                                                                                                                                                    "ownerAccount": "123456789012",
                                                                                                                                                    "lagName": "DA-LAG",
                                                                                                                                                    "connections": [
                                                                                                                                                    }
                                                                                                                                                    ]
                                                                                                                                            }]
                                                                                                                                        ]
                                                                                                                                    ]
                                                                                                                ]
                                                                                                            ]
                                                                                                        ]
                                                                                                    ]
                                                                                                ]
                                                                                            ]
                                                                                        ]
                                                                                    ]
                                                                                ]
                                                                            ]
                                                                        ]
                                                                    ]
                                                                }
```
The following code example shows how to use `describe-loa`.

**AWS CLI**

To describe your LOA-CFA for a connection using Linux or Mac OS X

The following example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The

• For API details, see [DescribeLags](#) in [AWS CLI Command Reference](#).
final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

**To describe your LOA-CFA for a connection using Windows**

The previous example requires the use of the `base64` utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for connection `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see [Controlling Command Output from the AWS Command Line Interface](https://docs.aws.amazon.com/cli/latest/userguide/cli-aws-controlling-output.html) in the *AWS Command Line Interface User Guide*.

- For API details, see [DescribeLoa](https://docs.aws.amazon.com/cli/latest/reference/directconnect/describe-loa.html) in *AWS CLI Command Reference*.

### describe-locations

The following code example shows how to use `describe-locations`.

**AWS CLI**

**To list AWS Direct Connect partners and locations**

The following `describe-locations` command lists AWS Direct Connect partners and locations in the current region:

```
aws directconnect describe-locations
```

**Output:**
For API details, see DescribeLocations in AWS CLI Command Reference.

**describe-tags**

The following code example shows how to use describe-tags.

**AWS CLI**

To describe tags for your AWS Direct Connect resources

The following command describes the tags for the connection dxcon-abcabc12.

Command:

```
```

Output:

```
{
    "resourceTags": [
        {
            "tags": [
                {
                    "value": "VAConnection",
                    "key": "Name"
                }
            ]
        }
    ]
}
```
• For API details, see DescribeTags in AWS CLI Command Reference.

**describe-virtual-gateways**

The following code example shows how to use describe-virtual-gateways.

**AWS CLI**

**To list virtual private gateways**

The following describe-virtual-gateways command lists virtual private gateways owned by your AWS account:

```bash
aws directconnect describe-virtual-gateways
```

Output:

```json
{
    "virtualGateways": [
        {
            "virtualGatewayId": "vgw-aba37db6",
            "virtualGatewayState": "available"
        }
    ]
}
```

• For API details, see DescribeVirtualGateways in AWS CLI Command Reference.

**describe-virtual-interfaces**

The following code example shows how to use describe-virtual-interfaces.

**AWS CLI**

**To list all virtual interfaces**
The following `describe-virtual-interfaces` command lists the information about all virtual interfaces associated with your AWS account:

```bash
aws directconnect describe-virtual-interfaces --connection-id dxcon-ffjrkx17
```

Output:

```json
{
    "virtualInterfaces": [
        {
            "virtualInterfaceState": "down",
            "asn": 65000,
            "vlan": 101,
            "customerAddress": "192.168.1.2/30",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffjrkx17",
            "virtualGatewayId": "vgw-aba37db6",
            "virtualInterfaceId": "dxvif-ffhhk74f",
            "authKey": "asdf34example",
            "routeFilterPrefixes": [],
            "location": "TIVIT",
            "customerRouterConfig": "<?xml version="1.0" encoding="UTF-8"?><logical_connection id="dxvif-ffhhk74f">
                <vlan>101</vlan>
                <customer_address>192.168.1.2/30</customer_address>
                <amazon_address>192.168.1.1/30</amazon_address>
                <bgp_asn>65000</bgp_asn>
                <bgp_auth_key>asdf34example</bgp_auth_key>
                <amazon_bgp_asn>7224</amazon_bgp_asn>
                <connection_type>private</connection_type>
            </logical_connection>"
        },
        {
            "virtualInterfaceState": "verifying",
            "asn": 65000,
            "vlan": 2000,
            "customerAddress": "203.0.113.2/30",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffjrkx17",
            "virtualGatewayId": "",
            "virtualInterfaceId": "dxvif-fgh0hcrk",
            "authKey": "asdf34example",
            "routeFilterPrefixes": []
        }
    ]
}
```
For API details, see DescribeVirtualInterfaces in AWS CLI Command Reference.

disassociate-connection-from-lag

The following code example shows how to use disassociate-connection-from-lag.

AWS CLI

To disassociate a connection from a LAG

The following example disassociates the specified connection from the specified LAG.

Command:

```
aws directconnect disassociate-connection-from-lag --lag-id dxlag-fhccu14t --connection-id dxcon-fg9607vm
```

Output:

```
{
   "ownerAccount": "123456789012",
}
For API details, see DisassociateConnectionFromLag in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to an AWS Direct Connect resource**

The following command adds a tag with a key of Name and a value of VAConnection to the connection dxcon-abcabc12. If the command succeeds, no output is returned.

Command:

```
aws directconnect tag-resource --resource-arn arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12 --tags "key=Name,value=VAConnection"
```

For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove a tag from an AWS Direct Connect resource**

The following command removes the tag with the key Name from connection dxcon-abcabc12. If the command succeeds, no output is returned.

Command:

- For API details, see UntagResource in AWS CLI Command Reference.

update-direct-connect-gateway-association

The following code example shows how to use update-direct-connect-gateway-association.

AWS CLI

To update the specified attributes of the Direct Connect gateway association

The following update-direct-connect-gateway-association example adds the specified CIDR block to a Direct Connect gateway association.

aws directconnect update-direct-connect-gateway-association \
--association-id 820a6e4f-5374-4004-8317-3f64bEXAMPLE \
--add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.2.0/30

Output:

```json
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
        "directConnectGatewayOwnerAccount": "111122223333",
        "associationState": "updating",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "1112222333",
            "region": "us-east-1"
        },
        "associationId": "820a6e4f-5374-4004-8317-3f64bEXAMPLE",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.2.0/30"
            },
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
}
```
For more information, see [Working with Direct Connect Gateways](https://docs.aws.amazon.com/directconnect/latest/userguide/index.html) in the *AWS Direct Connect User Guide*.

- For API details, see [UpdateDirectConnectGatewayAssociation](https://docs.aws.amazon.com/cli/latest/reference/directconnect/update-lag.html) in *AWS CLI Command Reference*.

**update-lag**

The following code example shows how to use `update-lag`.

**AWS CLI**

**To update a LAG**

The following example changes the name of the specified LAG.

Command:

```bash
aws directconnect update-lag --lag-id dxlag-ffjhj9lx --lag-name 2ConnLag
```

Output:

```json
{
    "awsDevice": "CSVA1-23u8tlpaz8iks",
    "numberOfConnections": 2,
    "lagState": "down",
    "ownerAccount": "123456789012",
    "lagName": "2ConnLag",
    "connections": [
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fflqyj95",
            "lagId": "dxlag-ffjhj91x",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj91x",
            "region": "us-east-1"
        }
    ]
}
```
For API details, see [UpdateLag](#) in *AWS CLI Command Reference*.

### update-virtual-interface-attributes

The following code example shows how to use `update-virtual-interface-attributes`.

**AWS CLI**

**To update the MTU of a virtual interface**

The following `update-virtual-interface-attributes` example updates the MTU of the specified virtual interface.

```
aws directconnect update-virtual-interface-attributes
  --virtual-interface-id dxvif-fEXAMPLE
  --mtu 1500
```

**Output:**

```
{
  "ownerAccount": "1111222233333",
  "virtualInterfaceId": "dxvif-fEXAMPLE",
  "location": "loc1",
  "connectionId": "dxlag-fEXAMPLE",
  "lagId": "dxlag-ffjhj91x",
  "minimumLinks": 0,
  "connectionsBandwidth": "1Gbps",
  "region": "us-east-1",
  "location": "CSVA1"
}
```

For more information, see Setting Network MTU for Private Virtual Interfaces or Transit Virtual Interfaces in the AWS Direct Connect User Guide.

- For API details, see UpdateVirtualInterfaceAttributes in AWS CLI Command Reference.
AWS Directory Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Directory Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

desc��pe-directories

The following code example shows how to use `describe-directories`.

**AWS CLI**

To get details about your directories

The following `describe-directories` example displays details about the specified directory.

```
aws ds describe-directories \
   --directory-id d-a1b2c3d4e5
```

Output:

```
{
   "DirectoryDescriptions": [
       {
           "DirectoryId": "d-a1b2c3d4e5",
```
• For API details, see DescribeDirectories in AWS CLI Command Reference.

describe-trusts

The following code example shows how to use describe-trusts.
AWS CLI

To get details about your trust relationships

The following describe-trusts example displays details about the trust relationships for the specified directory.

```
aws ds describe-trusts \
   --directory-id d-a1b2c3d4e5
```

Output:

```
{
   "Trusts": [
      {
         "DirectoryId": "d-a1b2c3d4e5",
         "TrustId": "t-9a8b7c6d5e",
         "RemoteDomainName": "other.example.com",
         "TrustType": "Forest",
         "TrustDirection": "Two-Way",
         "TrustState": "Verified",
         "CreatedDateTime": "2017-06-20T18:08:45.614000-07:00",
         "LastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",
         "StateLastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",
         "SelectiveAuth": "Disabled"
      }
   ]
}
```

AWS DMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS DMS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- **Actions**

Actions

**add-tags-to-resource**

The following code example shows how to use `add-tags-to-resource`.

**AWS CLI**

To add tags to a resource

The following `add-tags-to-resource` example adds tags to a replication instance.

```
aws dms add-tags-to-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZ7P7G7RNUE \
  --tags Key=Environment,Value=PROD Key=Project,Value=dbMigration
```

This command produces no output.

For more information, see [Tagging Resources](#) in the [AWS Database Migration Service User Guide](#).
- For API details, see [AddTagsToResource](#) in [AWS CLI Command Reference](#).

**create-endpoint**

The following code example shows how to use `create-endpoint`.

**AWS CLI**

To create an endpoint

The following `create-endpoint` example creates an endpoint for an Amazon S3 source.

```
aws dms create-endpoint \
  --endpoint-type source \
  --engine-name s3
```
## Contents of `s3-settings.json`:  

```
{
    "BucketName":"my-corp-data",
    "BucketFolder":"sourcedata",
    "ServiceAccessRoleArn":"arn:aws:iam::123456789012:role/my-s3-access-role"
}
```

## Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\n;",
        "Status": "active",
        "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34ECUOJ6QVZ56DAHT3U",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
            "CsvRowDelimiter": "\n",
            "CsvDelimiter": ",",
            "BucketFolder": "sourcedata",
            "BucketName": "my-corp-data",
            "CompressionType": "NONE",
            "EnableStatistics": true
        }
    }
}
```

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/working-with-endpoints.html) in the [AWS Database Migration Service User Guide](https://docs.aws.amazon.com/dms/latest/userguide/).  

**create-event-subscription**

The following code example shows how to use `create-event-subscription`.

**AWS CLI**

To list event subscriptions

The following `create-event-subscription` example creates an event subscription to an Amazon SNS topic (my-sns-topic).

```bash
aws dms create-event-subscription \
   --subscription-name my-dms-events \
```

Output:

```json
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "creating",
      "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
      "Enabled": true
   }
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateEventSubscription](#) in *AWS CLI Command Reference*.

**create-replication-instance**

The following code example shows how to use `create-replication-instance`.

**AWS CLI**

To create a replication instance

The following `create-replication-instance` example creates a replication instance.
aws dms create-replication-instance \
   --replication-instance-identifier my-repl-instance \
   --replication-instance-class dms.t2.micro \
   --allocated-storage 5

Output:

{
   "ReplicationInstance": {
      "ReplicationInstanceIdentifier": "my-repl-instance",
      "ReplicationInstanceClass": "dms.t2.micro",
      "ReplicationInstanceStatus": "creating",
      "AllocatedStorage": 5,
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sg-f839b688",
            "Status": "active"
         }
      ],
      "ReplicationSubnetGroup": {
         "ReplicationSubnetGroupIdentifier": "default",
         "ReplicationSubnetGroupDescription": "default",
         "VpcId": "vpc-136a4c6a",
         "SubnetGroupStatus": "Complete",
         "Subnets": [
            {
               "SubnetIdentifier": "subnet-da327bf6",
               "SubnetAvailabilityZone": {
                  "Name": "us-east-1a"
               },
               "SubnetStatus": "Active"
            },
            {
               "SubnetIdentifier": "subnet-42599426",
               "SubnetAvailabilityZone": {
                  "Name": "us-east-1d"
               },
               "SubnetStatus": "Active"
            },
            {
               "SubnetIdentifier": "subnet-bac383e0",
               "SubnetAvailabilityZone": {
                  "Name": "us-east-1c"
               }
            }
         ]
      }
   }
}
For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see CreateReplicationInstance in AWS CLI Command Reference.
create-replication-subnet-group

The following code example shows how to use create-replication-subnet-group.

AWS CLI

To create a subnet group

The following create-replication-subnet-group example creates a group consisting of 3 subnets.

```bash
aws dms create-replication-subnet-group \
  --replication-subnet-group-identifier my-subnet-group \
  --replication-subnet-group-description "my subnet group" \
  --subnet-ids subnet-da327bf6 subnet-bac383e0 subnet-d7c825e8
```

Output:

```
{
  "ReplicationSubnetGroup": {
    "ReplicationSubnetGroupIdentifier": "my-subnet-group",
    "ReplicationSubnetGroupDescription": "my subnet group",
    "VpcId": "vpc-136a4c6a",
    "SubnetGroupStatus": "Complete",
    "Subnets": [
      {
        "SubnetIdentifier": "subnet-da327bf6",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-bac383e0",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1c"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-d7c825e8",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1e"
        },
        "SubnetStatus": "Active"
      }
    ]
  }
}
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see CreateReplicationSubnetGroup in AWS CLI Command Reference.

`create-replication-task`

The following code example shows how to use `create-replication-task`.

**AWS CLI**

**To create a replication task**

The following `create-replication-task` example creates a replication task.

```bash
aws dms create-replication-task \
  --replication-task-identifier movedata \
  --target-endpoint-arn arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U \
  --replication-instance-arn $RI_ARN \
  --migration-type full-load \
  --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```json
{
  "rules": [
    {
      "rule-type": "selection",
      "rule-id": "1",
      "rule-name": "1",
      "object-locator": {
        "schema-name": "prodrep",
        "table-name": "%"
      }
    }
  ]
}
```
Output:

```json
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": "...output omitted...",
        "ReplicationTaskSettings": "...output omitted...",
        "Status": "creating",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/ug/working-with-dms-tasks.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateReplicationTask](https://docs.aws.amazon.com/cli/latest/reference/dms/create-replication-task.html) in *AWS CLI Command Reference*.

### delete-connection

The following code example shows how to use delete-connection.

#### AWS CLI

**To delete a connection**

The following delete-connection example disassociates an endpoint from a replication instance.
aws dms delete-connection
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7U8B5NM2LCVZF73PGJRNUE

Output:

{
   "Connection": {
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7U8B5NM2LCVZF73PGJRNUE",
      "Status": "deleting",
      "EndpointIdentifier": "src-database-1",
      "ReplicationInstanceIdentifier": "my-repl-instance"
   }
}

For more information, see https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.Creating.html in the AWS Database Migration Service User Guide.

- For API details, see DeleteConnection in AWS CLI Command Reference.

delete-endpoint

The following code example shows how to use delete-endpoint.

AWS CLI

To delete an endpoint

The following delete-endpoint example deletes an endpoint.

aws dms delete-endpoint
   --endpoint-arn arn:aws:dms:us-east-1:123456789012:endpoint:0UJ7X04Z4CYTSEG5XGMN2R3Y

Output:

{

"Endpoint": {
   "EndpointIdentifier": "src-endpoint",
   "EndpointType": "SOURCE",
   "EngineName": "s3",
   "EngineDisplayName": "Amazon S3",
   "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\n;",
   "Status": "deleting",
   "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:OUJJVXO4XZ4CYTSEG5XMG2R3Y",
   "SslMode": "none",
   "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
   "S3Settings": {
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
      "CsvRowDelimiter": "\n",
      "CsvDelimiter": ",",
      "BucketFolder": "sourcedata",
      "BucketName": "my-corp-data",
      "CompressionType": "NONE",
      "EnableStatistics": true
   }
}

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/working-with-endpoints.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteEndpoint](https://docs.aws.amazon.com/cli/latest/reference/dms/delete-event-subscription.html) in *AWS CLI Command Reference*.

### delete-event-subscription

The following code example shows how to use `delete-event-subscription`.

**AWS CLI**

**To delete an event subscription**

The following delete-event-subscription example deletes a subscription to an Amazon SNS topic.

```
aws dms delete-event-subscription \
   --subscription-name "my-dms-events"
```
Output:

```
{
  "EventSubscription": {
    "CustomerAwsId": "123456789012",
    "CustSubscriptionId": "my-dms-events",
    "Status": "deleting",
    "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
    "Enabled": true
  }
}
```

For more information, see [Working with Events and Notifications](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [DeleteEventSubscription](#) in [AWS CLI Command Reference](#).

### delete-replication-instance

The following code example shows how to use `delete-replication-instance`.

**AWS CLI**

To delete a replication instance

The following `delete-replication-instance` example deletes a replication instance.

```
aws dms delete-replication-instance
  --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZ7F7JPGJRNUE
```

Output:

```
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "deleting",
    "AllocatedStorage": 5,
    "InstanceCreateTime": 1590011235.952,
    "VpcSecurityGroups": [ ]
  }
}
```
"VpcSecurityGroupId": "sg-f839b688",
"Status": "active"
],
"AvailabilityZone": "us-east-1e",
"ReplicationSubnetGroup": {
  "ReplicationSubnetGroupIdentifier": "default",
  "ReplicationSubnetGroupDescription": "default",
  "VpcId": "vpc-136a4c6a",
  "SubnetGroupStatus": "Complete",
  "Subnets": [
    {
      "SubnetIdentifier": "subnet-da327bf6",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1a"
      },
      "SubnetStatus": "Active"
    },
    {
      "SubnetIdentifier": "subnet-42599426",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1d"
      },
      "SubnetStatus": "Active"
    },
    {
      "SubnetIdentifier": "subnet-bac383e0",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1c"
      },
      "SubnetStatus": "Active"
    },
    {
      "SubnetIdentifier": "subnet-6746046b",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1f"
      },
      "SubnetStatus": "Active"
    },
    {
      "SubnetIdentifier": "subnet-d7c825e8",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1e"
      },
      "SubnetStatus": "Active"
    }
  ]
}
For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationInstance in AWS CLI Command Reference.

delete-replication-subnet-group

The following code example shows how to use delete-replication-subnet-group.
AWS CLI

To delete a subnet group

The following delete-replication-subnet-group example deletes a subnet group.

```
aws dms delete-replication-subnet-group \n   --replication-subnet-group-identifier my-subnet-group
```

Output:

```
(none)
```

For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationSubnetGroup in AWS CLI Command Reference.

**delete-replication-task**

The following code example shows how to use delete-replication-task.

AWS CLI

To delete a replication task

The following delete-replication-task example deletes a replication task.

```
aws dms delete-replication-task \n   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKZCZHYBFGAGZT3QEC5U",
```

Actions and scenarios
"ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
  "MigrationType": "full-load",
  "TableMappings": ...
  "ReplicationTaskSettings": ...
  "Status": "deleting",
  "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
  "ReplicationTaskCreationDate": 1590524772.505,
  "ReplicationTaskStartDate": 1590789988.677,
  "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHJIIA45FII"
}
}

For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationTask in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe account attributes

The following describe-account-attributes example lists the attributes for your AWS account.

aws dms describe-account-attributes

Output:

```json
{
  "AccountQuotas": [
    {
      "AccountQuotaName": "ReplicationInstances",
      "Used": 1,
      "Max": 20
    },
    {
```
For API details, see [DescribeAccountAttributes](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-certificates) in *AWS CLI Command Reference*.

**describe-certificates**

The following code example shows how to use `describe-certificates`.

**AWS CLI**

**To list the available certificates**

The following `describe-certificates` example lists the available certificates in your AWS account.

```
aws dms describe-certificates
```

Output:

```
{
  "Certificates": [
    {
      "CertificateIdentifier": "my-cert",
      "CertificateCreationDate": 1543259542.506,
      "CertificatePem": "-----BEGIN CERTIFICATE-----
MIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ...U"

      ... remaining output omitted ...

    }
  ]
}
```
For more information, see Using SSL in the AWS Database Migration Service User Guide.

- For API details, see DescribeCertificates in AWS CLI Command Reference.

### describe-connections

The following code example shows how to use `describe-connections`.

**AWS CLI**

**To describe connections**

The following `describe-connections` example lists the connections that you have tested between a replication instance and an endpoint.

```bash
aws dms describe-connections
```

Output:

```
{
  "Connections": [
    {
      "Status": "successful",
      "ReplicationInstanceIdentifier": "test",
      "EndpointIdentifier": "testsrv1",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:6UTDJGBOUS3VI3SUWA66XFJCJQ"
    }
  ]
}
```

For more information, see Creating Source and Target Endpoints in the AWS Database Migration Service User Guide.

- For API details, see DescribeConnections in AWS CLI Command Reference.

### describe-endpoint-types

The following code example shows how to use `describe-endpoint-types`.

```
```
AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```bash
aws dms describe-endpoint-types \
   --filters "Name=engine-name,Values=mysql"
```

Output:

```json
{
   "SupportedEndpointTypes": [
      {
         "EngineName": "mysql",
         "SupportsCDC": true,
         "EndpointType": "source",
         "EngineDisplayName": "MySQL"
      },
      {
         "EngineName": "mysql",
         "SupportsCDC": true,
         "EndpointType": "target",
         "EngineDisplayName": "MySQL"
      }
   ]
}
```

For more information, see Working with AWS DMS Endpoints [https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html](https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html) in the AWS Database Migration Service User Guide.

- For API details, see [DescribeEndpointTypes](#) in AWS CLI Command Reference.

**describe-endpoints**

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints
The following `describe-endpoints` example lists the endpoints in your AWS account.

```bash
aws dms describe-endpoints
```

Output:

```json
{
   "Endpoints": [
   {
      "Username": "dms",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:SF2W0FLWYWKVEOHID2EKLP3SJI",
      "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/94d5c4e7-4e4c-44be-b58a-c8da7adf57cd",
      "DatabaseName": "test",
      "EngineName": "mysql",
      "EndpointIdentifier": "pri100",
      "Port": 8193
   },
   {
      "Username": "admin",
      "Status": "active",
      "ServerName": "test.example.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/2431021b-1cf2-a2d4-77b2-59a9e4bce323",
      "DatabaseName": "EMPL",
      "EngineName": "oracle",
      "EndpointIdentifier": "test",
      "Port": 1521
   }
   ]
}
```

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/aws-dms-endpoint.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-endpoints.html) in *AWS CLI Command Reference*.
describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories

The following describe-event-categories example lists the available event categories.

```bash
aws dms describe-event-categories
```

Output:

```json
{
   "EventCategoryGroupList": [
      {
         "SourceType": "replication-instance",
         "EventCategories": ["low storage", "configuration change", "maintenance", "deletion", "creation", "failover", "failure"]
      },
      {
         "SourceType": "replication-task",
         "EventCategories": ["configuration change", "state change", "deletion", "creation", "failure"]
      }
   ]
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.
describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

The following describe-event-subscriptions example lists the event subscriptions to an Amazon SNS topic.

```bash
aws dms describe-event-subscriptions
```

Output:

```json
{
   "EventSubscriptionsList": [
   {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "deleting",
      "Enabled": true
   }
   ]
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.

For API details, see DescribeEventSubscriptions in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list DMS events
The following `describe-events` example lists the events that originated from a replication instance.

```bash
aws dms describe-events 
   --source-type "replication-instance"
```

Output:

```json
{
   "Events": [
      {
         "SourceIdentifier": "my-repl-instance",
         "SourceType": "replication-instance",
         "Message": "Replication application shutdown",
         "EventCategories": [],
         "Date": 1590771645.776
      }
   ]
}
```

For more information, see [Working with Events and Notifications](https://docs.aws.amazon.com/AmazonDMS/latest/migration-service-user-guide/working-with-events-and-notifications.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEvents](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-events.html) in *AWS CLI Command Reference*.

### describe-orderable-replication-instances

The following code example shows how to use `describe-orderable-replication-instances`.

**AWS CLI**

To describe orderable replication instances

The following `describe-orderable-replication-instances` example lists replication instance types that you can order.

```bash
aws dms describe-orderable-replication-instances
```

Output:

```json
{
   "Actions": [
      {
         "ActionName": "create-replication-instance",
         "Description": "Create a replication instance.",
         "OrderableInstanceTypes": [
            "db-100a",
            "db-100b",
            "db-100c"
         ],
         "ServiceRoleArn": "arn:aws:iam::123456789012:role/service-role/service-role/MyDBRole",
         "Status": "ORDERABLE"
      }
   ]
}
```
"OrderableReplicationInstances": [
    {
        "EngineVersion": "3.3.2",
        "ReplicationInstanceClass": "dms.c4.2xlarge",
        "StorageType": "gp2",
        "MinAllocatedStorage": 5,
        "MaxAllocatedStorage": 6144,
        "DefaultAllocatedStorage": 100,
        "IncludedAllocatedStorage": 100,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d",
            "us-east-1e",
            "us-east-1f"
        ]
    },
    {
        "EngineVersion": "3.3.2",
        "ReplicationInstanceClass": "dms.c4.4xlarge",
        "StorageType": "gp2",
        "MinAllocatedStorage": 5,
        "MaxAllocatedStorage": 6144,
        "DefaultAllocatedStorage": 100,
        "IncludedAllocatedStorage": 100,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d",
            "us-east-1e",
            "us-east-1f"
        ]
    },
],

...remaining output omitted...

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeOrderableReplicationInstances in AWS CLI Command Reference.
describe-refresh-schemas-status

The following code example shows how to use describe-refresh-schemas-status.

AWS CLI

To list the refresh status for an endpoint

The following describe-refresh-schemas-status example returns the status of a previous refresh request.

```
aws dms describe-refresh-schemas-status
```

Output:

```
{
    "RefreshSchemasStatus": {
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF73PJNUE",
        "Status": "successful",
        "LastRefreshDate": 1590786544.605
    }
}
```

• For API details, see DescribeRefreshSchemasStatus in AWS CLI Command Reference.

describe-replication-instances

The following code example shows how to use describe-replication-instances.

AWS CLI

To describe replication instances

The following describe-replication-instances example lists the replication instances in your AWS account.

```
aws dms describe-replication-instances
```
Output:

```json
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-east-1e",
            "ReplicationSubnetGroup": {
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",
                "VpcId": "vpc-136a4c6a",
                "SubnetGroupStatus": "Complete",
                "Subnets": [
                    {
                        "SubnetIdentifier": "subnet-da327bf6",
                        "SubnetAvailabilityZone": {
                            "Name": "us-east-1a"
                        },
                        "SubnetStatus": "Active"
                    },
                    {
                        "SubnetIdentifier": "subnet-42599426",

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationInstances in AWS CLI Command Reference.

describe-replication-subnet-groups

The following code example shows how to use describe-replication-subnet-groups.

**AWS CLI**

**To display the available subnet groups**

The following describe-replication-subnet-groups example lists the available subnet groups.

```
aws dms describe-replication-subnet-groups \
    --filter "Name=replication-subnet-group-id,Values=my-subnet-group"
```

Output:

```
{
    "ReplicationSubnetGroups": [
        {
            "ReplicationSubnetGroupIdentifier": "my-subnet-group",
            "ReplicationSubnetGroupDescription": "my subnet group",
            "VpcId": "vpc-136a4c6a",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-da327bf6",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-bac3830e",}
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationSubnetGroups in AWS CLI Command Reference.

describe-replication-task-assessment-results

The following code example shows how to use describe-replication-task-assessment-results.

AWS CLI

**To list the results of replication task assessment**

The following describe-replication-task-assessment-results example lists the results of a prior task assessment.

```bash
aws dms describe-replication-task-assessment-results
```

Output:

```json
{
   "ReplicationTaskAssessmentResults": [
      {
      }
   ]
}
```
"ReplicationTaskIdentifier": "moveit2",
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
"ReplicationTaskLastAssessmentDate": 1590790230.0,
"AssessmentStatus": "No issues found",
"AssessmentResultsFile": "moveit2/2020-05-29-22-10"
]
}

For more information, see Creating a Task Assessment Report in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationTaskAssessmentResults in AWS CLI Command Reference.

describe-replication-tasks

The following code example shows how to use describe-replication-tasks.

AWS CLI

To describe a replication task

The following describe-replication-tasks example describes current replication tasks.

```shell
aws dms describe-replication-tasks
```

Output:

```json
{
   "ReplicationTasks": [
   {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFCKZEHVZBFAGZT3QECSU",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF73PGJRNUE",
      "MigrationType": "full-load",
      "TableMappings": "...output omitted..."
   }
   ]
}
```
"ReplicationTaskSettings": ...output omitted...
"Status": "stopped",
"StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590619805.212,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJSVHJIIA45FII",
"ReplicationTaskStats": {
  "FullLoadProgressPercent": 100,
  "ElapsedTimeMillis": 0,
  "TablesLoaded": 0,
  "TablesLoading": 0,
  "TablesQueued": 0,
  "TablesErrored": 0,
  "FreshStartDate": 1590619811.528,
  "StartDate": 1590619811.528,
  "StopDate": 1590619842.068
}
}
]
}

For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationTasks in AWS CLI Command Reference.

describe-schemas

The following code example shows how to use describe-schemas.

AWS CLI

To describe database schemas

The following describe-schemas example lists the available tables at an endpoint.

```bash
aws dms describe-schemas \ --endpoint-arn "arn:aws:dms:us-east-1:123456789012:endpoint:6GGI6YPWGWYLMKIB732KEVWA"
```

Output:
For more information, see This is the topic title in the AWS Database Migration Service User Guide.

- For API details, see DescribeSchemas in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list the tags for a resource**

The following list-tags-for-resource example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \   
   --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZ7F7JPNUE
```

**Output:**

```
{
   "TagList": [   
      {
         "Key": "Project",
         "Value": "dbMigration"
      },   
      {
         "Key": "Environment",
         "Value": "PROD"
      }
   ]
}
```

For more information, see Tagging Resources in the AWS Database Migration Service User Guide.
modify-endpoint

The following code example shows how to use modify-endpoint.

AWS CLI

To modify an endpoint

The following modify-endpoint example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
  --endpoint-arn "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U" \
  --extra-connection-attributes "compressionType=GZIP"
```

Output:

```
{
  "Endpoint": {
    "EndpointIdentifier": "src-endpoint",
    "EndpointType": "SOURCE",
    "EngineName": "s3",
    "EngineDisplayName": "Amazon S3",
    "ExtraConnectionAttributes": "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\n;",
    "Status": "active",
    "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U",
    "SslMode": "none",
    "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
    "S3Settings": {
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
      "CsvRowDelimiter": "\n",
      "CsvDelimiter": ",",
      "BucketFolder": "",
      "BucketName": "",
      "CompressionType": "GZIP",
      "EnableStatistics": true
    }
  }
}```
modify-event-subscription

The following code example shows how to use modify-event-subscription.

**AWS CLI**

**To modify an event subscription**

The following modify-event-subscription example changes the source type of an event subscription.

```
aws dms modify-event-subscription \
    --subscription-name "my-dms-events" \
    --source-type replication-task
```

Output:

```json
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "modifying",
      "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
      "SourceType": "replication-task",
      "Enabled": true
   }
}
```

For more information, see [Working with Events and Notifications](https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html) in the *AWS Database Migration Service User Guide*. 
modify-replication-instance

The following code example shows how to use modify-replication-instance.

AWS CLI

To modify a replication instance

The following modify-replication-instance example modifies a replication instance so that it uses a Multi-AZ deployment.

```bash
aws dms modify-replication-instance \
  --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JP6JRNEU \ 
  --multi-az
```

Output:

```json
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "available",
    "AllocatedStorage": 5,
    "InstanceCreateTime": 1590011235.952,
    "PendingModifiedValues": {
      "MultiAZ": true
    },
    "MultiAZ": false,
    "EngineVersion": "3.3.2",
    "AutoMinorVersionUpgrade": true,
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9fae-e8494fa3921a",
    "Output omitted..."
  }
}
```
For more information, see [Working with an AWS DMS Replication Instance](https://docs.aws.amazon.com/database-migration/latest/dg/replication-instance-aws.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationInstance](https://docs.aws.amazon.com/cli/latest/reference/dms/modify-replication-instance.html) in *AWS CLI Command Reference*.

### `modify-replication-subnet-group`

The following code example shows how to use `modify-replication-subnet-group`.

**AWS CLI**

*To modify a subnet group*

The following `modify-replication-subnet-group` example changes the lists of subnets associated with a subnet group.

```
aws dms modify-replication-subnet-group \
  --replication-subnet-group-identifier my-subnet-group \
  --subnet-id subnet-da327bf6 subnet-bac383e0
```

**Output:**

```json
{
  "ReplicationSubnetGroup": {
    "ReplicationSubnetGroupIdentifier": "my-subnet-group",
    "ReplicationSubnetGroupDescription": "my subnet group",
    "VpcId": "vpc-136a4c6a",
    "SubnetGroupStatus": "Complete",
    "Subnets": [
      {
        "SubnetIdentifier": "subnet-da327bf6",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-bac383e0",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1c"
        },
        "SubnetStatus": "Active"
      }
    ]
  }
}
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see ModifyReplicationSubnetGroup in AWS CLI Command Reference.

modify-replication-task

The following code example shows how to use modify-replication-task.

**AWS CLI**

To modify a replication task

The following modify-replication-task example changes the table mappings for a task.

```bash
aws dms modify-replication-task \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCBGASJS5VHZJIINA45FII" \ 
   --table-mappings file://table-mappings.json
```

Contents of table-mappings.json:

```json
{
   "rules": [
      {
         "rule-type": "selection",
         "rule-id": "1",
         "rule-name": "1",
         "object-locator": {
            "schema-name": "prodrep",
            "table-name": "ACCT_%"
         },
         "rule-action": "include",
         "filters": []
      }
   ],
```
Output:

```json
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEYHZBFAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": "...output omitted...",
        "ReplicationTaskSettings": "...output omitted...",
        "Status": "modifying",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationTask](#) in *AWS CLI Command Reference*.

**reboot-replication-instance**

The following code example shows how to use `reboot-replication-instance`.

**AWS CLI**

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance
```
--replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF73PGJRNUE

Output:

```json
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "rebooting",
    "AllocatedStorage": 5,
    "InstanceCreateTime": 1590011235.952,
    ... output omitted ...
  }
}
```

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see RebootReplicationInstance in AWS CLI Command Reference.

**refresh-schemas**

The following code example shows how to use refresh-schemas.

**AWS CLI**

**To refresh database schemas**

The following refresh-schemas example requests that AWS DMS refresh the list of schemas at an endpoint.

```bash
aws dms refresh-schemas \
  --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF73PGJRNUE \
```

Output:

```json
{
  "RefreshSchemasStatus": {
    ...
  }
}
"ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:TMQ70UB5NM2LCV2F7PQGJRNUE",
"Status": "refreshing",
"LastRefreshDate": 1590019949.103
}

For API details, see RefreshSchemas in AWS CLI Command Reference.

reload-tables

The following code example shows how to use reload-tables.

AWS CLI

To refresh the list of tables available at an endpoint

The following reload-tables example reloads the list of available tables at an endpoint.

```
aws dms reload-tables \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZIINA45FII" \
   --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

Output:

```
{
   "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZIINA45FII"
}
```

For API details, see ReloadTables in AWS CLI Command Reference.

remove-tags-from-resource

The following code example shows how to use remove-tags-from-resource.

AWS CLI

To remove tags from a replication instance
The following `remove-tags-from-resource` example removes tags from a replication instance.

```
aws dms remove-tags-from-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVF7JPGJRNUE \
  --tag-keys Environment Project
```

This command produces no output.

For more information, see [Tagging Resources](https://docs.aws.amazon.com/database-migration-service/latest/userguide/migration-service-quick-reference.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [RemoveTagsFromResource](https://docs.aws.amazon.com/cli/latest/reference/dms/remove-tags-from-resource.html) in *AWS CLI Command Reference*.

### start-replication-task-assessment

The following code example shows how to use `start-replication-task-assessment`.

**AWS CLI**

**To start a task assessment**

The following `start-replication-task-assessment` example starts a replication task assessment.

```
aws dms start-replication-task-assessment \
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

**Output:**

```json
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFCKZ3YEHZBFAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVF7JPGJRNUE",
    "MigrationType": "full-load",
```
For more information, see [Creating a Task Assessment Report](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [StartReplicationTaskAssessment](#) in [AWS CLI Command Reference](#).

### start-replication-task

The following code example shows how to use `start-replication-task`.

**AWS CLI**

**To start a replication task**

The following command-name example lists the available widgets in your AWS account.

```bash
aws dms start-replication-task \ 
   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \ 
   --start-replication-task-type reload-target
```

**Output:**

```json
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEHYHZBFAGZT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVF7JPGJRNUE",
```
For more information, see [Working with AWS DMS Tasks](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [StartReplicationTask](#) in [AWS CLI Command Reference](#).

**stop-replication-task**

The following code example shows how to use `stop-replication-task`.

**AWS CLI**

To stop a task

The following `stop-replication-task` example stops a task.

```
aws dms stop-replication-task \
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCEYHZBGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZJPRNUE",
    "MigrationType": "full-load",
  }
}```
For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see StopReplicationTask in AWS CLI Command Reference.

test-connection

The following code example shows how to use test-connection.

AWS CLI

To test a connection to an endpoint

The following test-connection example tests whether an endpoint can be accessed from a replication instance.

```
aws dms test-connection \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
```

Output:

```
{
   "Connection": {
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
      "Status": "testing",
   }
}
```
For more information, see Creating source and target endpoints in the AWS Database Migration Service User Guide.

- For API details, see TestConnection in AWS CLI Command Reference.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

To add one or more tags to a specified resource

The following add-tags-to-resource example adds three tags to sample-cluster. One tag (CropB) has a key name but no value.

```
"EndpointIdentifier": "src-database-1",
"ReplicationInstanceIdentifier": "my-repl-instance"
} }
aws docdb add-tags-to-resource \
  --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"

This command produces no output.

For more information, see Tagging Amazon DocumentDB Resources in the Amazon DocumentDB Developer Guide.

- For API details, see AddTagsToResource in AWS CLI Command Reference.

apply-pending-maintenance-action

The following code example shows how to use apply-pending-maintenance-action.

AWS CLI

To have pending maintenance actions take place during the next maintenance window

The following apply-pending-maintenance-action example causes all system-update actions to be performed during the next scheduled maintenance window.

aws docdb apply-pending-maintenance-action \
  --apply-action system-update \
  --opt-in-type next-maintenance

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the Amazon DocumentDB Developer Guide.

- For API details, see ApplyPendingMaintenanceAction in AWS CLI Command Reference.

copy-db-cluster-parameter-group

The following code example shows how to use copy-db-cluster-parameter-group.

AWS CLI

To duplicate an existing DB cluster parameter group
The following `copy-db-cluster-parameter-group` example makes a copy of the parameter group `custom-docdb3-6` named `custom-docdb3-6-copy`. When making the copy it adds tags to the new parameter group.

```bash
aws docdb copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier custom-docdb3-6 \
    --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
    --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
    --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```json
{
    "DBClusterParameterGroup": {
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-pg:custom-docdb3-6-copy",
        "DBClusterParameterGroupName": "custom-docdb3-6-copy",
        "Description": "Copy of custom-docdb3-6"
    }
}
```

For more information, see [Copying an Amazon DocumentDB Cluster Parameter Group](https://docs.aws.amazon.com/documentdb/latest/developerguide/copy-parameter-group.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CopyDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/docdb/copy-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

### copy-db-cluster-snapshot

The following code example shows how to use `copy-db-cluster-snapshot`.

#### AWS CLI

**To create a copy of a snapshot**

The following `copy-db-cluster-snapshot` example makes a copy of `sample-cluster-snapshot` named `sample-cluster-snapshot-copy`. The copy has all the tags of the original plus a new tag with the key name `CopyNumber`.

```bash
aws docdb copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier sample-cluster-snapshot \
    --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```
--target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \ 
--copy-tags \ 
--tags Key="CopyNumber",Value="1"

This command produces no output.

For more information, see [Copying a Cluster Snapshot](#) in the Amazon DocumentDB Developer Guide.

- For API details, see [CopyDbClusterSnapshot](#) in AWS CLI Command Reference.

**create-db-cluster-parameter-group**

The following code example shows how to use create-db-cluster-parameter-group.

**AWS CLI**

To create an Amazon DocumentDB cluster parameter group

The following create-db-cluster-parameter-group example creates the DB cluster parameter group sample-parameter-group using the docdb3.6 family.

```bash
aws docdb create-db-cluster-parameter-group \
  --db-cluster-parameter-group-name sample-parameter-group \
  --db-parameter-group-family docdb3.6 \
  --description "Sample parameter group based on docdb3.6"
```

Output:

```json
{
   "DBClusterParameterGroup": {
      "Description": "Sample parameter group based on docdb3.6",
      "DBParameterGroupFamily": "docdb3.6",
      "DBClusterParameterGroupName": "sample-parameter-group"
   }
}
```

For more information, see [Creating an Amazon DocumentDB Cluster Parameter Group](#) in the Amazon DocumentDB Developer Guide.
For API details, see CreateDbClusterParameterGroup in AWS CLI Command Reference.

### create-db-cluster-snapshot

The following code example shows how to use create-db-cluster-snapshot.

#### AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following `create-db-cluster-snapshot` example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```bash
aws docdb create-db-cluster-snapshot \
   --db-cluster-identifier sample-cluster \
   --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
   "DBClusterSnapshot": {
      "MasterUsername": "master-user",
      "AvailabilityZones": [
         "us-west-2a",
         "us-west-2b",
         "us-west-2c",
         "us-west-2d",
         "us-west-2e",
         "us-west-2f"
      ],
      "SnapshotType": "manual",
      "EngineVersion": "3.6.0",
      "PercentProgress": 0,
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
      "Engine": "docdb",
      "DBClusterIdentifier": "sample-cluster",
      "Status": "creating",
      "Port": 0,
```

Actions and scenarios
For more information, see [Creating a Manual Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/) in the Amazon DocumentDB Developer Guide.

- For API details, see [CreateDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/docdb/create-db-cluster snapshot.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/docdb.html).

**create-db-cluster**

The following code example shows how to use `create-db-cluster`.

**AWS CLI**

**To create an Amazon DocumentDB cluster**

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named `sample-cluster` with the preferred maintenance window on Sundays between 20:30 and 11:00.

```bash
aws docdb create-db-cluster \
--db-cluster-identifier sample-cluster \
--engine docdb \
--master-username master-user \
--master-user-password password \
--preferred-maintenance-window Sun:20:30-Sun:21:00
```

Output:

```
{
    "DBCluster": {
        "DBClusterParameterGroup": "default.docdb3.6",
        "AssociatedRoles": [],
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
        "Status": "creating",
        "Port": 27017,
        "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
        "HostedZoneId": "ZNKXH8ST7WV",
        "DBClusterMembers": []
    }
}
```
For more information, see [Creating an Amazon DocumentDB Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-cluster.html) in *AWS CLI Command Reference*.

### create-db-instance

The following code example shows how to use `create-db-instance`.

**AWS CLI**

To create an Amazon DocumentDB cluster instance

The following `create-db-instance` example code creates the instance `sample-cluster-instance-2` in the Amazon DocumentDB cluster `sample-cluster`.

```json
"Engine": "docdb",
"DBClusterIdentifier": "sample-cluster",
"PreferredBackupWindow": "10:12-10:42",
"AvailabilityZones": [
  "us-west-2d",
  "us-west-2f",
  "us-west-2e"
],
"MasterUsername": "master-user",
"BackupRetentionPeriod": 1,
"ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"VpcSecurityGroups": [
  {
    "VpcSecurityGroupId": "sg-77186e0d",
    "Status": "active"
  }
],
"StorageEncrypted": false,
"DbClusterResourceId": "cluster-L3R4YRSBUYDP4GLMTJ2WF5GH5Q",
"MultiAZ": false,
"Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"EngineVersion": "3.6.0"
}
```
aws docdb create-db-instance \
   --db-cluster-identifier sample-cluster \
   --db-instance-class db.r4.xlarge \
   --db-instance-identifier sample-cluster-instance-2 \
   --engine docdb

Output:

```json
{
   "DBInstance": {
      "DBInstanceStatus": "creating",
      "PendingModifiedValues": {
         "PendingCloudwatchLogsExports": {
            "LogTypesToEnable": [
               "audit"
            ]
         }
      },
      "PubliclyAccessible": false,
      "PreferredBackupWindow": "00:00-00:30",
      "PromotionTier": 1,
      "EngineVersion": "3.6.0",
      "BackupRetentionPeriod": 3,
      "DBInstanceIdentifier": "sample-cluster-instance-2",
      "PreferredMaintenanceWindow": "tue:10:28-tue:10:58",
      "StorageEncrypted": false,
      "Engine": "docdb",
      "DBClusterIdentifier": "sample-cluster",
      "DBSubnetGroup": {
         "Subnets": [
            {
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2a"
               },
               "SubnetStatus": "Active",
               "SubnetIdentifier": "subnet-4e26d263"
            },
            {
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2c"
               },
               "SubnetStatus": "Active",
               "SubnetIdentifier": "subnet-afc329f4"
            }
         ]
      }
   }
}
```
For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbInstance in AWS CLI Command Reference.

create-db-subnet-group

The following code example shows how to use create-db-subnet-group.
AWS CLI

To create an Amazon DocumentDB subnet group

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.

```bash
aws docdb create-db-subnet-group \
  --db-subnet-group-description "a sample subnet group" \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

Output:

```
{
  "DBSubnetGroup": {
    "SubnetGroupStatus": "Complete",
    "DBSubnetGroupName": "sample-subnet-group",
    "DBSubnetGroupDescription": "a sample subnet group",
    "VpcId": "vpc-91280df6",
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-53ab3636",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2d"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-991cb8d0",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2b"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-29ab1025",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2c"
        }
      }
    ]
  }
}
```
For more information, see Creating an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbSubnetGroup in AWS CLI Command Reference.

delete-db-cluster-parameter-group

The following code example shows how to use delete-db-cluster-parameter-group.

**AWS CLI**

To delete an Amazon DocumentDB cluster parameter group

The following delete-db-cluster-parameter-group example deletes the Amazon DocumentDB parameter group sample-parameter-group.

```bash
aws docdb delete-db-cluster-parameter-group \\
    --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbClusterParameterGroup in AWS CLI Command Reference.

delete-db-cluster-snapshot

The following code example shows how to use delete-db-cluster-snapshot.

**AWS CLI**

To delete an Amazon DocumentDB cluster snapshot

The following delete-db-cluster-snapshot example deletes the Amazon DocumentDB cluster snapshot sample-cluster-snapshot.

```bash
aws docdb delete-db-cluster-snapshot \\
```

Actions and scenarios
Output:

```json
{
    "DBClusterSnapshot": {
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c",
            "us-west-2d"
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
        "VpcId": "vpc-91280df6",
        "EngineVersion": "3.6.0",
        "Engine": "docdb",
        "Status": "available",
        "MasterUsername": "master-user",
        "PercentProgress": 100,
        "StorageEncrypted": false,
        "SnapshotType": "manual",
        "Port": 0
    }
}
```

For more information, see Deleting a Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbClusterSnapshot in AWS CLI Command Reference.

**delete-db-cluster**

The following code example shows how to use delete-db-cluster.

**AWS CLI**

To delete an Amazon DocumentDB cluster
The following delete-db-cluster example deletes the Amazon DocumentDB cluster sample-cluster. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```bash
aws docdb delete-db-cluster \
  --db-cluster-identifier sample-cluster \
  --skip-final-snapshot
```

Output:

```json
{
  "DBCluster": {
    "DBClusterIdentifier": "sample-cluster",
    "DBSubnetGroup": "default",
    "EngineVersion": "3.6.0",
    "Engine": "docdb",
    "LatestRestorableTime": "2019-03-18T18:24:610Z",
    "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
    "StorageEncrypted": false,
    "EarliestRestorableTime": "2019-03-18T18:24:610Z",
    "Port": 27017,
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ],
    "MultiAZ": false,
    "MasterUsername": "master-user",
    "Status": "available",
    "PreferredBackupWindow": "10:12-10:42",
    "ReaderEndpoint": "sample-cluster.cluster-ro-corcj0zrl5fc.us-west-2.docdb.amazonaws.com",
    "AvailabilityZones": [
      "us-west-2c",
      "us-west-2b",
      "us-west-2a"
    ],
    "Endpoint": "sample-cluster.cluster-corcj0zrl5fc.us-west-2.docdb.amazonaws.com",
    "DbClusterResourceId": "cluster-L3R4YRSBUYDP4GLMTJ2WF5GH5Q",
    "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
  }
}
```
For more information, see [Deleting an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbCluster](#) in AWS CLI Command Reference.

### delete-db-instance

The following code example shows how to use `delete-db-instance`.

**AWS CLI**

**To delete an Amazon DocumentDB instance**

The following `delete-db-instance` example deletes the Amazon DocumentDB instance `sample-cluster-instance-2`.

```
aws docdb delete-db-instance \
    --db-instance-identifier sample-cluster-instance-2
```

**Output:**

```
{
    "DBInstance": {
        "DBSubnetGroup": {
            "Subnets": [
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-86d26346"
                }
            ]
        }
    }
}
```
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-afc329f4"
},
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-53ab3636"
},
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-991cb8d0"
}
],
"DBSubnetGroupName": "default",
"DBSubnetGroupDescription": "default",
"VpcId": "vpc-91280df6",
"SubnetGroupStatus": "Complete"
},
"PreferredBackupWindow": "00:00-00:30",
"InstanceCreateTime": "2019-03-18T18:37:33.709Z",
"DBInstanceClass": "db.r4.xlarge",
"DbiResourceId": "db-XEKJLEMGRV5ZKCARUVA4HO3ITE",
"BackupRetentionPeriod": 3,
"Engine": "docdb",
"VpcSecurityGroups": [
    {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
    }
],
"AutoMinorVersionUpgrade": true,
"PromotionTier": 1,
"EngineVersion": "3.6.0",
"Endpoint": {
    "Address": "sample-cluster-instance-2.corcjozrslsfcs.us-west-2.docdb.amazonaws.com",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Port": 27017
For more information, see Deleting an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbInstance in AWS CLI Command Reference.

**delete-db-subnet-group**

The following code example shows how to use delete-db-subnet-group.

**AWS CLI**

**To delete an Amazon DocumentDB subnet group**

The following delete-db-subnet-group example deletes the Amazon DocumentDB subnet group sample-subnet-group.

```bash
aws docdb delete-db-subnet-group 
  --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbSubnetGroup in AWS CLI Command Reference.
**describe-db-cluster-parameter-groups**

The following code example shows how to use `describe-db-cluster-parameter-groups`.

**AWS CLI**

**To see the details of one or more Amazon DocumentDB cluster parameter groups**

The following `describe-db-cluster-parameter-groups` example displays details for the Amazon DocumentDB cluster parameter group custom3-6-param-grp.

```
aws docdb describe-db-cluster-parameter-groups \
 --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
   "DBClusterParameterGroups": [
      {
         "DBParameterGroupFamily": "docdb3.6",
         "Description": "Custom docdb3.6 parameter group",
         "DBClusterParameterGroupName": "custom3-6-param-grp"
      }
   ]
}
```

For more information, see [Viewing Amazon DocumentDB Cluster Parameter Groups](https://docs.aws.amazon.com/AmazonDocumentDB/latest/currentguide/cluster-parameter-groups.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbClusterParameterGroups](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-cluster-parameter-groups.html) in AWS CLI Command Reference.

**describe-db-cluster-parameters**

The following code example shows how to use `describe-db-cluster-parameters`.

**AWS CLI**

**To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.**

The following `describe-db-cluster-parameters` example lists the parameters for the Amazon DocumentDB parameter group custom3-6-param-grp.
aws docdb describe-db-cluster-parameters \
  --db-cluster-parameter-group-name custom3-6-param-grp

Output:

```json
{
  "Parameters": [
    {
      "DataType": "string",
      "ParameterName": "audit_logs",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "system",
      "ApplyType": "dynamic",
      "AllowedValues": "enabled,disabled",
      "Description": "Enables auditing on cluster.",
      "ParameterValue": "disabled"
    },
    {
      "DataType": "string",
      "ParameterName": "tls",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "system",
      "ApplyType": "static",
      "AllowedValues": "disabled,enabled",
      "Description": "Config to enable/disable TLS",
      "ParameterValue": "enabled"
    },
    {
      "DataType": "string",
      "ParameterName": "ttl_monitor",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "user",
      "ApplyType": "dynamic",
      "AllowedValues": "disabled,enabled",
      "Description": "Enables TTL Monitoring",
      "ParameterValue": "enabled"
    }
  ]
}
```
For more information, see Viewing Amazon DocumentDB Cluster Parameters in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterParameters in AWS CLI Command Reference.

describe-db-cluster-snapshot-attributes

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

**AWS CLI**

To list an Amazon DocumentDB snapshot attribute names and values

The following `describe-db-cluster-snapshot-attributes` example lists the attribute names and values for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshot-attributes \\n  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": []
      }
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
  }
}
```

For more information, see DescribeDBClusterSnapshotAttributes in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterSnapshotAttributes in AWS CLI Command Reference.

describe-db-cluster-snapshots

The following code example shows how to use `describe-db-cluster-snapshots`.

Actions and scenarios
AWS CLI

**To describe Amazon DocumentDB snapshots**

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```bash
aws docdb describe-db-cluster-snapshots \
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```json
{
  "DBClusterSnapshots": [
    {
      "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b",
        "us-west-2c",
        "us-west-2d"
      ],
      "Status": "available",
      "SnapshotType": "manual",
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
      "DBClusterIdentifier": "sample-cluster",
      "MasterUsername": "master-user",
      "StorageEncrypted": false,
      "VpcId": "vpc-91280df6",
      "EngineVersion": "3.6.0",
      "PercentProgress": 100,
      "Port": 0,
      "Engine": "docdb",
      "ClusterCreateTime": "2019-03-15T20:29:58.836Z"
    }
  ]
}
```

For more information, see [DescribeDBClusterSnapshots](https://docs.aws.amazon.com/documentdb/latest/developerguide/using-dbcluster-snapshots.html) in the *Amazon DocumentDB Developer Guide*. 
describe-db-clusters

The following code example shows how to use describe-db-clusters.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following describe-db-clusters example displays details for the Amazon DocumentDB cluster sample-cluster. By omitting the `--db-cluster-identifier` parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBClusters": [
        {
            "DBClusterParameterGroup": "default.docdb3.6",
            "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
            "PreferredBackupWindow": "00:00-00:30",
            "DBClusterIdentifier": "sample-cluster",
            "LatestRestorableTime": "2019-03-18T20:28:03.239Z",
            "MasterUsername": "master-user",
            "DBClusterMembers": [
                {
                    "PromotionTier": 1,
                    "DBClusterParameterGroupStatus": "in-sync",
                    "IsClusterWriter": false,
                    "DBInstanceIdentifier": "sample-cluster"
                },
                {
                    "PromotionTier": 1,
                    "DBClusterParameterGroupStatus": "in-sync",
                    "IsClusterWriter": true,
                    "DBInstanceIdentifier": "sample-cluster2"
                }
            ]
        }
    ]
}
For more information, see Describing Amazon DocumentDB Clusters in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusters in AWS CLI Command Reference.
**describe-db-engine-versions**

The following code example shows how to use `describe-db-engine-versions`.

**AWS CLI**

**To list available Amazon DocumentDB engine versions**

The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```bash
aws docdb describe-db-engine-versions \
    --engine docdb
```

Output:

```
{
    "DBEngineVersions": [
        {
            "DBEngineVersionDescription": "DocDB version 1.0.200837",
            "DBParameterGroupFamily": "docdb3.6",
            "EngineVersion": "3.6.0",
            "ValidUpgradeTarget": [],
            "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
            "SupportsLogExportsToCloudwatchLogs": true,
            "Engine": "docdb",
            "ExportableLogTypes": ["audit"
        ]
        ]
    }
}
```

For more information, see [DescribeDBEngineVersions](https://docs.aws.amazon.com/documentdb/latest/developerguide/DescribeDBEngineVersions.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbEngineVersions](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-engine-versions.html) in AWS CLI Command Reference.

**describe-db-instances**

The following code example shows how to use `describe-db-instances`.
AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter, you get information on up to 100 instances.

```bash
aws docdb describe-db-instances \    --db-instance-identifier sample-cluster-instance
```

Output:

```json
{
  "DBInstances": [
    {
      "Endpoint": {
        "HostedZoneId": "ZNKXH85TT8VV",
        "Address": "sample-cluster-instance.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017
      },
      "PreferredBackupWindow": "00:00-00:30",
      "DBInstanceStatus": "available",
      "DBInstanceClass": "db.r4.large",
      "EnabledCloudwatchLogsExports": [

describe-db-subnet-groups

The following code example shows how to use describe-db-subnet-groups.

AWS CLI

To retrieve a list of Amazon DocumentDB subnet descriptions

The following describe-db-subnet-groups example describes details for the Amazon DocumentDB subnet named default.

```bash
aws docdb describe-db-subnet-groups \
  --db-subnet-group-name default
```

Output:

```json
{
  "DBSubnetGroups": [
    {
      "VpcId": "vpc-91280df6",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-4e26d263",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        },
        {
          "SubnetIdentifier": "subnet-afc329f4",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2b"
          }
        }
      ]
    }]
}
```
For more information, see [Describing Subnet Groups](https://docs.aws.amazon.com/AmazonDocumentDB/latest/DeveloperGuide/) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbSubnetGroups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/about-db-subnet-groups.html) in AWS CLI Command Reference.

**describe-engine-default-cluster-parameters**

The following code example shows how to use `describe-engine-default-cluster-parameters`.

**AWS CLI**

To describe the default engine and system parameter information for Amazon DocumentDB

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group docdb3.6.
```bash
aws docdb describe-engine-default-cluster-parameters \
    --db-parameter-group-family docdb3.6
```

Output:

```json
{
    "EngineDefaults": {
        "DBParameterGroupFamily": "docdb3.6",
        "Parameters": [
            {
                "ApplyType": "dynamic",
                "ParameterValue": "disabled",
                "Description": "Enables auditing on cluster.",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "enabled,disabled",
                "ParameterName": "audit_logs",
                "IsModifiable": true
            },
            {
                "ApplyType": "static",
                "ParameterValue": "enabled",
                "Description": "Config to enable/disable TLS",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "tls",
                "IsModifiable": true
            },
            {
                "ApplyType": "dynamic",
                "ParameterValue": "enabled",
                "Description": "Enables TTL Monitoring",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "ttl_monitor",
                "IsModifiable": true
            }
        ]
    }
}
```
For more information, see DescribeEngineDefaultClusterParameters in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeEngineDefaultClusterParameters in AWS CLI Command Reference.

**describe-event-categories**

The following code example shows how to use describe-event-categories.

**AWS CLI**

To describe all Amazon DocumentDB event categories

The following describe-event-categories example lists all categories for the Amazon DocumentDB event source type db-instance.

```bash
aws docdb describe-event-categories \
   --source-type db-cluster
```

Output:

```
{
   "EventCategoriesMapList": [
      {
         "SourceType": "db-cluster",
         "EventCategories": ["failover",
                              "maintenance",
                              "notification",
                              "failure"
         ]
      }
   ]
}
```

For more information, see Viewing Event Categories in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeEventCategories in AWS CLI Command Reference.
**describe-events**

The following code example shows how to use `describe-events`.

**AWS CLI**

To list Amazon DocumentDB events

The following `describe-events` example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```
aws docdb describe-events \
   --duration 1440
```

This command produces no output. Output:

```json
{
   "Events": [
      {
         "EventCategories": [
            "failover"
         ],

For more information, see Viewing Amazon DocumentDB Events in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

**describe-orderable-db-instance-options**

The following code example shows how to use describe-orderable-db-instance-options.

**AWS CLI**

To find the Amazon DocumentDB instance options you can order
The following `describe-orderable-db-instance-options` example lists all instance options for Amazon DocumentDB for a region.

```bash
aws docdb describe-orderable-db-instance-options \
   --engine docdb \
   --region us-east-1
```

Output:

```json
{
   "OrderableDBInstanceOptions": [
   {
      "Vpc": true,
      "AvailabilityZones": [
         {
            "Name": "us-east-1a"
         },
         {
            "Name": "us-east-1b"
         },
         {
            "Name": "us-east-1c"

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the Amazon DocumentDB Developer Guide.

• For API details, see DescribeOrderableDbInstanceOptions in AWS CLI Command Reference.

describe-pending-maintenance-actions

The following code example shows how to use describe-pending-maintenance-actions.

AWS CLI

To list your pending Amazon DocumentDB maintenance actions

The following describe-pending-maintenance-actions example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": []
}
```

For more information, see Maintaining Amazon DocumentDB in the Amazon DocumentDB Developer Guide.

• For API details, see DescribePendingMaintenanceActions in AWS CLI Command Reference.

failover-db-cluster

The following code example shows how to use failover-db-cluster.
To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster `sample-cluster` to failover to a replica.

```bash
aws docdb failover-db-cluster \
  --db-cluster-identifier sample-cluster
```

Output:

```
{
  "DBCluster": {
    "AssociatedRoles": [],
    "DBClusterIdentifier": "sample-cluster",
    "EngineVersion": "3.6.0",
    "DBSubnetGroup": "default",

      }
    ],
    "StorageEncrypted": false,
    "MultiAZ": true,
    "Status": "available",
    "DBClusterMembers": [
      {
```
For more information, see Amazon DocumentDB Failover in the Amazon DocumentDB Developer Guide.

- For API details, see FailoverDbCluster in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list all the tags on an Amazon DocumentDB resource

The following list-tags-for-resource example lists all tags on the Amazon DocumentDB cluster sample-cluster.

```
aws docdb list-tags-for-resource
```
Output:

```json
{
    "TagList": [
        {
            "Key": "A",
            "Value": "ALPHA"
        },
        {
            "Key": "B",
            "Value": ""
        },
        {
            "Key": "C",
            "Value": "CHARLIE"
        }
    ]
}
```

For more information, see [Listing Tags on an Amazon DocumentDB Resource](https://docs.aws.amazon.com/documentdb/latest/developerguide/Listing-DocumentDB-Resource-Tags.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/rds/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### modify-db-cluster-parameter-group

The following code example shows how to use `modify-db-cluster-parameter-group`.

**AWS CLI**

**To modify an Amazon DocumentDB DB cluster parameter group**

The following `modify-db-cluster-parameter-group` example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```
aws docdb modify-db-cluster-parameter-group
  --db-cluster-parameter-group-name custom3-6-param-grp
```
parameters

ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-reboot

ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot

Output:

{
"DBClusterParameterGroupName": "custom3-6-param-grp"
}

For more information, see Modifying an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

• For API details, see ModifyDbClusterParameterGroup in AWS CLI Command Reference.

modify-db-cluster-snapshot-attribute

The following code example shows how to use modify-db-cluster-snapshot-attribute.

**AWS CLI**

**Example 1: To add an attribute to an Amazon DocumentDB snapshot**

The following modify-db-cluster-snapshot-attribute example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
  --db-cluster-snapshot-identifier sample-cluster-snapshot \
  --attribute-name restore \
  --values-to-add 123456789011 123456789012 123456789013
```

Output:

```
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AddAttribute": {
          "AttributeName": "restore",
          "AttributeValues": [
            "123456789011",
            "123456789012",
            "123456789013"
          ]
        }
      }
    ]
  }
}
```
Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following modify-db-cluster-snapshot-attribute example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```bash
aws docdb modify-db-cluster-snapshot-attribute \
   --db-cluster-snapshot-identifier sample-cluster-snapshot \
   --attribute-name restore \
   --values-to-remove 123456789012
```

Output:

```json
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "123456789011",
               "123456789013"
            ]
         }
      ],
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
   }
}
```

For more information, see [ModifyDBClusterSnapshotAttribute](https://docs.aws.amazon.com/docdb/latest/ug/db-tools-aws-cli.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/docdb/modify-db-cluster-snapshot-attribute.html) in *AWS CLI Command Reference*. 
modify-db-cluster

The following code example shows how to use modify-db-cluster.

AWS CLI

To modify an Amazon DocumentDB cluster

The following modify-db-cluster example modifies the Amazon DocumentDB cluster sample-cluster by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```bash
aws docdb modify-db-cluster \
   --db-cluster-identifier sample-cluster \
   --no-apply-immediately \
   --backup-retention-period 7 \
   --preferred-backup-window 18:00-18:30 \
   --preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```json
{
   "DBCluster": {
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
      "DBClusterMembers": [
         {
            "DBClusterParameterGroupStatus": "in-sync",
            "DBInstanceIdentifier": "sample-cluster",
            "IsClusterWriter": true,
            "PromotionTier": 1
         },
         {
            "DBClusterParameterGroupStatus": "in-sync",
            "DBInstanceIdentifier": "sample-cluster2",
            "IsClusterWriter": false,
            "PromotionTier": 2
         }
      ],
      "HostedZoneId": "ZNKXH85TT8WV",
      "StorageEncrypted": false,
   }
}
```
"PreferredBackupWindow": "18:00-18:30",

For more information, see [Modifying an Amazon DocumentDB Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/ModifyDBCluster.html) in the *Amazon DocumentDB Developer Guide*.

modify-db-instance

The following code example shows how to use modify-db-instance.

**AWS CLI**

To modify an Amazon DocumentDB instance

The following modify-db-instance example modifies the Amazon DocumentDB instance sample-cluster2 by changing its instance class to db.r4.4xlarge and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```
aws docdb modify-db-instance \
  --db-instance-identifier sample-cluster2 \
  --apply-immediately \
  --db-instance-class db.r4.4xlarge \
  --promotion-tier 5
```

**Output:**

```json
{
  "DBInstance": {
    "EngineVersion": "3.6.0",
    "StorageEncrypted": false,
    "DBInstanceClass": "db.r4.large",
    "PreferredMaintenanceWindow": "mon:08:39-mon:09:09",

For more information, see Modifying an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbInstance in AWS CLI Command Reference.

modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following modify-db-subnet-group example modifies the subnet group sample-subnet-group by adding the specified subnets and a new description.

```bash
aws docdb modify-db-subnet-group \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
  --db-subnet-group-description "New subnet description"
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "sample-subnet-group",
        "SubnetGroupStatus": "Complete",
        "VpcId": "vpc-91280df6",
        "DBSubnetGroupDescription": "New subnet description",
        "Subnets": [
```
"SubnetIdentifier": "subnet-b3806e8f",
"SubnetStatus": "Active",
"SubnetAvailabilityZone": {
   "Name": "us-west-2a"
},
},
{
   "SubnetIdentifier": "subnet-53ab3636",
   "SubnetStatus": "Active",
   "SubnetAvailabilityZone": {
      "Name": "us-west-2c"
   }
},
{
   "SubnetIdentifier": "subnet-991cb8d0",
   "SubnetStatus": "Active",
   "SubnetAvailabilityZone": {
      "Name": "us-west-2b"
   }
}
]
}

For more information, see Modifying an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

• For API details, see ModifyDbSubnetGroup in AWS CLI Command Reference.

reboot-db-instance

The following code example shows how to use reboot-db-instance.

AWS CLI

To reboot an Amazon DocumentDB instance

The following reboot-db-instance example reboots the Amazon DocumentDB instance sample-cluster2.

```
aws docdb reboot-db-instance
   --db-instance-identifier sample-cluster2
```
This command produces no output. Output:

```
{
  "DBInstance": {
    "PreferredBackupWindow": "18:00-18:30",
    "DBInstanceIdentifier": "sample-cluster2",
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ],
    "DBSubnetGroup": {
      "VpcId": "vpc-91280df6",
      "Subnets": [
        {
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          },
          "SubnetIdentifier": "subnet-4e26d263"
        },
        {
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2c"
          },
          "SubnetIdentifier": "subnet-a3f329f4"
        },
        {
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2d"
          },
          "SubnetIdentifier": "subnet-53ab3636"
        },
        {
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2b"
          },
          "SubnetIdentifier": "subnet-991cb8d0"
        }
      ]
    }
  }
}
```
For more information, see [Rebooting an Amazon DocumentDB Instance](https://docs.aws.amazon.com/documentdb/latest/developerguide/reboot-instance.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [RebootDbInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/reboot-db-instance.html) in AWS CLI Command Reference.

### remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

#### AWS CLI

To remove tags from an Amazon DocumentDB resource
The following `remove-tags-from-resource` example removes the tag with the key named `B` from the Amazon DocumentDB cluster `sample-cluster`.

```bash
aws docdb remove-tags-from-resource \
  --tag-keys B
```

This command produces no output.

For more information, see [Removing Tags from an Amazon DocumentDBResource](https://docs.aws.amazon.com/AmazonDocumentDB/latest/developerguide/removing-tags.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RemoveTagsFromResource](https://docs.aws.amazon.com/cli/latest/reference/docdb/remove-tags-from-resource.html) in *AWS CLI Command Reference*.

### reset-db-cluster-parameter-group

The following code example shows how to use `reset-db-cluster-parameter-group`.

**AWS CLI**

To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets the parameter `ttl_monitor` in the Amazon DocumentDB parameter group `custom3-6-param-grp` to its default value.

```bash
aws docdb reset-db-cluster-parameter-group \
  --db-cluster-parameter-group-name custom3-6-param-grp \
  --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```json
{
   "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the *Amazon DocumentDB Developer Guide*.

**To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group**
The following `reset-db-cluster-parameter-group` example resets all parameters in the Amazon DocumentDB parameter group `custom3-6-param-grp` to their default value.

```bash
aws docdb reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --reset-all-parameters
```

Output:

```json
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see [Resetting an Amazon DocumentDB Cluster Parameter Group](https://docs.aws.amazon.com/AmazonDocumentDB/latest/DeveloperGuide/reset-parameters.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ResetDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/docdb/reset-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

### `restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

**AWS CLI**

**To restore an Amazon DocumentDB cluster from an automatic or manual snapshot**

The following `restore-db-cluster-from-snapshot` example creates a new Amazon DocumentDB cluster named `sample-cluster-2019-03-16-00-01-restored` from the snapshot `rds:sample-cluster-2019-03-16-00-01`.

```bash
aws docdb restore-db-cluster-from-snapshot \
    --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
    --engine docdb \
    --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```json
{
    "DBCluster": {
```

**Actions and scenarios**
For more information, see [Restoring from a Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/backup.restore.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterFromSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-cluster-from-snapshot.html) in *AWS CLI Command Reference*. 

**restore-db-cluster-to-point-in-time**

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot

The following `restore-db-cluster-to-point-in-time` example uses the sample-cluster-snapshot to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```
aws docdb restore-db-cluster-to-point-in-time \
  --db-cluster-identifier sample-cluster-pit \
  --use-latest-restorable-time
```

**Output:**

```
{
  "DBCluster": {
    "StorageEncrypted": false,
    "BackupRetentionPeriod": 3,
    "MasterUsername": "master-user",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "PreferredBackupWindow": "00:00-00:30",
    "MultiAZ": false,
    "DBClusterIdentifier": "sample-cluster-pit",
    "DBSubnetGroup": "default",
    "AssociatedRoles": [],
    "DBClusterParameterGroup": "default.docdb3.6",
    "DBClusterMembers": [],
    "Status": "creating",
    "AvailabilityZones": [
      "us-west-2a",
      "us-west-2d",
      "us-west-2b"
    ],
    "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
    "Port": 27017,
  }
}
```
For more information, see [Restoring a Snapshot to a Point in Time](https://docs.aws.amazon.com/documentdb/latest/developerguide/working-with-snapshots.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/docdb/restore-db-cluster-to-point-in-time.html) in *AWS CLI Command Reference*.

### start-db-cluster

The following code example shows how to use `start-db-cluster`.

**AWS CLI**

To start a stopped Amazon DocumentDB cluster

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```bash
aws docdb start-db-cluster \
   --db-cluster-identifier sample-cluster
```

Output:

```json
{
   "DBCluster": {
      "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
      "HostedZoneId": "ZNKXH85TT8WVW",
      "Engine": "docdb",
```

---

}

For more information, see Stopping and Starting an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see StartDbCluster in AWS CLI Command Reference.

