.

```
aws workmail delete-mailbox-permissions \\
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \\
    --entity-id S-1-1-11-1122222222-2222233333-333334444-4444 \\
    --grantee-id S-1-1-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeleteMailboxPermissions in AWS CLI Command Reference.

**delete-resource**

The following code example shows how to use delete-resource.

**AWS CLI**

To delete an existing resource

The following delete-resource command deletes an existing resource from Amazon WorkMail.

```
aws workmail delete-resource \\
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \\
    --resource-id r-7afe0efbade843a58c010251f892c
```

This command produces no output.

- For API details, see DeleteResource in AWS CLI Command Reference.

**delete-user**

The following code example shows how to use delete-user.

**AWS CLI**

To delete a user

The following delete-user command deletes the specified user from Amazon WorkMail and all subsequent systems.
This command produces no output.

- For API details, see [DeleteUser](#) in AWS CLI Command Reference.

**deregister-from-work-mail**

The following code example shows how to use `deregister-from-work-mail`.

**AWS CLI**

**To disable an existing entity**

The following `deregister-from-work-mail` command disables an existing entity (user, group, or resource) from using Amazon WorkMail.

```
aws workmail deregister-from-work-mail \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DeregisterFromWorkMail](#) in AWS CLI Command Reference.

**describe-group**

The following code example shows how to use `describe-group`.

**AWS CLI**

**To retrieve information for a group**

The following `describe-group` command retrieves information about the specified group.

```
aws workmail describe-group \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --group-id S-1-1-1112222222-2222233333-3333334444-4444
```
Output:

```json
{
    "GroupId": "S-1-1-11-1122222222-2222333333-3333344444-4444",
    "Name": "exampleGroup1",
    "State": "ENABLED"
}
```

- For API details, see [DescribeGroup](https://docs.aws.amazon.com/awscmds/latest/cli/html/aws_workmail_describe-group.html) in *AWS CLI Command Reference*.

**describe-organization**

The following code example shows how to use `describe-organization`.

**AWS CLI**

**To retrieve information for an organization**

The following `describe-organization` command retrieves information for the specified Amazon WorkMail organization.

```
aws workmail describe-organization \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```json
{
    "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
    "Alias": "alias",
    "State": "Active",
    "DirectoryId": "d-926726012c",
    "DirectoryType": "VpcDirectory",
    "DefaultMailDomain": "site.awsapps.com",
    "CompletedDate": 1522693605.468,
    "ARN": "arn:aws:workmail:us-west-2:111122223333:organization/m-n1pq2345678r901st2u3vx45x6789yza"
}
```

For more information, see [Working with Organizations](https://docs.aws.amazon.com/workmail/latest/adminGuide/organisms.html) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [DescribeOrganization](https://docs.aws.amazon.com/awscmds/latest/cli/html/aws_workmail_describe-organization.html) in *AWS CLI Command Reference*. 

Actions and scenarios
**describe-resource**

The following code example shows how to use `describe-resource`.

**AWS CLI**

To retrieve information for a resource

The following `describe-resource` command retrieves information about the specified resource.

```
aws workmail describe-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cd10251fce992c
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cd10251fce992c",
    "Name": "exampleRoom1",
    "Type": "ROOM",
    "BookingOptions": {
        "AutoAcceptRequests": true,
        "AutoDeclineRecurringRequests": false,
        "AutoDeclineConflictingRequests": true
    },
    "State": "ENABLED"
}
```

- For API details, see [DescribeResource](#) in *AWS CLI Command Reference*.

**describe-user**

The following code example shows how to use `describe-user`.

**AWS CLI**

To retrieve user information

The following `describe-user` command retrieves information about the specified user.

```
aws workmail describe-user \
```
Output:

```json
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333",
    "Name": "exampleUser1",
    "Email": "exampleUser1@site.awsapps.com",
    "DisplayName": "",
    "State": "ENABLED",
    "UserRole": "USER",
    "EnabledDate": 1532459261.827
}
```

- For API details, see [DescribeUser](https://awscli.amazonaws.com/v2/documentation/api/current/reference/api/describe-user.html) in *AWS CLI Command Reference*.

### disassociate-delegate-from-resource

The following code example shows how to use `disassociate-delegate-from-resource`.

**AWS CLI**

**To remove a member from a resource**

The following `disassociate-delegate-from-resource` command removes the specified member from a resource.

```
ws workmail disassociate-delegate-from-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aabb7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DisassociateDelegateFromResource](https://awscli.amazonaws.com/v2/documentation/api/current/reference/api/disassociate-delegate-from-resource.html) in *AWS CLI Command Reference*.

### disassociate-member-from-group

The following code example shows how to use `disassociate-member-from-group`.

Actions and scenarios
**AWS CLI**

**To remove a member from a group**

The following disassociate-member-from-group command removes the specified member from a group.

```bash
aws workmail disassociate-member-from-group
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
  --group-id S-1-1-11-1122222222-2222233333-3333344444-4444
  --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DisassociateMemberFromGroup in *AWS CLI Command Reference*.

**get-access-control-effect**

The following code example shows how to use get-access-control-effect.

**AWS CLI**

**To get the effect of access control rules**

The following get-access-control-effect example retrieves the effect of the specified Amazon WorkMail organization's access control rules for the specified IP address, access protocol action, and user ID.

```bash
aws workmail get-access-control-effect
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza
  --ip-address "192.0.2.0"
  --action "WindowsOutlook"
  --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333"
```

Output:

```json
{
  "Effect": "DENY",
  "MatchedRules": [
    "myRule"
  ]
}
```
For more information, see Working with Access Control Rules in the Amazon WorkMail Administrator Guide.

- For API details, see GetAccessControlEffect in AWS CLI Command Reference.

get-mailbox-details

The following code example shows how to use get-mailbox-details.

AWS CLI

To get a user's mailbox details

The following get-mailbox-details command retrieves details about the specified user's mailbox.

```bash
aws workmail get-mailbox-details \
   --organization-id m-npq2345678r901st2u3vx45x6789yza \
   --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```json
{
   "MailboxQuota": 51200,
   "MailboxSize": 0.03890800476074219
}
```

For more information, see Managing User Accounts in the Amazon WorkMail Administrator Guide.

- For API details, see GetMailboxDetails in AWS CLI Command Reference.

list-access-control-rules

The following code example shows how to use list-access-control-rules.

AWS CLI

To list access control rules
The following list-access-control-rules example lists the access control rules for the specified Amazon WorkMail organization.

```bash
aws workmail list-access-control-rules \
   --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
   "Rules": [
   {
      "Name": "default",
      "Effect": "ALLOW",
      "Description": "Default WorkMail Rule",
      "DateCreated": 0.0,
      "DateModified": 0.0
   },
   {
      "Name": "myRule",
      "Effect": "DENY",
      "Description": "my rule",
      "UserIds": [
      "S-1-1-1111111111-2222222222-3333333333-3333"
      ],
      "DateCreated": 1581635628.0,
      "DateModified": 1581635628.0
   }
   ]
}
```

For more information, see [Working with Access Control Rules](#) in the [Amazon WorkMail Administrator Guide](#).

- For API details, see [ListAccessControlRules](#) in AWS CLI Command Reference.

**list-aliases**

The following code example shows how to use list-aliases.

**AWS CLI**

To list aliases for a member
The following list-aliases command lists aliases for the specified member (user or group).

```
aws workmail list-aliases \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
  "Aliases": [
    "exampleAlias@site.awsapps.com",
    "exampleAlias1@site.awsapps.com"
  ]
}
```

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

**list-group-members**

The following code example shows how to use list-group-members.

**AWS CLI**

**To list group members**

The following list-group-members command lists the members of the specified group.

```
aws workmail list-group-members \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --group-id S-1-1-11-1122222222-2222333333-3333344444-4444
```

Output:

```
{
  "Members": [
    {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
      "Name": "exampleUser1",
      "Type": "USER",
      "State": "ENABLED",
      "EnabledDate": 1532459261.827
    }
  ]
}
```
list-groups

The following code example shows how to use list-groups.

**AWS CLI**

**To retrieve a list of groups**

The following `list-groups` command retrieves summaries of the groups in the specified organization.

```
aws workmail list-groups \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333344444-4444",
            "Name": "exampleGroup1",
            "State": "DISABLED"
        },
        {
            "Id": "S-4-4-44-1122222222-2222233333-3333344444-4444",
            "Name": "exampleGroup2",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see [ListGroupMembers](https://docs.aws.amazon.com/cli/latest/reference/workmail/list-group-members.html) in *AWS CLI Command Reference*.

**list-mailbox-permissions**

The following code example shows how to use list-mailbox-permissions.

Actions and scenarios
AWS CLI

To retrieve mailbox permissions

The following list-mailbox-permissions command retrieves the mailbox permissions associated with the specified entity's mailbox.

```
aws workmail list-mailbox-permissions \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
   "Permissions": [
      {
         "GranteeId": "S-1-1-11-1122222222-2222233333-3333344444-4444",
         "GranteeType": "USER",
         "PermissionValues": [
            "FULL_ACCESS"
         ]
      }
   ]
}
```

- For API details, see ListMailboxPermissions in AWS CLI Command Reference.

list-organizations

The following code example shows how to use list-organizations.

AWS CLI

To retrieve a list of organizations

The following list-organizations command retrieves summaries of non-deleted organizations.

```
aws workmail list-organizations
```

Output:
For API details, see ListOrganizations in AWS CLI Command Reference.

list-resource-delegates

The following code example shows how to use list-resource-delegates.

AWS CLI

To list the delegates for a resource

The following list-resource-delegates command retrieves the delegates associated with the specified resource.

```bash
code
aws workmail list-resource-delegates
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
   --resource-id r-68bf2d3b1c0244aab7264c24b9217443
```

Output:

```json
{
   "Delegates": [
      {
         "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
         "Type": "USER"
      }
   ]
}
```

For API details, see ListResourceDelegates in AWS CLI Command Reference.
list-resources

The following code example shows how to use list-resources.

AWS CLI

To retrieve a list of resources

The following list-resources command retrieves summaries of the resources for the specified organization.

```
aws workmail list-resources \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
   "Resources": [
     {
       "Id": "r-7afe0efbade843a58c0d10251f992c",
       "Name": "exampleRoom1",
       "Type": "ROOM",
       "State": "ENABLED"
     }
   ]
}
```

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a resource

The following list-tags-for-resource example lists the tags for the specified Amazon WorkMail organization.

```
aws workmail list-tags-for-resource \
```
--resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-n1pq2345678r901st2u3vx45x6789yza

Output:

```json
{
   "Tags": [
      {
         "Key": "priority",
         "Value": "1"
      }
   ]
}
```

For more information, see [Tagging an Organization](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

### list-users

The following code example shows how to use `list-users`.

**AWS CLI**

#### To retrieve a list of users

The following `list-users` command retrieves summaries of the users in the specified organization.

```bash
aws workmail list-users \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```json
{
   "Users": [
      {
         "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
         "Email": "exampleUser1@site.awsapps.com",
         "Name": "exampleUser1",
         "State": "ENABLED",
```
• For API details, see ListUsers in AWS CLI Command Reference.

put-access-control-rule

The following code example shows how to use put-access-control-rule.

AWS CLI

To put a new access control rule

The following put-access-control-rule example denies the specified user access to the specified Amazon WorkMail organization.

```bash
aws workmail put-access-control-rule
  --name "myRule" 
  --effect "DENY" 
  --description "my rule" 
  --user-ids "S-1-1-11-1111111111-2222222222-3333333333-3333" 
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

This command produces no output.

For more information, see Working with Access Control Rules in the Amazon WorkMail Administrator Guide.

• For API details, see PutAccessControlRule in AWS CLI Command Reference.

put-mailbox-permissions

The following code example shows how to use put-mailbox-permissions.
AWS CLI

To set mailbox permissions

The following `put-mailbox-permissions` command sets full access permissions for the specified grantee (user or group). The entity represents the owner of the mailbox.

```
aws workmail put-mailbox-permissions \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
   --grantee-id S-1-1-11-1122222222-2222333333-3333334444-4444 \
   --permission-values FULL_ACCESS
```

This command produces no output.

- For API details, see `PutMailboxPermissions` in *AWS CLI Command Reference*.

register-to-work-mail

The following code example shows how to use `register-to-work-mail`.

AWS CLI

To register an existing or disabled entity

The following `register-to-work-mail` command enables the specified existing entity (user, group, or resource) to use Amazon WorkMail.

```
aws workmail register-to-work-mail \
   --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
   --entity-id S-1-1-11-1122222222-2222333333-3333334444-4444 \
   --email exampleGroup1@site.awsapps.com
```

This command produces no output.

- For API details, see `RegisterToWorkMail` in *AWS CLI Command Reference*.

reset-password

The following code example shows how to use `reset-password`.
AWS CLI

To reset a user's password

The following `reset-password` command resets the password for the specified user.

```bash
aws workmail reset-password \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --password examplePa$$w0rd
```

This command produces no output.

- For API details, see `ResetPassword` in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To apply a tag to a resource

The following `tag-resource` example applies a tag with key "priority" and value "1" to the specified Amazon WorkMail organization.

```bash
aws workmail tag-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-n1pq2345678r901st2u3vx45x6789yza \
    --tags "Key=priority,Value=1"
```

This command produces no output.

For more information, see [Tagging an Organization](https://docs.aws.amazon.com/workmail/latest/admin-guide/Tagging-an-Organization.html) in the *Amazon WorkMail Administrator Guide*.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use `untag-resource`.
AWS CLI

**To untag a resource**

The following `untag-resource` example removes the specified tag from the specified Amazon WorkMail organization.

```bash
aws workmail untag-resource \
   --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-nlpq2345678r901st2u3vx45x6789yza \
   --tag-keys "priority"
```

This command produces no output.

For more information, see [Tagging an Organization](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

**update-mailbox-quota**

The following code example shows how to use `update-mailbox-quota`.

AWS CLI

**To update a user's mailbox quota**

The following `update-mailbox-quota` command changes the specified user's mailbox quota.

```bash
awsworkmailupdate-mailbox-quota \
   --organization-id m-nlpq2345678r901st2u3vx45x6789yza \
   --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
   --mailbox-quota 40000
```

This command produces no output.

For more information, see [Managing User Accounts](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [UpdateMailboxQuota](#) in *AWS CLI Command Reference*. 
update-primary-email-address

The following code example shows how to use update-primary-email-address.

AWS CLI

To update a primary email address

The following update-primary-email-address command updates the primary email address of the specified entity (user, group, or resource).

```bash
aws workmail update-primary-email-address \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
  --email exampleUser2@site.awsapps.com
```

This command produces no output.

- For API details, see [UpdatePrimaryEmailAddress](#) in [AWS CLI Command Reference](#).

update-resource

The following code example shows how to use update-resource.