**stop-db-cluster**

The following code example shows how to use stop-db-cluster.
AWS CLI

To stop a running Amazon DocumentDB cluster

The following `stop-db-cluster` example stops the specified Amazon DocumentDB cluster.

```bash
aws docdb stop-db-cluster
   --db-cluster-identifier sample-cluster
```

Output:

```
{
   "DBCluster": {
      "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
      "HostedZoneId": "ZNKXH85TT8WVW",

      "BackupRetentionPeriod": 3,
      "AssociatedRoles": [],
      "Status": "creating",
      "VpcSecurityGroups": [\
```
```
For more information, see [Stopping and Starting an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [StopDbCluster](#) in *AWS CLI Command Reference*.

**DynamoDB examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**batch-get-item**

The following code example shows how to use batch-get-item.

**AWS CLI**

To retrieve multiple items from a table
The following batch-get-items example reads multiple items from the MusicCollection table using a batch of three GetItem requests, and requests the number of read capacity units consumed by the operation. The command returns only the AlbumTitle attribute.

```
aws dynamodb batch-get-item \
    --request-items file://request-items.json \
    --return-consumed-capacity TOTAL
```

Contents of `request-items.json`:

```
{
    "MusicCollection": {
        "Keys": [
            {
              "Artist": {"S": "No One You Know"},
              "SongTitle": {"S": "Call Me Today"}
            },
            {
              "Artist": {"S": "Acme Band"},
              "SongTitle": {"S": "Happy Day"}
            },
            {
              "Artist": {"S": "No One You Know"},
              "SongTitle": {"S": "Scared of My Shadow"}
            }
        ],
        "ProjectionExpression":"AlbumTitle"
    }
}
```

Output:

```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            }
        ]
    }
}
```
The following code example shows how to use `batch-write-item`.

### AWS CLI

**To add multiple items to a table**

The following `batch-write-item` example adds three new items to the `MusicCollection` table using a batch of three `PutItem` requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```
aws dynamodb batch-write-item \
    --request-items file://request-items.json \
    --return-consumed-capacity INDEXES \
    --return-item-collection-metrics SIZE
```

Contents of `request-items.json`:

```json
{
  "S": "Blue Sky Blues"
},
{
  "UnprocessedKeys": {},
  "ConsumedCapacity": [
    {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.5
    }
  ]
}

For more information, see [Batch Operations](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/batch-operations.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [BatchGetItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/batch-get-item.html) in *AWS CLI Command Reference*. 
{  
  "MusicCollection": [
    {
      "PutRequest": {
        "Item": {
          "Artist": {"S": "No One You Know"},
          "SongTitle": {"S": "Call Me Today"},
          "AlbumTitle": {"S": "Somewhat Famous"}
        }
      },
    },
    {
      "PutRequest": {
        "Item": {
          "Artist": {"S": "Acme Band"},
          "SongTitle": {"S": "Happy Day"},
          "AlbumTitle": {"S": "Songs About Life"}
        }
      },
    },
    {
      "PutRequest": {
        "Item": {
          "Artist": {"S": "No One You Know"},
          "SongTitle": {"S": "Scared of My Shadow"},
          "AlbumTitle": {"S": "Blue Sky Blues"}
        }
      }
    }
  ]
}

Output:

{  
  "UnprocessedItems": {},
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        }
      }
    ]
  }
}
The following code example shows how to use create-backup.

For more information, see [Batch Operations](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/Batch-Operations.html) in the Amazon DynamoDB Developer Guide.

- For API details, see [BatchWriteItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/batch-write-item.html) in AWS CLI Command Reference.
AWS CLI

To create a backup for an existing DynamoDB table

The following `create-backup` example creates a backup of the MusicCollection table.

```bash
aws dynamodb create-backup \
   --table-name MusicCollection \
   --backup-name MusicCollectionBackup
```

Output:

```
{
   "BackupDetails": {
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/0157661636715-b4e58d3a",
      "BackupName": "MusicCollectionBackup",
      "BackupSizeBytes": 0,
      "BackupStatus": "CREATING",
      "BackupType": "USER",
      "BackupCreationDateTime": 1576616366.715
   }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see `CreateBackup` in AWS CLI Command Reference.

create-global-table

The following code example shows how to use `create-global-table`.

AWS CLI

To create a global table

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```bash
aws dynamodb create-global-table \
   --global-table-name MusicCollection
```
--replication-group RegionName=us-east-2 RegionName=us-east-1 \
--region us-east-2

Output:

```
{
   "GlobalTableDescription": {
      "ReplicationGroup": [
         
         {
            "RegionName": "us-east-2"
         },
         
         {
            "RegionName": "us-east-1"
         }
      ],
      "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
      "CreationDateTime": 1576625818.532,
      "GlobalTableStatus": "CREATING",
      "GlobalTableName": "MusicCollection"
   }
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/GatewayGlobalTables.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateGlobalTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/create-table.html) in *AWS CLI Command Reference*.

**create-table**

The following code example shows how to use `create-table`.

**AWS CLI**

**Example 1: To create a table with tags**

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection`. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of `Owner` and a value of `blueTeam`.

```
aws dynamodb create-table \
   --table-name MusicCollection \
```
--attribute-definition AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S

--key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE

--provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5

--tags Key=Owner,Value=blueTeam

Output:

```
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "WriteCapacityUnits": 5,
         "ReadCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "TableName": "MusicCollection",
      "TableStatus": "CREATING",
      "KeySchema": [
         {
            "KeyType": "HASH",
            "AttributeName": "Artist"
         },
         {
            "KeyType": "RANGE",
            "AttributeName": "SongTitle"
         }
      ],
      "ItemCount": 0,
      "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
```
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 2: To create a table in On-Demand Mode

The following example creates a table called MusicCollection using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType= RANGE \
  --billing-mode PAY_PER_REQUEST
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ]
    }
}
```
Example 3: To create a table and encrypt it with a Customer Managed CMK

The following example creates a table named MusicCollection and encrypts it using a customer managed CMK.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=Artist,AttributeType=S  AttributeName=SongTitle,AttributeType=S \
    --key-schema AttributeName=Artist,KeyType=HASH  AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-a123-ab1234a1b234
```

Output:

```
{}
```
"TableDescription": {
  "AttributeDefinitions": [
    {
      "AttributeName": "Artist",
      "AttributeType": "S"
    },
    {
      "AttributeName": "SongTitle",
      "AttributeType": "S"
    }
  ],
  "TableName": "MusicCollection",
  "KeySchema": [
    {
      "AttributeName": "Artist",
      "KeyType": "HASH"
    },
    {
      "AttributeName": "SongTitle",
      "KeyType": "RANGE"
    }
  ],
  "TableStatus": "CREATING",
  "CreationDateTime": "2020-05-27T11:12:16.431000-07:00",
  "ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 5,
    "WriteCapacityUnits": 5
  },
  "TableSizeBytes": 0,
  "ItemCount": 0,
  "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
  "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "SSEDescription": {
    "Status": "ENABLED",
    "SSEType": "KMS",
    "KMSMasterKeyArn": "arn:aws:kms:us-west-2:123456789012:key/abcd1234-abcd-1234-a123-ab1234a1b234"
  }
}
Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named MusicCollection with a Local Secondary Index named AlbumTitleIndex.

```bash
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S AttributeName=AlbumTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --local-secondary-indexes "[
  {
    "IndexName": "AlbumTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "Artist", "KeyType": "HASH"},
      {
        "AttributeName": "AlbumTitle", "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "INCLUDE",
      "NonKeyAttributes": ["Genre", "Year"]
    }
  }
]
"
```

Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      }
   }
```

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.
"AttributeName": "SongTitle",
"AttributeType": "S"
}
],
"TableName": "MusicCollection",
"KeySchema": [
{
"AttributeName": "Artist",
"KeyType": "HASH"
},
{
"AttributeName": "SongTitle",
"KeyType": "RANGE"
}
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
"ProvisionedThroughput": {
"NumberOfDecreasesToday": 0,
"ReadCapacityUnits": 10,
"WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"LocalSecondaryIndexes": [
{
"IndexName": "AlbumTitleIndex",
"KeySchema": [
{
"AttributeName": "Artist",
"KeyType": "HASH"
},
{
"AttributeName": "AlbumTitle",
"KeyType": "RANGE"
}
],
"Projection": {
"ProjectionType": "INCLUDE",
"NonKeyAttributes": [  

Example 5: To create a table with a Global Secondary Index

The following example creates a table named GameScores with a Global Secondary Index called GameTitleIndex. The base table has a partition key of UserId and a sort key of GameTitle, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of GameTitle and a sort key of TopScore, allowing you to quickly find the overall highest score for a particular game.

```bash
aws dynamodb create-table \
  --table-name GameScores \ 
  --attribute-definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \ 
  --key-schema AttributeName=UserId,KeyType=HASH \ 
  AttributeName=GameTitle,KeyType=RANGE \ 
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \ 
  --global-secondary-indexes \ 
  "[ \n    { \n      "IndexName": "GameTitleIndex", \n      "KeySchema": [ \n        {"AttributeName": "GameTitle", "KeyType": "HASH"}, \n        {"AttributeName": "TopScore", "KeyType": "RANGE"} \n      ], \n      "Projection": { \n        "ProjectionType": "INCLUDE", \n        "NonKeyAttributes": ["UserId"]
      }  
    }  
  ]"
```

For more information, see [Basic Operations for Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/aws-dynamodb-create-table.html) in the *Amazon DynamoDB Developer Guide*. 
Output:

```
{
   "TableDescription": {
       "AttributeDefinitions": [
       {
           "AttributeName": "GameTitle",
           "AttributeType": "S"
       },
       {
           "AttributeName": "TopScore",
           "AttributeType": "N"
       },
       {
           "AttributeName": "UserId",
           "AttributeType": "S"
       }
   ],
   "TableName": "GameScores",
   "KeySchema": [
       {
           "AttributeName": "UserId",
           "KeyType": "HASH"
       },
       {
           "AttributeName": "GameTitle",
           "KeyType": "RANGE"
       }
   ],
   "TableStatus": "CREATING",
   "CreationDateTime": "2020-05-26T17:28:15.602000-07:00",
   "ProvisionedThroughput": {
       "NumberOfDecreasesToday": 0,
       "ReadCapacityUnits": 10,
       "WriteCapacityUnits": 5
   }
}
```
For more information, see [Basic Operations for Tables](#) in the Amazon DynamoDB Developer Guide.

**Example 6: To create a table with multiple Global Secondary Indexes at once**
The following example creates a table named GameScores with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions \
    AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N AttributeName=Date,AttributeType=S \
  --key-schema \
    AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --global-secondary-indexes file://gsi.json
```

Contents of gsi.json:

```
[
  {
    "IndexName": "GameTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "TopScore",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    },
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    }
  },
  {
    "IndexName": "GameDateIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
```
Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Date",
                "AttributeType": "S"
            },
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",

"IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores/index/GameDateIndex"
]
]
"

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 7: To create a table with Streams enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```
aws dynamodb create-table
  --table-name GameScores
  --attribute-definitions
    AttributeName=UserId,AttributeType=S  AttributeName=GameTitle,AttributeType=S
```
Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "UserId",
            "AttributeType": "S"
         }
      ],
      "TableName": "GameScores",
      "KeySchema": [
         {
            "AttributeName": "UserId",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "GameTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": "2020-05-27T10:49:34.056000-07:00",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 10,
         "WriteCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "ItemCount": 0,
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "StreamSpecification": {
         "StreamEnabled": true,
         "StreamViewType": "NEW_AND_OLD_IMAGES"
      }
   }
}```
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.

```bash
aws dynamodb create-table \
  --table-name GameScores \n  --attribute-definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S \n  --key-schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \n  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \n  --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "TableName": "GameScores",
    "KeySchema": [
      
```
Example 9: To create a table with the Standard Infrequent Access class

The following example creates a table called GameScores and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```
aws dynamodb create-table \
  --table-name GameScores
```
```
--attribute-definitions 
AttributeName=UserId,AttributeType=S  
AttributeName=GameTitle,AttributeType=S 

--key-schema 
AttributeName=UserId,KeyType=HASH  
AttributeName=GameTitle,KeyType=RANGE 

--provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 
--table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "TableName": "GameScores",
    "KeySchema": [
      {
        "AttributeName": "UserId",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "GameTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "CREATING",
    "CreationDateTime": "2023-05-25T18:33:07.581000+00:00",
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    },
    "TableSizeBytes": 0,
    "ItemCount": 0,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
```
For more information, see Table classes in the Amazon DynamoDB Developer Guide.

Example 10: To Create a table with Delete Protection enabled

The following example creates a table called GameScores and enables deletion protection.

```bash
aws dynamodb create-table \
   --table-name GameScores \ 
   --attribute-definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S \ 
   --key-schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \ 
   --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \ 
   --deletion-protection-enabled
```

Output:

```
{ 
   "TableDescription": { 
      "AttributeDefinitions": [ 
         { 
            "AttributeName": "GameTitle", 
            "AttributeType": "S"
         }, 
         { 
            "AttributeName": "UserId", 
            "AttributeType": "S"
         }
      ], 
      "TableName": "GameScores", 
      "KeySchema": [ 
         { 
            "AttributeName": "UserId", 
            "KeyType": "HASH"
         }
      ]
   }
}
```
For more information, see Using deletion protection in the Amazon DynamoDB Developer Guide.

- For API details, see CreateTable in AWS CLI Command Reference.

**delete-backup**

The following code example shows how to use delete-backup.

**AWS CLI**

**To delete an existing DynamoDB backup**

The following delete-backup example deletes the specified existing backup.

```
aws dynamodb delete-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```

Output:

```
{}
```
"BackupDescription": {
    "BackupDetails": {
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
        "BackupName": "MusicCollectionBackup",
        "BackupSizeBytes": 0,
        "BackupStatus": "DELETED",
        "BackupType": "USER",
        "BackupCreationDateTime": 1576616366.715
    },
    "SourceTableDetails": {
        "TableName": "MusicCollection",
        "TableId": "b0c04bccc-309b-4352-b2ae-9088af169fe2",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",

            "WriteCapacityUnits": 5
        },
        "ItemCount": 0,
        "BillingMode": "PROVISIONED"
    },
    "SourceTableFeatureDetails": {}
}

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/backup-restore-howto-dynamodb.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/delete-backup.html) in *AWS CLI Command Reference*.
delete-item

The following code example shows how to use delete-item.

AWS CLI

Example 1: To delete an item

The following delete-item example deletes an item from the MusicCollection table and requests details about the item that was deleted and the capacity used by the request.

```
aws dynamodb delete-item  
  --table-name MusicCollection  
  --key file://key.json  
  --return-values ALL_OLD  
  --return-consumed-capacity TOTAL  
  --return-item-collection-metrics SIZE
```

Contents of key.json:

```json
{
  "Artist": {"S": "No One You Know"},
  "SongTitle": {"S": "Scared of My Shadow"}
}
```

Output:

```json
{
  "Attributes": {
    "AlbumTitle": {
      "S": "Blue Sky Blues"
    },
    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Scared of My Shadow"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 2.0
  }
}
```
For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.

Example 2: To delete an item conditionally

The following example deletes an item from the ProductCatalog table only if its ProductCategory is either Sporting Goods or Gardening Supplies and its price is between 500 and 600. It returns details about the item that was deleted.

```bash
aws dynamodb delete-item \
  --table-name ProductCatalog \
  --key '{"Id":{"N":"456"}}' \
  --condition-expression "ProductCategory IN (:cat1, :cat2) and (#P between :lo and :hi)" \
  --expression-attribute-names file://names.json \
  --expression-attribute-values file://values.json \
  --return-values ALL_OLD
```

Contents of names.json:

```json
{}
```

Contents of values.json:

```json
{
  "#P": "Price"
}
```
Output:

```
{
  "Attributes": {
    "Id": {
      "N": "456"
    },
    "Price": {
      "N": "550"
    },
    "ProductCategory": {
      "S": "Sporting Goods"
    }
  }
}
```

For more information, see [Writing an Item](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/delete-item.html) in *AWS CLI Command Reference*.

**delete-table**

The following code example shows how to use delete-table.

**AWS CLI**

**To delete a table**

The following delete-table example deletes the MusicCollection table.

```
aws dynamodb delete-table \
  --table-name MusicCollection
```

Output:

```
{
  "TableDescription": {
    "TableStatus": "DELETING",
```
For more information, see [Deleting a Table](https://aws.amazon.com/dynamodb/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see `DeleteTable` in *AWS CLI Command Reference*.

**describe-backup**

The following code example shows how to use `describe-backup`.

**AWS CLI**

**To get information about an existing backup of a table**

The following `describe-backup` example displays information about the specified existing backup.

```
aws dynamodb describe-backup \
  --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```

Output:

```
{
  "BackupDescription": {
    "BackupDetails": {
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
      "BackupName": "MusicCollectionBackup",
      "BackupSizeBytes": 0,
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupCreationDateTime": 1576616366.715
    }
  }
}
```
"SourceTableDetails": {
  "TableName": "MusicCollection",
  "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
  "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
  "TableSizeBytes": 0,
  "KeySchema": [
    {
      "AttributeName": "Artist",
      "KeyType": "HASH"
    },
    {
      "AttributeName": "SongTitle",
      "KeyType": "RANGE"
    }
  ],
  "TableCreationDateTime": 1576615228.571,
  "ProvisionedThroughput": {
    "ReadCapacityUnits": 5,
    "WriteCapacityUnits": 5
  },
  "ItemCount": 0,
  "BillingMode": "PROVISIONED"
},
"SourceTableFeatureDetails": {}
}

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeBackup in AWS CLI Command Reference.

describe-continuous-backups

The following code example shows how to use describe-continuous-backups.

AWS CLI

To get information about continuous backups for a DynamoDB table

The following describe-continuous-backups example displays details about the continuous backup settings for the MusicCollection table.
aws dynamodb describe-continuous-backups \
    --table-name MusicCollection

Output:

```json
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "DISABLED"
        }
    }
}
```

For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeContinuousBackups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-continuous-backups.html) in *AWS CLI Command Reference*.

describe-contributor-insights

The following code example shows how to use `describe-contributor-insights`.

**AWS CLI**

**To view Contributor Insights settings for a DynamoDB table**

The following `describe-contributor-insights` example displays the Contributor Insights settings for the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb describe-contributor-insights \
    --table-name MusicCollection \ 
    --index-name AlbumTitle-index
```

Output:

```json
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsRuleList": [
```

---

**Actions and scenarios**

---

"DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
"DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
"DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
"DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
],
"ContributorInsightsStatus": "ENABLED",
"LastUpdateDateTime": 1576629654.78
}

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/analytics-contributor-insights.html) in the Amazon DynamoDB Developer Guide.

- For API details, see [DescribeContributorInsights](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-contributor-insights.html) in AWS CLI Command Reference.

**describe-endpoints**

The following code example shows how to use `describe-endpoints`.

**AWS CLI**

**To view regional endpoint information**

The following `describe-endpoints` example displays details about the endpoints for the current AWS Region.

```
aws dynamodb describe-endpoints
```

**Output:**

```
{
    "Endpoints": [
        {
            "Address": "dynamodb.us-west-2.amazonaws.com",
            "CachePeriodInMinutes": 1440
        }
    ]
}
```

For more information, see [Amazon DynamoDB Endpoints and Quotas](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/using-endpoints.html) in the AWS General Reference.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-endpoints.html) in AWS CLI Command Reference.
describe-global-table-settings

The following code example shows how to use describe-global-table-settings.

AWS CLI

To get information about a DynamoDB global table's settings

The following describe-global-table-settings example displays the settings for the MusicCollection global table.

```
aws dynamodb describe-global-table-settings \
    --global-table-name MusicCollection
```

Output:

```json
{
    "GlobalTableSettings": "MusicCollection",
    "ReplicaSettings": [
        {
            "RegionName": "us-east-1",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-2",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        }
    ]
}
```
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTableSettings](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-global-table-settings.html) in *AWS CLI Command Reference*.

**describe-global-table**

The following code example shows how to use `describe-global-table`.

**AWS CLI**

*To display information about a DynamoDB global table*

The following `describe-global-table` example displays details about the `MusicCollection` global table.

```bash
aws dynamodb describe-global-table \
    --global-table-name MusicCollection
```

**Output:**

```json
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*. 
describe-limits

The following code example shows how to use describe-limits.

AWS CLI

To view provisioned-capacity limits

The following describe-limits example displays provisioned-capacity limits for your account in the current AWS Region.

```bash
aws dynamodb describe-limits
```

Output:

```json
{
   "AccountMaxReadCapacityUnits": 80000,
   "AccountMaxWriteCapacityUnits": 80000,
   "TableMaxReadCapacityUnits": 40000,
   "TableMaxWriteCapacityUnits": 40000
}
```

For more information, see Limits in DynamoDB in the Amazon DynamoDB Developer Guide.

describe-table-replica-auto-scaling

The following code example shows how to use describe-table-replica-auto-scaling.

AWS CLI

To view auto scaling settings across replicas of a global table

The following describe-table-replica-auto-scaling example displays auto scaling settings across replicas of the MusicCollection global table.

```bash
aws dynamodb describe-table-replica-auto-scaling \
   --table-name MusicCollection
```
Output:

```json
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {
                "RegionName": "us-east-1",
                "GlobalSecondaryIndexes": [],
                "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaStatus": "ACTIVE"
            }
        ]
    }
}
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTableReplicaAutoScaling in AWS CLI Command Reference.
**describe-table**

The following code example shows how to use `describe-table`.

**AWS CLI**

**To describe a table**

The following `describe-table` example describes the `MusicCollection` table.

```
aws dynamodb describe-table \
  --table-name MusicCollection
```

**Output:**

```json
{
  "Table": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "WriteCapacityUnits": 5,
      "ReadCapacityUnits": 5
    },
    "TableSizeBytes": 0,
    "TableName": "MusicCollection",
    "TableStatus": "ACTIVE",
    "KeySchema": ["ACTIVE",
      {
        "KeyType": "HASH",
        "AttributeName": "Artist"
      },
      {
        "KeyType": "RANGE",
        "AttributeName": "SongTitle"
      }
    ]
  }
}
```
For more information, see [Describing a Table](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTable](#) in *AWS CLI Command Reference*.

**describe-time-to-live**

The following code example shows how to use `describe-time-to-live`.

### AWS CLI

**To view Time to Live settings for a table**

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```bash
aws dynamodb describe-time-to-live \
    --table-name MusicCollection
```

**Output:**

```
{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}
```

For more information, see [Time to Live](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTimeToLive](#) in *AWS CLI Command Reference*.

**get-item**

The following code example shows how to use `get-item`.

```bash

g
```
Example 1: To read an item in a table

The following get-item example retrieves an item from the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```bash
aws dynamodb get-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```json
{
  "Artist": {"S": "Acme Band"},
  "SongTitle": {"S": "Happy Day"}
}
```

Output:

```json
{
  "Item": {
    "AlbumTitle": {
      "S": "Songs About Life"
    },
    "SongTitle": {
      "S": "Happy Day"
    },
    "Artist": {
      "S": "Acme Band"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 0.5
  }
}
```

For more information, see [Reading an Item](#) in the *Amazon DynamoDB Developer Guide*. 
Example 2: To read an item using a consistent read

The following example retrieves an item from the MusicCollection table using strongly consistent reads.

```
aws dynamodb get-item \
   --table-name MusicCollection \
   --key file://key.json \
   --consistent-read \
   --return-consumed-capacity TOTAL
```

Contents of key.json:

```
{
   "Artist": {"S": "Acme Band"},
   "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
   "Item": {
      "AlbumTitle": {
         "S": "Songs About Life"
      },
      "SongTitle": {
         "S": "Happy Day"
      },
      "Artist": {
         "S": "Acme Band"
      },
      "ConsumedCapacity": {
         "TableName": "MusicCollection",
         "CapacityUnits": 1.0
      }
   }
}
```

For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

Example 3: To retrieve specific attributes of an item
The following example uses a projection expression to retrieve only three attributes of the desired item.

```
aws dynamodb get-item \
    --table-name ProductCatalog \
    --key '{"Id": {"N": "102"}}' \
    --projection-expression "#T, #C, #P" \
    --expression-attribute-names file://names.json
```

Contents of names.json:

```
{
    "#T": "Title",
    "#C": "ProductCategory",
    "#P": "Price"
}
```

Output:

```
{
    "Item": {
        "Price": {
            "N": "20"
        },
        "Title": {
            "S": "Book 102 Title"
        },
        "ProductCategory": {
            "S": "Book"
        }
    }
}
```

For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

- For API details, see GetItem in AWS CLI Command Reference.

**list-backups**

The following code example shows how to use list-backups.
Example 1: To list all existing DynamoDB backups

The following list-backups example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```json
{
   "BackupSummaries": [
   {
   "TableName": "MusicCollection",
   "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
   "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
   "BackupName": "MusicCollectionBackup1",
   "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
   "BackupStatus": "AVAILABLE",
   "BackupType": "USER",
   "BackupSizeBytes": 170
   },
   {
   "TableName": "MusicCollection",
   "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
   "BackupName": "MusicCollectionBackup2",
   "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
   "BackupStatus": "AVAILABLE",
   "BackupType": "USER",
   "BackupSizeBytes": 400
   }
   ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.
Example 2: To list user-created backups in a specific time range

The following example lists only backups of the MusicCollection table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```bash
aws dynamodb list-backups \\
    --table-name MusicCollection \\
    --time-range-lower-bound 1577836800 \\
    --time-range-upper-bound 1583020800 \\
    --backup-type USER
```

**Output:**

```json
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

Example 3: To limit page size

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.
aws dynamodb list-backups \
   --page-size 1

Output:

```json
{
   "BackupSummaries": [
       {
           "TableName": "MusicCollection",
           "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
           "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
           "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
           "BackupName": "MusicCollectionBackup1",
           "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
           "BackupStatus": "AVAILABLE",
           "BackupType": "USER",
           "BackupSizeBytes": 170
       },
       {
           "TableName": "MusicCollection",
           "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
           "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
           "BackupName": "MusicCollectionBackup2",
           "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
           "BackupStatus": "AVAILABLE",
           "BackupType": "USER",
           "BackupSizeBytes": 400
       }
   ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 4: To limit the number of items returned**
The following example limits the number of items returned to 1. The response includes a NextToken value with which to retrieve the next page of results.

```
aws dynamodb list-backups \
   --max-items 1
```

Output:

```json
{
   "BackupSummaries": [
      {
         "TableName": "MusicCollection",
         "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
         "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
         "BackupName": "MusicCollectionBackup1",
         "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
         "BackupStatus": "AVAILABLE",
         "BackupType": "USER",
         "BackupSizeBytes": 170
      }
   ],
   "NextToken": "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBcdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhi2JkJ3LmnoPQ6RST9"
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 5: To retrieve the next page of results**

The following command uses the NextToken value from a previous call to the list-backups command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-backups \
   --starting-token abCDeFGhiJKlmn0PqrSTuvwxYZ1aBcdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhi2JkJ3LmnoPQ6RST9
```

Output
{  
    "BackupSummaries": [  
        {  
            "TableName": "MusicCollection",  
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",  
            "BackupName": "MusicCollectionBackup2",  
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",  
            "BackupStatus": "AVAILABLE",  
            "BackupType": "USER",  
            "BackupSizeBytes": 400  
        }  
    ]  
}  

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/AmazonDynamoDB/latest/DeveloperGuide/DynamoDB-Backups.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListBackups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-backups.html) in *AWS CLI Command Reference*.

### list-contributor-insights

The following code example shows how to use `list-contributor-insights`.

**AWS CLI**

**Example 1: To view a list of Contributor Insights summaries**

The following `list-contributor-insights` example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

**Output:**

```
{  
    "ContributorInsightsSummaries": [  
        {  
            "TableName": "MusicCollection",  
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",  
            "BackupName": "MusicCollectionBackup2",  
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",  
            "BackupStatus": "AVAILABLE",  
            "BackupType": "USER",  
            "BackupSizeBytes": 400  
        }  
    ]  
}  
```
For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

Example 2: To limit the number of items returned

The following example limits the number of items returned to 4. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-contributor-insights \
    --max-results 4
```

Output:

```json
{
    "ContributorInsightsSummaries": [
    {
        "TableName": "MusicCollection",
        "IndexName": "AlbumTitle-index",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "ProductCatalog",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Forum",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Reply",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Thread",
        "ContributorInsightsStatus": "ENABLED"
    }
]
}
```
For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To retrieve the next page of results**

The following command uses the NextToken value from a previous call to the list-contributor-insights command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-contributor-insights \
  --max-results 4 \
  --next-token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijklM51n0pqRSTuv3WxY3ZabC5dEF GhI2Jk3LmnoPQ6RST9
```

Output:

```json
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```
For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see ListContributorInsights in AWS CLI Command Reference.

### list-global-tables

The following code example shows how to use list-global-tables.

**AWS CLI**

**To list existing DynamoDB global tables**

The following list-global-tables example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
   "GlobalTables": [
   {
      "GlobalTableName": "MusicCollection",
      "ReplicationGroup": [
      {
         "RegionName": "us-east-2"
      },
      {
         "RegionName": "us-east-1"
      }
      ]
   }
   ]
}
```

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see ListGlobalTables in AWS CLI Command Reference.

### list-tables

The following code example shows how to use list-tables.
Example 1: To list tables

The following list-tables example lists all of the tables associated with the current AWS account and Region.

```bash
aws dynamodb list-tables
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```

For more information, see [Listing Table Names](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/query.html) in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit page size

The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```bash
aws dynamodb list-tables \ 
    --page-size 1
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```
Example 3: To limit the number of items returned

The following example limits the number of items returned to 2. The response includes a NextToken value with which to retrieve the next page of results.

```
aws dynamodb list-tables \
   --max-items 2
```

Output:

```
{
   "TableNames": [
      "Forum",
      "ProductCatalog"
   ],
   "NextToken":
   "abCDeFGhiJKlmn0PqrSTuvwxYZ1aBCdEFghiJK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.

Example 4: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the list-tables command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \
   --starting-token abCDeFGhiJKlmn0PqrSTuvwxYZ1aBCdEFghiJK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
   "TableNames": [
```
For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.

- For API details, see ListTables in AWS CLI Command Reference.

**list-tags-of-resource**

The following code example shows how to use list-tags-of-resource.

**AWS CLI**

**Example 1: To list tags of a DynamoDB resource**

The following list-tags-of-resource example displays tags for the MusicCollection table.

```bash
aws dynamodb list-tags-of-resource \
```

**Output:**

```json
{
   "Tags": [
      {
         "Key": "Owner",
         "Value": "blueTeam"
      },
      {
         "Key": "Environment",
         "Value": "Production"
      }
   ]
}
```

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 2: To limit the number of tags returned**
The following example limits the number of tags returned to 1. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-tags-of-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
   --max-items 1
```

Output:

```json
{
   "Tags": [
   {
      "Key": "Owner",
      "Value": "blueTeam"
   }
   ],
   "NextToken": "abCDeFGhiJKlml0PqrSTuvwxYZ1aBCdEFghijK7LM51rn0pqRSTuv3Wy3zabC5dEFGhi2Jk3LmnoPQ6RST9"
}
```

For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/amazondynamodb-devguide.html) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To retrieve the next page of results**

The following command uses the NextToken value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-tags-of-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
   --starting-token abCDeFGhiJKlml0PqrSTuvwxYZ1aBCdEFghijK7LM51rn0pqRSTuv3Wy3zabC5dEFGhi2Jk3LmnoPQ6RST9
```

Output:

```json
{
   "Tags": [
   {
      "Key": "Environment",
      "Value": "Production"
   }
   ]
}
```
For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.
- For API details, see ListTagsOfResource in AWS CLI Command Reference.

**put-item**

The following code example shows how to use `put-item`.

**AWS CLI**

**Example 1: To add an item to a table**

The following `put-item` example adds a new item to the `MusicCollection` table.

```bash
aws dynamodb put-item \
    --table-name MusicCollection \
    --item file://item.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `item.json`:

```json
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Call Me Today"},
    "AlbumTitle": {"S": "Greatest Hits"}
}
```

Output:

```json
{
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "No One You Know"
            }
        }
    }
}
```
For more information, see **Writing an Item** in the *Amazon DynamoDB Developer Guide*.

**Example 2: To conditionally overwrite an item in a table**

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```bash
aws dynamodb put-item
   --table-name MusicCollection
   --item file://item.json
   --condition-expression "#A = :A"
   --expression-attribute-names file://names.json
   --expression-attribute-values file://values.json
   --return-values ALL_OLD
```

Contents of `item.json`:

```json
{
   "Artist": {"S": "No One You Know"},
   "SongTitle": {"S": "Call Me Today"},
   "AlbumTitle": {"S": "Somewhat Famous"}
}
```

Contents of `names.json`:

```json
{
   "#A": "AlbumTitle"
}
```

Contents of `values.json`:

```json
{
}
```
The following code example shows how to use `query`.

**AWS CLI**

**Example 1: To query a table**

The following query example queries items in the MusicCollection table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```
aws dynamodb query \
```
Contents of expression-attributes.json:

```json
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```json
{
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/dynamodb/latest/developerguide/working-with-queries.html) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To query a table using strongly consistent reads and traverse the index in descending order**

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.
aws dynamodb query \
   --table-name MusicCollection \
   --projection-expression "SongTitle" \
   --key-condition-expression "Artist = :v1" \
   --expression-attribute-values file://expression-attributes.json \
   --consistent-read \
   --no-scan-index-forward \
   --return-consumed-capacity TOTAL

Contents of expression-attributes.json:

```json
{
   "v1": {"S": "No One You Know"}
}
```

Output:

```json
{
   "Items": [
      {
         "SongTitle": {
            "S": "Scared of My Shadow"
         }
      },
      {
         "SongTitle": {
            "S": "Call Me Today"
         }
      }
   ],
   "Count": 2,
   "ScannedCount": 2,
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.0
   }
}
```

For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To filter out specific results**
The following example queries the MusicCollection but excludes results with specific values in the AlbumTitle attribute. Note that this does not affect the ScannedCount or ConsumedCapacity, because the filter is applied after the items have been read.

```
aws dynamodb query \
  --table-name MusicCollection \
  --key-condition-expression "#n1 = :v1" \
  --filter-expression "NOT (#n2 IN (:v2, :v3))" \
  --expression-attribute-names file://names.json \
  --expression-attribute-values file://values.json \
  --return-consumed-capacity TOTAL
```

Contents of values.json:

```
{
  ":v1": {"S": "No One You Know"},
  ":v2": {"S": "Blue Sky Blues"},
  ":v3": {"S": "Greatest Hits"}
}
```

Contents of names.json:

```
{
  "#n1": "Artist",
  "#n2": "AlbumTitle"
}
```

Output:

```
{
  "Items": [
    {
      "AlbumTitle": {
        "S": "Somewhat Famous"
      },
      "Artist": {
        "S": "No One You Know"
      },
      "SongTitle": {
        "S": "Call Me Today"
      }
    }
  ]
}
```
Example 4: To retrieve only an item count

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```
aws dynamodb query \
  --table-name MusicCollection \
  --select COUNT \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json
```

Contents of expression-attributes.json:

```
{
  ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Count": 2,
  "ScannedCount": 2,
  "ConsumedCapacity": null
}
```

For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/working-with-queries.html) in the *Amazon DynamoDB Developer Guide*.
Example 5: To query an index

The following example queries the local secondary index AlbumTitleIndex. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the table-name parameter.

```bash
aws dynamodb query \\
   --table-name MusicCollection \\
   --index-name AlbumTitleIndex \\
   --key-condition-expression "Artist = :v1" \\
   --expression-attribute-values file://expression-attributes.json \\
   --select ALL_PROJECTED_ATTRIBUTES \\
   --return-consumed-capacity INDEXES
```

Contents of expression-attributes.json:

```json
{
   ":v1": {"S": "No One You Know"}
}
```

Output:

```json
{
   "Items": [
      {
         "AlbumTitle": {
            "S": "Blue Sky Blues"
         },
         "Artist": {
            "S": "No One You Know"
         },
         "SongTitle": {
            "S": "Scared of My Shadow"
         }
      },
      {
         "AlbumTitle": {
            "S": "Somewhat Famous"
         },
         "Artist": {
            "S": "No One You Know"
         }
      }
   ]
}
```
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Query in AWS CLI Command Reference.

**restore-table-from-backup**

The following code example shows how to use `restore-table-from-backup`.

**AWS CLI**

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```
aws dynamodb restore-table-from-backup \
   --target-table-name MusicCollection \
   --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```
Output:

```json
{

```
restore-table-to-point-in-time

The following code example shows how to use restore-table-to-point-in-time.

AWS CLI

To restore a DynamoDB table to a point in time

The following restore-table-to-point-in-time example restores the MusicCollection table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time \
   --source-table-name MusicCollection \ 
   --target-table-name MusicCollectionRestore \ 
   --restore-date-time 1576622404.0
```

Output:

```
{
   "TableDescription": {
      "AttributeDefinitions": [
      {
         "AttributeName": "Artist",
         "AttributeType": "S"
      },
      {
         "AttributeName": "SongTitle",
         "AttributeType": "S"
      }
      ],
```

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/ondemand-backup-restore.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableFromBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/restore-table-from-backup.html) in *AWS CLI Command Reference*. 

"TableName": "MusicCollectionRestore",
"KeySchema": [
  {
    "AttributeName": "Artist",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "SongTitle",
    "KeyType": "RANGE"
  }
],
"TableStatus": "CREATING",

  "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
  "RestoreDateTime": 1576622404.0,
  "RestoreInProgress": true
}
}

For more information, see [Point-in-Time Recovery for DynamoDB](http://example.com) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableToPointInTime](http://example.com) in *AWS CLI Command Reference*.

**scan**

The following code example shows how to use `scan`. 

```python
"TableName": "MusicCollectionRestore",
"KeySchema": [
  {
    "AttributeName": "Artist",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "SongTitle",
    "KeyType": "RANGE"
  }
],
"TableStatus": "CREATING",
"CreationDateTime": 1576623311.86,
"ProvisionedThroughput": {
  "NumberOfDecreasesToday": 0,
  "ReadCapacityUnits": 5,
  "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollectionRestore",
"TableId": "befd9e0e-1843-4dc6-a147-d6d00e85cb1f",
"BillingModeSummary": {
  "BillingMode": "PROVISIONED"
},
"RestoreSummary": {
  "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
  "RestoreDateTime": 1576622404.0,
  "RestoreInProgress": true
}
```
AWS CLI

To scan a table

The following scan example scans the entire MusicCollection table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```bash
aws dynamodb scan \
  --table-name MusicCollection \
  --filter-expression "Artist = :a" \
  --projection-expression "#ST, #AT" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json
```

Contents of expression-attribute-names.json:

```json
{
  "#ST": "SongTitle",
  "#AT": "AlbumTitle"
}
```

Contents of expression-attribute-values.json:

```json
{
  ":a": {
    "S": "No One You Know"
  }
}
```

Output:

```json
{
  "Count": 2,
  "Items": [
    {
      "SongTitle": {
        "S": "Call Me Today"
      },
      "AlbumTitle": {
        "S": "Somewhat Famous"
      }
    },
    {
      "SongTitle": {
        "S": "No One You Know"
      },
      "AlbumTitle": {
        "S": "No One You Know"
      }...
    }
  ]
}
```
For more information, see Working with Scans in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Scan in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a DynamoDB resource

The following tag-resource example adds a tag key/value pair to the MusicCollection table.

```
aws dynamodb tag-resource \
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
  --tags Key=Owner,Value=blueTeam
```

This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

transact-get-items

The following code example shows how to use transact-get-items.
AWS CLI

To retrieve multiple items atomically from one or more tables

The following transact-get-items example retrieves multiple items atomically.

```bash
aws dynamodb transact-get-items \
   --transact-items file://transact-items.json \
   --return-consumed-capacity TOTAL
```

Contents of transact-items.json:

```json
[
  {
    "Get": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "TableName": "MusicCollection"
    }
  },
  {
    "Get": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection"
    }
  }
]
```

Output:

```json
{
  "ConsumedCapacity": [
    {
      "TableName": "MusicCollection",
      "CapacityUnits": 4.0,
      "ReadCapacityUnits": 4.0
    }
  ]
}
```
The following code example shows how to use `transact-write-items`.

**AWS CLI**

**Example 1: To write items atomically to one or more tables**

For more information, see [Managing Complex Workflows with DynamoDB Transactions](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/transactions.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TransactGetItems](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/transact-get-items.html) in *AWS CLI Command Reference*.
The following `transact-write-items` example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a `Rating` attribute.

```bash
aws dynamodb transact-write-items \
  --transact-items file://transact-items.json \
  --return-consumed-capacity TOTAL \
  --return-item-collection-metrics SIZE
```

Contents of the `transact-items.json` file:

```json
[
    {
      "Update": {
        "Key": {
          "Artist": {"S": "Acme Band"},
          "SongTitle": {"S": "Happy Day"}
        },
        "UpdateExpression": "SET AlbumTitle = :newval",
        "ExpressionAttributeValues": {
          ":newval": {"S": "Updated Album Title"}
        },
        "TableName": "MusicCollection",
        "ConditionExpression": "attribute_not_exists(Rating)"
      }
    },
    {
      "Delete": {
        "Key": {
          "Artist": {"S": "No One You Know"},
          "SongTitle": {"S": "Call Me Today"}
        },
        "TableName": "MusicCollection",
        "ConditionExpression": "attribute_not_exists(Rating)"
      }
    }
]
```

Output:

```json
{
  "ConsumedCapacity": [
  ]
}
```
"TableName": "MusicCollection",
"CapacityUnits": 10.0,
"WriteCapacityUnits": 10.0
]
"ItemCollectionMetrics": {
"MusicCollection": [
{
"ItemCollectionKey": {
"Artist": {
"S": "No One You Know"
}
},
"SizeEstimateRangeGB": [0.0, 1.0]
},
{
"ItemCollectionKey": {
"Artist": {
"S": "Acme Band"
}
},
"SizeEstimateRangeGB": [0.0, 1.0]
}
]
}
}

For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

Example 2: To write items atomically using a client request token

The following command uses a client request token to make the call to transact-write-items idempotent, meaning that multiple calls have the same effect as one single call.

```
aws dynamodb transact-write-items \
  --transact-items file://transact-items.json \
```
Contents of the `transact-items.json` file:

```
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  }
]
```

This command produces no output.

For more information, see [Managing Complex Workflows with DynamoDB Transactions](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/transactions-transact-items.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TransactWriteItems](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/transactwriteitems.html) in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use `untag-resource`.
AWS Command Line Interface

To remove a tag from a DynamoDB resource

The following `untag-resource` example removes the tag with the key `Owner` from the `MusicCollection` table.

```
aws dynamodb untag-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
   --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.
- For API details, see `UntagResource` in AWS CLI Command Reference.

update-continuous-backups

The following code example shows how to use update-continuous-backups.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following `update-continuous-backups` example enables point-in-time recovery for the `MusicCollection` table.

```
aws dynamodb update-continuous-backups \
   --table-name MusicCollection \
   --point-in-time-recovery-specification PointInTimeRecoveryEnabled=true
```

Output:

```json
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "ENABLED",
            "EarliestRestorableDateTime": 1576622404.0,
            "LatestRestorableDateTime": 1576622404.0
        }
    }
}
```
For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateContinuousBackups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-continuous-backups.html) in *AWS CLI Command Reference*.

**update-contributor-insights**

The following code example shows how to use `update-contributor-insights`.

**AWS CLI**

**To enable Contributor Insights on a table**

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```shell
aws dynamodb update-contributor-insights \
  --table-name MusicCollection \
  --index-name AlbumTitle-index \
  --contributor-insights-action ENABLE
```

Output:

```json
{
  "TableName": "MusicCollection",
  "IndexName": "AlbumTitle-index",
  "ContributorInsightsStatus": "ENABLING"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateContributorInsights](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-contributor-insights.html) in *AWS CLI Command Reference*.

**update-global-table-settings**

The following code example shows how to use `update-global-table-settings`.

**Actions and scenarios**

1954
To update provisioned write capacity settings on a DynamoDB global table

The following update-global-table-settings example sets the provisioned write capacity of the MusicCollection global table to 15.

```bash
aws dynamodb update-global-table-settings \
  --global-table-name MusicCollection \
  --global-table-provisioned-write-capacity-units 15
```

Output:

```json
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "eu-west-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
      "RegionName": "us-east-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
      "RegionName": "us-east-2",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    }
  ]
}```
update-global-table

The following code example shows how to use `update-global-table`. 

AWS CLI

To update a DynamoDB global table

The following `update-global-table` example adds a replica in the specified Region to the `MusicCollection` global table.

```bash
aws dynamodb update-global-table \
   --global-table-name MusicCollection \
   --replica-updates Create={RegionName=eu-west-1}
```

Output:

```json
{
   "GlobalTableDescription": { 
   "ReplicationGroup": [ 
   { 
       "RegionName": "eu-west-1"
   },
   { 
       "RegionName": "us-east-2"
   },
   { 
       "RegionName": "us-west-2"
   }
   ]
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*. 

- For API details, see [UpdateGlobalTableSettings](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-global-table.html) in *AWS CLI Command Reference*.
update-item

The following code example shows how to use update-item.

AWS CLI

Example 1: To update an item in a table

The following update-item example updates an item in the MusicCollection table. It adds a new attribute (Year) and modifies the AlbumTitle attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```
wso dynamodb update-item \
    --table-name MusicCollection \
    --key file://key.json \
    --update-expression "SET #Y = :y, #AT = :t" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json \
    --return-values ALL_NEW \n    --return-consumed-capacity TOTAL \n    --return-item-collection-metrics SIZE
```

Contents of key.json:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```
Contents of expression-attribute-names.json:

```
{
   "#Y":"Year", "#AT":"AlbumTitle"
}
```

Contents of expression-attribute-values.json:

```
{
   ":y":{"N": "2015"},
   ":t":{"S": "Louder Than Ever"}
}
```

Output:

```
{
   "Attributes": {
      "AlbumTitle": {
         "S": "Louder Than Ever"
      },
      "Awards": {
         "N": "10"
      },
      "Artist": {
         "S": "Acme Band"
      },
      "Year": {
         "N": "2015"
      },
      "SongTitle": {
         "S": "Happy Day"
      }
   },
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 3.0
   },
   "ItemCollectionMetrics": {
      "ItemCollectionKey": {
         "Artist": {
```

Actions and scenarios
"S": "Acme Band"

For more information, see [Writing an Item](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To update an item conditionally**

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```bash
aws dynamodb update-item \
  --table-name MusicCollection \
  --key file://key.json \
  --update-expression "SET #Y = :y, #AT = :t" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json \
  --condition-expression "attribute_not_exists(#Y)"
```

Contents of `key.json`:

```json
{
  "Artist": {"S": "Acme Band"},
  "SongTitle": {"S": "Happy Day"}
}
```

Contents of `expression-attribute-names.json`:

```json
{
  "#Y":"Year",
  "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```json
{
}
```
If the item already has a `Year` attribute, DynamoDB returns the following output.

An error occurred (ConditionalCheckFailedException) when calling the `UpdateItem` operation: The conditional request failed.

For more information, see [Writing an Item](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/WritingItems.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-item.html) in *AWS CLI Command Reference*.

### update-table-replica-auto-scaling

The following code example shows how to use `update-table-replica-auto-scaling`.

**AWS CLI**

To update auto scaling settings across replicas of a global table

The following `update-table-replica-auto-scaling` example updates write capacity auto scaling settings across replicas of the specified global table.

```
aws dynamodb update-table-replica-auto-scaling \
  --table-name MusicCollection \
  --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```

Contents of `auto-scaling-policy.json`:

```json
{
   "MinimumUnits": 10,
   "MaximumUnits": 100,
   "AutoScalingDisabled": false,
   "ScalingPolicyUpdate": {
       "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
       "TargetTrackingScalingPolicyConfiguration": {
           "TargetValue": 80
       }
   }
}
```
Output:

```json
{
   "TableAutoScalingDescription": {
      "TableName": "MusicCollection",
      "TableStatus": "ACTIVE",
      "Replicas": [
         {
            "RegionName": "eu-central-1",
            "GlobalSecondaryIndexes": [],
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
               "MinimumUnits": 5,
               "MaximumUnits": 40000,
               "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
               "ScalingPolicies": [
                  {
                     "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
                     "TargetTrackingScalingPolicyConfiguration": {
                        "TargetValue": 70.0
                     }
                  }
               ],
            },
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
               "MinimumUnits": 10,
               "MaximumUnits": 100,
               "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
               "ScalingPolicies": [
                  {
                     "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
                     "TargetTrackingScalingPolicyConfiguration": {

### `update-table`

The following code example shows how to use `update-table`. 
AWS CLI

Example 1: To modify a table’s billing mode

The following update-table example increases the provisioned read and write capacity on the MusicCollection table.

```bash
aws dynamodb update-table \
  --table-name MusicCollection \
  --billing-mode PROVISIONED \
  --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "UPDATING",
    "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
  }
}
```
For more information, see [Updating a Table](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/)...
Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [

    }
]
}

For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

Example 3: To enable DynamoDB Streams on a table

The following command enables DynamoDB Streams on the MusicCollection table.
aws dynamodb update-table \
 --table-name MusicCollection \
 --stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE

Output:

{  
  "TableDescription": {  
    "AttributeDefinitions": [  
      {  
        "AttributeName": "AlbumTitle",  
        "AttributeType": "S"  
      },  
      {  
        "AttributeName": "Artist",  
        "AttributeType": "S"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "AttributeType": "S"  
      }  
    ],  
    "TableName": "MusicCollection",  
    "KeySchema": [  
      {  
        "AttributeName": "Artist",  
        "KeyType": "HASH"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "KeyType": "RANGE"  
      }  
    ]  
  },  
  "TableStatus": "UPDATING",

Example 4: To enable server-side encryption

The following example enables server-side encryption on the MusicCollection table.

```bash
aws dynamodb update-table \
  --table-name MusicCollection \
  --sse-specification Enabled=true,SSEType=KMS
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 10
    },
    "StreamSpecification": {
      "StreamEnabled": true,
      "StreamViewType": "NEW_IMAGE"
    },
  }
}
```
"AttributeType": "S",
}
,
{
  "AttributeName": "SongTitle",
  "AttributeType": "S"
}
],
"TableName": "MusicCollection",
"KeySchema": [
  {
    "AttributeName": "Artist",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "SongTitle",
    "KeyType": "RANGE"
  }
],

"StreamSpecification": {
  "StreamEnabled": true,
  "StreamViewType": "NEW_IMAGE"}
For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTable in AWS CLI Command Reference.

**update-time-to-live**

The following code example shows how to use update-time-to-live.

**AWS CLI**

To update Time to Live settings on a table

The following update-time-to-live example enables Time to Live on the specified table.

```
aws dynamodb update-time-to-live \
  --table-name MusicCollection \
  --time-to-live-specification Enabled=true,AttributeName=ttl
```

**Output:**

```
{
  "TimeToLiveSpecification": {
    "Enabled": true, 
    "AttributeNames": "ttl"
  }
}
```

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTimeToLive in AWS CLI Command Reference.
DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-stream

The following code example shows how to use describe-stream.

AWS CLI

To get information about a DynamoDB stream

The following describe-stream command displays information about the specific DynamoDB stream.

```
aws dynamodbstreams describe-stream \
     stream/2019-10-22T18:02:01.576
```

Output:

```
{
    "StreamDescription": {
            stream/2019-10-22T18:02:01.576",
```

"StreamLabel": "2019-10-22T18:02:01.576",
"StreamStatus": "ENABLED",
"StreamViewType": "NEW_AND_OLD_IMAGES",
"CreationRequestDateTime": 1571767321.571,
"TableName": "Music",
"KeySchema": [
    {
        "AttributeName": "Artist",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
    }
],
"Shards": [
    {
        "ShardId": "shardId-00000001571767321804-697ce3d2",
        "SequenceNumberRange": {
            "StartingSequenceNumber": "4000000000000642977831",
            "EndingSequenceNumber": "4000000000000642977831"
        }
    },
    {
        "ShardId": "shardId-00000001571780995058-40810d86",
        "SequenceNumberRange": {
            "StartingSequenceNumber": "757400000000005655171150"
        },
        "ParentShardId": "shardId-00000001571767321804-697ce3d2"
    }
]
}

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeStream in AWS CLI Command Reference.

get-records

The following code example shows how to use get-records.
AWS CLI

To get records from a Dynamodb stream

The following get-records command retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \
--shard-iterator "arn:aws:dynamodb:us-west-1:123456789012:table/Music/stream/2019-10-22T18:02:01.576|1|AAAARAAAAAAGgM3YZ89vLZZxjmoQeo33r9M4x3+zmmTLsiL86MfrF4+B4EbsByi52InVmi0Nmy6xVW4IRcIIbs1z07MNI+CFpLqQjnyRSAanf0wWmKhlL1/KNPzrWSfz2odf780o0bIDIWRRMkt7+Hyzh9SD+hFxFAWR5C7QIloXpc8mRbfNiAzfrVCjJK8/JsjCzsqNyXKzJbh+hGCoxyn+Kpmg4nyj1EAsYhbGL35muvHFhjcyuynbscbWaXNfThDwRAyvoTmc8XhHKtAWUbJiaVd8ZPtQwDsThCrmDRPIdmTRG+w/LEG505ha1qNP+VL4+tuohz2TRnhnJo/pany96I/yGpce97mWv5Pr5KPwy+DtcmSBHayBs+PVYHITaTliInFLT+LCwvazIH3Y3b8A05Z800wpjktsM0IqqtMeDwN4NX6FrcxR34JoFKGsgR8XkhVJzz2xr1xqS12ycpNTyHndusw=="
```

Output:

```

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see GetRecords in AWS CLI Command Reference.

get-shard-iterator

The following code example shows how to use get-shard-iterator.

AWS CLI

To get a shard iterator

The following get-shard-iterator command retrieves a shard iterator for the specified shard.

```bash
aws dynamodbstreams get-shard-iterator \
```
--shard-id shardId-000000157178099508-40810d86 \
--shard-iterator-type LATEST

Output:

```json
{
stream/2019-10-22T18:02:01.576|1|
AAAAAAAAGgM3YZ89vLZZjmoQeo33r9M4x3+zmmTLsiL86MfrF4+B4EbsByi52InVmiONmy6xVW4IRcIIbs1z07MNI

}
```

For more information, see [Capturing Table Activity with DynamoDB Streams](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/DynamoDBStreams.html) in the Amazon DynamoDB Developer Guide.

**list-streams**

The following code example shows how to use `list-streams`.

**AWS CLI**

**To list DynamoDB streams**

The following `list-streams` command lists all existing Amazon DynamoDB streams within the default AWS Region.

```
aws dynamodbstreams list-streams
```

Output:

```json
{
   "Streams": [
   
   ]
```
For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

accept-address-transfer

The following code example shows how to use accept-address-transfer.

AWS CLI

To accept an Elastic IP address transferred to your account
The following `accept-address-transfer` example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \
   --address 100.21.184.216
```

Output:

```
{
   "AddressTransfer": {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "TransferAccountId": "123456789012",
      "TransferOfferExpirationTimestamp": "2023-02-22T20:51:10.000Z",
      "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",
      "AddressTransferStatus": "accepted"
   }
}
```

- For API details, see [AcceptAddressTransfer](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_AcceptAddressTransfer.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ec2/accept-address-transfer.html).

### accept-reserved-instances-exchange-quote

The following code example shows how to use `accept-reserved-instances-exchange-quote`.

**AWS CLI**

**To perform a Convertible Reserved Instance exchange**

This example performs an exchange of the specified Convertible Reserved Instances.

Command:

```
aws ec2 accept-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbc6-a45ebexample --target-configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:
• For API details, see [AcceptReservedInstancesExchangeQuote](https://aws.amazon.com/cli/command-reference/) in *AWS CLI Command Reference*.

**accept-transit-gateway-peering-attachment**

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

**AWS CLI**

**To accept a transit gateway peering attachment**

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```bash
aws ec2 accept-transit-gateway-peering-attachment
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
    --region us-east-2
```

Output:

```json
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "pending",
        "CreationTime": "2019-12-09T11:38:31.000Z"
    }
}
```
accept-transit-gateway-vpc-attachment

The following code example shows how to use accept-transit-gateway-vpc-attachment.

AWS CLI

To accept a request to attach a VPC to a transit gateway.

The following accept-transit-gateway-vpc-attachment example accepts the request for the specified attachment.

```bash
aws ec2 accept-transit-gateway-vpc-attachment \
--transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8fffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit Gateway Attachments to a VPC in the Transit Gateways Guide.

- For API details, see AcceptTransitGatewayVpcAttachment in AWS CLI Command Reference.
accept-vpc-endpoint-connections

The following code example shows how to use accept-vpc-endpoint-connections.

AWS CLI

To accept an interface endpoint connection request

This example accepts the specified endpoint connection request for the specified endpoint service.

Command:

```bash
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [AcceptVpcEndpointConnections](#) in [AWS CLI Command Reference](#).

accept-vpc-peering-connection

The following code example shows how to use accept-vpc-peering-connection.

AWS CLI

To accept a VPC peering connection

This example accepts the specified VPC peering connection request.

Command:

```bash
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```json
{
}
```
The following code example shows how to use advertise-byoip-cidr.

**AWS CLI**

To advertise an address range

The following advertise-byoip-cidr example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
   --cidr 203.0.113.25/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
```

For API details, see [AcceptVpcPeeringConnection](#) in *AWS CLI Command Reference*.

```
advertise-byoip-cidr
```
allocate-address

The following code example shows how to use allocate-address.

AWS CLI

Example 1: To allocate an Elastic IP address from Amazon's address pool

The following allocate-address example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```bash
aws ec2 allocate-address
```

Output:

```json
{
  "PublicIp": "70.224.234.241",
  "AllocationId": "eipalloc-01435ba59eEXAMPLE",
  "PublicIpv4Pool": "amazon",
  "NetworkBorderGroup": "us-west-2",
  "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

Example 2: To allocate an Elastic IP address and associate it with a network border group

The following allocate-address example allocates an Elastic IP address and associates it with the specified network border group.

```bash
aws ec2 allocate-address \
--network-border-group us-west-2-lax-1
```

Output:
For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

Example 3: To allocate an Elastic IP address from an address pool that you own

The following allocate-address example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```bash
aws ec2 allocate-address \
   --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```json
{
   "AllocationId": "eipalloc-02463d08ceEXAMPLE",
   "NetworkBorderGroup": "us-west-2",
   "CustomerOwnedIp": "18.218.95.81",
   "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
   "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

- For API details, see AllocateAddress in AWS CLI Command Reference.

allocate-hosts

The following code example shows how to use allocate-hosts.

AWS CLI

Example 1: To allocate a Dedicated Host
The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone, onto which you can launch `m5.large` instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --quantity 1
```

Output:

```json
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

**Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled**

The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone with auto-placement and host recovery enabled.

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --auto-placement on \
  --host-recovery on \
  --quantity 1
```

Output:

```json
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

**Example 3: To allocate a Dedicated Host with tags**

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`. 

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --tag-key purpose \
  --tag-value production \
  --quantity 1
```
aws ec2 allocate-hosts \
   --instance-type m5.large \
   --availability-zone eu-west-1a \
   --quantity 1 \
   --tag-specifications 'ResourceType=dedicated-host,Tags={Key=purpose,Value=production}'

Output:

```json
{
   "HostIds": [
      "h-07879acf49EXAMPLE"
   ]
}
```

For more information, see Allocating Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see AllocateHosts in AWS CLI Command Reference.

allocate-ipam-pool-cidr

The following code example shows how to use allocate-ipam-pool-cidr.

AWS CLI

To allocate a CIDR from an IPAM pool

The following allocate-ipam-pool-cidr example allocates a CIDR from an IPAM pool.

(Linux):

```bash
aws ec2 allocate-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --netmask-length 24
```

(Windows):

```bash
aws ec2 allocate-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --netmask-length 24
```
Output:

```json
{
    "IpamPoolAllocation": {
        "Cidr": "10.0.0.0/24",
        "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfb0",
        "ResourceType": "custom",
        "ResourceOwner": "123456789012"
    }
}
```

For more information, see [Manually allocate a CIDR to a pool to reserve IP address space](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/allocate-ipam-pool-cidr.html) in the Amazon VPC IPAM User Guide.

**apply-security-groups-to-client-vpn-target-network**

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

**AWS CLI**

To apply security groups to a target network for a Client VPN endpoint

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network \
    --security-group-ids sg-01f6e627a89f4db32 \
    --vpc-id vpc-0e2110c2f324332e0 \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abce
df
```

Output:

```json
{
    "SecurityGroupIds": [
        "sg-01f6e627a89f4db32"
    ]
}
```
For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see ApplySecurityGroupsToClientVpnTargetNetwork in AWS CLI Command Reference.

**assign-ipv6-addresses**

The following code example shows how to use assign-ipv6-addresses.

**AWS CLI**

**To assign specific IPv6 addresses to a network interface**

This example assigns the specified IPv6 addresses to the specified network interface.

Command:

```bash
```

Output:

```
{
   "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
   ],
   "NetworkInterfaceId": "eni-38664473"
}
```

**To assign IPv6 addresses that Amazon selects to a network interface**

This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

Command:

```bash
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2
```
Output:

```json
{
    "AssignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071",
        "2001:db8:1234:1a00:9691:9503:25ad:1761"
    ],
    "NetworkInterfaceId": "eni-38664473"
}
```

- For API details, see [AssignIpv6Addresses](https://awscli.amazonaws.com/v2/documentation/api/current/reference/services/ec2/operation/AssignIpv6Addresses.html) in *AWS CLI Command Reference*.

### assign-private-ip-addresses

The following code example shows how to use `assign-private-ip-addresses`.

#### AWS CLI

**To assign a specific secondary private IP address a network interface**

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

**To assign secondary private IP addresses that Amazon EC2 selects to a network interface**

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --secondary-private-ip-address-count 2
```
assign-private-nat-gateway-address

The following code example shows how to use assign-private-nat-gateway-address.

AWS CLI

To assign private IP addresses to your private NAT gateway

The following assign-private-nat-gateway-address example assigns two private IP addresses to the specified private NAT gateway.

```
aws ec2 assign-private-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --private-ip-address-count 2
```

Output:

```
{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
    },
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
    }
  ]
}
```

For more information, see NAT gateways in the Amazon VPC User Guide.

• For API details, see AssignPrivateNatGatewayAddress in AWS CLI Command Reference.

associate-address

The following code example shows how to use associate-address.
AWS CLI

To associate an Elastic IP addresses in EC2-Classic

This example associates an Elastic IP address with an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-address --instance-id i-07ffe74c7330ebf53 --public-ip 198.51.100.0
```

To associate an Elastic IP address in EC2-VPC

This example associates an Elastic IP address with an instance in a VPC.

Command:

```
aws ec2 associate-address --instance-id i-0b263919b6498b123 --allocation-id eipalloc-64d5890a
```

Output:

```
{
   "AssociationId": "eipassoc-2bebb745"
}
```

This example associates an Elastic IP address with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d
```

This example associates an Elastic IP with a private IP address that's associated with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d --private-ip-address 10.0.0.85
```
• For API details, see AssociateAddress in AWS CLI Command Reference.

associate-client-vpn-target-network

The following code example shows how to use associate-client-vpn-target-network.

AWS CLI

To associate a target network with a Client VPN endpoint

The following associate-client-vpn-target-network example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
   --subnet-id subnet-0123456789abcabca \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
   "AssociationId": "cvpn-assoc-12312312312312312",
   "Status": {
      "Code": "associating"
   }
}
```

For more information, see Target Networks in the AWS Client VPN Administrator Guide.

• For API details, see AssociateClientVpnTargetNetwork in AWS CLI Command Reference.

associate-dhcp-options

The following code example shows how to use associate-dhcp-options.

AWS CLI

To associate a DHCP options set with your VPC

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.
Command:
```
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```

To associate the default DHCP options set with your VPC

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:
```
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see [AssociateDhcpOptions](https://awscli.amazonaws.com/wiki/AWS-CLI-Command-Reference) in *AWS CLI Command Reference*.

### associate-iam-instance-profile

The following code example shows how to use `associate-iam-instance-profile`.

**AWS CLI**

To associate an IAM instance profile with an instance

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcde123`.

Command:
```
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcde123 --iam-instance-profile Name=admin-role
```

Output:
```
{
  "IamInstanceProfileAssociation": {
    "InstanceId": "i-123456789abcde123",
    "State": "associating",
    "AssociationId": "iip-assoc-073651e163c209",
    "IamInstanceProfile": {
      "Id": "AIPAJBLK7RKJKWDXVHIC",
```
For API details, see [AssociateIamInstanceProfile](#) in *AWS CLI Command Reference*.

**associate-instance-event-window**

The following code example shows how to use `associate-instance-event-window`.

**AWS CLI**

**Example 1: To associate one or more instances with an event window**

The following `associate-instance-event-window` example associates one or more instances with an event window.

```bash
aws ec2 associate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [
            "i-1234567890abcdef0",
            "i-0598c7d356eba48d7"
         ],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 2: To associate instance tags with an event window

The following associate-instance-event-window example associates instance tags with an event window. Enter an instance-event-window-id parameter to specify the event window. To associate instance tags, specify the association-target parameter, and for the parameter value, specify one or more tags.

```
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k1",
          "Value": "v1"
        }
      ],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.
Example 3: To associate a Dedicated Host with an event window

The following associate-instance-event-window example associates a Dedicated Host with an event window. Enter an instance-event-window-id parameter to specify the event window. To associate a Dedicated Host, specify the --association-target parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \\
  --region us-east-1 \\
  --instance-event-window-id iew-0abcdef1234567890 \\
  --association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": [
        "h-029fa35a02b99801d"
      ],
      "State": "creating"
    }
  }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see AssociateInstanceEventWindow in AWS CLI Command Reference.

associate-ipam-resource-discovery

The following code example shows how to use associate-ipam-resource-discovery.

AWS CLI

To associate a resource discovery with an IPAM
In this example, you are an IPAM delegated admin and a resource discovery has been created and shared with you by another AWS account so that you can use IPAM to manage and monitor resource CIDRs owned by the other account.

Note

To complete this request, you'll need the resource discovery ID which you can get with `describe-ipam-resource-discoveries` and the IPAM ID which you can get with `describe-ipams`. The resource discovery that you are associating must have first been shared with your account using AWS RAM. The `--region` you enter must match the home Region of the IPAM you are associating it with.

The following `associate-ipam-resource-discovery` example associates a resource discovery with an IPAM.

```bash
aws ec2 associate-ipam-resource-discovery \
   --ipam-id ipam-005f921c17ebd5107 \
   --ipam-resource-discovery-id ipam-res-disco-03e0406de76a044ee \
   --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-center,Value=cc123}]' \
   --region us-east-1
```

Output:

```json
{
  "IpamResourceDiscoveryAssociation": {
    "OwnerId": "320805250157",
    "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-04382a6346357cf82",
    "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
    "IpamId": "ipam-005f921c17ebd5107",
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
    "IpamRegion": "us-east-1",
    "IsDefault": false,
    "ResourceDiscoveryStatus": "active",
    "State": "associate-in-progress",
    "Tags": []
  }
}
```
Once you associate a resource discovery, you can monitor and/or manage the IP addresses of resources created by the other accounts. For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see AssociateIpamResourceDiscovery in AWS CLI Command Reference.

**associate-nat-gateway-address**

The following code example shows how to use associate-nat-gateway-address.

**AWS CLI**

**To associate an Elastic IP address with a public NAT gateway**

The following associate-nat-gateway-address example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```
aws ec2 associate-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --allocation-ids eipalloc-0be6ecac95EXAMPLE
```

Output:

```
{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
      "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
      "IsPrimary": false,
      "Status": "associating"
    }
  ]
}
```

For more information, see NAT gateways in the Amazon VPC User Guide.

- For API details, see AssociateNatGatewayAddress in AWS CLI Command Reference.
**associate-route-table**

The following code example shows how to use `associate-route-table`.

**AWS CLI**

To associate a route table with a subnet

This example associates the specified route table with the specified subnet.

Command:

```bash
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-id subnet-9d4a7b6c
```

Output:

```json
{
   "AssociationId": "rtbassoc-781d0d1a"
}
```

- For API details, see [AssociateRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/associate-route-table.html) in *AWS CLI Command Reference*.

**associate-subnet-cidr-block**

The following code example shows how to use `associate-subnet-cidr-block`.

**AWS CLI**

To associate an IPv6 CIDR block with a subnet

This example associates an IPv6 CIDR block with the specified subnet.

Command:

```bash
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-block 2001:db8:1234:1a00::/64
```

Output:

```json
{
   "SubnetId": "subnet-5f46ec3b",
   "Ipv6CidrBlockAssociation": {
```

Actions and scenarios
For API details, see AssociateSubnetCidrBlock in AWS CLI Command Reference.

associate-transit-gateway-multicast-domain

The following code example shows how to use associate-transit-gateway-multicast-domain.

AWS CLI

To associate a transit gateway with a multicast domain

The following associate-transit-gateway-multicast-domain example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
   --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
   --subnet-ids subnet-000de86e3b49c932a \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "Associations": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
        "ResourceId": "vpc-01128d2c240c09bd5",
        "ResourceType": "vpc",
        "Subnets": [
            {
                "SubnetId": "subnet-000de86e3b49c932a",
                "State": "associating"
            }
        ]
    }
}
```
associate-transit-gateway-route-table

The following code example shows how to use associate-transit-gateway-route-table.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following example associates the specified transit gateway route table with the specified VPC attachment.

```bash
aws ec2 associate-transit-gateway-route-table \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
   --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```json
{
   "Association": {
      "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
      "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
      "ResourceId": "vpc-0065acced4EXAMPLE",
      "ResourceType": "vpc",
      "State": "associating"
   }
}
```

For more information, see Associate a Transit Gateway Route Table in the AWS Transit Gateways Guide.

• For API details, see AssociateTransitGatewayRouteTable in AWS CLI Command Reference.

associate-vpc-cidr-block

The following code example shows how to use associate-vpc-cidr-block.
**AWS CLI**

**Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC**

The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC:

```bash
aws ec2 associate-vpc-cidr-block \
  --amazon-provided-ipv6-cidr-block \
  --ipv6-cidr-block-network-border-group us-west-2-lax-1 \
  --vpc-id vpc-8EXAMPLE
```

Output:

```
{
  "Ipv6CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
    "Ipv6CidrBlockState": {
      "State": "associating"
    },
    "NetworkBorderGroup": "us-west-2-lax-1"
  },
  "VpcId": "vpc-8EXAMPLE"
}
```

**Example 2: To associate an additional IPv4 CIDR block with a VPC**

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block 10.2.0.0/16 with the specified VPC.

```bash
aws ec2 associate-vpc-cidr-block \
  --vpc-id vpc-1EXAMPLE \
  --cidr-block 10.2.0.0/16
```

Output:

```
{
  "CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
    "CidrBlock": "10.2.0.0/16",
    "CidrBlockState": {
      "State": "associating"
    }
  }
}
```
attach-classic-link-vpc

The following code example shows how to use attach-classic-link-vpc.

AWS CLI

To link (attach) an EC2-Classic instance to a VPC

This example links instance i-1234567890abcdef0 to VPC vpc-88888888 through the VPC security group sg-12312312.

Command:

```bash
aws ec2 attach-classic-link-vpc --instance-id i-1234567890abcdef0 --vpc-id vpc-88888888 --groups sg-12312312
```

Output:

```json
{
   "Return": true
}
```

attach-internet-gateway

The following code example shows how to use attach-internet-gateway.

AWS CLI

To attach an internet gateway to your VPC

The following attach-internet-gateway example attaches the specified internet gateway to the specific VPC.
aws ec2 attach-internet-gateway \
   --internet-gateway-id igw-0d0fb496b3EXAMPLE \
   --vpc-id vpc-0a60eb65b4EXAMPLE

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see AttachInternetGateway in AWS CLI Command Reference.

attach-network-interface

The following code example shows how to use attach-network-interface.

AWS CLI

Example 1: To attach a network interface to an instance

The following attach-network-interface example attaches the specified network interface to the specified instance.

aws ec2 attach-network-interface \
   --network-interface-id eni-0dc56a8d4640ad10a \
   --instance-id i-1234567890abcdef0 \
   --device-index 1

Output:

{
   "AttachmentId": "eni-attach-01a8fc8736f07cf9"
}

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

Example 2: To attach a network interface to an instance with multiple network cards

The following attach-network-interface example attaches the specified network interface to the specified instance and network card.

aws ec2 attach-network-interface \
   --network-interface-id eni-07483b1897541ad83 \
   --instance-id i-01234567890abcdef
Output:

{
    "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see AttachNetworkInterface in AWS CLI Command Reference.

attach-verified-access-trust-provider

The following code example shows how to use attach-verified-access-trust-provider.

AWS CLI

To attach a trust provider to an instance

The following attach-verified-access-trust-provider example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```
aws ec2 attach-verified-access-trust-provider \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": { 
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": ":",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:00:38"
    },
    "VerifiedAccessInstance": { 
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
```
For more information, see [Verified Access instances](#) in the AWS Verified Access User Guide.

- For API details, see [AttachVerifiedAccessTrustProvider](#) in AWS CLI Command Reference.

**attach-volume**

The following code example shows how to use `attach-volume`.

**AWS CLI**

**To attach a volume to an instance**

This example command attaches a volume (vol-1234567890abcdef0) to an instance (i-01474ef662b89480) as /dev/sdf.

**Command:**

```
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-id i-01474ef662b89480 --device /dev/sdf
```

**Output:**

```
{
    "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "InstanceId": "i-01474ef662b89480",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "attaching",
    "Device": "/dev/sdf"
}
```
attach-vpn-gateway

The following code example shows how to use `attach-vpn-gateway`.

**AWS CLI**

To attach a virtual private gateway to your VPC

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```bash
aws ec2 attach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

Output:

```json
{
    "VpcAttachment": {
        "State": "attaching",
        "VpcId": "vpc-a01106c2"
    }
}
```

authorize-client-vpn-ingress

The following code example shows how to use `authorize-client-vpn-ingress`.

**AWS CLI**

To add an authorization rule for a Client VPN endpoint

The following `authorize-client-vpn-ingress` example adds an ingress authorization rule that permits all clients to access the internet (0.0.0.0/0).

```bash
aws ec2 authorize-client-vpn-ingress \
```

• For API details, see [AttachVolume](#) in *AWS CLI Command Reference*.

• For API details, see [AttachVpnGateway](#) in *AWS CLI Command Reference*.
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
--target-network-cidr 0.0.0.0/0 \
--authorize-all-groups

Output:

```
{
    "Status": {
        "Code": "authorizing"
    }
}
```

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

- For API details, see AuthorizeClientVpnIngress in AWS CLI Command Reference.

authorize-security-group-egress

The following code example shows how to use authorize-security-group-egress.

AWS CLI

**To add a rule that allows outbound traffic to a specific address range**

This example command adds a rule that grants access to the specified address ranges on TCP port 80.

Command (Linux):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='[CidrIp=10.0.0.0/16]'
```

Command (Windows):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[CidrIp=10.0.0.0/16]
```

**To add a rule that allows outbound traffic to a specific security group**

This example command adds a rule that grants access to the specified security group on TCP port 80.

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
```

```
IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='[CidrIp=10.0.0.0/16]'
```
Command (Linux):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
  IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='[[GroupId=sg-4b51a32f]]'
```

Command (Windows):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
  IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='[[GroupId=sg-4b51a32f]]'
```

- For API details, see [AuthorizeSecurityGroupEgress](#) in [AWS CLI Command Reference](#).

### authorize-security-group-ingress

The following code example shows how to use `authorize-security-group-ingress`.

**AWS CLI**

**Example 1: To add a rule that allows inbound SSH traffic**

The following `authorize-security-group-ingress` example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \
  --group-id sg-1234567890abcdef0 \
  --protocol tcp \
  --port 22 \
  --cidr 203.0.113.0/24
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-01afa97ef3e1bedfc",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 22,
      "ToPort": 22,
      "IpRanges": [
        {
          "CidrIp": "203.0.113.0/24",
          "Description": "ssh
```
Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following authorize-security-group-ingress example adds a rule that allows inbound access on TCP port 80 from the source security group sg-1a2b3c4d. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```
aws ec2 authorize-security-group-ingress \\
  --group-id sg-1234567890abcdef0 \\
  --protocol tcp \\
  --port 80 \\
  --source-group sg-1a2b3c4d
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-01f4be99110f638a7",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 80,
      "ToPort": 80,
      "ReferencedGroupInfo": {
        "GroupId": "sg-1a2b3c4d",
        "UserId": "123456789012"
      }
    }
  ]
}
```

Example 3: To add multiple rules in the same call
The following authorize-security-group-ingress example uses the ip-permissions parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions 
IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=172.31.0.0/16}]"
IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges="[{CidrIp=172.31.0.0/16}]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "123456789012",
         "IsEgress": false,
         "IpProtocol": "tcp",
         "FromPort": 3389,
         "ToPort": 3389,
         "CidrIpv4": "172.31.0.0/16"
      },
      {
         "SecurityGroupRuleId": "sgr-a133dd4493944b87",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "123456789012",
         "IsEgress": false,
         "IpProtocol": "tcp",
         "FromPort": -1,
         "ToPort": -1,
         "CidrIpv4": "172.31.0.0/16"
      }
   ]
}
```

**Example 4: To add a rule for ICMP traffic**

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows the ICMP message **Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4)** from anywhere.
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges="[CidrIp=0.0.0.0/0]]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

**Example 5: To add a rule for IPv6 traffic**

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range 2001:db8:1234:1a00::/64.

aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges="[[CidrIpv6=2001:db8:1234:1a00::/64]]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv6": "2001:db8:1234:1a00::/64"
        }
    ]
}
```
Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmpv6,Ipv6Ranges=['{CidrIpv6=::/0}']
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "123456789012",
         "IsEgress": false,
         "IpProtocol": "icmpv6",
         "FromPort": -1,
         "ToPort": -1,
         "CidrIpv6": "::/0"
      }
   ]
}
```

Example 7: Add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges=['{CidrIp=203.0.113.0/24,Description='RDP access from NY office'}']
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "123456789012",
         "IsEgress": false,
         "IpProtocol": "tcp",
         "FromPort": 3389,
         "ToPort": 3389,
         "IpRanges": ['{CidrIp=203.0.113.0/24}'],
         "Description": "RDP access from NY office"
      }
   ]
}
```
Example 8: To add an inbound rule that uses a prefix list

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```
aws ec2 authorize-security-group-ingress --group-id sg-04a351bfe432d4e71 --ip-permissions IpProtocol=all,PrefixListIds="[{PrefixListId=pl-002dc3ec097de1514}]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "PrefixListId": "pl-0721453c7ac4ec009"
   }
   ]
}
```
For more information, see Security groups in the Amazon VPC User Guide.

- For API details, see AuthorizeSecurityGroupIngress in AWS CLI Command Reference.

**bundle-instance**

The following code example shows how to use bundle-instance.

**AWS CLI**

**To bundle an instance**

This example bundles instance i-1234567890abcdef0 to a bucket called bundletasks. Before you specify values for your access key IDs, review and follow the guidance in Best Practices for Managing AWS Access Keys.

Command:

```
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```json
{
   "BundleTask": {
      "UpdateTime": "2015-09-15T13:30:35.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
         "S3": {
            "Prefix": "winami",
            "Bucket": "bundletasks"
         }
      },
      "State": "pending",
      "StartTime": "2015-09-15T13:30:35.000Z",
      "BundleId": "bun-294e041f"
   }
}
```

- For API details, see BundleInstance in AWS CLI Command Reference.
cancel-bundle-task

The following code example shows how to use cancel-bundle-task.

AWS CLI

To cancel a bundle task

This example cancels bundle task bun-2a4e041c.

Command:

```bash
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

Output:

```json
{
  "BundleTask": {
    "UpdateTime": "2015-09-15T13:27:40.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "Storage": {
      "S3": {
        "Prefix": "winami",
        "Bucket": "bundletasks"
      }
    },
    "State": "cancelling",
    "StartTime": "2015-09-15T13:24:35.000Z",
    "BundleId": "bun-2a4e041c"
  }
}
```

• For API details, see CancelBundleTask in AWS CLI Command Reference.

cancel-capacity-reservation-fleets

The following code example shows how to use cancel-capacity-reservation-fleets.

AWS CLI

To cancel a Capacity Reservation Fleet
The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to cancelled, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```
aws ec2 cancel-capacity-reservation-fleets \\
   --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
   "SuccessfulFleetCancellations": [
      {
         "CurrentFleetState": "cancelling",
         "PreviousFleetState": "active",
         "CapacityReservationFleetId": "crf-abcdef01234567890"
      }
   ],
   "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/capacity_reservation_fleets.html) in the *Amazon EC2 User Guide*.

- For API details, see [CancelCapacityReservationFleets](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-capacity-reservation-fleets.html) in *AWS CLI Command Reference*.

---

**cancel-capacity-reservation**

The following code example shows how to use `cancel-capacity-reservation`.

**AWS CLI**

**To cancel a capacity reservation**

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```
aws ec2 cancel-capacity-reservation \\
   --capacity-reservation-id cr-1234abcd56EXAMPLE
```
Output:

```json
{
   "Return": true
}
```

For more information, see [Canceling a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/canceling-a-capacity-reservation.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelCapacityReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-capacity-reservation.html) in *AWS CLI Command Reference*.

### cancel-conversion-task

The following code example shows how to use `cancel-conversion-task`.

**AWS CLI**

**To cancel an active conversion of an instance or a volume**

This example cancels the upload associated with the task ID `import-i-fh95npoc`. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see [CancelConversionTask](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-conversion-task.html) in *AWS CLI Command Reference*.

### cancel-export-task

The following code example shows how to use `cancel-export-task`.

**AWS CLI**

**To cancel an active export task**

This example cancels an active export task with the task ID `export-i-fgelt0i7`. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```
cancel-image-launch-permission

The following code example shows how to use cancel-image-launch-permission.

AWS CLI

To cancel having an AMI shared with your Amazon Web Services account

The following cancel-image-launch-permission example removes your account from the specified AMI's launch permissions.

```bash
aws ec2 cancel-image-launch-permission \
  --image-id ami-0123456789example \
  --region us-east-1
```

Output:

```json
{
  "Return": true
}
```

For more information, see Cancel having an AMI shared with your Amazon Web Services account in the Amazon EC2 User Guide.

- For API details, see CancelImageLaunchPermission in AWS CLI Command Reference.

cancel-import-task

The following code example shows how to use cancel-import-task.

AWS CLI

To cancel an import task

The following cancel-import-task example cancels the specified import image task.

```bash
aws ec2 cancel-import-task \
  --import-task-id import-ami-1234567890abcdef0
```
Output:

```json
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "PreviousState": "active",
    "State": "deleting"
}
```

- For API details, see [CancelImportTask](#) in *AWS CLI Command Reference*.

**cancel-reserved-instances-listing**

The following code example shows how to use `cancel-reserved-instances-listing`.

**AWS CLI**

**To cancel a Reserved Instance listing**

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```bash
aws ec2 cancel-reserved-instances-listing \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see [CancelReservedInstancesListing](#) in *AWS CLI Command Reference*.

**cancel-spot-fleet-requests**

The following code example shows how to use `cancel-spot-fleet-requests`.

**AWS CLI**

**Example 1: To cancel a Spot fleet request and terminate the associated instances**

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```
Output:

```json
{
  "SuccessfulFleetRequests": [
    {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
      "CurrentSpotFleetRequestState": "cancelled_terminating",
      "PreviousSpotFleetRequestState": "active"
    }
  ],
  "UnsuccessfulFleetRequests": []
}
```

For more information, see [Cancel a Spot Fleet request](https://docs.aws.amazon.com/Amazon Elastic Compute Cloud User Guide for Linux Instances) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To cancel a Spot fleet request without terminating the associated instances**

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
  --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
  --no-terminate-instances
```

Output:

```json
{
  "SuccessfulFleetRequests": [
    {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
      "CurrentSpotFleetRequestState": "cancelled_running",
      "PreviousSpotFleetRequestState": "active"
    }
  ],
  "UnsuccessfulFleetRequests": []
}
```

For more information, see [Cancel a Spot Fleet request](https://docs.aws.amazon.com/Amazon Elastic Compute Cloud User Guide for Linux Instances) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelSpotFleetRequests](https://docs.aws.amazon.com/AWSCommandReference/latest/AWS_CLI Command Reference) in *AWS CLI Command Reference*.  

Actions and scenarios  

2025
cancel-spot-instance-requests

The following code example shows how to use cancel-spot-instance-requests.

AWS CLI

To cancel Spot Instance requests

This example command cancels a Spot Instance request.

Command:

```bash
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```

Output:

```json
{
   "CancelledSpotInstanceRequests": [
      {
         "State": "cancelled",
         "SpotInstanceRequestId": "sir-08b93456"
      }
   ]
}
```

• For API details, see CancelSpotInstanceRequests in AWS CLI Command Reference.

confirm-product-instance

The following code example shows how to use confirm-product-instance.

AWS CLI

To confirm the product instance

This example determines whether the specified product code is associated with the specified instance.

Command:

```bash
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-id i-1234567890abcdef0
```
AWS Command Line Interface

Output:

```
{
    "OwnerId": "123456789012"
}
```

- For API details, see [ConfirmProductInstance](#) in AWS CLI Command Reference.

**copy-fpga-image**

The following code example shows how to use `copy-fpga-image`.

**AWS CLI**

**To copy an Amazon FPGA image**

This example copies the specified AFI from the `us-east-1` region to the current region (`eu-west-1`).

Command:

```
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc --source-region us-east-1 --region eu-west-1
```

Output:

```
{
    "FpgaImageId": "afi-06b12350a123fbabc"
}
```

- For API details, see [CopyFpgaImage](#) in AWS CLI Command Reference.

**copy-image**

The following code example shows how to use `copy-image`.

**AWS CLI**

**Example 1: To copy an AMI to another Region**
The following `copy-image` example command copies the specified AMI from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```bash
aws ec2 copy-image \
  --region us-east-1 \
  --name ami-name \
  --source-region us-west-2 \
  --source-image-id ami-066877671789bd71b \
  --description "This is my copied image."
```

Output:

```json
{
  "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-ami.html) in the Amazon EC2 User Guide.

**Example 2: To copy an AMI to another Region and encrypt the backing snapshot**

The following `copy-image` command copies the specified AMI from the `us-west-2` Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```bash
aws ec2 copy-image \
  --source-region us-west-2 \
  --name ami-name \
  --source-image-id ami-066877671789bd71b \
  --encrypted \
  --kms-key-id alias/my-kms-key
```

Output:

```json
{
  "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-ami.html) in the Amazon EC2 User Guide.

**Example 3: To include your user-defined AMI tags when copying an AMI**

The following `copy-image` command uses the `--copy-image-tags` parameter to copy your user-defined AMI tags when copying the AMI.
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-066877671789bd71b \
    --description "This is my copied image." \
    --copy-image-tags

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/CopyAMI.html) in the Amazon EC2 User Guide.

- For API details, see [CopyImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/copy-image.html) in AWS CLI Command Reference.

**copy-snapshot**

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**Example 1: To copy a snapshot to another Region**

The following `copy-snapshot` example command copies the specified snapshot from the us-west-2 Region to the us-east-1 Region and adds a short description.

```
aws ec2 copy-snapshot \
    --region us-east-1 \
    --source-region us-west-2 \
    --source-snapshot-id snap-066877671789bd71b \
    --description "This is my copied snapshot."
```

Output:

```
{
    "SnapshotId": "snap-066877671789bd71b"
}
```
For more information, see [Copy an Amazon EBS snapshot](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

**Example 2: To copy an unencrypted snapshot and encrypt the new snapshot**

The following `copy-snapshot` command copies the specified unencrypted snapshot from the us-west-2 Region to the current Region and encrypts the new snapshot using the specified KMS key.

```bash
aws ec2 copy-snapshot \
   --source-region us-west-2 \
   --source-snapshot-id snap-066877671789bd71b \
   --encrypted \
   --kms-key-id alias/my-kms-key
```

Output:

```json
{
   "SnapshotId": "snap-066877671789bd71b"
}
```

For more information, see [Copy an Amazon EBS snapshot](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

- For API details, see [CopySnapshot](https://docs.aws.amazon.com/cli/latest/reference/ec2/copy-snapshot.html) in *AWS CLI Command Reference*.

### create-capacity-reservation-fleet

The following code example shows how to use `create-capacity-reservation-fleet`.

#### AWS CLI

**To create a Capacity Reservation Fleet**

The following `create-capacity-reservation-fleet` example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```bash
aws ec2 create-capacity-reservation-fleet \
   --total-target-capacity 24 \
   --allocation-strategy prioritized
```
Contents of `instanceTypeSpecification.json`:

```json
[
  {
    "InstanceType": "m5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "Weight": 3.0,
    "AvailabilityZone": "us-east-1a",
    "EbsOptimized": true,
    "Priority": 1
  }
]
```

Output:

```json
{
  "Status": "submitted",
  "TotalFulfilledCapacity": 0.0,
  "CapacityReservationFleetId": "crf-abcdef01234567890",
  "TotalTargetCapacity": 24
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacity-reservation-fleet.html) in the *Amazon EC2 User Guide*.

For more information about instance type weight and total target capacity, see [Instance type weight](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacity-reservation-fleet.html) and [Total target capacity](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacity-reservation-fleet.html) in the *Amazon EC2 User Guide*.

- For API details, see [CreateCapacityReservationFleet](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-capacity-reservation-fleet.html) in *AWS CLI Command Reference*.

### `create-capacity-reservation`

The following code example shows how to use `create-capacity-reservation`.

```bash
--instance-match-criteria open \
--tenancy default \
--end-date 2022-12-31T23:59:59.000Z \
--instance-type-specifications file://instanceTypeSpecification.json
```
Example 1: To create a Capacity Reservation

The following create-capacity-reservation example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three t2.medium instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```bash
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type t2.medium \
    --instance-platform Linux/UNIX \
    --instance-count 3
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T09:27:35.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "t2.medium"
    }
}
```

Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following create-capacity-reservation example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three m5.large instances running a
Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```bash
aws ec2 create-capacity-reservation \
   --availability-zone eu-west-1a \
   --instance-type m5.large \
   --instance-platform Linux/UNIX \
   --instance-count 3 \
   --end-date-type limited \
   --end-date 2019-08-31T23:59:59Z
```

Output:

```json
{
   "CapacityReservation": {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
      "EndDateType": "limited",
      "AvailabilityZone": "eu-west-1a",
      "EndDate": "2019-08-31T23:59:59.000Z",
      "InstanceMatchCriteria": "open",
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T10:15:53.000Z",
      "AvailableInstanceCount": 3,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 3,
      "State": "active",
      "Tenancy": "default",
      "EbsOptimized": false,
      "InstanceType": "m5.large"
   }
}
```

**Example 3: To create a Capacity Reservation that accepts only targeted instance launches**

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```bash
aws ec2 create-capacity-reservation \
   --availability-zone eu-west-1a \
   --instance-type m5.large \
   --instance-platform Linux/UNIX \
   --instance-count 3
```
--instance-match-criteria targeted

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

For more information, see Creating a Capacity Reservation in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateCapacityReservation in AWS CLI Command Reference.

create-carrier-gateway

The following code example shows how to use create-carrier-gateway.

**AWS CLI**

To create a carrier gateway

The following create-carrier-gateway example creates a carrier gateway for the specified VPC.

```
aws ec2 create-carrier-gateway \
--vpc-id vpc-0c529aEXAMPLE1111
```

Output:
For more information, see Carrier gateways in the AWS Wavelength User Guide.

- For API details, see CreateCarrierGateway in AWS CLI Command Reference.

create-client-vpn-endpoint

The following code example shows how to use create-client-vpn-endpoint.

AWS CLI

To create a Client VPN endpoint

The following create-client-vpn-endpoint example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```
aws ec2 create-client-vpn-endpoint
  --client-cidr-block "172.31.0.0/16" 
  --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE 
  --authentication-options Type=certificate-authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} 
  --connection-log-options Enabled=false
```

Output:

```
{
  "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
  "Status": {
    "Code": "pending-associate"
  },
  "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com"
}
```
create-client-vpn-route

The following code example shows how to use create-client-vpn-route.

AWS CLI

To create a route for a Client VPN endpoint

The following create-client-vpn-route example adds a route to the internet (0.0.0.0/0) for the specified subnet of the Client VPN endpoint.

```
aws ec2 create-client-vpn-route \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --destination-cidr-block 0.0.0.0/0 \
   --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
   "Status": {
      "Code": "creating"
   }
}
```

For more information, see Routes in the AWS Client VPN Administrator Guide.

- For API details, see CreateClientVpnRoute in AWS CLI Command Reference.

create-coip-cidr

The following code example shows how to use create-coip-cidr.

AWS CLI

To create a range of customer-owned IP (CoIP) addresses
The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 create-coip-cidr \
    --cidr 15.0.0.0/24 \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipCidr": {
        "Cidr": "15.0.0.0/24",
        "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
    }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see CreateCoipCidr in AWS CLI Command Reference.

### create-coip-pool

The following code example shows how to use `create-coip-pool`.

**AWS CLI**

**To create a pool of customer-owned IP (CoIP) addresses**

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \
    --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
    }
}
```
"LocalGatewayRouteTableId": "lgw-rtb-abcd1234567890",  
]
}

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see CreateCoipPool in AWS CLI Command Reference.

**create-customer-gateway**

The following code example shows how to use create-customer-gateway.

**AWS CLI**

**To create a customer gateway**

This example creates a customer gateway with the specified IP address for its outside interface.

Command:

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

Output:

```
{
   "CustomerGateway": {
      "CustomerGatewayId": "cgw-0e11f167",
      "IpAddress": "12.1.2.3",
      "State": "available",
      "Type": "ipsec.1",
      "BgpAsn": "65534"
   }
}
```

- For API details, see CreateCustomerGateway in AWS CLI Command Reference.

**create-default-subnet**

The following code example shows how to use create-default-subnet.
AWS CLI

To create a default subnet

This example creates a default subnet in Availability Zone us-east-2a.

Command:

```bash
aws ec2 create-default-subnet --availability-zone us-east-2a
```

```json
{
    "Subnet": {
        "AvailabilityZone": "us-east-2a",
        "Tags": [],
        "AvailableIpAddressCount": 4091,
        "DefaultForAz": true,
        "Ip6CidrBlockAssociationSet": [],
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "MapPublicIpOnLaunch": true,
        "SubnetId": "subnet-1122aabb",
        "CidrBlock": "172.31.32.0/20",
        "AssignIpv6AddressOnCreation": false
    }
}
```

- For API details, see [CreateDefaultSubnet](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-default-subnet.html) in AWS CLI Command Reference.

create-default-vpc

The following code example shows how to use create-default-vpc.

AWS CLI

To create a default VPC

This example creates a default VPC.

Command:

```bash
aws ec2 create-default-vpc
```
For API details, see [CreateDefaultVpc](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-dhcp-options.html) in *AWS CLI Command Reference*.

### create-dhcp-options

The following code example shows how to use `create-dhcp-options`.

**AWS CLI**

To create a set of DHCP options

The following `create-dhcp-options` example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```
aws ec2 create-dhcp-options \
   --dhcp-configuration \
   "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \
   "Key=domain-name,Values=example.com" \
   "Key=netbios-node-type,Values=2"
```

Output:

```
{
   "DhcpOptions": {
      "DhcpConfigurations": [
         {
            "Key": "domain-name",
```
"Values": [
  {
    "Value": "example.com"
  }
],

"Key": "domain-name-servers",
"Values": [
  {
    "Value": "10.2.5.1"
  },
  {
    "Value": "10.2.5.2"
  }
],

"Key": "netbios-node-type",
"Values": [
  {
    "Value": "2"
  }
],

"DhcpOptionsId": "dopt-06d52773eff4c55f3"
}

• For API details, see CreateDhcpOptions in AWS CLI Command Reference.

create-egress-only-internet-gateway

The following code example shows how to use create-egress-only-internet-gateway.

AWS CLI

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.

Command:
```
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468
```

Output:

```
{
  "EgressOnlyInternetGateway": {
    "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
    "Attachments": [
      {
        "State": "attached",
        "VpcId": "vpc-0c62a468"
      }
    ]
  }
}
```

- For API details, see [CreateEgressOnlyInternetGateway](#) in [AWS CLI Command Reference](#).

create-fleet

The following code example shows how to use `create-fleet`.

**AWS CLI**

**Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of `file_name.json`:
Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is on-demand, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
   --cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
    "LaunchTemplateConfigs": [
      {
        "LaunchTemplateSpecification": {
          "LaunchTemplateId": "lt-0e8c754449b27161c",
          "Version": "1"
        }
      },
      {
        "TargetCapacitySpecification": {
          "TotalTargetCapacity": 2,
          "DefaultTargetCapacityType": "spot"
        }
      }
    ]
}
```
Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following create-fleet example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```bash
aws ec2 create-fleet \--cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateId": "lt-0e8c754449b27161c",
            "Version": "1"
        }
    },
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "on-demand"
    }
}
```

Output:

```json
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```
"LaunchTemplateId": "lt-0e8c75449b27161c",
"Version": "1"
}
}

"TargetCapacitySpecification": {
  "TotalTargetCapacity": 2,
  "OnDemandTargetCapacity": 1,
  "DefaultTargetCapacityType": "spot"
}
}

Output:

{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is lowest-price, is used. The following `create-fleet` example creates an EC2 Fleet using the lowest-price allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```bash
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
  "LaunchTemplateConfigs": [
  {
    "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e8c75449b27161c",
      "Version": "1"
    }
  }
  ]
}
```

```json
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```
"Overrides": [
  {
    "InstanceType": "c4.large",
    "WeightedCapacity": 1,
    "SubnetId": "subnet-a4f6c5d3"
  },
  {
    "InstanceType": "c3.large",
    "WeightedCapacity": 1,
    "SubnetId": "subnet-a4f6c5d3"
  },
  {
    "InstanceType": "c5.large",
    "WeightedCapacity": 1,
    "SubnetId": "subnet-a4f6c5d3"
  }
],
"TargetCapacitySpecification": {
  "TotalTargetCapacity": 2,
  "DefaultTargetCapacityType": "spot"
}
]

Output:

{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}

- For API details, see CreateFleet in AWS CLI Command Reference.

create-flow-logs

The following code example shows how to use create-flow-logs.

AWS CLI

Example 1: To create a flow log
The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```
aws ec2 create-flow-logs \
  --resource-type NetworkInterface \
  --resource-ids eni-11223344556677889 \
  --traffic-type REJECT \
  --log-group-name my-flow-logs \
  --deliver-logs-permission-arn arn:aws:iam::123456789101:role/publishFlowLogs
```

Output:

```
{
  "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
  "FlowLogIds": [
    "fl-12345678901234567"
  ],
  "Unsuccessful": []
}
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-flow-logs.html) in the *Amazon VPC User Guide*.

**Example 2: To create a flow log with a custom format**

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```
aws ec2 create-flow-logs \
  --resource-type VPC \
  --resource-ids vpc-00112233344556677 \
  --traffic-type ALL \
  --log-destination-type s3 \
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
  --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr} ${pkt-dstaddr}'
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-flow-logs.html) in the *Amazon VPC User Guide*. 

---

**Actions and scenarios**
Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```
aws ec2 create-flow-logs \
   --resource-type VPC \
   --resource-ids vpc-00112233344556677 \
   --traffic-type ALL \
   --log-destination-type s3 \
   --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
   --max-aggregation-interval 60
```

For more information, see VPC Flow Logs in the Amazon VPC User Guide.

- For API details, see CreateFlowLogs in AWS CLI Command Reference.

create-fpga-image

The following code example shows how to use `create-fpga-image`.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

```
aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```json
{
   "FpgaImageId": "afi-0d123e123bfc85abc",
   "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}
```
• For API details, see CreateFpgaImage in AWS CLI Command Reference.

create-image

The following code example shows how to use create-image.

**AWS CLI**

**Example 1: To create an AMI from an Amazon EBS-backed instance**

The following create-image example creates an AMI from the specified instance.

```bash
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --description "An AMI for my server"
```

Output:

```json
{
   "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the Amazon EC2 User Guide.

**Example 2: To create an AMI from an Amazon EBS-backed instance without reboot**

The following create-image example creates an AMI and sets the --no-reboot parameter, so that the instance is not rebooted before the image is created.

```bash
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --no-reboot
```

Output:

```json
{
   "ImageId": "ami-abcdef01234567890"
}
```
For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/sib-devmappings.html) in the *Amazon EC2 User Guide*.

**Example 3: To tag an AMI and snapshots on creation**

The following create-image example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --tag-specifications "ResourceType=image,Tags=[{Key=cost-center,Value=cc123}]" "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

Output:

```json
{
  "ImageId": "ami-abcdef01234567890"
}
```

For more information about tagging your resources on creation, see [Add tags on resource creation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-tags.html) in the *Amazon EC2 User Guide*.

- For API details, see [CreateImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-image.html) in *AWS CLI Command Reference*.

### create-instance-connect-endpoint

The following code example shows how to use `create-instance-connect-endpoint`.

**AWS CLI**

**To create an EC2 Instance Connect Endpoint**

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```bash
aws ec2 create-instance-connect-endpoint \
  --region us-east-1 \
  --subnet-id subnet-0123456789example
```

Output:
For more information, see [Create an EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/create-instance-connect-endpoint.html) in the Amazon EC2 User Guide.

- For API details, see [CreateInstanceConnectEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-instance-connect-endpoint.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/index.html).

**create-instance-event-window**

The following code example shows how to use `create-instance-event-window`.

**AWS CLI**

**Example 1: To create an event window with a time range**

The following `create-instance-event-window` example creates an event window with a time range. You can't also specify the `cron-expression` parameter.

```bash
aws ec2 create-instance-event-window
```
For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To create an event window with a cron expression**

The following `create-instance-event-window` example creates an event window with a cron expression. You can't also specify the `time-range` parameter.

```bash
aws ec2 create-instance-event-window \
   --region us-east-1 \
   --cron-expression "* 21-23 * * 2,3" \
   --tag-specifications "ResourceType=instance-event-window,Tags=[[Key=K1,Value=V1]]"
```
Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "State": "creating",
      "Tags": [
          {
              "Key": "K1",
              "Value": "V1"
          }
      ]
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [CreateInstanceEventWindow](#) in *AWS CLI Command Reference*.

### create-instance-export-task

The following code example shows how to use `create-instance-export-task`.

**AWS CLI**

**To export an instance**

This example command creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

**Command:**

```
aws ec2 create-instance-export-task --description "RHEL5 instance" --instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

**Output:**
For API details, see [CreateInstanceExportTask](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/create-instance-export-task.html) in [AWS CLI Command Reference](https).

**create-internet-gateway**

The following code example shows how to use create-internet-gateway.

**AWS CLI**

To create an internet gateway

The following `create-internet-gateway` example creates an internet gateway with the tag `Name=my-igw`.

```
aws ec2 create-internet-gateway \
    --tag-specifications ResourceType=internet-gateway,Tags=[{Key=Name,Value=my-igw}]
```

Output:

```
{
    "InternetGateway": {
        "Attachments": [],
        "InternetGatewayId": "igw-0d0fb496b3994d755",
    }
}
```
For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see CreateInternetGateway in AWS CLI Command Reference.

create-ipam-pool

The following code example shows how to use create-ipam-pool.

AWS CLI

To create an IPAM pool

The following create-ipam-pool example creates an IPAM pool.

(Linux):

```bash
aws ec2 create-ipam-pool \
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --address-family ipv4 \
  --auto-import \
  --allocation-min-netmask-length 16 \
  --allocation-max-netmask-length 26 \
  --allocation-default-netmask-length 24 \
  --allocation-resource-tags "Key=Environment,Value=Preprod" \
  --tag-specifications 'ResourceType=ipam-pool,Tags=[[Key=Name,Value="Preprod pool"]]
```

(Windows):

```bash
aws ec2 create-ipam-pool ^
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --address-family ipv4 ^
```
--auto-import
--allocation-min-netmask-length 16
--allocation-max-netmask-length 26
--allocation-default-netmask-length 24
--allocation-resource-tags "Key=Environment,Value=Preprod"
--tag-specifications ResourceType=ipam-pool,Tags=[[Key=Name,Value="Preprod pool"]]

Output:

```json
{
   "IpamPool": {
      "OwnerId": "123456789012",
      "IpamPoolId": "ipam-pool-0533048da7d823723",
      "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-0533048da7d823723",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
      "IpamScopeType": "private",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",

         }
      ]
   }
}
```
For more information, see Plan for IP address provisioning in the Amazon VPC IPAM User Guide.

- For API details, see CreateIpamPool in AWS CLI Command Reference.

create-ipam-resource-discovery

The following code example shows how to use create-ipam-resource-discovery.

AWS CLI

To create a resource discovery

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin in the other organization can manage and monitor the IP addresses of resources in your organization.

Important

This example includes both the --region and --operating-regions options because, while they are optional, they must be configured in a particular way to successfully integrate a resource discovery with an IPAM. *--operating-regions must match the Regions where you have resources that you want IPAM to discover. If there are Regions where you do not want IPAM to manage the IP addresses (for example for compliance reasons), do not include them. *--region must match the home Region of the IPAM you want to associate it with. You must create the resource discovery in the same Region that the IPAM was created in. For example, if the IPAM you are associating with was created in us-east-1, include --region us-east-1 in the request. Both the --region and --operating-regions options default to the Region you're running the command in if you don't specify them.

In this example, the operating Regions of the IPAM we're integrating with include us-west-1, us-west-2, and ap-south-1. When we create the resource discovery, we want IPAM to discover the resource IP addresses in us-west-1 and us-west-2 but not ap-south-1. So we are including only --operating-regions RegionName='us-west-1' RegionName='us-west-2' in the request.

The following create-ipam-resource-discovery example creates an IPAM resource discovery.

```
aws ec2 create-ipam-resource-discovery \
  --description 'Example-resource-discovery' \
```

Actions and scenarios
Once you create a resource discovery, you may want to share it with another IPAM delegated admin, which you can do with `create-resource-share`. For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/vpc-ipam/userguide/ipam-integrate-accounts-outside-organization.html) in the Amazon VPC IPAM User Guide.

### create-ipam-scope

The following code example shows how to use `create-ipam-scope`.

**AWS CLI**

To create an IPAM scope

```
--tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-center,Value=cc123}]'
--operating-regions RegionName='us-west-1' RegionName='us-west-2'
--region us-east-1
```

Output:

```
{
   "IpamResourceDiscovery":{
       "OwnerId": "149977607591",
       "IpamResourceDiscoveryId": "ipam-res-disco-0257046d8aa78b8bc",
       "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-discovery/ipam-res-disco-0257046d8aa78b8bc",
       "IpamResourceDiscoveryRegion": "us-east-1",
       "Description": "Example-resource-discovery",
       "OperatingRegions":[
           {"RegionName": "us-west-1"},
           {"RegionName": "us-west-2"},
           {"RegionName": "us-east-1"}
       ],
       "IsDefault": false,
       "State": "create-in-progress",
       "Tags": [
           {
               "Key": "cost-center",
               "Value": "cc123"
           }
       ]
   }
}
```
The following `create-ipam-scope` example creates an IPAM scope.

(Linux):

```bash
aws ec2 create-ipam-scope \
  --ipam-id ipam-08440e7a3acde3908 \
  --description "Example description" \
  --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]
```

(Windows):

```bash
aws ec2 create-ipam-scope ^
  --ipam-id ipam-08440e7a3acde3908 ^
  --description "Example description" ^
  --tag-specifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]
```

Output:

```json
{
   "IpamScope": {
      "OwnerId": "123456789012",
      "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "IpamScopeType": "private",
      "IsDefault": false,
      "Description": "Example description",
      "PoolCount": 0,
      "State": "create-in-progress",
      "Tags": [
        {
          "Key": "Name",
          "Value": "Example name value"
        }]
   }
}
```
For more information, see Create additional scopes in the Amazon VPC IPAM User Guide.

- For API details, see CreateIpamScope in AWS CLI Command Reference.

create-ipam

The following code example shows how to use create-ipam.

AWS CLI

To create an IPAM

The following create-ipam example creates an IPAM.

(Linux):

```bash
aws ec2 create-ipam \
   --description "Example description" \
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" \
   --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```bash
aws ec2 create-ipam ^
   --description "Example description" ^
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
   --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

Output:

```json
{
   "Ipam": {
      "OwnerId": "123456789012",
      "IpamId": "ipam-036486dfa6af58ee0",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
      "IpamRegion": "us-east-1",
      "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
      "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
      "ScopeCount": 2,
      "OperatingRegions": [
         {
            "RegionName": "us-east-2"
         },
```
For more information, see Create an IPAM in the Amazon VPC IPAM User Guide.

- For API details, see CreateIpam in AWS CLI Command Reference.

**create-key-pair**

The following code example shows how to use create-key-pair.

**AWS CLI**

**To create a key pair**

This example creates a key pair named MyKeyPair.

Command:

```
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see Using Key Pairs in the AWS Command Line Interface User Guide.

- For API details, see CreateKeyPair in AWS CLI Command Reference.
create-launch-template-version

The following code example shows how to use create-launch-template-version.

AWS CLI

To create a launch template version

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

Command:

```sh
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123
--version-description WebVersion2 --source-version 1 --launch-template-data
'{"ImageId":"ami-c998b6b2"}'
```

Output:

```json
{
   "LaunchTemplateVersion": {
      "VersionDescription": "WebVersion2",
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "VersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "LaunchTemplateData": {
         "ImageId": "ami-c998b6b2",
         "InstanceType": "t2.micro",
         "NetworkInterfaces": [
            {
               "Ipv6Addresses": [
                  {
                     "Ipv6Address": "2001:db8:1234:1a00::123"
                  }
               ],
               "DeviceIndex": 0,
               "SubnetId": "subnet-7b16de0c",
               "AssociatePublicIpAddress": true
            }
         ],
         "DefaultVersion": false,
         "CreateTime": "2017-12-01T13:35:46.000Z"
   }
}
```
create-launch-template

The following code example shows how to use `create-launch-template`.

**AWS CLI**

**Example 1: To create a launch template**

The following `create-launch-template` example creates a launch template that specifies the subnet in which to launch the instance, assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForWebServer \
    --version-description WebVersion1 \
    --launch-template-data '{"NetworkInterfaces": \
                             ["AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b1e0c9e"], \
                             "ImageId":"ami-8c1be5f6","InstanceType":"t2.small","TagSpecifications": \
                             ["ResourceType":"instance","Tags":["Key":"purpose","Value":"webserver"]]}'
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-01238c059e3466abc",
        "LaunchTemplateName": "TemplateForWebServer",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2019-01-27T09:13:24.000Z"
    }
}
```

For more information, see Launching an Instance from a Launch Template in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 2: To create a launch template for Amazon EC2 Auto Scaling**
The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```bash
aws ec2 create-launch-template \
   --launch-template-name TemplateForAutoScaling \
   --version-description AutoScalingVersion1 \
   --launch-template-data '{"NetworkInterfaces":
   ["DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups":
   ["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-b42209de","InstanceType":"m4.large","TagSpecifications":
   ["ResourceType":"instance","Tags":
   ["Key":"environment","Value":"production"],
   ["Key":"purpose","Value":"webserver"],
   ["ResourceType":"volume","Tags":
   ["Key":"environment","Value":"production"],
   ["Key":"cost-center","Value":"cc123"]],"BlockDeviceMappings":
   ["DeviceName":"/dev/sda1","Ebs":
   ["VolumeSize":100]]}' --region us-east-1
```

Output:

```json
{
   "LaunchTemplate": {
      "LatestVersionNumber": 1,
      "LaunchTemplateId": "lt-0123c79c33a54e0abc",
      "LaunchTemplateName": "TemplateForAutoScaling",
      "DefaultVersionNumber": 1,
      "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
      "CreateTime": "2019-04-30T18:16:06.000Z"
   }
}
```

For more information, see Creating a Launch Template for an Auto Scaling Group in the Amazon EC2 Auto Scaling User Guide. For information about quoting JSON-formatted parameters, see Quoting Strings in the AWS Command Line Interface User Guide.

**Example 3: To create a launch template that specifies encryption of EBS volumes**

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the "Encrypted" option as
shown in the following example. If you use the "KmsKeyId" option to specify a customer managed CMK, you also must specify the "Encrypted" option even if encryption by default is enabled.

```
aws ec2 create-launch-template
  --launch-template-name TemplateForEncryption
  --launch-template-data file://config.json
```

Contents of `config.json`:

```json
{
  "BlockDeviceMappings": [
    {
      "DeviceName": "/dev/sda1",
      "Ebs": {
        "VolumeType": "gp2",
        "DeleteOnTermination": true,
        "SnapshotId": "snap-066877671789bd71b",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
      }
    }
  ],
  "ImageId": "ami-00068cd7555f543d5",
  "InstanceType": "c5.large",
  "TagSpecifications": [
    {
      "ResourceType": "volume",
      "Tags": [
        {
          "Key": "encrypted",
          "Value": "yes"
        }
      ]
    }
  ]
}
```

Output:

```json
{
}
```
For more information, see Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [CreateLaunchTemplate](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-launch-template.html) in *AWS CLI Command Reference*.

### create-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

**AWS CLI**

**To associate a local gateway route table with a virtual interfaces (VIFs) group**

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.

```bash
aws ec2 create-local-gateway-route-table-virtual-interface-group-association  
  --local-gateway-route-table-id lgw-rtb-exampleidabcd1234  
  --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd
```

**Output:**

```json
{
  "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-associ-exempleid12345678",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
    "LocalGatewayId": "lgw-exampleid0123abcd",
    "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
  }
}
```
"OwnerId": "111122223333",
"State": "pending",
"Tags": []
}
}

For more information, see VIF group associations in the AWS Outposts User Guide.

• For API details, see CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation in AWS CLI Command Reference.

create-local-gateway-route-table-vpc-association

The following code example shows how to use create-local-gateway-route-table-vpc-association.

AWS CLI

To associate a VPC with a route table

The following create-local-gateway-route-table-vpc-association example associates the specified VPC with the specified local gateway route table.

```
aws ec2 create-local-gateway-route-table-vpc-association \
   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
   --vpc-id vpc-07ef66ac71EXAMPLE
```

Output:

```
{
   "LocalGatewayRouteTableVpcAssociation": {
      "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
      "VpcId": "vpc-07ef66ac71EXAMPLE",
      "State": "associated"
   }
}
```
create-local-gateway-route-table

The following code example shows how to use create-local-gateway-route-table.

AWS CLI

To create a local gateway route table

The following create-local-gateway-route-table example creates a local gateway route table with the direct VPC routing mode.

```bash
aws ec2 create-local-gateway-route-table \
   --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
   --mode direct-vpc-routing
```

Output:

```json
{
   "LocalGatewayRouteTable": {
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
      "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
      "OwnerId": "111122223333",
      "State": "pending",
      "Tags": [],
      "Mode": "direct-vpc-routing"
   }
}
```

For more information, see Local gateway route tables in the AWS Outposts User Guide.

create-local-gateway-route

The following code example shows how to use create-local-gateway-route.

• For API details, see CreateLocalGatewayRouteTable in AWS CLI Command Reference.
AWS CLI

To create a static route for a local gateway route table

The following create-local-gateway-route example creates the specified route in the specified local gateway route table.

```
aws ec2 create-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
    }
}
```

- For API details, see [CreateLocalGatewayRoute](#) in *AWS CLI Command Reference*.

create-managed-prefix-list

The following code example shows how to use create-managed-prefix-list.

AWS CLI

To create a prefix list

The following create-managed-prefix-list example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```
aws ec2 create-managed-prefix-list \
    --address-family IPv4 \
    --max-entries 10 \
    --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b \
    --prefix-list-name vpc-cidrs
```
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see CreateManagedPrefixList in AWS CLI Command Reference.

**create-nat-gateway**

The following code example shows how to use create-nat-gateway.

**AWS CLI**

**Example 1: To create a public NAT gateway**

The following create-nat-gateway example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
  --subnet-id subnet-0250c25a1fEXAMPLE \
  --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```json
{
  "NatGateway": {
    "CreateTime": "2021-12-01T22:22:38.000Z",
    "OwnerId": "123456789012",
    "NatGatewayId": "ng-0123456abcabcabc1"
  }
}
```
"NatGatewayAddresses": [
   {
      "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
   }
],
"NatGatewayId": "nat-0c61bf8a12EXAMPLE",
"State": "pending",
"SubnetId": "subnet-0250c25a1fEXAMPLE",
"VpcId": "vpc-0a60eb65b4EXAMPLE",
"ConnectivityType": "public"
}
}

For more information, see [NAT gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/) in the *Amazon VPC User Guide*.  

**Example 2: To create a private NAT gateway**

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```
aws ec2 create-nat-gateway \
   --subnet-id subnet-0250c25a1fEXAMPLE \
   --connectivity-type private
```

**Output:**

```json
{
   "NatGateway": {
      "CreateTime": "2021-12-01T22:26:00.000Z",
      "NatGatewayAddresses": [
         {}
      ],
      "NatGatewayId": "nat-011b568379EXAMPLE",
      "State": "pending",
      "SubnetId": "subnet-0250c25a1fEXAMPLE",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "ConnectivityType": "private"
   }
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/) in the *Amazon VPC User Guide*.  

- For API details, see [CreateNatGateway](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/) in *AWS CLI Command Reference*.  

---

**Actions and scenarios**

2071
create-network-acl-entry

The following code example shows how to use create-network-acl-entry.

AWS CLI

To create a network ACL entry

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

Command:

```bash
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```

• For API details, see CreateNetworkAclEntry in AWS CLI Command Reference.

create-network-acl

The following code example shows how to use create-network-acl.

AWS CLI

To create a network ACL

This example creates a network ACL for the specified VPC.

Command:
aws ec2 create-network-acl --vpc-id vpc-a01106c2

Output:

```json
{
   "NetworkAcl": {
      "Associations": [],
      "NetworkAclId": "acl-5fb85d36",
      "VpcId": "vpc-a01106c2",
      "Tags": [],
      "Entries": [
      {
         "CidrBlock": "0.0.0.0/0",
         "RuleNumber": 32767,
         "Protocol": "-1",
         "Egress": true,
         "RuleAction": "deny"
      },
      {
         "CidrBlock": "0.0.0.0/0",
         "RuleNumber": 32767,
         "Protocol": "-1",
         "Egress": false,
         "RuleAction": "deny"
      }
      ],
      "IsDefault": false
   }
}
```

• For API details, see CreateNetworkAcl in AWS CLI Command Reference.

create-network-insights-access-scope

The following code example shows how to use create-network-insights-access-scope.

AWS CLI

To create a Network Access Scope

The following create-network-insights-access-scope example creates a Network Access Scope.
aws ec2 create-network-insights-access-scope \
--cli-input-json file://access-scope-file.json

Contents of access-scope-file.json:

```json
{
    "MatchPaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "Resources": [
                        "vpc-abcd12e3"
                    ]
                }
            }
        }
    ],
    "ExcludePaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "ResourceTypes": [
                        "AWS::EC2::InternetGateway"
                    ]
                }
            }
        }
    ]
}
```

Output:

```json
{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
```

Actions and scenarios

2074
The following code example shows how to use `create-network-insights-path`.

**AWS CLI**

**To create a path**

The following `create-network-insights-path` example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the `start-network-insights-analysis` command.

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/network-access-analyzer/latest/userguide/guidecli.html) in the Network Access Analyzer Guide.

aws ec2 create-network-insights-path \
  --source igw-0797ccccdc9e73b0e5 \
  --destination i-0495d38ad28331c7 \
  --destination-port 22 \
  --protocol TCP

Output:

```json
{
  "NetworkInsightsPaths": {
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
    "CreatedDate": "2021-01-20T22:43:46.933Z",
    "Source": "igw-0797ccccdc9e73b0e5",
    "Destination": "i-0495d38ad28331c7",
    "Protocol": "tcp"
  }
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [CreateNetworkInsightsPath](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-insights-path.html) in *AWS CLI Command Reference*.

**create-network-interface-permission**

The following code example shows how to use `create-network-interface-permission`.

**AWS CLI**

**To create a network interface permission**

This example grants permission to account 123456789012 to attach network interface eni-1a2b3c4d to an instance.

Command:

```bash
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

Output:
create-network-interface

The following code example shows how to use create-network-interface.

AWS CLI

Example 1: To specify an IPv4 address for a network interface

The following create-network-interface example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67ac6333 \
    --description "my network interface" \
    --groups sg-09dfba7ed20cda78b \
    --private-ip-address 10.0.8.17
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ]
    }
}
```
Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following create-network-interface example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```
aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my dual stack network interface" \
  --ipv6-address-count 1 \
  --groups sg-09dfba7ed20cda78b
```

Output:

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
```
"Description": "my dual stack network interface",
"Groups": [
  {
    "GroupName": "my-security-group",
    "GroupId": "sg-09dfba7ed20cda78b"
  }
],
"InterfaceType": "interface",
"Ipv6Addresses": [
  {
    "Ipv6Address": "2600:1f13:cf:3650:a1dc:237:c393a:4ba7",
    "IsPrimaryIpv6": false
  }
],
"MacAddress": "06:b8:68:d2:b2:2d",
"NetworkInterfaceId": "eni-05da417453f9a8bf",
"OwnerId": "123456789012",
"PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
"PrivateIpAddress": "10.0.8.18",
"PrivateIpAddresses": [
  {
    "Primary": true,
    "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.18"
  }
],
"RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-00a24d0d67ac6333",
"TagSet": []
],
"VpcId": "vpc-02723a0f0eb9d57b",
"Ipv6Address": "2600:1f13:cf:3650:a1dc:237c:393a:4ba7"
}

Example 3: To create a network interface with connection tracking configuration options

The following create-network-interface example creates a network interface and configures the idle connection tracking timeouts.

```
aws ec2 create-network-interface \
```
--subnet-id subnet-00a24d0d67acf6333 \
--groups sg-02e57dbfe0331c1b \
--connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60

Output:

```json
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "ConnectionTrackingConfiguration": {
      "TcpEstablishedTimeout": 86400,
      "UdpTimeout": 60
    },
    "Description": "",
    "Groups": [
      {
        "GroupName": "my-security-group",
        "GroupId": "sg-02e57dbfe0331c1b"
      }
    ],
    "InterfaceType": "interface",
    "Ipv6Addresses": [],
    "MacAddress": "06:4c:53:de:6d:91",
    "NetworkInterfaceId": "eni-0c133586e08903d0b",
    "OwnerId": "123456789012",
    "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.94",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.94"
      }
    ],
    "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
    "RequesterManaged": false,
    "SourceDestCheck": true,
    "Status": "pending",
    "SubnetId": "subnet-00a24d0d67acf6333",
    "TagSet": [],
    "VpcId": "vpc-02723a0feeeb9d57b"
  }
}
```
Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```bash
aws ec2 create-network-interface \
  --interface-type efa \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my efa" \
  --groups sg-02e57dbcf0331c1b
```

Output:

```json
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "my efa",
    "Groups": [
      {
        "GroupName": "my-efa-sg",
        "GroupId": "sg-02e57dbcf0331c1b"
      }
    ],
    "InterfaceType": "efa",
    "Ipv6Addresses": [],
    "MacAddress": "06:d7:a4:f7:4d:57",
    "NetworkInterfaceId": "eni-034acc28b5e862b65",
    "OwnerId": "123456789012",
    "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.180",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.180"
      }
    ],
    "RequesterId": "AIDA4Z3Y7G5XTMEXAMPLE",
    "RequesterManaged": false,
    "SourceDestCheck": true,
    "Status": "pending",
    "SubnetId": "subnet-00a24d0d67acf6333",
    "TagSet": [],
    "VpcId": "vpc-02723a0feeeb9d57b"
  }
}
```
For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see CreateNetworkInterface in AWS CLI Command Reference.

create-placement-group

The following code example shows how to use create-placement-group.

AWS CLI

To create a placement group

This example command creates a placement group with the specified name.

Command:

```
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

To create a partition placement group

This example command creates a partition placement group named HDFS-Group-A with five partitions.

Command:

```
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```

- For API details, see CreatePlacementGroup in AWS CLI Command Reference.

create-replace-root-volume-task

The following code example shows how to use create-replace-root-volume-task.

AWS CLI

Example 1: To restore a root volume to its initial launch state
The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to its initial launch state.

```bash
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa
```

Output:

```json
{
   "ReplaceRootVolumeTask": {
      "InstanceId": "i-0123456789abcdefa",
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "TaskState": "pending",
      "StartTime": "2022-03-14T15:06:38Z",
      "Tags": []
   }
}
```

**Example 2: To restore a root volume to a specific snapshot**

The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to snapshot snap-0abcdef1234567890.

```bash
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa \
   --snapshot-id snap-0abcdef1234567890
```

Output:

```json
{
   "ReplaceRootVolumeTask": {
      "InstanceId": "i-0123456789abcdefa",
      "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",
      "TaskState": "pending",
      "StartTime": "2022-03-14T15:16:28Z",
      "Tags": []
   }
}
```
For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

• For API details, see CreateReplaceRootVolumeTask in AWS CLI Command Reference.

create-reserved-instances-listing

The following code example shows how to use create-reserved-instances-listing.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following create-reserved-instances-listing example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```bash
aws ec2 create-reserved-instances-listing \
    --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \
    --instance-count 3 \
    --price-schedules CurrencyCode=USD,Price=25.50 \
    --client-token 550e8400-e29b-41d4-a716-446655440000
```

• For API details, see CreateReservedInstancesListing in AWS CLI Command Reference.

create-restore-image-task

The following code example shows how to use create-restore-image-task.

AWS CLI

To restore an AMI from an S3 bucket

The following create-restore-image-task example restores an AMI from an S3 bucket. Use the values for S3ObjectKey `` and ```Bucket from the describe-store-image-tasks output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```bash
aws ec2 create-restore-image-task \
```
--object-key ami-1234567890abcdef0.bin
--bucket my-ami-bucket
--name "New AMI Name"

Output:

```json
{
  "ImageId": "ami-0eab20fe36f83e1a8"
}
```

- For API details, see CreateRestoreImageTask in AWS CLI Command Reference.

create-route-table

The following code example shows how to use create-route-table.

AWS CLI

**To create a route table**

This example creates a route table for the specified VPC.

Command:

```
aws ec2 create-route-table --vpc-id vpc-a01106c2
```

Output:

```json
{
  "RouteTable": {
    "Associations": [],
    "RouteTableId": "rtb-22574640",
    "VpcId": "vpc-a01106c2",
    "PropagatingVgws": [],
    "Tags": [],
    "Routes": [
      {
```
• For API details, see `CreateRouteTable` in *AWS CLI Command Reference*.

**create-route**

The following code example shows how to use `create-route`.

**AWS CLI**

**To create a route**

This example creates a route for the specified route table. The route matches all IPv4 traffic (0.0.0.0/0) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-1a2b3c4d. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block 10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (::/0) and routes it to the specified egress-only Internet gateway.

Command:
aws ec2 create-route --route-table-id rtb-dce620b8 --destination-ipv6-cidr-block ::/0 --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f

- For API details, see CreateRoute in AWS CLI Command Reference.

create-security-group

The following code example shows how to use create-security-group.

**AWS CLI**

**To create a security group for EC2-Class**

This example creates a security group named MySecurityGroup.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group"
```

Output:

```
{
   "GroupId": "sg-903004f8"
}
```

**To create a security group for EC2-VPC**

This example creates a security group named MySecurityGroup for the specified VPC.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group" --vpc-id vpc-1a2b3c4d
```

Output:

```
{
   "GroupId": "sg-903004f8"
}
```
The following code example shows how to use `create-snapshot`.

**AWS CLI**

**To create a snapshot**

This example command creates a snapshot of the volume with a volume ID of vol-1234567890abcdef0 and a short description to identify the snapshot.

Command:

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot"
```

Output:

```
{
    "Description": "This is my root volume snapshot",
    "Tags": [],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:01.000Z",
    "Progress": ",",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-066877671789bd71b"
}
```

**To create a snapshot with tags**

This example command creates a snapshot and applies two tags: purpose=prod and costcenter=123.

Command:
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod}, {Key=costcenter,Value=123}]'

Output:

```json
{
    "Description": "Prod backup",
    "Tags": [
        {
            "Value": "prod",
            "Key": "purpose"
        },
        {
            "Value": "123",
            "Key": "costcenter"
        }
    ],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:06.000Z",
    "Progress": "",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-09ed24a70bc19bbe4"
}
```

- For API details, see CreateSnapshot in AWS CLI Command Reference.

**create-snapshots**

The following code example shows how to use create-snapshots.

**AWS CLI**

**Example 1: To create a multi-volume snapshot**

The following create-snapshots example creates snapshots of all volumes attached to the specified instance.

```bash
aws ec2 create-snapshots \
```
--instance-specification InstanceId=i-1234567890abcdef0 \ 
--description "This is snapshot of a volume from my-instance"

Output:

```
{
   "Snapshots": [
   {
   "Description": "This is a snapshot of a volume from my-instance",
   "Tags": [],
   "Encrypted": false,
   "VolumeId": "vol-0a01d2d5a34697479",
   "State": "pending",
   "VolumeSize": 16,
   "StartTime": "2019-08-05T16:58:19.000Z",
   "Progress": "",
   "OwnerId": "123456789012",
   "SnapshotId": "snap-07f30e3909aa0045e"
   },
   {
   "Description": "This is a snapshot of a volume from my-instance",
   "Tags": [],
   "Encrypted": false,
   "VolumeId": "vol-02d0d4947008cb1a2",
   "State": "pending",
   "VolumeSize": 20,
   "StartTime": "2019-08-05T16:58:19.000Z",
   "Progress": "",
   "OwnerId": "123456789012",
   "SnapshotId": "snap-0ec20b602264aad48"
   },
   ...
   ]
}
```

Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \ 
   --instance-specification InstanceId=i-1234567890abcdef0 \ 
   --copy-tags-from-source volume \
```
Output:

```json
{
    "Snapshots": [
        {
            "Description": "This is snapshot of a volume from my-instance",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-volume"
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T16:53:04.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-053bfaeb821a458dd"
        }
    ]
}
```

Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.
aws ec2 create-snapshots
   --instance-specificationInstanceId=i-1234567890abcdef0
   --tag-specifications 'ResourceType=snapshot,Tags=[{{Key=Name,Value=backup},{Key=costcenter,Value=123}}]

See example 1 for sample output.

- For API details, see CreateSnapshots in AWS CLI Command Reference.

create-spot-datafeed-subscription

The following code example shows how to use create-spot-datafeed-subscription.

AWS CLI

To create a Spot Instance data feed

The following create-spot-datafeed-subscription example creates a Spot Instance data feed.

aws ec2 create-spot-datafeed-subscription
   --bucket my-bucket
   --prefix spot-data-feed

Output:

{
   "SpotDatafeedSubscription": {
      "Bucket": "my-bucket",
      "OwnerId": "123456789012",
      "Prefix": "spot-data-feed",
      "State": "Active"
   }
}

The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

my-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-HH.n.abcd1234.gz
For more information, see Spot Instance data feed in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateSpotDatafeedSubscription in AWS CLI Command Reference.

create-store-image-task

The following code example shows how to use create-store-image-task.

AWS CLI

To store an AMI in an S3 bucket

The following create-store-image-task example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```bash
aws ec2 create-store-image-task \
  --image-id ami-1234567890abcdef0 \
  --bucket my-ami-bucket
```

Output:

```json
{
  "ObjectKey": "ami-1234567890abcdef0.bin"
}
```

For more information, see Store and restore an AMI using S3 in the Amazon EC2 User Guide.

- For API details, see CreateStoreImageTask in AWS CLI Command Reference.

create-subnet-cidr-reservation

The following code example shows how to use create-subnet-cidr-reservation.

AWS CLI

To create a subnet CIDR reservation

The following create-subnet-cidr-reservation example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```bash
aws ec2 create-subnet-cidr-reservation \
```

Actions and scenarios
create-subnet

The following code example shows how to use create-subnet.

AWS CLI

Example 1: To create a subnet with an IPv4 CIDR block only

The following create-subnet example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```bash
aws ec2 create-subnet \
   --vpc-id vpc-081ec835f3EXAMPLE \
   --cidr-block 10.0.0.0/24 \
   --tag-specifications ResourceType=subnet,Tags=[[Key=Name,Value=my-ipv4-only-subnet]]
```

Output:

```json
{
   "Subnet": {
      "AvailabilityZone": "us-west-2a",
```
"AvailabilityZoneId": "usw2-az2",
"AvailableIpAddressCount": 251,
"CidrBlock": "10.0.0.0/24",
"DefaultForAz": false,
"MapPublicIpOnLaunch": false,
"State": "available",
"SubnetId": "subnet-0e99b93155EXAMPLE",
"VpcId": "vpc-081ec835f3EXAMPLE",
"OwnerId": "123456789012",
"AssignIpv6AddressOnCreation": false,
"Ipv6CidrBlockAssociationSet": []
"Tags": [
  {
    "Key": "Name",
    "Value": "my-ipv4-only-subnet"
  }
],
"SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0e99b93155EXAMPLE"
}

Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```
aws ec2 create-subnet \\
   --vpc-id vpc-081ec835f3EXAMPLE \\
   --cidr-block 10.0.0.0/24 \\
   --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \\
   --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-ipv6-subnet}]
```

Output:

```
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 251,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,
```
Example 3: To create a subnet with an IPv6 CIDR block only

The following create-subnet example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```bash
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --ipv6-native \
    --ipv6-cidr-block 2600:1f16:115:200::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-subnet}]
```

Output:

```json
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
```

Actions and scenarios

}

For more information, see VPCs and subnets in the Amazon VPC User Guide.

- For API details, see CreateSubnet in AWS CLI Command Reference.

create-tags

The following code example shows how to use create-tags.

AWS CLI

Example 1: To add a tag to a resource

The following create-tags example adds the tag Stack=production to the specified image, or overwrites an existing tag for the AMI where the tag key is Stack.
Example 2: To add tags to multiple resources

The following `create-tags` example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (`webserver`) but no value (value is set to an empty string). The other tag has a key (`stack`) and a value (`Production`).

```bash
aws ec2 create-tags
  --resources ami-1a2b3c4d i-1234567890abcdef0
  --tags Key=webserver,Value=
  Key=stack,Value=Production
```

For more information, see [This is the topic title](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 3: To add tags containing special characters

The following `create-tags` example adds the tag 

```
[Group]=test
```

for an instance. The square brackets ([ and ]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:

```bash
aws ec2 create-tags
  --resources i-1234567890abcdef0
  --tags Key="[Group]",Value=test
```

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then surround the entire key and value structure with single quotes (') as follows:

```bash
aws ec2 create-tags
  --resources i-1234567890abcdef0
  --tags 'Key="[Group]",Value=test'
```
If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (’) as follows:

```bash
aws ec2 create-tags
   --resources i-1234567890abcdef0
   --tags 'Key="[Group]",Value=test'
```

For more information, see [This is the topic title](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateTags](#) in *AWS CLI Command Reference*.

**create-traffic-mirror-filter-rule**

The following code example shows how to use `create-traffic-mirror-filter-rule`.

**AWS CLI**

To create a filter rule for incoming TCP traffic

The following `create-traffic-mirror-filter-rule` example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use `create-traffic-mirror-filter` to create the Traffic Mirror filter.

```bash
aws ec2 create-traffic-mirror-filter-rule
   --description "TCP Rule"
   --destination-cidr-block 0.0.0.0/0
   --protocol 6
   --rule-action accept
   --rule-number 1
   --source-cidr-block 0.0.0.0/0
   --traffic-direction ingress
   --traffic-mirror-filter-id tmf-04812ff784b25ae67
```

Output:

```json
{
   "TrafficMirrorFilterRule": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
      "TrafficMirrorFilterRuleId": "tmfr-02d0d996673f3732",
      "SourceCidrBlock": "0.0.0.0/0",
```
For more information, see Create a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorFilterRule in AWS CLI Command Reference.

create-traffic-mirror-filter

The following code example shows how to use create-traffic-mirror-filter.

**AWS CLI**

To create a Traffic Mirror Filter

The following create-traffic-mirror-filter example creates a Traffic Mirror filter. After you create the filter, use create-traffic-mirror-filter-rule to add rules to the filter.

```bash
aws ec2 create-traffic-mirror-filter \
  --description "TCP Filter"
```

Output:

```json
{
  "ClientToken": "28908518-100b-4987-8233-8c744EXAMPLE",
  "TrafficMirrorFilter": {
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "Description": "TCP Filter",
    "EgressFilterRules": [],
    "IngressFilterRules": [],
    "Tags": [],
    "NetworkServices": []
  }
}
```

For more information, see Create a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.
For API details, see CreateTrafficMirrorFilter in AWS CLI Command Reference.

**create-traffic-mirror-session**

The following code example shows how to use `create-traffic-mirror-session`.

**AWS CLI**

**To create a Traffic Mirror Session**

The following `create-traffic-mirror-session` command creates a traffic mirror session for the specified source and target for 25 bytes of the packet.

```bash
aws ec2 create-traffic-mirror-session \
  --description "example session" \
  --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \
  --network-interface-id eni-070203f901EXAMPLE \
  --session-number 1 \
  --packet-length 25 \
  --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

Output:

```json
{
  "TrafficMirrorSession": {
    "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
    "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "NetworkInterfaceId": "eni-070203f901EXAMPLE",
    "OwnerId": "111122223333",
    "PacketLength": 25,
    "SessionNumber": 1,
    "VirtualNetworkId": 7159709,
    "Description": "example session",
    "Tags": []
  },
  "ClientToken": "5236cffc-ee13-4a32-bb5b-388d9da09d96"
}
```

For more information, see [Create a Traffic Mirror Session](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/create-traffic-mirror-session.html) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorSession](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-traffic-mirror-session.html) in *AWS CLI Command Reference*. 
create-traffic-mirror-target

The following code example shows how to use create-traffic-mirror-target.

AWS CLI

To create a Network Load Balancer Traffic Mirror target

The following create-traffic-mirror-target example creates a Network Load Balancer Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \
  --description "Example Network Load Balancer Target" \
```

Output:

```
{
  "TrafficMirrorTarget": {
    "Type": "network-load-balancer",
    "Tags": [],
    "Description": "Example Network Load Balancer Target",
    "OwnerId": "111122223333",
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:111122223333:loadbalancer/net/NLB/7cdec873EXAMPLE",
    "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"
  },
  "ClientToken": "d5c090f5-8a0f-49c7-8281-72c796a21f72"
}
```

To create a network Traffic Mirror target

The following create-traffic-mirror-target example creates a network interface Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target --description "Network interface target" --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{

```
"ClientToken": "5289a345-0358-4e62-93d5-47ef3061d65e",
"TrafficMirrorTarget": {
    "Description": "Network interface target",
    "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
    "TrafficMirrorTargetId": "tmt-02dcdbe2abEXAMPLE",
    "OwnerId": "111122223333",
    "Type": "network-interface",
    "Tags": []
}
}

For more information, see [Create a Traffic Mirror Target](https://aws.amazon.com/documentation/trafficmirroring/guides/) in the [AWS Traffic Mirroring Guide](https://aws.amazon.com/documentation/trafficmirroring/guides/).

- For API details, see [CreateTrafficMirrorTarget](https://aws.amazon.com/documentation/trafficmirroring/guides/) in [AWS CLI Command Reference](https://aws.amazon.com/documentation/trafficmirroring/guides/).

### create-transit-gateway-connect-peer

The following code example shows how to use `create-transit-gateway-connect-peer`.

**AWS CLI**

**To create a Transit Gateway Connect peer**

The following `create-transit-gateway-connect-peer` example creates a Connect peer.

```bash
aws ec2 create-transit-gateway-connect-peer \
    --transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
    --peer-address 172.31.1.11 \
    --inside-cidr-blocks 169.254.6.0/29
```

**Output:**

```json
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
```

```
"169.254.6.0/29"
],
"Protocol": "gre",
"BgpConfigurations": [
{
    "TransitGatewayAsn": 64512,
    "PeerAsn": 64512,
    "TransitGatewayAddress": "169.254.6.2",
    "PeerAddress": "169.254.6.1",
    "BgpStatus": "down"
},
{
    "TransitGatewayAsn": 64512,
    "PeerAsn": 64512,
    "TransitGatewayAddress": "169.254.6.3",
    "PeerAddress": "169.254.6.1",
    "BgpStatus": "down"
}
]
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayConnectPeer in AWS CLI Command Reference.

create-transit-gateway-connect

The following code example shows how to use create-transit-gateway-connect.

AWS CLI

To create a transit gateway Connect attachment

The following create-transit-gateway-connect example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```
aws ec2 create-transit-gateway-connect \
   --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
   --options "Protocol=gre"
```
Output:

{  
  "TransitGatewayConnect": {  
    "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",  
    "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",  
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",  
    "State": "pending",  
    "CreationTime": "2021-03-09T19:59:17+00:00",  
    "Options": {  
      "Protocol": "gre"  
    }  
  }  
}

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayConnect in AWS CLI Command Reference.

create-transit-gateway-multicast-domain

The following code example shows how to use create-transit-gateway-multicast-domain.

AWS CLI

Example 1: To create an IGMP multicast domain

The following create-transit-gateway-multicast-domain example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```bash
aws ec2 create-transit-gateway-multicast-domain \  
   --transit-gateway-id tgw-0bf0bffeafaEXAMPLE \  
   --options StaticSourcesSupport=disable,IGmpv2Support=enable
```

Output:

{  
  "TransitGatewayMulticastDomain": {  
    "TransitGatewayId": "tgw-0bf0bffeafaEXAMPLE",  
    "CreationTime": "2021-03-09T19:59:17+00:00",  
    "Description": "Multicast domain for transit gateway with IGMPv2支持 enabled",  
    "Options": {  
      "Protocol": "gre",  
      "StaticSourcesSupport": "disable",  
      "IGmpv2Support": "enable"  
    }  
}
Example 2: To create a static multicast domain

The following create-transit-gateway-multicast-domain example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```bash
aws ec2 create-transit-gateway-multicast-domain \
  --transit-gateway-id tgw-0bf0bffeфаEXAMPLE \
  --options StaticSourcesSupport=enable,Igmpv2Support=disable
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffeфаEXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "disable",
            "StaticSourcesSupport": "enable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
        "CreationTime": "2021-09-29T22:17:13.000Z"
    }
}
```
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayMulticastDomain in AWS CLI Command Reference.

**create-transit-gateway-peering-attachment**

The following code example shows how to use create-transit-gateway-peering-attachment.

**AWS CLI**

**To create a transit gateway peering attachment**

The following create-transit-gateway-peering-attachment example creates a peering attachment request between the two specified transit gateways.

```bash
aws ec2 create-transit-gateway-peering-attachment \
    --transit-gateway-id tgw-123abc05e04123abc \
    --peer-transit-gateway-id tgw-11223344aabbcc112 \
    --peer-account-id 123456789012 \
    --peer-region us-east-2
```

**Output:**

```json
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-445566778aabbcccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "initiatingRequest",
    }
}
```
create-transit-gateway-policy-table

The following code example shows how to use create-transit-gateway-policy-table.

AWS CLI

To create a transit gateway policy table

The following create-transit-gateway-policy-table example creates a transit gateway policy table for the specified transit gateway.

```bash
aws ec2 create-transit-gateway-policy-table \
  --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```
{
    "TransitGatewayPolicyTable": {
        "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
        "TransitGatewayId": "tgw-067f8505c18f0bd6e",
        "State": "pending",
        "CreationTime": "2023-11-28T16:36:43+00:00"
    }
}
```

For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see CreateTransitGatewayPolicyTable in AWS CLI Command Reference.

create-transit-gateway-prefix-list-reference

The following code example shows how to use create-transit-gateway-prefix-list-reference.

For more information, see Transit Gateway Peering Attachments in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayPeeringAttachment in AWS CLI Command Reference.
AWS CLI

To create a reference to a prefix list

The following create-transit-gateway-prefix-list-reference example creates a reference to the specified prefix list in the specified transit gateway route table.