AWS CLI

To update a resource

The following update-resource command updates the name of the specified resource.

```bash
aws workmail update-resource \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --resource-id r-7afe0efbade843a58cdc10251fceb992c \
  --name exampleRoom2
```

This command produces no output.

- For API details, see [UpdateResource](#) in [AWS CLI Command Reference](#).

Amazon WorkMail Message Flow examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail Message Flow.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

get-raw-message-content

The following code example shows how to use get-raw-message-content.

AWS CLI

To get the raw content of an email message

The following get-raw-message-content example gets the raw content of an in-transit email message and sends it to a text file named test.

```bash
aws workmailmessageflow get-raw-message-content \
    --message-id a1b2cd34-ef5g-6h7j-kl8m-npq9012345rs \
    test
```

Contents of file test after command runs:

```
Subject: Hello World
From: =?UTF-8?Q?marymajor marymajor?= <marymajor@example.com>
To: =?UTF-8?Q?mateojackson=40example=2Enet?= <mateojackson@example.net>
Date: Thu, 7 Nov 2019 19:22:46 +0000
Mime-Version: 1.0
Content-Type: multipart/alternative;
    boundary="=_EXAMPLE+
References: <mail.1ab23c45.5de6.7f890g123hj45678@storeage.wm.amazon.com>
```
This is a multi-part message in MIME format. Your mail reader does not understand MIME message format.

---_EXAMPLE+
Content-Type: text/plain; charset=UTF-8
Content-Transfer-Encoding: 7bit

**WorkSpaces examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with WorkSpaces.
**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**create-tags**

The following code example shows how to use `create-tags`.

**AWS CLI**

**To add tags to a WorkSpace**

The following `create-tags` example adds the specified tags to the specified WorkSpace.

```bash
aws workspaces create-tags \
  --resource-id ws-dk1xzc417 \
  --tags Key=Department,Value=Finance
```

This command produces no output.

For more information, see [Tag WorkSpaces resources](https://docs.aws.amazon.com/wss/latest/userguide/working-with-ws-tags.html) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [CreateTags](https://docs.aws.amazon.com/cli/latest/reference/workspaces/create-tags.html) in *AWS CLI Command Reference*.

**create-workspaces**

The following code example shows how to use `create-workspaces`.
## AWS CLI

**Example 1: To create an AlwaysOn WorkSpace**

The following `create-workspaces` example creates an AlwaysOn WorkSpace for the specified user, using the specified directory and bundle.

```bash
aws workspaces create-workspaces \
  --workspaces DirectoryId=d-926722edaf,UserName=Mateo,BundleId=wsb-0zsvgp8fc
```

Output:

```json
{
  "FailedRequests": [],
  "PendingRequests": [
  {
    "WorkspaceId": "ws-kcqms853t",
    "DirectoryId": "d-926722edaf",
    "UserName": "Mateo",
    "State": "PENDING",
    "BundleId": "wsb-0zsvgp8fc"
  }
  ]
}
```

**Example 2: To create an AutoStop WorkSpace**

The following `create-workspaces` example creates an AutoStop WorkSpace for the specified user, using the specified directory and bundle.

```bash
aws workspaces create-workspaces \
  --workspaces DirectoryId=d-926722edaf,UserName=Mary,BundleId=wsb-0zsvgp8fc,WorkspaceProperties={RunningMode=AUTO_STOP}
```

Output:

```json
{
  "FailedRequests": [],
  "PendingRequests": [
  {
    "WorkspaceId": "ws-dk1xzr417",
    "DirectoryId": "d-926722edaf",
    "UserName": "Mary",
    "State": "PENDING",
    "BundleId": "wsb-0zsvgp8fc"
  }
  ]
}
```
Example 3: To create a user-decoupled WorkSpace

The following `create-workspaces` example creates a user-decoupled WorkSpace by setting the username to `[UNDEFINED]`, and specifying a WorkSpace name, directory ID, and bundle ID.

```bash
aws workspaces create-workspaces \
  --workspaces \
    DirectoryId=d-926722edaf,UserName='[UNDEFINED]',WorkspaceName=MaryWorkspace1,BundleId=wsb-0zsvgp8fc,WorkspaceProperties={RunningMode=ALWAYS_ON}
```

Output:

```json
{
   "FailedRequests": [],
   "PendingRequests": [
      {
         "WorkspaceId": "ws-abcd1234",
         "DirectoryId": "d-926722edaf",
         "UserName": "[UNDEFINED]",
         "State": "PENDING",
         "BundleId": "wsb-0zsvgp8fc",
         "WorkspaceName": "MaryWorkspace1"
      }
   ]
}
```

For more information, see [Launch a virtual desktop](https://docs.aws.amazon.com/workspaces/admin-guide/launch.html) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [CreateWorkspaces](https://docs.aws.amazon.com/cli/latest/reference/workspaces/create-workspaces.html) in *AWS CLI Command Reference*.

**delete-tags**

The following code example shows how to use `delete-tags`.
AWS CLI

To delete a tag from a WorkSpace

The following delete-tags example deletes the specified tag from the specified WorkSpace.

```
aws workspaces delete-tags \
  --resource-id ws-dk1xzt417 \
  --tag-keys Department
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the Amazon WorkSpaces Administration Guide.
- For API details, see DeleteTags in AWS CLI Command Reference.

deregister-workspace-directory

The following code example shows how to use deregister-workspace-directory.

AWS CLI

To deregister a directory

The following deregister-workspace-directory example deregisters the specified directory.

```
aws workspaces deregister-workspace-directory \
  --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register a directory with WorkSpaces in the Amazon WorkSpaces Administration Guide.
- For API details, see DeregisterWorkspaceDirectory in AWS CLI Command Reference.

describe-tags

The following code example shows how to use describe-tags.
AWS CLI

To describe the tags for a WorkSpace

The following describe-tags example describes the tags for the specified WorkSpace.

```
aws workspaces describe-tags \
  --resource-id ws-dk1xzr417
```

Output:

```
{
  "TagList": [
    {
      "Key": "Department",
      "Value": "Finance"
    }
  ]
}
```

For more information, see Tag WorkSpaces resources in the Amazon WorkSpaces Administration Guide.

- For API details, see DescribeTags in AWS CLI Command Reference.

describe-workspace-bundles

The following code example shows how to use describe-workspace-bundles.

AWS CLI

To list the bundles provided by Amazon

The following describe-workspace-bundles example lists the names and IDs of the bundles provided by Amazon, in table format and sorted by name.

```
aws workspaces describe-workspace-bundles \
  --owner AMAZON \
  --query "Bundles[*].[Name, BundleId]"
```

Output:
For more information, see WorkSpaces bundles and images in the Amazon WorkSpaces Administration Guide.

- For API details, see DescribeWorkspaceBundles in AWS CLI Command Reference.

describe-workspace-directories

The following code example shows how to use describe-workspace-directories.

AWS CLI

To describe a registered directory

The following describe-workspace-directories example describes the specified registered directory.

aws workspaces describe-workspace-directories \
--directory-ids d-926722edaf
Output:

```json
{
    "Directories": [
        {
            "DirectoryId": "d-926722edaf",
            "Alias": "d-926722edaf",
            "DirectoryName": "example.com",
            "RegistrationCode": "WSpdx+9RJ8JT",
            "SubnetIds": [
                "subnet-9d19c4c6",
                "subnet-500d5819"
            ],
            "DnsIpAddresses": [
                "172.16.1.140",
                "172.16.0.30"
            ],
            "CustomerUserName": "Administrator",
            "IamRoleId": "arn:aws:iam::123456789012:role/workspaces_DefaultRole",
            "DirectoryType": "SIMPLE_AD",
            "WorkspaceSecurityGroupId": "sg-0d89e927e5645d7c5",
            "State": "REGISTERED",
            "WorkspaceCreationProperties": {
                "EnableWorkDocs": false,
                "EnableInternetAccess": false,
                "UserEnabledAsLocalAdministrator": true,
                "EnableMaintenanceMode": true
            },
            "WorkspaceAccessProperties": {
                "DeviceTypeWindows": "ALLOW",
                "DeviceTypeOsx": "ALLOW",
                "DeviceTypeWeb": "DENY",
                "DeviceTypeIos": "ALLOW",
                "DeviceTypeAndroid": "ALLOW",
                "DeviceTypeChromeOs": "ALLOW",
                "DeviceTypeZeroClient": "ALLOW",
                "DeviceTypeLinux": "DENY"
            },
            "Tenancy": "SHARED",
            "SelfservicePermissions": {
                "RestartWorkspace": "ENABLED",
                "IncreaseVolumeSize": "DISABLED",
                "ChangeComputeType": "DISABLED",
                "SwitchRunningMode": "DISABLED"
            }
        }
    ]
}
```
"RebuildWorkspace": "DISABLED"
}
]
}

For more information, see Manage directories for WorkSpaces in the Amazon WorkSpaces Administration Guide.

- For API details, see DescribeWorkspaceDirectories in AWS CLI Command Reference.

describe-workspaces-connection-status

The following code example shows how to use describe-workspaces-connection-status.

AWS CLI

To describe the connection status of a WorkSpace

The following describe-workspaces-connection-status example describes the connection status of the specified WorkSpace.

```bash
aws workspaces describe-workspaces-connection-status \
--workspace-ids ws-dk1xzr417
```

Output:

```json
{
  "WorkspacesConnectionStatus": [
    {
      "WorkspaceId": "ws-dk1xzr417",
      "ConnectionState": "CONNECTED",
      "ConnectionStateCheckTimestamp": 1662526214.744
    }
  ]
}
```

For more information, see Administer your WorkSpaces in the Amazon WorkSpaces Administration Guide.

- For API details, see DescribeWorkspacesConnectionStatus in AWS CLI Command Reference.
**describe-workspaces**

The following code example shows how to use `describe-workspaces`.

### AWS CLI

**To describe a WorkSpace**

The following `describe-workspaces` example describes the specified WorkSpace.

```bash
aws workspaces describe-workspaces \
    --workspace-ids ws-dk1xzr417
```

**Output:**

```json
{
    "Workspaces": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "IpAddress": "172.16.0.175",
            "State": "STOPPED",
            "BundleId": "wsb-0zsvgp8fc",
            "SubnetId": "subnet-500d5819",
            "ComputerName": "WSAMZN-RBSLTTD9",
            "WorkspaceProperties": {
                "RunningMode": "AUTO_STOP",
                "RunningModeAutoStopTimeoutInMinutes": 60,
                "RootVolumeSizeGib": 80,
                "UserVolumeSizeGib": 10,
                "ComputeTypeName": "VALUE"
            },
            "ModificationStates": []
        }
    ]
}
```

For more information, see [Administer your WorkSpaces](https://docs.aws.amazon.com/workspaces/latest/adminguide/compute-types.html) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeWorkspaces](https://docs.aws.amazon.com/cli/latest/reference/workspaces/describe-workspaces.html) in *AWS CLI Command Reference*.
**migrate-workspace**

The following code example shows how to use `migrate-workspace`.

**AWS CLI**

**To migrate a WorkSpace**

The following `migrate-workspace` example migrates the specified WorkSpace to the specified bundle.

```bash
aws workspaces migrate-workspace \
   --source-workspace-id ws-dk1xzr417 \
   --bundle-id wsb-j4dky1gs4
```

Output:

```json
{
   "SourceWorkspaceId": "ws-dk1xzr417",
   "TargetWorkspaceId": "ws-x5h1lbkp5"
}
```

For more information, see [Migrate a WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [MigrateWorkspace](#) in *AWS CLI Command Reference*.

**modify-workspace-creation-properties**

The following code example shows how to use `modify-workspace-creation-properties`.

**AWS CLI**

**To modify a WorkSpace creation property of a directory**

The following `modify-workspace-creation-properties` example enables the `EnableInternetAccess` property for the specified directory. This enables automatic assignment of public IP addresses for the WorkSpaces created for the directory.

```bash
aws workspaces modify-workspace-creation-properties \
   --resource-id d-926722edaf \
   --resource-id d-926722edaf
```
This command produces no output.

For more information, see Update directory details for your WorkSpaces in the Amazon WorkSpaces Administration Guide.

- For API details, see ModifyWorkspaceCreationProperties in AWS CLI Command Reference.

modify-workspace-properties

The following code example shows how to use modify-workspace-properties.

AWS CLI

To modify the running mode of a WorkSpace

The following modify-workspace-properties example sets the running mode of the specified WorkSpace to AUTO_STOP.

```
aws workspaces modify-workspace-properties \
   --workspace-id ws-dklxzx417 \
   --workspace-properties RunningMode=AUTO_STOP
```

This command produces no output.

For more information, see Modify a WorkSpace in the Amazon WorkSpaces Administration Guide.

- For API details, see ModifyWorkspaceProperties in AWS CLI Command Reference.

modify-workspace-state

The following code example shows how to use modify-workspace-state.

AWS CLI

To modify the state of a WorkSpace

The following modify-workspace-state example sets the state of the specified WorkSpace to ADMIN_MAINTENANCE.

```
aws workspaces modify-workspace-state \
```
This command produces no output.

For more information, see WorkSpace maintenance in the Amazon WorkSpaces Administration Guide.
• For API details, see ModifyWorkspaceState in AWS CLI Command Reference.

**reboot-workspaces**

The following code example shows how to use `reboot-workspaces`.

**AWS CLI**

**To reboot a WorkSpace**

The following `reboot-workspaces` example reboots the specified WorkSpace.

```bash
aws workspaces reboot-workspaces \
   --reboot-workspace-requests ws-dk1xzr417
```

Output:

```json
{
   "FailedRequests": []
}
```

For more information, see Reboot a WorkSpace in the Amazon WorkSpaces Administration Guide.
• For API details, see RebootWorkspaces in AWS CLI Command Reference.

**rebuild-workspaces**

The following code example shows how to use `rebuild-workspaces`.

**AWS CLI**

**To rebuild a WorkSpace**
The following `rebuild-workspaces` example rebuilds the specified WorkSpace.

```
aws workspaces rebuild-workspaces \\
   --rebuild-workspace-requests ws-dk1xze417
```

Output:

```
{
   "FailedRequests": []
}
```

For more information, see [Rebuild a WorkSpace](https://docs.aws.amazon.com/workspaces/latest/admguide/rebuild-workspace.html) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RebuildWorkspaces](https://docs.aws.amazon.com/awscmdreference/latest/developerguide/cli-reference-workspaces-rebuild-workspace.html) in *AWS CLI Command Reference*.

**register-workspace-directory**

The following code example shows how to use `register-workspace-directory`.

**AWS CLI**

**To register a directory**

The following `register-workspace-directory` example registers the specified directory for use with Amazon WorkSpaces.

```
aws workspaces register-workspace-directory \\
   --directory-id d-926722edaf \\
   --no-enable-work-docs
```

This command produces no output.