```bash
aws ec2 create-transit-gateway-prefix-list-reference \
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
   --prefix-list-id pl-11111122222222333 \
   --transit-gateway-attachment-id tgw-attach-aaaaaabbbbbb11111
```

Output:

```json
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "pending",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbbb11111",
            "ResourceType": "vpc",
            "ResourceId": "vpc-112233445566aabbc"
        }
    }
}
```

For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayPrefixListReference in AWS CLI Command Reference.

create-transit-gateway-route-table

The following code example shows how to use create-transit-gateway-route-table.

AWS CLI

To create a Transit Gateway Route Table

The following create-transit-gateway-route-table example creates a route table for the specified transit gateway.
aws ec2 create-transit-gateway-route-table \
--transit-gateway-id tgw-0262a0e521EXAMPLE

Output:

{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-10T19:01:46.000Z"
    }
}

For more information, see Create a transit gateway route table in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayRouteTable in AWS CLI Command Reference.

create-transit-gateway-route

The following code example shows how to use create-transit-gateway-route.

AWS CLI

To create a transit gateway route

The following create-transit-gateway-route example creates a route, with the specified destination, for the specified route table.

aws ec2 create-transit-gateway-route \
--destination-cidr-block 10.0.2.0/24 \
--transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
--transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE

Output:

{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "State": "pending"
    }
}
"TransitGatewayAttachments": [ 
  
  
  "ResourceId": "vpc-0065acced4EXAMPLE",
  "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
  "ResourceType": "vpc"
  
  ],
  "Type": "static",
  "State": "active"
}

For more information, see [Transit gateway route tables](#) in the [Transit Gateways Guide](#).

- For API details, see [CreateTransitGatewayRoute](#) in [AWS CLI Command Reference](#).

**create-transit-gateway-vpc-attachment**

The following code example shows how to use create-transit-gateway-vpc-attachment.

**AWS CLI**

**Example 1: To associate a transit gateway with a VPC**

The following create-transit-gateway-vpc-attachment example creates a transit gateway attachment to the specified VPC.

```bash
aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-0262a0e521EXAMPLE \
  --vpc-id vpc-07e8fffd50f49335df \
  --subnet-id subnet-0752213d59EXAMPLE
```

Output:

```json
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8fffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [ 
```
Example 2: To associate a transit gateway with multiple subnets in a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC and subnets.

```
aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-02f776b1a7EXAMPLE \
  --vpc-id vpc-3EXAMPLE \
  --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:

```
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0e141e0bebeEXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "VpcId": "vpc-3EXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-6EXAMPLE",
      "subnet-dEXAMPLE"
    ],
    "CreationTime": "2019-12-17T20:07:52.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}```

For more information, see [Create a transit gateway attachment to a VPC](https://docs.aws.amazon.com/transitgateways/latest/userguide/create-transit-gateway-vpc-attachment.html) in the *Transit Gateways Guide*. 
For more information, see Create a transit gateway attachment to a VPC in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayVpcAttachment in AWS CLI Command Reference.

**create-transit-gateway**

The following code example shows how to use create-transit-gateway.

**AWS CLI**

**To create a transit gateway**

The following create-transit-gateway example creates a transit gateway.

```bash
aws ec2 create-transit-gateway \\
  --description MyTGW \\
  --
  options AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=enable,VpnEcmpSupport=enable,DnsSupport=enable
```

Output:

```json
{
  "TransitGateway": {
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "State": "pending",
    "OwnerId": "111122223333",
    "Description": "MyTGW",
    "CreationTime": "2019-07-10T14:02:12.000Z",
    "Options": {
      "AmazonSideAsn": 64516,
      "AutoAcceptSharedAttachments": "enable",
      "DefaultRouteTableAssociation": "enable",
      "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
      "DefaultRouteTablePropagation": "enable",
      "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
      "VpnEcmpSupport": "enable",
      "DnsSupport": "enable"
    }
  }
}
```
For more information, see Create a transit gateway in the Transit Gateways Guide.

- For API details, see CreateTransitGateway in AWS CLI Command Reference.

create-verified-access-endpoint

The following code example shows how to use create-verified-access-endpoint.

AWS CLI

To create a Verified Access endpoint

The following create-verified-access-endpoint example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```
aws ec2 create-verified-access-endpoint \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --endpoint-type network-interface \
  --attachment-type vpc \
  --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE \
  --application-domain example.com \
  --endpoint-domain-prefix my-ava-app \
  --security-group-ids sg-004915970c4c8f13a \
  --network-interface-options NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 \
  --tag-specifications ResourceType=verified-access-endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]
```

Output:

```
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
  }
}
```
"AttachmentType": "vpc",
"DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
"EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
"SecurityGroupIds": [
  "sg-004915970c4c8f13a"
],
"NetworkInterfaceOptions": {
  "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
  "Protocol": "https",
  "Port": 443
},
"Status": {
  "Code": "pending"
},
"Description": "",
"CreationTime": "2023-08-25T20:54:43",
"LastUpdatedTime": "2023-08-25T20:54:43",
"Tags": [
  {
    "Key": "Name",
    "Value": "my-va-endpoint"
  }
]
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verifiedaccess/latest/userguide/) in the [AWS Verified Access User Guide](https://docs.aws.amazon.com/verifiedaccess/latest/userguide/).

- For API details, see [CreateVerifiedAccessEndpoint](https://docs.aws.amazon.com/cli/latest/reference/) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/).

**create-verified-access-group**

The following code example shows how to use `create-verified-access-group`.

**AWS CLI**

**To create a Verified Access group**

The following `create-verified-access-group` example creates a Verified Access group for the specified Verified Access instance.
aws ec2 create-verified-access-group \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --tag-specifications ResourceType=verified-access-group,Tags=[{Key=Name,Value=my-va-group}]

Output:

```
{
   "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T19:55:19",
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-va-group"
         }
      ]
   }
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verifiedaccess/latest/userguide/) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessGroup](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-verified-access-instance.html) in *AWS CLI Command Reference*.

### create-verified-access-instance

The following code example shows how to use `create-verified-access-instance`.

#### AWS CLI

**To create a Verified Access instance**

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```
aws ec2 create-verified-access-instance \
```
create-verified-access-trust-provider

The following code example shows how to use create-verified-access-trust-provider.

AWS CLI

To create a Verified Access trust provider

The following create-verified-access-trust-provider example sets up a Verified Access trust provider using AWS Identity Center.

```
aws ec2 create-verified-access-trust-provider \
  --trust-provider-type user \
  --user-trust-provider-type iam-identity-center \
  --policy-reference-name idc \
  --tag-specifications ResourceType=verified-access-trust-provider,Tags=[{Key=Name,Value=my-va-trust-provider}]
```
Output:

```json
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T18:40:36",
        "LastUpdatedTime": "2023-08-25T18:40:36",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-trust-provider"
            }
        ]
    }
}
```

For more information, see [Trust providers for Verified Access](https://docs.aws.amazon.com/verified-access/latest/userguide/trust-providers.html) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-verified-access-trust-provider.html) in *AWS CLI Command Reference*.

**create-volume**

The following code example shows how to use `create-volume`.

**AWS CLI**

To create an empty General Purpose SSD (gp2) volume

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-east-1`, or you can add the `--region` parameter to specify the Region for the command.

```bash
aws ec2 create-volume \
    --volume-type gp2 \
    --size 80 \
    --availability-zone us-east-1a
```
Output:

```json
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```
aws ec2 create-volume \
    --size 80 \
    --availability-zone us-east-1a
```

Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```
aws ec2 create-volume \
    --volume-type io1 \
    --iops 1000 \
    --snapshot-id snap-066877671789bd71b \
    --availability-zone us-east-1a
```

Output:

```json
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "io1",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
}
```
"Iops": 1000,
"SnapshotId": "snap-066877671789bd71b",
"CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
"Size": 500
}

Example 3: To create an encrypted volume

The following create-volume example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the --encrypted parameter as follows.

```bash
aws ec2 create-volume \
  --size 80 \
  --encrypted \
  --availability-zone us-east-1a
```

Output:

```
{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": true,
  "VolumeType": "gp2",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
  "Iops": 240,
  "SnapshotId": "",
  "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
  "Size": 80
}
```

If encryption by default is enabled, the following example command creates an encrypted volume, even without the --encrypted parameter.

```bash
aws ec2 create-volume \
  --size 80 \
  --availability-zone us-east-1a
```

If you use the --kms-key-id parameter to specify a customer managed CMK, you must specify the --encrypted parameter even if encryption by default is enabled.
Example 4: To create a volume with tags

The following `create-volume` example creates a volume and adds two tags.

```bash
aws ec2 create-volume \
  --availability-zone us-east-1a \
  --volume-type gp2 \
  --size 80 \
  --encrypted \
  --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production}, {Key=cost-center,Value=cc123}]'
```

- For API details, see [CreateVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-volume.html) in *AWS CLI Command Reference*.

### create-vpc-endpoint-connection-notification

The following code example shows how to use `create-vpc-endpoint-connection-notification`.

**AWS CLI**

**To create an endpoint connection notification**

This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

**Command:**

```bash
```

**Output:**
For API details, see [CreateVpcEndpointConnectionNotification](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-endpoint-service-configuration.html) in *AWS CLI Command Reference*.

### create-vpc-endpoint-service-configuration

The following code example shows how to use `create-vpc-endpoint-service-configuration`.

#### AWS CLI

**Example 1: To create an endpoint service configuration for an interface endpoint**

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Network Load Balancer `nlb-vpce`. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration \  
  --network-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \  
  --acceptance-required
```

**Output:**

```json
{
  "ServiceConfiguration": {
```

```json
```
Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Gateway Load Balancer GWLBService. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```
```

Output:

```json
{
   "ServiceConfiguration": {
      "ServiceType": [ {
         "ServiceType": "GatewayLoadBalancer"
      } ]
   }
}
```
For more information, see [VPC endpoint services](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-endpoint-services.html) in the *Amazon VPC User Guide*.

- For API details, see [CreateVpcEndpointServiceConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-endpoint-service-configuration.html) in *AWS CLI Command Reference*.

### create-vpc-endpoint

The following code example shows how to use `create-vpc-endpoint`.

**AWS CLI**

**Example 1: To create a gateway endpoint**

The following `create-vpc-endpoint` example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region, and associates route table `rtb-11aa22bb` with the endpoint.

```bash
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --service-name com.amazonaws.us-east-1.s3 \
    --route-table-ids rtb-11aa22bb
```

**Output:**

```
{
    "VpcEndpoint": {
        "PolicyDocument": "{
            "Version":"2008-10-17",
            "Statement":[
                {"Sid":"
                
                
                "Effect":"Allow",
            "Principal":"
            
            
            
            
            "Action":"
            
            
            
            "Resource":"
            
            
            
            
            
            
            
            
            
            
            "Condition":{}
        },
    "AcceptanceRequired": false,
    "ManagesVpcEndpoints": false,
    "GatewayLoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc"
    ]
}
}
```
"VpcId": "vpc-1a2b3c4d",
"State": "available",
"ServiceName": "com.amazonaws.us-east-1.s3",
"RouteTableIds": [
  "rtb-11aa22bb"
],
"VpcEndpointId": "vpc-1a2b3c4d",
"CreationTimestamp": "2015-05-15T09:40:50Z"
}
}

For more information, see Creating a gateway endpoint in the AWSPrivateLink Guide.

**Example 2: To create an interface endpoint**

The following create-vpc-endpoint example creates an interface VPC endpoint between VPC vpc-1a2b3c4d and Amazon S3 in the us-east-1 region. The command creates the endpoint in subnet subnet-1a2b3c4d, associates it with security group sg-1a2b3c4d, and adds a tag with a key of "Service" and a Value of "S3".

```bash
aws ec2 create-vpc-endpoint \
  --vpc-id vpc-1a2b3c4d \
  --vpc-endpoint-type Interface \
  --service-name com.amazonaws.us-east-1.s3 \
  --subnet-ids subnet-7b16de0c \
  --security-group-id sg-1a2b3c4d \
  --tagSpecifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]
```

Output:

```json
{
  "VpcEndpoint": {
    "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
    "VpcEndpointType": "Interface",
    "VpcId": "vpc-1a2b3c4d",
    "ServiceName": "com.amazonaws.us-east-1.s3",
    "State": "pending",
    "RouteTableIds": [],
    "SubnetIds": [
      "subnet-1a2b3c4d"
    ],
    "Groups": [ application
```
For more information, see Creating an interface endpoint in the User Guide for AWSPrivateLink.

Example 3: To create a Gateway Load Balancer endpoint

The following create-vpc-endpoint example creates a Gateway Load Balancer endpoint between VPC vpc-111122223333aabbc and a service that is configured using a Gateway Load Balancer.

```
aws ec2 create-vpc-endpoint \
   --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \
```
Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-aabbaabbaabbaabba",
        "VpcEndpointType": "GatewayLoadBalancer",
        "VpcId": "vpc-111122223333aabbc",
        "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
        "State": "pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "RequesterManaged": false,
        "NetworkInterfaceIds": [
            "eni-01010120203030405"
        ],
        "CreationTimestamp": "2020-11-11T08:06:03.522Z",
        "OwnerId": "123456789012"
    }
}
```

For more information, see [Gateway Load Balancer endpoints](https://docs.aws.amazon.com/awscalculator/latest/userguide/aws-calc.html) in the *User Guide for AWS PrivateLink*.

- For API details, see [CreateVpcEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-endpoint.html) in *AWS CLI Command Reference*.

### create-vpc-peering-connection

The following code example shows how to use `create-vpc-peering-connection`.

#### AWS CLI

**To create a VPC peering connection between your VPCs**

This example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

Command:
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233

Output:

```
{
  "VpcPeeringConnection": {
    "Status": {
      "Message": "Initiating Request to 444455556666",
      "Code": "initiating-request"
    },
    "Tags": [],
    "RequesterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-1a2b3c4d",
      "CidrBlock": "10.0.0.0/28"
    },
    "VpcPeeringConnectionId": "pcx-111aaa111",
    "ExpirationTime": "2014-04-02T16:13:36.000Z",
    "AccepterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-11122233"
    }
  }
}
```

To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012
```

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the us-west-2 region.

Command:
This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the us-west-2 region.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-region us-west-2
```

- For API details, see [CreateVpcPeeringConnection](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-peering-connection.html) in *AWS CLI Command Reference*.

### create-vpc

The following code example shows how to use `create-vpc`.

**AWS CLI**

**Example 1: To create a VPC**

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```bash
aws ec2 create-vpc \
--cidr-block 10.0.0.0/16 \n--tag-specifications ResourceType=vpc,Tags=[{Key=Name,Value=MyVpc}]
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-5EXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0a6eb65b4EXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": []
    }
}
```
Example 2: To create a VPC with dedicated tenancy

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```
aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --instance-tenancy dedicated
```

Output:

```
{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-19edf471",
    "State": "pending",
    "VpcId": "vpc-0a53287fa4EXAMPLE",
    "OwnerId": "111122223333",
    "InstanceTenancy": "dedicated",
    "Ipv6CidrBlockAssociationSet": [],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
        "CidrBlock": "10.0.0.0/16",
      }
    ]
  }
}```
Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```bash
aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --amazon-provided-ipv6-cidr-block
```

Output:

```json
{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-dEXAMPLE",
    "State": "pending",
    "VpcId": "vpc-0fc5e3406bEXAMPLE",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
        "Ipv6CidrBlock": "",
        "Ipv6CidrBlockState": {
          "State": "associating"
        },
        "Ipv6Pool": "Amazon",
        "NetworkBorderGroup": "us-west-2"
      }
    ],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {
```
Example 4: To create a VPC with a CIDR from an IPAM pool

The following create-vpc example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```
aws ec2 create-vpc \
  --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
  --tag-specifications ResourceType=vpc,Tags='[[Key=Environment,Value="Preprod"],
  {Key=Owner,Value="Build Team"}]'
```

Windows:

```
aws ec2 create-vpc ^
  --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
  --tag-specifications ResourceType=vpc,Tags='[[Key=Environment,Value="Preprod"],
  {Key=Owner,Value="Build Team"}]'
```

Output:

```
{
  "Vpc": {
    "CidrBlock": "10.0.1.0/24",
    "DhcpOptionsId": "dopt-2afccf50",
    "State": "pending",
    "VpcId": "vpc-010e1791024eb0af9",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",
```
"CidrBlock": "10.0.1.0/24",
"CidrBlockState": {
  "State": "associated"
}
],
"IsDefault": false,
"Tags": [
  {
    "Key": "Environment",
    "Value": "Preprod"
  },
  {
    "Key": "Owner",
    "Value": "Build Team"
  }
]
}

For more information, see Create a VPC that uses an IPAM pool CIDR in the Amazon VPC IPAM User Guide.

- For API details, see CreateVpc in AWS CLI Command Reference.

**create-vpn-connection-route**

The following code example shows how to use create-vpn-connection-route.

**AWS CLI**

**To create a static route for a VPN connection**

This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see CreateVpnConnectionRoute in AWS CLI Command Reference.
create-vpn-connection

The following code example shows how to use create-vpn-connection.

AWS CLI

Example 1: To create a VPN connection with dynamic routing

The following create-vpn-connection example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
   --type ipsec.1 \ 
   --customer-gateway-id cgw-001122334455aabbcc \ 
   --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \ 
   --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]
```

Output:

```
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-001122334455aabbcc",
      "Category": "VPN",
      "State": "pending",
      "VpnConnectionId": "vpn-123123123123abcb",
      "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
      "Options": {
         "EnableAcceleration": false,
         "StaticRoutesOnly": false,
         "LocalIpv4NetworkCidr": "0.0.0.0/0",
         "RemoteIpv4NetworkCidr": "0.0.0.0/0",
         "TunnelInsideIpVersion": "ipv4",
         "TunnelOptions": [ ]
      },
      "Routes": [],
      "Tags": [ ]
   }
}
```
Example 2: To create a VPN connection with static routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```bash
aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --customer-gateway-id cgw-001122334455aabbc \
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
  --options "{"StaticRoutesOnly":true}"
```

Output:

```json
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "...configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": true,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [ ],
    }
  }
}
```
For more information, see [How AWS Site-to-Site VPN works](#) in the [AWS Site-to-Site VPN User Guide](#).

**Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key**

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```bash
aws ec2 create-vpn-connection \
  --type ipsec.1 \ 
  --customer-gateway-id cgw-001122334455aabbc \ 
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \ 
  --options TunnelOptions='[{TunnelInsideCidr=169.254.12.0/30,PreSharedKey=ExamplePreSharedKey1}, {TunnelInsideCidr=169.254.13.0/30,PreSharedKey=ExamplePreSharedKey2}]'
```

Output:

```
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": false,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [
```
For more information, see [How AWS Site-to-Site VPN works](https://aws.amazon.com/), in the [AWS Site-to-Site VPN User Guide](https://aws.amazon.com/).

**Example 4: To create a VPN connection that supports IPv6 traffic**

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```shell
aws ec2 create-vpn-connection \
   --type ipsec.1 \
   --transit-gateway-id tgw-12312312312312312 \
   --customer-gateway-id cgw-001122334455aabbc \
   --options TunnelInsideIpVersion=ipv6,TunnelOptions=[[StartupAction=start], \n   [{StartupAction=start}]
```

**Output:**

```json
{
   "CustomerGatewayConfiguration": "..configuration information...",
   "CustomerGatewayId": "cgw-001122334455aabbc",
   "Category": "VPN",
   "State": "pending",
   "VpnConnectionId": "vpn-1111111122222222"
}
```
"TransitGatewayId": "tgw-12312312312312312",
"Options": {
   "EnableAcceleration": false,
   "StaticRoutesOnly": false,
   "LocalIpv6NetworkCidr": "::/0",
   "RemoteIpv6NetworkCidr": "::/0",
   "TunnelInsideIpVersion": "ipv6",
   "TunnelOptions": [
      {
         "OutsideIpAddress": "203.0.113.3",
         "StartupAction": "start"
      },
      {
         "OutsideIpAddress": "203.0.113.5",
         "StartupAction": "start"
      }
   ]
},
"Routes": [],
"Tags": []
}

For more information, see [How AWS Site-to-Site VPN works](https://aws.amazon.com) in the [AWS Site-to-Site VPN User Guide](https://aws.amazon.com).

- For API details, see [CreateVpnConnection](https://aws.amazon.com) in [AWS CLI Command Reference](https://aws.amazon.com).

create-vpn-gateway

The following code example shows how to use `create-vpn-gateway`.

**AWS CLI**

**To create a virtual private gateway**

This example creates a virtual private gateway.

Command:

```bash
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:
To create a virtual private gateway with a specific Amazon-side ASN

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```bash
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```json
{
    "VpnGateway": {
        "AmazonSideAsn": 65001,
        "State": "available",
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-9a4cac3f",
        "VpcAttachments": []
    }
}
```

- For API details, see [CreateVpnGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpn-gateway.html) in *AWS CLI Command Reference*.

### delete-carrier-gateway

The following code example shows how to use `delete-carrier-gateway`.

## AWS CLI

**To delete your carrier gateway**
The following `delete-carrier-gateway` example deletes the specified carrier gateway.

```bash
aws ec2 delete-carrier-gateway \
    --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{
    "CarrierGateway": {
        "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
        "VpcId": "vpc-0c529aEXAMPLE1111",
        "State": "deleting",
        "OwnerId": "123456789012"
    }
}
```

For more information, see [Carrier gateways](https://docs.aws.amazon.com/AmazonVirtualPrivateCloud/latest/UserGuide/capabilities_carrier-gateways.html) in the Amazon Virtual Private Cloud User Guide.

- For API details, see [DeleteCarrierGateway](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_DeleteCarrierGateway.html) in AWS CLI Command Reference.

### delete-client-vpn-endpoint

The following code example shows how to use `delete-client-vpn-endpoint`.

**AWS CLI**

**To delete a Client VPN endpoint**

The following `delete-client-vpn-endpoint` example deletes the specified Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Status": {
        "Code": "deleting"
    }
}
```
For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

- For API details, see DeleteClientVpnEndpoint in AWS CLI Command Reference.

delete-client-vpn-route

The following code example shows how to use delete-client-vpn-route.

AWS CLI

To delete a route for a Client VPN endpoint

The following delete-client-vpn-route example deletes the 0.0.0.0/0 route for the specified subnet of a Client VPN endpoint.

```
aws ec2 delete-client-vpn-route \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --destination-cidr-block 0.0.0.0/0 \
  --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
   "Status": {
      "Code": "deleting"
   }
}
```

For more information, see Routes in the AWS Client VPN Administrator Guide.

- For API details, see DeleteClientVpnRoute in AWS CLI Command Reference.

delete-coip-cidr

The following code example shows how to use delete-coip-cidr.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following delete-coip-cidr example deletes the specified range of CoIP addresses in the specified CoIP pool.
aws ec2 delete-coip-cidr \
   --cidr 14.0.0.0/24  \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg

Output:

{
   "CoipCidr": {
       "Cidr": "14.0.0.0/24",
       "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
       "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
   }
}

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipCidr in AWS CLI Command Reference.

delete-coip-pool

The following code example shows how to use delete-coip-pool.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses

The following delete-coip-pool example deletes a CoIP pool of CoIP addresses.

aws ec2 delete-coip-pool \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg

Output:

{
   "CoipPool": {
       "PoolId": "ipv4pool-coip-1234567890abcdefg",
       "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
   }
}

Actions and scenarios 2142
For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipPool in AWS CLI Command Reference.

delete-customer-gateway

The following code example shows how to use delete-customer-gateway.

AWS CLI

**To delete a customer gateway**

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

- For API details, see DeleteCustomerGateway in AWS CLI Command Reference.

delete-dhcp-options

The following code example shows how to use delete-dhcp-options.

AWS CLI

**To delete a DHCP options set**

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebbb
```

- For API details, see DeleteDhcpOptions in AWS CLI Command Reference.

delete-egress-only-internet-gateway

The following code example shows how to use delete-egress-only-internet-gateway.
AWS CLI

To delete an egress-only Internet gateway

This example deletes the specified egress-only Internet gateway.

Command:

```bash
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```json
{
   "ReturnCode": true
}
```

- For API details, see [DeleteEgressOnlyInternetGateway](#) in *AWS CLI Command Reference*.

delete-fleets

The following code example shows how to use delete-fleets.

AWS CLI

Example 1: To delete an EC2 Fleet and terminate the associated instances

The following delete-fleets example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 delete-fleets \  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \  --terminate-instances
```

Output:

```json
{
   "SuccessfulFleetDeletions": [
      {
         "CurrentFleetState": "deleted_terminating",
         "PreviousFleetState": "active",
         "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
      }
   ]
}
```
For more information, see [Delete an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To delete an EC2 Fleet without terminating the associated instances**

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 delete-fleets \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \n   --no-terminate-instances
```

**Output:**

```json
{
   "SuccessfulFleetDeletions": [
      {
         "CurrentFleetState": "deleted_running",
         "PreviousFleetState": "active",
         "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
      }
   ],
   "UnsuccessfulFleetDeletions": []
}
```

For more information, see [Delete an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeleteFleets](#) in AWS CLI Command Reference.

**delete-flow-logs**

The following code example shows how to use `delete-flow-logs`.

**AWS CLI**

To delete a flow log
The following `delete-flow-logs` example deletes the specified flow log.

```bash
aws ec2 delete-flow-logs --flow-log-id fl-11223344556677889
```

Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [DeleteFlowLogs](#) in *AWS CLI Command Reference*.

`delete-fpga-image`

The following code example shows how to use `delete-fpga-image`.

**AWS CLI**

*To delete an Amazon FPGA image*

This example deletes the specified AFI.

Command:

```bash
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

Output:

```json
{
    "Return": true
}
```

- For API details, see [DeleteFpgaImage](#) in *AWS CLI Command Reference*.

`delete-instance-connect-endpoint`

The following code example shows how to use `delete-instance-connect-endpoint`.

**AWS CLI**

*To delete an EC2 Instance Connect Endpoint*
The following delete-instance-connect-endpoint example deletes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 delete-instance-connect-endpoint \
  --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```json
{
  "InstanceConnectEndpoint": {
    "OwnerId": "111111111111",
    "InstanceConnectEndpointId": "eice-0123456789example",
    "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
    "State": "delete-in-progress",
    "StateMessage": "",
    "NetworkInterfaceIds": [],
    "VpcId": "vpc-0123abcd",
    "AvailabilityZone": "us-east-1d",
    "CreatedAt": "2023-02-07T12:05:37+00:00",
    "SubnetId": "subnet-0123abcd"
  }
}
```

For more information, see [Remove EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

- For API details, see [DeleteInstanceConnectEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-instance-connect-endpoint.html) in *AWS CLI Command Reference*.

### delete-instance-event-window

The following code example shows how to use delete-instance-event-window.

**AWS CLI**

**Example 1: To delete an event window**

The following delete-instance-event-window example deletes an event window.

```bash
aws ec2 delete-instance-event-window \
  --region us-east-1 \
```
Output:

```json
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

**Example 2: To force delete an event window**

The following `delete-instance-event-window` example force deletes an event window if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --force-delete
```

Output:

```json
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [DeleteInstanceEventWindow](#) in *AWS CLI Command Reference*.

**delete-internet-gateway**

The following code example shows how to use `delete-internet-gateway`.

---

**Actions and scenarios** 2148
AWS CLI

To delete an internet gateway

The following `delete-internet-gateway` example deletes the specified internet gateway.

```bash
aws ec2 delete-internet-gateway \
   --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/) in the *Amazon VPC User Guide*.

- For API details, see [DeleteInternetGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-internet-gateway.html) in *AWS CLI Command Reference*.

delete-ipam-pool

The following code example shows how to use `delete-ipam-pool`.

AWS CLI

To delete an IPAM pool

In this example, you're a IPAM delegated admin who wants to delete an IPAM pool that you no longer need, but the pool has a CIDR provisioned to it. You cannot delete a pool if it has CIDRs provisioned to it unless you use the `--cascade` option, so you'll use `--cascade`.

To complete this request:

You'll need the IPAM pool ID which you can get with `describe-ipam-pools`. The `--region` must be the IPAM home Region.

The following `delete-ipam-pool` example deletes an IPAM pool in your AWS account.

```bash
aws ec2 delete-ipam-pool \
   --ipam-pool-id ipam-pool-050c886a3ca41cd5b \
   --cascade \
   --region us-east-1
```

Output:

```json
{
}
```
For more information, see [Delete a pool](#) in the Amazon VPC IPAM User Guide.

- For API details, see [DeleteIpamPool](#) in AWS CLI Command Reference.

### delete-ipam-resource-discovery

The following code example shows how to use `delete-ipam-resource-discovery`.

#### AWS CLI

To delete a resource discovery

In this example, you're a IPAM delegated admin who wants to delete a non-default resource discovery that you created to share with another IPAM admin during the process of integrating IPAM with accounts outside of your organization.

To complete this request:

The `--region` must be the Region where you created the resource discovery. You cannot delete a default resource discovery if "IsDefault": true. A default resource discovery is one that is created automatically in the account that creates an IPAM. To delete a default resource discovery, you have to delete the IPAM.
The following delete-ipam-resource-discovery example deletes a resource discovery.

```bash
aws ec2 delete-ipam-resource-discovery \
   --ipam-resource-discovery-id ipam-res-disco-0e39761475298ee0f \
   --region us-east-1
```

Output:

```
{
   "IpamResourceDiscovery": {
      "OwnerId": "149977607591",
      "IpamResourceDiscoveryId": "ipam-res-disco-0e39761475298ee0f",
      "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
      discovery/ipam-res-disco-0e39761475298ee0f",
      "IpamResourceDiscoveryRegion": "us-east-1",
      "OperatingRegions": [
         {
            "RegionName": "us-east-1"
         }
      ],
      "IsDefault": false,
      "State": "delete-in-progress"
   }
}
```

For more information about resource discoveries, see [Work with resource discoveries](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/work-with-resource-discoveries.html) in the Amazon VPC IPAM User Guide.

**delete-ipam-scope**

The following code example shows how to use delete-ipam-scope.

**AWS CLI**

**To delete an IPAM scope**

The following delete-ipam-scope example deletes an IPAM.

```bash
aws ec2 delete-ipam-scope \
   --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```
For more information, see [Delete a scope](#) in the Amazon VPC IPAM User Guide.

- For API details, see [DeleteIpamScope](#) in AWS CLI Command Reference.

**delete-ipam**

The following code example shows how to use delete-ipam.

**AWS CLI**

**To delete an IPAM**

The following delete-ipam example deletes an IPAM.

```
aws ec2 delete-ipam \
  --ipam-id ipam-036486d6fa6af58ee0
```

Output:

```json
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-036486d6fa6af58ee0",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486d6fa6af58ee0",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "delete-in-progress"
  }
}
```
For more information, see [Delete an IPAM](#) in the Amazon VPC IPAM User Guide.

- For API details, see [DeleteIpam](#) in AWS CLI Command Reference.

**delete-key-pair**

The following code example shows how to use delete-key-pair.

**AWS CLI**

**To delete a key pair**

The following delete-key-pair example deletes the specified key pair.

```
aws ec2 delete-key-pair \
    --key-name my-key-pair
```

Output:

```
{
    "Return": true,
    "KeyPairId": "key-03c8d3aceb53b507"
}
```
For more information, see Create and delete key pairs in the AWS Command Line Interface User Guide.

- For API details, see DeleteKeyPair in AWS CLI Command Reference.

dele-te-launch-template-versions

The following code example shows how to use delete-launch-template-versions.

AWS CLI

To delete a launch template version

This example deletes the specified launch template version.

Command:

```
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --versions 1
```

Output:

```
{
   "UnsuccessfullyDeletedLaunchTemplateVersions": [],
   "SuccessfullyDeletedLaunchTemplateVersions": [
      {
         "LaunchTemplateName": "TestVersion",
         "VersionNumber": 1,
         "LaunchTemplateId": "lt-0abcd290751193123"
      }
   ]
}
```

- For API details, see DeleteLaunchTemplateVersions in AWS CLI Command Reference.

dele-te-launch-template

The following code example shows how to use delete-launch-template.

AWS CLI

To delete a launch template
This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 2,
    "LaunchTemplateId": "lt-0abcd290751193123",
    "LaunchTemplateName": "TestTemplate",
    "DefaultVersionNumber": 2,
    "CreatedBy": "arn:aws:iam::123456789012:root",
    "CreateTime": "2017-11-23T16:46:25.000Z"
  }
}
```

- For API details, see [DeleteLaunchTemplate](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-launch-template.html) in AWS CLI Command Reference.

**delete-local-gateway-route-table-virtual-interface-group-association**

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

**AWS CLI**

To disassociate a local gateway route table from a virtual interfaces (VIFs) group

The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
```

Output:

```
{
```
"LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
    "LocalGatewayId": "lgw-exampleid11223344",
    "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
    "OwnerId": "111122223333",
    "State": "disassociating",
    "Tags": []
}

For more information, see [VIF group associations](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC-Outposts.html) in the **AWS Outposts User Guide**.

- For API details, see [DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-local-gateway-route-table-vpc-association.html) in **AWS CLI Command Reference**.

---

### delete-local-gateway-route-table-vpc-association

The following code example shows how to use `delete-local-gateway-route-table-vpc-association`.

**AWS CLI**

**To disassociate a local gateway route table from a VPC**

The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.

```bash
aws ec2 delete-local-gateway-route-table-vpc-association \
  --local-gateway-route-table-vpc-association-id vpc-example0123456789
```

Output:

```json
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-gateway-route-table/lgw-rtb-abcdefg1234567890",
        "OwnerId": "555555555555"
    }
}
```
"LocalGatewayId": "lgw-exampleid01234567",
"VpcId": "vpc-example0123456789",
"OwnerId": "555555555555",
"State": "disassociating"
}
}

For more information, see [VPC associations](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVpcAssociation](#) in *AWS CLI Command Reference*.

delete-local-gateway-route-table

The following code example shows how to use `delete-local-gateway-route-table`.

**AWS CLI**

To delete a local gateway route table

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```bash
aws ec2 delete-local-gateway-route-table \
  --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
   "LocalGatewayRouteTable": {
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
      "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
      "OwnerId": "111122223333",
      "State": "deleting",
      "Tags": [],
      "Mode": "direct-vpc-routing"
   }
}
```
For more information, see Local gateway route tables in the AWS Outposts User Guide.

- For API details, see DeleteLocalGatewayRouteTable in AWS CLI Command Reference.

delete-local-gateway-route

The following code example shows how to use delete-local-gateway-route.

AWS CLI

To delete a route from a local gateway route table

The following delete-local-gateway-route example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \
   --destination-cidr-block 0.0.0.0/0 \
   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
   "Route": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
      "Type": "static",
      "State": "deleted",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
   }
}
```

- For API details, see DeleteLocalGatewayRoute in AWS CLI Command Reference.

delete-managed-prefix-list

The following code example shows how to use delete-managed-prefix-list.

AWS CLI

To delete a prefix list

The following delete-managed-prefix-list example deletes the specified prefix list.
The following code example shows how to use `delete-managed-prefix-list`.

**AWS CLI**

Command:

```
aws ec2 delete-managed-prefix-list \
   --prefix-list-id pl-0123456abcabcabc1
```

Output:

```json
{
   "PrefixList": {
      "PrefixListId": "pl-0123456abcabcabc1",
      "AddressFamily": "IPv4",
      "State": "delete-in-progress",
      "PrefixListName": "test",
      "MaxEntries": 10,
      "Version": 1,
      "OwnerId": "123456789012"
   }
}
```

For more information, see [Managed prefix lists](https://docs.aws.amazon.com/vpc/latest/userguide/managed-prefix-lists.html) in the *Amazon VPC User Guide*.

- For API details, see [DeleteManagedPrefixList](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-managed-prefix-list.html) in *AWS CLI Command Reference*.

The following code example shows how to use `delete-nat-gateway`.

**AWS CLI**

Command:

```
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```json
{
   "NatGatewayId": "nat-04ae55e711cec5680"
}
```
For API details, see `DeleteNatGateway` in *AWS CLI Command Reference*.

**delete-network-acl-entry**

The following code example shows how to use `delete-network-acl-entry`.

**AWS CLI**

**To delete a network ACL entry**

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100
```

For API details, see `DeleteNetworkAclEntry` in *AWS CLI Command Reference*.

**delete-network-acl**

The following code example shows how to use `delete-network-acl`.

**AWS CLI**

**To delete a network ACL**

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

For API details, see `DeleteNetworkAcl` in *AWS CLI Command Reference*.

**delete-network-insights-access-scope-analysis**

The following code example shows how to use `delete-network-insights-access-scope-analysis`.

Actions and scenarios
AWS CLI

To delete a Network Access Scope analysis

The following delete-network-insights-access-scope-analysis example deletes the specified Network Access Scope analysis.

```bash
aws ec2 delete-network-insights-access-scope-analysis \
   --network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.
- For API details, see DeleteNetworkInsightsAccessScopeAnalysis in AWS CLI Command Reference.

ddelete-network-insights-access-scope

The following code example shows how to use delete-network-insights-access-scope.

AWS CLI

To delete a Network Access Scope

The following delete-network-insights-access-scope example deletes the specified Network Access Scope.

```bash
aws ec2 delete-network-insights-access-scope \
   --network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{
   "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```
delete-network-insights-analysis

The following code example shows how to use delete-network-insights-analysis.

AWS CLI

To delete a path analysis

The following delete-network-insights-analysis example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \
    --network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"
}
```

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DeleteNetworkInsightsAnalysis in AWS CLI Command Reference.

delete-network-insights-path

The following code example shows how to use delete-network-insights-path.

AWS CLI

To delete a path

The following delete-network-insights-path example deletes the specified path. Before you can delete a path, you must delete all its analyses using the delete-network-insights-analysis command.

```
aws ec2 delete-network-insights-path \
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DeleteNetworkInsightsAccessScope in AWS CLI Command Reference.
--network-insights-path-id nip-0b26f224f1d131fa8

Output:

```json
{
   "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DeleteNetworkInsightsPath in AWS CLI Command Reference.

**delete-network-interface-permission**

The following code example shows how to use delete-network-interface-permission.

**AWS CLI**

To delete a network interface permission

This example deletes the specified network interface permission.

**Command:**

```
aws ec2 delete-network-interface-permission --network-interface-permission-id eni-perm-06fd19020ede149ea
```

Output:

```json
{
   "Return": true
}
```

- For API details, see DeleteNetworkInterfacePermission in AWS CLI Command Reference.

**delete-network-interface**

The following code example shows how to use delete-network-interface.

**AWS CLI**

To delete a network interface
This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

- For API details, see `DeleteNetworkInterface` in *AWS CLI Command Reference*.

### delete-placement-group

The following code example shows how to use `delete-placement-group`.

**AWS CLI**

**To delete a placement group**

This example command deletes the specified placement group.

Command:

```bash
aws ec2 delete-placement-group --group-name my-cluster
```

- For API details, see `DeletePlacementGroup` in *AWS CLI Command Reference*.

### delete-queued-reserved-instances

The following code example shows how to use `delete-queued-reserved-instances`.

**AWS CLI**

**To delete a queued purchase**

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```bash
aws ec2 delete-queued-reserved-instances \  
  --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```json
{
}
```
For API details, see `DeleteQueuedReservedInstances` in *AWS CLI Command Reference*.

delete-route-table

The following code example shows how to use `delete-route-table`.

**AWS CLI**

**To delete a route table**

This example deletes the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-route-table --route-table-id rtb-22574640
```

For API details, see `DeleteRouteTable` in *AWS CLI Command Reference*.

delete-route

The following code example shows how to use `delete-route`.

**AWS CLI**

**To delete a route**

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0
```
For API details, see DeleteRoute in AWS CLI Command Reference.

**delete-security-group**

The following code example shows how to use delete-security-group.

**AWS CLI**

**[EC2-Classic] To delete a security group**

This example deletes the security group named MySecurityGroup. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-security-group --group-name MySecurityGroup
```

**[EC2-VPC] To delete a security group**

This example deletes the security group with the ID sg-903004f8. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-security-group --group-id sg-903004f8
```

For more information, see Using Security Groups in the AWS Command Line Interface User Guide.

For API details, see DeleteSecurityGroup in AWS CLI Command Reference.

**delete-snapshot**

The following code example shows how to use delete-snapshot.

**AWS CLI**

**To delete a snapshot**

This example command deletes a snapshot with the snapshot ID of snap-1234567890abcdef0. If the command succeeds, no output is returned.
delete-snapshot

The following code example shows how to use delete-snapshot.

AWS CLI

To delete a snapshot

Command:

```bash
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see DeleteSnapshot in AWS CLI Command Reference.

delete-spot-datafeed-subscription

The following code example shows how to use delete-spot-datafeed-subscription.

AWS CLI

To cancel a Spot Instance data feed subscription

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-spot-datafeed-subscription
```

- For API details, see DeleteSpotDatafeedSubscription in AWS CLI Command Reference.

delete-subnet-cidr-reservation

The following code example shows how to use delete-subnet-cidr-reservation.

AWS CLI

To delete a subnet CIDR reservation

The following delete-subnet-cidr-reservation example deletes the specified subnet CIDR reservation.

Command:

```bash
aws ec2 delete-subnet-cidr-reservation \
   --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

Output:

```json
{
   "DeletedSubnetCidrReservation": {}
}
```
For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see DeleteSubnetCidrReservation in AWS CLI Command Reference.

delete-subnet

The following code example shows how to use delete-subnet.

AWS CLI

To delete a subnet

This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see DeleteSubnet in AWS CLI Command Reference.

delete-tags

The following code example shows how to use delete-tags.

AWS CLI

Example 1: To delete a tag from a resource

The following delete-tags example deletes the tag Stack=Test from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```
aws ec2 delete-tags \n   --resources ami-1234567890abcdef0 \n```
It's optional to specify the value for a tag. The following `delete-tags` example deletes the tag with the key name `purpose` from the specified instance, regardless of the tag value for the tag.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
    --tags Key=purpose
```

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following `delete-tags` example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
    --tags Key=Name,Value=
```

**Example 2: To delete a tag from multiple resources**

The following `delete-tags` example deletes the tag ``Purpose=Test`` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
    --tags Key=Purpose
```

- For API details, see [DeleteTags](#) in *AWS CLI Command Reference*.

### delete-traffic-mirror-filter-rule

The following code example shows how to use `delete-traffic-mirror-filter-rule`.

**AWS CLI**

**To delete a traffic mirror filter rule**

The following `delete-traffic-mirror-filter-rule` example deletes the specified traffic mirror filter rule.

```
aws ec2 delete-traffic-mirror-filter-rule \
```
Output:

```json
{
   "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see Modify Your Traffic Mirror Filter Rules in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorFilterRule in AWS CLI Command Reference.

**delete-traffic-mirror-filter**

The following code example shows how to use `delete-traffic-mirror-filter`.

**AWS CLI**

To delete a traffic mirror filter

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```bash
aws ec2 delete-traffic-mirror-filter \
  --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```json
{
   "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorFilter in AWS CLI Command Reference.

**delete-traffic-mirror-session**

The following code example shows how to use `delete-traffic-mirror-session`.

Actions and scenarios
AWS CLI

To delete a traffic mirror session

The following delete-traffic-mirror-session example deletes the specified traffic mirror-session.

```bash
aws ec2 delete-traffic-mirror-session \
--traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```json
{
    "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Session in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorSession in AWS CLI Command Reference.

delete-traffic-mirror-target

The following code example shows how to use delete-traffic-mirror-target.

AWS CLI

To delete a traffic mirror target

The following delete-traffic-mirror-target example deletes the specified traffic mirror target.

```bash
aws ec2 delete-traffic-mirror-target \
--traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```json
{
    "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Target in the AWS Traffic Mirroring Guide.
• For API details, see [DeleteTrafficMirrorTarget](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-traffic-mirror-target.html) in *AWS CLI Command Reference*.

### delete-transit-gateway-connect-peer

The following code example shows how to use `delete-transit-gateway-connect-peer`.

**AWS CLI**

**To delete a Transit Gateway Connect peer**

The following `delete-transit-gateway-connect-peer` example deletes the specified Connect peer.

```bash
aws ec2 delete-transit-gateway-connect-peer \
  --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

**Output:**

```json
{
  "TransitGatewayConnectPeer": {
    "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
    "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
    "State": "deleting",
    "CreationTime": "2021-10-13T03:35:17.000Z",
    "ConnectPeerConfiguration": {
      "TransitGatewayAddress": "10.0.0.234",
      "PeerAddress": "172.31.1.11",
      "InsideCidrBlocks": [
        "169.254.6.0/29"
      ],
      "Protocol": "gre",
      "BgpConfigurations": [
        {
          "TransitGatewayAsn": 64512,
          "PeerAsn": 64512,
          "TransitGatewayAddress": "169.254.6.2",
          "PeerAddress": "169.254.6.1",
          "BgpStatus": "down"
        },
        {
          "TransitGatewayAsn": 64512,
          "PeerAsn": 64512,
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnectPeer in AWS CLI Command Reference.

delete-transit-gateway-connect

The following code example shows how to use delete-transit-gateway-connect.

AWS CLI

To delete a transit gateway Connect attachment

The following delete-transit-gateway-connect example deletes the specified Connect attachment.

```
aws ec2 delete-transit-gateway-connect \
   --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
   "TransitGatewayConnect": {
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "State": "deleting",
      "CreationTime": "2021-03-09T19:59:17+00:00",
      "Options": {
         "Protocol": "gre"
      }
   }
}
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnect in AWS CLI Command Reference.

delete-transit-gateway-multicast-domain

The following code example shows how to use delete-transit-gateway-multicast-domain.

AWS CLI

To delete a transit gateway multicast domain

The following delete-transit-gateway-multicast-domain example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
   "TransitGatewayMulticastDomain": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",
      "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",
      "State": "deleting",
      "CreationTime": "2019-11-20T22:02:03.000Z"
   }
}
```

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayMulticastDomain in AWS CLI Command Reference.

delete-transit-gateway-peering-attachment

The following code example shows how to use delete-transit-gateway-peering-attachment.

AWS CLI

To delete a transit gateway peering attachment
The following delete-transit-gateway-peering-attachment example deletes the specified transit gateway peering attachment.

```bash
aws ec2 delete-transit-gateway-peering-attachment \
--transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```json
{
   "TransitGatewayPeeringAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
      "RequesterTgwInfo": {
         "TransitGatewayId": "tgw-123abc05e04123abc",
         "OwnerId": "123456789012",
         "Region": "us-west-2"
      },
      "AccepterTgwInfo": {
         "TransitGatewayId": "tgw-11223344aabbcc112",
         "OwnerId": "123456789012",
         "Region": "us-east-2"
      },
      "State": "deleting",
      "CreationTime": "2019-12-09T11:38:31.000Z"
   }
}
```

For more information, see Transit Gateway Peering Attachments in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayPeeringAttachment in AWS CLI Command Reference.

**delete-transit-gateway-policy-table**

The following code example shows how to use delete-transit-gateway-policy-table.

**AWS CLI**

**To delete a transit gateway policy table**

The following delete-transit-gateway-policy-table example deletes the specified transit gateway policy table.

```bash
aws ec2 delete-transit-gateway-policy-table \
```
**Output:**

```json
{
  "TransitGatewayPolicyTables": [
    {
      "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
      "TransitGatewayId": "tgw-067f8505c18f0bd6e",
      "State": "deleting",
      "CreationTime": "2023-11-28T16:36:43+00:00",
      "Tags": []
    }
  ]
}
```

For more information, see [Transit gateway policy tables](https://docs.aws.amazon.com/TransitGateway/latest/UserGuide/) in the *Transit Gateway User Guide*.

- For API details, see [DeleteTransitGatewayPolicyTable](https://docs.aws.amazon.com/AWSCommandReference/) in *AWS CLI Command Reference*.

**delete-transit-gateway-prefix-list-reference**

The following code example shows how to use `delete-transit-gateway-prefix-list-reference`.

**AWS CLI**

**To delete a prefix list reference**

The following `delete-transit-gateway-prefix-list-reference` example deletes the specified prefix list reference.

```bash
aws ec2 delete-transit-gateway-prefix-list-reference \
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
  --prefix-list-id pl-11111122222222333
```

**Output:**

```json
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
    "Tags": []
  }
}
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayPrefixListReference in AWS CLI Command Reference.

**delete-transit-gateway-route-table**

The following code example shows how to use delete-transit-gateway-route-table.

**AWS CLI**

**To delete a transit gateway route table**

The following delete-transit-gateway-route-table example deletes the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-17T20:27:26.000Z"
    }
}
```
For more information, see [Delete a transit gateway route table](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.

**delete-transit-gateway-route**

The following code example shows how to use delete-transit-gateway-route.

### AWS CLI

#### To delete a CIDR block from a route table

The following delete-transit-gateway-route example deletes the CIDR block from the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route \\
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \\
  --destination-cidr-block 10.0.2.0/24
```

**Output:**

```
{
  "Route": {
    "DestinationCidrBlock": "10.0.2.0/24",
    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceType": "vpc"
      }
    ],
    "Type": "static",
    "State": "deleted"
  }
}
```

For more information, see [Delete a static route](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRoute](#) in *AWS CLI Command Reference*.

**delete-transit-gateway-vpc-attachment**

The following code example shows how to use delete-transit-gateway-vpc-attachment.
AWS CLI

To delete a transit gateway VPC attachment

The following delete-transit-gateway-vpc-attachment example deletes the specified VPC attachment.

```
aws ec2 delete-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:

```
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0d2c54bdb3EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "VpcId": "vpc-0065acced4f61c651",
      "VpcOwnerId": "111122223333",
      "State": "deleting",
      "CreationTime": "2019-07-17T16:04:27.000Z"
   }
}
```

For more information, see Delete a VPC attachment in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayVpcAttachment in AWS CLI Command Reference.

delete-transit-gateway

The following code example shows how to use delete-transit-gateway.

AWS CLI

To delete a transit gateway

The following delete-transit-gateway example deletes the specified transit gateway.

```
aws ec2 delete-transit-gateway \
   --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:
For more information, see [Delete a transit gateway](https://docs.aws.amazon.com/ transite-gateways/latest/userguide/delete-transit-gateway.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway.html) in *AWS CLI Command Reference*.

### delete-verified-access-endpoint

The following code example shows how to use `delete-verified-access-endpoint`.

**AWS CLI**

**To delete a Verified Access endpoint**

The following `delete-verified-access-endpoint` example deletes the specified Verified Access endpoint.

```bash
aws ec2 delete-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```json
{
}
```
"VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
    "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
    "SecurityGroupIds": ["sg-004915970c4c8f13a"],
    "NetworkInterfaceOptions": {
        "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
        "Protocol": "https",
        "Port": 443
    },
    "Status": {
        "Code": "deleting"
    },
    "Description": "Testing Verified Access",
    "CreationTime": "2023-08-25T20:54:43",
    "LastUpdatedTime": "2023-08-25T22:46:32"
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-endpoints.html) in the AWS Verified Access User Guide.

- For API details, see [DeleteVerifiedAccessEndpoint](https://docs.aws.amazon.com/cli/latest/reference/verified-access/delete-verified-access-group.html) in AWS CLI Command Reference.

delete-verified-access-group

The following code example shows how to use delete-verified-access-group.

**AWS CLI**

**To delete a Verified Access group**

The following delete-verified-access-group example deletes the specified Verified Access group.
aws ec2 delete-verified-access-group \
   --verified-access-group-id vagr-0dbe967baf14b7235

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:49:03",
        "DeletionTime": "2023-08-26T00:58:31"
    }
}
```

For more information, see [Verified Access groups](https://aws.amazon.com/documentation/verified-access/groups/) in the AWS Verified Access User Guide.

---

### delete-verified-access-instance

The following code example shows how to use delete-verified-access-instance.

**AWS CLI**

**To delete a Verified Access instance**

The following delete-verified-access-instance example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \
   --verified-access-instance-id vai-0ce000c0b7643abea
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:49:03",
        "DeletionTime": "2023-08-26T00:58:31"
    }
}
```
"Description": "Testing Verified Access",
"VerifiedAccessTrustProviders": [],
"CreationTime": "2023-08-25T18:27:56",
"LastUpdatedTime": "2023-08-26T01:00:18"
}
}

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/APIReference/API_CreateVerifiedAccessInstance.html) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessInstance](https://docs.aws.amazon.com/verified-access/latest/APIReference/API_DeleteVerifiedAccessInstance.html) in *AWS CLI Command Reference*.

### delete-verified-access-trust-provider

The following code example shows how to use `delete-verified-access-trust-provider`.

**AWS CLI**

**To delete a Verified Access trust provider**

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

**Output:**

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36"
   }
}
```

For more information, see [Trust providers for Verified Access](https://docs.aws.amazon.com/verified-access/latest/APIReference/API_CreateVerifiedAccessInstance.html) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessTrustProvider](https://docs.aws.amazon.com/verified-access/latest/APIReference/API_DeleteVerifiedAccessTrustProvider.html) in *AWS CLI Command Reference*. 

Actions and scenarios 2183
**delete-volume**

The following code example shows how to use `delete-volume`.

**AWS CLI**

**To delete a volume**

This example command deletes an available volume with the volume ID of `vol-049df61146c4d7901`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-volume --volume-id vol-049df61146c4d7901
```

- For API details, see [DeleteVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-volume.html) in *AWS CLI Command Reference*.

**delete-vpc-endpoint-connection-notifications**

The following code example shows how to use `delete-vpc-endpoint-connection-notifications`.

**AWS CLI**

**To delete an endpoint connection notification**

This example deletes the specified endpoint connection notification.

Command:

```
aws ec2 delete-vpc-endpoint-connection-connection-notifications --connection-notification-ids vpce-nfn-008776de7e03f5abc
```

Output:

```
{
   "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointConnectionNotifications](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-vpc-endpoint-connection-notifications.html) in *AWS CLI Command Reference*.  

Actions and scenarios
delete-vpc-endpoint-service-configurations

The following code example shows how to use `delete-vpc-endpoint-service-configurations`.

**AWS CLI**

**To delete an endpoint service configuration**

This example deletes the specified endpoint service configuration.

Command:

```bash
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-svc-03d5ebb7d9579a2b3
```

Output:

```json
{
   "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointServiceConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-vpc-endpoint-service-configurations.html) in *AWS CLI Command Reference*.

delete-vpc-endpoints

The following code example shows how to use `delete-vpc-endpoints`.

**AWS CLI**

**To delete an endpoint**

This example deletes endpoints `vpce-aa22bb33` and `vpce-1a2b3c4d`. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

Command:

```bash
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:
For API details, see DeleteVpcEndpoints in AWS CLI Command Reference.

delete-vpc-peering-connection

The following code example shows how to use delete-vpc-peering-connection.

AWS CLI

To delete a VPC peering connection

This example deletes the specified VPC peering connection.

Command:

```
aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "Return": true
}
```

For API details, see DeleteVpcPeeringConnection in AWS CLI Command Reference.

delete-vpc

The following code example shows how to use delete-vpc.

AWS CLI

To delete a VPC

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpc --vpc-id vpc-a01106c2
```
• For API details, see DeleteVpc in AWS CLI Command Reference.

delete-vpn-connection-route

The following code example shows how to use delete-vpn-connection-route.

AWS CLI

To delete a static route from a VPN connection

This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

• For API details, see DeleteVpnConnectionRoute in AWS CLI Command Reference.

delete-vpn-connection

The following code example shows how to use delete-vpn-connection.

AWS CLI

To delete a VPN connection

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

• For API details, see DeleteVpnConnection in AWS CLI Command Reference.

delete-vpn-gateway

The following code example shows how to use delete-vpn-gateway.
AWS CLI

**To delete a virtual private gateway**

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```

- For API details, see [DeleteVpnGateway](#) in *AWS CLI Command Reference*.

**deprovision-byoip-cidr**

The following code example shows how to use `deprovision-byoip-cidr`.

**AWS CLI**

**To remove an IP address range from use**

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr 
--cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-deprovision"
    }
}
```

- For API details, see [DeprovisionByoipCidr](#) in *AWS CLI Command Reference*.

**deprovision-ipam-pool-cidr**

The following code example shows how to use `deprovision-ipam-pool-cidr`.

Actions and scenarios
AWS CLI

To deprovision an IPAM pool CIDR

The following deprovision-ipam-pool-cidr example deprovisions a CIDR provisioned to an IPAM pool.

(Linux):

```bash
aws ec2 deprovision-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
   --cidr 11.0.0.0/16
```

(Windows):

```bash
aws ec2 deprovision-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
   --cidr 11.0.0.0/16
```

Output:

```
{
   "IpamPoolCidr": {
      "Cidr": "11.0.0.0/16",
      "State": "pending-deprovision"
   }
}
```

For more information, see Deprovision pool CIDRs in the Amazon VPC IPAM User Guide. For API details, see DeprovisionIpamPoolCidr in AWS CLI Command Reference.

deregister-image

The following code example shows how to use deregister-image.

AWS CLI

To deregister an AMI

This example deregisters the specified AMI. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see [DeregisterImage](#) in AWS CLI Command Reference.

**deregister-instance-event-notification-attributes**

The following code example shows how to use deregister-instance-event-notification-attributes.

**AWS CLI**

**Example 1: To remove all tags from event notifications**

The following deregister-instance-event-notification-attributes example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to `false`.

```bash
aws ec2 deregister-instance-event-notification-attributes \  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```json
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [],
    "IncludeAllTagsOfInstance": true
  }
}
```

For more information, see [Scheduled events for your instances](#) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To remove specific tags from event notifications**

The following deregister-instance-event-notification-attributes example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use describe-instance-event-notification-attributes.
aws ec2 deregister-instance-event-notification-attributes \
   --instance-tag-attribute InstanceTagKeys="tag-key2"

Output:

{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [
         "tag-key2"
      ],
      "IncludeAllTagsOfInstance": false
   }
}

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DeregisterInstanceEventNotificationAttributes in AWS CLI Command Reference.

deregister-transit-gateway-multicast-group-members

The following code example shows how to use deregister-transit-gateway-multicast-group-members.

AWS CLI

To deregister group members from a multicast group

This example deregisters the specified network interface group member from the transit gateway multicast group.

aws ec2 deregister-transit-gateway-multicast-group-members \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \
   --group-ip-address 224.0.1.0 \
   --network-interface-ids eni-0e246d3269EXAMPLE

Output:

{
"DeregisteredMulticastGroupMembers": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
    "RegisteredNetworkInterfaceIds": [
        "eni-0e246d3269EXAMPLE"
    ],
    "GroupIpAddress": "224.0.1.0"
}
}

For more information, see Deregister Members from a Multicast Group in the AWS Transit Gateways Users Guide.

- For API details, see DeregisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.

deregister-transit-gateway-multicast-group-source

The following code example shows how to use deregister-transit-gateway-multicast-group-source.

AWS CLI

to deregister a source from the transit gateway multicast group

This example deregisters the specified network interface group source from the multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "DeregisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "DeregisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```
For more information, see Deregister Sources from a Multicast Group in the AWS Transit Gateways User Guide.

- For API details, see DeregisterTransitGatewayMulticastGroupSource in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

**AWS CLI**

**To describe all the attributes for your AWS account**

This example describes the attributes for your AWS account.

Command:

```
aws ec2 describe-account-attributes
```

Output:

```json
{
    "AccountAttributes": [
        {
            "AttributeName": "vpc-max-security-groups-per-interface",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "max-instances",
            "AttributeValues": [
                {
                    "AttributeValue": "20"
                }
            ]
        }
    ]
}
```
To describe a single attribute for your AWS account

This example describes the `supported-platforms` attribute for your AWS account.

Command:
**aws ec2 describe-account-attributes --attribute-names supported-platforms**

Output:

```json
{
    "AccountAttributes": [
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                { "AttributeValue": "EC2" },
                { "AttributeValue": "VPC" }
            ]
        }
    ]
}
```

- For API details, see [DescribeAccountAttributes](#) in **AWS CLI Command Reference**.

**describe-address-transfers**

The following code example shows how to use `describe-address-transfers`.

**AWS CLI**

**To describe an Elastic IP address transfer**

The following `describe-address-transfers` example describes the Elastic IP address transfer for the specified Elastic IP address.

```bash
aws ec2 describe-address-transfers \  
   --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```json
{
    "AddressTransfers": [
        {
        }
    ]
}
```
For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

• For API details, see DescribeAddressTransfers in AWS CLI Command Reference.

describe-addresses-attribute

The following code example shows how to use describe-addresses-attribute.

AWS CLI

To view the attributes of the domain name associated with an elastic IP address

The following describe-addresses-attribute examples return the attributes of the domain name associated with the elastic IP address.

Linux:

```bash
aws ec2 describe-addresses-attribute
    --allocation-ids eipalloc-abcdef01234567890
    --attribute domain-name
```

Windows:

```bash
aws ec2 describe-addresses-attribute ^
    --allocation-ids eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

Output:

```json
{
   "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "TransferAccountId": "123456789012",
      "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
      "AddressTransferStatus": "pending"
    }
  ]
}
```
To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see Use reverse DNS for email applications in the Amazon EC2 User Guide or modify-address-attribute in the AWS CLI Command Reference.

• For API details, see DescribeAddressesAttribute in AWS CLI Command Reference.

describe-addresses

The following code example shows how to use describe-addresses.

AWS CLI

Example 1: To retrieve details about all of your Elastic IP addresses

The following describe addresses example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

Output:

```
{
   "Addresses": [
   {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "198.51.100.0",
      "PublicIpv4Pool": "amazon",
      "Domain": "standard"
   },
   {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
   }
]
}```
Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
  --filters "Name=domain,Values=vpc"
```

Output:

```
{
  "Addresses": [
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
      "AllocationId": "eipalloc-12345678",
      "PrivateIpAddress": "10.0.1.241"
    }
  ]
}
```

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
  --allocation-ids eipalloc-282d9641
```

Output:
Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following describe-addresses example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```
aws ec2 describe-addresses \
    --filters "Name=private-ip-address,Values=10.251.50.12"
```

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following describe-addresses example displays details about your Elastic IP addresses for use in EC2-Classic.

```
aws ec2 describe-addresses \
    --filters "Name=domain,Values=standard"
```

Output:

```json
{
    "Addresses": [
    {
        "InstanceId": "i-1234567890abcdef0",
        "PublicIp": "203.0.110.25",
        "PublicIpv4Pool": "amazon",
        "AssociationId": "eipassoc-123abc12",
        "NetworkInterfaceOwnerId": "1234567891012",
        "PublicIp": "203.0.113.25",
        "AllocationId": "eipalloc-282d9641",
        "PrivateIpAddress": "10.251.50.12"
    }
    ]
}
```
Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following `describe-addresses` example displays details about the Elastic IP address with the value `203.0.110.25`, which is associated with an instance in EC2-Classic.

```bash
aws ec2 describe-addresses \
   --public-ips 203.0.110.25
```

Output:

```
{
   "Addresses": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "PublicIp": "203.0.110.25",
         "PublicIpv4Pool": "amazon",
         "Domain": "standard"
      }
   ]
}
```

- For API details, see [DescribeAddresses](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-security-groups.html) in *AWS CLI Command Reference*.

**describe-aggregate-id-format**

The following code example shows how to use `describe-aggregate-id-format`.

**AWS CLI**

To describe the longer ID format settings for all resource types in a Region

The following `describe-aggregate-id-format` example describes the overall long ID format status for the current Region. The Deadline value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The `UseLongIdsAggregated` value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.
aws ec2 describe-aggregate-id-format

Output:

```json
{
  "UseLongIdsAggregated": true,
  "Statutes": [ 
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "network-interface-attachment",
      "UseLongIds": true
    },
    {
      "Deadline": "2016-12-13T02:00:00.000Z",
      "Resource": "instance",
      "UseLongIds": true
    },
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "elastic-ip-association",
      "UseLongIds": true
    },
    ...
  ]
}
```

- For API details, see [DescribeAggregateIdFormat](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-aggregate-id-format.html) in *AWS CLI Command Reference*.

**describe-availability-zones**

The following code example shows how to use `describe-availability-zones`.

**AWS CLI**

*To describe your Availability Zones*

The following example `describe-availability-zones` displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2 (Oregon)` Region.

```
aws ec2 describe-availability-zones
```
Output:

```json
{
    "AvailabilityZones": [
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2a",
        "ZoneId": "usw2-az1",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2b",
        "ZoneId": "usw2-az2",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2c",
        "ZoneId": "usw2-az3",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2d",
        "ZoneId": "usw2-az4",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    }
]}
```
For API details, see [DescribeAvailabilityZones](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/describe-availability-zones.html) in *AWS CLI Command Reference*.

**describe-aws-network-performance-metric-subscription**

The following code example shows how to use `describe-aws-network-performance-metric-subscription`.

**AWS CLI**

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes"
        }
    ]
}
```
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

**describe-aws-network-performance-metric-subscriptions**

The following code example shows how to use describe-aws-network-performance-metric-subscriptions.

**AWS CLI**

To describe your metric subscriptions

The following describe-aws-network-performance-metric-subscriptions example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
   "Subscriptions": [
   {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
   }
   ]
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscriptions in AWS CLI Command Reference.

**describe-bundle-tasks**

The following code example shows how to use describe-bundle-tasks.
**AWS CLI**

**To describe your bundle tasks**

This example describes all of your bundle tasks.

**Command:**

```bash
aws ec2 describe-bundle-tasks
```

**Output:**

```json
{
  "BundleTasks": [
    {
      "UpdateTime": "2015-09-15T13:26:54.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
        "S3": {
          "Prefix": "winami",
          "Bucket": "bundletasks"
        }
      },
      "State": "bundling",
      "StartTime": "2015-09-15T13:24:35.000Z",
      "Progress": "3%",
      "BundleId": "bun-2a4e041c"
    }
  ]
}
```

- For API details, see [DescribeBundleTasks](#) in *AWS CLI Command Reference*.

---

**describe-byoip-cidrs**

The following code example shows how to use `describe-byoip-cidrs`.

**AWS CLI**

**To describe your provisioned address ranges**

The following `describe-byoip-cidrs` example displays details about the public IPv4 address ranges that you provisioned for use by AWS.
aws ec2 describe-byoip-cidrs

Output:

```json
{
   "ByoipCidrs": [
      {
         "Cidr": "203.0.113.25/24",
         "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
         "State": "provisioned"
      }
   ]
}
```

- For API details, see [DescribeByoipCidrs](#) in *AWS CLI Command Reference*.

**describe-capacity-reservation-fleets**

The following code example shows how to use `describe-capacity-reservation-fleets`.

**AWS CLI**

**To view a Capacity Reservation Fleet**

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet:

```bash
aws ec2 describe-capacity-reservation-fleets \
   --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```json
{
   "CapacityReservationFleets": [
      {
         "Status": "active",
         "EndDate": "2022-12-31T23:59:59.000Z",
         "InstanceMatchCriteria": "open",
         "Tags": [],
         "CapacityReservationFleetId": "crf-abcdef01234567890",
         ... // more details
      }
   ]
}
```
"Tenancy": "default",
"InstanceTypeSpecifications": [  
  {  
    "CapacityReservationId": "cr-1234567890abcdef0",
    "AvailabilityZone": "us-east-1a",
    "FulfilledCapacity": 5.0,
    "Weight": 1.0,
    "CreateDate": "2022-07-02T08:34:33.398Z",
    "InstancePlatform": "Linux/UNIX",
    "TotalInstanceCount": 5,
    "Priority": 1,
    "EbsOptimized": true,
    "InstanceType": "m5.xlarge"
  }  
],
"TotalTargetCapacity": 5,
"TotalFulfilledCapacity": 5.0,
"CreateTime": "2022-07-02T08:34:33.397Z",
"AllocationStrategy": "prioritized"
}
]

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/CapacityReservationFleets.html) in the Amazon EC2 User Guide.

- For API details, see [DescribeCapacityReservationFleets](https://docs.aws.amazon.com/AWSCLI/latest/userguide/cli-aws-ec2.html#cli-aws-ec2-description) in AWS CLI Command Reference.

**describe-capacity-reservations**

The following code example shows how to use describe-capacity-reservations.

**AWS CLI**

**Example 1: To describe one or more of your capacity reservations**

The following describe-capacity-reservations example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:
Example 2: To describe one or more of your capacity reservations

The following describe-capacity-reservations example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \
```
Output:

```json
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1234abcd56EXAMPLE",
            "EndDateType": "unlimited",
            "AvailabilityZone": "eu-west-1a",
            "InstanceMatchCriteria": "open",
            "Tags": [],
            "EphemeralStorage": false,
            "CreateDate": "2019-08-16T09:03:18.000Z",
            "AvailableInstanceCount": 1,
            "InstancePlatform": "Linux/UNIX",
            "TotalInstanceCount": 1,
            "State": "active",
            "Tenancy": "default",
            "EbsOptimized": true,
            "InstanceType": "a1.medium"
        }
    ]
}
```

For more information, see Viewing a Capacity Reservation in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeCapacityReservations in AWS CLI Command Reference.

describe-carrier-gateways

The following code example shows how to use describe-carrier-gateways.

AWS CLI

To describe all carrier gateways

The following describe-carrier-gateways example lists all your carrier gateways.

```
aws ec2 describe-carrier-gateways
```

Output:
{  "CarrierGateways": [  {   "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",   "VpcId": "vpc-0c529aEXAMPLE",   "State": "available",   "OwnerId": "123456789012",   "Tags": [    {      "Key": "example",      "Value": "tag"    }   ]  }  ]}

For more information, see Carrier gateways<https://docs.aws.amazon.com/vpc/latest/userguide/Carrier_Gateway.html> in the Amazon Virtual Private Cloud User Guide.

- For API details, see DescribeCarrierGateways in AWS CLI Command Reference.

describe-classic-link-instances

The following code example shows how to use describe-classic-link-instances.

**AWS CLI**

**To describe linked EC2-Classic instances**

This example lists all of your linked EC2-Classic instances.

Command:

```
aws ec2 describe-classic-link-instances
```

Output:

```json
{
  "Instances": [  
    
  ]
}
```
This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```bash
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```json
{
  "Instances": [
    {
      "VpcId": "vpc-88888888",
      "Groups": [
        {
          "GroupId": "sg-11122233"
        }
      ],
      "Tags": [
        {
          "Value": "ClassicInstance",
          "Key": "Name"
        }
      ]
    },
    {
      "InstanceId": "i-0598c7d356eba48d7",
      "VpcId": "vpc-12312312",
      "Groups": [
        {
          "GroupId": "sg-aabbcddd"
        }
      ],
      "Tags": [
        {
          "Value": "ClassicInstance2",
          "Key": "Name"
        }
      ]
    }
  ]
}
```
For API details, see DescribeClassicLinkInstances in AWS CLI Command Reference.

describe-client-vpn-authorization-rules

The following code example shows how to use describe-client-vpn-authorization-rules.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following describe-client-vpn-authorization-rules example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "AuthorizationRules": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "GroupId": "",
            "AccessAll": true,
            "DestinationCidr": "0.0.0/0",
            "GroupId": "sg-11122233",
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ],
            "VpcId": "vpc-88888888",
            "Groups": [
                {
                    "GroupId": "sg-11122233"
                }
            ],
            "InstanceId": "i-1234567890abcdef0",
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```
For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnAuthorizationRules in AWS CLI Command Reference.

**describe-client-vpn-connections**

The following code example shows how to use describe-client-vpn-connections.

**AWS CLI**

To describe the connections to a Client VPN endpoint

The following describe-client-vpn-connections example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
   "Connections": [
      {
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "Timestamp": "2019-08-12 07:58:34",
         "ConnectionId": "cvpn-connection-0e03eb24267165acd",
         "ConnectionEstablishedTime": "2019-08-12 07:57:14",
         "IngressBytes": "32302",
         "EgressBytes": "5696",
         "IngressPackets": "332",
         "EgressPackets": "67",
         "ClientIp": "172.31.0.225",
         "CommonName": "client1.domain.tld",
         "Status": {
            "Code": "terminated"
         }
      }
   ]
}
```
For more information, see [Client Connections](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/aws-connection-status.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnConnections](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-client-vpn-endpoints.html) in *AWS CLI Command Reference*.

**describe-client-vpn-endpoints**

The following code example shows how to use `describe-client-vpn-endpoints`.

**AWS CLI**

To describe your Client VPN endpoints

The following `describe-client-vpn-endpoints` example displays details about all of your Client VPN endpoints.

```
aws ec2 describe-client-vpn-endpoints
```

Output:

```
{
    "ClientVpnEndpoints": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-1234567890123abcde",

For more information, see [Client VPN Endpoints](https://aws.amazon.com) in the [AWS Client VPN Administrator Guide](https://aws.amazon.com).

- For API details, see [DescribeClientVpnEndpoints](https://aws.amazon.com) in [AWS CLI Command Reference](https://aws.amazon.com).