For more information, see [Register a directory with WorkSpaces](https://docs.aws.amazon.com/workspaces/latest/admguide/register-workspace-directory.html) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RegisterWorkspaceDirectory](https://docs.aws.amazon.com/awscmdreference/latest/developerguide/cli-reference-workspaces-register-workspace-directory.html) in *AWS CLI Command Reference*.

**restore-workspace**

The following code example shows how to use `restore-workspace`. 
AWS CLI

To restore a WorkSpace

The following `restore-workspace` example restores the specified WorkSpace.

```bash
aws workspaces restore-workspace \
--workspace-id ws-dk1xzr417
```

This command produces no output.

For more information, see [Restore a WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RestoreWorkspace](#) in *AWS CLI Command Reference*.

start-workspaces

The following code example shows how to use `start-workspaces`.

AWS CLI

To start an AutoStop WorkSpace

The following `start-workspaces` example starts the specified WorkSpace. The WorkSpace must have a running mode of AutoStop.

```bash
aws workspaces start-workspaces \
--start-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```json
{
   "FailedRequests": []
}
```

For more information, see [Stop and start an AutoStop WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [StartWorkspaces](#) in *AWS CLI Command Reference*. 
**stop-workspaces**

The following code example shows how to use `stop-workspaces`.

**AWS CLI**

**To stop an AutoStop WorkSpace**

The following `stop-workspaces` example stops the specified WorkSpace. The WorkSpace must have a running mode of AutoStop.

```bash
aws workspaces stop-workspaces \
    --stop-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```json
{
    "FailedRequests": []
}
```

For more information, see [Stop and start an AutoStop WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [StopWorkspaces](#) in *AWS CLI Command Reference*.

**terminate-workspaces**

The following code example shows how to use `terminate-workspaces`.

**AWS CLI**

**To terminate a WorkSpace**

The following `terminate-workspaces` example terminates the specified workspace.

```bash
aws workspaces terminate-workspaces \
    --terminate-workspace-requests ws-dk1xzr417
```

Output:

```json
{
}
```
"FailedRequests": []
}

For more information, see Delete a WorkSpace in the Amazon WorkSpaces Administration Guide.

- For API details, see TerminateWorkspaces in AWS CLI Command Reference.

X-Ray examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with X-Ray.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

batch-traces-get

The following code example shows how to use batch-traces-get.

AWS CLI

To get a list of traces

The following batch-get-traces example retrieves a list of traces specified by an ID. The full trace includes a document for each segment, compiled from all of the segment documents received with the same trace ID.

```bash
aws xray batch-get-traces
```
Output:

```
{
    "Traces": [
    {
        "Id": "1-5d82881a-0a9126e92a73e971eed891b9",
        "Duration": 0.232,
        "Segments": [
        {

        {
            "Id": "0f278b6334c34e6b",
            "Document": "{"id":"0f278b6334c34e6b","name":"DynamoDB","start_time":1.568835610658E9,"end_time":1.568835610664E9,"http":{"response":{"status":200,"content_length":61}},"aws":{"table_name":"scorekeep-user","operation":"UpdateItem","request_id":"TPEIDNDUOMLP0V17U4A79555NV4KQNS05AEMVJF66Q9ASUAAJG","resource_names":[]},"namespace":"aws"}"
        }
    }
    ]
}
```
create-group

The following code example shows how to use create-group.

AWS CLI

To create a group

The following create-group example creates a group resource named AdminGroup. The group gets a filter expression that defines the criteria of the group as a segment related to a specific service causing a fault or an error.

```bash
aws xray create-group \
  --group-name "AdminGroup" \
  --filter-expression "service("mydomain.com") {fault OR error}"
```

Output:

```json
{
   "GroupName": "AdminGroup",
   "FilterExpression": "service("mydomain.com") {fault OR error}"}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

• For API details, see CreateGroup in AWS CLI Command Reference.

create-sampling-rule

The following code example shows how to use create-sampling-rule.
AWS CLI

To create a sampling rule

The following create-sampling-rule example creates a rule to control sampling behavior for instrumented applications. The rules are provided by a JSON file. The majority of the sampling rule fields are required to create the rule.

```
aws xray create-sampling-rule \
   --cli-input-json file://9000-base-scorekeep.json
```

Contents of 9000-base-scorekeep.json:

```
{
   "SamplingRule": {
      "RuleName": "base-scorekeep",
      "ResourceARN": "*",
      "Priority": 9000,
      "FixedRate": 0.1,
      "ReservoirSize": 5,
      "ServiceName": "Scorekeep",
      "ServiceType": "*",
      "Host": "*",
      "HTTPMethod": "*",
      "URLPath": "*",
      "Version": 1
   }
}
```

Output:

```
{
   "SamplingRuleRecord": {
      "SamplingRule": {
         "RuleName": "base-scorekeep",
         "ResourceARN": "*",
         "Priority": 9000,
         "FixedRate": 0.1,
         "ReservoirSize": 5,
         "ServiceName": "Scorekeep",
         "ServiceType": "*",
         "Host": "*",
         "HTTPMethod": "*",
         "URLPath": "*",
```
For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see CreateSamplingRule in AWS CLI Command Reference.

**delete-group**

The following code example shows how to use delete-group.

**AWS CLI**

To delete a group

The following delete-group example deletes the specified group resource.

```
aws xray delete-group \
  --group-name "AdminGroup" \
  --group-arn "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789"
```

This command produces no output.

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see DeleteGroup in AWS CLI Command Reference.

**delete-sampling-rule**

The following code example shows how to use delete-sampling-rule.
To delete a sampling rule

The following delete-sampling-rule example deletes the specified sampling rule. You can specify the group by using either the group name or group ARN.

```bash
aws xray delete-sampling-rule \
  --rule-name polling-scorekeep
```

Output:

```
{
   "SamplingRuleRecord": {
      "SamplingRule": {
         "RuleName": "polling-scorekeep",
         "ResourceARN": ".",
         "Priority": 5000,
         "FixedRate": 0.003,
         "ReservoirSize": 0,
         "ServiceName": "Scorekeep",
         "ServiceType": ".",
         "Host": ".",
         "HTTPMethod": "GET",
         "URLPath": "/api/state/*",
         "Version": 1,
         "Attributes": {} 
      },
      "CreatedAt": 1530574399.0,
      "ModifiedAt": 1530574399.0
   }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see DeleteSamplingRule in AWS CLI Command Reference.

get-encryption-config

The following code example shows how to use get-encryption-config.
AWS CLI

To retrieve the encryption configuration

The following get-encryption-config example retrieves the current encryption configuration for your AWS X-Ray data.

```
aws xray get-encryption-config
```

Output:

```
{
   "EncryptionConfig": {
      "KeyId": "ae4aa6d49-a4d8-9df9-a475-4ff6d7898456",
      "Status": "ACTIVE",
      "Type": "NONE"
   }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see GetEncryptionConfig in AWS CLI Command Reference.

get-group

The following code example shows how to use get-group.

AWS CLI

To retrieve a group

The following get-group example displays details for the specified group resource. The details include the group name, the group ARN, and the filter expression that defines the criteria for that group. Groups can also be retrieved by ARN.

```
aws xray get-group
   --group-name "AdminGroup"
```

Output:

```
{
```
For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see GetGroup in AWS CLI Command Reference.

### get-groups

The following code example shows how to use get-groups.

**AWS CLI**

**To retrieve all groups**

The following example displays details for all active group.

```bash
aws xray get-groups
```

**Output:**

```json
{
  "Groups": [
    {
      "GroupName": "AdminGroup",
      "FilterExpression": "service("mydomain.com") {fault OR error}"}
  ,
    {
      "GroupName": "SDETGroup",
      "FilterExpression": "responsetime > 2"
    }
  ]
}
```
For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see GetGroups in AWS CLI Command Reference.

get-sampling-rules

The following code example shows how to use get-sampling-rules.

AWS CLI

To retrieve all sampling rules

The following get-sampling-rules example displays details for all available sampling rules:

```
aws xray get-sampling-rules
```

Output:

```
{
  "SamplingRuleRecords": [
    {
      "SamplingRule": {
        "RuleName": "Default",
        "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/Default",
        "ResourceARN": "*",
        "Priority": 10000,
        "FixedRate": 0.01,
        "ReservoirSize": 0,
        "ServiceName": "*",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1,
        "Attributes": {}
      },
      "CreatedAt": 0.0,
      "ModifiedAt": 1530558121.0
    },
  ]
}
```
{  
  "SamplingRule": {  
    "RuleName": "base-scorekeep",
    "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/base-scorekeep",
    "ResourceARN": "*",
    "Priority": 9000,
    "FixedRate": 0.1,
    "ReservoirSize": 2,
    "ServiceName": "Scorekeep",
    "ServiceType": "*",
    "Host": "*",
    "HTTPMethod": "*",
    "URLPath": "*",
    "Version": 1,
    "Attributes": {}
  },
  "CreatedAt": 1530573954.0,
  "ModifiedAt": 1530920505.0
  
  },
  {  
    "SamplingRule": {  
      "RuleName": "polling-scorekeep",
      "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/polling-scorekeep",
      "ResourceARN": "*",
      "Priority": 5000,
      "FixedRate": 0.003,
      "ReservoirSize": 0,
      "ServiceName": "Scorekeep",
      "ServiceType": "*",
      "Host": "*",
      "HTTPMethod": "GET",
      "URLPath": "/api/state/*",
      "Version": 1,
      "Attributes": {}
    },
    "CreatedAt": 1530918163.0,
    "ModifiedAt": 1530918163.0
  }
}
For more information, see Using Sampling Rules with the X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see GetSamplingRules in AWS CLI Command Reference.

get-sampling-targets

The following code example shows how to use get-sampling-targets.

AWS CLI

To request a sampling quota

The following get-sampling-targets example requests a sampling quota for rules that the service is using to sample requests. The response from AWS X-Ray includes a quota that can be used instead of borrowing from the reservoir.

```bash
aws xray get-sampling-targets \
    --sampling-statistics-documents ' [ { "RuleName": "base-scorekeep", "ClientID": "ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06", "RequestCount": 110, "SampledCount": 20, "BorrowCount": 10 }, { "RuleName": "polling-scorekeep", 31, "BorrowCount": 0 } ]'
```

Output:

```json
{
    "SamplingTargetDocuments": [
        {
            "RuleName": "base-scorekeep",
            "FixedRate": 0.1,
            "ReservoirQuota": 2,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        },
        {
            "RuleName": "polling-scorekeep",
            "FixedRate": 0.003,
            "ReservoirQuota": 0,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        }
    ],
    "LastRuleModification": 1530920505.0
}
```
get-service-graph

The following code example shows how to use get-service-graph.

AWS CLI

To get a service graph

The following example displays a document within a specified time period that describes services processing incoming requests, and the downstream services that they call as a result:

```bash
aws xray get-service-graph \
   --start-time 1568835392.0 \
   --end-time 1568835446.0
```

Output:

```json
{
   "Services": [
      {
         "ReferenceId": 0,
         "Name": "Scorekeep",
         "Names": [
            "Scorekeep"
         ],
         "Root": true,
         "Type": "AWS::ElasticBeanstalk::Environment",
         "State": "active",
         "StartTime": 1568835392.0,
         "EndTime": 1568835446.0,
         "Edges": [
            {
               "ReferenceId": 1,
               "StartTime": 1568835392.0,
               "EndTime": 1568835446.0,

```

For more information, see Using Sampling Rules with the X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see GetSamplingTargets in AWS CLI Command Reference.

    "Value": 0.006,
    "Count": 2
  }
],
For more information, see Using the AWS X-Ray API with the AWS CLI in the AWS X-Ray Developer Guide.

- For API details, see GetServiceGraph in AWS CLI Command Reference.

get-trace-summaries

The following code example shows how to use get-trace-summaries.

AWS CLI

To get a trace summary

The following get-trace-summaries example retrieves IDs and metadata for traces available within a specified time frame.

```
aws xray get-trace-summaries \
  --start-time 1568835392.0 \
  --end-time 1568835446.0
```

Output:

```
[
]```
For more information, see **Using the AWS X-Ray API with the AWS CLI** in the *AWS X-Ray Developer Guide*.

- For API details, see **GetTraceSummaries** in *AWS CLI Command Reference*.

### put-encryption-config

The following code example shows how to use put-encryption-config.

**AWS CLI**

**To update the encryption configuration**

The following `put-encryption-config` example updates the encryption configuration for AWS X-Ray data to use the default AWS managed KMS key `aws/xray`.

```bash
aws xray put-encryption-config 
  --type KMS 
  --key-id alias/aws/xray
```

**Output:**

```
{
    "EncryptionConfig": {
        "KeyId": "arn:aws:kms:us-west-2:123456789012:key/c234g4e8-39e9-4gb0-84e2-b0ea215cbba5",
        "Status": "UPDATING",
        "Type": "KMS"
    }
}
```

For more information, see **Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API** in the *AWS X-Ray Developer Guide*.

- For API details, see **PutEncryptionConfig** in *AWS CLI Command Reference*.
**put-trace-segments**

The following code example shows how to use `put-trace-segments`.

**AWS CLI**

**To upload a segment**

The following `put-trace-segments` example uploads segment documents to AWS X-Ray. The segment document is consumed as a list of JSON segment documents.

```
aws xray put-trace-segments
   --trace-segment-documents "{"id":"20312a0e2b8809f4","name":"DynamoDB","trace_id":"1-5832862d-a43aafded333a971fe312db","start_time":1.479706157195E9,"end_time":1.479706157202E9,"parent_id":"79736b962fe3239e","http":{"response":{"content_length":60,"status":200}},"inferred":true,"aws":{"consistent_read":false,"table_name":"scorekeep-session-xray","operation":"GetItem","request_id":"SCAU23OM6M8F038UASGC7785ARVV4KQNS05AEMVJF66Q9ASUAAJG","resource_names": ["scorekeep-session-xray"],"origin":"AWS::DynamoDB::Table"}"
```

Output:

```
{
   "UnprocessedTraceSegments": []
}
```

For more information, see [Sending Trace Data to AWS X-Ray](https://docs.aws.amazon.com/xray/latest/devguide/send-trace-data-to-xray.html) in the *AWS X-Ray Developer Guide*.

- For API details, see [PutTraceSegments](https://docs.aws.amazon.com/cli/latest/reference/xray/put-trace-segments.html) in *AWS CLI Command Reference*.

**update-group**

The following code example shows how to use `update-group`.

**AWS CLI**

**To update a group**

The following `update-group` example updates the criteria by which to accept traces into the group named AdminGroup. You can specify the desired group by using either the group name or group ARN.
aws xray update-group \
   --group-name "AdminGroup" \
   --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789" \
   --filter-expression "service("mydomain.com") {fault}" 

Output:

```json
{
  "GroupName": "AdminGroup",
  "FilterExpression": "service("mydomain.com") {fault}"}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see UpdateGroup in AWS CLI Command Reference.

**update-sampling-rule**

The following code example shows how to use update-sampling-rule.

**AWS CLI**

To update a sampling rule

The following update-sampling-rule example modifies a sampling rule's configuration. The rules are consumed from a JSON file. Only the fields being updated are required.