**describe-client-vpn-routes**

The following code example shows how to use `describe-client-vpn-routes`.

**AWS CLI**

**To describe the routes for a Client VPN endpoint**

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-routes
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

**Output:**

```
{
   "Routes": [
      {
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "DestinationCidr": "10.0.0.0/16",
         "TargetSubnet": "subnet-0123456789abcabca",
         "Type": "Nat",
         "Origin": "associate",
         "Status": {
            "Code": "active"
         },
         "Description": "Default Route"
      }
   ]
}
```
For more information, see Routes in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnRoutes in AWS CLI Command Reference.

describe-client-vpn-target-networks

The following code example shows how to use describe-client-vpn-target-networks.

AWS CLI

To describe the target networks for a Client VPN endpoint

The following describe-client-vpn-target-networks example displays details about the target networks for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-target-networks \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
  "ClientVpnTargetNetworks": [
    {
      "AssociationId": "cvpn-assoc-012e837060753dc3d",
      "VpcId": "vpc-1111122222333333",
      "TargetNetworkId": "subnet-0123456789abcabca",
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Status": {
        "Code": "associating"
      }
    }
  ]
}
```
"SecurityGroups": [ "sg-012345678910abcab" ]

For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnTargetNetworks in AWS CLI Command Reference.

describe-coip-pools

The following code example shows how to use describe-coip-pools.

**AWS CLI**

**To describe customer-owned IP address pools**

The following describe-coip-pools example describes the customer-owned IP address pools in your AWS account.

```bash
aws ec2 describe-coip-pools
```

Output:

```json
{
   "CoipPools": [
      {
         "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
         "PoolCidrs": [ "0.0.0.0/0"
         ],
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      }
   ]
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DescribeCoipPools in AWS CLI Command Reference.
describe-conversion-tasks

The following code example shows how to use describe-conversion-tasks.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```

Output:

```json
{
   "ConversionTasks": [
      {
         "ConversionTaskId": "import-i-ffvko9js",
         "ImportInstance": {
            "InstanceId": "i-1234567890abcdef0",
            "Volumes": [
               {
                  "Volume": {
                     "Id": "vol-049df61146c4d7901",
                     "Size": 16
                  },
                  "Status": "completed",
                  "Image": {
                     "Size": 1300687360,
                     "ImportManifestUrl": "https://s3.amazonaws.com/myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=140EXAMPLE&Signature=XYNhznHNgCqsjDxL9wRL%2FJvEXAMPLE",
                     "Format": "VMDK"
                  },
                  "BytesConverted": 1300682960,
                  "AvailabilityZone": "us-east-1d"
               }
            ]
         },
         "State": "completed"
      }
   ]
```
describe-customer-gateways

The following code example shows how to use describe-customer-gateways.

AWS CLI

To describe your customer gateways

This example describes your customer gateways.

Command:

```bash
aws ec2 describe-customer-gateways
```

Output:

```
{
    "CustomerGateways": [
    {
        "CustomerGatewayId": "cgw-b4dc3961",
        "IpAddress": "203.0.113.12",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65000"
    },
    {
        "CustomerGatewayId": "cgw-0e11f167",
        "IpAddress": "12.1.2.3",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65534"
    }
    ]
}
```

To describe a specific customer gateway

• For API details, see DescribeConversionTasks in AWS CLI Command Reference.
This example describes the specified customer gateway.

Command:

```bash
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```json
{
   "CustomerGateways": [
      {
         "CustomerGatewayId": "cgw-0e11f167",
         "IpAddress": "12.1.2.3",
         "State": "available",
         "Type": "ipsec.1",
         "BgpAsn": "65534"
      }
   ]
}
```

describe-dhcp-options

The following code example shows how to use describe-dhcp-options.

**AWS CLI**

**Example 1: To describe your DHCP options**

The following describe-dhcp-options example retrieves details about your DHCP options.

```bash
aws ec2 describe-dhcp-options
```

Output:

```json
{
   "DhcpOptions": [
      {
         "DhcpConfigurations": [
            {
               "Key": "domain-name",
               "Value": "example.com"
            }
         ]
      }
   ]
}
```
"Values": [  
  {  
    "Value": "us-east-2.compute.internal"  
  }  
],  
"Key": "domain-name-servers",  
"Values": [  
  {  
    "Value": "AmazonProvidedDNS"  
  }  
]  
},  
{  
  "DhcpConfigurations": [  
    {  
      "Key": "domain-name",  
      "Values": [  
        {  
          "Value": "us-east-2.compute.internal"  
        }  
      ]  
    },  
    {  
      "Key": "domain-name-servers",  
      "Values": [  
        {  
          "Value": "AmazonProvidedDNS"  
        }  
      ]  
    }  
  ],  
  "DhcpOptionsId": "dopt-fEXAMPLE",  
  "OwnerId": "111122223333"  
},  
{  
  "DhcpConfigurations": [  
    {  
      "Key": "domain-name",  
      "Values": [  
        {  
          "Value": "us-east-2.compute.internal"  
        }  
      ]  
    },  
    {  
      "Key": "domain-name-servers",  
      "Values": [  
        {  
          "Value": "AmazonProvidedDNS"  
        }  
      ]  
    }  
  ],  
  "DhcpOptionsId": "dopt-19edf471",  
  "OwnerId": "111122223333"  
}  
]
For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

Example 2: To describe your DHCP options and filter the output

The following describe-dhcp-options example describes your DHCP options and uses a filter to return only DHCP options that have example.com for the domain name server. The example uses the --query parameter to display only the configuration information and ID in the output.

```
aws ec2 describe-dhcp-options \
  --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
  --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:

```
[
  [
    {
      "Key": "domain-name",
      "Values": [
        {
          "Value": "example.com"
        }
      ]
    },
    {
      "Key": "domain-name-servers",
      "Values": [
        {
          "Value": "172.16.16.16"
        }
      ]
    }
  ],
  "dopt-001122334455667ab"
]
```

For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

- For API details, see DescribeDhcpOptions in AWS CLI Command Reference.
describe-egress-only-internet-gateways

The following code example shows how to use describe-egress-only-internet-gateways.

AWS CLI

To describe your egress-only Internet gateways

This example describes your egress-only Internet gateways.

Command:

```
aws ec2 describe-egress-only-internet-gateways
```

Output:

```
{
  "EgressOnlyInternetGateways": [
    {
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
      "Attachments": [
        {
          "State": "attached",
          "VpcId": "vpc-0c62a468"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeEgressOnlyInternetGateways](#) in AWS CLI Command Reference.

describe-elastic-gpus

The following code example shows how to use describe-elastic-gpus.

AWS CLI

To describe an Elastic GPU

Command:
For API details, see [DescribeElasticGpus](#) in AWS CLI Command Reference.

### describe-export-image-tasks

The following code example shows how to use `describe-export-image-tasks`.

**AWS CLI**

#### To monitor an export image task

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

```bash
aws ec2 describe-export-image-tasks \
    --export-image-task-ids export-ami-1234567890abcdef0
```

Output for an export image task that is in progress.

```json
{
    "ExportImageTasks": [
        {
            "ExportImageTaskId": "export-ami-1234567890abcdef0",
            "Progress": "21",
            "S3ExportLocation": {
                "S3Bucket": "my-export-bucket",
                "S3Prefix": "exports/"
            },
            "Status": "active",
            "StatusMessage": "updating"
        }
    ]
}
```

Output for an export image task that is completed.

```json
{
    "ExportImageTasks": [
```
For more information, see [Export a VM from an AMI](#) in the *VM Import/Export User Guide*.

- For API details, see [DescribeExportImageTasks](#) in *AWS CLI Command Reference*.

**describe-export-tasks**

The following code example shows how to use describe-export-tasks.

**AWS CLI**

To list details about an instance export task

This example describes the export task with ID export-i-fh8sjjsq.

Command:

```
aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq
```

Output:

```json
{
    "ExportTasks": [
        {
            "State": "active",
            "InstanceExportDetails": {
                "InstanceId": "i-1234567890abcdef0",
                "TargetEnvironment": "vmware"
            },
            "ExportToS3Task": {
                "S3Bucket": "myexportbucket",
                "S3Key": "RHEL5export-i-fh8sjjsq.ova",
                "DiskImageFormat": "vmdk"
            }
        }
    ]
}
```
For API details, see [DescribeExportTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-export-tasks.html) in *AWS CLI Command Reference.*

### describe-fast-launch-images

The following code example shows how to use `describe-fast-launch-images`.

**AWS CLI**

To describe the details for Windows AMIs that are configured for faster launching

The following `describe-fast-launch-images` example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```bash
aws ec2 describe-fast-launch-images
```

**Output:**

```json
{
   "FastLaunchImages": [
   {

   }
   ]
}
```
For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the [Amazon EC2 User Guide](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/AMIGetStarted.html).

### describe-fast-snapshot-restores

The following code example shows how to use describe-fast-snapshot-restores.

#### AWS CLI

**To describe fast snapshot restores**

The following `describe-fast-snapshot-restores` example displays details for all fast snapshot restores with a state of `disabled`.

```bash
code
aws ec2 describe-fast-snapshot-restores \
  --filters Name=state,Values=disabled
```

**Output:**

```json
code
{
  "FastSnapshotRestores": [
    {
      "SnapshotId": "snap-1234567890abcdef0",
      "AvailabilityZone": "us-west-2c",
      "State": "disabled",
      "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",
      "OwnerId": "123456789012",
      "EnablingTime": "2020-01-25T23:57:49.596Z",
      "OptimizingTime": "2020-01-25T23:58:25.573Z",
      "DisablingTime": "2020-01-26T00:40:56.069Z",
      "DisabledTime": "2020-01-26T00:41:27.390Z"
    }
  ]
}
```
The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```bash
aws ec2 describe-fast-snapshot-restores
```

- For API details, see `DescribeFastSnapshotRestores` in *AWS CLI Command Reference*.

---

**describe-fleet-history**

The following code example shows how to use `describe-fleet-history`.

**AWS CLI**

To describe EC2 Fleet history

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```bash
aws ec2 describe-fleet-history \
    --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --start-time 2020-09-01T00:00:00Z
```

Output:

```json
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        }
    ]
}
```
For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeFleetHistory in AWS CLI Command Reference.

**describe-fleet-instances**

The following code example shows how to use describe-fleet-instances.
AWS CLI

To describe the running instances for an EC2 Fleet

The following describe-fleet-instances example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances \\
   --fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
   "ActiveInstances": [
    {
      "InstanceId": "i-090db02406cc3c2d6",
      "InstanceType": "t2.small",
      "SpotInstanceRequestId": "sir-a43gtpfk",
      "InstanceHealth": "healthy"
    },
    {
      "InstanceId": "i-083a1c446e66085d2",
      "InstanceType": "t2.small",
      "SpotInstanceRequestId": "sir-iwcit2nj",
      "InstanceHealth": "healthy"
    }
   ],
   "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see [Managing an EC2 Fleet](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/using-ec2-fleet.html) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see [DescribeFleetInstances](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/API_DescribeFleetInstances.html) in AWS CLI Command Reference.

**describe-fleets**

The following code example shows how to use describe-fleets.
The following describe-fleets example describes the specified EC2 Fleet.

```
aws ec2 describe-fleets \
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```json
{
  "Fleets": [
    {
      "ActivityStatus": "pending_fulfillment",
      "CreateTime": "2020-09-01T18:26:05.000Z",
      "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
      "FleetState": "active",

      "FulfilledOnDemandCapacity": 0.0,
      "LaunchTemplateConfigs": [
        {
          "LaunchTemplateSpecification": {
            "LaunchTemplateId": "lt-0e632f2855a979cd5",
            "Version": "1"
          }
        }
      ],
      "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "OnDemandTargetCapacity": 0,
        "SpotTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
      },
      "TerminateInstancesWithExpiration": false,
      "Type": "maintain",
      "ReplaceUnhealthyInstances": false,
      "SpotOptions": {
        "AllocationStrategy": "lowestPrice",
        "InstanceInterruptionBehavior": "terminate",
        "InstancePoolsToUseCount": 1
      },
      "OnDemandOptions": {
        "AllocationStrategy": "lowestPrice"
      }
    }
  ]
}
```
describe-flow-logs

The following code example shows how to use `describe-flow-logs`.

**AWS CLI**

**Example 1: To describe all of your flow logs**

The following `describe-flow-logs` example displays details for all of your flow logs.

```
aws ec2 describe-flow-logs
```

Output:

```json
{
    "FlowLogs": [
        {
            "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-role",
            "DeliverLogsStatus": "SUCCESS",
            "FlowLogId": "fl-aabbccdd112233445",
            "MaxAggregationInterval": 600,
            "FlowLogStatus": "ACTIVE",
            "LogGroupName": "FlowLogGroup",

"LogFormat": "${version} ${vpc-id} ${subnet-id} ${instance-id} ${interface-id} ${account-id} ${type} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${pkt-srcaddr} ${pkt-dstaddr} ${protocol} ${bytes} ${packets} ${start} ${end} ${action} ${tcp-flags} ${log-status}"
}
]

Example 2: To describe a subset of your flow logs

The following describe-flow-logs example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

aws ec2 describe-flow-logs \
   --filter "Name=log-group-name,Values=MyFlowLogs"

- For API details, see DescribeFlowLogs in AWS CLI Command Reference.

describe-fpga-image-attribute

The following code example shows how to use describe-fpga-image-attribute.

AWS CLI

To describe the attributes of an Amazon FPGA image

This example describes the load permissions for the specified AFI.

Command:

aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission

Output:
For API details, see `DescribeFpgaImageAttribute` in *AWS CLI Command Reference*.

**describe-fpga-images**

The following code example shows how to use `describe-fpga-images`.

**AWS CLI**

**To describe Amazon FPGA images**

This example describes AFIs that are owned by account 123456789012.

Command:

```bash
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

Output:

```json
{
   "FpgaImages": [
      {
         "UpdateTime": "2017-12-22T12:09:14.000Z",
         "Name": "my-afi",
         "PciId": {
            "SubsystemVendorId": "0xfedd",
            "VendorId": "0x1d0f",
            "DeviceId": "0xf000",
            "SubsystemId": "0x1d51"
         },
         "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
      }
   }
}
```
For API details, see [DescribeFpgaImages](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fpga-images.html) in *AWS CLI Command Reference*.

**describe-host-reservation-offerings**

The following code example shows how to use `describe-host-reservation-offerings`.

**AWS CLI**

To **describe Dedicated Host Reservation offerings**

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```bash
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```json
{
  "OfferingSet": [
    {
      "HourlyPrice": "1.499",
      "OfferingId": "hro-03f707bf363b6b324",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ]
}
```
For API details, see [DescribeHostReservationOfferings](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-host-reservation-offerings) in *AWS CLI Command Reference*. 

```json
{
  
  "HourlyPrice": "1.045",
  "OfferingId": "hro-0ef9181cabdef7a02",
  "InstanceFamily": "m4",
  "PaymentOption": "NoUpfront",
  "UpfrontPrice": "0.000",
  "Duration": 94608000
}
,
{
  "HourlyPrice": "0.714",
  "OfferingId": "hro-04567a15500b92a51",
  "InstanceFamily": "m4",
  "PaymentOption": "PartialUpfront",
  "UpfrontPrice": "6254.000",
  "Duration": 31536000
}
,
{
  "HourlyPrice": "0.484",
  "OfferingId": "hro-0d5d7a9d23ed7f7bfe",
  "InstanceFamily": "m4",
  "PaymentOption": "PartialUpfront",
  "UpfrontPrice": "12720.000",
  "Duration": 94608000
}
,
{
  "HourlyPrice": "0.000",
  "OfferingId": "hro-05da4108ca998c2e5",
  "InstanceFamily": "m4",
  "PaymentOption": "AllUpfront",
  "UpfrontPrice": "23913.000",
  "Duration": 94608000
}
,
{
  "HourlyPrice": "0.000",
  "OfferingId": "hro-0a9f9be3b95a3dc8f",
  "InstanceFamily": "m4",
  "PaymentOption": "AllUpfront",
  "UpfrontPrice": "12257.000",
  "Duration": 31536000
}
}```
describe-host-reservations

The following code example shows how to use describe-host-reservations.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
   "HostReservationSet": [
   {
      "Count": 1,
      "End": "2019-01-10T12:14:09Z",
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "OfferingId": "hro-03f707bf363b6b324",
      "PaymentOption": "NoUpfront",
      "State": "active",
      "HostIdSet": [
         "h-013abcd2a00cbd123"
      ],
      "Start": "2018-01-10T12:14:09Z",
      "HostReservationId": "hr-0d418a3a4ffcc669ae",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
   }
   ]
}
```

- For API details, see [DescribeHostReservations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-host-reservations.html) in [AWS CLI Command Reference](https).

describe-hosts

The following code example shows how to use describe-hosts.
AWS CLI

To view details about Dedicated Hosts

The following describe-hosts example displays details for the available Dedicated Hosts in your AWS account.

```
aws ec2 describe-hosts --filter "Name=state,Values=available"
```

Output:

```
{
  "Hosts": [
    {
      "HostId": "h-07879acf49EXAMPLE",
      "Tags": [
        {
          "Value": "production",
          "Key": "purpose"
        }
      ],
      "HostProperties": {
        "Cores": 48,
        "TotalVCpus": 96,
        "InstanceType": "m5.large",
        "Sockets": 2
      },
      "Instances": [],
      "State": "available",
      "AvailabilityZone": "eu-west-1a",
      "AvailableCapacity": {
        "AvailableInstanceCapacity": [
          {
            "AvailableCapacity": 48,
            "InstanceType": "m5.large",
            "TotalCapacity": 48
          }
        ],
        "AvailableVCpus": 96
      },
      "HostRecovery": "on",
      "AllocationTime": "2019-08-19T08:57:44.000Z",
      "AutoPlacement": "off"
    }
  ]
}
```
The following code example shows how to use `describe-iam-instance-profile-associations`.

**AWS CLI**

**To describe IAM instance profile associations**

This example describes all of your IAM instance profile associations.

**Command:**

```
aws ec2 describe-iam-instance-profile-associations
```

**Output:**

```
{
   "IamInstanceProfileAssociations": [
      {
         "InstanceId": "i-09eb09efa73ec1dee",
         "State": "associated",
         "AssociationId": "iip-assoc-0db249b1f25fa24b8",
         "IamInstanceProfile": {
            "Id": "AIPAJVQN4F5WVLGJDRGM",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
         }
      },
      {
         "InstanceId": "i-0402909a2f4dffer14",
         "State": "associating",
         "AssociationId": "iip-assoc-0d1ec06278d29f44a",
         "IamInstanceProfile": {
            "Id": "AGJAJVQN4F5WVLGJACBM",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
         }
      }
   ]
}
```
For API details, see [DescribeIamInstanceProfileAssociations](#) in *AWS CLI Command Reference*.

**describe-id-format**

The following code example shows how to use `describe-id-format`.

**AWS CLI**

**Example 1: To describe the ID format of a resource**

The following `describe-id-format` example describes the ID format for security groups.

```
aws ec2 describe-id-format \
   --resource security-group
```

In the following example output, the `Deadline` value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```
{
   "Statuses": [
      {
         "Deadline": "2018-08-15T00:00:00.000Z",
         "Resource": "security-group",
         "UseLongIds": true
      }
   ]
}
```

**Example 2: To describe the ID format for all resources**

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```
For API details, see `DescribeIdFormat` in *AWS CLI Command Reference*.

**describe-identity-id-format**

The following code example shows how to use `describe-identity-id-format`.

**AWS CLI**

**To describe the ID format for an IAM role**

The following `describe-identity-id-format` example describes the ID format received by instances created by the IAM role `EC2Role` in your AWS account.

```bash
aws ec2 describe-identity-id-format \\
   --principal-arn arn:aws:iam::123456789012:role/my-iam-role \\
   --resource instance
```

The following output indicates that instances created by this role receive IDs in long ID format.

```json
{
   "Statuses": [
      {
         "Deadline": "2016-12-15T00:00:00Z",
         "Resource": "instance",
         "UseLongIds": true
      }
   ]
}
```

**To describe the ID format for an IAM user**

The following `describe-identity-id-format` example describes the ID format received by snapshots created by the IAM user `AdminUser` in your AWS account.

```bash
aws ec2 describe-identity-id-format \\
   --principal-arn arn:aws:iam::123456789012:user/AdminUser \\
   --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

```json
{
}
```
"Statuses": [
    {
        "Deadline": "2016-12-15T00:00:00Z",
        "Resource": "snapshot",
        "UseLongIds": true
    }
]

- For API details, see DescribeIdentityIdFormat in AWS CLI Command Reference.

describe-image-attribute

The following code example shows how to use describe-image-attribute.

**AWS CLI**

To describe the launch permissions for an AMI

This example describes the launch permissions for the specified AMI.

**Command:**

```bash
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute launchPermission
```

**Output:**

```json
{
    "LaunchPermissions": [
        {
            "UserId": "123456789012"
        }
    ],
    "ImageId": "ami-5731123e",
}
```

To describe the product codes for an AMI

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

**Command:**
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes

Output:

```json
{
    "ProductCodes": [],
    "ImageId": "ami-5731123e",
}
```

- For API details, see [DescribeImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-image-attribute.html) in *AWS CLI Command Reference*.

### describe-images

The following code example shows how to use describe-images.

**AWS CLI**

**Example 1: To describe an AMI**

The following describe-images example describes the specified AMI in the specified Region.

```bash
aws ec2 describe-images \
  --region us-east-1 \
  --image-ids ami-1234567890EXAMPLE
```

Output:

```json
{
    "Images": [
    {
        "VirtualizationType": "hvm",
        "Description": "Provided by Red Hat, Inc.",
        "PlatformDetails": "Red Hat Enterprise Linux",
        "EnaSupport": true,
        "Hypervisor": "xen",
        "State": "available",
        "SriovNetSupport": "simple",
        "ImageId": "ami-1234567890EXAMPLE",
        "UsageOperation": "RunInstances:0010",

} 
] 
} 

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

**Example 2: To describe AMIs based on filters**

The following describe-images example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```
aws ec2 describe-images \
  --owners amazon \
  --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

For an example of the output for describe-images, see Example 1.

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

**Example 3: To describe AMIs based on tags**

The following describe-images example describes all AMIs that have the tag Type=Custom. The example uses the --query parameter to display only the AMI IDs.
aws ec2 describe-images \
--filters "Name=tag:Type,Values=Custom" \
--query 'Images[*].[ImageId]' \
--output text

Output:

ami-1234567890EXAMPLE
ami-0abcdef1234567890

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribelImages in AWS CLI Command Reference.

**describe-import-image-tasks**

The following code example shows how to use describe-import-image-tasks.

**AWS CLI**

**To monitor an import image task**

The following describe-import-image-tasks example checks the status of the specified import image task.

```bash
aws ec2 describe-import-image-tasks \
--import-task-ids import-ami-1234567890abcdef0
```

Output for an import image task that is in progress.

```
{
   "ImportImageTasks": [ 
   {
      "ImportTaskId": "import-ami-1234567890abcdef0",
      "Progress": "28",
      "SnapshotDetails": [ 
      {
         "DiskImageSize": 705638400.0,
         "Format": "ova",
         "Status": "completed",
```
Output for an import image task that is completed. The ID of the resulting AMI is provided by ImageId.

```json
{
    "ImportImageTasks": [
        {
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "ImageId": "ami-1234567890abcdef0",
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "SnapshotId": "snap-1234567890abcdef0"
                }
            ],
            "Status": "completed"
        }
    ],
    "Status": "completed"
}
```

- For API details, see [DescribeImportImageTasks](#) in *AWS CLI Command Reference*.

**describe-import-snapshot-tasks**

The following code example shows how to use describe-import-snapshot-tasks.
AWS CLI

To monitor an import snapshot task

The following describe-import-snapshot-tasks example checks the status of the specified import snapshot task.

```
aws ec2 describe-import-snapshot-tasks \
  --import-task-ids import-snap-1234567890abcdef0
```

Output for an import snapshot task that is in progress:

```json
{
  "ImportSnapshotTasks": [
    {
      "Description": "My server VMDK",
      "ImportTaskId": "import-snap-1234567890abcdef0",
      "SnapshotTaskDetail": {
        "Description": "My server VMDK",
        "DiskImageSize": "705638400.0",
        "Format": "VMDK",
        "Progress": "42",
        "Status": "active",
        "StatusMessage": "downloading/converting",
        "UserBucket": {
          "S3Bucket": "my-import-bucket",
          "S3Key": "vms/my-server-vm.vmdk"
        }
      }
    }
  ]
}
```

Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by SnapshotId.

```json
{
  "ImportSnapshotTasks": [
    {
      "Description": "My server VMDK",
      "ImportTaskId": "import-snap-1234567890abcdef0",
      "SnapshotTaskDetail": {
```
For API details, see [DescribeImportSnapshotTasks](#) in *AWS CLI Command Reference*.  

**describe-instance-attribute**

The following code example shows how to use `describe-instance-attribute`.

**AWS CLI**

**To describe the instance type**

This example describes the instance type of the specified instance.

**Command:**

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute instanceType
```

**Output:**

```json
{
    "InstanceId": "i-1234567890abcdef0",
    "InstanceType": {
        "Value": "t1.micro"
    }
}
```

**To describe the disableApiTermination attribute**
This example describes the `disableApiTermination` attribute of the specified instance.

Command:
```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --
attribute disableApiTermination
```

Output:
```
{
  "InstanceId": "i-1234567890abcdef0"
  "DisableApiTermination": {
    "Value": "false"
  }
}
```

To describe the block device mapping for an instance

This example describes the `blockDeviceMapping` attribute of the specified instance.

Command:
```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --
attribute blockDeviceMapping
```

Output:
```
{
  "InstanceId": "i-1234567890abcdef0"
  "BlockDeviceMappings": [
    {
      "DeviceName": "/dev/sda1",
      "Ebs": {
        "Status": "attached",
        "DeleteOnTermination": true,
        "VolumeId": "vol-049df61146c4d7901",
        "AttachTime": "2013-05-17T22:42:34.000Z"
      }
    },
    {
      "DeviceName": "/dev/sdf",
      "Ebs": {
```
For API details, see [DescribeInstanceAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-connect-endpoints) in *AWS CLI Command Reference*.

**describe-instance-connect-endpoints**

The following code example shows how to use `describe-instance-connect-endpoints`.

**AWS CLI**

**To describe an EC2 Instance Connect Endpoint**

The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 describe-instance-connect-endpoints \
  --region us-east-1 \
  --instance-connect-endpoint-ids eice-0123456789example
```

**Output:**

```json
{
  "InstanceConnectEndpoints": [
    {
      "OwnerId": "111111111111",
      "InstanceConnectEndpointId": "eice-0123456789example",
      "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
      "State": "create-complete",
      "StateMessage": "",
      "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-endpoint.us-east-1.amazonaws.com",
      "NetworkInterfaceIds": [
        "eni-0123456789example"
      ]
    }
  ]
}
```
"VpcId": "vpc-0123abcd",
"AvailabilityZone": "us-east-1d",
"CreatedAt": "2023-02-07T12:05:37+00:00",
"SubnetId": "subnet-0123abcd",
"Tags": []
}
]
}

For more information, see Create an EC2 Instance Connect Endpoint in the Amazon EC2 User Guide.
• For API details, see DescribeInstanceConnectEndpoints in AWS CLI Command Reference.

describe-instance-credit-specifications

The following code example shows how to use describe-instance-credit-specifications.

AWS CLI

To describe the credit option for CPU usage of one or more instances

The following describe-instance-credit-specifications example describes the CPU credit option for the specified instance.

```bash
cmd
aws ec2 describe-instance-credit-specifications \  
--instance-ids i-1234567890abcdef0
```  

Output:

```bash
{
   "InstanceCreditSpecifications": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "CpuCredits": "unlimited"
      }
   ]
}
```

For more information, see Work with burstable performance instances in the Amazon EC2 User Guide.
• For API details, see DescribeInstanceCreditSpecifications in AWS CLI Command Reference.
describe-instance-event-notification-attributes

The following code example shows how to use describe-instance-event-notification-attributes.

AWS CLI

**To describe the tags for scheduled event notifications**

The following describe-instance-event-notification-attributes example describes the tags to appear in scheduled event notifications.

```bash
aws ec2 describe-instance-event-notification-attributes
```

Output:

```
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [],
    "IncludeAllTagsOfInstance": true
  }
}
```

For more information, see [Scheduled events for your instances](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/scheduled-events.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeInstanceEventNotificationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-event-notification-attributes.html) in *AWS CLI Command Reference*.

describe-instance-event-windows

The following code example shows how to use describe-instance-event-windows.

AWS CLI

**Example 1: To describe all event windows**

The following describe-instance-event-windows example describes all event windows in the specified Region.

```bash
aws ec2 describe-instance-event-windows \   --region us-east-1
```
Example 2: To describe a specific event window

The following describe-instance-event-windows example describes a specific event by using the instance-event-window parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \  
  --region us-east-1 \  
  --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
        "InstanceIds": [
          "i-1234567890abcdef0",
          "i-0598c7d356eba48d7"
        ],
        "Tags": [],
        "DedicatedHostIds": []
      },
      "State": "active",
      "Tags": []
    }
  ],
  "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```
Example 3: To describe event windows that match one or more filters

The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```bash
aws ec2 describe-instance-event-windows \
    --region us-east-1 \
    --filters Name=instance-id,Values=i-1234567890abcdef0 \
    --max-results 100 \
    --next-token <next-token-value>
```

Output:

```json
{
   "InstanceEventWindows": [
   {
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",
      "TimeRanges": [
      {
         "StartWeekDay": "sunday",
         "StartHour": 2,
         "EndWeekDay": "sunday",
         "EndHour": 8
      }
   }
   ]
}
```
In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceEventWindows in AWS CLI Command Reference.

**describe-instance-status**

The following code example shows how to use describe-instance-status.

**AWS CLI**

**To describe the status of an instance**

The following describe-instance-status example describes the current status of the specified instance.

```bash
aws ec2 describe-instance-status \
--instance-ids i-1234567890abcdef0
```

Output:

```json
{
   "InstanceStatuses": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "InstanceState": {

```
For more information, see Monitor the status of your instances in the Amazon EC2 User Guide.

For API details, see DescribeInstanceStatus in AWS CLI Command Reference.

describe-instance-topology

The following code example shows how to use describe-instance-topology.

AWS CLI

To describe the instance topology of all your instances

The following describe-instance-topology example describes the topology of all your instances that match the supported instance types for this command.

```bash
aws ec2 describe-instance-topology \   --region us-west-2
```
Output:

```json
{
  "Instances": [
    {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "my-ml-cpg",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
    },
    {
      "InstanceId": "i-2222222222example",
      "InstanceType": "p4d.24xlarge",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
    },
    {
      "InstanceId": "i-3333333333example",
      "InstanceType": "trn1.32xlarge",
      "NetworkNodes": [
        "nn-1212121212example",
        "nn-1211122211example",
        "nn-1311133311example"
      ],
      "ZoneId": "usw2-az4",
      "AvailabilityZone": "us-west-2d"
    },
    {
      "InstanceId": "i-4444444444example",
      "InstanceType": "trn1.2xlarge",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-5434334334example"
      ]
    }
  ]
}
```
The following code example shows how to use `describe-instance-type-offerings`.

**AWS CLI**

**Example 1: To list the instance types offered in a Region**

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```bash/aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```bash
/aws ec2 describe-instance-type-offerings \
   --region us-east-2
```

**Output:**

```json
{
   "InstanceTypeOfferings": [
   {
      "InstanceType": "m5.2xlarge",
      "LocationType": "region",
      "Location": "us-east-2"
   }
   ]
}
```
Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
    --location-type availability-zone \
    --filters Name=location,Values=us-east-2a \
    --region us-east-2
```

Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` command indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5.xlarge \
    --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5* \
    --query "InstanceTypeOfferings[].InstanceType" \
    --region us-east-2
```

Output:

```
[
```
For API details, see DescribeInstanceTypeOfferings in AWS CLI Command Reference.

describe-instance-types

The following code example shows how to use describe-instance-types.

AWS CLI

Example 1: To describe an instance type

The following describe-instance-types example displays details for the specified instance type.

```
aws ec2 describe-instance-types \
   --instance-types t2.micro
```
Output:

```json
{
    "InstanceTypes": [
        {
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
            "Hypervisor": "xen",
            "ProcessorInfo": {
                "SupportedArchitectures": [
                    "i386",
                    "x86_64"
                ],
                "SustainedClockSpeedInGhz": 2.5
            },
            "VCpuInfo": {
                "DefaultVCpus": 1,
                "DefaultCores": 1,
                "DefaultThreadsPerCore": 1,
                "ValidCores": [1],
                "ValidThreadsPerCore": [1]
            },
            "MemoryInfo": {
                "SizeInMiB": 1024
            },
            "InstanceStorageSupported": false,
            "EbsInfo": {
                "EbsOptimizedSupport": "unsupported",
                "EncryptionSupport": "supported"
            },
            "NetworkInfo": {
```
For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 2: To filter the available instance types

You can specify a filter to scope the results to instance types that have a specific characteristic. The following describe-instance-types example lists the instance types that support hibernation.

```bash
aws ec2 describe-instance-types \ 
   --filters Name=hibernation-supported,Values=true --query 'InstanceTypes[*].InstanceType'
```

Output:

```
[  
   "m5.8xlarge",  
   "r3.large",  
   "c3.8xlarge",  
   "r5.large",  
   "m4.4xlarge",  
   "c4.large",  
   
]```
For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeInstanceTypes in AWS CLI Command Reference.

**describe-instances**

The following code example shows how to use describe-instances.

**AWS CLI**

**Example 1: To describe an instance**

The following describe-instances example describes the specified instance.

```bash
aws ec2 describe-instances \
  --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "Reservations": [
    {
      "Groups": [],
      "Instances": [
        {
          "AmiLaunchIndex": 0,
          "ImageId": "ami-0abcdef1234567890",
          "InstanceId": "i-1234567890abcdef0",
          "InstanceType": "t3.nano",
          "KeyName": "my-key-pair",
          "LaunchTime": "2022-11-15T10:48:59+00:00",

Example 2: To filter for instances with the specified type

The following describe-instances example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see List and filter using the CLI in the Amazon EC2 User Guide.

Example 3: To filter for instances with the specified type and Availability Zone

The following describe-instances example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-zone,Values=us-east-2c
```

For example output, see Example 1.

Example 4: To filter for instances with the specified type and Availability Zone using a JSON file
The following describe-instances example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```bash
aws ec2 describe-instances \
   --filters file://filters.json
```

Contents of `filters.json`:

```json
[
    {
        "Name": "instance-type",
        "Values": ["t2.micro", "t3.micro"]
    },
    {
        "Name": "availability-zone",
        "Values": ["us-east-2c"]
    }
]
```

For example output, see Example 1.

**Example 5: To filter for instances with the specified Owner tag**

The following describe-instances example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```bash
aws ec2 describe-instances \
   --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

**Example 6: To filter for instances with the specified my-team tag value**

The following describe-instances example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```bash
aws ec2 describe-instances \
   --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.
Example 7: To filter for instances with the specified Owner tag and my-team value

The following describe-instances example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```
aws ec2 describe-instances \
    --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

Example 8: To display only instance and subnet IDs for all instances

The following describe-instances examples use the --query parameter to display only the instance and subnet IDs for all instances, in JSON format.

Linux and macOS:

```
aws ec2 describe-instances \
    --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}' \
    --output json
```

Windows:

```
aws ec2 describe-instances ^
    --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^
    --output json
```

Output:

```
[
  {
    "Instance": "i-057750d42936e468a",
    "Subnet": "subnet-069beee9b12030077"
  },
  {
    "Instance": "i-001efd250faaa6ffa",
    "Subnet": "subnet-0b715c6b7db68927a"
  },
  {
    "Instance": "i-027552a73f021f3bd",
    "Subnet": "subnet-0250c25a1f4e15235"
  }
]
Example 9: To filter instances of the specified type and only display their instance IDs

The following describe-instances example uses filters to scope the results to instances of the specified type and the --query parameter to display only the instance IDs.

```bash
aws ec2 describe-instances \
  --filters "Name=instance-type,Values=t2.micro" \
  --query "Reservations[*].Instances[*].[InstanceId]" \
  --output text
```

Output:

```
i-031c0dc19de2fb70c
i-00d8bff789a736b75
i-0b715c6b7db68927a
i-0626d4edd54f1286d
i-00b8ae04f9f99908e
i-0fc71c25d2374130c
```

Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following describe-instances examples display the instance ID, Availability Zone, and the value of the Name tag for instances that have a tag with the name tag-key, in table format.

Linux and macOS:

```bash
aws ec2 describe-instances \
  --filters Name=tag-key,Values=Name \
  --query 'Reservations[*].Instances[*].
{InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`][0].Value}' \
  --output table
```

Windows:

```bash
aws ec2 describe-instances ^
```
Example 11: To describe instances in a partition placement group

The following `describe-instances` example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```
aws ec2 describe-instances \
  --instance-ids i-0123a456700123456 \
  --query "Reservations[*].Instances[*].Placement"
```

Output:

```json
[
  [
    {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 3,
      "Tenancy": "default"
    }
  ]
]
```
For more information, see Describing instances in a placement group in the Amazon EC2 User Guide.

Example 12: To filter to instances with the specified placement group and partition number

The following describe-instances example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \
   --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-partition-number,Values=7"
```

The following shows only the relevant information from the output.

```
"Instances": [ 
   {
      "InstanceId": "i-0123a456700123456",
      "InstanceType": "r4.large",
      "Placement": {
         "AvailabilityZone": "us-east-1c",
         "GroupName": "HDFS-Group-A",
         "PartitionNumber": 7,
         "Tenancy": "default"
      }
   },
   {
      "InstanceId": "i-9876a543210987654",
      "InstanceType": "r4.large",
      "Placement": {
         "AvailabilityZone": "us-east-1c",
         "GroupName": "HDFS-Group-A",
         "PartitionNumber": 7,
         "Tenancy": "default"
      }
   }
],
```

For more information, see Describing instances in a placement group in the Amazon EC2 User Guide.

Example 13: To filter to instances that are configured to allow access to tags from instance metadata
The following describe-instances example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \
   --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
   --query "Reservations[*].Instances[*].InstanceId" \
   --output text
```

The following shows the expected output.

```
i-1234567890abcdefg
i-abcdefg1234567890
i-11111111aaaaaa
i-aaaaaaa11111111
```

- For API details, see [DescribeInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instances.html) in AWS CLI Command Reference.

---

**describe-internet-gateways**

The following code example shows how to use describe-internet-gateways.

AWS CLI

**To describe an internet gateway**

The following describe-internet-gateways example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \
   --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

Output:

```json
{
   "InternetGateways": [
      {
         "Attachments": [  
```
For more information, see Internet gateways in the Amazon VPC User Guide.

• For API details, see DescribeInternetGateways in AWS CLI Command Reference.

describe-ipam-pools

The following code example shows how to use describe-ipam-pools.

AWS CLI

To view the details for an IPAM pool

The following describe-ipam-pools example shows the details for pools.

(Windows):

```bash
aws ec2 describe-ipam-pools \
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-scope-02fc38cd4c48e7d38
```

(Windows):

```bash
aws ec2 describe-ipam-pools ^
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-scope-02fc38cd4c48e7d38
```
Output:

```json
{
   "IpamPools": [
      {
         "OwnerId": "123456789012",
         "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
         "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-02ec043a19bbe5d08",
         "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
         "IpamScopeType": "private",
         "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
         "IpamRegion": "us-east-1",
         "Locale": "None",
         "PoolDepth": 1,
         "State": "create-complete",
         "AutoImport": true,
         "AddressFamily": "ipv4",
         "AllocationMinNetmaskLength": 16,
         "AllocationMaxNetmaskLength": 26,
         "AllocationDefaultNetmaskLength": 24,
         "AllocationResourceTags": [
            {
               "Key": "Environment",
               "Value": "Preprod"
            }
         ],
         "Tags": [
            {
               "Key": "Name",
               "Value": "Preprod pool"
            }
         ]
      }
   ]
}
```

- For API details, see [DescribeIpamPools](https://docs.aws.amazon.com/cli/latest/reference/ipam/describe-ipam-pools.html) in *AWS CLI Command Reference*.

**describe-ipam-resource-discoveries**

The following code example shows how to use `describe-ipam-resource-discoveries`.
**Example 1: View complete details of resource discoveries**

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin can manage and monitor the IP addresses of resources in your organization.

This example may be useful if:

You tried to create a resource discovery, but you got an error that you've reached your limit of 1. You realize that you may have already created a resource discovery and you want to view it in your account. You have resources in a Region that are not being discovered by the IPAM. You want to view the `--operating-regions` defined for the resource and ensure that you've added the right Region as an operating Region so that the resources there can be discovered.

The following `describe-ipam-resource-discoveries` example lists the details of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscoveries": [
    {
        "OwnerId": "149977607591",
        "IpamResourceDiscoveryId": "ipam-res-disco-0f8bdee9067137c0d",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-discovery/ipam-res-disco-0f8bdee9067137c0d",
        "IpamResourceDiscoveryRegion": "us-east-1",
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            }
        ],
        "IsDefault": false,
        "State": "create-complete",
        "Tags": []
    }
    ]
}
```
For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

**Example 2: View only resource discovery IDs**

The following `describe-ipam-resource-discoveries` example lists the ID of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```bash
aws ec2 describe-ipam-resource-discoveries \
    --query "IpamResourceDiscoveries[*].IpamResourceDiscoveryId" \
    --output text
```

Output:

```
ipam-res-disco-0481e39b242860333
```

For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see [DescribeIpamResourceDiscoveries](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-ipam-resource-discoveries.html) in [AWS CLI Command Reference](https).

### `describe-ipam-resource-discovery-associations`

The following code example shows how to use `describe-ipam-resource-discovery-associations`.

**AWS CLI**

**To view all resource discovery associations with your IPAM**

In this example, you're a IPAM delegated admin who has associated resource discoveries with your IPAM to integrate other accounts with your IPAM. You've noticed that your IPAM is not discovering the resources in the operating Regions of the resource discovery as expected. You want to check the status and state of the resource discovery to ensure that the account that created it is still active and the resource discovery is still being shared.

The `--region` must be the home Region of your IPAM.

The following `describe-ipam-resource-discovery-associations` example lists the resource discovery associations in your AWS account.
aws ec2 describe-ipam-resource-discovery-associations \
   --region us-east-1

Output:

```json
{
   "IpamResourceDiscoveryAssociations": [
      {
         "OwnerId": "320805250157",
         "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-05e6b45eca5bf5cf7",
         "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-resource-discovery-association/ipam-res-disco-assoc-05e6b45eca5bf5cf7",
         "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
         "IpamId": "ipam-005f921c17ebd5107",
         "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
         "IpamRegion": "us-east-1",
         "IsDefault": true,
         "ResourceDiscoveryStatus": "active",
         "State": "associate-complete",
         "Tags": []
      },
      {
         "OwnerId": "149977607591",
         "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-0dfd21ae189ab5f62",
         "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::149977607591:ipam-resource-discovery-association/ipam-res-disco-assoc-0dfd21ae189ab5f62",
         "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
         "IpamId": "ipam-005f921c17ebd5107",
         "IpamArn": "arn:aws:ec2::149977607591:ipam/ipam-005f921c17ebd5107",
         "IpamRegion": "us-east-1",
         "IsDefault": false,
         "ResourceDiscoveryStatus": "active",
         "State": "create-complete",
         "Tags": []
      }
   ]
}
```

In this example, after running this command, you notice that you have one non-default resource discovery ("IsDefault": false`) that is `"ResourceDiscoveryStatus":
"not-found" and "State": "create-complete". The resource discovery owner's account has been closed. If, in another case, you notice that is "ResourceDiscoveryStatus": "not-found" and "State": "associate-complete", this indicates that one of the following has happened:

The resource discovery was deleted by the resource discovery owner. The resource discovery owner unshared the resource discovery.

For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see DescribeIpamResourceDiscoveryAssociations in AWS CLI Command Reference.

describe-ipam-scopes

The following code example shows how to use describe-ipam-scopes.

AWS CLI

To view the details for an IPAM scope

The following describe-ipam-scopes example shows the details for scopes.

```bash
aws ec2 describe-ipam-scopes \   --filters Name=owner-id,Values=123456789012 Name=ipam-id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
   "IpamScopes": [
   
   {
       "OwnerId": "123456789012",
       "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
       "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
       "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
       "IpamRegion": "us-east-1",
       "IpamScopeType": "private",
       "IsDefault": true,
       "PoolCount": 2,
```
For API details, see `DescribeIpamScopes` in *AWS CLI Command Reference*.

**describe-iptables**

The following code example shows how to use describe-iptables.
AWS CLI

To view the details for an IPAM

The following describe-ipams example shows the details of an IPAM.

```
aws ec2 describe-ipams \
   --filters Name=owner-id,Values=123456789012
```

Output:

```
{
   "Ipams": [
      {
        "OwnerId": "123456789012",
        "IpamId": "ipam-08440e7a3acde3908",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
        "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
        "ScopeCount": 3,
        "OperatingRegions": [
          {
            "RegionName": "us-east-1"
          },
          {
            "RegionName": "us-east-2"
          },
          {
            "RegionName": "us-west-1"
          }
        ],
        "State": "create-complete",
        "Tags": [
          {
            "Key": "Name",
            "Value": "ExampleIPAM"
          }
        ]
      }
   ]
}
```
• For API details, see `Describedpams` in *AWS CLI Command Reference*.

### describe-ipv6-pools

The following code example shows how to use `describe-ipv6-pools`.

**AWS CLI**

#### To describe your IPv6 address pools

The following `describe-ipv6-pools` example displays details for all of your IPv6 address pools.

```bash
aws ec2 describe-ipv6-pools
```

**Output:**

```json
{
   "Ipv6Pools": [ 
      {
         "PoolId": "ipv6pool-ec2-012345abc12345abc",
         "PoolCidrBlocks": [ 
            {
               "Cidr": "2001:db8:123::/48"
            }
         ],
         "Tags": [ 
            {
               "Key": "pool-1",
               "Value": "public"
            }
         ]
      }
   ]
}
```

• For API details, see `DescribeIpv6Pools` in *AWS CLI Command Reference*.

### describe-key-pairs

The following code example shows how to use `describe-key-pairs`.

Actions and scenarios
AWS CLI

To display a key pair

The following describe-key-pairs example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \
    --key-names my-key-pair
```

Output:

```
{
   "KeyPairs": [
       {
           "KeyPairId": "key-0b94643da6EXAMPLE",
           "KeyName": "my-key-pair",
           "KeyType": "rsa",
           "Tags": [],
       }
   ]
}
```

For more information, see Describe public keys in the Amazon EC2 User Guide.

- For API details, see DescribeKeyPairs in AWS CLI Command Reference.

describe-launch-template-versions

The following code example shows how to use describe-launch-template-versions.

AWS CLI

To describe launch template versions

This example describes the versions of the specified launch template.

Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```
Output:

```json
{
    "LaunchTemplateVersions": [
        {
            "LaunchTemplateId": "lt-068f72b72934aff71",
            "LaunchTemplateName": "Webservers",
            "VersionNumber": 3,
            "CreatedBy": "arn:aws:iam::123456789102:root",
            "LaunchTemplateData": {
                "KeyName": "kp-us-east",
                "ImageId": "ami-6057e21a",
                "InstanceType": "t2.small",
                "NetworkInterfaces": [
                    {
                        "SubnetId": "subnet-7b16de0c",
                        "DeviceIndex": 0,
                        "Groups": [
                            "sg-7c227019"
                        ]
                    }
                ],
                "DefaultVersion": false,
                "CreateTime": "2017-11-20T13:19:54.000Z"
            }
        },
        {
            "LaunchTemplateId": "lt-068f72b72934aff71",
            "LaunchTemplateName": "Webservers",
            "VersionNumber": 2,
            "CreatedBy": "arn:aws:iam::123456789102:root",
            "LaunchTemplateData": {
                "KeyName": "kp-us-east",
                "ImageId": "ami-6057e21a",
                "InstanceType": "t2.medium",
                "NetworkInterfaces": [
                    {
                        "SubnetId": "subnet-1a2b3c4d",
                        "DeviceIndex": 0,
                        "Groups": [
                            "sg-7c227019"
                        ]
                    }
                ]
            }
        }
    ]
}
```
describe-launch-templates

The following code example shows how to use describe-launch-templates.

AWS CLI

To describe launch templates

This example describes your launch templates.

For API details, see DescribeLaunchTemplateVersions in AWS CLI Command Reference.
### Command:

`aws ec2 describe-launch-templates`

### Output:

```json
{
   "LaunchTemplates": [
      {
         "LatestVersionNumber": 2,
         "LaunchTemplateId": "lt-0e06d290751193123",
         "LaunchTemplateName": "TemplateForWebServer",
         "DefaultVersionNumber": 2,
         "CreatedBy": "arn:aws:iam::123456789012:root",
         "CreateTime": "2017-11-27T09:30:23.000Z"
      },
      {
         "LatestVersionNumber": 6,
         "LaunchTemplateId": "lt-0c45b5e061ec98456",
         "LaunchTemplateName": "DBServersTemplate",
         "DefaultVersionNumber": 1,
         "CreatedBy": "arn:aws:iam::123456789012:root",
         "CreateTime": "2017-11-20T09:25:22.000Z"
      },
      {
         "LatestVersionNumber": 1,
         "LaunchTemplateId": "lt-0d47d774e8e52dabc",
         "LaunchTemplateName": "MyLaunchTemplate2",
         "DefaultVersionNumber": 1,
         "CreatedBy": "arn:aws:iam::123456789012:root",
         "CreateTime": "2017-11-02T12:06:21.000Z"
      },
      {
         "LatestVersionNumber": 3,
         "LaunchTemplateId": "lt-01e5f948eb4f589d6",
         "LaunchTemplateName": "testingtemplate2",
         "DefaultVersionNumber": 1,
         "CreatedBy": "arn:aws:sts::123456789012:assumed-role/AdminRole/i-03ee35176e2e5aabc",
         "CreateTime": "2017-12-01T08:19:48.000Z"
      }
   ]
}
```
For API details, see `DescribeLaunchTemplates` in *AWS CLI Command Reference*.

**describe-local-gateway-route-table-virtual-interface-group-associations**

The following code example shows how to use `describe-local-gateway-route-table-virtual-interface-group-associations`.

**AWS CLI**

To describe associations between virtual interface groups and local gateway route tables

The following `describe-local-gateway-route-table-virtual-interface-group-associations` example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

```
aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
    {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-07145b276bEXAMPLE",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
        "OwnerId": "123456789012",
        "State": "associated",
        "Tags": []
    }
    ]
}
```

For more information, see [Working with local gateways](https://docs.aws.amazon.com/AWSECDocuments/latest/OutpostsGuide/index.html) in the *AWS Outposts User Guide*.

- For API details, see `DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations` in *AWS CLI Command Reference*. 
**describe-local-gateway-route-table-vpc-associations**

The following code example shows how to use `describe-local-gateway-route-table-vpc-associations`.

**AWS CLI**

**To describe the associations between VPCs and local gateway route tables**

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \
  --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
   "LocalGatewayRouteTableVpcAssociation": {
      "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af15EXAMPLE",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
      "VpcId": "vpc-0efe9bde08EXAMPLE",
      "State": "associated"
   }
}
```

For more information, see [Local gateway route tables](#) in the [Outposts User Guide](#).

- For API details, see [DescribeLocalGatewayRouteTableVpcAssociations](#) in [AWS CLI Command Reference](#).

**describe-local-gateway-route-tables**

The following code example shows how to use `describe-local-gateway-route-tables`.

**AWS CLI**

**To describe your Local Gateway Route Tables**
The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```bash
aws ec2 describe-local-gateway-route-tables
```

Output:
```
{
   "LocalGatewayRouteTables": [
      {
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
         "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
         "State": "available"
      }
   ]
}
```

- For API details, see [DescribeLocalGatewayRouteTables](#) in AWS CLI Command Reference.

**describe-local-gateway-virtual-interface-groups**

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

**AWS CLI**

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```bash
aws ec2 describe-local-gateway-virtual-interface-groups
```

Output:
```
{
   "LocalGatewayVirtualInterfaceGroups": [
      {
         "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
         "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
         "State": "available"
      }
   ]
}
```
For more information, see [Working with local gateways](#) in the [AWS Outposts User Guide](#).

- For API details, see [DescribeLocalGatewayVirtualInterfaceGroups](#) in [AWS CLI Command Reference](#).

**describe-local-gateway-virtual-interfaces**

The following code example shows how to use `describe-local-gateway-virtual-interfaces`.

**AWS CLI**

**To describe local gateway virtual interfaces**

The following `describe-local-gateway-virtual-interfaces` example describes the local gateway virtual interfaces in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interfaces
```

**Output:**

```json
{
  "LocalGatewayVirtualInterfaces": [
    {
      "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
      "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
      "Vlan": 2410,
      "LocalAddress": "0.0.0.0/0",
      "PeerAddress": "0.0.0.0/0",
      "LocalBgpAsn": 65010,
      "PeerBgpAsn": 65000,
      "Tags": []
    }
  ]
}
```

For more information, see [Working with local gateways](#) in the [AWS Outposts User Guide](#).

- For API details, see [DescribeLocalGatewayVirtualInterfaceGroups](#) in [AWS CLI Command Reference](#).

```
aws ec2 describe-local-gateway-virtual-interfaces
```

**Output:**

```json
{
  "LocalGatewayVirtualInterfaces": [
    {
      "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
      "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
      "Vlan": 2410,
      "LocalAddress": "0.0.0.0/0",
      "PeerAddress": "0.0.0.0/0",
      "LocalBgpAsn": 65010,
      "PeerBgpAsn": 65000,
      "Tags": []
    }
  ]
}
```
describe-local-gateways

The following code example shows how to use describe-local-gateways.

AWS CLI

To describe your Local Gateways

The following describe-local-gateways example displays details for the local gateways that are available to you.

```
aws ec2 describe-local-gateways
```

Output:

```
{
    "LocalGateways": [
    {
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "OwnerId": "123456789012",
        "Tags": []
    }
    ]
}
```
For API details, see `DescribeLocalGateways` in *AWS CLI Command Reference*.

describe-locked-snapshots

The following code example shows how to use `describe-locked-snapshots`.

**AWS CLI**

**To describe the lock status of a snapshot**

The following `describe-locked-snapshots` example describes the lock status of the specified snapshot.

```
aws ec2 describe-locked-snapshots \
 --snapshot-ids snap-0b5e733b4a8df6e0d
```

Output:

```
{
   "Snapshots": [
   {
      "OwnerId": "123456789012",
      "SnapshotId": "snap-0b5e733b4a8df6e0d",
      "LockState": "governance",
      "LockDuration": 365,
      "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
      "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00",
      "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00"
   }
   ]
}
```

For more information, see `Snapshot lock` in the *Amazon EBS User Guide*.

• For API details, see `DescribeLockedSnapshots` in *AWS CLI Command Reference*.
describe-managed-prefix-lists

The following code example shows how to use describe-managed-prefix-lists.

AWS CLI

To describe managed prefix lists

The following describe-managed-prefix-lists example describes the prefix lists owned by AWS account 123456789012.

```
aws ec2 describe-managed-prefix-lists \\
  --filters Name=owner-id,Values=123456789012
```

Output:

```json
{
  "PrefixLists": [
    {
      "PrefixListId": "pl-11223344556677aab",
      "AddressFamily": "IPv6",
      "State": "create-complete",
      "PrefixListName": "vpc-ipv6-cidrs",
      "MaxEntries": 25,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    },
    {
      "PrefixListId": "pl-0123456abcabc1",
      "AddressFamily": "IPv4",
      "State": "active",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    }
  ]
}
```
describe-moving-addresses

The following code example shows how to use describe-moving-addresses.

AWS CLI

To describe your moving addresses

This example describes all of your moving Elastic IP addresses.

Command:

```bash
aws ec2 describe-moving-addresses
```

Output:

```json
{
   "MovingAddressStatuses": [
      {
         "PublicIp": "198.51.100.0",
         "MoveStatus": "MovingToVpc"
      }
   ]
}
```

This example describes all addresses that are moving to the EC2-VPC platform.

Command:

```bash
aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc
```

- For API details, see DescribeMovingAddresses in AWS CLI Command Reference.

describe-nat-gateways

The following code example shows how to use describe-nat-gateways.

Actions and scenarios
**Example 1: To describe a public NAT gateway**

The following `describe-nat-gateways` example describes the specified public NAT gateway.

```
aws ec2 describe-nat-gateways \
    --nat-gateway-id nat-01234567890abcdef
```

**Output:**

```json
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T01:56:51.000Z",
            "NatGatewayAddresses": [
                {
                    "AllocationId": "eipalloc-0790180cd2EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.211",
                    "PublicIp": "54.85.121.213",
                    "AssociationId": "eipassoc-04d295cc9b8815b24",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.74",
                    "PublicIp": "3.211.231.218",
                    "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-01234567890abcdef",
            "State": "available",
            "SubnetId": "subnet-655eab5f08EXAMPLE",
            "VpcId": "vpc-098eb5ef58EXAMPLE",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "public-nat"
                }
            ]
        }
    ]
}
```
Example 2: To describe a private NAT gateway

The following `describe-nat-gateways` example describes the specified private NAT gateway.

```bash
aws ec2 describe-nat-gateways \
    --nat-gateway-id nat-1234567890abcdef0
```

Output:

```json
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T00:50:05.000Z",
            "NatGatewayAddresses": [
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.240",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.33",
                    "IsPrimary": false,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.197",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-1234567890abcdef0",
            "State": "available",
        }
    ]
}
```
"SubnetId": "subnet-08fc749671EXAMPLE",
"VpcId": "vpc-098eb5ef58EXAMPLE",
"Tags": [

  
    {  
      "Key": "Name",
      "Value": "private-nat"
    }

],

"ConnectivityType": "private"
]

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeNatGateways](#) in *AWS CLI Command Reference*.

describe-network-acls

The following code example shows how to use describe-network-acls.

**AWS CLI**

To describe your network ACLs

The following `describe-network-acls` example retrieves details about your network ACLs.

```bash
aws ec2 describe-network-acls
```

Output:

```
{
    "NetworkAcls": [
        {
            "Associations": [
                {
                    "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
                    "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
                    "SubnetId": "subnet-0931fc2fa5EXAMPLE"
                }
            ],
            "Entries": [
                {
                    "Action": "allow",
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": true
                },
                {
                    "Action": "permit",
                    "CidrBlock": "192.168.0.0/16",
                    "Egress": false
                }
            ]
        }
    ]
}

- For API details, see DescribeNetworkAcls in AWS CLI Command Reference.

**describe-network-insights-access-scope-analyses**

The following code example shows how to use describe-network-insights-access-scope-analyses.

**AWS CLI**

**To describe Network Insights access scope analyses**

The following describe-network-insights-access-scope-analyses example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses \ 
   --region us-east-1
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalyses": [
      {
         "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
         "NetworkInsightsAccessScopeId": "nis-123456789222",
         "IsDefault": true,
         "NetworkAclId": "acl-0e2a78e4e2EXAMPLE",
         "Tags": [],
         "VpcId": "vpc-03914af3b3eEXAMPLE",
         "OwnerId": "111122223333"
      }
   ]
}
```
For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/network-access-analyzer/latest/userguide/) in the Network Access Analyzer Guide.

### describe-network-insights-access-scopes

The following code example shows how to use `describe-network-insights-access-scopes`.

#### AWS CLI

**To describe Network Insights access scopes**

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```bash
aws ec2 describe-network-insights-access-scopes \   --region us-east-1
```

**Output:**

```
{
  "NetworkInsightsAccessScopes": [
    {
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "CreatedDate": "2021-11-29T12:41:416000+00:00",
      "UpdatedDate": "2021-11-29T12:41:416000+00:00",
      "Tags": []
    }
  ]
}
```
describe-network-insights-analyses

The following code example shows how to use describe-network-insights-analyses.

AWS CLI

To view the results of a path analysis

The following describe-network-insights-analyses example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (Status is succeeded) and the path is not reachable (NetworkPathFound is false). The explanation code ENI_SG_RULES_MISMATCH indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```bash
aws ec2 describe-network-insights-analyses \
  --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalyses": [ 
        {
            "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "StartDate": "2021-01-20T22:58:37.495Z",
            "Status": "succeeded",
            "NetworkPathFound": false,
            "Explanations": [ 
                {
                    "Direction": "ingress",
                    "ExplanationCode": "ENI_SG_RULES_MISMATCH",
                    "NetworkInterface": { 
                        "Id": "eni-0a25edef15a6cc08c",

  }
],
"Tags": []
}

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.
• For API details, see DescribeNetworkInsightsAnalyses in AWS CLI Command Reference.

describe-network-insights-paths

The following code example shows how to use describe-network-insights-paths.

AWS CLI

To describe a path

The following describe-network-insights-paths example describes the specified path.

```
aws ec2 describe-network-insights-paths \
  --network-insights-path-ids nip-0b26f224f1d131fa8
```
Output:

```json
{
    "NetworkInsightsPaths": [
        {
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "CreatedDate": "2021-01-20T22:43:46.933Z",
            "Source": "igw-0797ccdc9d73b0e5",
            "Destination": "i-0495d385ad28331c7",
            "Protocol": "tcp"
        }
    ]
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/getting-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsPaths](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-insights-paths.html) in *AWS CLI Command Reference*.

**describe-network-interface-attribute**

The following code example shows how to use `describe-network-interface-attribute`.

**AWS CLI**

To describe the attachment attribute of a network interface

This example command describes the attachment attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute attachment
```

Output:

```json
{
    "NetworkInterfaceId": "eni-686ea200",
    "Attachment": {
        "Status": "attached",
        "DeviceIndex": 0,
        "AttachTime": "2015-05-21T20:02:20.000Z",
    }
}
```
To describe the description attribute of a network interface

This example command describes the description attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute description
```

Output:

```json
{
   "NetworkInterfaceId": "eni-686ea200",
   "Description": {
      "Value": "My description"
   }
}
```

To describe the groupSet attribute of a network interface

This example command describes the groupSet attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute groupSet
```

Output:

```json
{
   "NetworkInterfaceId": "eni-686ea200",
   "Groups": [
      {
         "GroupName": "my-security-group",
      }
   ]
}
```
To describe the sourceDestCheck attribute of a network interface

This example command describes the sourceDestCheck attribute of the specified network interface.

Command:
```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute sourceDestCheck
```

Output:
```json
{
    "NetworkInterfaceId": "eni-686ea200",
    "SourceDestCheck": {
        "Value": true
    }
}
```

• For API details, see DescribeNetworkInterfaceAttribute in AWS CLI Command Reference.

describe-network-interface-permissions

The following code example shows how to use describe-network-interface-permissions.

AWS CLI

To describe your network interface permissions

This example describes all of your network interface permissions.

Command:
```bash
aws ec2 describe-network-interface-permissions
```

Output:
For API details, see `DescribeNetworkInterfacePermissions` in *AWS CLI Command Reference.*

describe-network-interfaces

The following code example shows how to use describe-network-interfaces.

AWS CLI

To describe your network interfaces

This example describes all your network interfaces.

Command:

```
aws ec2 describe-network-interfaces
```

Output:

```json
{
    "NetworkInterfaces": [
        {
            "Status": "in-use",
            "MacAddress": "02:2f:8f:b0:cf:75",
            "SourceDestCheck": true,
            "VpcId": "vpc-a01106c2",
            "Description": "my network interface",
            "Association": {
                "PublicIp": "203.0.113.12",
            }
        }
    ]
}
```

Actions and scenarios

2309
"MacAddress": "02:58:f5:ef:4b:06",
"SourceDestCheck": true,
"VpcId": "vpc-a01106c2",
"Description": "Primary network interface",
"Association": {
   "PublicIp": "198.51.100.0",
   "IpOwnerId": "amazon"
},
"NetworkInterfaceId": "eni-f9ba99bf",
"PrivateIpAddresses": [
   {
      "Association": {
         "PublicIp": "198.51.100.0",
         "IpOwnerId": "amazon"

"TagSet": [
  {
    "Value": "Prod",
    "Key": "Purpose"
  },
  
  "PrivateIpAddress": "10.0.1.55"
]
}

- For API details, see [DescribeNetworkInterfaces](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-placement-groups.html) in *AWS CLI Command Reference*.

### describe-placement-groups

The following code example shows how to use `describe-placement-groups`.

**AWS CLI**

**To describe your placement groups**

This example command describes all of your placement groups.

**Command:**

```bash
aws ec2 describe-placement-groups
```

**Output:**

```json
{
   "PlacementGroups": [
   {
    "GroupName": "my-cluster",
    "State": "available",
    "Strategy": "cluster"
   },
   ...
   ]
}
```
describe-prefix-lists

The following code example shows how to use describe-prefix-lists.

AWS CLI

To describe prefix lists

This example lists all available prefix lists for the region.

Command:

```bash
aws ec2 describe-prefix-lists
```

Output:

```json
{
  "PrefixLists": [
    {
      "PrefixListName": "com.amazonaws.us-east-1.s3",
      "Cidrs": [
        "54.231.0.0/17"
      ],
      "PrefixListId": "pl-63a5400a"
    }
  ]
}
```

• For API details, see DescribePrefixLists in AWS CLI Command Reference.

describe-principal-id-format

The following code example shows how to use describe-principal-id-format.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following describe-principal-id-format example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.
aws ec2 describe-principal-id-format \
--resource instance

Output:

```json
{
  "Principals": [
    {
      "Arn": "arn:aws:iam::123456789012:root",
      "Statuses": [
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "reservation",
          "UseLongIds": true
        },
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "instance",
          "UseLongIds": true
        },
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "volume",
          "UseLongIds": true
        }
      ]
    },
    ...
  ]
}
```

• For API details, see DescribePrincipalIdFormat in AWS CLI Command Reference.

describe-public-ipv4-pools

The following code example shows how to use describe-public-ipv4-pools.

AWS CLI

To describe your public IPv4 address pools
The following `describe-public-ipv4-pools` example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```bash
aws ec2 describe-public-ipv4-pools
```

Output:

```json
{
  "PublicIpv4Pools": [
    {
      "PoolId": "ipv4pool-ec2-1234567890abcdef0",
      "PoolAddressRanges": [
        {
          "FirstAddress": "203.0.113.0",
          "LastAddress": "203.0.113.255",
          "AddressCount": 256,
          "AvailableAddressCount": 256
        }
      ],
      "TotalAddressCount": 256,
      "TotalAvailableAddressCount": 256
    }
  ]
}
```

For API details, see [DescribePublicIpv4Pools](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-public-ipv4-pools.html) in [AWS CLI Command Reference](https).

**describe-regions**

The following code example shows how to use `describe-regions`.

**AWS CLI**

**Example 1: To describe all of your enabled Regions**

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```bash
aws ec2 describe-regions
```
Output:

```json
{
   "Regions": [
      {
         "Endpoint": "ec2.eu-north-1.amazonaws.com",
         "RegionName": "eu-north-1",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.ap-south-1.amazonaws.com",
         "RegionName": "ap-south-1",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.eu-west-3.amazonaws.com",
         "RegionName": "eu-west-3",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.eu-west-2.amazonaws.com",
         "RegionName": "eu-west-2",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.eu-west-1.amazonaws.com",
         "RegionName": "eu-west-1",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
         "RegionName": "ap-northeast-3",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
         "RegionName": "ap-northeast-2",
         "OptInStatus": "opt-in-not-required"
      },
      {
         "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
         "RegionName": "ap-northeast-1",
         "OptInStatus": "opt-in-not-required"
      }
   ]
}
```
{
    "Endpoint": "ec2.sa-east-1.amazonaws.com",
    "RegionName": "sa-east-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.ca-central-1.amazonaws.com",
    "RegionName": "ca-central-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
    "RegionName": "ap-southeast-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
    "RegionName": "ap-southeast-2",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.eu-central-1.amazonaws.com",
    "RegionName": "eu-central-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.us-east-1.amazonaws.com",
    "RegionName": "us-east-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.us-east-2.amazonaws.com",
    "RegionName": "us-east-2",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.us-west-1.amazonaws.com",
    "RegionName": "us-west-1",
    "OptInStatus": "opt-in-not-required"
},
{
    "Endpoint": "ec2.us-west-2.amazonaws.com",
    "RegionName": "us-west-2",
    "OptInStatus": "opt-in-not-required"
}
Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following describe-regions example describes all Regions that you have enabled that have the string "us" in the endpoint.

```bash
aws ec2 describe-regions \
   --filters "Name=endpoint,Values=*us*"
```

Output:

```json
{
   "Regions": [
      {
         "Endpoint": "ec2.us-east-1.amazonaws.com",
         "RegionName": "us-east-1"
      },
      {
         "Endpoint": "ec2.us-east-2.amazonaws.com",
         "RegionName": "us-east-2"
      },
      {
         "Endpoint": "ec2.us-west-1.amazonaws.com",
         "RegionName": "us-west-1"
      },
      {
         "Endpoint": "ec2.us-west-2.amazonaws.com",
         "RegionName": "us-west-2"
      }
   ]
}
```

For more information, see [Regions and Zones](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/regions-zones.html) in the *Amazon EC2 User Guide*.

Example 3: To describe all Regions
The following `describe-regions` example describes all available Regions, including Regions that are disabled.

```bash
aws ec2 describe-regions \
--all-regions
```

Output:

```json
{
  "Regions": [
    {
      "Endpoint": "ec2.eu-north-1.amazonaws.com",
      "RegionName": "eu-north-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.ap-south-1.amazonaws.com",
      "RegionName": "ap-south-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-3.amazonaws.com",
      "RegionName": "eu-west-3",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-2.amazonaws.com",
      "RegionName": "eu-west-2",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-1.amazonaws.com",
      "RegionName": "eu-west-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
      "RegionName": "ap-northeast-3",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.me-south-1.amazonaws.com",
      "RegionName": "me-south-1",
      "OptInStatus": "opt-in-not-required"
    }
  ]
}
```
"OptInStatus": "not-opted-in",
},
{
  "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
  "RegionName": "ap-northeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
  "RegionName": "ap-northeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-east-1.amazonaws.com",
  "RegionName": "ap-east-1",
  "OptInStatus": "not-opted-in"
},
{
  "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
  "RegionName": "ap-southeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
  "RegionName": "ap-southeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.eu-central-1.amazonaws.com",
  "RegionName": "eu-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-east-1.amazonaws.com",
  "RegionName": "us-east-1",
  "OptInStatus": "opt-in-not-required"}
"RegionName": "us-east-1",
"OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-east-2.amazonaws.com",
  "RegionName": "us-east-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-west-1.amazonaws.com",
  "RegionName": "us-west-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-west-2.amazonaws.com",
  "RegionName": "us-west-2",
  "OptInStatus": "opt-in-not-required"
}
]
}

For more information, see [Regions and Zones](http://example.com) in the *Amazon EC2 User Guide*.

**Example 4: To list the Region names only**

The following `describe-regions` example uses the `--query` parameter to filter the output and return only the names of the Regions as text.

```
aws ec2 describe-regions \
  --all-regions \
  --query "Regions[].{Name:RegionName}" \
  --output text
```

**Output:**

```
eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
```
describe-replace-root-volume-tasks

The following code example shows how to use describe-replace-root-volume-tasks.

AWS CLI

Example 1: To view information about a specific root volume replacement task

The following describe-replace-root-volume-tasks example describes root volume replacement task replacevol-011122223333abcd.

```
aws ec2 describe-replace-root-volume-tasks \
  --replace-root-volume-task-ids replacevol-011122223333abcd
```

Output:

```
{
  "ReplaceRootVolumeTasks": [
    {
      "ReplaceRootVolumeTaskId": "replacevol-011122223333abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:16:28Z",
      "CompleteTime": "2022-03-14T15:16:52Z"
    }
  ]
}
```
For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

Example 2: To view information about all root volume replacement tasks for a specific instance

The following describe-replace-root-volume-tasks example describes all of the root volume replacement tasks for instance i-0123456789abcdefa.

```bash
aws ec2 describe-replace-root-volume-tasks \   
   --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```json
{
   "ReplaceRootVolumeTasks": [
      {
       "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
       "Tags": [],
       "InstanceId": "i-0123456789abcdefa",
       "TaskState": "succeeded",
       "StartTime": "2022-03-14T15:06:38Z",
       "CompleteTime": "2022-03-14T15:07:03Z"
      },
      {
       "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
       "Tags": [],
       "InstanceId": "i-0123456789abcdefa",
       "TaskState": "succeeded",
       "StartTime": "2022-03-14T15:16:28Z",
       "CompleteTime": "2022-03-14T15:16:52Z"
      }
   ]
}
```

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeReplaceRootVolumeTasks in AWS CLI Command Reference.
**describe-reserved-instances-listings**

The following code example shows how to use `describe-reserved-instances-listings`.

**AWS CLI**

**To describe a Reserved Instance listing**

The following `describe-reserved-instances-listings` example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings
   --reserved-instances-listing-id Sec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see [DescribeReservedInstancesListings](#) in [AWS CLI Command Reference](#).

**describe-reserved-instances-modifications**

The following code example shows how to use `describe-reserved-instances-modifications`.

**AWS CLI**

**To describe Reserved Instances modifications**

This example command describes all the Reserved Instances modification requests that have been submitted for your account.

**Command:**

```
aws ec2 describe-reserved-instances-modifications
```

**Output:**

```
{
   "ReservedInstancesModifications": [
      {
         "Status": "fulfilled",
         "ModificationResults": [
            {
               "ReservedInstancesId": "93bbbca2-62f1-4d9d-b225-16bada29e6c7",
```

For API details, see DescribeReservedInstancesModifications in AWS CLI Command Reference.

describe-reserved-instances-offerings

The following code example shows how to use describe-reserved-instances-offerings.

AWS CLI

To describe Reserved Instances offerings

This example command describes all Reserved Instances available for purchase in the region.

Command:
aws ec2 describe-reserved-instances-offerings

Output:

```json
{
   "ReservedInstancesOfferings": [
      {
         "OfferingType": "Partial Upfront",
         "AvailabilityZone": "us-east-1b",
         "InstanceTenancy": "default",
         "PricingDetails": [],
         "ProductDescription": "Red Hat Enterprise Linux",
         "UsagePrice": 0.0,
         "RecurringCharges": [
            {
               "Amount": 0.088,
               "Frequency": "Hourly"
            }
         ],
         "Marketplace": false,
         "CurrencyCode": "USD",
         "FixedPrice": 631.0,
         "Duration": 94608000,
         "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
         "InstanceType": "c1.medium"
      },
      {
         "OfferingType": "PartialUpfront",
         "AvailabilityZone": "us-east-1b",
         "InstanceTenancy": "default",
         "PricingDetails": [],
         "ProductDescription": "Linux/UNIX",
         "UsagePrice": 0.0,
         "RecurringCharges": [
            {
               "Amount": 0.028,
               "Frequency": "Hourly"
            }
         ],
         "Marketplace": false,
         "CurrencyCode": "USD",
         "FixedPrice": 631.0,
         "Duration": 94608000,
```
To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```bash
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```json
{
   "ReservedInstancesOfferings": [
      {
         "OfferingType": "No Upfront",
         "AvailabilityZone": "us-east-1b",
         "InstanceTenancy": "default",
         "PricingDetails": [],
         "ProductDescription": "Windows",
         "UsagePrice": 0.0,
         "RecurringCharges": [
            {
               "Amount": 0.015,
               "Frequency": "Hourly"
            }
         ],
         "Marketplace": false,
         "CurrencyCode": "USD",
         "FixedPrice": 0.0,
         "Duration": 31536000,
         "ReservedInstancesOfferingId": "c48ab04c-fe69-4f94-8e39-a23842292823",
         "InstanceType": "t1.micro"
      }
   ]
}
```

```
{
   "OfferingType": "No Upfront",
   "AvailabilityZone": "us-east-1d",
   "InstanceTenancy": "default",
   "PricingDetails": [],
   "ProductDescription": "Windows (Amazon VPC)",
   "UsagePrice": 0.0,
   "RecurringCharges": [
      {
         "Amount": 0.015,
         "Frequency": "Hourly"
      }
   ],
   "Marketplace": false,
   "CurrencyCode": "USD",
   "FixedPrice": 0.0,
   "Duration": 315360000,
   "ReservedInstancesOfferingId": "3a98bf7d-2123-42d4-b4f5-8dbec4b06dc6",
   "InstanceType": "t1.micro"
}
```

- For API details, see [DescribeReservedInstancesOfferings](https://awscli.amazonaws.com/#DescribeReservedInstancesOfferings) in *AWS CLI Command Reference*.

**describe-reserved-instances**

The following code example shows how to use `describe-reserved-instances`.

**AWS CLI**

**To describe your Reserved Instances**

This example command describes the Reserved Instances that you own.

**Command:**

```
aws ec2 describe-reserved-instances
```

**Output:**

```
{
   "ReservedInstances": [
```
To describe your Reserved Instances using filters

This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```
aws ec2 describe-reserved-instances --
filters Name=duration,Values=94608000
  Name=instance-type,Values=t2.micro
  Name=product-description,Values=Linux/UNIX
  Name=availability-zone,Values=us-east-1e
```

Output:

```
{
  "ReservedInstances": [
    {
      "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342fexample",
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-west-1c",
      "End": "2016-08-14T21:34:34.000Z",
      "ProductDescription": "Linux/UNIX",
      "UsagePrice": 0.00,
      "RecurringCharges": [
        {
          "Amount": 0.104,
          "Frequency": "Hourly"
        }
      ],
      "Start": "2015-08-15T21:34:35.086Z",
      "State": "active",
      "FixedPrice": 0.0,
      "CurrencyCode": "USD",
      "Duration": 31536000,
      "InstanceTenancy": "default",
      "InstanceType": "m3.medium",
      "InstanceCount": 2
    },
    ...
  ]
}
```
"ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
"OfferingType": "All Upfront",
"AvailabilityZone": "us-east-1e",
"End": "2018-03-26T21:34:34.000Z",
"ProductDescription": "Linux/UNIX",
"UsagePrice": 0.00,
"RecurringCharges": [],
"Start": "2015-03-27T21:34:35.848Z",
"State": "active",
"FixedPrice": 151.0,
"CurrencyCode": "USD",
"Duration": 94608000,
"InstanceTenancy": "default",
"InstanceType": "t2.micro",
"InstanceCount": 1
]
}
]

For more information, see Using Amazon EC2 Instances in the AWS Command Line Interface User Guide.

- For API details, see DescribeReservedInstances in AWS CLI Command Reference.

describe-route-tables

The following code example shows how to use describe-route-tables.

**AWS CLI**

**To describe your route tables**

The following describe-route-tables example retrieves the details about your route tables.

```bash
aws ec2 describe-route-tables
```

**Output:**

```json
{
    "RouteTables": [
        {
            "Associations": [
                {
```
"Main": true,
"RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
"RouteTableId": "rtb-09ba434c1bEXAMPLE"
}
],
"PropagatingVgws": [],
"RouteTableId": "rtb-09ba434c1bEXAMPLE",
"Routes": [
{
  "DestinationCidrBlock": "10.0.0.0/16",
  "GatewayId": "local",
  "Origin": "CreateRouteTable",
  "State": "active"
},
{
  "DestinationCidrBlock": "0.0.0.0/0",
  "NatGatewayId": "nat-06c018cbd8EXAMPLE",
  "Origin": "CreateRoute",
  "State": "blackhole"
}
],
"Tags": [],
"VpcId": "vpc-0065acced4EXAMPLE",
"OwnerId": "111122223333"
},
{
  "Associations": [
    {
      "Main": true,
      "RouteTableAssociationId": "rtbassoc-9EXAMPLE",
      "RouteTableId": "rtb-a1eec7de"
    }
  ],
  "PropagatingVgws": [],
  "RouteTableId": "rtb-a1eec7de",
  "Routes": [
    {
      "DestinationCidrBlock": "172.31.0.0/16",
      "GatewayId": "local",
      "Origin": "CreateRouteTable",
      "State": "active"
    },
    {
      "DestinationCidrBlock": "0.0.0.0/0",
      "NatGatewayId": "nat-06c018cbd8EXAMPLE",
      "Origin": "CreateRoute",
      "State": "blackhole"
    }
  ]
}
For more information, see Working with Route Tables in the AWS VPC User Guide.

- For API details, see DescribeRouteTables in AWS CLI Command Reference.
describe-scheduled-instance-availability

The following code example shows how to use describe-scheduled-instance-availability.

AWS CLI

To describe an available schedule

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Command:

```
aws ec2 describe-scheduled-instance-availability --
recurrence Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-
range EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

Output:

```
{
    "ScheduledInstanceAvailabilitySet": [
        {
            "AvailabilityZone": "us-west-2b",
            "TotalScheduledInstanceHours": 1219,
            "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
            "MinTermDurationInDays": 366,
            "AvailableInstanceCount": 20,
            "Recurrence": {
                "OccurrenceDaySet": [1],
                "Interval": 1,
                "Frequency": "Weekly",
                "OccurrenceRelativeToEnd": false
            },
            "Platform": "Linux/UNIX",
            "FirstSlotStartTime": "2016-01-31T00:00:00Z",
            "MaxTermDurationInDays": 366,
            "SlotDurationInHours": 23,
            "NetworkPlatform": "EC2-VPC",
            "InstanceType": "c4.large",
            "HourlyPrice": "0.095"
        }
    ]
}
```
To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large

- For API details, see DescribeScheduledInstanceAvailability in AWS CLI Command Reference.

**describe-scheduled-instances**

The following code example shows how to use describe-scheduled-instances.

**AWS CLI**

**To describe your Scheduled Instances**

This example describes the specified Scheduled Instance.

Command:

```
aws ec2 describe-scheduled-instances --scheduled-instance-ids sci-1234-1234-1234-1234-123456789012
```

Output:

```json
{
   "ScheduledInstanceSet": [
      {
         "AvailabilityZone": "us-west-2b",
         "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
         "HourlyPrice": "0.095",
         "CreateDate": "2016-01-25T21:43:38.612Z",
         "Recurrence": {
            "OccurrenceDaySet": [1]
         }
      }
   ]
}
```
This example describes all your Scheduled Instances.

Command:

```bash
aws ec2 describe-scheduled-instances
```

- For API details, see [DescribeScheduledInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-scheduled-instances.html) in *AWS CLI Command Reference*.

**describe-security-group-references**

The following code example shows how to use `describe-security-group-references`.

**AWS CLI**

**To describe security group references**

This example describes the security group references for sg-bbbbb2222. The response indicates that security group sg-bbbbb2222 is being referenced by a security group in VPC vpc-aaaaaaaa.

Command:

```bash
aws ec2 describe-security-group-references --group-id sg-bbbbb2222
```
Output:

```json
{
    "SecurityGroupsReferenceSet": [
    {
        "ReferencingVpcId": "vpc-aaaaaaaa",
        "GroupId": "sg-bbbbb22222",
        "VpcPeeringConnectionId": "pcx-b04deed9"
    }
    ]
}
```

- For API details, see [DescribeSecurityGroupReferences](#) in *AWS CLI Command Reference*.

**describe-security-group-rules**

The following code example shows how to use `describe-security-group-rules`.

**AWS CLI**

**Example 1: To describe the security group rules for a security group**

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.

```
aws ec2 describe-security-group-rules \
    --filters Name="group-id",Values="sg-1234567890abcdef0"
```

Output:

```json
{
    "SecurityGroupRules": [
    {
        "SecurityGroupRuleId": "sgr-abcdef01234567890",
        "GroupId": "sg-1234567890abcdef0",
        "GroupOwnerId": "111122223333",
        "IsEgress": false,
        "IpProtocol": ":-1",
        "FromPort": -1,
        "ToPort": -1,
        "ReferencedGroupInfo": {
```
Example 2: To describe a security group rule

The following describe-security-group-rules example describes the specified security group rule.

```
aws ec2 describe-security-group-rules \
    --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```
{
    "SecurityGroupRules": [
        {
```
For more information, see Security group rules in the Amazon VPC User Guide.

- For API details, see DescribeSecurityGroupRules in AWS CLI Command Reference.

describe-security-groups

The following code example shows how to use describe-security-groups.

AWS CLI

Example 1: To describe a security group

The following describe-security-groups example describes the specified security group.

```
aws ec2 describe-security-groups \
   --group-ids sg-903004f8
```

Output:

```json
{
   "SecurityGroups": [
      {
         "IpPermissionsEgress": [
            {
               "IpProtocol": "-1",
               "IpRanges": [
               {
                  "CidrIp": "0.0.0.0/0",
                 "Tags": []
               }
           ]
       }
   ]
}
}
"UserIdGroupPairs": [],
"PrefixListIds": []
],
"Description": "My security group",
"Tags": [
  {
    "Value": "SG1",
    "Key": "Name"
  }
],
"IpPermissions": [
  {
    "IpProtocol": ":1",
    "IpRanges": [],
    "UserIdGroupPairs": [
      {
        "UserId": "123456789012",
        "GroupId": "sg-903004f8"
      }
    ],
    "PrefixListIds": []
  },
  {
    "PrefixListIds": [],
    "FromPort": 22,
    "IpRanges": [
      {
        "Description": "Access from NY office",
        "CidrIp": "203.0.113.0/24"
      }
    ],
    "ToPort": 22,
    "IpProtocol": "tcp",
    "UserIdGroupPairs": []
  }
],
"GroupName": "MySecurityGroup",
"VpcId": "vpc-1a2b3c4d",
"OwnerId": "123456789012",
"GroupId": "sg-903004f8"}
Example 2: To describe security groups that have specific rules

The following describe-security-groups example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (0.0.0.0/0). The example uses the --query parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```bash
aws ec2 describe-security-groups \
   --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
   --query "SecurityGroups[*].[GroupName]" \
   --output text
```

Output:

```
default
my-security-group
web-servers
launch-wizard-1
```

Example 3: To describe security groups based on tags

The following describe-security-groups example uses filters to scope the results to security groups that include test in the security group name, and that have the tag Test=To-delete. The example uses the --query parameter to display only the names and IDs of the security groups.

```bash
aws ec2 describe-security-groups \
   --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
   --query "SecurityGroups[*].[Name:GroupName,ID:GroupId]"
```

Output:

```
[
  {
```
"Name": "testfornewinstance",
"ID": "sg-33bb22aa"
},
{
"Name": "newgrouptest",
"ID": "sg-1a2b3c4d"
}
]

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSecurityGroups in AWS CLI Command Reference.

describe-snapshot-attribute

The following code example shows how to use describe-snapshot-attribute.

AWS CLI

To describe the snapshot attributes for a snapshot

The following describe-snapshot-attribute example lists the accounts with which a snapshot is shared.

```bash
aws ec2 describe-snapshot-attribute \
   --snapshot-id snap-01234567890abcedf \
   --attribute createVolumePermission
```

Output:

```json
{
   "SnapshotId": "snap-01234567890abcedf",
   "CreateVolumePermissions": [
      {
         "UserId": "123456789012"
      }
   ]
}
```

For more information, see Share an Amazon EBS snapshot in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotAttribute in AWS CLI Command Reference.
describe-snapshot-tier-status

The following code example shows how to use describe-snapshot-tier-status.

AWS CLI

To view archival information about an archived snapshot

The following describe-snapshot-tier-status example provides archival information about an archived snapshot.

```
aws ec2 describe-snapshot-tier-status \
   --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```
{
   "SnapshotTierStatuses": [
      {
         "Status": "completed",
         "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
         "LastTieringProgress": 100,
         "Tags": [],
         "VolumeId": "vol-01234567890abcedf",
         "LastTieringOperationState": "archival-completed",
         "StorageTier": "archive",
         "OwnerId": "123456789012",
         "SnapshotId": "snap-01234567890abcedf",
         "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
      }
   ]
}
```

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotTierStatus in AWS CLI Command Reference.

describe-snapshots

The following code example shows how to use describe-snapshots.
Example 1: To describe a snapshot

The following describe-snapshots example describes the specified snapshot.

```
aws ec2 describe-snapshots \
  --snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
  "Snapshots": [ 
    {
      "Description": "This is my snapshot",
      "Encrypted": false,
      "VolumeId": "vol-049df61146c4d7901",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2019-02-28T21:28:32.000Z",
      "Progress": "100%",
      "OwnerId": "012345678910",
      "SnapshotId": "snap-01234567890abcdef",
      "Tags": [ 
        {
          "Key": "Stack",
          "Value": "test"
        }
      ]
    }
  ]
}
```

For more information, see Amazon EBS snapshots in the Amazon EC2 User Guide.

Example 2: To describe snapshots based on filters

The following describe-snapshots example uses filters to scope the results to snapshots owned by your AWS account that are in the pending state. The example uses the --query parameter to display only the snapshot IDs and the time the snapshot was started.

```
aws ec2 describe-snapshots \
```

Actions and scenarios
--owner-ids self \
--filters Name=status,Values=pending \
--query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"

Output:

```
[
  {
    "ID": "snap-1234567890abcdef0",
    "Time": "2019-08-04T12:48:18.000Z"
  },
  {
    "ID": "snap-066877671789bd71b",
    "Time": "2019-08-04T02:45:16.000Z"
  },
  ...
]
```

The following describe-snapshots example uses filters to scope the results to snapshots created from the specified volume. The example uses the --query parameter to display only the snapshot IDs.

```
aws ec2 describe-snapshots \
  --filters Name=volume-id,Values=049df61146c4d7901 \
  --query "Snapshots[*].[SnapshotId]" \
  --output text
```

Output:

```
snap-1234567890abcdef0
snap-08637175a712c3fb9
...
```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/listing-filtering-resources.html) in the *Amazon EC2 User Guide*.

**Example 3: To describe snapshots based on tags**

The following describe-snapshots example uses tag filters to scope the results to snapshots that have the tag Stack=Prod.
For an example of the output for `describe-snapshots`, see Example 1.

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

**Example 4: To describe snapshots based on age**

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
  --owner-ids 012345678910 \
  --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

**Example 5: To view only archived snapshots**

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
  --filters "Name=storage-tier,Values=archive"
```

Output:

```
{
  "Snapshots": [
    {
      "Description": "Snap A",
      "Encrypted": false,
      "VolumeId": "vol-01234567890aaaaaa",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2021-09-07T21:00:00.000Z",
      "Progress": "100%",
      "OwnerId": "123456789012",
```
"SnapshotId": "snap-01234567890aaaaa",
"StorageTier": "archive",
"Tags": []
],
}
]
}

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshots in AWS CLI Command Reference.

describe-spot-datafeed-subscription

The following code example shows how to use describe-spot-datafeed-subscription.

AWS CLI

To describe Spot Instance datafeed subscription for an account

This example command describes the data feed for the account.

Command:

```
aws ec2 describe-spot-datafeed-subscription
```

Output:

```
{
   "SpotDatafeedSubscription": {
      "OwnerId": "123456789012",
      "Prefix": "spotdata",
      "Bucket": "my-s3-bucket",
      "State": "Active"
   }
}
```

- For API details, see DescribeSpotDatafeedSubscription in AWS CLI Command Reference.

describe-spot-fleet-instances

The following code example shows how to use describe-spot-fleet-instances.
To describe the Spot Instances associated with a Spot fleet

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```
aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
   "ActiveInstances": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "InstanceType": "m3.medium",
         "SpotInstanceRequestId": "sir-08b93456"
      },
      ...
   ],
   "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

- For API details, see [DescribeSpotFleetInstances](#) in [AWS CLI Command Reference](#).

describe-spot-fleet-request-history

The following code example shows how to use describe-spot-fleet-request-history.

AWS CLI

To describe Spot fleet history

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```
The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```json
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange"
        },
        {
            "EventInformation": {
                "InstanceId": "i-1234567890abcdef0",
                "EventSubType": "launched"
            },
            "EventType": "instanceChange"
        },
        {
            "EventInformation": {
                "InstanceId": "i-1234567890abcdef1",
                "EventSubType": "launched"
            },
            "EventType": "instanceChange"
        }
    ],
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
    "NextToken": "CpHNsscimcV5oH7bSbub03CI2Qms5+ypNpNm

"Type": "one-time"
Example 2: To describe Spot Instance requests based on filters

The following `describe-spot-instance-requests` example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the `--query` parameter to display only the instance IDs.

```bash
aws ec2 describe-spot-instance-requests \
  --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-east-2a \
  --query "SpotInstanceRequests[*].InstanceId" \
  --output text
```

Output:

```
i-057750d42936e468a
i-001efd250faaa6ffa
i-027552a73f021f3bd
...```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/) in the *Amazon Elastic Compute Cloud User Guide*.

Example 3: To describe Spot Instance requests based on tags

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

```bash
aws ec2 describe-spot-instance-requests \
  --filters Name=tag:cost-center,Values=cc123
```

For an example of the output for `describe-spot-instance-requests`, see Example 1.

For additional examples using tag filters, see [Working with tags](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeSpotInstanceRequests](https://docs.aws.amazon.com/AWSCommandReference/) in *AWS CLI Command Reference*.
describe-spot-price-history

The following code example shows how to use describe-spot-price-history.

AWS CLI

To describe Spot price history

This example command returns the Spot Price history for m1.xlarge instances for a particular day in January.

Command:

```bash
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```json
{
   "SpotPriceHistory": [
      {
         "Timestamp": "2014-01-06T07:10:55.000Z",
         "ProductDescription": "SUSE Linux",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.087000",
         "AvailabilityZone": "us-west-1b"
      },
      {
         "Timestamp": "2014-01-06T07:10:55.000Z",
         "ProductDescription": "SUSE Linux",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.087000",
         "AvailabilityZone": "us-west-1c"
      },
      {
         "Timestamp": "2014-01-06T05:42:36.000Z",
         "ProductDescription": "SUSE Linux (Amazon VPC)",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.087000",
         "AvailabilityZone": "us-west-1a"
      },
      ...
   ]
}
```
To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{
    "SpotPriceHistory": [
        {
            "Timestamp": "2014-01-06T04:32:53.000Z",
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-1a"
        },
        {
            "Timestamp": "2014-01-05T11:28:26.000Z",
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-1c"
        }
    ]
}
```

- For API details, see [DescribeSpotPriceHistory](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-spot-price-history.html) in *AWS CLI Command Reference*.

**describe-stale-security-groups**

The following code example shows how to use `describe-stale-security-groups`.

**AWS CLI**

To describe stale security groups
This example describes stale security group rules for vpc-11223344. The response shows that sg-5fa68d3a in your account has a stale ingress SSH rule that references sg-279ab042 in the peer VPC, and that sg-fe6fba9a in your account has a stale egress SSH rule that references sg-ef6fba8b in the peer VPC.

Command:

    aws ec2 describe-stale-security-groups --vpc-id vpc-11223344

Output:

```json
{
  "StaleSecurityGroupSet": [
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-ef6fba8b",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ],
          "IpProtocol": "tcp"
        }
      ],
      "GroupName": "MySG1",
      "StaleIpPermissions": [],
      "GroupId": "sg-fe6fba9a",
      "Description": "MySG1"
    },
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [],
      "GroupName": "MySG2",
      "StaleIpPermissions": [
        {
          "ToPort": 22,
          "FromPort": 22,
```
"UserIdGroupPairs": [
  {
    "VpcId": "vpc-7a20e51f",
    "GroupId": "sg-279ab042",
    "Description": "Access from pcx-b04deed9",
    "VpcPeeringConnectionId": "pcx-b04deed9",
    "PeeringStatus": "active"
  }
],
  "IpProtocol": "tcp"
}
],
  "GroupId": "sg-5fa68d3a",
  "Description": "MySG2"
}
]
}

- For API details, see DescribeStaleSecurityGroups in AWS CLI Command Reference.

**describe-store-image-tasks**

The following code example shows how to use describe-store-image-tasks.

**AWS CLI**

To describe the progress of an AMI store task

The following describe-store-image-tasks example describes the progress of an AMI store task.

```bash
aws ec2 describe-store-image-tasks
```

Output:

```json
{
  "AmiId": "ami-1234567890abcdef0",
  "Bucket": "my-ami-bucket",
  "ProgressPercentage": 17,
  "S3ObjectKey": "ami-1234567890abcdef0.bin",
  "StoreTaskState": "InProgress",
  "StoreTaskFailureReason": null,
}

- For API details, see DescribeStoreImageTasks in AWS CLI Command Reference.

**describe-subnets**

The following code example shows how to use describe-subnets.

**AWS CLI**

**Example 1: To describe all your subnets**

The following describe-subnets example displays the details of your subnets.

```
aws ec2 describe-subnets
```

Output:

```json
{
    "Subnets": [
        {
            "AvailabilityZone": "us-east-1d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": false,
            "MapCustomerOwnedIpOnLaunch": true,
            "State": "available",
            "SubnetId": "subnet-0bb1c79de3EXAMPLE",
            "VpcId": "vpc-0ee975135dEXAMPLE",
            "OwnerId": "111122223333",
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "CustomerOwnedIpv4Pool": "pool-2EXAMPLE",
            "SubnetArn": "arn:aws:ec2:us-east-2:111122223333:subnet/subnet-0bb1c79de3EXAMPLE",
        }
    ]
}
```
"EnableDns64": false,
"Ipv6Native": false,
"PrivateDnsNameOptionsOnLaunch": {
   "HostnameType": "ip-name",
   "EnableResourceNameDnsARecord": false,
   "EnableResourceNameDnsAAAARecord": false
}
],
{
   "AvailabilityZone": "us-east-1d",
   "AvailabilityZoneId": "use1-az2",
   "AvailableIpAddressCount": 4089,
   "CidrBlock": "172.31.80.0/20",
   "DefaultForAz": true,
   "MapPublicIpOnLaunch": true,
   "MapCustomerOwnedIpOnLaunch": false,
   "State": "available",
   "SubnetId": "subnet-8EXAMPLE",
   "VpcId": "vpc-3EXAMPLE",
   "OwnerId": "111122223333",
   "AssignIpv6AddressOnCreation": false,
   "Ipv6CidrBlockAssociationSet": [],
   "Tags": [
      {
         "Key": "Name",
         "Value": "MySubnet"
      }
   ],
   "EnableDns64": false,
   "Ipv6Native": false,
   "PrivateDnsNameOptionsOnLaunch": {
      "HostnameType": "ip-name",
      "EnableResourceNameDnsARecord": false,
      "EnableResourceNameDnsAAAARecord": false
   }
}
]}

For more information, see Working with VPCs and Subnets in the AWS VPC User Guide.

Example 2: To describe the subnets of a specific VPC
The following `describe-subnets` example uses a filter to retrieve details for the subnets of the specified VPC.

```bash
aws ec2 describe-subnets \
  --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

Output:

```json
{
  "Subnets": [
    {
      "AvailabilityZone": "us-east-1d",
      "AvailabilityZoneId": "use1-az2",
      "AvailableIpAddressCount": 4089,
      "CidrBlock": "172.31.80.0/20",
      "DefaultForAz": true,
      "MapPublicIpOnLaunch": true,
      "MapCustomerOwnedIpOnLaunch": false,
      "State": "available",
      "SubnetId": "subnet-8EXAMPLE",
      "VpcId": "vpc-3EXAMPLE",
      "OwnerId": "1111222233333",
      "AssignIpv6AddressOnCreation": false,
      "Ipv6CidrBlockAssociationSet": [],
      "Tags": [
        {
          "Key": "Name",
          "Value": "MySubnet"
        }
      ],
      "EnableDns64": false,
      "Ipv6Native": false,
      "PrivateDnsNameOptionsOnLaunch": {
        "HostnameType": "ip-name",
        "EnableResourceNameDnsARecord": false,
        "EnableResourceNameDnsAAAARecord": false
      }
    }
  ]
}
```
For more information, see Working with VPCs and Subnets in the AWS VPC User Guide.

**Example 3: To describe the subnets with a specific tag**

The following describe-subnets example uses a filter to retrieve the details of those subnets with the tag CostCenter=123 and the --query parameter to display the subnet IDs of the subnets with this tag.

```bash
aws ec2 describe-subnets \
  --filters "Name=tag:CostCenter,Values=123" \
  --query "Subnets[*].SubnetId" \
  --output text
```

Output:

```
subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73
```

For more information, see Working with VPCs and Subnets in the Amazon VPC User Guide.

- For API details, see DescribeSubnets in AWS CLI Command Reference.

**describe-tags**

The following code example shows how to use describe-tags.

**AWS CLI**

**Example 1: To describe all tags for a single resource**

The following describe-tags example describes the tags for the specified instance.

```bash
aws ec2 describe-tags \
  --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "instance",
      "Tags": [
        {
          "Key": "Name",
          "Value": "instance-1234567890abcdef8"
        }
      ]
    }
  ]
}
```
Example 2: To describe all tags for a resource type

The following describe-tags example describes the tags for your volumes.

```bash
aws ec2 describe-tags \
   --filters "Name=resource-type,Values=volume"
```

Output:

```json
{
   "Tags": [
      {
         "ResourceType": "volume",
         "ResourceId": "vol-1234567890abcdef0",
         "Value": "Project1",
         "Key": "Purpose"
      },
      {
         "ResourceType": "volume",
         "ResourceId": "vol-049df61146c4d7901",
         "Value": "Logs",
         "Key": "Purpose"
      }
   ]
}
```

Example 3: To describe all your tags

The following describe-tags example describes the tags for all your resources.

```json
{
   "Tags": [
      {
         "ResourceType": "instance",
         "ResourceId": "i-1234567890abcdef8",
         "Value": "Test",
         "Key": "Stack"
      },
      {
         "ResourceType": "instance",
         "ResourceId": "i-1234567890abcdef8",
         "Value": "Beta Server",
         "Key": "Name"
      }
   ]
}
```
Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```bash
aws ec2 describe-tags
--filters Name=key,Values=Stack
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "volume",
      "ResourceId": "vol-027552a73f021f3b",
      "Value": "Production",
      "Key": "Stack"
    },
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef8",
      "Value": "Test",
      "Key": "Stack"
    }
  ]
}
```

Example 5: To describe the tags for your resources based on a tag key and tag value

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```bash
aws ec2 describe-tags
--filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
  "Tags": [
```

Actions and scenarios 2364
The following describe-tags example uses alternate syntax to describe resources with the tag Stack=Test.

```bash
aws ec2 describe-tags \
  --filters "Name=tag:Stack,Values=Test"
```

The following describe-tags example describes the tags for all your instances that have a tag with the key Purpose and no value.

```bash
aws ec2 describe-tags \
  --filters "Name=resource-type,Values=instance" "Name=key,Values=Purpose" "Name=value,Values="
```

Output:

```json
{
   "Tags": [
      {
         "ResourceType": "instance",
         "ResourceId": "i-1234567890abcdef5",
         "Value": null,
         "Key": "Purpose"
      }
   ]
}
```

- For API details, see [DescribeTags](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-tags.html) in *AWS CLI Command Reference*. 

describe-traffic-mirror-filters

The following code example shows how to use describe-traffic-mirror-filters.

AWS CLI

To view your traffic mirror filters

The following describe-traffic-mirror-filters example displays details for all of your traffic mirror filters.

```bash
aws ec2 describe-traffic-mirror-filters
```

Output:

```json
{
   "TrafficMirrorFilters": [
   {
      "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
      "IngressFilterRules": [
      {
         "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
         "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
         "TrafficDirection": "ingress",
         "RuleNumber": 100,
         "RuleAction": "accept",
         "Protocol": 6,
         "DestinationCidrBlock": "10.0.0.0/24",
         "SourceCidrBlock": "10.0.0.0/24",
         "Description": "TCP Rule"
      }
      ],
      "EgressFilterRules": [],
      "NetworkServices": [],
      "Description": "Example filter",
      "Tags": []
   }
   ]
}
```

For more information, see View your traffic mirror filters in the Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorFilters in AWS CLI Command Reference.
describe-traffic-mirror-sessions

The following code example shows how to use describe-traffic-mirror-sessions.

AWS CLI

To describe a Traffic Mirror Session

The following describe-traffic-mirror-sessions example displays details of the your Traffic Mirror sessions.

```bash
aws ec2 describe-traffic-mirror-sessions
```

Output:

```
{
   "TrafficMirrorSessions": [
   {
      "Tags": [],
      "VirtualNetworkId": 42,
      "OwnerId": "111122223333",
      "Description": "TCP Session",
      "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
      "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
      "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
      "PacketLength": 20,
      "SessionNumber": 1,
      "TrafficMirrorSessionId": "tms-0567a4c684EXAMPLE"
   },
   {
      "Tags": [
      {
         "Key": "Name",
         "Value": "tag test"
      }
      ],
      "VirtualNetworkId": 13314501,
      "OwnerId": "111122223333",
      "Description": "TCP Session",
      "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
      "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
      "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
      "PacketLength": 20,
      "SessionNumber": 2,
```
For more information, see [View Traffic Mirror Session Details](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/traffic-mirror-session-details.html) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorSessions](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-traffic-mirror-sessions.html) in *AWS CLI Command Reference*.

**describe-traffic-mirror-targets**

The following code example shows how to use `describe-traffic-mirror-targets`.

**AWS CLI**

To describe a traffic mirror target

The following `describe-traffic-mirror-targets` example displays information about the specified traffic mirror target.

```bash
aws ec2 describe-traffic-mirror-targets \ 
   --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```json
{
   "TrafficMirrorTargets": [
      {
         "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
         "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",
         "Type": "network-load-balancer",
         "Description": "Example Network Load Balancer target",
         "OwnerId": "111122223333",
         "Tags": []
      }
   ]
}
```

For more information, see [Traffic mirror targets](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/traffic-targets.html) in the *Amazon VPC Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorTargets](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-traffic-mirror-targets.html) in *AWS CLI Command Reference*. 
describe-transit-gateway-attachments

The following code example shows how to use describe-transit-gateway-attachments.

AWS CLI

To view your transit gateway attachments

The following describe-transit-gateway-attachments example displays details for your transit gateway attachments.

```
aws ec2 describe-transit-gateway-attachments
```

Output:

```
{
    "TransitGatewayAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",

describe-transit-gateway-connect-peers

The following code example shows how to use describe-transit-gateway-connect-peers.

AWS CLI

To describe a Transit Gateway Connect peer

The following describe-transit-gateway-connect-peers example describes the specified Connect peer.

```
aws ec2 describe-transit-gateway-connect-peers \
    --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPE
```

Output:

```json
{
    "TransitGatewayConnectPeers": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
            "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
            "State": "available",
            "CreationTime": "2021-10-13T03:35:17.000Z",
            "ConnectPeerConfiguration": {
                "TransitGatewayAddress": "10.0.0.234",
                "PeerAddress": "172.31.1.11",
                "InsideCidrBlocks": [
                    "169.254.6.0/29"
                ],
                "Protocol": "gre",
                "BgpConfigurations": [
                    {
                        "TransitGatewayAsn": 64512,
                        "PeerAsn": 64512,
                        "TransitGatewayAddress": "169.254.6.2",
                        "PeerAddress": "169.254.6.1",
                        "BgpStatus": "down"

                    }
                ]
            }
        }
    ]
}
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnectPeers in AWS CLI Command Reference.

describe-transit-gateway-connects

The following code example shows how to use describe-transit-gateway-connects.

AWS CLI

To describe a transit gateway Connect attachment

The following describe-transit-gateway-connects example describes the specified Connect attachment.

```
aws ec2 describe-transit-gateway-connects \
  --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
  "TransitGatewayConnects": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "State": "available",
      "CreationTime": "2021-03-09T19:59:17+00:00",
      "Options": {
        "PeerAsn": 64512,
        "TransitGatewayAddress": "169.254.6.3",
        "PeerAddress": "169.254.6.1",
        "BgpStatus": "down"
      }
    }
  ]
}
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnects in AWS CLI Command Reference.

**describe-transit-gateway-multicast-domains**

The following code example shows how to use describe-transit-gateway-multicast-domains.

**AWS CLI**

**To describe your transit gateway multicast domains**

The following describe-transit-gateway-multicast-domains example displays details for all of your transit gateway multicast domains.

```bash
aws ec2 describe-transit-gateway-multicast-domains
```

**Output:**

```json
{
    "TransitGatewayMulticastDomains": [
        {
            "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
            "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
            "OwnerId": "123456789012",
            "Options": {
                "Igmpv2Support": "disable",
                "StaticSourcesSupport": "enable",
                "AutoAcceptSharedAssociations": "disable"
            }
        }
    ]
}
```
For more information, see [Managing multicast domains](https://docs.aws.amazon.com/translate/latest/userguide/Transit-Gateways-Guide.html) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayMulticastDomains](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-multicast-domains.html) in *AWS CLI Command Reference*.

### describe-transit-gateway-peering-attachments

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

**AWS CLI**

**To describe your transit gateway peering attachments**

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```bash
aws ec2 describe-transit-gateway-peering-attachments
```

**Output:**

```json
{
  "TransitGatewayPeeringAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
      "RequesterTgwInfo": {
        "TransitGatewayId": "tgw-123abc05e04123abc",
        "OwnerId": "123456789012",
        "Region": "us-west-2"
      }
    }
  ]
}
```
"AccepterTgwInfo": {
    "TransitGatewayId": "tgw-11223344aabbcc112",
    "OwnerId": "123456789012",
    "Region": "us-east-2"
},
"State": "pendingAcceptance",
"CreationTime": "2019-12-09T11:38:05.000Z",
"Tags": []
}
]
}

For more information, see Transit Gateway Peering Attachments in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayPeeringAttachments in AWS CLI Command Reference.

describe-transit-gateway-policy-tables

The following code example shows how to use describe-transit-gateway-policy-tables.

**AWS CLI**

To describe a transit gateway policy table

The following describe-transit-gateway-policy-tables example describes the specified transit gateway policy table.

```bash
aws ec2 describe-transit-gateway-policy-tables \
    --transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```json
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "available",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```
For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DescribeTransitGatewayPolicyTables in AWS CLI Command Reference.

**describe-transit-gateway-route-tables**

The following code example shows how to use describe-transit-gateway-route-tables.

**AWS CLI**

**To describe your transit gateway route tables**

The following describe-transit-gateway-route-tables example displays details for your transit gateway route tables.

```
aws ec2 describe-transit-gateway-route-tables
```

**Output:**

```
{
    "TransitGatewayRouteTables": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
            "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:49.000Z",
            "Tags": []
        },
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:00.000Z",
            "Tags": []
        }
    ]
}
```
For more information, see View transit gateway route tables in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayRouteTables in AWS CLI Command Reference.

describe-transit-gateway-vpc-attachments

The following code example shows how to use describe-transit-gateway-vpc-attachments.

AWS CLI

To describe your transit gateway VPC attachments

The following describe-transit-gateway-vpc-attachments example displays details for your transit gateway VPC attachments.

```
aws ec2 describe-transit-gateway-vpc-attachments
```

Output:

```
{
  "TransitGatewayVpcAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
      "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
      "VpcId": "vpc-0f501f7ee8EXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "available",
      "SubnetIds": [
        "subnet-045d586432EXAMPLE",
        "subnet-0a0ad478a6EXAMPLE"
      ],
      "CreationTime": "2019-02-13T11:04:02.000Z",
      "Options": {
        "DnsSupport": "enable",
        "Ipv6Support": "disable"
      },
      "Tags": [
        {
...
"Key": "Name",
  "Value": "attachment name"
  ]
]}
]
}

For more information, see View your VPC attachments in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayVpcAttachments in AWS CLI Command Reference.

describe-transit-gateways

The following code example shows how to use describe-transit-gateways.

AWS CLI

To describe your transit gateways

The following describe-transit-gateways example retrieves details about your transit gateways.

aws ec2 describe-transit-gateways

Output:

```json
{
  "TransitGateways": [
    {
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "State": "available",
      "OwnerId": "111122223333",
      "Description": "MyTGW",
      "CreationTime": "2019-07-10T14:02:12.000Z",
      "Options": {
        "AmazonSideAsn": 64516,
        "AutoAcceptSharedAttachments": "enable",
        "DefaultRouteTableAssociation": "enable",
        "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
```
For API details, see DescribeTransitGateways in AWS CLI Command Reference.

describe-verified-access-endpoints

The following code example shows how to use describe-verified-access-endpoints.

AWS CLI

To describe a Verified Access endpoint
The following `delete-verified-access-endpoints` example describes the specified Verified Access endpoint.

```bash
code
aws ec2 describe-verified-access-endpoints
   --verified-access-endpoint-ids vae-066fac616d4d546f2
```

Output:

```json
{
   "VerifiedAccessEndpoints": [
      {
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
         "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
         "ApplicationDomain": "example.com",
         "EndpointType": "network-interface",
         "AttachmentType": "vpc",
         "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
         "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
         "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
         ],
         "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
         },
         "Status": {
            "Code": "active"
         },
         "Description": "",
         "CreationTime": "2023-08-25T20:54:43",
         "LastUpdatedTime": "2023-08-25T22:17:26",
         "Tags": [
            {
               "Key": "Name",
               "Value": "my-va-endpoint"
            }
         ]
      }
   ]
}```
For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/userguide/index.html) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessEndpoints](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-verified-access-endpoints.html) in *AWS CLI Command Reference*.

### describe-verified-access-groups

The following code example shows how to use `describe-verified-access-groups`.

#### AWS CLI

**To describe a Verified Access group**

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```bash
cmd:
aws ec2 describe-verified-access-groups \\
   --verified-access-group-ids vagr-0dbe967baf14b7235
```

**Output:**

```json
{
   "VerifiedAccessGroups": [
      {
         "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "Description": "Testing Verified Access",
         "Owner": "123456789012",
         "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
         "CreationTime": "2023-08-25T19:55:19",
         "LastUpdatedTime": "2023-08-25T22:17:25",
         "Tags": [
            {
               "Key": "Name",
               "Value": "my-va-group"
            }
         ]
      }
   ]
}
```
describe-verified-access-instance-logging-configurations

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

**AWS CLI**

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \
   --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```json
{
   "LoggingConfigurations": [
   {
       "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
       "AccessLogs": {
           "S3": {
               "Enabled": false
           },
           "CloudWatchLogs": {
               "Enabled": true,
               "DeliveryStatus": {
                   "Code": "success"
               },
               "LogGroup": "my-log-group"
           },
           "KinesisDataFirehose": {
               "Enabled": false
           },
           "LogVersion": "ocsf-1.0.0-rc.2",
   }]
}
```
"IncludeTrustContext": false
}
]
}

For more information, see [Verified Access logs](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in *AWS CLI Command Reference*.

**describe-verified-access-instances**

The following code example shows how to use `describe-verified-access-instances`.

**AWS CLI**

To describe a Verified Access instance

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```
aws ec2 describe-verified-access-instances \
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

**Output:**

```
{
   "VerifiedAccessInstances": [
      {
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "Description": "Testing Verified Access",
         "VerifiedAccessTrustProviders": [
            {
               "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
               "TrustProviderType": "user",
               "UserTrustProviderType": "iam-identity-center"
            }
         ],
         "CreationTime": "2023-08-25T18:27:56",
         "LastUpdatedTime": "2023-08-25T19:03:32",
         "Tags": [
            {
```
For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstances](#) in *AWS CLI Command Reference*.

describe-verified-access-trust-providers

The following code example shows how to use `describe-verified-access-trust-providers`.

**AWS CLI**

**To describe a Verified Access trust provider**

The following `describe-verified-access-trust-providers` example describes the specified Verified Access trust provider.

```
aws ec2 describe-verified-access-trust-providers \
    --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProviders": [ 
    {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:03:32",
        "Tags": [ 
            {
                "Key": "Name",
            ],
        ],
    },
}]
```
For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessTrustProviders in AWS CLI Command Reference.

describe-volume-attribute

The following code example shows how to use describe-volume-attribute.

AWS CLI

To describe a volume attribute

This example command describes the autoEnableIo attribute of the volume with the ID vol-049df61146c4d7901.

Command:

```
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --attribute autoEnableIO
```

Output:

```
{
   "AutoEnableIO": {
      "Value": false
   },
   "VolumeId": "vol-049df61146c4d7901"
}
```

- For API details, see DescribeVolumeAttribute in AWS CLI Command Reference.

describe-volume-status

The following code example shows how to use describe-volume-status.
AWS CLI

To describe the status of a single volume

This example command describes the status for the volume `vol-1234567890abcdef0`.

Command:

```bash
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```json
{
  "VolumeStatuses": [
    {
      "VolumeStatus": {
        "Status": "ok",
        "Details": [
          {
            "Status": "passed",
            "Name": "io-enabled"
          },
          {
            "Status": "not-applicable",
            "Name": "io-performance"
          }
        ]
      },
      "AvailabilityZone": "us-east-1a",
      "VolumeId": "vol-1234567890abcdef0",
      "Actions": [],
      "Events": []
    }
  }
}
```

To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:
aws ec2 describe-volume-status --filters Name=volume-status.status,Values=impaired

Output:

```
{
   "VolumeStatuses": []
}
```

If you have a volume with a failed status check (status is impaired), see Working with an Impaired Volume in the Amazon EC2 User Guide.

- For API details, see DescribeVolumeStatus in AWS CLI Command Reference.

**describe-volumes-modifications**

The following code example shows how to use describe-volumes-modifications.

**AWS CLI**

To describe the modification status for a volume

The following describe-volumes-modifications example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
   --volume-ids vol-1234567890abcdef0
```

Output:

```
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "optimizing",
      "VolumeId": " vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 70,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```
describe-volumes

The following code example shows how to use describe-volumes.

AWS CLI

Example 1: To describe a volume

The following describe-volumes example describes the specified volumes in the current Region.

```
aws ec2 describe-volumes \
--volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

Output:

```
{
   "Volumes": [
      {
         "AvailabilityZone": "us-east-1a",
         "Attachments": [
            {
               "AttachTime": "2013-12-18T22:35:00.000Z",
               "InstanceId": "i-1234567890abcdef0",
               "VolumeId": "vol-049df61146c4d7901",
               "State": "attached",
               "DeleteOnTermination": true,
               "Device": "/dev/sda1"
            }
         ],
         "Encrypted": true,
         "KmsKeyId": "arn:aws:kms:us-east-2a:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE",
         "VolumeType": "gp2",
         "VolumeId": "vol-049df61146c4d7901",
         "State": "in-use",
         "Iops": 100,
```
Example 2: To describe volumes that are attached to a specific instance

The following `describe-volumes` example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```
aws ec2 describe-volumes \
   --region us-east-1 \n   --filters Name=attachment.instance-id,Values=i-1234567890abcdef0 Name=attachment.delete-on-termination,Values=true
```

For an example of the output for `describe-volumes`, see Example 1.

Example 3: To describe available volumes in a specific Availability Zone

The following `describe-volumes` example describes all volumes that have a status of available and are in the specified Availability Zone.

```
aws ec2 describe-volumes \n   --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a
```

For an example of the output for `describe-volumes`, see Example 1.

Example 4: To describe volumes based on tags
The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```bash
aws ec2 describe-volumes \
  --filters Name=tag:Name,Values=Test* \
  --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```json
[
  {
    "Tag": [
      {
        "Value": "Test2",
        "Key": "Name"
      }
    ],
    "ID": "vol-1234567890abcdef0"
  },
  {
    "Tag": [
      {
        "Value": "Test1",
        "Key": "Name"
      }
    ],
    "ID": "vol-049df61146c4d7901"
  }
]
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeVolumes in AWS CLI Command Reference.

**describe-vpc-attribute**

The following code example shows how to use `describe-vpc-attribute`.

**AWS CLI**

To describe the `enableDnsSupport` attribute
This example describes the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is true, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

**Command:**

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

**Output:**

```json
{
   "VpcId": "vpc-a01106c2",
   "EnableDnsSupport": {
      "Value": true
   }
}
```

**To describe the enableDnsHostnames attribute**

This example describes the enableDnsHostnames attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not.

**Command:**

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames
```

**Output:**

```json
{
   "VpcId": "vpc-a01106c2",
   "EnableDnsHostnames": {
      "Value": true
   }
}
```

- For API details, see [DescribeVpcAttribute](#) in [AWS CLI Command Reference](#).

**describe-vpc-classic-link-dns-support**

The following code example shows how to use describe-vpc-classic-link-dns-support.
To describe ClassicLink DNS support for your VPCs

This example describes the ClassicLink DNS support status of all of your VPCs.

Command:

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
    "Vpcs": [
        {
            "VpcId": "vpc-88888888",
            "ClassicLinkDnsSupported": true
        },
        {
            "VpcId": "vpc-1a2b3c4d",
            "ClassicLinkDnsSupported": false
        }
    ]
}
```

For API details, see [DescribeVpcClassicLinkDnsSupport](https://awscli.amazonaws.com/v2_docs/CLI_AWSCLI.html#describe-vpc-classic-link) in *AWS CLI Command Reference*.

describe-vpc-classic-link

The following code example shows how to use describe-vpc-classic-link.

AWS CLI

To describe the ClassicLink status of your VPCs

This example lists the ClassicLink status of vpc-88888888.

Command:

```
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

Output:
This example lists only VPCs that are enabled for Classiclink (the filter value of is-classic-link-enabled is set to true).

Command:

```bash
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-enabled,Values=true"
```

- For API details, see DescribeVpcClassicLink in AWS CLI Command Reference.

### describe-vpc-endpoint-connection-notifications

The following code example shows how to use describe-vpc-endpoint-connection-notifications.

#### AWS CLI

To describe endpoint connection notifications

The following describe-vpc-endpoint-connection-notifications example describes all of your endpoint connection notifications.

```bash
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:
For API details, see `DescribeVpcEndpointConnectionNotifications` in *AWS CLI Command Reference*.

**describe-vpc-endpoint-connections**

The following code example shows how to use `describe-vpc-endpoint-connections`.

**AWS CLI**

To describe VPC endpoint connections

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are `PendingAcceptance`.

Command:

```bash
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

Output:

```json
{
    "VpcEndpointConnections": [
    
    ]
}
```
For API details, see DescribeVpcEndpointConnections in AWS CLI Command Reference.

describe-vpc-endpoint-service-configurations

The following code example shows how to use describe-vpc-endpoint-service-configurations.

AWS CLI

To describe endpoint service configurations

The following describe-vpc-endpoint-service-configurations example describes your endpoint service configurations.

aws ec2 describe-vpc-endpoint-service-configurations

Output:

```json
{
    "ServiceConfigurations": [
        {
            "ServiceType": [
                {
                    "ServiceType": "GatewayLoadBalancer"
                }
            ],
            "ServiceId": "vpce-svc-0123a331c4321cabc",
            "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-0123a331c4321cabc",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-east-1d"
            ]
        }
    ]
}
```
For more information, see VPC endpoint services in the Amazon VPC User Guide.
describe-vpc-endpoint-service-permissions

The following code example shows how to use describe-vpc-endpoint-service-permissions.

AWS CLI

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
   "AllowedPrincipals": [
      {
         "PrincipalType": "Account",
         "Principal": "arn:aws:iam::123456789012:root"
      }
   ]
}
```

describe-vpc-endpoint-services

The following code example shows how to use describe-vpc-endpoint-services.

AWS CLI

Example 1: To describe all VPC endpoint services

The following "describe-vpc-endpoint-services" example lists all VPC endpoint services for an AWS Region.
aws ec2 describe-vpc-endpoint-services

Output:

```json
{
    "ServiceDetails": [
        {
            "ServiceType": [
                {
                    "ServiceType": "Gateway"
                }
            ],
            "AcceptanceRequired": false,
            "ServiceName": "com.amazonaws.us-east-1.dynamodb",
            "VpcEndpointPolicySupported": true,
            "Owner": "amazon",
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1c",
                "us-east-1d",
                "us-east-1e",
                "us-east-1f"
            ],
            "BaseEndpointDnsNames": [
                "dynamodb.us-east-1.amazonaws.com"
            ]
        },
        {
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "PrivateDnsName": "ec2.us-east-1.amazonaws.com",
            "ServiceName": "com.amazonaws.us-east-1.ec2",
            "VpcEndpointPolicySupported": false,
            "Owner": "amazon",
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1c",
                "us-east-1d"
            ]
        }
    ]
}
```
"us-east-1e",
"us-east-1f"
],
"AcceptanceRequired": false,
"BaseEndpointDnsNames": [
  "ec2.us-east-1.vpce.amazonaws.com"
]
},
{
  "ServiceType": [
    {
      "ServiceType": "Interface"
    }
  ],
  "PrivateDnsName": "ssm.us-east-1.amazonaws.com",
  "ServiceName": "com.amazonaws.us-east-1.ssm",
  "VpcEndpointPolicySupported": true,
  "Owner": "amazon",
  "AvailabilityZones": [
    "us-east-1a",
    "us-east-1b",
    "us-east-1c",
    "us-east-1d",
    "us-east-1e"
  ],
  "AcceptanceRequired": false,
  "BaseEndpointDnsNames": [
    "ssm.us-east-1.vpce.amazonaws.com"
  ]
}
],
"ServiceNames": [
  "com.amazonaws.us-east-1.dynamodb",
  "com.amazonaws.us-east-1.ec2",
  "com.amazonaws.us-east-1.ec2messages",
  "com.amazonaws.us-east-1.elasticloadbalancing",
  "com.amazonaws.us-east-1.kinesis-streams",
  "com.amazonaws.us-east-1.s3",
  "com.amazonaws.us-east-1.ssm"
]
For more information, see View available AWS service names in the User Guide for AWSPrivateLink.

**Example 2: To describe the details about an endpoint service**

The following "describe-vpc-endpoint-services" example lists the details of the Amazon S3 interface endpoint service

```bash
aws ec2 describe-vpc-endpoint-services \
   --filter "Name=service-type,Values=Interface" Name=service-name,Values=com.amazonaws.us-east-1.s3
```

**Output:**

```json
{
   "ServiceDetails": [
      {
         "ServiceName": "com.amazonaws.us-east-1.s3",
         "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
         "ServiceType": [
            "ServiceType": "Interface"
         ],
         "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d",
            "us-east-1e",
            "us-east-1f"
         ],
         "Owner": "amazon",
         "BaseEndpointDnsNames": [
            "s3.us-east-1.vpce.amazonaws.com"
         ],
         "VpcEndpointPolicySupported": true,
         "AcceptanceRequired": false,
         "ManagesVpcEndpoints": false,
         "Tags": []
      }
   ],
   "ServiceNames": [
```
For more information, see View available AWS service names in the User Guide for AWSPrivateLink.

- For API details, see DescribeVpcEndpointServices in AWS CLI Command Reference.

describe-vpc-endpoints

The following code example shows how to use describe-vpc-endpoints.

AWS CLI

To describe your VPC endpoints

The following describe-vpc-endpoints example displays details for all of your VPC endpoints.

```
aws ec2 describe-vpc-endpoints
```

Output:

```
{
   "VpcEndpoints": [
    {
        "VpcId": "vpc-aabb1122",
        "NetworkInterfaceIds": [],
        "SubnetIds": [],
        "PrivateDnsEnabled": true,
        "State": "available",
        "ServiceName": "com.amazonaws.us-east-1.dynamodb",

    }
  ]
For more information, see VPC endpoints in the Amazon VPC User Guide.

- For API details, see DescribeVpcEndpoints in AWS CLI Command Reference.

describe-vpc-peering-connections

The following code example shows how to use describe-vpc-peering-connections.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

```bash
aws ec2 describe-vpc-peering-connections
```

Output:
{
    "VpcPeeringConnections": [
        {
            "Status": {
                "Message": "Active",
                "Code": "active"
            },
            "Tags": [
                {
                    "Value": "Peering-1",
                    "Key": "Name"
                }
            ],
            "AccepterVpcInfo": {
                "OwnerId": "111122223333",
                "VpcId": "vpc-1a2b3c4d",
                "CidrBlock": "10.0.1.0/28"
            },

                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "444455556666",
                "VpcId": "vpc-11aa22bb",
                "CidrBlock": "10.0.0.0/28"
            }
        }
    ]
}
To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```

This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see [DescribeVpcPeeringConnections](#) in *AWS CLI Command Reference*.

**describe-vpcs**

The following code example shows how to use describe-vpcs.
Example 1: To describe all of your VPCs

The following `describe-vpcs` example retrieves details about your VPCs.

```bash
aws ec2 describe-vpcs
```

Output:

```json
{
   "Vpcs": [
      {
         "CidrBlock": "30.1.0.0/16",
         "DhcpOptionsId": "dopt-19edf471",
         "State": "available",
         "VpcId": "vpc-0e981d129EXAMPLE",
         "OwnerId": "111122223333",
         "InstanceTenancy": "default",
         "CidrBlockAssociationSet": [
            {
               "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
               "CidrBlock": "30.1.0.0/16",
               "CidrBlockState": {
                  "State": "associated"
               }
            }
         ],
         "IsDefault": false,
         "Tags": [
            {
               "Key": "Name",
               "Value": "Not Shared"
            }
         ]
      },
      {
         "CidrBlock": "10.0.0.0/16",
         "DhcpOptionsId": "dopt-19edf471",
         "State": "available",
         "VpcId": "vpc-06e4ab6c6cEXAMPLE",
         "OwnerId": "222222222222",
         "InstanceTenancy": "default"
      }
   ]
}
```
Example 2: To describe a specified VPC

The following `describe-vpcs` example retrieves details for the specified VPC.

```bash
aws ec2 describe-vpcs \
  --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```json
{
  "Vpcs": [
    {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-06e4ab6c6cEXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
          "CidrBlock": "10.0.0.0/16",
          "CidrBlockState": {
            "State": "associated"
          }
        }
      ],
      "IsDefault": false,
      "Tags": [
        {
          "Key": "Name",
          "Value": "Shared VPC"
        }
      ]
    }
  ]
}
```
For API details, see DescribeVpcs in AWS CLI Command Reference.

describe-vpn-connections

The following code example shows how to use describe-vpn-connections.

AWS CLI

Example 1: To describe your VPN connections

The following describe-vpn-connections example describes all of your Site-to-Site VPN connections.

```bash
aws ec2 describe-vpn-connections
```

Output:

```json
{
   "VpnConnections": [
      {
         "CustomerGatewayConfiguration": "...configuration information...",
         "CustomerGatewayId": "cgw-01234567abcde1234",
         "Category": "VPN",
         "State": "available",
         "Type": "ipsec.1",
         "VpnConnectionId": "vpn-1122334455aabbccd",
         "TransitGatewayId": "tgw-00112233445566aab",
      }
   ]
}
```
"Options": {
    "EnableAcceleration": false,
    "StaticRoutesOnly": true,
    "LocalIpv4NetworkCidr": "0.0.0.0/0",
    "RemoteIpv4NetworkCidr": "0.0.0.0/0",
    "TunnelInsideIpVersion": "ipv4"
},
"Routes": [],
"Tags": [
    {
        "Key": "Name",
        "Value": "CanadaVPN"
    }
],
"VgwTelemetry": [
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2020-07-29T10:35:11.000Z",
        "OutsideIpAddress": "203.0.113.3",
        "Status": "DOWN",
        "StatusMessage": ""
    },
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2020-09-02T09:09:33.000Z",
        "OutsideIpAddress": "203.0.113.5",
        "Status": "UP",
        "StatusMessage": ""
    }
]
}

For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-site-to-site-vpn.html) in the *[AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-site-to-site-vpn.html)*.

**Example 2: To describe your available VPN connections**

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of available.

```bash
aws ec2 describe-vpn-connections
```
--filters "Name=state,Values=available"

For more information, see [How AWS Site-to-Site VPN works](aws-site-to-site-vpn-user-guide) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [DescribeVpnConnections](aws-cli-command-reference) in *AWS CLI Command Reference*.

**describe-vpn-gateways**

The following code example shows how to use `describe-vpn-gateways`.

**AWS CLI**

**To describe your virtual private gateways**

This example describes your virtual private gateways.

**Command:**

```
aws ec2 describe-vpn-gateways
```

**Output:**

```
{
   "VpnGateways": [
      {
         "State": "available",
         "Type": "ipsec.1",
         "VpnGatewayId": "vgw-f211f09b",
         "VpcAttachments": [
            {
               "State": "attached",
               "VpcId": "vpc-98eb5ef5"
            }
         ]
      },
      {
         "State": "available",
         "Type": "ipsec.1",
         "VpnGatewayId": "vgw-9a4cacf3",
         "VpcAttachments": [
            {
            }
         ]
      }
   ]
}
```
The following code example shows how to use `detach-classic-link-vpc`.

**AWS CLI**

To unlink (detach) an EC2-Classic instance from a VPC

This example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

**Command:**

```bash
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-id vpc-88888888
```

**Output:**

```json
{
    "Return": true
}
```

For API details, see [DetachClassicLinkVpc](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-classic-link-vpc.html) in *AWS CLI Command Reference*.

The following code example shows how to use `detach-internet-gateway`.

**AWS CLI**

To detach an internet gateway from your VPC

**Example:**

```bash
aws ec2 detach-internet-gateway --vpc-id vpc-88888888
```

For API details, see [DetachInternetGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-internet-gateway.html) in *AWS CLI Command Reference*. 
The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```bash
aws ec2 detach-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE \
    --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.
- For API details, see DetachInternetGateway in AWS CLI Command Reference.

**detach-network-interface**

The following code example shows how to use `detach-network-interface`.

**AWS CLI**

**To detach a network interface from your instance**

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

- For API details, see DetachNetworkInterface in AWS CLI Command Reference.

**detach-verified-access-trust-provider**

The following code example shows how to use `detach-verified-access-trust-provider`.

**AWS CLI**

**To detach a trust provider from an instance**

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```bash
aws ec2 detach-verified-access-trust-provider \
```
--verified-access-instance-id vai-0ce000c0b7643abea \
--verified-access-trust-provider-id vatp-0bb32de759a3e19e7

Output:

```json
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:00:38"
    },
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56"
    }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-objects.html) in the *AWS Verified Access User Guide*.

- For API details, see [DetachVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-volume.html) in *AWS CLI Command Reference*.

detach-volume

The following code example shows how to use `detach-volume`.

**AWS CLI**

To detach a volume from an instance

This example command detaches the volume (vol-049df61146c4d7901) from the instance it is attached to.

Command:

```bash
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```
Output:

```json
{
    "AttachTime": "2014-02-27T19:23:06.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "VolumeId": "vol-049df61146c4d7901",
    "State": "detaching",
    "Device": "/dev/sdb"
}
```

- For API details, see [DetachVolume](#) in *AWS CLI Command Reference*.

**detach-vpn-gateway**

The following code example shows how to use `detach-vpn-gateway`.

**AWS CLI**

To detach a virtual private gateway from your VPC

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

- For API details, see [DetachVpnGateway](#) in *AWS CLI Command Reference*.

**disable-address-transfer**

The following code example shows how to use `disable-address-transfer`.

**AWS CLI**

To disable an Elastic IP address transfer

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \
```
--allocation-id eipalloc-09ad461b0d03f6aaf

Output:

```
{
   "AddressTransfer": {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "AddressTransferStatus": "disabled"
   }
}
```

For more information, see [Transfer Elastic IP addresses](https://docs.aws.amazon.com/vpc/latest/userguide/transfer-addresses.html) in the [Amazon VPC User Guide](https://docs.aws.amazon.com/vpc/latest/userguide/).

- For API details, see [DisableAddressTransfer](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-address-transfer.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ec2.html).

disable-aws-network-performance-metric-subscription

The following code example shows how to use disable-aws-network-performance-metric-subscription.

**AWS CLI**

**To disable a metric subscription**

The following disable-aws-network-performance-metric-subscription example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 disable-aws-network-performance-metric-subscription \
  --source us-east-1 \
  --destination eu-west-1 \
  --metric aggregate-latency \
  --statistic p50
```

Output:

```
{
   "Output": true
}
```
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DisableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

disable-ebs-encryption-by-default

The following code example shows how to use disable-ebs-encryption-by-default.

AWS CLI

To disable EBS encryption by default

The following disable-ebs-encryption-by-default example disables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 disable-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": false
}
```

- For API details, see DisableEbsEncryptionByDefault in AWS CLI Command Reference.

disable-fast-launch

The following code example shows how to use disable-fast-launch.

AWS CLI

To discontinue fast launching for an image

The following disable-fast-launch example discontinues fast launching on the specified AMI, and cleans up existing pre-provisioned snapshots.

```bash
aws ec2 disable-fast-launch \
    --image-id ami-01234567890abcedf
```

Output:
For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

- For API details, see DisableFastLaunch in AWS CLI Command Reference.

disable-fast-snapshot-restores

The following code example shows how to use disable-fast-snapshot-restores.

AWS CLI

To disable fast snapshot restore

The following disable-fast-snapshot-restores example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```bash
aws ec2 disable-fast-snapshot-restores \
   --availability-zones us-east-2a \
   --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
   "Successful": [
```
For API details, see DisableFastSnapshotRestores in AWS CLI Command Reference.

disable-image-block-public-access

The following code example shows how to use disable-image-block-public-access.

AWS CLI

To disable block public access for AMIs in the specified Region

The following disable-image-block-public-access example disables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 disable-image-block-public-access \  --region us-east-1
```

Output:

```json
{
   "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see Block public access to your AMIs in the Amazon EC2 User Guide.

For API details, see DisableImageBlockPublicAccess in AWS CLI Command Reference.

disable-image-deprecation

The following code example shows how to use disable-image-deprecation.
AWS CLI

To cancel the deprecation of an AMI

The following disable-image-deprecation example cancels the deprecation of an AMI, which removes the DeprecationTime field from the describe-images output. You must be the AMI owner to perform this procedure.

```bash
aws ec2 disable-image-deprecation \
   --image-id ami-1234567890abcdef0
```

Output:

```
{
   "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
   "Return": "true"
}
```

For more information, see Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami> in the Amazon EC2 User Guide.

- For API details, see DisableImageDeprecation in AWS CLI Command Reference.

disable-image

The following code example shows how to use disable-image.

AWS CLI

To disable an AMI

The following disable-image example disables the specified AMI.

```bash
aws ec2 disable-image \
   --image-id ami-1234567890abcdef0
```

Output:

```
{
}
```
For more information, see Disable an AMI in the Amazon EC2 User Guide.

- For API details, see DisableImage in AWS CLI Command Reference.

disable-ipam-organization-admin-account

The following code example shows how to use disable-ipam-organization-admin-account.

AWS CLI

To disable the delegated IPAM admin

In certain scenarios, you'll integrate IPAM with AWS Organizations. When you do that, the AWS Organizations management account delegates an AWS Organizations member account as the IPAM admin.

In this example, you are the AWS Organizations management account that delegated the IPAM admin account and you want to disable that account from being the IPAM admin.

You can use any AWS Region for --region when making this request. You don't have to use the Region where you originally delegated the admin, where the IPAM was created, or an IPAM operating Region. If you disable the delegated admin account, you can re-enable it at any time or delegate a new account as IPAM admin.

The following disable-ipam-organization-admin-account example disables the delegated IPAM admin in your AWS account.

```
aws ec2 disable-ipam-organization-admin-account \
  --delegated-admin-account-id 320805250157 \
  --region ap-south-1
```

Output:

```
{
    "Success": true
}
```
disable-serial-console-access

The following code example shows how to use disable-serial-console-access.

AWS CLI

**To disable access to the EC2 serial console for your account**

The following disable-serial-console-access example disables account access to the serial console.

```bash
aws ec2 disable-serial-console-access
```

Output:

```
{
   "SerialConsoleAccessEnabled": false
}
```

For more information, see [EC2 Serial Console](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-serial-console.html) in the *Amazon EC2 User Guide*.

- For API details, see [DisableSerialConsoleAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-run-instances.html) in *AWS CLI Command Reference*.

disable-snapshot-block-public-access

The following code example shows how to use disable-snapshot-block-public-access.

AWS CLI

**To disable block public access for snapshots**

The following disable-snapshot-block-public-access example disables block public access for snapshots to allow public sharing of your snapshots.

```bash
aws ec2 disable-snapshot-block-public-access
```
Output:

```
{
   "State": "unblocked"
}
```

For more information, see [Block public access for snapshots](https://docs.aws.amazon.com/ebs/latest/ug/s3-access-block.html) in the *Amazon EBS User Guide*.

- For API details, see [DisableSnapshotBlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-snapshot-block-public-access.html) in *AWS CLI Command Reference*.

### disable-transit-gateway-route-table-propagation

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

#### AWS CLI

**To disable a transit gateway attachment to propagate routes to the specified propagation route table**

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \
  --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE \ 
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
   "Propagation": {
      "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "TransitGatewayRouteTableId": "tgw-rtb-0a823edbeEXAMPLE",
      "State": "disabled"
   }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/gateway-router-propagates-routes.html) in the *Transit Gateways Guide*. 

---

Actions and scenarios 2422
disable-vgw-route-propagation

The following code example shows how to use disable-vgw-route-propagation.

AWS CLI

To disable route propagation

This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

• For API details, see DisableVgwRoutePropagation in AWS CLI Command Reference.

disable-vpc-classic-link-dns-support

The following code example shows how to use disable-vpc-classic-link-dns-support.

AWS CLI

To disable ClassicLink DNS support for a VPC

This example disables ClassicLink DNS support for vpc-88888888.

Command:

```bash
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```
**disable-vpc-classic-link**

The following code example shows how to use `disable-vpc-classic-link`.

**AWS CLI**

**To disable ClassicLink for a VPC**

This example disables ClassicLink for vpc-8888888.

Command:

```bash
aws ec2 disable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

**disassociate-address**

The following code example shows how to use `disassociate-address`.

**AWS CLI**

**To disassociate an Elastic IP addresses in EC2-Classic**

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-address --public-ip 198.51.100.0
```

**To disassociate an Elastic IP address in EC2-VPC**
This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

- For API details, see [DisassociateAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-address.html) in *AWS CLI Command Reference*.

### disassociate-client-vpn-target-network

The following code example shows how to use `disassociate-client-vpn-target-network`.

**AWS CLI**

**To disassociate a network from a Client VPN endpoint**

The following `disassociate-client-vpn-target-network` example disassociates the target network that's associated with the `cvpn-assoc-12312312312312312` association ID for the specified Client VPN endpoint.

```bash
aws ec2 disassociate-client-vpn-target-network \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --association-id cvpn-assoc-12312312312312312
```

Output:

```json
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "disassociating"
    }
}
```

For more information, see [Target Networks](https://docs.aws.amazon.com/vpc/latest/clientvpn/admin-guide/target-networks.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DisassociateClientVpnTargetNetwork](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-client-vpn-target-network.html) in *AWS CLI Command Reference*.

### disassociate-iam-instance-profile

The following code example shows how to use `disassociate-iam-instance-profile`.
AWS CLI

To disassociate an IAM instance profile

This example disassociates an IAM instance profile with the association ID iip-assoc-05020b59952902f5f.

Command:

```shell
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-05020b59952902f5f
```

Output:

```json
{
   "IamInstanceProfileAssociation": {
      "InstanceId": "i-123456789abcde123",
      "State": "disassociating",
      "AssociationId": "iip-assoc-05020b59952902f5f",
      "IamInstanceProfile": {
         "Id": "AIPAI5IYHMFFY2DKV5Y",
         "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
   }
}
```

- For API details, see DisassociateIamInstanceProfile in AWS CLI Command Reference.

**disassociate-instance-event-window**

The following code example shows how to use disassociate-instance-event-window.

AWS CLI

**Example 1: To disassociate one or more instances from an event window**

The following disassociate-instance-event-window example disassociates one or more instances from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instances, specify the association-target parameter, and for the parameter values, specify one or more instance IDs.
aws ec2 disassociate-instance-event-window \ 
  --region us-east-1 \ 
  --instance-event-window-id iew-0abcdef1234567890 \ 
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"

Output:

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To disassociate instance tags from an event window**

The following disassociate-instance-event-window example disassociates instance tags from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instance tags, specify the association-target parameter, and for the parameter values, specify one or more tags.

aws ec2 disassociate-instance-event-window \ 
  --region us-east-1 \ 
  --instance-event-window-id iew-0abcdef1234567890 \ 
  --association-target "InstanceTags=[[Key=k2,Value=v2],[Key=k1,Value=v1]]"

Output:

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 3: To disassociate a Dedicated Host from an event window

The following disassociate-instance-event-window example disassociates a Dedicated Host from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate a Dedicated Host, specify the association-target parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see DisassociateInstanceEventWindow in AWS CLI Command Reference.

disassociate-ipam-resource-discovery

The following code example shows how to use disassociate-ipam-resource-discovery.

**AWS CLI**

To disassociate a resource discovery from an IPAM

In this example, you are an IPAM delegated admin account and you want to disassociate an IPAM resource discovery from your IPAM. You ran the describe command and noticed that the "ResourceDiscoveryStatus": "not-found" and you want to disassociate it from your IPAM to make room for other associations.

The following disassociate-ipam-resource-discovery example disassociates an IPAM resource discovery in your AWS account.