```bash
aws xray update-sampling-rule \
   --cli-input-json file://1000-default.json
```

Contents of 1000-default.json:

```json
{
   "SamplingRuleUpdate": {
      "RuleName": "Default",
      "FixedRate": 0.01,
      "ReservoirSize": 0
   }
}
```
Output:

```
{
   "SamplingRuleRecords": [
   {
      "SamplingRule": {
         "RuleName": "Default",
         "ResourceARN": "*",
         "Priority": 10000,
         "FixedRate": 0.01,
         "ReservoirSize": 0,
         "ServiceName": "*",
         "ServiceType": "*",
         "Host": "*",
         "HTTPMethod": "*",
         "URLPath": "*",
         "Version": 1,
         "Attributes": {}
      },
      "CreatedAt": 0.0,
      "ModifiedAt": 1529959993.0
   }
   ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the AWS X-Ray Developer Guide.

- For API details, see UpdateSamplingRule in AWS CLI Command Reference.

## AWS CLI with Bash script code examples

The code examples in this topic show you how to use the AWS Command Line Interface with Bash script with AWS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Cross-service examples are sample applications that work across multiple AWS services.

Examples
- Actions and scenarios using AWS CLI with Bash script

Actions and scenarios using AWS CLI with Bash script

The following code examples show how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS services.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Services
- DynamoDB examples using AWS CLI with Bash script
- Amazon EC2 examples using AWS CLI with Bash script
- HealthImaging examples using AWS CLI with Bash script
- IAM examples using AWS CLI with Bash script
- Amazon S3 examples using AWS CLI with Bash script
- AWS STS examples using AWS CLI with Bash script

DynamoDB examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

BatchGetItem

The following code example shows how to use BatchGetItem.

AWS CLI with Bash script

```bash
#############################################################################
# function dynamodb_batch_get_item
#
# This function gets a batch of items from a DynamoDB table.
#
# Parameters:
#   -i item  -- Path to json file containing the keys of the items to get.
#
# Returns:
#   The items as json output.
# And:
#   0 - If successful.
#   1 - If it fails.
#############################################################################
function dynamodb_batch_get_item() {
    local item response
    local option OPTARG # Required to use getopts command in a function.
```
function usage() {
    echo "function dynamodb_batch_get_item"
    echo "Get a batch of items from a DynamoDB table."
    echo " -i item -- Path to json file containing the keys of the items to get."
    echo ""
}

while getopts "i:h" option; do
    case "${option}" in
        i) item="${OPTARG}" ;;
        h) usage
            return 0
            ;;
        \?)
            echo "Invalid parameter"
            usage
            return 1
            ;;
        esac
    done
    export OPTIND=1
    if [[ -z "$item" ]]; then
        errecho "ERROR: You must provide an item with the -i parameter."
        usage
        return 1
    fi

    response=$(aws dynamodb batch-get-item \
        --request-items file://"$item")
    local error_code=${?}
    if [[ $error_code -ne 0 ]]; then
        aws_cli_error_log $error_code
        errecho "ERROR: AWS reports batch-get-item operation failed.$response"
        return 1
    fi
    echo "$response"
The utility functions used in this example.

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
function errecho() {
    printf "%s\n" "$*" 1>&2
}

# function aws_cli_error_log()
#
# This function is used to log the error messages from the AWS CLI.
#
#
# The function expects the following argument:
#       $1 - The error code returned by the AWS CLI.
#
# Returns:
#       0: - Success.
#
function aws_cli_error_log() {
    local err_code=$1
    errecho "Error code : $err_code"
    if [ "$err_code" == 1 ]; then
        errecho " One or more S3 transfers failed."
    elif [ "$err_code" == 2 ]; then
        errecho " Command line failed to parse."
    elif [ "$err_code" == 130 ]; then
        errecho " Process received SIGINT."
    elif [ "$err_code" == 252 ]; then
        errecho " Command syntax invalid."
    elif [ "$err_code" == 253 ]; then
```

---

Actions and scenarios

---

6436
if [ "$err_code" -eq 250 ]; then
  errecho " The system environment or configuration was invalid."
elif [ "$err_code" -eq 254 ]; then
  errecho " The service returned an error."
elif [ "$err_code" -eq 255 ]; then
  errecho " 255 is a catch-all error."
fi

return 0
}

- For API details, see `BatchGetItem` in *AWS CLI Command Reference*.

### BatchWriteItem

The following code example shows how to use `BatchWriteItem`.

#### AWS CLI with Bash script

```
# This function writes a batch of items into a DynamoDB table.

# Parameters:
#   -i item  -- Path to json file containing the items to write.

# Returns:
#   0 - If successful.
#   1 - If it fails.

function dynamodb_batch_write_item() {
  local item response
  local option OPTARG # Required to use getopts command in a function.

  # Required to use getopts command in a function.

  # This function writes a batch of items into a DynamoDB table.

  # Parameters:
  #   -i item  -- Path to json file containing the items to write.
  #
  # Returns:
  #   0 - If successful.
  #   1 - If it fails.

  # Required to use getopts command in a function.
```

Query

The following code example shows how to use Query.

AWS CLI with Bash script

```bash
# function dynamodb_query
#
# This function queries a DynamoDB table.
```

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
# Parameters:
#       -n table_name  -- The name of the table.
#       -k key_condition_expression -- The key condition expression.
#       -a attribute_names -- Path to JSON file containing the attribute names.
#       -v attribute_values -- Path to JSON file containing the attribute values.
#       [-p projection_expression]  -- Optional projection expression.
#
#  Returns:
#       The items as json output.
# And:
#       0 - If successful.
#       1 - If it fails.

    elif [ "$err_code" == 255 ]; then
        errecho " 255 is a catch-all error."
    fi

    return 0
}
```
Scenarios

Get started with tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

AWS CLI with Bash script

```bash
# function dynamodb_getting_started_movies
#
# Scenario to create an Amazon DynamoDB table and perform a series of operations on
# the table.
#
# Returns:
#   0 - If successful.
#   1 - If an error occurred.
function dynamodb_getting_started_movies() {
  source ./dynamodb_operations.sh
}
```

The DynamoDB functions used in this scenario.

# function dynamodb_create_table
#
# This function creates an Amazon DynamoDB table.
# Parameters:
#       -n table_name  -- The name of the table to create.
#       -a attribute_definitions -- JSON file path of a list of attributes and their types.
#       -k key_schema -- JSON file path of a list of attributes and their key types.
#       -p provisioned_throughput -- Provisioned throughput settings for the table.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.

Amazon EC2 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

AllocateAddress

The following code example shows how to use AllocateAddress.

AWS CLI with Bash script

```
# function ec2_allocate_address
#
```

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
# This function allocates an Elastic IP address for use with Amazon Elastic Compute
Cloud (Amazon EC2) instances in a specific AWS Region.
#
# Parameters:
#       -d domain - The domain for the Elastic IP address (either 'vpc' or 'standard').
#
# Returns:
#       The allocated Elastic IP address, or an error message if the operation
#       fails.
# And:
#       0 - If successful.
#       1 - If it fails.
#
function ec2_allocate_address() {
    local domain response

    # Function to display usage information
    function usage() {
        echo "function ec2_allocate_address"
        echo "Allocates an Elastic IP address for use with Amazon Elastic Compute Cloud
        (Amazon EC2) instances in a specific AWS Region."
        echo "    -d domain - The domain for the Elastic IP address (either 'vpc' or 'standard')."
        echo ""
    }

    # Parse the command-line arguments
    while getopts "d:h" option; do
        case "${option}" in
            d) domain="${OPTARG}" ;;
            h)
                usage
                return 0
                ;;
            \?)
                echo "Invalid parameter"
                usage
                return 1
                ;;
        esac
    done
    export OPTIND=1
# Validate the input parameters

DeleteKeyPair

The following code example shows how to use DeleteKeyPair.

AWS CLI with Bash script

```bash
# function ec2_delete_keypair
#
# This function deletes an Amazon EC2 ED25519 or 2048-bit RSA key pair.
# Parameters:
# -n key_pair_name - A key pair name.
# And:
# 0 - If successful.
# 1 - If it fails.
function ec2_delete_keypair() {
    local key_pair_name response
    local option OPTARG
    # Required to use getopts command in a function.
    bashsupport disable=BP5008
    function usage() {
        echo "function ec2_delete_keypair"
    }
    # This function deletes an Amazon EC2 ED25519 or 2048-bit RSA key pair.
    # Parameters:
    # -n key_pair_name - A key pair name.
    # And:
    # 0 - If successful.
    # 1 - If it fails.
    #}
```
echo "Deletes an Amazon EC2 ED25519 or 2048-bit RSA key pair."
  -n key_pair_name - A key pair name.
echo ""

# Retrieve the calling parameters.
while getopts "n:h" option; do
  case "$option" in
    n) key_pair_name="${OPTARG}" ;;
    h) usage
      return 0
      ;;
    \?)
      echo "Invalid parameter"
      usage
      return 1
      ;;
  esac
done
export OPTIND=1

if [[ -z "$key_pair_name" ]]; then
  errecho "ERROR: You must provide a key pair name with the -n parameter."
  usage
  return 1
fi

response=$(aws ec2 delete-key-pair 
  --key-name "$key_pair_name") || {
  aws_cli_error_log ${?}
  errecho "ERROR: AWS reports delete-key-pair operation failed.$response"
  return 1
}

return 0
}

The utility functions used in this example.
# This function outputs everything sent to it to STDERR (standard error output).

## Scenarios

### Get started with instances

The following code example shows how to:
AWS Command Line Interface

User Guide for Version 2

• Create a key pair and security group.
• Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.
• Stop and restart the instance.
• Associate an Elastic IP address with your instance.
• Connect to your instance with SSH, then clean up resources.
AWS CLI with Bash script
Note
There's more on GitHub. Find the complete example and learn how to set up and run in
the AWS Code Examples Repository.

Run an interactive scenario at a command prompt.

### function ec2_authorize_security_group_ingress

This function authorizes an ingress rule for an Amazon Elastic Compute Cloud (Amazon EC2) security group.

**Parameters:**
- `-g security_group_id` - The ID of the security group.
- `-i ip_address` - The IP address or CIDR block to authorize.
- `-p protocol` - The protocol to authorize (e.g., tcp, udp, icmp).
- `-f from_port` - The start of the port range to authorize.
- `-t to_port` - The end of the port range to authorize.

**And:**
- `0` - If successful.
- `1` - If it fails.

```bash
function ec2_authorize_security_group_ingress() {
    local security_group_id ip_address protocol from_port to_port response
    local option OPTARG # Required to use getopts command in a function.

The utility functions used in this scenario.

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
function errecho() {
    printf "%s\n" "$*

# function aws_cli_error_log()
```
This function is used to log the error messages from the AWS CLI.

The function expects the following argument:

$1 - The error code returned by the AWS CLI.

Returns:

0: - Success.

######################################################################

function aws_cli_error_log() {
    local err_code=$1
    errecho "Error code : $err_code"
    if [ "$err_code" == 1 ]; then
        errecho " One or more S3 transfers failed."
    elif [ "$err_code" == 2 ]; then
        errecho " Command line failed to parse."
    elif [ "$err_code" == 130 ]; then
        errecho " Process received SIGINT."
    elif [ "$err_code" == 252 ]; then
        errecho " Command syntax invalid."
    elif [ "$err_code" == 253 ]; then
        errecho " The system environment or configuration was invalid."
    elif [ "$err_code" == 254 ]; then
        errecho " The service returned an error."
    elif [ "$err_code" == 255 ]; then
        errecho " 255 is a catch-all error."
    fi

    return 0
}

HealthImaging examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

GetDatastore

The following code example shows how to use GetDatastore.

AWS CLI with Bash script

```bash
# function erroecho
#
# This function outputs everything sent to it to STDERR (standard error output).
# function erroecho()
#    printf "\%s\n" "$" 1>&2
#

# function imaging_get_datastore
#
# Get a data store's properties.
# Parameters:
#   -i data_store_id - The ID of the data store.
# Returns:
#   [datastore_name, datastore_id, datastore_status, datastore_arn, created_at, updated_at]
#   And:
#   0 - If successful.
#   1 - If it fails.
# function imaging_get_datastore()
#    local datastore_id option OPTARG # Required to use getopts command in a function.
#    local error_code
#    # bashsupport disable=BP5008
#    function usage()
#       echo "function imaging_get_datastore"
#       echo "Gets a data store's properties."
```
echo " -i datastore_id - The ID of the data store."

# Retrieve the calling parameters.
while getopts "i:h" option; do
  case "${option}" in
    i) datastore_id="${OPTARG}" ;;
    h)
      usage
      return 0
      ;;
    ?)
      echo "Invalid parameter"
      usage
      return 1
      ;;
  esac
done

export OPTIND=1

if [[ -z "$datastore_id" ]]; then
  errorecho "ERROR: You must provide a data store ID with the -i parameter."
  usage
  return 1
fi

local response

response=$(aws medical-imaging get-datastore
                      --datastore-id "$datastore_id"
                      --output text
                      --query "[ datastoreProperties.datastoreName, datastoreProperties.datastoreId, datastoreProperties.datastoreStatus, datastoreProperties.datastoreArn, datastoreProperties.createdAt, datastoreProperties.updatedAt]"
)
error_code=${?}

if [[ $error_code -ne 0 ]]; then

### ListDatastores

The following code example shows how to use ListDatastores.

#### AWS CLI with Bash script

```bash
#!/bin/bash

# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#
function errecho() {
    printf "\%s\n" "$*" 1>&2
}

# function imaging_list_datastores
#
# List the HealthImaging data stores in the account.
#
# Returns:
#       
#   [[datastore_name, datastore_id, datastore_status]]
#   And:
#       0 - If successful.
#       1 - If it fails.
#
function imaging_list_datastores() {
```
For API details, see ListDatastores in AWS CLI Command Reference.
IAM examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with IAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**AttachRolePolicy**

The following code example shows how to use AttachRolePolicy.

**AWS CLI with Bash script**
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
###############################################################################
function errecho() {
    printf "\%s\n" "$*" 1>&2
}
###############################################################################
# function iam_attach_role_policy
#
# This function attaches an IAM policy to a role.
#
# Parameters:
#   -n role_name -- The name of the IAM role.
#   -p policy_ARN -- The IAM policy document ARN.
#
# Returns:
#   0 - If successful.
#   1 - If it fails.
###############################################################################
function iam_attach_role_policy() {
    local role_name policy_arn response
    local option OPTARG # Required to use getopts command in a function.

    # bashsupport disable=BP5008
    function usage() {
        echo "function iam_attach_role_policy"
        echo "Attaches an AWS Identity and Access Management (IAM) policy to an IAM role."
        echo "  -n role_name -- The name of the IAM role."
        echo "  -p policy_ARN -- The IAM policy document ARN."
        echo ""
    }

    # Retrieve the calling parameters.
    while getopts "n:p:h" option; do
        case "${option}" in
            n) role_name="${OPTARG}" ;;
            p) policy_arn="${OPTARG}" ;;
            h) usage
        esac
    esac
}
For API details, see AttachRolePolicy in AWS CLI Command Reference.
CreateAccessKey

The following code example shows how to use CreateAccessKey.

AWS CLI with Bash script

---

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
# function errecho() {
#     printf "%s\n" "$*" 1>&2
#

# function iam_create_user_access_key
#
# This function creates an IAM access key for the specified user.
# Parameters:
#       -u user_name -- The name of the IAM user.
#       [-f file_name] -- The optional file name for the access key output.
# Returns:
#       [access_key_id access_key_secret]
#     And:
#       0 - If successful.
#       1 - If it fails.
# function iam_create_user_access_key() {
#     local user_name file_name response
#     local option OPTARG # Required to use getopts command in a function.
#
#     # bashsupport disable=BP5008
#     function usage() {
#         echo "function iam_create_user_access_key"
```

    aws_cli_error_log $error_code
    errecho "ERROR: AWS reports list-users operation failed.$response"
    return 1
fi

echo "$response"
return 0
}

- For API details, see ListUsers in AWS CLI Command Reference.

Scenarios

Create a user and assume a role

The following code example shows how to create a user and assume a role.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

AWS CLI with Bash script

ℹ️ Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
# function iam_create_user_assume_role
#
# Scenario to create an IAM user, create an IAM role, and apply the role to the
# user.
#
# "IAM access" permissions are needed to run this code.
# "STS assume role" permissions are needed to run this code. (Note: It might be
# necessary to
# create a custom policy).

Amazon S3 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon S3.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**
- **Scenarios**

**Actions**

**CopyObject**

The following code example shows how to use CopyObject.

**AWS CLI with Bash script**

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
function errecho()
{
```

---

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws/aws-code-examples).

---
printf "%s\n" "$*" 1>&2
}

###############################################################################
# function copy_item_in_bucket
#
# This function creates a copy of the specified file in the same bucket.
#
# Parameters:
#       $1 - The name of the bucket to copy the file from and to.
#       $2 - The key of the source file to copy.
#       $3 - The key of the destination file.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
###############################################################################
function copy_item_in_bucket() {
    local bucket_name=$1
    local source_key=$2
    local destination_key=$3
    local response

    response=$(aws s3api copy-object \

    if [[ $? -ne 0 ]]; then
        errecho "ERROR: AWS reports s3api copy-object operation failed.\n$response"
        return 1
    fi
}

• For API details, see CopyObject in AWS CLI Command Reference.

CreateBucket

The following code example shows how to use CreateBucket.
### AWS CLI with Bash script

#### Note
There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-code-examples).

```bash
# function iecho
#
# This function enables the script to display the specified text only if the global variable $VERBOSE is set to true.
function iecho() {
    if [[ $VERBOSE == true ]]; then
        echo "$@
    fi
}
```

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
function errecho() {
    printf "%s\n" "$*" 1>&2
}
```

```bash
# function create-bucket
#
# This function creates the specified bucket in the specified AWS Region, unless it already exists.
#
# Parameters:
#   -b bucket_name  -- The name of the bucket to create.
#   -r region_code  -- The code for an AWS Region in which to create the bucket.
#
# Returns:
#   The URL of the bucket that was created.
```
function create_bucket()

        errecho "ERROR: AWS reports s3api delete-object operation failed.\n$response"
    fi
}
• For API details, see `DeleteObject` in AWS CLI Command Reference.

**DeleteObjects**

The following code example shows how to use DeleteObjects.

**AWS CLI with Bash script**

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
function errecho() {
    printf "\n" "$*" 1>&2
}

# function delete_items_in_bucket
#
# This function deletes the specified list of keys from the specified bucket.
# Parameters:
#   $1 - The name of the bucket.
#   $2 - A list of keys in the bucket to delete.
# Returns:
#   0 - If successful.
#   1 - If it fails.
```
function delete_items_in_bucket() {
    local bucket_name=$1
    local keys=$2
    local response

    # Create the JSON for the items to delete.
    local delete_items
    delete_items="{"\"Objects\":[
    for key in $keys; do
        delete_items+="{"\"Key\": \"$key\"},"
    done
    delete_items=${delete_items%?} # Remove the final comma.
    delete_items="$delete_items"]"

    response=$(aws s3api delete-objects \
        --bucket "$bucket_name" \
        --delete "$delete_items")

    # shellcheck disable=SC2181
    if [[ $? -ne 0 ]]; then
        errecho "ERROR: AWS reports s3api delete-object operation failed.\n$response"
        return 1
    fi
}

- For API details, see [DeleteObjects](https://docs.aws.amazon.com/cli/latest/reference/s3api/delete-objects.html) in AWS CLI Command Reference.

GetObject

The following code example shows how to use GetObject.

AWS CLI with Bash script

ℹ️ Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws-samples/aws-cli-code-examples).
```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
*****************************************************************************
function errecho() {
    printf "\%s\n" "$*" 1>&2
}
*****************************************************************************

# function download_object_from_bucket
#
# This function downloads an object in a bucket to a file.
#
# Parameters:
#       $1 - The name of the bucket to download the object from.
#       $2 - The path and file name to store the downloaded bucket.
#       $3 - The key (name) of the object in the bucket.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
*****************************************************************************
function download_object_from_bucket() {
    local bucket_name=$1
    local destination_file_name=$2
    local object_name=$3
    local response

    response=$(aws s3api get-object
        --bucket "$bucket_name"
        --key "$object_name"
        "$destination_file_name"
    )

    # shellcheck disable=SC2181
    if [[ $? -ne 0 ]]; then
        errecho "ERROR: AWS reports put-object operation failed.\n$response"
        return 1
    fi
}
```

HeadBucket

The following code example shows how to use HeadBucket.

**AWS CLI with Bash script**

```bash
#!/bin/bash
# function bucket_exists
#
# This function checks to see if the specified bucket already exists.
#
# Parameters:
# $1 - The name of the bucket to check.
#
# Returns:
# 0 - If the bucket already exists.
# 1 - If the bucket doesn't exist.

function bucket_exists() {
    local bucket_name
    bucket_name=$1

    # Check whether the bucket already exists.
    # We suppress all output - we're interested only in the return code.

    if aws s3api head-bucket -b $bucket_name >/dev/null 2>&1; then
        return 0 # 0 in Bash script means true.
    else
        return 1 # 1 in Bash script means false.
    fi
}
```

- For API details, see [HeadBucket](#) in *AWS CLI Command Reference*.
ListObjectsV2

The following code example shows how to use ListObjectsV2.

AWS CLI with Bash script

```
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
# function errecho() {
#   printf "$s\n" "$*" 1>&2
# }

# function list_items_in_bucket
#
# This function displays a list of the files in the bucket with each file's size. The function uses the --query parameter to retrieve only the key and size fields from the Contents collection.
#
# Parameters:
# $1 - The name of the bucket.
#
# Returns:
# The list of files in text format.
# And:
# 0 - If successful.
# 1 - If it fails.
# function list_items_in_bucket() {
#   local bucket_name=$1
#   local response

#   response=$(aws s3api list-objects
#     --query "Contents[*].Key,Size"
#     --bucket "$bucket_name"
#     --output text)
```

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
For API details, see ListObjectsV2 in AWS CLI Command Reference.

**PutObject**

The following code example shows how to use PutObject.

**AWS CLI with Bash script**

```bash
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#
function errecho() {
    printf "%s\n " "$*" 1>&2
}

# function copy_file_to_bucket
#
# This function creates a file in the specified bucket.
```
# Parameters:
#       $1 - The name of the bucket to copy the file to.
#       $2 - The path and file name of the local file to copy to the bucket.
#       $3 - The key (name) to call the copy of the file in the bucket.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.

function copy_file_to_bucket() {
    local response bucket_name source_file destination_file_name
    bucket_name=$1
    source_file=$2
    destination_file_name=$3

    response=$(aws s3api put-object
        --bucket "$bucket_name"
        --body "$source_file"
        --key "$destination_file_name"
    )

    # shellcheck disable=SC2181
    if [[ ${?} -ne 0 ]]; then
        errecho "ERROR: AWS reports put-object operation failed.\n$response"
        return 1
    fi
}

• For API details, see **PutObject** in *AWS CLI Command Reference*.

**Scenarios**

**Get started with buckets and objects**

The following code example shows how to:

• Create a bucket and upload a file to it.
• Download an object from a bucket.
• Copy an object to a subfolder in a bucket.
• List the objects in a bucket.
• Delete the bucket objects and the bucket.
### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](https://github.com/aws/aws-code-examples).

# function s3_getting_started
#
# This function creates, copies, and deletes S3 buckets and objects.
#
# Returns:
#     0  - If successful.

**AWS STS examples using AWS CLI with Bash script**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS STS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

AssumeRole

The following code example shows how to use AssumeRole.

AWS CLI with Bash script

```bash
#!/bin/bash

# This function enables the script to display the specified text only if the global variable $VERBOSE is set to true.
function iecho() {
    if [[ $VERBOSE == true ]]; then
        echo "$@
    fi
}

# This function outputs everything sent to it to STDERR (standard error output).
function errecho() {
    printf "\n" "$*" 1>&2
}

# This function assumes a role in the AWS account and returns the temporary credentials.
# Parameters:
#   -n role_session_name -- The name of the session.

# Additional code for AssumeRole
```

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.
function sts_assume_role() {
    local role_session_name role_arn response
    local option OPTARG # Required to use getopts command in a function.

    # bashsupport disable=BP5008
    function usage() {
        echo "function sts_assume_role"
        echo "Assumes a role in the AWS account and returns the temporary credentials:"
        echo "  -n role_session_name -- The name of the session."
        echo "  -r role_arn -- The ARN of the role to assume."
        echo ""
    }

    while getopts n:r:h option; do
        case "${option}" in
            n) role_session_name=${OPTARG} ;;

Security in the AWS Command Line Interface

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to AWS Command Line Interface, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using the AWS Command Line Interface (AWS CLI). The following topics show you how to configure the AWS CLI to meet your security and compliance objectives. You also learn how to use the AWS CLI to help you to monitor and secure your AWS resources.

**Topics**

- Data protection in the AWS CLI
- Identity and Access Management
- Compliance Validation for this AWS Product or Service
- Resilience for this AWS Product or Service
- Infrastructure Security for this AWS Product or Service
- Enforce a minimum version of TLS

**Data protection in the AWS CLI**

The AWS shared responsibility model applies to data protection in AWS Command Line Interface. As described in this model, AWS is responsible for protecting the global infrastructure that runs all
of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a Name field. This includes when you work with AWS CLI or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data encryption

A key feature of any secure service is that information is encrypted when it is not being actively used.

Encryption at rest

The AWS CLI does not itself store any customer data other than the credentials it needs to interact with the AWS services on the user's behalf.
If you use the AWS CLI to invoke an AWS service that transmits customer data to your local computer for storage, then refer to the Security & Compliance chapter in that service's User Guide for information on how that data is stored, protected, and encrypted.

**Encryption in transit**

By default, all data transmitted from the client computer running the AWS CLI and AWS service endpoints is encrypted by sending everything through a HTTPS/TLS connection.

You don't need to do anything to enable the use of HTTPS/TLS. It is always enabled unless you explicitly disable it for an individual command by using the `--no-verify-ssl` command line option.

**Identity and Access Management**

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

**Topics**

- [Audience](#)
- [Authenticating with identities](#)
- [Managing access using policies](#)
- [How AWS services work with IAM](#)
- [Troubleshooting AWS identity and access](#)

**Audience**

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

**Service user** – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see [Troubleshooting AWS identity and access](#) or the user guide of the AWS service you are using.
**Service administrator** – If you’re in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

## Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see [How to sign in to your AWS account](#) in the [AWS Sign-In User Guide](#).

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see [Signing AWS API requests](#) in the [IAM User Guide](#).

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see [Multi-factor authentication](#) in the [AWS IAM Identity Center User Guide](#) and [Using multi-factor authentication (MFA) in AWS](#) in the [IAM User Guide](#).
AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the IAM User Guide.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A federated identity is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see What is IAM Identity Center? in the AWS IAM Identity Center User Guide.

IAM users and groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.
Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the AWS IAM Identity Center User Guide.

- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the IAM User Guide.

- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.

- **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the
principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see Forward access sessions.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

## Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.
By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

**Identity-based policies**

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](https://docs.aws.amazon.com/iam/latest/userguide/creating-iam-policies.html) in the *IAM User Guide*.

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](https://docs.aws.amazon.com/iam/latest/userguide/choosing-managed-inlines.html) in the *IAM User Guide*.

**Resource-based policies**

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.
Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.
Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see AWS services that work with IAM in the IAM User Guide.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

Topics

- I am not authorized to perform an action in AWS
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my AWS resources

I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a fictional my-example-widget resource but doesn't have the fictional awes:GetWidget permissions.

User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: awes:GetWidget on resource: my-example-widget

In this case, the policy for the mateojackson user must be updated to allow access to the my-example-widget resource by using the awes:GetWidget action.
If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

**I am not authorized to perform iam:PassRole**

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named *marymajor* tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

**I want to allow people outside of my AWS account to access my AWS resources**

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see [How AWS services work with IAM](#).
- To learn how to provide access to your resources across AWS accounts that you own, see [Providing access to an IAM user in another AWS account that you own](#) in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see [Providing access to AWS accounts owned by third parties](#) in the IAM User Guide.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users (identity federation)](#) in the IAM User Guide.
To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the IAM User Guide.

Compliance Validation for this AWS Product or Service

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- **Architecting for HIPAA Security and Compliance on Amazon Web Services** – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

**Note**

Not all AWS services are HIPAA eligible. For more information, see the HIPAA Eligible Services Reference.

- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **AWS Customer Compliance Guides** – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- **Evaluating Resources with Rules** in the AWS Config Developer Guide – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
• **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).

• **Amazon GuardDuty** – This AWS service detects potential threats to your AWS accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious activities. GuardDuty can help you address various compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.

• **AWS Audit Manager** – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

### Resilience for this AWS Product or Service

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

### Infrastructure Security for this AWS Product or Service

This AWS product or service uses managed services, and therefore is protected by the AWS global network security. For information about AWS security services and how AWS protects
infrastructure, see [AWS Cloud Security](#). To design your AWS environment using the best practices for infrastructure security, see [Infrastructure Protection](#) in [Security Pillar AWS Well-Architected Framework](#).

You use AWS published API calls to access this AWS Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

### Enforce a minimum version of TLS

To add increased security when communicating with AWS services, you should use TLS 1.2 or later. When you use the AWS CLI, Python is used to set the TLS version.