```
aws ec2 disassociate-ipam-resource-discovery
  --ipam-resource-discovery-association-id ipam-res-disco-assoc-04382a6346357cf82
  --region us-east-1
```

Output:

```
{
  "IpamResourceDiscoveryAssociation": {
    "OwnerId": "320805250157",
    "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-04382a6346357cf82",
    "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
    "IpamId": "ipam-005f921c17ebd5107",
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
    "IpamRegion": "us-east-1",
    "IsDefault": false,
  }
}```
"ResourceDiscoveryStatus": "not-found",
"State": "disassociate-in-progress"
}
}

For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see DisassociateIpamResourceDiscovery in AWS CLI Command Reference.

disassociate-nat-gateway-address

The following code example shows how to use disassociate-nat-gateway-address.

AWS CLI

**To disassociate an Elastic IP address from a public NAT gateway**

The following disassociate-nat-gateway-address example disassociates the specified Elastic IP address from the specified public NAT gateway.

```bash
aws ec2 disassociate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```json
{

    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "PrivateIp": "10.0.0.74",
            "PublicIp": "3.211.231.218",
            "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
            "IsPrimary": false,
            "Status": "disassociating"
        }
    ]
}
```
For more information, see NAT gateways in the Amazon VPC User Guide.

- For API details, see DisassociateNatGatewayAddress in AWS CLI Command Reference.

disassociate-route-table

The following code example shows how to use disassociate-route-table.

AWS CLI

To disassociate a route table

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see DisassociateRouteTable in AWS CLI Command Reference.

disassociate-subnet-cidr-block

The following code example shows how to use disassociate-subnet-cidr-block.

AWS CLI

To disassociate an IPv6 CIDR block from a subnet

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```bash
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```json
{
}
```
"SubnetId": "subnet-5f46ec3b",
"Ipv6CidrBlockAssociation": {
   "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
   "AssociationId": "subnet-cidr-assoc-3aa54053",
   "Ipv6CidrBlockState": {
      "State": "disassociating"
   }
}
}

- For API details, see DisassociateSubnetCidrBlock in AWS CLI Command Reference.

disassociate-transit-gateway-multicast-domain

The following code example shows how to use disassociate-transit-gateway-multicast-domain.

AWS CLI

To disassociate subnets from a multicast domain

The following disassociate-transit-gateway-multicast-domain example disassociates a subnet from the specified multicast domain.

```
aws ec2 disassociate-transit-gateway-multicast-domain \\
    --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \\
    --subnet-id subnet-000de86e3bEXAMPLE \\
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
   "Associations": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnets": [
         {
            "SubnetId": "subnet-000de86e3bEXAMPLE",
            "State": "disassociating"
         }
      ]
   }
}
```
For more information, see [Working with multicast](#) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

### disassociate-transit-gateway-route-table

The following code example shows how to use disassociate-transit-gateway-route-table.

**AWS CLI**

To disassociate a transit gateway route table from a resource attachment

The following disassociate-transit-gateway-route-table example disassociates the specified attachment from the transit gateway route table.

```bash
aws ec2 disassociate-transit-gateway-route-table
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
  --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```
{
  "Association": {
    "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
    "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
    "ResourceType": "direct-connect-gateway",
    "State": "disassociating"
  }
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.  

disassociate-vpc-cidr-block

The following code example shows how to use disassociate-vpc-cidr-block.

**AWS CLI**

**To disassociate an IPv6 CIDR block from a VPC**

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

Command:

```bash
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

Output:

```
{
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",
        "AssociationId": "vpc-cidr-assoc-eca54085",
        "Ipv6CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-a034d6c4"
}
```

**To disassociate an IPv4 CIDR block from a VPC**

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```bash
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```
{
    "CidrBlockAssociation": {
```
"AssociationId": "vpc-cidr-assoc-0287ac6b",
"CidrBlock": "172.18.0.0/16",
"CidrBlockState": {
    "State": "disassociating"
}
},
"VpcId": "vpc-27621243"
}

- For API details, see DisassociateVpcCidrBlock in AWS CLI Command Reference.

enable-address-transfer

The following code example shows how to use enable-address-transfer.

AWS CLI

To enable an Elastic IP address transfer

The following enable-address-transfer example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

aws ec2 enable-address-transfer \
   --allocation-id eipalloc-09ad461b0d03f6aaf \
   --transfer-account-id 123456789012

Output:

{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
}

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

- For API details, see EnableAddressTransfer in AWS CLI Command Reference.
enable-aws-network-performance-metric-subscription

The following code example shows how to use enable-aws-network-performance-metric-subscription.

AWS CLI

To enable a metric subscription

The following enable-aws-network-performance-metric-subscription example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```bash
aws ec2 enable-aws-network-performance-metric-subscription \\
    --source us-east-1 \\
    --destination eu-west-1 \\
    --metric aggregate-latency \\
    --statistic p50
```

Output:

```json
{
    "Output": true
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see EnableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

enable-ebs-encryption-by-default

The following code example shows how to use enable-ebs-encryption-by-default.

AWS CLI

To enable EBS encryption by default

The following enable-ebs-encryption-by-default example enables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 enable-ebs-encryption-by-default
```
Output:

```json
{
  "EbsEncryptionByDefault": true
}
```

- For API details, see `EnableEbsEncryptionByDefault` in *AWS CLI Command Reference*.

**enable-fast-launch**

The following code example shows how to use `enable-fast-launch`.

**AWS CLI**

**To start fast launching for an image**

The following `enable-fast-launch` example starts fast launching on the specified AMI and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to snapshot, which is also the default value.

```
aws ec2 enable-fast-launch \
  --image-id ami-01234567890abcedf \
  --max-parallel-launches 6 \
  --resource-type snapshot
```

Output:

```json
{
  "ImageId": "ami-01234567890abcedf",
  "ResourceType": "snapshot",
  "SnapshotConfiguration": {
    "TargetResourceCount": 10
  },
  "LaunchTemplate": {},
  "MaxParallelLaunches": 6,
  "OwnerId": "0123456789123",
  "State": "enabling",
  "StateTransitionReason": "Client.UserInitiated",
  "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```
For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the Amazon EC2 User Guide.

- For API details, see [EnableFastLaunch](#) in AWS CLI Command Reference.

### enable-fast-snapshot-restores

The following code example shows how to use `enable-fast-snapshot-restores`.

### AWS CLI

#### To enable fast snapshot restore

The following `enable-fast-snapshot-restores` example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```bash
aws ec2 enable-fast-snapshot-restores \
    --availability-zones us-east-2a us-east-2b \
    --source-snapshot-ids snap-1234567890abcdef0
```

**Output:**

```json
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2a",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        },
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2b",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z"
        }
    ],
    "Unsuccessful": []
}
```
enable-image-block-public-access

The following code example shows how to use enable-image-block-public-access.

**AWS CLI**

**To enable block public access for AMIs in the specified Region**

The following enable-image-block-public-access example enables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 enable-image-block-public-access \
  --region us-east-1 \
  --image-block-public-access-state block-new-sharing
```

Output:

```json
{
  "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AmznBlockPublicAccess.html) in the *Amazon EC2 User Guide*.

**enable-image-deprecation**

The following code example shows how to use enable-image-deprecation.

**AWS CLI**

**Example 1: To deprecate an AMI**

The following enable-image-deprecation example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```bash
aws ec2 enable-image-deprecation \
```

For API details, see [EnableFastSnapshotRestores](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-image-block-public-access.html) in *AWS CLI Command Reference*.
The following code example shows how to use **enable-image**.

**AWS CLI**

**To enable an AMI**

The following enable-image example enables the specified AMI.

```bash
aws ec2 enable-image \
  --image-id ami-1234567890abcdef0
```

Output:

```json
{
  "Return": "true"
}
```

For more information, see [Disable an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImage](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in *AWS CLI Command Reference*.

**enable-ipam-organization-admin-account**

The following code example shows how to use **enable-ipam-organization-admin-account**.
AWS CLI

**To integrate with AWS Organizations and delegate a member account as the IPAM account**

The following enable-ipam-organization-admin-account example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```bash
aws ec2 enable-ipam-organization-admin-account
   --delegated-admin-account-id 320805250157
```

Output:

```json
{
   "Success": true
}
```

For more information, see [Integrate IPAM with AWS Organizations](#) in the [Amazon VPC IPAM User Guide](#).

- For API details, see [EnableIpamOrganizationAdminAccount](#) in AWS CLI Command Reference.

**enable-reachability-analyzer-organization-sharing**

The following code example shows how to use enable-reachability-analyzer-organization-sharing.

**AWS CLI**

**To enable trusted access for Reachability Analyzer**

The following enable-reachability-analyzer-organization-sharing example enables trusted access for Reachability Analyzer.

```bash
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see [Cross-account analyses](#) in the [Reachability Analyzer User Guide](#).

- For API details, see [EnableReachabilityAnalyzerOrganizationSharing](#) in AWS CLI Command Reference.
enable-serial-console-access

The following code example shows how to use enable-serial-console-access.

**AWS CLI**

To enable access to the serial console for your account

The following enable-serial-console-access example enables account access to the serial console.

```bash
aws ec2 enable-serial-console-access
```

Output:

```json
{
  "SerialConsoleAccessEnabled": true
}
```

For more information, see [EC2 Serial Console](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/EC2-ControlPlane.html) in the *Amazon EC2 User Guide*.

- For API details, see [EnableSerialConsoleAccess](http://docs.aws.amazon.com/cli/latest/reference/ec2/enable-serial-console-access.html) in *AWS CLI Command Reference*.

enable-snapshot-block-public-access

The following code example shows how to use enable-snapshot-block-public-access.

**AWS CLI**

To enable block public access for snapshots

The following enable-snapshot-block-public-access example blocks all public sharing of your snapshots.

```bash
aws ec2 enable-snapshot-block-public-access \\
  --state block-all-sharing
```

Output:

```json
{
  "State": "block-all-sharing"
}
```
For more information, see [Block public access for snapshots](https://docs.aws.amazon.com/AmazonEBS/latest/UserGuide/block-public-access-for-snapshots.html) in the *Amazon EBS User Guide*.

- For API details, see [EnableSnapshotBlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-snapshot-block-public-access.html) in *AWS CLI Command Reference*.

### enable-transit-gateway-route-table-propagation

The following code example shows how to use `enable-transit-gateway-route-table-propagation`.

**AWS CLI**

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following `enable-transit-gateway-route-table-propagation` example enables the specified attachment to propagate routes to the specified propagation route table.

```bash
aws ec2 enable-transit-gateway-route-table-propagation \
   --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
   --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```json
{
   "Propagation": {
      "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
      "State": "disabled"
   }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/vpc-routing-options.html) in the *Transit Gateways Guide*.

- For API details, see [EnableTransitGatewayRouteTablePropagation](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-transit-gateway-route-table-propagation.html) in *AWS CLI Command Reference*.

### enable-vgw-route-propagation

The following code example shows how to use `enable-vgw-route-propagation`.

```bash
aws ec2 enable-vgw-route-propagation
   --vpc-id vpc-4d7de228
   --route-table-id rtb-0a823edbdeEXAMPLE
```

Output:

```json
{
   "Propagation": {
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "State": "disabled",
      "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE"
   }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/vpc-routing-options.html) in the *Transit Gateways Guide*.

- For API details, see [EnableTransitGatewayRouteTablePropagation](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-transit-gateway-route-table-propagation.html) in *AWS CLI Command Reference*.
**AWS CLI**

**To enable route propagation**

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see [EnableVgwRoutePropagation](#) in AWS CLI Command Reference.

**enable-volume-io**

The following code example shows how to use enable-volume-io.

**AWS CLI**

**To enable I/O for a volume**

This example enables I/O on volume `vol-1234567890abcdef0`.

Command:

```bash
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [EnableVolumeIo](#) in AWS CLI Command Reference.

**enable-vpc-classic-link-dns-support**

The following code example shows how to use enable-vpc-classic-link-dns-support.
AWS CLI

To enable ClassicLink DNS support for a VPC

This example enables ClassicLink DNS support for vpc-8888888.

Command:

```
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-8888888
```

Output:

```
{
   "Return": true
}
```

enable-vpc-classic-link

The following code example shows how to use enable-vpc-classic-link.

AWS CLI

To enable a VPC for ClassicLink

This example enables vpc-8888888 for ClassicLink.

Command:

```
aws ec2 enable-vpc-classic-link --vpc-id vpc-8888888
```

Output:

```
{
   "Return": true
}
```

export-client-vpn-client-certificate-revocation-list

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

**AWS CLI**

**To export a client certificate revocation list**

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```bash
aws ec2 export-client-vpn-client-certificate-revocation-list \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

Output:

```

```

export-client-vpn-client-configuration

The following code example shows how to use export-client-vpn-client-configuration.

AWS CLI

To export the client configuration

The following export-client-vpn-client-configuration example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
     --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
     --output text
```

Output:

Actions and scenarios

2447
For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

- For API details, see ExportClientVpnClientConfiguration in AWS CLI Command Reference.

**export-image**

The following code example shows how to use export-image.

**AWS CLI**

**To export a VM from an AMI**

The following export-image example exports the specified AMI to the specified bucket in the specified format.

```bash
aws ec2 export-image \
  --image-id ami-1234567890abcdef0 \
  --disk-image-format VMDK \
  --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

Output:

```
{
  "DiskImageFormat": "vmdk",
  "ExportImageTaskId": "export-ami-1234567890abcdef0"
  "ImageId": "ami-1234567890abcdef0",
  "RoleName": "vmimport",
  "Progress": "0",
  "S3ExportLocation": {
    "S3Bucket": "my-export-bucket",
    "S3Prefix": "exports/"
  },
  "Status": "active",
  "StatusMessage": "validating"
}
```
get-associated-ipv6-pool-cidrs

The following code example shows how to use get-associated-ipv6-pool-cidrs.

AWS CLI

To get the associations for an IPv6 address pool

The following get-associated-ipv6-pool-cidrs example gets the associations for the specified IPv6 address pool.

```bash
aws ec2 get-associated-ipv6-pool-cidrs \
--pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
   "Ipv6CidrAssociations": [
   {
      "Ipv6Cidr": "2001:db8:1234:1a00::/56",
      "AssociatedResource": "vpc-1111122222333ab"
   }
   ]
}
```

For API details, see GetAssociatedIpv6PoolCidrs in AWS CLI Command Reference.

get-aws-network-performance-data

The following code example shows how to use get-aws-network-performance-data.

AWS CLI

To get network performance data

The following get-aws-network-performance-data example retrieves data about the network performance between the specified Regions in the specified time period.
aws ec2 get-aws-network-performance-data \
   --start-time 2022-10-26T12:00:00.000Z \
   --end-time 2022-10-26T12:30:00.000Z \
   --data-queries Id=my-query,Source=us-east-1,Destination=eu-west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes

Output:

```json
{
   "DataResponses": [
      {
         "Id": "my-query",
         "Source": "us-east-1",
         "Destination": "eu-west-1",
         "Metric": "aggregate-latency",
         "Statistic": "p50",
         "Period": "five-minutes",
         "MetricPoints": [
            {
               "StartDate": "2022-10-26T12:00:00+00:00",
               "EndDate": "2022-10-26T12:05:00+00:00",
               "Value": 62.44349,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:05:00+00:00",
               "EndDate": "2022-10-26T12:10:00+00:00",
               "Value": 62.483498,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:10:00+00:00",
               "EndDate": "2022-10-26T12:15:00+00:00",
               "Value": 62.51248,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:15:00+00:00",
               "EndDate": "2022-10-26T12:20:00+00:00",
               "Value": 62.635475,
               "Status": "OK"
            }
         ]
      }
   ]
}
```
For more information, see [Monitor network performance](#) in the *Infrastructure Performance User Guide*.

- For API details, see [GetAwsNetworkPerformanceData](#) in *AWS CLI Command Reference*.

### get-capacity-reservation-usage

The following code example shows how to use `get-capacity-reservation-usage`.

#### AWS CLI

**To view capacity reservation usage across AWS accounts**

The following `get-capacity-reservation-usage` example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \\
  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

**Output:**

<table>
<thead>
<tr>
<th>StartDate</th>
<th>EndDate</th>
<th>Value</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;2022-10-26T12:20:00+00:00&quot;</td>
<td>&quot;2022-10-26T12:25:00+00:00&quot;</td>
<td>62.733974</td>
<td>&quot;OK&quot;</td>
</tr>
<tr>
<td>&quot;2022-10-26T12:25:00+00:00&quot;</td>
<td>&quot;2022-10-26T12:30:00+00:00&quot;</td>
<td>62.773975</td>
<td>&quot;OK&quot;</td>
</tr>
<tr>
<td>&quot;2022-10-26T12:30:00+00:00&quot;</td>
<td>&quot;2022-10-26T12:35:00+00:00&quot;</td>
<td>62.75349</td>
<td>&quot;OK&quot;</td>
</tr>
</tbody>
</table>
For more information, see Viewing Shared Capacity Reservation Usage in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetCapacityReservationUsage in AWS CLI Command Reference.

get-coip-pool-usage

The following code example shows how to use get-coip-pool-usage.

AWS CLI

To get customer-owned IP address pool usage

The following get-coip-pool-usage example gets the usage details for the specified customer-owned IP address pool.

```bash
aws ec2 get-coip-pool-usage \
    --pool-id ipv4pool-coip-123a45678bEXAMPLE
```

Output:

```json
{
    "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
    "CoipAddressUsages": [
        {
            "CoIp": "0.0.0.0"
        }
    ]
}
```
For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see GetCoipPoolUsage in AWS CLI Command Reference.

**get-console-output**

The following code example shows how to use get-console-output.

**AWS CLI**

**Example 1: To get the console output**

The following get-console-output example gets the console output for the specified Linux instance.

```bash
aws ec2 get-console-output \   
   --instance-id i-1234567890abcdef0
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0",
   "Output": "...
}
```

For more information, see Instance console output in the Amazon EC2 User Guide.
Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```
aws ec2 get-console-output \\
    --instance-id i-1234567890abcdef0 \\
    --latest \\
    --output text
```

Output:

```
i-1234567890abcdef0 [ 0.000000] Command line: root=LABEL=/ console=tty1
    console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295

For more information, see [Instance console output](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-console-output.html) in the *Amazon EC2 User Guide*.

- For API details, see [GetConsoleOutput](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-console-output.html) in *AWS CLI Command Reference*.

get-console-screenshot

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```
aws ec2 get-console-screenshot \\
    --instance-id i-1234567890abcdef0
```
Output:

```json
{
   "ImageData": "997987/8kgj49ikjhewkwe0008084EXAMPLE",
   "InstanceId": "i-1234567890abcdef0"
}
```

- For API details, see [GetConsoleScreenshot](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-console-screenshot.html) in *AWS CLI Command Reference*.

### get-default-credit-specification

The following code example shows how to use `get-default-credit-specification`.

**AWS CLI**

**To describe the default credit option**

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
   --instance-family t2
```

Output:

```json
{
   "InstanceFamilyCreditSpecification": {
      "InstanceFamily": "t2",
      "CpuCredits": "standard"
   }
}
```

### get-ebs-default-kms-key-id

The following code example shows how to use `get-ebs-default-kms-key-id`.

**AWS CLI**

**To describe your default CMK for EBS encryption**
The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```bash
aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```json
{
    "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```json
{
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see `GetEbsDefaultKmsKeyId` in *AWS CLI Command Reference*.

**get-ebs-encryption-by-default**

The following code example shows how to use `get-ebs-encryption-by-default`.

**AWS CLI**

**To describe whether EBS encryption by default is enabled**

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```bash
aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```json
{
    "EbsEncryptionByDefault": false
}
```
The following output indicates that EBS encryption by default is enabled.

```
{
    "EbsEncryptionByDefault": true
}
```

- For API details, see [GetEbsEncryptionByDefault](#) in *AWS CLI Command Reference*.

**get-flow-logs-integration-template**

The following code example shows how to use `get-flow-logs-integration-template`.

**AWS CLI**

To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

**Linux:**

```bash
aws ec2 get-flow-logs-integration-template \
    --flow-log-id fl-1234567890abcdef0 \
    --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET \
    --integrate-services AthenaIntegrations='[{
    IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET,
    PartitionLoadFrequency=none,
    PartitionStartDate=2021-07-21T00:40:00,
    PartitionEndDate=2021-07-21T00:42:00
    },
    IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET,
    PartitionLoadFrequency=none,
    PartitionStartDate=2021-07-21T00:40:00,
    PartitionEndDate=2021-07-21T00:42:00
}]
```

**Windows:**

```bash
aws ec2 get-flow-logs-integration-template ^
    --flow-log-id fl-1234567890abcdef0 ^
    --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET ^
    --integrate-services AthenaIntegrations='[{
    IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET,
    PartitionLoadFrequency=none,
    PartitionStartDate=2021-07-21T00:40:00,
    PartitionEndDate=2021-07-21T00:42:00
    },
    IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-Bucket,
    PartitionLoadFrequency=none,
    PartitionStartDate=2021-07-21T00:40:00,
    PartitionEndDate=2021-07-21T00:42:00
}]
```
Output:

```json
{
   "Result": "https://DOC-EXAMPLE-BUCKET.s3.us-east-2.amazonaws.com/
VPCFlowLogsIntegrationTemplate_fl-1234567890abcdef0_Wed%20Jul%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see [Working with AWS CloudFormation templates](#) in the *AWS CloudFormation User Guide*.

For information on using Amazon Athena and flow logs, see [Query flow logs using Amazon Athena](#) in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [GetFlowLogsIntegrationTemplate](#) in *AWS CLI Command Reference*.

### get-groups-for-capacity-reservation

The following code example shows how to use `get-groups-for-capacity-reservation`.

**AWS CLI**

**To list the resource groups with a Capacity Reservation**

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
   --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```json
{
   "CapacityReservationsGroup": [
      {
         "OwnerId": "123456789012"
      }
   }
}
```
For more information, see Working with Capacity Reservations in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetGroupsForCapacityReservation in AWS CLI Command Reference.

get-host-reservation-purchase-preview

The following code example shows how to use get-host-reservation-purchase-preview.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

Command:

```
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
    "TotalHourlyPrice": "1.499",
    "Purchase": [
        {
            "HourlyPrice": "1.499",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "HostIdSet": [
                "h-013abcd2a00cbd123"
            ],
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ],
    "TotalUpfrontPrice": "0.000"
}
```

- For API details, see GetHostReservationPurchasePreview in AWS CLI Command Reference.
get-image-block-public-access-state

The following code example shows how to use `get-image-block-public-access-state`.

**AWS CLI**

**To get the block public access state for AMIs in the specified Region**

The following `get-image-block-public-access-state` example gets the block public access state for AMIs at the account level in the specified Region.

```
aws ec2 get-image-block-public-access-state
--region us-east-1
```

Output:

```
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/block-public-access.html) in the *Amazon EC2 User Guide*.

get-instance-types-from-instance-requirements

The following code example shows how to use `get-instance-types-from-instance-requirements`.

**AWS CLI**

**To preview the instance types that match specified attributes**

The following `get-instance-types-from-instance-requirements` example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.

```
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json

Output:

```json
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVCpu": {
            "Min": 0.0,
            "Max": 0.0
        },
        "ExcludedInstanceTypes": [],
        "InstanceGenerations": [
            "current"
        ],
        "SpotMaxPricePercentageOverLowestPrice": 0,
        "OnDemandMaxPricePercentageOverLowestPrice": 0,
        "BareMetal": "included",
        "BurstablePerformance": "excluded",
        "RequireHibernateSupport": true,
        "NetworkInterfaceCount": {
            "Min": 0,
            "Max": 0
        }
    }
}
```
Configure the JSON file. You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VcpuCount`, and `MemoryMiB`. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.
Preview the instance types that have the attributes specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter. In the following request, the output is formatted as a table.

```bash
aws ec2 get-instance-types-from-instance-requirements \
  --cli-input-json file://attributes.json \
  --output table
```

Actions and scenarios
get-instance-uefi-data

The following code example shows how to use get-instance-uefi-data.

AWS CLI

To retrieve UEFI data from an instance

The following get-instance-uefi-data example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```bash
aws ec2 get-instance-uefi-data \
--instance-id i-0123456789example
```

Output:

```
{
   "InstanceId": "i-0123456789example",
   "UefiData": "QU1aTlVFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/.
<snipped>
   AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/A0Dshho=
}
```

For more information, see UEFI Secure Boot in the Amazon EC2 User Guide.

- For API details, see GetInstanceUefiData in AWS CLI Command Reference.
get-ipam-address-history

The following code example shows how to use `get-ipam-address-history`.

**AWS CLI**

**To get the history of a CIDR**

The following `get-ipam-address-history` example gets the history of a CIDR.

(Linux):

```bash
aws ec2 get-ipam-address-history \
  --cidr 10.0.0.0/16 \
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --start-time 2021-12-08T01:00:00Z \
  --end-time 2021-12-10T01:00:00Z
```

(Windows):

```bash
aws ec2 get-ipam-address-history ^
  --cidr 10.0.0.0/16 ^
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --start-time 2021-12-08T01:00:00Z ^
  --end-time 2021-12-10T01:00:00Z
```

**Output:**

```json
{
  "HistoryRecords": [
    {
      "ResourceOwnerId": "123456789012",
      "ResourceRegion": "us-west-1",
      "ResourceType": "vpc",
      "ResourceId": "vpc-06cbefa9ee907e1c0",
      "ResourceCidr": "10.0.0.0/16",
      "ResourceName": "Demo",
      "ResourceComplianceStatus": "unmanaged",
      "ResourceOverlapStatus": "overlapping",
      "VpcId": "vpc-06cbefa9ee907e1c0",
      "SampledStartTime": "2021-12-08T19:54:57.675000+00:00"
    },
    {
    }
  ]
}
```
For more information, see View the history of IP addresses in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamAddressHistory in AWS CLI Command Reference.

get-ipam-discovered-accounts

The following code example shows how to use get-ipam-discovered-accounts.

AWS CLI

To view the accounts discovered by an IPAM

In this scenario, you're a IPAM delegated admin who wants to view the AWS accounts that own resources that the IPAM is discovering.

The --discovery-region is the IPAM operating Region you want to view the monitored account statuses in. For example, if you have three IPAM operating Regions, you may want to
make this request three times to view the timestamps specific to discovery in each of those particular Regions.

The following `get-ipam-discovered-accounts` example lists the AWS accounts that own resources that the IPAM is discovering.

```bash
aws ec2 get-ipam-discovered-accounts \
    --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
    --discovery-region us-east-1
```

Output:

```json
{
    "IpamDiscoveredAccounts": [
        {
            "AccountId": "149977607591",
            "DiscoveryRegion": "us-east-1",
            "LastAttemptedDiscoveryTime": "2024-02-09T19:04:31.379000+00:00",
            "LastSuccessfulDiscoveryTime": "2024-02-09T19:04:31.379000+00:00"
        }
    ]
}
```

For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/integrate-ipam-with-accounts.html) in the *Amazon VPC IPAM User Guide*.

- For API details, see [GetIpamDiscoveredAccounts](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-ipam-discovered-accounts.html) in *AWS CLI Command Reference*.

**get-ipam-discovered-public-addresses**

The following code example shows how to use `get-ipam-discovered-public-addresses`.

**AWS CLI**

**To view discovered public IP addresses**

In this example, you are an IPAM delegated admin and you want to view the IP addresses of resources discovered by IPAM. You can get the resource discovery ID with [describe-ipam-resource-discoveries](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-ipam-resource-discoveries.html).

The following `get-ipam-discovered-public-addresses` example shows the discovered public IP addresses for a resource discovery.
aws ec2 get-ipam-discovered-public-addresses \
  --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
  --address-region us-east-1 \
  --region us-east-1

Output:

```json
{
    "IpamDiscoveredPublicAddresses": [
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-east-1",
            "Address": "54.208.155.7",
            "AddressOwnerId": "320805250157",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-073b294916198ce49",
            "SubnetId": "subnet-0b6c8a8839e9a4f15",
            "NetworkInterfaceId": "eni-081c446b5284a5e06",
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-07459a6fca5b35823",
            "Tags": {},
            "NetworkBorderGroup": "us-east-1c",
            "SecurityGroups": [
                {
                    "GroupName": "launch-wizard-2",
                    "GroupId": "sg-0a489dd6a65c244ce"
                }
            ],
            "SampleTime": "2024-04-05T15:13:59.228000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-east-1",
            "Address": "44.201.251.218",
            "AddressOwnerId": "470889052923",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-6c31a6a11",
            "SubnetId": "subnet-062f47608b99834b1",
            "NetworkInterfaceId": "eni-024845359c2c3ae9b",
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-04ef786d9c4e03f41",
            "Tags": {},
            "NetworkBorderGroup": "us-east-1c",
            "SecurityGroups": [
                {
                    "GroupName": "launch-wizard-2",
                    "GroupId": "sg-0a489dd6a65c244ce"
                }
            ],
            "SampleTime": "2024-04-05T15:13:59.228000+00:00"
        }
    ]
}
```
For more information, see View public IP insights in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamDiscoveredPublicAddresses in AWS CLI Command Reference.

**get-ipam-discovered-resource-cidrs**

The following code example shows how to use get-ipam-discovered-resource-cidrs.

**AWS CLI**

**To view the IP address CIDRs discovered by an IPAM**

In this example, you're a IPAM delegated admin who wants to view details related to the IP address CIDRs for resources that the IPAM is discovering.

To complete this request:

The resource discovery you choose must be associated with the IPAM. The --resource-region is the AWS Region where resource was created.

The following get-ipam-discovered-resource-cidrs example lists the IP addresses for resources that the IPAM is discovering.

```bash
aws ec2 get-ipam-discovered-resource-cidrs \
   --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
   --resource-region us-east-1
```

Output:

```json
{
```
For more information, see Monitor CIDR usage by resource in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamDiscoveredResourceCidrs in AWS CLI Command Reference.
get-ipam-pool-allocations

The following code example shows how to use get-ipam-pool-allocations.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following get-ipam-pool-allocations example gets the CIDRs allocated from an IPAM pool.

(Linux):

```
aws ec2 get-ipam-pool-allocations \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220
```

(Windows):

```
aws ec2 get-ipam-pool-allocations ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220
```

Output:

```
{
    "IpamPoolAllocations": [
        {
            "Cidr": "10.0.0.0/16",
            "IpamPoolAllocationId": "ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012"
        }
    ]
}
```

• For API details, see GetIpamPoolAllocations in AWS CLI Command Reference.
**get-ipam-pool-cidrs**

The following code example shows how to use `get-ipam-pool-cidrs`.

**AWS CLI**

To get the CIDRs provisioned to an IPAM pool

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

(Linux):

```bash
aws ec2 get-ipam-pool-cidrs \\
    --ipam-pool-id ipam-pool-0533048da7d823723 \\
    --filters 'Name=cidr,Values=10.*'
```

(Windows):

```bash
aws ec2 get-ipam-pool-cidrs ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=cidr,Values=10.*
```

Output:

```json
{
    "IpamPoolCidr": {
        "Cidr": "10.0.0.0/24",
        "State": "provisioned"
    }
}
```

**get-ipam-resource-cidrs**

The following code example shows how to use `get-ipam-resource-cidrs`.

**AWS CLI**

To get the CIDRs allocated to a resource

The following `get-ipam-resource-cidrs` example gets the CIDRs allocated to a resource.
(Linux):

```
aws ec2 get-ipam-resource-cidrs \
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
   --filters Name=management-state,Values=unmanaged
```

(Windows):

```
aws ec2 get-ipam-resource-cidrs ^
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
   --filters Name=management-state,Values=unmanaged
```

Output:

```
{
    "IpamResourceCidrs": [
        {
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ResourceRegion": "us-east-2",
            "ResourceOwnerId": "123456789012",
            "ResourceId": "vpc-621b8709",
            "ResourceName": "Default AWS VPC",
            "ResourceCidr": "172.33.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Test"
                },
                {
                    "Key": "Name",
                    "Value": "Default AWS VPC"
                }
            ],
            "IpUsage": 0.0039,

        }
    ]
}
```
get-launch-template-data

The following code example shows how to use get-launch-template-data.

AWS CLI

To get instance data for a launch template

This example gets data about the specified instance and uses the --query option to return the contents in LaunchTemplateData. You can use the output as a base to create a new launch template or launch template version.

Command:

```bash
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query 'LaunchTemplateData'
```

Output:

```json
{
    "Monitoring": {} ,
    "ImageId": "ami-8c185e5f6",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/xvda",
            "Ebs": {
                "DeleteOnTermination": true
            }
        }
    ],
    "EbsOptimized": false,
    "Placement": {
        "Tenancy": "default",
        "GroupName": "",
        "AvailabilityZone": "us-east-1a"
    }
}
```
"InstanceType": "t2.micro",
"NetworkInterfaces": [
{
  "Description": "",
  "NetworkInterfaceId": "eni-35306abc",
  "PrivateIpAddresses": [
    {
      "Primary": true,
      "PrivateIpAddress": "10.0.0.72"
    }
  ],
  "SubnetId": "subnet-7b16de0c",
  "Groups": [
    "sg-7c227019"
  ],
  "Ipv6Addresses": [
    {
      "Ipv6Address": "2001:db8:1234:1a00::123"
    }
  ],
  "PrivateIpAddress": "10.0.0.72"
}
]
}

- For API details, see [GetLaunchTemplateData](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-launch-template-data.html) in *AWS CLI Command Reference*.

**get-managed-prefix-list-associations**

The following code example shows how to use `get-managed-prefix-list-associations`.

**AWS CLI**

**To get prefix list associations**

The following `get-managed-prefix-list-associations` example gets the resources that are associated with the specified prefix list.

```
aws ec2 get-managed-prefix-list-associations \
  --prefix-list-id pl-0123456abcabcabc1
```

Output:
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see GetManagedPrefixListAssociations in AWS CLI Command Reference.

get-managed-prefix-list-entries

The following code example shows how to use get-managed-prefix-list-entries.

AWS CLI

To get the entries for a prefix list

The following get-managed-prefix-list-entries gets the entries for the specified prefix list.

```bash/aws ec2 get-managed-prefix-list-entries \\--prefix-list-id pl-0123456abcabc1
```

Output:

```json
{
   "Entries": [
      {
         "Cidr": "10.0.0.0/16",
         "Description": "vpc-a"
      },
      {
         "Cidr": "10.2.0.0/16",
         "Description": "vpc-b"
      }
   ]
}
```
get-network-insights-access-scope-analysis-findings

The following code example shows how to use `get-network-insights-access-scope-analysis-findings`.

AWS CLI

To get the findings of Network Insights access scope analysis

The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```
aws ec2 get-network-insights-access-scope-analysis-findings \
   --region us-east-1 \
   --network-insights-access-scope-analysis-id nis \
   --nis-123456789111
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
   "AnalysisFindings": [
      {
         "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
         "NetworkInsightsAccessScopeId": "nis-123456789111",

}
}
}

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see GetNetworkInsightsAccessScopeAnalysisFindings in AWS CLI Command Reference.

get-network-insights-access-scope-content

The following code example shows how to use get-network-insights-access-scope-content.

AWS CLI

To get Network Insights access scope content
The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```bash
aws ec2 get-network-insights-access-scope-content \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789222
```

Output:

```json
{
  "NetworkInsightsAccessScopeContent": {
    "NetworkInsightsAccessScopeId": "nis-123456789222",
    "MatchPaths": [
      {
        "Source": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::NetworkInterface"
            ]
          }
        },
        "Destination": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::InternetGateway"
            ]
          }
        }
      }
    ]
  }
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/networkaccess/latest/ug/guidewith-cli.html) in the *Network Access Analyzer Guide*.

**get-password-data**

The following code example shows how to use `get-password-data`.
AWS CLI

To get the encrypted password

This example gets the encrypted password.

Command:

```bash
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-07T22:18:38.000Z",
    "PasswordData": "gSlJFq+VpcZXqy+iktxMF6NyxA4qCrT4+ga0uNOenX1MmgXPTj7XEXAMPLEUQ+YeFfbL1U4C4AKv652Ux1iRB3CPTYP7WmU3TUnhsuBd+p6LVk7T21KUm16Oxbk6WPW1VYYm/TRRPB1e1DQ7PY4an/DgZT4mwcSRF1gzhniQgDDE01InvSDcwouTwns0Y1S8ouri2W4n5GNiMrM3QOAnNVelVz/53TkDtxbNoU605M1gK9zUWSxqEgwvbV2j8c5rP0WCuaMWSF14ziDu4bd7q+4RSyi8NUsVwnKZ4aEZffuDP6zKx5yLlf3etP2L4ZR6CvG7K1hx7VKQVN32Dajw="
}
```

To get the decrypted password

This example gets the decrypted password.

Command:

```bash
aws ec2 get-password-data --instance-id i-1234567890abcdef0 --priv-launch-key C:\Keys\MyKeyPair.pem
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-30T23:18:05.000Z",
    "PasswordData": "&ViJ652e*u"
}
```

get-reserved-instances-exchange-quote

The following code example shows how to use get-reserved-instances-exchange-quote.

AWS CLI

To get a quote for exchanging a Convertible Reserved Instance

This example gets the exchange information for the specified Convertible Reserved Instances.

Command:

```bash
aws ec2 get-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample
```

Output:

```json
{
    "CurrencyCode": "USD",
    "ReservedInstanceValueSet": [
        {
            "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",
            "ReservationValue": {
                "RemainingUpfrontValue": "0.000000",
                "HourlyPrice": "0.027800",
                "RemainingTotalValue": "730.556200"
            }
        }
    ],
    "PaymentDue": "424.983828",
    "TargetConfigurationValueSet": [
        {
            "TargetConfiguration": {
                "InstanceCount": 5,
                "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
            },
            "ReservationValue": {
                "RemainingUpfrontValue": "424.983828",
                "HourlyPrice": "0.016000",
                "RemainingTotalValue": "845.447828"
            }
        }
    }
}
```
For API details, see [GetReservedInstancesExchangeQuote](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-reserved-instances-exchange-quote.html) in *AWS CLI Command Reference*.

**get-security-groups-for-vpc**

The following code example shows how to use `get-security-groups-for-vpc`.

**AWS CLI**

To view security groups that can be associated with network interfaces in a specified VPC.

The following `get-security-groups-for-vpc` example shows the security groups that can be associated with network interfaces in the VPC.

```
aws ec2 get-security-groups-for-vpc \
    --vpc-id vpc-6c31a611 \
    --region us-east-1
```

Output:

```
{
    "SecurityGroupForVpcs": [
        {
            "Description": "launch-wizard-36 created 2022-08-29T15:59:35.338Z",
            "GroupName": "launch-wizard-36",
            "OwnerId": "470889052923",
            "GroupId": "sg-007e0c3027ee885f5",
            "Tags": []
        }
    ]
}
```
get-serial-console-access-status

The following code example shows how to use get-serial-console-access-status.

AWS CLI

To view the status of account access to the serial console

The following get-serial-console-access-status example determines whether serial console access is enabled for your account.

```bash
aws ec2 get-serial-console-access-status
```

Output:

```json
{
   "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the Amazon EC2 User Guide.

For API details, see GetSerialConsoleAccessStatus in AWS CLI Command Reference.

get-snapshot-block-public-access-state

The following code example shows how to use get-snapshot-block-public-access-state.
**AWS CLI**

**To get the current state of block public access for snapshots**

The following `get-snapshot-block-public-access-state` example gets the current state of block public access for snapshots.

```bash
done
```

```bash
aws ec2 get-snapshot-block-public-access-state
```

Output:

```json
{
  "State": "block-all-sharing"
}
```

For more information, see [Block public access for snapshots](https://docs.aws.amazon.com/AmazonEBS/latest/UserGuide/block-public-access.html) in the Amazon EBS User Guide.

**get-spot-placement-scores**

The following code example shows how to use `get-spot-placement-scores`.

**AWS CLI**

**To calculate the Spot placement score for specified requirements**

The following `get-spot-placement-scores` example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.

To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```bash
done
```

```bash
aws ec2 get-spot-placement-scores \
  --region us-east-1 \
  --generate-cli-skeleton input > attributes.json
```

Output:

```json
{
}
```
"InstanceTypes": [ "" ],
"TargetCapacity": 0,
"TargetCapacityUnitType": "vcpu",
"SingleAvailabilityZone": true,
"RegionNames": [ "" ],
"InstanceRequirementsWithMetadata": {
  "ArchitectureTypes": [ "x86_64_mac" ],
  "VirtualizationTypes": [ "hvm" ],
  "InstanceRequirements": {
    "VCpuCount": {
      "Min": 0,
      "Max": 0
    },
    "MemoryMiB": {
      "Min": 0,
      "Max": 0
    },
    "CpuManufacturers": [ "amd" ],
    "MemoryGiBPerVCpu": {
      "Min": 0.0,
      "Max": 0.0
    },
    "ExcludedInstanceTypes": [ "" ],
    "InstanceGenerations": [ "previous" ],
    "SpotMaxPricePercentageOverLowestPrice": 0,
    "OnDemandMaxPricePercentageOverLowestPrice": 0,
    "BareMetal": "excluded",
    "BurstablePerformance": "excluded",
    "RequireHibernateSupport": true,
    "NetworkInterfaceCount": { }
Configure the JSON file. You must provide a value for `TargetCapacity`. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.
Calculate the Spot placement score for the requirements specified in attributes.json. Specify the name and path to your JSON file by using the --cli-input-json parameter.

```
aws ec2 get-spot-placement-scores
   --region us-east-1
   --cli-input-json file://attributes.json
```

Output if `SingleAvailabilityZone` is set to false or omitted (if omitted, it defaults to false). A scored list of Regions is returned.

```
"Recommendation": [
   {
      "Region": "us-east-1",
      "Score": 7
   },
   {
      "Region": "us-west-1",
      "Score": 5
   },
   ...
]
```

Output if `SingleAvailabilityZone` is set to true. A scored list of SingleAvailability Zones is returned.

```
"Recommendation": [
   {
      "Region": "us-east-1",
      "AvailabilityZoneId": "use1-az1",
      "Score": 8
   },
   {
      "Region": "us-east-1",
      "AvailabilityZoneId": "usw2-az3",
      "Score": 6
   },
   ...
]
```

For more information about calculating a Spot placement score, and for example configurations, see [Calculate a Spot placement score](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/calculate-spot-placement-score.html) in the Amazon EC2 User Guide.

get-subnet-cidr-reservations

The following code example shows how to use get-subnet-cidr-reservations.

**AWS CLI**

**To get information about a subnet CIDR reservation**

The following get-subnet-cidr-reservations example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \
   --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{
   "SubnetIpv4CidrReservations": [
      {
         "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
         "SubnetId": "subnet-03c51e2e6cEXAMPLE",
         "Cidr": "10.1.0.16/28",
         "ReservationType": "prefix",
         "OwnerId": "123456789012"
      }
   ],
   "SubnetIpv6CidrReservations": []
}
```

For more information, see [Subnet CIDR reservations](https://docs.aws.amazon.com/vpc/latest/UserGuide) in the *Amazon VPC User Guide*.

- For API details, see [GetSubnetCidrReservations](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-subnet-cidr-reservations) in *AWS CLI Command Reference*.

get-transit-gateway-attachment-propagations

The following code example shows how to use get-transit-gateway-attachment-propagations.

**AWS CLI**

**To list the route tables to which the specified resource attachment propagates routes**

```
aws ec2 get-transit-gateway-attachment-propagations \
   --transit-gateway-id tgw-044f977c4eEXAMPLE \
   --vpc-id vpc-03c51e2e6cEXAMPLE
```

Output:

```
{
   "TransitGatewayAttachments": [
      {
         "TransitGatewayAttachmentId": "tga-044f977c4eEXAMPLE",
         "TransitGatewayId": "tgw-044f977c4eEXAMPLE",
         "VpcId": "vpc-03c51e2e6cEXAMPLE",
         "VpnGatewayId": null,
         "State": "attached",
         "RouteTableIds": [
            "rtb-044f977c4eEXAMPLE"
         ]
      }
   ]
}
```

For more information, see [Transit Gateway Attachments Propagations](https://docs.aws.amazon.com/vpc/latest/UserGuide) in the *Amazon VPC User Guide*.

- For API details, see [GetTransitGatewayAttachmentPropagations](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-transit-gateway-attachment-propagations) in *AWS CLI Command Reference*.
The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```
aws ec2 get-transit-gateway-attachment-propagations \\
--transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
```

Output:

```json
{
    "TransitGatewayAttachmentPropagations": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
            "State": "enabled"
        }
    ]
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/TransitGateswaysGuide) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayAttachmentPropagations](https://docs.aws.amazon.com/AWSCommandReference) in *AWS CLI Command Reference*.

**get-transit-gateway-multicast-domain-associations**

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

**AWS CLI**

To view the information about the transit gateway multicast domain associations

The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \\
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```json
{
    "MulticastDomainAssociations": [
        {
```
"TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
"ResourceId": "vpc-01128d2c24EXAMPLE",
"ResourceType": "vpc",
"Subnet": {
    "SubnetId": "subnet-000de86e3bEXAMPLE",
    "State": "associated"
}
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-4EXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-5EXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-aEXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-fEXAMPLE",
        "State": "associated"
    }
}
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see GetTransitGatewayMulticastDomainAssociations in AWS CLI Command Reference.

get-transit-gateway-prefix-list-references

The following code example shows how to use get-transit-gateway-prefix-list-references.

**AWS CLI**

**To get prefix list references in a transit gateway route table**

The following get-transit-gateway-prefix-list-references example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```bash
aws ec2 get-transit-gateway-prefix-list-references \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --filters Name=prefix-list-id,Values=pl-11111122222222333
```

Output:

```json
{
    "TransitGatewayPrefixListReferences": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
            "PrefixListId": "pl-11111122222222333",
            "PrefixListOwnerId": "123456789012",
            "State": "available",
            "Blackhole": false,
            "TransitGatewayAttachment": {
                "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbcaab",
                "ResourceType": "vpc",
                "ResourceId": "vpc-112233445566aabb"}
        }
    ]
}
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see GetTransitGatewayPrefixListReferences in AWS CLI Command Reference.

get-transit-gateway-route-table-associations

The following code example shows how to use get-transit-gateway-route-table-associations.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following get-transit-gateway-route-table-associations example displays information about the associations for the specified transit gateway route table.

```bash
aws ec2 get-transit-gateway-route-table-associations \
   --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE
```

Output:

```json
{
   "Associations": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
         "ResourceId": "vpc-4d7de228",
         "ResourceType": "vpc",
         "State": "associating"
      }
   ]
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see GetTransitGatewayRouteTableAssociations in AWS CLI Command Reference.
**get-transit-gateway-route-table-propagations**

The following code example shows how to use `get-transit-gateway-route-table-propagations`.

**AWS CLI**

To display information about the route table propagations for the specified transit gateway route table

The following `get-transit-gateway-route-table-propagations` example returns the route table propagations for the specified route table.

```bash
aws ec2 get-transit-gateway-route-table-propagations \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```json
{
   "TransitGatewayRouteTablePropagations": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
         "ResourceId": "vpc-3EXAMPLE",
         "ResourceType": "vpc",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
         "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
         "ResourceType": "direct-connect-gateway",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
         "ResourceId": "8384da05-13ce-4a91-aada-5a1baEXAMPLE",
         "ResourceType": "direct-connect-gateway",
         "State": "enabled"
      }
   ]
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.
get-verified-access-endpoint-policy

The following code example shows how to use get-verified-access-endpoint-policy.

AWS CLI

To get the Verified Access policy of an endpoint

The following get-verified-access-endpoint-policy example gets the Verified Access policy of the specified endpoint.

```
aws ec2 get-verified-access-endpoint-policy \
--verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
   "PolicyEnabled": true,
   "PolicyDocument": "permit(principal,action,resource)\nwhen
        context.identity.groups.contains("finance") &&\n        context.identity.email_verified == true\n";
}
```

For more information, see Verified Access policies in the AWS Verified Access User Guide.

get-verified-access-group-policy

The following code example shows how to use get-verified-access-group-policy.

AWS CLI

To get the Verified Access policy of a group

The following get-verified-access-group-policy example gets the Verified Access policy of the specified group.

```
aws ec2 get-verified-access-group-policy \
```

For API details, see GetTransitGatewayRouteTablePropagations in AWS CLI Command Reference.
--verified-access-group-id vagr-0dbe967baf14b7235

Output:

```json
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/verified-access/get-verified-access-group-policy.html) in *AWS CLI Command Reference*.

### get-vpn-connection-device-sample-configuration

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

**AWS CLI**

**To download a sample configuration file**

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```bash
aws ec2 get-vpn-connection-device-sample-configuration \
--vpn-connection-id vpn-123456789abc01234 \
--vpn-connection-device-type-id 5fb390ba
```

Output:

```json
{
    "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-file"
}
```

For more information, see [Download the configuration file](https://docs.aws.amazon.com/siteto-site/latest/userguide/download-sample-configuration.html) in the *AWS Site-to-Site VPN User Guide*.
For API details, see `GetVpnConnectionDeviceSampleConfiguration` in AWS CLI Command Reference.

**get-vpn-connection-device-types**

The following code example shows how to use `get-vpn-connection-device-types`.

**AWS CLI**

**To list gateway devices with a sample configuration file**

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```bash
aws ec2 get-vpn-connection-device-types \
 --query "VpnConnectionDeviceTypes[?Vendor==`Palo Alto Networks`]"
```

Output:

```
[
  {
    "VpnConnectionDeviceTypeId": "754a6372",
    "Vendor": "Palo Alto Networks",
    "Platform": "PA Series",
    "Software": "PANOS 4.1.2+"
  },
  {
    "VpnConnectionDeviceTypeId": "9612cbed",
    "Vendor": "Palo Alto Networks",
    "Platform": "PA Series",
    "Software": "PANOS 4.1.2+ (GUI)"
  },
  {
    "VpnConnectionDeviceTypeId": "5fb390ba",
    "Vendor": "Palo Alto Networks",
    "Platform": "PA Series",
    "Software": "PANOS 7.0+"
  }
]
```

For more information, see Download the configuration file in the AWS Site-to-Site VPN user Guide.
import-client-vpn-client-certificate-revocation-list

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

**AWS CLI**

To import a client certificate revocation list

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```
aws ec2 import-client-vpn-client-certificate-revocation-list  
  --certificate-revocation-list file:///path/to/crl.pem  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "Return": true
}
```

For more information, see [Client Certificate Revocation Lists](https://docs.aws.amazon.com) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ImportClientVpnClientCertificateRevocationList](https://docs.aws.amazon.com) in *AWS CLI Command Reference*.

import-image

The following code example shows how to use `import-image`.

**AWS CLI**

To import a VM image file as an AMI

The following `import-image` example imports the specified OVA.
```bash
aws ec2 import-image \
   --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.ova}"
```

Output:

```
{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "Progress": "2",
   "SnapshotDetails": [
      {
         "DiskImageSize": 0.0,
         "Format": "ova",
         "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
         }
      }
   ],
   "Status": "active",
   "StatusMessage": "pending"
}
```

- For API details, see [ImportImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/import-image.html) in AWS CLI Command Reference.

**import-key-pair**

The following code example shows how to use `import-key-pair`.

**AWS CLI**

**To import a public key**

First, generate a key pair with the tool of your choice. For example, use this `ssh-keygen` command:

**Command:**

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

**Output:**
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...

This example command imports the specified public key.

Command:

```bash
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```json
{
   "KeyName": "my-key",
}
```

- For API details, see `ImportKeyPair` in *AWS CLI Command Reference*.

**import-snapshot**

The following code example shows how to use import-snapshot.

**AWS CLI**

**To import a snapshot**

The following import-snapshot example imports the specified disk as a snapshot.

```bash
aws ec2 import-snapshot
   --description "My server VMDK"
   --disk-container Format=VMDK,UserBucket={S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.vmdk}
```

Output:

```json
{
}
```
For API details, see ImportSnapshot in AWS CLI Command Reference.

list-images-in-recycle-bin

The following code example shows how to use list-images-in-recycle-bin.

AWS CLI

To list the images in the Recycle Bin

The following list-images-in-recycle-bin example lists all of the images that are currently retained in the Recycle Bin.

```
aws ec2 list-images-in-recycle-bin
```

Output:

```
{
   "Images": [
   {
      "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
      "Description": "Monthly AMI One",
      "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
      "Name": "AMI_01",
      "ImageId": "ami-0111222333444abcd"
   }
   ]
}
```
list-snapshots-in-recycle-bin

The following code example shows how to use list-snapshots-in-recycle-bin.

AWS CLI

To view snapshots in the Recycle Bin

The following list-snapshots-in-recycle-bin example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```bash
aws ec2 list-snapshots-in-recycle-bin \\
   --snapshot-id snap-01234567890abcdef
```

Output:

```json
{
   "SnapshotRecycleBinInfo": [
      {
         "Description": "Monthly data backup snapshot",
         "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
         "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
         "VolumeId": "vol-abcdef09876543210",
         "SnapshotId": "snap-01234567890abcdef"
      }
   ]
}
```

For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.
For API details, see ListSnapshotsInRecycleBin in AWS CLI Command Reference.

lock-snapshot

The following code example shows how to use lock-snapshot.

AWS CLI

Example 1: To lock a snapshot in governance mode

The following lock-snapshot example locks the specified snapshot in governance mode.

```bash
aws ec2 lock-snapshot \
   --snapshot-id snap-0b5e733b4a8df6e0d \
   --lock-mode governance \
   --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "governance",
    "LockDuration": 365,
    "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
    "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00",
    "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00"
}
```

For more information, see Snapshot lock in the Amazon EBS User Guide.

Example 2: To lock a snapshot in compliance mode

The following lock-snapshot example lock the specified snapshot in compliance mode.

```bash
aws ec2 lock-snapshot \
   --snapshot-id snap-0163a8524c5b9901f \
   --lock-mode compliance \
   --cool-off-period 24 \
   --lock-duration 365
```

Output:

```
For more information, see [Snapshot lock](#) in the [Amazon EBS User Guide](#).

- For API details, see [LockSnapshot](#) in [AWS CLI Command Reference](#).

### modify-address-attribute

The following code example shows how to use `modify-address-attribute`.

**AWS CLI**

**To modify the domain name attribute associated with an elastic IP address**

The following `modify-address-attribute` examples modify the domain name attribute of an elastic IP address.

**Linux:**

```bash
aws ec2 modify-address-attribute
   --allocation-id eipalloc-abcdef01234567890
   --domain-name example.com
```

**Windows:**

```bash
aws ec2 modify-address-attribute ^
   --allocation-id eipalloc-abcdef01234567890 ^
   --domain-name example.com
```

**Output:**

```json
{
   "SnapshotId": "snap-0b5e733b4a8df6e0d",
   "LockState": "compliance-cooloff",
   "LockDuration": 365,
   "CoolOffPeriod": 24,
   "CoolOffPeriodExpiresOn": "2024-05-06T01:02:20.527000+00:00",
   "LockCreatedOn": "2024-05-05T01:02:20.527000+00:00",
   "LockExpiresOn": "2025-05-05T01:02:20.527000+00:00",
   "LockDurationStartTime": "2024-05-05T01:02:20.527000+00:00"
}
```
To monitor the pending change and to view the modified attributes of an elastic IP address, see `describe-addresses-attribute` in the AWS CLI Command Reference.

- For API details, see `ModifyAddressAttribute` in AWS CLI Command Reference.

modify-availability-zone-group

The following code example shows how to use modify-availability-zone-group.

**AWS CLI**

**To enable a zone group**

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
  --group-name us-west-2-lax-1 \
  --opt-in-status opted-in
```

Output:

```
{
  "Return": true
}
```

For more information, see `Regions and Zones` in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `ModifyAvailabilityZoneGroup` in AWS CLI Command Reference.
modify-capacity-reservation-fleet

The following code example shows how to use modify-capacity-reservation-fleet.

AWS CLI

Example 1: To modify the total target capacity of a Capacity Reservation Fleet

The following modify-capacity-reservation-fleet example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \
   --capacity-reservation-fleet-id crf-01234567890abcedf \
   --total-target-capacity 160
```

Output:

```
{
   "Return": true
}
```

Example 2: To modify the end date of a Capacity Reservation Fleet

The following modify-capacity-reservation-fleet example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \
   --capacity-reservation-fleet-id crf-01234567890abcedf \
   --end-date 2022-07-04T23:59:59.000Z
```

Output:

```
{
   "Return": true
}
```
For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacity-reservation-fleets.html) in the *Amazon EC2 User Guide*.

- For API details, see [ModifyCapacityReservationFleet](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_ModifyCapacityReservationFleet.html) in *AWS CLI Command Reference*.

**modify-capacity-reservation**

The following code example shows how to use `modify-capacity-reservation`.

**AWS CLI**

**Example 1: To change the number of instances reserved by an existing capacity reservation**

The following `modify-capacity-reservation` example changes the number of instances for which the capacity reservation reserves capacity.

```bash
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --instance-count 5
```

Output:

```
{
    "Return": true
}
```

**Example 2: To change the end date and time for an existing capacity reservation**

The following `modify-capacity-reservation` example modifies an existing capacity reservation to end at the specified date and time.

```bash
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --end-date-type limited \
    --end-date 2019-08-31T23:59:59Z
```

For more information, see [Modifying a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/usingcapacityreservations/modify-capacity-reservation.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.
modify-client-vpn-endpoint

The following code example shows how to use modify-client-vpn-endpoint.

AWS CLI

To modify a Client VPN endpoint

The following modify-client-vpn-endpoint example enables client connection logging for the specified Client VPN endpoint.

```
aws ec2 modify-client-vpn-endpoint \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{
   "Return": true
}
```

For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

modify-default-credit-specification

The following code example shows how to use modify-default-credit-specification.

AWS CLI

To modify the default credit option

The following modify-default-credit-specification example modifies the default credit option for T2 instances.

```
aws ec2 modify-default-credit-specification \
   --instance-family t2 \
   --cpu-credits unlimited
```
Output:

```json
{
   "InstanceFamilyCreditSpecification": {
      "InstanceFamily": "t2",
      "CpuCredits": "unlimited"
   }
}
```

- For API details, see [ModifyDefaultCreditSpecification](#) in *AWS CLI Command Reference*.

**modify-ebs-default-kms-key-id**

The following code example shows how to use `modify-ebs-default-kms-key-id`.

AWS CLI

**To set your default CMK for EBS encryption**

The following `modify-ebs-default-kms-key-id` example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```bash
aws ec2 modify-ebs-default-kms-key-id \
   --kms-key-id alias/my-cmk
```

Output:

```json
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [ModifyEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

**modify-fleet**

The following code example shows how to use `modify-fleet`.

AWS CLI

**To scale an EC2 Fleet**
The following modify-fleet example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is terminate, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{
   "Return": true
}
```

For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyFleet in AWS CLI Command Reference.

**modify-fpga-image-attribute**

The following code example shows how to use modify-fpga-image-attribute.

**AWS CLI**

**To modify the attributes of an Amazon FPGA image**

This example adds load permissions for account ID 123456789012 for the specified AFI.

Command:

```
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id afi-0d123e123bfc85abc --load-permission Add=[$.UserId=123456789012]]
```

Output:

```
{
   "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "LoadPermission": {
         "Add": ["UserId=123456789012"]
      }
   }
}
```
modify-hosts

The following code example shows how to use modify-hosts.

AWS CLI

Example 1: To enable auto-placement for a Dedicated Host

The following modify-hosts example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```
aws ec2 modify-hosts \
  --host-id h-06c2f189b4EXAMPLE \
  --auto-placement on
```

Output:

```
{
   "Successful": [ 
      "h-06c2f189b4EXAMPLE"
   ],
   "Unsuccessful": []
}
```

Example 2: To enable host recovery for a Dedicated Host

The following modify-hosts example enables host recovery for the specified Dedicated Host.

```
aws ec2 modify-hosts \
  --host-id h-06c2f189b4EXAMPLE \
  --host-recovery on
```
Output:

```json
{
   "Successful": [
      "h-06c2f189b4EXAMPLE"
   ],
   "Unsuccessful": []
}
```

For more information, see Modifying Dedicated Host Auto-Placement in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyHosts in AWS CLI Command Reference.

**modify-id-format**

The following code example shows how to use modify-id-format.

**AWS CLI**

To enable the longer ID format for a resource

The following modify-id-format example enables the longer ID format for the instance resource type.

```bash
aws ec2 modify-id-format \
   --resource instance \n   --use-long-ids
```

To disable the longer ID format for a resource

The following modify-id-format example disables the longer ID format for the instance resource type.

```bash
aws ec2 modify-id-format \
   --resource instance \n   --no-use-long-ids
```

The following modify-id-format example enables the longer ID format for all supported resource types that are within their opt-in period.
aws ec2 modify-id-format \
   --resource all-current \
   --use-long-ids

- For API details, see ModifyIdFormat in AWS CLI Command Reference.

modify-identity-id-format

The following code example shows how to use modify-identity-id-format.

AWS CLI

To enable an IAM role to use longer IDs for a resource

The following modify-identity-id-format example enables the IAM role EC2Role in your AWS account to use long ID format for the instance resource type.

aws ec2 modify-identity-id-format \
   --principal-arn arn:aws:iam::123456789012:role/EC2Role \
   --resource instance \
   --use-long-ids

To enable an IAM user to use longer IDs for a resource

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for the volume resource type.

aws ec2 modify-identity-id-format \
   --principal-arn arn:aws:iam::123456789012:user/AdminUser \
   --resource volume \
   --use-long-ids

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

aws ec2 modify-identity-id-format \
   --principal-arn arn:aws:iam::123456789012:user/AdminUser \
   --resource all-current \

--use-long-ids

- For API details, see ModifyIdentityIdFormat in AWS CLI Command Reference.

modify-image-attribute

The following code example shows how to use modify-image-attribute.

AWS CLI

Example 1: To make an AMI public

The following modify-instance-attribute example makes the specified AMI public.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

Example 2: To make an AMI private

The following modify-instance-attribute example makes the specified AMI private.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

Example 3: To grant launch permission to an AWS account

The following modify-instance-attribute example grants launch permissions to the specified AWS account.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.
Example 4: To remove launch permission from an AWS account

The following modify-instance-attribute example removes launch permissions from the specified AWS account.

```
aws ec2 modify-image-attribute 
   --image-id ami-5731123e 
   --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see ModifyImageAttribute in AWS CLI Command Reference.

modify-instance-attribute

The following code example shows how to use modify-instance-attribute.

AWS CLI

Example 1: To modify the instance type

The following modify-instance-attribute example modifies the instance type of the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --instance-type "{Value": "m1.small"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following modify-instance-attribute example enables enhanced networking for the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute
The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```bash
code
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check "{"Value": true}"
```

This command produces no output.

**Example 4: To modify the deleteOnTermination attribute of the root volume**

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

Command:

```bash
code
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --block-device-mappings "[{{"DeviceName": "/dev/sda1"},"Ebs": 
  {"DeleteOnTermination":false}}]"
```

This command produces no output.

**Example 5: To modify the user data attached to an instance**

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the `UserData` for the specified instance.

Contents of original file `UserData.txt`:

```bash
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

Linux/macOS version of the command:

```bash
base64 UserData.txt > UserData.base64.txt
```
This command produces no output.

Windows version of the command:

certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 > UserData.base64.txt

Output:

Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.

Now you can reference that file in the CLI command that follows:

```bash
aws ec2 modify-instance-attribute \
  --instance-id=i-09b5a14dbca622e76 \
  --attribute UserData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the EC2 User Guide.

- For API details, see ModifyInstanceAttribute in AWS CLI Command Reference.

modify-instance-capacity-reservation-attributes

The following code example shows how to use modify-instance-capacity-reservation-attributes.

AWS CLI

Example 1: To modify an instance's capacity reservation targeting settings

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance to target a specific capacity reservation.

```bash
aws ec2 modify-instance-capacity-reservation-attributes \
  --instance-id i-EXAMPLE8765abcd4e \
  --capacity-reservation-specification
  'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```
Example 2: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```bash
aws ec2 modify-instance-capacity-reservation-attributes
  --instance-id i-EXAMPLE8765abcd4e
  --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```json
{
  "Return": true
}
```

For more information, see [Modifying an Instance's Capacity Reservation Settings](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-reservation-modify.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceCapacityReservationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-capacity-resolution-attributes.html) in *AWS CLI Command Reference*.

modify-instance-credit-specification

The following code example shows how to use `modify-instance-credit-specification`.

**AWS CLI**

To modify the credit option for CPU usage of an instance

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

Command:
aws ec2 modify-instance-credit-specification --instance-credit-specification "InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"

Output:

```
{
    "SuccessfulInstanceCreditSpecifications": [
        {
            "InstanceId": "i-1234567890abcdef0"
        }
    ],
    "UnsuccessfulInstanceCreditSpecifications": []
}
```

- For API details, see [ModifyInstanceCreditSpecification](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-credit-specification.html) in *AWS CLI Command Reference*.

**modify-instance-event-start-time**

The following code example shows how to use `modify-instance-event-start-time`.

**AWS CLI**

**To modify the event start time for an instance**

The following `modify-instance-event-start-time` command shows how to modify the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0
--instance-event-id instance-event-0abcdef1234567890 --not-before 2019-03-25T10:00:00.000
```

Output:

```
"Event": {
    "InstanceEventId": "instance-event-0abcdef1234567890",
    "Code": "system-reboot",
    "Description": "scheduled reboot",
    "NotAfter": "2019-03-25T12:00:00.000Z",
    "NotBefore": "2019-03-25T10:00:00.000Z",
```
modify-instance-event-window

The following code example shows how to use modify-instance-event-window.

AWS CLI

 Example 1: To modify the time range of an event window

The following modify-instance-event-window example modifies the time range of an event window. Specify the time-range parameter to modify the time range. You can't also specify the cron-expression parameter.

```
aws ec2 modify-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "TimeRanges": [
         {
            "StartWeekDay": "monday",
            "StartHour": 2,
            "EndWeekDay": "wednesday",
            "EndHour": 8
         }
      ],
      "Name": "myEventWindowName",
      "AssociationTarget": {
         "InstanceIds": [

```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To modify a set of time ranges for an event window**

The following modify-instance-event-window example modifies the time range of an event window. Specify the time-range parameter to modify the time range. You can't also specify the cron-expression parameter.

```
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8},
               {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday",
                "EndHour": 8}]
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 3: To modify the cron expression of an event window

The following modify-instance-event-window example modifies the cron expression of an event window. Specify the cron-expression parameter to modify the cron expression. You can't also specify the time-range parameter.

```bash
aws ec2 modify-instance-event-window
   --region us-east-1
   --instance-event-window-id iew-0abcdef1234567890
   --cron-expression "* 21-23 * * 2,3"
```
Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see [ModifyInstanceEventWindow](#) in AWS CLI Command Reference.

**modify-instance-maintenance-options**

The following code example shows how to use modify-instance-maintenance-options.

**AWS CLI**

**Example 1: To disable the recovery behavior of an instance**

The following modify-instance-maintenance-options example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \
```
--auto-recovery disabled

Output:

```json
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "disabled"
}
```

For more information, see [Recover your instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

**Example 2: To set the recovery behavior of an instance to default**

The following modify-instance-maintenance-options example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \\
    --instance-id i-0abcdef1234567890 \\
    --auto-recovery default
```

Output:

```json
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "default"
}
```

For more information, see [Recover your instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMaintenanceOptions](#) in *AWS CLI Command Reference*.

**modify-instance-metadata-options**

The following code example shows how to use modify-instance-metadata-options.

**AWS CLI**

**Example 1: To enable IMDSv2**
The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```bash
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-tokens required \
    --http-endpoint enabled
```

Output:

```json
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled"
    }
}
```

For more information, see [Instance metadata and user data](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/InstanceMetadataOptions.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To disable instance metadata**

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```bash
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-endpoint disabled
```

Output:

```json
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "disabled"
    }
}
```
Example 3: To enable instance metadata IPv6 endpoint for your instance

The following modify-instance-metadata-options example shows you how to turn on the IPv6 endpoint for the instance metadata service.

```bash
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-protocol-ipv6 enabled \
  --http-endpoint enabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled",
        "HttpProtocolIpv6": "enabled"
    }
}
```

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System. For more information, see [Instance metadata and user data](https://docs.aws.amazon.com/AmazonElasticComputeCloud/UserGuide/Amazon-Elastic-Compute-Cloud-User-Guide-For-Linux-Instances.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMetadataOptions](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-metadata-options.html) in *AWS CLI Command Reference*.

modify-instance-placement

The following code example shows how to use modify-instance-placement.

**AWS CLI**

**Example 1: To remove an instance's affinity with a Dedicated Host**
The following modify-instance-placement example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity default
```

Output:
```
{
   "Return": true
}
```

**Example 2: To establish affinity between an instance and the specified Dedicated Host**

The following modify-instance-placement example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity host \
   --host-id i-0e6ddf6187EXAMPLE
```

Output:
```
{
   "Return": true
}
```

For more information, see [Modifying Instance Tenancy and Affinity](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 3: To move an instance to a placement group**

The following modify-instance-placement example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```
aws ec2 stop-instances \
```

```
Example 4: To remove an instance from a placement group

The following modify-instance-placement example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string ("") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

```bash
aws ec2 stop-instances \
   --instance-ids i-0123a456700123456
```

Modify the placement (Windows Command Prompt, Linux, and macOS):

```bash
aws ec2 modify-instance-placement \
   --instance-id i-0123a456700123456 \
   --group-name ""
```

Modify the placement (Windows PowerShell):

```bash
aws ec2 modify-instance-placement ` \
   --instance-id i-0123a456700123456 ` \
   --group-name """"
```

Restart the instance:

```bash
aws ec2 start-instances \
   --instance-ids i-0123a456700123456
```
Output:

```
{
   "Return": true
}
```

For more information, see [Modifying Instance Tenancy and Affinity](#) in the [Amazon Elastic Compute Cloud User Guide for Linux Instances](#).

- For API details, see [ModifyInstancePlacement](#) in [AWS CLI Command Reference](#).

modify-ipam-pool

The following code example shows how to use modify-ipam-pool.

**AWS CLI**

**To modify an IPAM pool**

The following modify-ipam-pool example modifies an IPAM pool.

(Linux):

```
aws ec2 modify-ipam-pool \\
   --ipam-pool-id ipam-pool-0533048da7d823723 \\
   --add-allocation-resource-tags "Key=Owner,Value=Build Team" \\
   --clear-allocation-default-netmask-length \\
   --allocation-min-netmask-length 14
```

(Windows):

```
aws ec2 modify-ipam-pool ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
   --clear-allocation-default-netmask-length ^
   --allocation-min-netmask-length 14
```

Output:

```
{
   "IpamPool": {
```
modify-ipam-resource-cidr

The following code example shows how to use modify-ipam-resource-cidr.

AWS CLI

To modify the CIDR allocated to a resource

The following modify-ipam-resource-cidr example modifies a resource CIDR.

(Linux):
aws ec2 modify-ipam-resource-cidr \
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 \
  --resource-id vpc-010e1791024eb0af9 \
  --resource-cidr 10.0.1.0/24 \n  --resource-region us-east-1 \n  --monitored

(Windows):

aws ec2 modify-ipam-resource-cidr ^
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
  --resource-id vpc-010e1791024eb0af9 ^
  --resource-cidr 10.0.1.0/24 ^
  --resource-region us-east-1 ^
  --monitored

Output:

{
  "IpamResourceCidr": {
    "Ipam": "ipam-08440e7a3acde3908",
    "IpamScopeId": "ipam-scope-0da34c61fd189a141",
    "IpamPoolId": "ipam-pool-0533048da7d823723",
    "ResourceRegion": "us-east-1",
    "ResourceOwnerId": "123456789012",
    "ResourceId": "vpc-010e1791024eb0af9",
    "ResourceCidr": "10.0.1.0/24",
    "ResourceType": "vpc",
    "ResourceTags": [
      {
        "Key": "Environment",
        "Value": "Preprod"
      },
      {
        "Key": "Owner",
        "Value": "Build Team"
      }
    ],
    "IpUsage": 0.0,
    "ComplianceStatus": "noncompliant",
  }
}
"ManagementState": "managed",
"OverlapStatus": "overlapping",
"VpcId": "vpc-010e1791024eb0af9"
}
}

For more information on moving resources, see Move resource CIDRs between scopes in the Amazon VPC IPAM User Guide.