AWS CLI version 2 uses an internal Python script that's compiled to use a minimum of TLS 1.2 when the service it's talking to supports it. As long as you use version 2 of the AWS CLI, no further steps are needed to enforce this minimum.
Troubleshoot AWS CLI errors

This section covers common errors and troubleshooting steps to follow to resolve your issue. We suggest following the general troubleshooting first.

Contents

• General troubleshooting to try first
  • Check your AWS CLI command formatting
  • Check the AWS Region your AWS CLI command is using
  • Confirm that you're running a recent version of the AWS CLI
  • Use the --debug option
  • Enable and review the AWS CLI command history logs
  • Confirm that your AWS CLI is configured

• Command not found errors
  • The "aws --version" command returns a different version than you installed
  • The "aws --version" command returns a version after uninstalling the AWS CLI
  • The AWS CLI processed a command with an incomplete parameter name

• Access denied errors
• Invalid credentials and key errors
• Signature does not match errors
• SSL certificate errors
• Invalid JSON errors
• Additional resources

General troubleshooting to try first

If you receive an error or encounter an issue with the AWS CLI, we suggest the following general tips to help you troubleshoot.
Check your AWS CLI command formatting

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter (Parameter validation failed) that the documentation says is available, then your command might be formatted incorrectly. We suggest that you check the following:

- Check your command for spelling and formatting errors.
- Confirm all quotes and escaping appropriate for your terminal is correct in your command.
- Generate an AWS CLI skeleton to confirm your command structure.
- For JSON, see the additional troubleshooting for JSON values. If you're having issues with your terminal processing JSON formatting, we suggest skipping past the terminal's quoting rules by using Blobs to pass JSON data directly to the AWS CLI.

For more information on how a specific command should be structured, see the AWS CLI version 2 reference guide.

Check the AWS Region your AWS CLI command is using

Note

You must specify an AWS Region when using the AWS CLI, either explicitly or by setting a default Region. For a list of all of the AWS Regions that you can specify, see AWS Regions and Endpoints in the Amazon Web Services General Reference. The AWS Region designators used by the AWS CLI are the same names that you see in AWS Management Console URLs and service endpoints.

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. In order of precedence, the AWS Region is set in the following ways:

- The --region command line option.
- The SDK compatible AWS_REGION environment variable.
- The AWS_DEFAULT_REGION environment variable.
- The region profile setting.
Confirm you’re using the correct AWS Region for your resources.

**Back to top**

**Confirm that you're running a recent version of the AWS CLI**

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter that the [AWS CLI version 2 reference guide](https://docs.aws.amazon.com/cli/latest/reference/index.html) says is available, first confirm that your command is correctly formatted. If the formatting is correct, then we recommend that you upgrade to the most recent version of the AWS CLI. Updated versions of the AWS CLI are released almost every business day. New AWS services, features, and parameters are introduced in those new versions of the AWS CLI. The only way to get access to those new services, features, or parameters is to upgrade to a version that was released after that element was first introduced.

How you update your version of the AWS CLI depends on how you originally installed it as described in the section called “Install/Update”.

If you used one of the bundled installers, you might need to remove the existing installation before you download and install the latest version for your operating system.

**Back to top**

**Use the --debug option**

When the AWS CLI reports an error that you don't immediately understand, or produces results that you don't expect, you can get more detail about the error by running the command again with the --debug option. With this option, the AWS CLI outputs details about every step it takes to process your command. The details in the output can help you to determine when the error occurs and provides clues about where it started.

You can send the output to a text file for later review, or to send to AWS Support when asked for it.

When you include the --debug option, some of the details include:

- Looking for credentials
- Parsing the provided parameters
- Constructing the request sent to AWS servers
- The contents of the request sent to AWS
- The contents of the raw response
- The formatted output
Here's an example of a command run with and without the `--debug` option.

```bash
$ aws iam list-groups --profile MyTestProfile
{
    "Groups": [
        {
            "Path": "/",
            "GroupName": "MyTestGroup",
            "GroupId": "AGPA0123456789EXAMPLE",
            " Arn": "arn:aws:iam::123456789012:group/MyTestGroup",
            "CreateDate": "2019-08-12T19:34:04Z"
        }
    ]
}

$ aws iam list-groups --profile MyTestProfile --debug
2019-08-12 12:36:18,305 - MainThread - awscli.clidriver - DEBUG - Arguments entered to CLI: ['iam', 'list-groups', ' --debug']
2019-08-12 12:36:18,307 - MainThread - botocore.credentials - DEBUG - Skipping environment variable credential check because profile name was explicitly set.
2019-08-12 12:36:18,307 - MainThread - botocore.hooks - DEBUG - Event session-initialized: calling handler <function add_scalar_parsers at 0x7fdf173161e0>
2019-08-12 12:36:18,308 - MainThread - botocore.hooks - DEBUG - Event session-initialized: calling handler <function register_uri_param_handler at 0x7fdf17dec400>
2019-08-12 12:36:18,308 - MainThread - botocore.hooks - DEBUG - Event session-initialized: calling handler <function inject_assume_role_provider_cache at 0x7fdf17da9378>
2019-08-12 12:36:18,317 - MainThread - botocore.hooks - DEBUG - Event building-command-table.iam: calling handler <function add_waiters at 0x7fdf1731a840>
2019-08-12 12:36:18,321 - MainThread - awscli.clidriver - DEBUG - OrderedDict([('path-prefix', <awscli.arguments.CLIArgument object at 0x7fdf171ac7b0>)), ('marker', <awscli.arguments.CLIArgument object at 0x7fdf171b09e8>)), ('max-items', <awscli.arguments.CLIArgument object at 0x7fdf171b09b0>))
```
Use the --debug option
Use the --debug option
Use the --debug option
Enable and review the AWS CLI command history logs

You can enable the AWS CLI command history logs using the `cli_history` file setting. After enabling this setting, the AWS CLI records the history of `aws` commands.

You can list your history using the `aws history list` command, and use the resulting `command_ids` in the `aws history show` command for details. For more information see `aws history` in the `AWS CLI reference guide`.

When you include the `--debug` option, some of the details include:

- API calls made to botocore
- Status codes
- HTTP responses
- Headers
- Return codes

You can use this information to confirm parameter data and API calls are behaving in the way you expect, and can then deduce at what step in the process your command is failing.

Confirm that your AWS CLI is configured

Various errors can occur if your `config` and `credentials` files or your IAM user or role is not configured correctly. For more information on resolving errors with `config` and `credentials` files or your IAM user or roles, see the section called “Access denied errors” and the section called “Invalid credentials and key errors”.

Back to top
Command not found errors

This error means that the operating system can't find the AWS CLI command. The installation might be incomplete or requires updating.

Possible cause: You're trying to use an AWS CLI feature newer than your installed version, or have incorrect formatting

Example error text:

```
$ aws s3 copy
usage: aws [options] <command> <subcommand> [...] [parameters]
To see help text, you can run:

  aws help
  aws <command> help
  aws <command> <subcommand> help
aws: error: argument subcommand: Invalid choice, valid choices are:

  ls                                       | website
  cp                                       | mv
  ....
```

Various errors can occur if your command is formatted incorrectly or you are using an earlier version from before the feature was released. For more information on resolving errors around these two issues, see the section called “Check your AWS CLI command formatting” and the section called “Confirm that you're running a recent version of the AWS CLI”.

Back to top

Possible cause: The terminal needs to be restarted after installation

Example error text:

```
$ aws --version
command not found: aws
```

If the aws command cannot be found after first installing or updating the AWS CLI, you might need to restart your terminal for it to recognize any PATH updates.

Back to top
Possible cause: The AWS CLI did not fully install

Example error text:

```
$ aws --version
command not found: aws
```

If the aws command cannot be found after first installing or updating the AWS CLI, it might not have been fully installed. Try reinstalling by following the steps for your platform in the section called “Install/Update”.

Back to top

Possible cause: The AWS CLI does not have permissions (Linux)

If the aws command cannot be found after first installing or updating the AWS CLI on Linux, it might not have execute permissions for the folder it installed in. Run the following command with the PATH to your AWS CLI installation, to provide chmod permissions to the AWS CLI:

```
$ sudo chmod -R 755 /usr/local/aws-cli/
```

Back to top

Possible cause: The operating system PATH was not updated during installation

Example error text:

```
$ aws --version
command not found: aws
```

You might need to add the aws executable to your operating system's PATH environment variable. To add the AWS CLI to your PATH, use the following instructions for your operating system.

Linux and macOS

1. Find your shell's profile script in your user directory. If you're not sure which shell you have, run `echo $SHELL`.

```
$ ls -a ~
```
• **Bash** – `.bash_profile`, `.profile`, or `.bash_login`
• **Zsh** – `.zshrc`
• **Tcsh** – `.tcshrc`, `.cshrc`, or `.login`

2. Add an export command to your profile script. The following command adds your local bin to the current PATH variable.

```
export PATH=/usr/local/bin:$PATH
```

3. Reload the updated profile into your current session.

```
$ source ~/.bash_profile
```

**Windows**

1. In a Windows Command Prompt, use the `where` command with the `/R` *path* parameter to find the `aws` file location. The results return all folders containing `aws`.

```
C:\> where /R c:\ aws
c:\Program Files\Amazon\AWSCLIV2\aws.exe
...
```

By default, the AWS CLI version 2 is located in:

```
c:\Program Files\Amazon\AWSCLIV2\aws.exe
```

2. Press the Windows key and enter **environment variables**.
3. From the list of suggestions, choose **Edit environment variables for your account**.
4. Choose **PATH**, and then choose **Edit**.
5. Add the path you found in the first step into the **Variable value** field, for example, `C:\Program Files\Amazon\AWSCLIV2\aws.exe`.
6. Choose **OK** twice to apply the new settings.
7. Close any running command prompts and reopen the command prompt window.

[Back to top]
The "aws --version" command returns a different version than you installed

Your terminal might be returning a different PATH for the AWS CLI than you expect.

**Possible cause: The terminal needs to be restarted after installing**

If the aws command shows the wrong version, you might need to restart your terminal for it to recognize any PATH updates. All open terminals need to be closed, not just your active terminal.

**Possible cause: The system needs to be restarted after installing**

If the aws command shows the wrong version and restarting the terminal didn't work, you might need to restart your system for it to recognize your PATH updates.

**Possible cause: You have multiple versions of the AWS CLI**

If you updated the AWS CLI and used a different install method than your pre-existing installation, it might cause multiple versions to be installed. For example, if on Linux or macOS you used pip for your current install, but tried to update using the .pkg install file, this could cause some conflicts especially with your PATH pointing to the old version.

To resolve this, **uninstall all versions of the AWS CLI** and perform a clean install.

After uninstalling all versions, follow instructions appropriate for your operating system to install your desired version of the [AWS CLI version 1](https://docs.aws.amazon.com/cli/latest/userguide/cli-usage.html) or [AWS CLI version 2](https://docs.aws.amazon.com/cli/latest/userguide/cli-usage.html).

**Note**

If this is happening after you installed the AWS CLI version 2 with a pre-existing install of AWS CLI version 1, follow the migration instructions in [the section called “Migration instructions”](https://docs.aws.amazon.com/cli/latest/userguide/cli-usage.html).
The "aws --version" command returns a version after uninstalling the AWS CLI

This often occurs when there is still an AWS CLI installed somewhere on your system.

**Possible cause: The terminal needs to be restarted after uninstalling**

If the `aws --version` command still works, you might need to restart your terminal for it to recognize any terminal updates.

**Possible cause: You have multiple versions of the AWS CLI on your system, or didn't use the same uninstall method that you used to originally install the AWS CLI**

The AWS CLI might not uninstall correctly if you uninstalled the AWS CLI using a different method than you used to install it, or if you installed multiple versions. For example, if you used `pip` for your current install, you must use `pip` to uninstall it. To resolve this, uninstall AWS CLI using the same method that you used to install it.

1. Follow the instructions appropriate for your operating system and your original installation method to uninstall the AWS CLI version 1 and AWS CLI version 2.
2. Close all terminals you have open.
3. Open your preferred terminal, enter in the following command and confirm that no version is returned.

   ```
   $ aws --version
   command not found: aws
   ```

If you still have a version listed in the output, the AWS CLI was most likely installed using a different method or there are multiple versions. If you don't know which method you installed the AWS CLI, follow the instructions for each uninstall method for the AWS CLI version 1 and AWS CLI version 2 appropriate to your operating system until no version output is received.

**Note**

If you used a package manager to install the AWS CLI (pip, apt, brew, etc.), you must use the same package manager to uninstall it. Be sure to follow the
The AWS CLI processed a command with an incomplete parameter name

Possible cause: You used a recognized abbreviation of the AWS CLI parameter

Since the AWS CLI is built using Python, the AWS CLI uses the Python `argparse` library, including the `allow_abbrev` argument. Abbreviations of parameters are recognized by the AWS CLI and processed.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-n` is recognized as an abbreviation of `--change-set-name`, and the AWS CLI processes the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set-n my-change-set
```

When your abbreviation could be multiple commands, the parameter will not be recognized as an abbreviation.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-` is not recognized as an abbreviation, as there are multiple parameters it could be an abbreviation of, such as `--change-set-name` and `--change-set-type`. Therefore the AWS CLI does not process the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set- my-change-set
```

⚠️ Warning

Do not purposefully use parameter abbreviations. They are unreliable and are not backwards compatible. If any new parameters are added to a command that confuse your abbreviations, it will break your commands.
Additionally, if the parameter is a single-value argument, it can cause unexpected behavior with your commands. If multiple instances of a single-value argument is passed, only the last instance will run. In the following example, the parameter `--filters` is a single-valued argument. The parameters `--filters` and `--filter` are specified. The `--filter` parameter is an abbreviation of `--filters`. This cause two instances of `--filters` being applied and only the last `--filter` argument applies.

```
$ aws ec2 describe-vpc-peering-connections \
    --filters Name=tag:TagName,Values=VpcPeeringConnection \
    --filter Name=status-code,Values=active
```

Confirm you are using valid parameters before running a command to prevent unexpected behavior.

### Access denied errors

**Possible cause: The AWS CLI program file doesn't have "run" permission**

On Linux or macOS, make sure that the `aws` program has run permissions for the calling user. Typically, the permissions are set to 755.

To add run permission for your user, run the following command, substituting `~/.local/bin/aws` with the path to the program on your computer.

```
$ chmod +x ~/.local/bin/aws
```

**Possible cause: Your IAM identity doesn't have permission to perform the operation**

*Example error text:*

```
$ aws s3 ls
An error occurred (AccessDenied) when calling the ListBuckets operation: Access denied.
```
When you run an AWS CLI command, AWS operations are performed on your behalf, using credentials that associate you with an IAM account or role. The policies attached must grant you permission to call the API actions that correspond to the commands that you run with the AWS CLI.

Most commands call a single action with a name that matches the command name. However, custom commands like `aws s3 sync` call multiple APIs. You can see which APIs a command calls by using the `--debug` option.

If you are sure that the user or role has the proper permissions assigned by policy, make sure that your AWS CLI command is using the credentials you expect. See the next section about credentials to verify that the credentials the AWS CLI is using are the ones that you expect.

For information about assigning IAM permissions, see Overview of Access Management: Permissions and Policies in the IAM User Guide.

Invalid credentials and key errors

Example error text:

```
$ aws s3 ls
An error occurred (InvalidAccessKeyId) when calling the ListBuckets operation: The AWS Access Key Id you provided does not exist in our records.
```

```
$ aws s3 ls
An error occurred (InvalidClientTokenId) when calling the ListBuckets operation: The security token included in the request is invalid.
```

Possible cause: The AWS CLI is reading incorrect credentials or from an unexpected location

The AWS CLI might be reading credentials from a different location than you expect, or your key pair information is incorrect. You can run `aws configure list` to confirm which credentials are used.

The following example shows how to check the credentials used for the default profile.
$ aws configure list
    Name                  Value             Type    Location
    ----                  -----             ----    --------
    profile               <not set>             None    None
    access_key            ****************XYVA  shared-credentials-file
    secret_key            ****************ZAGY  shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config

The following example shows how to check the credentials of a named profile.

$ aws configure list --profile saanvi
    Name                  Value             Type    Location
    ----                  -----             ----    --------
    profile               saanvi            manual    --profile
    access_key            ****************  shared-credentials-file
    secret_key            ****************  shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config

To confirm your key pair details, check your config and credentials files. For more information on config and credentials files, see the section called “Configuration and credential file settings”. For more information on credentials and authentication, including credentials precedence, see Authentication and access credentials.

Back to top

Possible cause: Your computer's clock is out of sync

If you are using valid credentials, your clock might be out of sync. On Linux or macOS, run date to check the time.

$ date

If your system clock is not correct within a few minutes, use ntpd to sync it.

$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat

On Windows, use the date and time options in the Control Panel to configure your system clock.
Signature does not match errors

Example error text:

```
$ aws s3 ls
An error occurred (SignatureDoesNotMatch) when calling the ListBuckets operation: The request signature we calculated does not match the signature you provided. Check your key and signing method.
```

When the AWS CLI runs a command, it sends an encrypted request to the AWS servers to perform the appropriate AWS service operations. Your credentials (the access key and secret key) are involved in the encryption and enable AWS to authenticate the person making the request. There are several things that can interfere with the correct operation of this process, as follows.

Possible cause: Your clock is out of sync with the AWS servers

To help protect against replay attacks, the current time can be used during the encryption/decryption process. If the time of the client and server disagree by more than the allowed amount, the process can fail and the request is rejected. This can also happen when you run a command in a virtual machine whose clock is out of sync with the host machine's clock. One possible cause is when the virtual machine hibernates and takes some time after waking up to sync the clock with the host machine.

On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.
Possible cause: Your operating system is mishandling AWS keys that contain certain special characters

If your AWS keys include certain special characters, such as -, +, /, or %, some operating system variants process the string improperly and cause the key string to be interpreted incorrectly.

If you process your keys using other tools or scripts, such as tools that build the credentials file on a new instance as part of its creation, those tools and scripts might have their own handling of special characters that causes them to be transformed into something that AWS no longer recognizes.

We suggest regenerating the secret key to get one that does not include the special character causing issues.

SSL certificate errors

Possible cause: The AWS CLI doesn't trust your proxy's certificate

Example error text:

```
$ aws s3 ls
[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed
```

When you use an AWS CLI command, you receive an [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed error message. This is caused by the AWS CLI not trusting your proxy's certificate due to factors such as your proxy's certificate being self-signed, with your company set as the Certification Authority (CA). This prevents the AWS CLI from finding your companies CA root certificate in the local CA registry.

To fix this, instruct the AWS CLI where to find your companies .pem file using the `ca_bundle` configuration file setting, `--ca-bundle` command line option, or the `AWS_CA_BUNDLE` environment variable.

Possible cause: Your configuration isn't pointing to the correct CA root certificate location

Example error text:
$ aws s3 ls
SSL validation failed for regionname [Errno 2] No such file or directory

This is caused by your Certification Authority (CA) bundle file location being configured incorrectly in the AWS CLI. To fix this, confirm where your companies .pem file is located and update the AWS CLI configuration by using the ca_bundle configuration file setting, --ca-bundle command line option, or the AWS_CA_BUNDLE environment variable.

Possible cause: Your configuration isn't using the correct AWS Region

Example error text:

$ aws s3 ls
[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. For troubleshooting steps, see the section called “Check the AWS Region your AWS CLI command is using”.

Possible cause: Your TLS version needs to be updated

Example error text:

$ aws s3 ls
[SSL: UNSAFE_LEGACY_RENEGOTIATION_DISABLED] unsafe legacy renegotiation disabled

The AWS service is using a version of TLS that is incompatible with your device's TLS version. To resolve this issue, update to a supported TLS version. For more information, see the section called “Enforcing a minimum TLS version”.

Invalid JSON errors

Example error text:
When you use an AWS CLI command, you receive a "Invalid JSON" error message. This is usually an error seen when you enter a command with an expected JSON format and the AWS CLI cannot read your JSON correctly.

**Possible cause: You did not enter valid JSON for the AWS CLI to use**

Confirm you have valid JSON entered for your command. We suggest using a JSON validator for JSON you're having issues formatting.

For more advanced JSON usage in the command line, consider using a command line JSON processor, like jq, to create JSON strings. For more information on jq, see the [jq repository](https://github.com/johngjones/jq) on GitHub.

**Possible cause: Your terminal's quoting rules are preventing valid JSON being sent to the AWS CLI**

Before the AWS CLI receives anything from a command, your terminal processes the command using it's own quoting and escaping rules. Due to a terminal's formatting rules, some of your JSON content may be stripped before the command is passed to the AWS CLI. When formulating commands, be sure to use your terminal's quoting rules.

To troubleshoot, use the echo command to see how the shell is handling your parameters:

```
$ echo {"ReadCapacityUnits":15,"WriteCapacityUnits":10}
ReadCapacityUnits:15 WriteCapacityUnits:10
```

```
$ echo '{"ReadCapacityUnits":15,"WriteCapacityUnits":10}''
{"ReadCapacityUnits":15,"WriteCapacityUnits":10}
```

Modify your command until your until valid JSON is returned.
For more in-depth troubleshooting, use the --debug parameter to view the debug logs as they'll display exactly what got passed to the AWS CLI:

```
$ aws dynamodb update-table \
   --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \
   --table-name MyDDBTable \
   --debug
```

2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - CLI version: aws-cli/1.18.147 Python/2.7.18 Linux/5.4.196-119.356.amzn2int.x86_64 botocore/1.18.6
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - Arguments entered to CLI:
['dynamodb', 'update-table', '--provisioned-throughput', '{"ReadCapacityUnits":15,WriteCapacityUnits":10}', '--table-name', 'MyDDBTable', '--debug']

Use your terminal's quoting rules to fix any issues your JSON input has when being sent to the AWS CLI. For more information on quoting rules, see the section called “Quotes with Strings”.

**Note**

If you're having issues with getting valid JSON to the AWS CLI, we recommend to bypass a terminal's quoting rules for JSON data input by using Blobs to pass your JSON data directly to the AWS CLI. For more information on Blobs, see Blob.

**Additional resources**

For additional help with your AWS CLI issues, visit the AWS CLI community on GitHub or the AWS re:Post community.
Migrate from AWS CLI version 1 to version 2

This section contains instructions for updating the AWS CLI version 1 to AWS CLI version 2. The AWS CLI version 2 builds on AWS CLI version 1 and includes features and enhancements based on community feedback.

Before you migrate to version 2, learn about the differences between the versions. The AWS CLI version 2 includes new features and changes that might require you to update your scripts or commands for backwards compatibility.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path.

If you previously installed AWS CLI version 1, follow our migration instructions to start using version 2.

If you have not previously installed AWS CLI version 1, follow the instructions in Get started.

Topics

- New features and changes in AWS CLI version 2
- AWS CLI version 2 migration instructions

New features and changes in AWS CLI version 2

This topic describes new features and changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

Topics

- AWS CLI version 2 new features
- Breaking changes between AWS CLI version 1 and AWS CLI version 2

AWS CLI version 2 new features

The AWS CLI version 2 is the most recent major version of the AWS CLI and supports all of the latest features. Some features introduced in version 2 are not backported to version 1 and you must upgrade to access those features. These features include the following:
Python interpreter not needed

The AWS CLI version 2 doesn't need a separate install of Python. It includes an embedded version.

Wizards

You can use a wizard with the AWS CLI version 2. The wizard guides you through constructing certain commands.

IAM Identity Center authentication

If your organization uses AWS IAM Identity Center (IAM Identity Center), your users can sign in to Active Directory, a built-in IAM Identity Center directory, or another IdP connected to IAM Identity Center. Then, they are mapped to an AWS Identity and Access Management (IAM) role that allows you to run AWS CLI commands.

Auto-prompt

When enabled, the AWS CLI version 2 can prompt you for commands, parameters, and resources when you run an `aws` command.

Run the AWS CLI from the official Amazon ECR Public or Docker images

The official Docker image for the AWS CLI provides isolation, portability, and security that AWS directly supports and maintains. This way, you can use the AWS CLI version 2 in a container-based environment without having to manage the installation yourself.

Client-side pager

The AWS CLI version 2 provides the use of a client-side pager program for output. By default, this feature is turned on and returns all output through your operating system's default pager program.

`aws configure import`

Import `.csv` credentials generated from the AWS Management Console. A `.csv` file is imported with the profile name matching the IAM user name.

`aws configure list-profiles`

Lists the names of all profiles you have configured.
the section called “YAML stream output format”

The yaml and yaml-stream format takes advantage of the YAML format while providing more responsive viewing of large datasets by streaming the data to you. You can start viewing and using YAML data before the entire query downloads.

New high-level ddb commands for DynamoDB

The AWS CLI version 2 has the high-level Amazon DynamoDB commands `ddb put` and `ddb select`. These commands provide a simplified interface for putting items in DynamoDB tables and searching in a DynamoDB table or index.

aws logs tail

The AWS CLI version 2 has a custom `aws logs tail` command that tails the logs for an Amazon CloudWatch Logs group. By default, the command returns logs from all associated CloudWatch Logs streams during the past ten minutes.

Added metadata support for high-level s3 commands

The AWS CLI version 2 adds the `--copy-props` parameter to the high-level `s3` commands. With this parameter, you can configure additional metadata and tags for Amazon Simple Storage Service (Amazon S3).

AWS_REGION

The AWS CLI version 2 has an AWS SDK-compatible environment variable called `AWS_REGION`. This variable specifies the AWS Region to send requests to. It overrides the `AWS_DEFAULT_REGION` environment variable, which is only applicable in the AWS CLI.

Breaking changes between AWS CLI version 1 and AWS CLI version 2

This section describes all of the changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

Topics

- Environment variable added to set text file encoding
- Binary parameters are passed as base64-encoded strings by default
- Improved Amazon S3 handling of file properties and tags for multipart copies
- No automatic retrieval of http:// or https:// URLs for parameters
• Pager used for all output by default
• Timestamp output values are standardized to ISO 8601 format
• Improved handling of CloudFormation deployments that result in no changes
• Changed default behavior for Regional Amazon S3 endpoint for us-east-1 Region
• Changed default behavior for Regional AWS STS endpoints
• ecr get-login removed and replaced with ecr get-login-password
• AWS CLI version 2 support for plugins is changing
• Hidden alias support removed
• The api_versions configuration file setting is not supported
• AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests
• AWS CLI version 2 is more consistent with paging parameters
• AWS CLI version 2 provides more consistent return codes across all commands

Environment variable added to set text file encoding

By default, text files for the section called “Blob” use the same encoding as the installed locale. Because the AWS CLI version 2 uses an embedded version of Python, the PYTHONUTF8 and PYTHONIOENCODING environment variables are not supported. To set encoding for text files to be different from the locale, use the AWS_CLI_FILE_ENCODING environment variable. The following example sets the AWS CLI to open text files using UTF-8 on Windows.

AWS_CLI_FILE_ENCODING=UTF-8

For more information, see Environment variables to configure the AWS CLI.

Binary parameters are passed as base64-encoded strings by default

In the AWS CLI, some commands required base64-encoded strings, while others required UTF-8-encoded byte strings. In the AWS CLI version 1, passing data between two encoded string types often required some intermediate processing. The AWS CLI version 2 makes handling binary parameters more consistent, which helps pass values from one command to another more reliably.

By default, the AWS CLI version 2 passes all binary input and binary output parameters as the base64-encoded string blobs (binary large object). For more information, see the section called “Blob”.
To revert to the AWS CLI version 1 behavior, use the `cli_binary_format` file configuration or the `--cli-binary-format` parameter.

**Improved Amazon S3 handling of file properties and tags for multipart copies**

When you use the AWS CLI version 1 commands in the `aws s3` namespace to copy a file from one S3 bucket location to another, and that operation uses `multipart copy`, no file properties from the source object are copied to the destination object.

By default, the corresponding commands in the AWS CLI version 2 transfer all tags and some of the properties from the source to the destination copy. Compared to the AWS CLI version 1, this can result in more AWS API calls being made to the Amazon S3 endpoint. To change the default behavior for `s3` commands in AWS CLI version 2, use the `--copy-props` parameter.

For more information, see the section called “File properties and tags in multipart copies”.

**No automatic retrieval of http:// or https:// URLs for parameters**

The AWS CLI version 2 does not perform a GET operation when a parameter value begins with `http://` or `https://`, and does not use the returned content as the parameter value. As a result, the associated command line option `cli_follow_urlparam` is removed from the AWS CLI version 2.

If you need to retrieve a URL and pass the URL contents into a parameter value, we recommend that you use `curl` or a similar tool to download the contents of the URL to a local file. Then, use the `file://` syntax to read the contents of that file and use it as the parameter value.

For example, the following command no longer tries to retrieve the contents of the page found at `http://www.example.com` and pass those contents as the parameter. Instead, it passes the literal text string `https://example.com` as the parameter.

```
$ aws ssm put-parameter \
   --value http://www.example.com \ 
   --name prod.microservice1.db.secret \ 
   --type String 2
```

If you need to retrieve and use the contents of a web URL as a parameter, you can do the following in version 2.

```
$ curl https://my.example.com/mypolicyfile.json -o mypolicyfile.json
```
In the preceding example, the `-o` parameter tells `curl` to save the file in the current folder with the same name as the source file. The second command retrieves the content of that downloaded file and passes the content as the value of `--policy-document`.

**Pager used for all output by default**

By default, the AWS CLI version 2 returns all output through your operating system's default pager program. This program is the `less` program on Linux or macOS, and the `more` program on Windows. This can help you navigate a large amount of output from a service by displaying that output one page at a time.

You can configure the AWS CLI version 2 to use a different paging program or none at all. For more information, see the section called “Client-side pager”.

**Timestamp output values are standardized to ISO 8601 format**

By default, the AWS CLI version 2 returns all timestamp response values in the ISO 8601 format. In AWS CLI version 1, commands returned timestamp values in whatever format was returned by the HTTP API response, which could vary from service to service.

To see timestamps in the format returned by the HTTP API response, use the `wire` value in your `config` file. For more information, see `cli_timestamp_format`.

**Improved handling of CloudFormation deployments that result in no changes**

By default in the AWS CLI version 1, if you deploy a AWS CloudFormation template that results in no changes, the AWS CLI returns a failed error code. This causes problems if you don't consider that to be an error and you want your script to continue. You can work around this in the AWS CLI version 1 by adding the flag `--no-fail-on-empty-changeset`, which returns 0.

Since this is a common use case, the AWS CLI version 2 defaults to returning a successful exit code of 0 when there is no change caused by a deployment and the operation returns an empty changeset.

To revert to the original behavior, add the flag `--fail-on-empty-changeset`. 

---

Breaking changes between AWS CLI version 1 and AWS CLI version 2
**Changed default behavior for Regional Amazon S3 endpoint for us-east-1 Region**

When you configure the AWS CLI version 1 to use the us-east-1 Region, the AWS CLI uses the global s3.amazonaws.com endpoint that is physically hosted in the us-east-1 Region. The AWS CLI version 2 uses the true Regional endpoint s3.us-east-1.amazonaws.com when that Region is specified. To force the AWS CLI version 2 to use the global endpoint, you can set the Region for a command to aws-global.

**Changed default behavior for Regional AWS STS endpoints**

By default, the AWS CLI version 2 sends all AWS Security Token Service (AWS STS) API requests to the Regional endpoint for the currently configured AWS Region.

By default, the AWS CLI version 1 sends AWS STS requests to the global AWS STS endpoint. You can control this default behavior in version 1 by using the `sts_regional_endpoints` setting.

**ecr get-login removed and replaced with ecr get-login-password**

The AWS CLI version 2 replaces the command `aws ecr get-login` with the `aws ecr get-login-password` command that improves automated integration with container authentication.

The `aws ecr get-login-password` command reduces the risk of exposing your credentials in the process list, shell history, or other log files. It also improves compatibility with the `docker login` command for better automation.

The `aws ecr get-login-password` command is available in the AWS CLI version 1.17.10 and later, and the AWS CLI version 2. The earlier `aws ecr get-login` command is still available in the AWS CLI version 1 for backward compatibility.

With the `aws ecr get-login-password` command, you can replace the following code that retrieves a password.

```bash
$ (aws ecr get-login --no-include-email)
```

To reduce the risk of exposing the password to the shell history or logs, use the following example command instead. In this example, the password is piped directly to the `docker login` command, where it is assigned to the password parameter by the `--password-stdin` option.
For more information, see `aws ecr get-login-password` in the *AWS CLI version 2 Reference Guide*.

**AWS CLI version 2 support for plugins is changing**

Plugin support in the AWS CLI version 2 is completely provisional and is intended to help users migrate from AWS CLI version 1 until a stable, updated plugin interface is released. There are no guarantees that a particular plugin or even the AWS CLI plugin interface will be supported in future versions of the AWS CLI version 2. If you rely on plugins, be sure to lock into a particular version of the AWS CLI and test the functionality of your plugin when you do upgrade.

To enable plugin support, create a `[plugins]` section in your `~/.aws/config`.

```
[plugins]
cli_legacy_plugin_path = <path-to-plugins>/python3.7/site-packages
<plugin-name> = <plugin-module>
```

In the `[plugins]` section, define the `cli_legacy_plugin_path` variable and set its value to the Python site packages path where your plugin module is. Then, you can configure a plugin by providing a name for the plugin (`<plugin-name>`) and the file name of the Python module (`<plugin-module>`) that contains the source code for your plugin. The AWS CLI loads each plugin by importing its `plugin-module` and calling its `awscli_initialize` function.

**Hidden alias support removed**

AWS CLI version 2 no longer supports the following hidden aliases that were supported in version 1.

In the following table, the first column displays the service, command, and parameter that work in all versions, including the AWS CLI version 2. The second column displays the alias that no longer works in the AWS CLI version 2.

<table>
<thead>
<tr>
<th>Working service, command, and parameter</th>

</table>
The `api_versions` configuration file setting is not supported

The AWS CLI version 2 doesn't support calling earlier versions of AWS service APIs by using the `api_versions` configuration file setting. All AWS CLI commands now call the latest version of the service APIs that are currently supported by the endpoint.

AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests

The AWS CLI version 2 doesn't support earlier signature algorithms to cryptographically authenticate service requests sent to Amazon S3 endpoints. This signing happens automatically with every Amazon S3 request and only the Signature Version 4 Signing Process is supported. You can't configure the signature version. All Amazon S3 bucket presigned URLs now use only SigV4 and have a maximum expiration duration of one week.

AWS CLI version 2 is more consistent with paging parameters

In the AWS CLI version 1, if you specify pagination parameters on the command line, then automatic pagination is turned off as expected. However, when you specify pagination parameters by using a file with the `--cli-input-json` parameter, automatic pagination was not turned off, which could result in unexpected output. The AWS CLI version 2 turns off automatic pagination regardless of how you provide the parameters.

AWS CLI version 2 provides more consistent return codes across all commands

The AWS CLI version 2 is more consistent across all commands and properly returns an appropriate exit code compared to the AWS CLI version 1. We also added exit codes 252, 253, and 254. For more information on exit codes, see the section called “Return Codes”.

If you have a dependency on how the AWS CLI version 1 uses return code values, we recommend checking the exit codes to make sure that you’re getting the values you expect.

AWS CLI version 2 migration instructions

This topic provides instructions for migrating from AWS CLI version 1 to AWS CLI version 2.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path. If you previously installed AWS CLI version 1, we recommend that you do one of the following to use AWS CLI version 2:

- **Recommended** – [Uninstall AWS CLI version 1 and use only AWS CLI version 2](#).
• **To have both version installed**, use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two `aws` commands.

For information on breaking changes between version 1 and version 2, see the section called “New features and changes”.

### Replacing version 1 with version 2

Perform the following steps to replace AWS CLI version 1 with AWS CLI version 2.

#### To replace AWS CLI version 1 with AWS CLI version 2

1. Prepare any existing scripts you have for the migration by confirming any breaking changes between version 1 and version 2 in the section called “New features and changes”.
2. Uninstall the AWS CLI version 1 by following the uninstall instructions for your operating system in Installing, updating, and uninstalling the AWS CLI version 1.
3. Confirm that the AWS CLI is completely uninstalled by using the following command.

   ```shell
   $ aws --version
   ```

   Complete one of the following based on the output:

   - **No version returned**: You've successfully uninstalled the AWS CLI version 1 and can proceed to the next step.
   - **A version is returned**: You still have an install of the AWS CLI version 1. For troubleshooting steps, see the section called “The "aws --version" command returns a version after uninstalling the AWS CLI”. Perform troubleshooting steps until no version output is received.

4. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in Install or update to the latest version of the AWS CLI.

### Side-by-side install

To have both versions installed, use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two `aws` commands.

1. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in Install or update to the latest version of the AWS CLI.
2. Use your operating system's ability to create a symlink or alias with a different name for one of the two `aws` commands, such as using `aws2` for AWS CLI version 2. The following are symlink examples for AWS CLI version 2. Replace the `PATH` with your install location.

Linux and macOS

You can use a symbolic link or alias on Linux and macOS.

```
$ alias aws2='PATH'
```

Windows command prompt

`DOSKEY` on Windows.

```
C:\> doskey aws2=PATH
```
Uninstall the AWS CLI version 2

This topic describes how to uninstall the AWS Command Line Interface version 2 (AWS CLI version 2).

AWS CLI version 2 uninstallation instructions:

**Linux**

To uninstall the AWS CLI version 2, run the following commands.

1. **Locate the symlink and install paths.**
   - Use the `which` command to find the symlink. This shows the path you used with the `--bin-dir` parameter.
     
     ```
     $ which aws
     /usr/local/bin/aws
     ```
   - Use the `ls` command to find the directory that the symlink points to. This gives you the path you used with the `--install-dir` parameter.
     
     ```
     $ ls -l /usr/local/bin/aws
     lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/aws-cli/v2/current/bin/aws
     ```

2. **Delete the two symlinks in the --bin-dir directory.** If your user has write permission to these directories, you don't need to use `sudo`.

   ```
   $ sudo rm /usr/local/bin/aws
   $ sudo rm /usr/local/bin/aws_completer
   ```

3. **Delete the --install-dir directory.** If your user has write permission to this directory, you don't need to use `sudo`.

   ```
   $ sudo rm -rf /usr/local/aws-cli
   ```

4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the .aws folder.
**Warning**

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the .aws folder differs between platforms, by default the folder is located in `~/.aws/`. If your user has write permission to this directory, you don't need to use `sudo`.

```
$ sudo rm -rf ~/.aws/
```

**macOS**

To uninstall the AWS CLI version 2, run the following commands, substituting the paths you used to install. The example commands use the default installation paths.

1. Find the folder that contains the symlinks to the main program and the completer.

```
$ which aws
/usr/local/bin/aws
```

2. Using that information, run the following command to find the installation folder that the symlinks point to.

```
$ ls -l /usr/local/bin/aws
lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/aws-cli/aws
```

3. Delete the two symlinks in the first folder. If your user already has write permission to these folders, you don't need to use `sudo`.

```
$ sudo rm /usr/local/bin/aws
$ sudo rm /usr/local/bin/aws_completer
```

4. Delete the main installation folder. Use `sudo` to gain write access to the `/usr/local` folder.
5. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the .aws folder.

⚠️ **Warning**

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the .aws folder differs between platforms, by default the folder is located in `~/.aws/`. If your user has write permission to this directory, you don't need to use sudo.

$ sudo rm -rf ~/.aws/

**Windows**

1. Open **Programs and Features** by doing one of the following:
   - Open the **Control Panel**, and then choose **Programs and Features**.
   - Open a command prompt, and then enter the following command.

   ```
   C:\> appwiz.cpl
   ```

2. Select the entry named **AWS Command Line Interface**, and then choose **Uninstall** to launch the uninstaller.

3. Confirm that you want to uninstall the AWS CLI.

4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the .aws folder.
Warning

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the .aws folder differs between platforms, by default the folder is located in %UserProfile%\.aws.

$ rmdir %UserProfile%\.aws

Troubleshooting AWS CLI install and uninstall errors

If you come across issues after installing or uninstalling the AWS CLI, see Troubleshoot errors for troubleshooting steps. For the most relevant troubleshooting steps, see the section called “Command not found errors”, the section called “The "aws --version" command returns a different version than you installed”, and the section called “The "aws --version" command returns a version after uninstalling the AWS CLI”.
## AWS CLI user guide document history

The following table describes important additions to the *AWS Command Line Interface User Guide*, beginning in January 2019. For notification about updates to this documentation, you can subscribe to the RSS feed.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Updated credential and authentication information.</td>
<td>Updated credential and authentication method instructions and examples. This includes updating relevant Getting started pages and configuration pages. To accommodate this increase in documentation, relevant credential topics were moved to the new Authentication and access credentials section.</td>
<td>March 31, 2023</td>
</tr>
<tr>
<td>Token provider configuration with automatic authentication refresh for AWS IAM Identity Center added</td>
<td>The new process to configure the AWS CLI to authenticate users with AWS IAM Identity Center (IAM Identity Center) using the SSO token provider configuration, which can automatically retrieve refreshed authentication tokens.</td>
<td>December 7, 2022</td>
</tr>
<tr>
<td>Official Amazon ECR Public image for the AWS CLI version 2 released</td>
<td>The official supported Amazon ECR Public image for the AWS CLI version 2 is released for Linux, macOS, and Windows.</td>
<td>November 18, 2022</td>
</tr>
<tr>
<td>Updated the guide for migrating from AWS CLI V1 to V2</td>
<td>Expanded the breaking changes guide to include migration instructions to going from AWS CLI version 1 to the AWS CLI version 2. Includes updates to the Troubleshooting page to help with installation issues.</td>
<td>May 13, 2022</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>New process to build a AWS CLI installer from source.</td>
<td>New process to install or update from source to the latest release of the AWS CLI on supported operating systems.</td>
<td>February 17, 2022</td>
</tr>
<tr>
<td>Content for the AWS CLI V1 and V2 are now separated into their respective guides</td>
<td>For clarity and ease, the AWS CLI version 1 and AWS CLI version 2 content is now separated into their own guides. For AWS CLI version 1, see the <a href="#">AWS CLI version 1 User Guide</a>.</td>
<td>November 2, 2021</td>
</tr>
<tr>
<td>Added AWS CLI alias information</td>
<td>Added AWS CLI alias information. Aliases are shortcuts you can create in the AWS Command Line Interface (AWS CLI) to shorten commands or scripts that you frequently use.</td>
<td>March 11, 2021</td>
</tr>
<tr>
<td>Updated filter output information</td>
<td>Updated information for filters and moved to their own page.</td>
<td>February 1, 2021</td>
</tr>
<tr>
<td>Added information for Wizards</td>
<td>Added AWS CLI version 2 wizard information.</td>
<td>November 20, 2020</td>
</tr>
<tr>
<td>Updated auto-prompt</td>
<td>Updated the AWS CLI version 2 auto-prompt information with current features.</td>
<td>November 10, 2020</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>Added Amazon S3 scripting example</td>
<td>Added an Amazon S3 lifecycle scripting example.</td>
<td>October 15, 2020</td>
</tr>
<tr>
<td>Added Amazon EC2 scripting example</td>
<td>Added an Amazon EC2 instance type scripting example.</td>
<td>October 15, 2020</td>
</tr>
<tr>
<td>Added retries information</td>
<td>Added a retries page for features and behavior of retries in the AWS CLI.</td>
<td>September 17, 2020</td>
</tr>
<tr>
<td>Server-side and client-side pagination page</td>
<td>Updated pagination information and centralized on a single page.</td>
<td>August 17, 2020</td>
</tr>
<tr>
<td>Updated s3 commands page</td>
<td>Updated the high-level s3 commands page with new examples and resources.</td>
<td>July 30, 2020</td>
</tr>
<tr>
<td>Updated installation information</td>
<td>The install, update, and uninstall information for Linux, macOS, and Windows are updated.</td>
<td>May 19, 2020</td>
</tr>
<tr>
<td>Added information for text file encoding on the AWS CLI version 2</td>
<td>By default, AWS CLI version 2 uses the same text file encoding as the local. You can now use environment variables to set text file encoding.</td>
<td>May 14, 2020</td>
</tr>
<tr>
<td>Release Date</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