For more information on changing monitoring states, see Change the monitoring state of resource CIDRs in the Amazon VPC IPAM User Guide.
• For API details, see ModifyIpamResourceCidr in AWS CLI Command Reference.

modify-ipam-resource-discovery

The following code example shows how to use modify-ipam-resource-discovery.

AWS CLI

To modify the operating regions of a resource discovery

In this example, you're an IPAM delegated admin who wants to modify the operating regions of a resource discovery.

To complete this request:

You cannot modify a default resource discovery and you must be the owner of the resource discovery. You need the resource discovery ID, which you can get with describe-ipam-resource-discoveries.

The following modify-ipam-resource-discovery example modifies a non-default resource discovery in your AWS account.

```bash
aws ec2 modify-ipam-resource-discovery \
   --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
   --add-operating-regions RegionName='us-west-1' \
   --remove-operating-regions RegionName='us-east-2' \
   --region us-east-1
```

Output:
modify-ipam-scope

The following code example shows how to use modify-ipam-scope.

AWS CLI

To modify the description of a scope

In this scenario, you're an IPAM delegated admin who wants to modify the description of an IPAM scope.

To complete this request, you'll need the scope ID, which you can get with describe-ipam-scopes.

The following modify-ipam-scope example updates the description of the scope.

```bash
aws ec2 modify-ipam-scope \
    --ipam-scope-id ipam-scope-0d3539a30b57dcdd1 \
```
modify-ipam

The following code example shows how to use modify-ipam.

AWS CLI

To modify an IPAM

The following modify-ipam example modifies an IPAM by adding an Operating Region.

(Linux):

```bash
aws ec2 modify-ipam
  --ipam-id ipam-08440e7a3acde3908 
  --add-operating-regions RegionName=us-west-2
```

(Windows):
```bash
aws ec2 modify-ipam
--ipam-id ipam-08440e7a3acde3908
--add-operating-regions RegionName=us-west-2
```

Output:

```
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-08440e7a3acde3908",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
    "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
    "ScopeCount": 3,
    "OperatingRegions": [
      {
        "RegionName": "us-east-1"
      },
      {
        "RegionName": "us-east-2"
      },
      {
        "RegionName": "us-west-1"
      },
      {
        "RegionName": "us-west-2"
      }
    ],
    "State": "modify-in-progress"
  }
}
```

- For API details, see [ModifyIpam](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-ipam.html) in *AWS CLI Command Reference*.

**modify-launch-template**

The following code example shows how to use `modify-launch-template`.

**AWS CLI**

To change the default launch template version
This example specifies version 2 of the specified launch template as the default version.

Command:

```bash
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-version 2
```

Output:

```json
{
   "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "DefaultVersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "CreateTime": "2017-12-01T13:35:46.000Z"
   }
}
```

- For API details, see [ModifyLaunchTemplate](#) in *AWS CLI Command Reference*.

modify-managed-prefix-list

The following code example shows how to use modify-managed-prefix-list.

**AWS CLI**

**To modify a prefix list**

The following modify-managed-prefix-list example adds an entry to the specified prefix list.

```bash
aws ec2 modify-managed-prefix-list
   --prefix-list-id pl-0123456abcabcabc1
   --add-entries Cidr=10.1.0.0/16,Description=vpc-c
   --current-version 1
```

Output:

```json
{
}
```
"PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
    "AddressFamily": "IPv4",
    "State": "modify-in-progress",
    "PrefixListName": "vpc-cidrs",
    "MaxEntries": 10,
    "Version": 1,
    "OwnerId": "123456789012"
}
}

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see ModifyManagedPrefixList in AWS CLI Command Reference.

modify-network-interface-attribute

The following code example shows how to use modify-network-interface-attribute.

AWS CLI

**To modify the attachment attribute of a network interface**

This example command modifies the attachment attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

**To modify the description attribute of a network interface**

This example command modifies the description attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --description "My description"
```
To modify the groupSet attribute of a network interface

This example command modifies the groupSet attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --groups sg-903004f8 sg-1a2b3c4d
```

To modify the sourceDestCheck attribute of a network interface

This example command modifies the sourceDestCheck attribute of the specified network interface.

Command:

```bash
```

modify-private-dns-name-options

The following code example shows how to use modify-private-dns-name-options.

AWS CLI

To modify the options for instance hostnames

The following modify-private-dns-name-options example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```bash
aws ec2 modify-private-dns-name-options \
   --instance-id i-1234567890abcdef0 \
   --no-enable-resource-name-dns-a-record
```

Output:

```json
{
   "Return": true
}
```
For more information, see Amazon EC2 instance hostname types in the Amazon EC2 User Guide.

- For API details, see ModifyPrivateDnsNameOptions in AWS CLI Command Reference.

modify-reserved-instances

The following code example shows how to use modify-reserved-instances.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=10
```

Output:

```
{
   "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

To modify the network platform of Reserved Instances

This example command converts EC2-Classic Reserved Instances to EC2-VPC.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-VPC,InstanceCount=5
```

Output:

```
{
   "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
}
For more information, see Modifying Your Reserved Instances in the Amazon EC2 User Guide.

To modify the instance size of Reserved Instances

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids 1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```
{
   "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modifying the Instance Size of Your Reservations in the Amazon EC2 User Guide.

- For API details, see ModifyReservedInstances in AWS CLI Command Reference.

modify-security-group-rules

The following code example shows how to use modify-security-group-rules.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following modify-security-group-rules example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the security-group-rules parameter to enter the updates for the specified security group rules. -1 specifies all protocols.
aws ec2 modify-security-group-rules \
   --group-id sg-1234567890abcdef0 \
   --security-group-rules SecurityGroupRuleId=sgr-abcdef01234567890,SecurityGroupRule='\{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'

Output:

```
{
   "Return": true
}
```

For more information about security group rules, see Security group rules in the Amazon EC2 User Guide.

- For API details, see ModifySecurityGroupRules in AWS CLI Command Reference.

modify-snapshot-attribute

The following code example shows how to use modify-snapshot-attribute.

AWS CLI

**Example 1: To modify a snapshot attribute**

The following modify-snapshot-attribute example updates the createVolumePermission attribute for the specified snapshot, removing volume permissions for the specified user.

```
aws ec2 modify-snapshot-attribute \
   --snapshot-id snap-1234567890abcdef0 \
   --attribute createVolumePermission \
   --operation-type remove \
   --user-ids 123456789012
```

**Example 2: To make a snapshot public**

The following modify-snapshot-attribute example makes the specified snapshot public.

```
aws ec2 modify-snapshot-attribute \
   --snapshot-id snap-1234567890abcdef0 \
   --attribute createVolumePermission \
```
--operation-type add \
--group-names all

- For API details, see [ModifySnapshotAttribute](#) in [AWS CLI Command Reference](#).

**modify-snapshot-tier**

The following code example shows how to use `modify-snapshot-tier`.

**AWS CLI**

**Example 1: To archive a snapshot**

The following `modify-snapshot-tier` example archives the specified snapshot.

```bash
aws ec2 modify-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --storage-tier archive
```

Output:

```json
{
    "SnapshotId": "snap-01234567890abcedf",
    "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

The `TieringStartTime` response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

For more information about snapshot archiving, see [Archive Amazon EBS snapshots](#) in the [Amazon EC2 User Guide](#).

- For API details, see [ModifySnapshotTier](#) in [AWS CLI Command Reference](#).

**modify-spot-fleet-request**

The following code example shows how to use `modify-spot-fleet-request`.

**AWS CLI**

**To modify a Spot fleet request**
This example command updates the target capacity of the specified Spot fleet request.

Command:

```bash
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```json
{
   "Return": true
}
```

This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

Command:

```bash
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```json
{
   "Return": true
}
```

modify-subnet-attribute

The following code example shows how to use modify-subnet-attribute.

AWS CLI

**To change a subnet's public IPv4 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.
Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

**To change a subnet's IPv6 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the *AWS Virtual Private Cloud User Guide*.

- For API details, see `ModifySubnetAttribute` in *AWS CLI Command Reference*.

**modify-traffic-mirror-filter-network-services**

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

**AWS CLI**

To add network services to a Traffic Mirror filter

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```
aws ec2 modify-traffic-mirror-filter-network-services \
    --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
    --add-network-service amazon-dns
```

Output:

```
{
    "TrafficMirrorFilter": {
        "Tags": [],
```
For more information, see Modify Traffic Mirror Filter Network Services in the AWS Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorFilterNetworkServices in AWS CLI Command Reference.

modify-traffic-mirror-filter-rule

The following code example shows how to use modify-traffic-mirror-filter-rule.

AWS CLI

To modify a traffic mirror filter rule

The following modify-traffic-mirror-filter-rule example modifies the description of the specified traffic mirror filter rule.
--traffic-mirror-filter-rule-id tmfr-0ca76e0e08EXAMPLE \
--description "TCP Rule"

Output:

```json
{
 "TrafficMirrorFilterRule": {
   "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
   "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
   "TrafficDirection": "ingress",
   "RuleNumber": 100,
   "RuleAction": "accept",
   "Protocol": 6,
   "DestinationCidrBlock": "10.0.0.0/24",
   "SourceCidrBlock": "10.0.0.0/24",
   "Description": "TCP Rule"
 }`
```

For more information, see [Modify Your Traffic Mirror Filter Rules](#) in the AWS Traffic Mirroring Guide.

- For API details, see [ModifyTrafficMirrorFilterRule](#) in [AWS CLI Command Reference](#).

**modify-traffic-mirror-session**

The following code example shows how to use `modify-traffic-mirror-session`.

**AWS CLI**

**To modify a traffic mirror session**

The following `modify-traffic-mirror-session` example changes the traffic mirror session description and the number of packets to mirror.

```
aws ec2 modify-traffic-mirror-session \
   --description "Change packet length" \
   --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
   --remove-fields "packet-length"
```

Output:
For more information, see Modify your traffic mirror session in the Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorSession in AWS CLI Command Reference.

modify-transit-gateway-prefix-list-reference

The following code example shows how to use modify-transit-gateway-prefix-list-reference.

AWS CLI

**To modify a reference to a prefix list**

The following modify-transit-gateway-prefix-list-reference example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference \
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
   --prefix-list-id pl-11111122222222333 \
   --transit-gateway-attachment-id tgw-attach-aabbccddaabbccab
```

Output:

```
{
   "TransitGatewayPrefixListReference": {
      "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
   }
}
```
"PrefixListId": "pl-1111112222222333",
"PrefixListOwnerId": "123456789012",
"State": "modifying",
"Blackhole": false,
"TransitGatewayAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-aabbccdaabbccbaab",
    "ResourceType": "vpc",
    "ResourceId": "vpc-112233445566aabbcc"
}
}

For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see ModifyTransitGatewayPrefixListReference in AWS CLI Command Reference.

modify-transit-gateway-vpc-attachment

The following code example shows how to use modify-transit-gateway-vpc-attachment.

AWS CLI

To modify a transit gateway VPC attachment

The following modify-transit-gateway-vpc-attachment example adds a subnet to the specified transit gateway VPC attachment.

```
aws ec2 modify-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
   --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
        "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
        "VpcId": "vpc-5ecccc927",
        "VpcOwnerId": "111122223333",
        "State": "modifying",
        "SubnetIds": [
            "subnet-0e51f45802EXAMPLE",
```
modify-transit-gateway

The following code example shows how to use modify-transit-gateway.

AWS CLI

To modify a transit gateway

The following modify-transit-gateway example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \
    --transit-gateway-id tgw-111111222222aaaaa \
    --options VpnEcmpSupport=enable
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-111111222222aaaaa",
        "TransitGatewayArn": "64512",
        "State": "modifying",
        "OwnerId": "123456789012",
        "CreationTime": "2020-04-30T08:41:37.000Z",
        "Options": {
            "AmazonSideAsn": 64512,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
        }
    }
}
```
modify-verified-access-endpoint-policy

The following code example shows how to use modify-verified-access-endpoint-policy.

AWS CLI

To configure the Verified Access policy for an endpoint

The following modify-verified-access-endpoint-policy example adds the specified Verified Access policy to the specified Verified Access endpoint.

```bash
cmd = ec2 modify-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --policy-enabled \
  --policy-document file://policy.txt
```

Contents of `policy.txt`:

```plaintext
permit(principal, action, resource)
when {
  context.identity.groups.contains("finance") &&
  context.identity.email.verified == true
};
```

Output:

```json
{
  "PolicyEnabled": true,
}
For more information, see [Verified Access policies](#) in the AWS Verified Access User Guide.

- For API details, see [ModifyVerifiedAccessEndpointPolicy](#) in AWS CLI Command Reference.

### modify-verified-access-endpoint

The following code example shows how to use `modify-verified-access-endpoint`.

**AWS CLI**

To modify the configuration of a Verified Access endpoint

The following `modify-verified-access-endpoint` example adds the specified description to the specified Verified Access endpoint.

```bash
aws ec2 modify-verified-access-endpoint \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --description "Testing Verified Access"
```

Output:

```json
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
    "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
    "SecurityGroupIds": [
      "sg-004915970c4c8f13a"
    ],
  }
}
```
For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpoint](#) in *AWS CLI Command Reference*.

### modify-verified-access-group-policy

The following code example shows how to use `modify-verified-access-group-policy`.

**AWS CLI**

To configure a Verified Access policy for a group

The following `modify-verified-access-group-policy` example adds the specified Verified Access policy to the specified Verified Access group.

```
aws ec2 modify-verified-access-group-policy \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --policy-enabled \
  --policy-document file://policy.txt
```

Contents of `policy.txt`:

```plaintext
permit(principal, action, resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email.verified == true
}
```
Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
{\n    context.identity.groups.contains("finance") &&
context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the AWS Verified Access User Guide.

**modify-verified-access-group**

The following code example shows how to use `modify-verified-access-group`.

**AWS CLI**

**To modify the configuration of a Verified Access group**

The following `modify-verified-access-group` example adds the specified description to the specified Verified Access group.

```
aws ec2 modify-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:17:25"
    }
}
```
modify-verified-access-instance-logging-configuration

The following code example shows how to use modify-verified-access-instance-logging-configuration.

AWS CLI

To enable logging for a Verified Access instance

The following modify-verified-access-instance-logging-configuration example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```
aws ec2 modify-verified-access-instance-logging-configuration \
  --verified-access-instance-id vai-0ce000c0b7643abea \
  --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```
{
   "LoggingConfiguration": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "AccessLogs": {
         "S3": {
            "Enabled": false
         },
         "CloudWatchLogs": {
            "Enabled": true,
            "DeliveryStatus": {
               "Code": "success"
            },
            "LogGroup": "my-log-group"
         },
         "KinesisDataFirehose": {
            "Enabled": false
         },
         "LogVersion": "ocsf-1.0.0-rc.2",
         "IncludeTrustContext": false
   }
}
```
modify-verified-access-instance

The following code example shows how to use modify-verified-access-instance.

**AWS CLI**

**To modify the configuration of a Verified Access instance**

The following modify-verified-access-instance example adds the specified description to the specified Verified Access instance.

```
aws ec2 modify-verified-access-instance \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --description "Testing Verified Access"
```

**Output:**

```json
{
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [
         {
            "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center"
         }
      ],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T22:41:04"
   }
}
```
modify-verified-access-trust-provider

The following code example shows how to use modify-verified-access-trust-provider.

AWS CLI

To modify the configuration of a Verified Access trust provider

The following modify-verified-access-trust-provider example adds the specified description to the specified Verified Access trust provider.

```bash
aws ec2 modify-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
    --description "Testing Verified Access"
```

Output:

```json
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:18:21"
    }
}
```

For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see ModifyVerifiedAccessTrustProvider in AWS CLI Command Reference.

modify-volume-attribute

The following code example shows how to use modify-volume-attribute.
AWS CLI

To modify a volume attribute

This example sets the autoEnableIo attribute of the volume with the ID vol-1234567890abcdef0 to true. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io
```

- For API details, see [ModifyVolumeAttribute](https://aws.amazon.com/cli) in *AWS CLI Command Reference*.

modify-volume

The following code example shows how to use modify-volume.

AWS CLI

**Example 1: To modify a volume by changing its size**

The following modify-volume example changes the size of the specified volume to 150GB.

Command:

```bash
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "modifying",
      "VolumeId": "vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 0,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```
**Example 2: To modify a volume by changing its type, size, and IOPS value**

The following `modify-volume` example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```
aws ec2 modify-volume \\
   --volume-type io1 \\
   --iops 10000 \\
   --size 350 \\
   --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
      "TargetSize": 350,
      "TargetVolumeType": "io1",
      "ModificationState": "modifying",
      "VolumeId": "vol-0721c1a9d08c93bf6",
      "TargetIops": 10000,
      "StartTime": "2019-05-17T11:38:57.000Z",
      "Progress": 0,
      "OriginalVolumeType": "gp2",
      "OriginalIops": 150,
      "OriginalSize": 50
   }
}
```

- For API details, see [ModifyVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-volume.html) in *AWS CLI Command Reference*.

**modify-vpc-attribute**

The following code example shows how to use `modify-vpc-attribute`.

**AWS CLI**

**To modify the enableDnsSupport attribute**

This example modifies the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS
hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{"Value ":false}"
```

To modify the enableDnsHostnames attribute

This example modifies the enableDnsHostnames attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{"Value ":false}"
```

- For API details, see ModifyVpcAttribute in AWS CLI Command Reference.

**modify-vpc-endpoint-connection-notification**

The following code example shows how to use modify-vpc-endpoint-connection-notification.

**AWS CLI**

To modify an endpoint connection notification

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```bash
```

Output:
modify-vpc-endpoint-service-configuration

The following code example shows how to use `modify-vpc-endpoint-service-configuration`.

**AWS CLI**

**To modify an endpoint service configuration**

This example changes the acceptance requirement for the specified endpoint service.

Command:

```bash
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-svc-09222513e6e77d86 --no-acceptance-required
```

Output:

```json
{
   "ReturnValue": true
}
```

**For API details, see** [ModifyVpcEndpointServiceConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-vpc-endpoint-service-configuration.html) in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-payer-responsibility

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

**AWS CLI**

**To modify the payer responsibility**
The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
  --service-id vpce-svc-071afff706666e61e0 \
  --payer-responsibility ServiceOwner
```

This command produces no output.

**modify-vpc-endpoint-service-permissions**

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

**AWS CLI**

**To modify endpoint service permissions**

This example adds permission for an AWS account to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '"arn:aws:iam::123456789012:root"'
```

Output:

```
{
    "ReturnValue": true
}
```

This example adds permission for a specific IAM user (admin) to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '"arn:aws:iam::123456789012:user/admin"'
```
modify-vpc-endpoint

The following code example shows how to use modify-vpc-endpoint.

**AWS CLI**

**To modify a gateway endpoint**

This example modifies gateway endpoint vpce-1a2b3c4d by associating route table rtb-aaa222bb with the endpoint, and resetting the policy document.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids rtb-aaa222bb --reset-policy
```

Output:

```
{
   "Return": true
}
```

**To modify an interface endpoint**

This example modifies interface endpoint vpce-0fe5b17a0707d6fa5 by adding subnet subnet-d6fcaa8d to the endpoint.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id subnet-d6fcaa8d
```

Output:

```
{
   "Return": true
}
```

- For API details, see ModifyVpcEndpoint in AWS CLI Command Reference.
modify-vpc-peering-connection-options

The following code example shows how to use modify-vpc-peering-connection-options.

**AWS CLI**

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection pcx-aaaabbb, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
      "AllowEgressFromLocalClassicLinkToRemoteVpc": true
   }
}
```

To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --accepter-peering-connection-options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:
To enable DNS resolution support for the VPC peering connection

In this example, the owner of the requester VPC modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Command:

```
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
      "AllowDnsResolutionFromRemoteVpc": true
   }
}
```

- For API details, see [ModifyVpcPeeringConnectionOptions](#) in *AWS CLI Command Reference*.

### modify-vpc-tenancy

The following code example shows how to use modify-vpc-tenancy.

**AWS CLI**

To modify the tenancy of a VPC

This example modifies the tenancy of VPC `vpc-1a2b3c4d` to default.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```
• For API details, see `ModifyVpcTenancy` in *AWS CLI Command Reference*.

**modify-vpn-connection-options**

The following code example shows how to use `modify-vpn-connection-options`.

**AWS CLI**

**To modify your VPN connection options**

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```
aws ec2 modify-vpn-connection-options \
  --vpn-connection-id vpn-1122334455aabbccd \
  --local-ipv4-network-cidr 10.0.0.0/16
```

**Output:**

```
{
  "VpnConnections": [
    {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-01234567abcde1234",
      "Category": "VPN",
      "State": "modifying",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-1122334455aabbccd",
      "TransitGatewayId": "tgw-00112233445566aab",
      "Options": {
        "EnableAcceleration": false,
        "StaticRoutesOnly": true,
        "LocalIpv4NetworkCidr": "10.0.0.0/16",
        "RemoteIpv4NetworkCidr": "0.0.0.0/0",
        "TunnelInsideIpVersion": "ipv4"
      }
    }
  ]
}
```
For more information, see [Modifying Site-to-Site VPN connection options](#) in the [AWS Site-to-Site VPN User Guide](#).

- For API details, see [ModifyVpnConnectionOptions](#) in [AWS CLI Command Reference](#).

### modify-vpn-connection

The following code example shows how to use `modify-vpn-connection`.

**AWS CLI**

**To modify a VPN connection**

The following `modify-vpn-connection` example changes the target gateway for VPN connection `vpn-12345678901234567` to virtual private gateway `vgw-11223344556677889`: 

```json
{
  "Routes": [],
  "Tags": [
    {
      "Key": "Name",
      "Value": "CanadaVPN"
    }
  ],
  "VgwTelemetry": [
    {
      "AcceptedRouteCount": 0,
      "LastStatusChange": "2020-07-29T10:35:11.000Z",
      "OutsideIpAddress": "203.0.113.3",
      "Status": "DOWN",
      "StatusMessage": ""
    },
    {
      "AcceptedRouteCount": 0,
      "LastStatusChange": "2020-09-02T09:09:33.000Z",
      "OutsideIpAddress": "203.0.113.5",
      "Status": "UP",
      "StatusMessage": ""
    }
  ]
}
```
aws ec2 modify-vpn-connection \
   --vpn-connection-id vpn-12345678901234567 \
   --vpn-gateway-id vgw-11223344556677889

Output:

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccdde1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-17T07:34:00.000Z",
                "OutsideIpAddress": "18.210.3.222",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-20T21:20:16.000Z",
                "OutsideIpAddress": "34.193.129.33",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            }
        ]
    }
}
```

- For API details, see [ModifyVpnConnection](#) in *AWS CLI Command Reference*.

modify-vpn-tunnel-certificate

The following code example shows how to use `modify-vpn-tunnel-certificate`. 
AWS CLI

To rotate a VPN tunnel certificate

The following `modify-vpn-tunnel-certificate` example rotates the certificate for the specified tunnel for a VPN connection

```
aws ec2 modify-vpn-tunnel-certificate \
   --vpn-tunnel-outside-ip-address 203.0.113.17 \
   --vpn-connection-id vpn-12345678901234567
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": ...configuration information...,  
      "CustomerGatewayId": "cgw-aabbccddeee122334",  
      "Category": "VPN",  
      "State": "modifying",  
      "Type": "ipsec.1",  
      "VpnConnectionId": "vpn-12345678901234567",  
      "VpnGatewayId": "vgw-1122344556677889",  
      "Options": {  
         "StaticRoutesOnly": false  
      },  
      "VgwTelemetry": [
         {
            "AcceptedRouteCount": 0,  
            "LastStatusChange": "2019-09-11T17:27:14.000Z",  
            "OutsideIpAddress": "203.0.113.17",  
            "Status": "DOWN",  
            "StatusMessage": "IPSEC IS DOWN",  
            "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/c544d8ce-20b8-4fff-98b0-example"
         },  
         {
            "AcceptedRouteCount": 0,  
            "LastStatusChange": "2019-09-11T17:26:47.000Z",  
            "OutsideIpAddress": "203.0.114.18",  
            "Status": "DOWN",  
            "StatusMessage": "IPSEC IS DOWN",  
            "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/5ab64566-761b-4ad3-b259-example"
         }
      ]
   }
}
```
modify-vpn-tunnel-options

The following code example shows how to use modify-vpn-tunnel-options.

**AWS CLI**

To modify the tunnel options for a VPN connection

The following modify-vpn-tunnel-options example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```bash
aws ec2 modify-vpn-tunnel-options \
   --vpn-connection-id vpn-12345678901234567 \
   --vpn-tunnel-outside-ip-address 203.0.113.17 \
   --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}]
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-aabbccddeee122334",
      "Category": "VPN",
      "State": "available",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-12345678901234567",
      "VpnGatewayId": "vgw-11223344556677889",
      "Options": {
         "StaticRoutesOnly": false,
         "TunnelOptions": [
            {
               "OutsideIpAddress": "203.0.113.17",
               "Phase1DHGroupNumbers": [
```

Actions and scenarios

2569


• For API details, see ModifyVpnTunnelOptions in AWS CLI Command Reference.

**monitor-instances**

The following code example shows how to use `monitor-instances`.

**AWS CLI**

**To enable detailed monitoring for an instance**

This example command enables detailed monitoring for the specified instance.

Command:

```bash
code
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```json
code
{
    "InstanceMonitorings": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "Monitoring": {
                "State": "pending"
            }
        }
    ]
}
```
move-address-to-vpc

The following code example shows how to use move-address-to-vpc.

AWS CLI

To move an address to EC2-VPC

This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

Command:

```
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

Output:

```
{
"Status": "MoveInProgress"
}
```

move-byoip-cidr-to-ipam

The following code example shows how to use move-byoip-cidr-to-ipam.

AWS CLI

To transfer a BYOIP CIDR to IPAM

The following move-byoip-cidr-to-ipam example transfers a BYOIP CIDR to IPAM.

(Linux):

```
aws ec2 move-byoip-cidr-to-ipam \
--region us-west-2 \
```
(Windows):

```
aws ec2 move-byoip-cidr-to-ipam
  --region us-west-2
  --ipam-pool-id ipam-pool-0a03d430ca3f5c035
  --ipam-pool-owner 111111111111
  --cidr 130.137.249.0/24
```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "130.137.249.0/24",
    "State": "pending-transfer"
  }
}
```

For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the Amazon VPC IPAM User Guide.

- For API details, see MoveByoipCidrToIpam in AWS CLI Command Reference.

**network-insights-access-scope**

The following code example shows how to use network-insights-access-scope.

**AWS CLI**

**To create Network Insights access scopes**

The following create-network-insights-access-scope example creates a network insights access scope in your AWS account.

```
aws ec2 create-network-insights-access-scope
  --cli-input-json file://access-scope-file.json
```

Contents of access-scope-file.json:
{  
  "MatchPaths": [  
    {  
      "Source": {  
        "ResourceStatement": {  
          "Resources": [  
            "vpc-abcd12e3"  
          ]  
        }  
      }  
    }  
  ],  
  "ExcludePaths": [  
    {  
      "Source": {  
        "ResourceStatement": {  
          "ResourceTypes": [  
            "AWS::EC2::InternetGateway"  
          ]  
        }  
      }  
    }  
  ]  
}

Output:

{  
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111"  
}

"NetworkInsightsAccessScope": {  
  "NetworkInsightsAccessScopeId": "nis-123456789222",  
  "CreatedDate": "2022-01-25T19:20:28.796000+00:00",  
  "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"  
},  
"NetworkInsightsAccessScopeContent": {  
  "NetworkInsightsAccessScopeId": "nis-04c0fbca737c404",  
  "MatchPaths": [  
    
  ]
}
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see NetworkInsightsAccessScope in AWS CLI Command Reference.

**provision-byoip-cidr**

The following code example shows how to use `provision-byoip-cidr`.

**AWS CLI**

To provision an address range

The following `provision-byoip-cidr` example provisions a public IP address range for use with AWS.

```
aws ec2 provision-byoip-cidr \
  --cidr 203.0.113.25/24 \
  --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```
provision-ipam-pool-cidr

The following code example shows how to use `provision-ipam-pool-cidr`.

**AWS CLI**

To provision a CIDR to an IPAM pool

The following `provision-ipam-pool-cidr` example provisions a CIDR to an IPAM pool.

(Linux):

```
aws ec2 provision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-0533048da7d823723 \ 
    --cidr 10.0.0.0/24
```

(Windows):

```
aws ec2 provision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --cidr 10.0.0.0/24
```

Output:

```
{
    "IpamPoolCidr": {
```

For more information about creating the messages strings for the authorization context, see [Bring Your Own IP Addresses](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/bring-your-own-ip-space.html) in the *Amazon EC2 User Guide*.

- For API details, see [ProvisionByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/ec2/provision-byoip-cidr.html) in *AWS CLI Command Reference*.
"Cidr": "10.0.0.0/24",
"State": "pending-provision"
}
}

For more information, see Provision CIDRs to a pool in the Amazon VPC IPAM User Guide.

- For API details, see ProvisionIpamPoolCidr in AWS CLI Command Reference.

**purchase-host-reservation**

The following code example shows how to use purchase-host-reservation.

**AWS CLI**

**To purchase a Dedicated Host Reservation**

This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
   "TotalHourlyPrice": "1.499",
   "Purchase": [
      {
         "HourlyPrice": "1.499",
         "InstanceFamily": "m4",
         "PaymentOption": "NoUpfront",
         "HostIdSet": [
            "h-013abcd2a00cbd123"
         ],
         "HostReservationId": "hr-0d418a3a4ff669ae",
         "UpfrontPrice": "0.000",
         "Duration": 31536000
      }
   ],
}
```
For API details, see PurchaseHostReservation in AWS CLI Command Reference.

**purchase-reserved-instances-offering**

The following code example shows how to use purchase-reserved-instances-offering.

**AWS CLI**

**To purchase a Reserved Instance offering**

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

Command:

```bash
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-id ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3
```

Output:

```json
{
   "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
}
```

For API details, see PurchaseReservedInstancesOffering in AWS CLI Command Reference.

**purchase-scheduled-instances**

The following code example shows how to use purchase-scheduled-instances.

**AWS CLI**

**To purchase a Scheduled Instance**

This example purchases a Scheduled Instance.

Command:
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-request.json

Purchase-request.json:

[  
  {  
    "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",  
    "InstanceCount": 1  
  }  
]

Output:

{  
  "ScheduledInstanceSet": [
    {  
      "AvailabilityZone": "us-west-2b",  
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",  
      "HourlyPrice": "0.095",  
      "CreateDate": "2016-01-25T21:43:38.612Z",  
      "Recurrence": {  
        "OccurrenceDaySet": [1],  
        "Interval": 1,  
        "Frequency": "Weekly",  
        "OccurrenceRelativeToEnd": false,  
        "OccurrenceUnit": ""  
      },  
      "Platform": "Linux/UNIX",  
      "TermEndDate": "2017-01-31T09:00:00Z",  
      "InstanceCount": 1,  
      "SlotDurationInHours": 32,  
      "TermStartDate": "2016-01-31T09:00:00Z",  
      "NetworkPlatform": "EC2-VPC",  
      "TotalScheduledInstanceHours": 1696,  
      "NextSlotStartTime": "2016-01-31T09:00:00Z",  
      "InstanceType": "c4.large"  
    }  
  ]
}
reboot-instances

The following code example shows how to use reboot-instances.

**AWS CLI**

To reboot an Amazon EC2 instance

This example reboots the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```

For more information, see Reboot Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see RebootInstances in *AWS CLI Command Reference*.

register-image

The following code example shows how to use register-image.

**AWS CLI**

**Example 1: To register an AMI using a manifest file**

The following register-image example registers an AMI using the specified manifest file in Amazon S3.

```
aws ec2 register-image \
   --name my-image \
   --image-location my-s3-bucket/myimage/image.manifest.xml
```

Output:

```
{
   "ImageId": "ami-1234567890EXAMPLE"
}
```
For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

Example 2: To register an AMI using a snapshot of a root device

The following register-image example registers an AMI using the specified snapshot of an EBS root volume as device /dev/xvda. The block device mapping also includes an empty 100 GiB EBS volume as device /dev/xvdf.

```
aws ec2 register-image \
  --name my-image \
  --root-device-name /dev/xvda \
  --block-device-mappings DeviceName=/dev/xvda, Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/xvdf, Ebs={VolumeSize=100}
```

Output:

```
{
    "ImageId": "ami-1a2b3c4d5eEXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

- For API details, see RegisterImage in AWS CLI Command Reference.

register-instance-event-notification-attributes

The following code example shows how to use register-instance-event-notification-attributes.

AWS CLI

Example 1: To include all tags in event notifications

The following register-instance-event-notification-attributes example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \
  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:
Example 2: To include specific tags in event notifications

The following `register-instance-event-notification-attributes` example includes the specified tags in event notifications. You cannot specify tags if `IncludeAllTagsOfInstance` is true.

```bash
aws ec2 register-instance-event-notification-attributes \
    --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [
            "tag-key1",
            "tag-key2"
        ],
        "IncludeAllTagsOfInstance": false
    }
}
```

For more information, see [Scheduled events for your instances](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/instances-scheduled-events.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [RegisterInstanceEventNotificationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/register-instance-event-notification-attributes.html) in *AWS CLI Command Reference*.

**register-transit-gateway-multicase-group-sources**

The following code example shows how to use `register-transit-gateway-multicase-group-sources`.
AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \n  --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```json
{
  "RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see Register Sources with a Multicast Group in the AWS Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticastGroupSources in AWS CLI Command Reference.

`register-transit-gateway-multicast-group-members`

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.
aws ec2 register-transit-gateway-multicast-group-members \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-0e246d32695012e81

Output:

```
{
  "RegisteredMulticastGroupMembers": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-0e246d32695012e81"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see Managing multicast domains in the Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.

---

register-transit-gateway-multicast-group-sources

The following code example shows how to use register-transit-gateway-multicast-group-sources.

AWS CLI

To register a source with a transit gateway multicast group.

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090c9bae
```

Output:
For more information, see [Managing multicast domains](https://docs.aws.amazon.com/gama/latest/userguide/managing-multicast-domains.html) in the *Transit Gateways Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupSources](https://docs.aws.amazon.com/cli/latest/reference/ec2/register-transit-gateway-multicast-group-sources.html) in AWS CLI Command Reference.

### reject-transit-gateway-peering-attachment

The following code example shows how to use `reject-transit-gateway-peering-attachment`.

**AWS CLI**

**To reject a transit gateway peering attachment**

The following `reject-transit-gateway-peering-attachment` example rejects the specified transit gateway peering attachment request. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```bash
aws ec2 reject-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd \
  --region us-east-2
```

**Output:**

```json
{
   "TransitGatewayPeeringAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
      "RequesterTgwInfo": {
         "TransitGatewayId": "tgw-123abc05e04123abc",
         "OwnerId": "123456789012",
         "Region": "us-west-2"
      }
   }
}
```
For more information, see [Transit Gateway Peering Attachments](https://docs.aws.amazon.com/AmazonVPC/latest/APIReference/API_RejectTransitGatewayPeeringAttachment.html) in the *Transit Gateways Guide*.

- For API details, see [RejectTransitGatewayPeeringAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/reject-transit-gateway-attachment.html) in *AWS CLI Command Reference*.

### reject-transit-gateway-vpc-attachment

The following code example shows how to use `reject-transit-gateway-vpc-attachment`.

**AWS CLI**

#### To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```bash
aws ec2 reject-transit-gateway-vpc-attachment \   --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8fffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
```

- For API details, see [RejectTransitGatewayVpcAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/reject-transit-gateway-vpc-attachment.html) in *AWS CLI Command Reference*.

### reject-transit-gateway-vpc-attachments

The following code example shows how to use `reject-transit-gateway-vpc-attachments`.

**AWS CLI**

**To reject a transit gateway VPC attachment**

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "VpcId": "vpc-07e8fffd50fEXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "pending",
      "SubnetIds": [
         "subnet-0752213d59EXAMPLE"
      ],
      "CreationTime": "2019-07-10T17:33:46.000Z",
      "Options": {
          "DnsSupport": "enable",
          "Ipv6Support": "disable"
      }
   }
}
```
For more information, see Transit gateway attachments to a VPC in the Transit Gateways Guide.

- For API details, see RejectTransitGatewayVpcAttachments in AWS CLI Command Reference.

reject-vpc-endpoint-connections

The following code example shows how to use reject-vpc-endpoint-connections.

AWS CLI

To reject an interface endpoint connection request

This example rejects the specified endpoint connection request for the specified endpoint service.

Command:

```bash
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```json
{
   "Unsuccessful": []
}
```

- For API details, see RejectVpcEndpointConnections in AWS CLI Command Reference.

reject-vpc-peering-connection

The following code example shows how to use reject-vpc-peering-connection.

AWS CLI

To reject a VPC peering connection

This example rejects the specified VPC peering connection request.

Command:
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d

Output:

```json
{
   "Return": true
}
```

- For API details, see `RejectVpcPeeringConnection` in *AWS CLI Command Reference*.

**release-address**

The following code example shows how to use `release-address`.

**AWS CLI**

To release an Elastic IP addresses for EC2-Classic

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 release-address --public-ip 198.51.100.0
```

To release an Elastic IP address for EC2-VPC

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

- For API details, see `ReleaseAddress` in *AWS CLI Command Reference*.

**release-hosts**

The following code example shows how to use `release-hosts`.
To release a Dedicated host from your account

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

Command:

```
aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

Output:

```
{
    "Successful": [
        "h-0029d6e3cacf1b3da"
    ],
    "Unsuccessful": []
}
```

For API details, see `ReleaseHosts` in AWS CLI Command Reference.

release-ipam-pool-allocation

The following code example shows how to use release-ipam-pool-allocation.

AWS CLI

To release an IPAM pool allocation

In this example, you're an IPAM delegated admin who tried to delete an IPAM pool but received an error that you cannot delete the pool while the pool has allocations. You are using this command to release a pool allocation.

Note the following:

You can only use this command for custom allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using `modify-ipam-resource-cidr`. To complete this request, you'll need the IPAM pool ID, which you can get with `describe-ipam-pools`. You'll also need the allocation ID, which you can get with `get-ipam-pool-`
allocations. If you do not want to remove allocations one by one, you can use the --cascade option when you delete an IPAM pool to automatically release any allocations in the pool before deleting it. There are a number of prerequisites before running this command. For more information, see [Release an allocation](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/ipam-api-release-ipam-pool-allocation.html) in the *Amazon VPC IPAM User Guide*. The --region in which you run this command must be the locale of the IPAM pool where the allocation is.

The following `release-ipam-pool-allocation` example releases an IPAM pool allocation.

```bash
aws ec2 release-ipam-pool-allocation \
  --ipam-pool-id ipam-pool-07bdd12d7c94e4693 \
  --cidr 10.0.0.0/23 \
  --ipam-pool-allocation-id ipam-pool-alloc-0e66a1f730da54791b99465b79e7d1e89 \
  --region us-west-1
```

Output:

```json
{
    "Success": true
}
```

Once you release an allocation, you may want to run the `delete-ipam-pool` command.

**replace-iam-instance-profile-association**

The following code example shows how to use `replace-iam-instance-profile-association`.

**AWS CLI**

To replace an IAM instance profile for an instance

This example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named AdminRole.

```bash
aws ec2 replace-iam-instance-profile-association \
  --iam-instance-profile Name=AdminRole \
  --association-id iip-assoc-060bae234aac2e7fa
```

Output:
For API details, see ReplaceIamInstanceProfileAssociation in AWS CLI Command Reference.

**replace-network-acl-association**

The following code example shows how to use `replace-network-acl-association`.

**AWS CLI**

**To replace the network ACL associated with a subnet**

This example associates the specified network ACL with the subnet for the specified network ACL association.

**Command:**

```bash
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --network-acl-id acl-5fb85d36
```

**Output:**

```json
{
    "NewAssociationId": "aclassoc-3999875b"
}
```

For API details, see ReplaceNetworkAclAssociation in AWS CLI Command Reference.

**replace-network-acl-entry**

The following code example shows how to use `replace-network-acl-entry`.

```json
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-087711ddaf98f9489",
        "State": "associating",
        "AssociationId": "iip-assoc-0b215292fab192820",
        "IamInstanceProfile": {
            "Id": "AIPAJLNLDX3AMYZNYYAY",
            "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
        }
    }
}
```
AWS CLI

To replace a network ACL entry

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see ReplaceNetworkAclEntry in AWS CLI Command Reference.

replace-route-table-association

The following code example shows how to use replace-route-table-association.

AWS CLI

To replace the route table associated with a subnet

This example associates the specified route table with the subnet for the specified route table association.

Command:

```
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```
{
    "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see ReplaceRouteTableAssociation in AWS CLI Command Reference.

replace-route

The following code example shows how to use replace-route.
AWS CLI

To replace a route

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-block 10.0.0.0/16 --gateway-id vgw-9a4cacf3
```

- For API details, see ReplaceRoute in AWS CLI Command Reference.

replace-transit-gateway-route

The following code example shows how to use replace-transit-gateway-route.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following replace-transit-gateway-route example replaces the route in the specified transit gateway route table.

```
aws ec2 replace-transit-gateway-route
  --destination-cidr-block 10.0.2.0/24
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                "ResourceType": "vpc"
            }
        ]
    }
}
```
report-instance-status

The following code example shows how to use report-instance-status.

AWS CLI

To report status feedback for an instance

This example command reports status feedback for the specified instance.

Command:

```
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --reason-codes unresponsive
```

- For API details, see ReportInstanceStatus in AWS CLI Command Reference.

request-spot-fleet

The following code example shows how to use request-spot-fleet.

AWS CLI

To request a Spot fleet in the subnet with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.
Note that you can’t specify different subnets from the same Availability Zone in a Spot fleet request.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Output:

```json
{
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

To request a Spot fleet in the Availability Zone with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot
instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "Placement": {
                "AvailabilityZone": "us-west-2a, us-west-2b"
            },
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```
Config.json:

```json
{
   "SpotPrice": "0.04",
   "TargetCapacity": 2,
   "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
   "LaunchSpecifications": [
      {
         "ImageId": "ami-1a2b3c4d",
         "KeyName": "my-key-pair",
         "InstanceType": "m3.medium",
         "NetworkInterfaces": [
            {
               "DeviceIndex": 0,
               "SubnetId": "subnet-1a2b3c4d",
               "Groups": [ "sg-1a2b3c4d" ],
               "AssociatePublicIpAddress": true
            }
         ],
         "IamInstanceProfile": {
            "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"
         }
      }
   ]
}
```

**To request a Spot fleet using the diversified allocation strategy**

This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

**Command:**

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
   "SpotPrice": "0.70",
   "TargetCapacity": 30,
}
```
For more information, see Spot Fleet Requests in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see RequestSpotFleet in *AWS CLI Command Reference*.

**request-spot-instances**

The following code example shows how to use request-spot-instances.

**AWS CLI**

To request Spot Instances

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

Command:

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```
### Specification.json:

```json
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "SecurityGroupIds": [ "sg-1a2b3c4d" ],
    "InstanceType": "m3.medium",
    "Placement": {
        "AvailabilityZone": "us-west-2a"
    },
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

### Output:

```json
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T20:54:21.000Z",
                "Code": "pending-evaluation",
                "Message": "Your Spot request has been submitted for review, and is pending evaluation."
            },
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-df6f405d",
            "State": "open",
            "LaunchSpecification": {
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                },
                "ImageId": "ami-1a2b3c4d",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "my-security-group",
                        "GroupId": "sg-1a2b3c4d"
                    }
                ],
                "Monitoring": {
                    "Enabled": false
                }
            }
        }
    ]
}
```
This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
    "ImageId": "ami-1a2b3c4d",
    "SecurityGroupIds": [ "sg-1a2b3c4d" ],
    "InstanceType": "m3.medium",
    "SubnetId": "subnet-1a2b3c4d",
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T22:21:58.000Z",
                "StatusCode": "成功",
                "InstanceStatus": {
                    "InstanceStatusDetails": {
                        "Code": "success",
                        "Message": "请求成功"
                    }
                }
            }
        }
    ]
}
```
"Code": "pending-evaluation",
"Message": "Your Spot request has been submitted for review, and is pending evaluation."
},
"ProductDescription": "Linux/UNIX",
"SpotInstanceRequestId": "sir-df6f405d",
"State": "open",
"LaunchSpecification": {
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  }
  "ImageId": "ami-1a2b3c4d"
  "SecurityGroups": [
    {
      "GroupName": "my-security-group",
      "GroupID": "sg-1a2b3c4d"
    }
  ]
  "SubnetId": "subnet-1a2b3c4d",
  "Monitoring": {
    "Enabled": false
  },
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  },
  "InstanceType": "m3.medium",
  "Type": "one-time",
  "SpotPrice": "0.050000"
},
...
}

This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-instances --spot-price "$0.050" --instance-count 1 --type "one-time" --launch-specification file:///specification.json
```
**Specification.json:**

```json
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "InstanceType": "m3.medium",
    "NetworkInterfaces": [
        {
            "DeviceIndex": 0,
            "SubnetId": "subnet-1a2b3c4d",
            "Groups": [ "sg-1a2b3c4d" ],
            "AssociatePublicIpAddress": true
        }
    ],
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

- For API details, see [RequestSpotInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/request-spot-instances.html) in *AWS CLI Command Reference*.

**reset-address-attribute**

The following code example shows how to use `reset-address-attribute`.

**AWS CLI**

**To reset the domain name attribute associated with an elastic IP address**

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

**Linux:**

```bash
aws ec2 reset-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --attribute domain-name
```

**Windows:**

```bash
aws ec2 reset-address-attribute ^
    --allocation-id eipalloc-abcdef01234567890 ^
```
Output:

```
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-abcd01234567890",
      "PtrRecord": "example.com."
      "PtrRecordUpdate": {
        "Value": "example.net.",
        "Status": "PENDING"
      }
    }
  ]
}
```

To monitor the pending change, see `describe-addresses-attribute` in the AWS CLI Command Reference.

- For API details, see `ResetAddressAttribute` in AWS CLI Command Reference.

**reset-ebs-default-kms-key-id**

The following code example shows how to use `reset-ebs-default-kms-key-id`.

**AWS CLI**

**To reset your default CMK for EBS encryption**

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```
{
  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE"
}
```
- For API details, see `ResetEbsDefaultKmsKeyId` in *AWS CLI Command Reference*.

**reset-fpga-image-attribute**

The following code example shows how to use `reset-fpga-image-attribute`.

**AWS CLI**

To reset the attributes of an Amazon FPGA image

This example resets the load permissions for the specified AFI.

Command:

```bash
aws ec2 reset-fpga-image-attribute --fpga-image-id ami-0d123e123bfc85abc --attribute loadPermission
```

Output:

```json
{
  "Return": true
}
```

- For API details, see `ResetFpgaImageAttribute` in *AWS CLI Command Reference*.

**reset-image-attribute**

The following code example shows how to use `reset-image-attribute`.

**AWS CLI**

To reset the launchPermission attribute

This example resets the launchPermission attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

- For API details, see `ResetImageAttribute` in *AWS CLI Command Reference*. 
reset-instance-attribute

The following code example shows how to use reset-instance-attribute.

AWS CLI

To reset the sourceDestCheck attribute

This example resets the sourceDestCheck attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute sourceDestCheck
```

To reset the kernel attribute

This example resets the kernel attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute kernel
```

To reset the ramdisk attribute

This example resets the ramdisk attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute ramdisk
```

- For API details, see ResetInstanceAttribute in AWS CLI Command Reference.

reset-network-interface-attribute

The following code example shows how to use reset-network-interface-attribute.
AWS CLI

To reset a network interface attribute

The following `reset-network-interface-attribute` example resets the value of the source/destination checking attribute to true.

```bash
aws ec2 reset-network-interface-attribute
    --network-interface-id eni-686ea200
    --source-dest-check
```

This command produces no output.

- For API details, see `ResetNetworkInterfaceAttribute` in AWS CLI Command Reference.

reset-snapshot-attribute

The following code example shows how to use `reset-snapshot-attribute`.

AWS CLI

To reset a snapshot attribute

This example resets the create volume permissions for snapshot snap-1234567890abcdef0. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --attribute createVolumePermission
```

- For API details, see `ResetSnapshotAttribute` in AWS CLI Command Reference.

restore-address-to-classic

The following code example shows how to use `restore-address-to-classic`.

AWS CLI

To restore an address to EC2-Classic
This example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

Command:

```
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```
{
    "Status": "MoveInProgress",
    "PublicIp": "198.51.100.0"
}
```

- For API details, see [RestoreAddressToClassic](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-address-to-classic.html) in *AWS CLI Command Reference*.

**restore-image-from-recycle-bin**

The following code example shows how to use `restore-image-from-recycle-bin`.

**AWS CLI**

To restore an image from the Recycle Bin

The following `restore-image-from-recycle-bin` example restores AMI ami-0111222333444abcd from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin \
    --image-id ami-0111222333444abcd
```

Output:

```
{
    "Return": true
}
```

For more information, see [Recover AMIs from the Recycle Bin](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/ebs-migration.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RestoreImageFromRecycleBin](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-image-from-recycle-bin.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

2607
**restore-managed-prefix-list-version**

The following code example shows how to use `restore-managed-prefix-list-version`.

**AWS CLI**

```
us-west-2**To restore a prefix list version**

The following `restore-managed-prefix-list-version` restores the entries from version 1 of the specified prefix list.

```
aws ec2 restore-managed-prefix-list-version \
   --prefix-list-id pl-0123456abcabcabc1 \
   --current-version 2 \
   --previous-version 1
```

Output:

```
{
   "PrefixList": {
      "PrefixListId": "pl-0123456abcabcabc1",
      "AddressFamily": "IPv4",
      "State": "restore-in-progress",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
      "Version": 2,
      "OwnerId": "123456789012"
   }
}
```

For more information, see [Managed prefix lists](http://aws.amazon.com) in the [Amazon VPC User Guide](http://aws.amazon.com).

- For API details, see [RestoreManagedPrefixListVersion](http://aws.amazon.com) in [AWS CLI Command Reference](http://aws.amazon.com).

**restore-snapshot-from-recycle-bin**

The following code example shows how to use `restore-snapshot-from-recycle-bin`.

**AWS CLI**

**To restore snapshots from the Recycle Bin**
The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```
aws ec2 restore-snapshot-from-recycle-bin \
   --snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.

- For API details, see RestoreSnapshotFromRecycleBin in AWS CLI Command Reference.

### `restore-snapshot-tier`

The following code example shows how to use `restore-snapshot-tier`.

#### AWS CLI

**Example 1: To permanently restore an archived snapshot**

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```
aws ec2 restore-snapshot-tier \
   --snapshot-id snap-01234567890abcedf \
   --permanent-restore
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.
Example 2: To temporarily restore an archived snapshot

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 5
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 5,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the *Amazon EC2 User Guide*.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 10
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 10,
    "IsPermanentRestore": false
}
```
For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**Example 4: To modify the restore type**

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```bash
code
aws ec2 restore-snapshot-tier
   --snapshot-id snap-01234567890abcedf
   --permanent-restore
```

Output:

```json
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

- For API details, see [RestoreSnapshotTier](AWSEC2 Command Reference) in AWS CLI Command Reference.

**revoke-client-vpn-ingress**

The following code example shows how to use `revoke-client-vpn-ingress`.

**AWS CLI**

**To revoke an authorization rule for a Client VPN endpoint**

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (0.0.0.0/0) for all groups.

```bash
code
aws ec2 revoke-client-vpn-ingress
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
   --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

Output:
For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

- For API details, see RevokeClientVpnIngress in AWS CLI Command Reference.

**revoke-security-group-egress**

The following code example shows how to use `revoke-security-group-egress`.

### AWS CLI

**Example 1: To remove the rule that allows outbound traffic to a specific address range**

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions [{IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]
```

This command produces no output.

For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove the rule that allows outbound traffic to a specific security group**

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions '[["IpProtocol": "tcp", "FromPort": 443, "ToPort": 443,"UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]]]
```

This command produces no output.
For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupEgress in AWS CLI Command Reference.

**revoke-security-group-ingress**

The following code example shows how to use `revoke-security-group-ingress`.

**AWS CLI**

**Example 1: To remove a rule from a security group**

The following `revoke-security-group-ingress` example removes TCP port 22 access for the 203.0.113.0/24 address range from the specified security group for a default VPC.

```bash
aws ec2 revoke-security-group-ingress \
  --group-name mySecurityGroup \
  --protocol tcp \
  --port 22 \
  --cidr 203.0.113.0/24
```

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove a rule using the IP permissions set**

The following `revoke-security-group-ingress` example uses the `ip-permissions` parameter to remove an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4).

```bash
aws ec2 revoke-security-group-ingress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]
```

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupIngress in AWS CLI Command Reference.
**run-instances**

The following code example shows how to use `run-instances`.

**AWS CLI**

**Example 1: To launch an instance into a default subnet**

The following `run-instances` example launches a single instance of type `t2.micro` into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```bash
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --key-name MyKeyPair
```

Output:

```json
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",
            "InstanceId": "i-1231231230abcdef0",
            "InstanceType": "t2.micro",
            "KeyName": "MyKeyPair",
            "LaunchTime": "2018-05-10T08:05:20.000Z",
            "Monitoring": {
                "State": "disabled"
            },
            "Placement": {
                "AvailabilityZone": "us-east-2a",
                "GroupName": "",
                "Tenancy": "default"
            },
            "PrivateDnsName": "ip-10-0-0-157.us-east-2.compute.internal",
            "PrivateIpAddress": "10.0.0.157",
            "ProductCodes": [],
            "PublicDnsName": "",
            "State": {
                "Code": 0,
```
"Name": "pending",
"StateTransitionReason": "",
"SubnetId": "subnet-04a636d18e83cfacb",
"VpcId": "vpc-1234567890abcdef0",

"OwnerId": "123456789012",
"PrivateDnsName": "ip-10-0-0-157.us-east-2.compute.internal",
"PrivateIpAddress": "10.0.0.157",
"PrivateIpAddresses": [
{
   "Primary": true,
   "PrivateDnsName": "ip-10-0-0-157.us-east-2.compute.internal",
   "PrivateIpAddress": "10.0.0.157"
}
],
"SourceDestCheck": true,
"Status": "in-use",
"SubnetId": "subnet-04a636d18e83cfacb",
"VpcId": "vpc-1234567890abcdef0"
Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```
aws ec2 run-instances
```
For an example of the output for `run-instances`, see Example 1.

**Example 3: To launch an instance with additional volumes**

The following `run-instances` example uses a block device mapping, specified in `mapping.json`, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --subnet-id subnet-08fc749671b2d077c \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --key-name MyKeyPair \
    --block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```
[
    {
        "DeviceName": "/dev/sdh",
        "Ebs": {
            "VolumeSize": 100
        }
    }
]
```

Contents of `mapping.json`. This example adds `ephemeral1` as an instance store volume.

```
[
    {
        "DeviceName": "/dev/sdc",
        "VirtualName": "ephemeral1"
    }
]
```
For an example of the output for `run-instances`, see Example 1.

For more information about block device mappings, see [Block device mapping](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/BlockDeviceMapping.html) in the *Amazon EC2 User Guide*.

**Example 4: To launch an instance and add tags on creation**

The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --count 1 \n  --subnet-id subnet-08fc749671b2d077c \
  --key-name MyKeyPair \
  --security-group-ids sg-0b0384b66d7d692f9 \
  --tag-specifications
    'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
    'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

For an example of the output for `run-instances`, see Example 1.

**Example 5: To launch an instance with user data**

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --count 1 \
  --subnet-id subnet-08fc749671b2d077c \
  --key-name MyKeyPair \
  --security-group-ids sg-0b0384b66d7d692f9 \
  --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.
For more information about instance user data, see [Working with instance user data](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/WorkingWithInstanceUserData.html) in the *Amazon EC2 User Guide*.

**Example 6: To launch a burstable performance instance**

The following `run-instances` example launches a t2.micro instance with the unlimited credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the standard credit option. When you launch a T3 instance, the default is the unlimited credit option.

```bash
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --count 1 \
  --subnet-id subnet-08fc749671b2d077c \
  --key-name MyKeyPair \
  --security-group-ids sg-0b0384b66d7d692f9 \
  --credit-specification CpuCredits=unlimited
```

For an example of the output for `run-instances`, see Example 1.

For more information about burstable performance instances, see [Burstable performance instances](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/BurstablePerformance.html) in the *Amazon EC2 User Guide*.

- For API details, see [RunInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/run-instances.html) in *AWS CLI Command Reference*.

---

**run-scheduled-instances**

The following code example shows how to use `run-scheduled-instances`.

**AWS CLI**

**To launch a Scheduled Instance**

This example launches the specified Scheduled Instance in a VPC.

**Command:**

```bash
aws ec2 run-scheduled-instances --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification file://launch-specification.json
```
Launch-specification.json:

```json
{
   "ImageId": "ami-12345678",
   "KeyName": "my-key-pair",
   "InstanceType": "c4.large",
   "NetworkInterfaces": [
      {
         "DeviceIndex": 0,
         "SubnetId": "subnet-12345678",
         "AssociatePublicIpAddress": true,
         "Groups": ["sg-12345678"]
      }
   ],
   "IamInstanceProfile": {
      "Name": "my-iam-role"
   }
}
```

Output:

```json
{
   "InstanceIdSet": ["i-1234567890abcdef0"
}
```

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification file://launch-specification.json
```

Launch-specification.json:

```json
{
   "ImageId": "ami-12345678",
   "KeyName": "my-key-pair",
   "SecurityGroupIds": ["sg-12345678"]
}
```
"InstanceType": "c4.large",
"Placement": {
    "AvailabilityZone": "us-west-2b"
},
"IamInstanceProfile": {
    "Name": "my-iam-role"
}
}

Output:

{
    "InstanceIdSet": [
        "i-1234567890abcdef0"
    ]
}

- For API details, see RunScheduledInstances in AWS CLI Command Reference.

**search-local-gateway-routes**

The following code example shows how to use search-local-gateway-routes.

**AWS CLI**

**To search for routes in a local gateway route table**

The following search-local-gateway-routes example searches for static routes in the specified local gateway route table.

```bash
code
aws ec2 search-local-gateway-routes \\
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \\
    --filters "Name=type,Values=static"
```

Output:

```bash
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
```
"State": "deleted",
"LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
}  

- For API details, see `SearchLocalGatewayRoutes` in *AWS CLI Command Reference*.

**search-transit-gateway-multicast-groups**

The following code example shows how to use `search-transit-gateway-multicast-groups`.

**AWS CLI**

To search one or more transit gateway multicast groups and return the group membership information

The following `search-transit-gateway-multicast-groups` example returns the group membership of the specified multicast group.

```bash
aws ec2 search-transit-gateway-multicast-groups \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```json
{
  "MulticastGroups": [
    {
      "GroupIpAddress": "224.0.1.0",
      "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
      "SubnetId": "subnet-0187aff814EXAMPLE",
      "ResourceId": "vpc-0065aced4EXAMPLE",
      "ResourceType": "vpc",
      "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
      "GroupMember": false,
      "GroupSource": true,
      "SourceType": "static"
    }
  ]
}
```

For more information, see `Managing multicast groups` in the *Transit Gateways Guide*. 
search-transit-gateway-routes

The following code example shows how to use search-transit-gateway-routes.

**AWS CLI**

To search for routes in the specified transit gateway route table

The following search-transit-gateway-routes example returns all the routes that are of type static in the specified route table.

```bash
aws ec2 search-transit-gateway-routes \
   --transit-gateway-route-table-id tgw-rtb-0a823edbdedEXAMPLE \n   --filters "Name=type,Values=static"
```

Output:

```
{
   "Routes": [
   {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceType": "vpc"
         }
      ],
      "Type": "static",
      "State": "active"
   },
   {
      "DestinationCidrBlock": "10.1.0.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceType": "vpc"
         }
      ]
   }
]
```
For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/eks/latest/userguide/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

- For API details, see [SearchTransitGatewayRoutes](https://docs.aws.amazon.com/cli/latest/reference/ec2/search-transit-gateway-routes.html) in *AWS CLI Command Reference*.

### send-diagnostic-interrupt

The following code example shows how to use send-diagnostic-interrupt.

**AWS CLI**

*To send a diagnostic interrupt*

The following send-diagnostic-interrupt example sends a diagnostic interrupt to the specified instance.

```bash
aws ec2 send-diagnostic-interrupt \
--instance-id i-1234567890abcdef0
```

This command produces no output.

- For API details, see [SendDiagnosticInterrupt](https://docs.aws.amazon.com/cli/latest/reference/ec2/send-diagnostic-interrupt.html) in *AWS CLI Command Reference*.

### start-instances

The following code example shows how to use start-instances.

**AWS CLI**

*To start an Amazon EC2 instance*

This example starts the specified Amazon EBS-backed instance.

Command:

```bash
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```
Output:

```
{
   "StartingInstances": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "CurrentState": {
            "Code": 0,
            "Name": "pending"
         },
         "PreviousState": {
            "Code": 80,
            "Name": "stopped"
         }
      }
   ]
}
```

For more information, see Stop and Start Your Instance in the Amazon Elastic Compute Cloud User Guide.

- For API details, see StartInstances in AWS CLI Command Reference.

**start-network-insights-access-scope-analysis**

The following code example shows how to use start-network-insights-access-scope-analysis.

**AWS CLI**

To start a Network Insights access scope analysis

The following start-network-insights-access-scope-analysis example starts the scope analysis in your AWS account.

```
aws ec2 start-network-insights-access-scope-analysis
   --region us-east-1
   --network-insights-access-scope-id nis-123456789111
```

Output:

```
{
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see StartNetworkInsightsAccessScopeAnalysis in AWS CLI Command Reference.

**start-network-insights-analysis**

The following code example shows how to use start-network-insights-analysis.

**AWS CLI**

To analyze a path

The following start-network-insights-analysis example analyzes the path between the source and destination. To view the results of the path analysis, use the describe-network-insights-analyses command.

```
aws ec2 start-network-insights-analysis \\
  --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
  "NetworkInsightsAnalysis": {
    "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
    "StartDate": "2021-01-20T22:58:37.495Z",
    "Status": "running"
  }
}
```
For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see StartNetworkInsightsAnalysis in AWS CLI Command Reference.

**start-vpc-endpoint-service-private-dns-verification**

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

**AWS CLI**

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```
aws ec2 start-vpc-endpoint-service-private-dns-verification \
--service-id vpce-svc-071aff70666e61e0
```

This command produces no output.

For more information, see Manage DNS names in the AWS PrivateLink User Guide.

- For API details, see StartVpcEndpointServicePrivateDnsVerification in AWS CLI Command Reference.

**stop-instances**

The following code example shows how to use `stop-instances`.

**AWS CLI**

Example 1: To stop an Amazon EC2 instance

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```
aws ec2 stop-instances \
--instance-ids i-1234567890abcdef0
```
Output:

```json
{
    "StoppingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see [Stop and Start Your Instance](#) in the *Amazon Elastic Compute Cloud User Guide*.

**Example 2: To hibernate an Amazon EC2 instance**

The following `stop-instances` example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```bash
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0 \
    --hibernate
```

Output:

```json
{
    "StoppingInstances": [
        {
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "InstanceId": "i-1234567890abcdef0",
            "PreviousState": {
```

For more information, see [Hibernate your On-Demand Linux instance](https://docs.aws.amazon.com/elastic-cloud-compute/latest/userguide/redirect-ondemand-hibernate.html) in the *Amazon Elastic Cloud Compute User Guide*.

- For API details, see [StopInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/stop-instances.html) in *AWS CLI Command Reference*.

### terminate-client-vpn-connections

The following code example shows how to use `terminate-client-vpn-connections`.

**AWS CLI**

**To terminate a connection to a Client VPN endpoint**

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```
aws ec2 terminate-client-vpn-connections \
   --client-vpn-endpoint-id vpn-endpoint-123456789123abcde \
   --connection-id cvpn-connection-04edd76f5201e0cb8
```

**Output:**

```
{
   "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
   "ConnectionStatuses": [
      {
         "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
         "PreviousStatus": {
            "Code": "active"
         },
         "CurrentStatus": {
            "Code": "terminating"
         }
      }
   ]
}
```
For more information, see Client Connections in the AWS Client VPN Administrator Guide.

- For API details, see TerminateClientVpnConnections in AWS CLI Command Reference.

**terminate-instances**

The following code example shows how to use `terminate-instances`.

### AWS CLI

**To terminate an Amazon EC2 instance**

This example terminates the specified instance.

**Command:**

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

**Output:**

```json
{
    "TerminatingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 32,
                "Name": "shutting-down"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Using Amazon EC2 Instances in the AWS Command Line Interface User Guide.

- For API details, see Terminatelnstances in AWS CLI Command Reference.
**unassign-ipv6-addresses**

The following code example shows how to use `unassign-ipv6-addresses`.

**AWS CLI**

**To unassign an IPv6 address from a network interface**

This example unassigns the specified IPv6 address from the specified network interface.

Command:

```bash
aws ec2 unassign-ipv6-addresses --ipv6-addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

Output:

```json
{
    "NetworkInterfaceId": "eni-23c49b68",
    "UnassignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071"
    ]
}
```

- For API details, see [UnassignIpv6Addresses](#) in *AWS CLI Command Reference*.

**unassign-private-ip-addresses**

The following code example shows how to use `unassign-private-ip-addresses`.

**AWS CLI**

**To unassign a secondary private IP address from a network interface**

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```
For API details, see `UnassignPrivateIpAddresses` in *AWS CLI Command Reference*.

**unassign-private-nat-gateway-address**

The following code example shows how to use `unassign-private-nat-gateway-address`.

**AWS CLI**

*To unassign a private IP address from your private NAT gateway*

The following `unassign-private-nat-gateway-address` example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --private-ip-addresses 10.0.20.197
```

Output:

```
{
    "NatGatewayId": "nat-0ee3edd182361f662",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
            "Status": "unassigning"
        }
    ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/nat_gateways.html) in the *Amazon VPC User Guide*.

For API details, see `UnassignPrivateNatGatewayAddress` in *AWS CLI Command Reference*.

**unlock-snapshot**

The following code example shows how to use `unlock-snapshot`.

**AWS CLI**

*To unlock a snapshot*
The following unlock-snapshot example unlocks the specified snapshot.

```
aws ec2 unlock-snapshot \
  --snapshot-id snap-0b5e733b4a8df6e0d
```

Output:

```
{
  "SnapshotId": "snap-0b5e733b4a8df6e0d"
}
```

For more information, see [Snapshot lock](https://docs.aws.amazon.com/EBS/latest/UserGuide/snapshot-lock.html) in the *Amazon EBS User Guide*.

- For API details, see [UnlockSnapshot](https://docs.aws.amazon.com/cli/latest/reference/ec2/unlock-snapshot.html) in *AWS CLI Command Reference*.

### unlock-snapshot

The following example unlocks the specified snapshot.

### unmonitor-instances

The following code example shows how to use `unmonitor-instances`.

#### AWS CLI

**To disable detailed monitoring for an instance**

This example command disables detailed monitoring for the specified instance.

Command:

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceMonitorings": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "Monitoring": {
        "State": "disabling"
      }
    }
  ]
}
```
For API details, see UnmonitorInstances in AWS CLI Command Reference.

update-security-group-rule-descriptions-egress

The following code example shows how to use update-security-group-rule-descriptions-egress.

AWS CLI

To update the description of an outbound security group rule

The following update-security-group-rule-descriptions-egress example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-egress \
  --group-id sg-02f0d35a850ba727f \
  --ip-permissions IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[[CidrIp=203.0.113.0/24,Description="Outbound HTTP access to server 2"]]
```

Output:

```
{
  "Return": true
}
```

For more information, see Security group rules in the Amazon EC2 User Guide.

For API details, see UpdateSecurityGroupRuleDescriptionsEgress in AWS CLI Command Reference.

update-security-group-rule-descriptions-ingress

The following code example shows how to use update-security-group-rule-descriptions-ingress.

AWS CLI

Example 1: To update the description of an inbound security group rule with a CIDR source
The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
   --group-id sg-02f0d35a850ba727f \
   --ip-permissions
   IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{{CidrIp=203.0.113.0/16,Description="SSH access from corpnet"}}]
```

Output:

```
{
   "Return": true
}
```

For more information, see Security group rules in the Amazon EC2 User Guide.

Example 2: To update the description of an inbound security group rule with a prefix list source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
   --group-id sg-02f0d35a850ba727f \
   --ip-permissions
   IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{{PrefixListId=pl-12345678,Description="SSH access from corpnet"}}]
```

Output:

```
{
   "Return": true
}
```

For more information, see Security group rules in the Amazon EC2 User Guide.

- For API details, see UpdateSecurityGroupRuleDescriptionsIngress in AWS CLI Command Reference.
**withdraw-byoip-cidr**

The following code example shows how to use `withdraw-byoip-cidr`.

**AWS CLI**

**To stop advertising an address range**

The following `withdraw-byoip-cidr` example stops advertising the specified address range.

```
aws ec2 withdraw-byoip-cidr
   --cidr 203.0.113.25/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "advertised"
   }
}
```

- For API details, see [WithdrawByoipCidr](#) in *AWS CLI Command Reference*.

**Amazon EC2 Instance Connect examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
**Actions**

**send-ssh-public-key**

The following code example shows how to use `send-ssh-public-key`.

**AWS CLI**

To send a SSH public key to an instance

The following `send-ssh-public-key` example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```bash
aws ec2-instance-connect send-ssh-public-key
   --instance-id i-1234567890abcdef0
   --instance-os-user ec2-user
   --availability-zone us-east-2b
   --ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

- For API details, see [SendSshPublicKey](https://awscli.amazonaws.com/v2/documentation/api/index.html) in *AWS CLI Command Reference*.

**Amazon ECR examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

**batch-check-layer-availability**

The following code example shows how to use `batch-check-layer-availability`.

**AWS CLI**

**To check the availability of a layer**

The following `batch-check-layer-availability` example checks the availability of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```bash
aws ecr batch-check-layer-availability \
  --repository-name cluster-autoscaler \
  --layer-digests sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
  "layers": [
    {
      "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
      "layerAvailability": "AVAILABLE",
      "layerSize": 2777,
      "mediaType": "application/vnd.docker.container.image.v1+json"
    }
  ],
  "failures": []
}
```

- For API details, see [BatchCheckLayerAvailability](https://docs.aws.amazon.com/cli/latest/reference/ecr/batch-check-layer-availability.html) in [AWS CLI Command Reference](https).

**batch-delete-image**

The following code example shows how to use `batch-delete-image`.
Example 1: To delete an image

The following `batch-delete-image` example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
   --repository-name ubuntu \
   --image-ids imageTag=precise
```

Output:

```
{
   "failures": [],
   "imageIds": [
      {
         "imageTag": "precise",
         "imageDigest": "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
      }
   ]
}
```

Example 2: To delete multiple images

The following `batch-delete-image` example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
   --repository-name MyRepository \
   --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
   "imageIds": [
      {
         "imageDigest": "sha256:123456789012",
         "imageTag": "prod"
      },
      {
```
For more information, see Deleting an Image in the Amazon ECR User Guide.

- For API details, see BatchDeleteImage in AWS CLI Command Reference.

**batch-get-image**

The following code example shows how to use batch-get-image.

**AWS CLI**

**Example 1: To get an image**

The following batch-get-image example gets an image with the tag v1.13.6 in a repository called cluster-autoscaler in the default registry for an account.

```
aws ecr batch-get-image \
   --repository-name cluster-autoscaler \
   --image-ids imageTag=v1.13.6
```

Output:

```
{
   "images": [
      {
         "registryId": "012345678910",
         "repositoryName": "cluster-autoscaler",
         "imageId": {
            "imageDigest": "sha256:4a1c6567c38904384e64e35b7eedd8451110c299e3368d2210066487d97e5",
            "imageTag": "v1.13.6"
         },
         "imageManifest": "{\n            \"schemaVersion\": 2,\n            \"mediaType\": "application/vnd.docker.distribution.manifest.v2+json\n          },\n          \"config\": {\n            \"mediaType\": "application/vnd.docker.container.image.v1+json\n          },\n          \"size\": 2777,\n          \"digest\n```
Example 2: To get multiple images

The following batch-get-image example displays details of all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-get-image \
  --repository-name MyRepository \
  --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
  "images": [
    {
      "registryId": "123456789012",
      "repositoryName": "MyRepository",
      "imageId": {
        "imageDigest": "sha256:123456789012",
        "imageTag": "prod"
      },
      "imageManifest": "manifestExample1"
    }
  ]
}
```
For more information, see [Images](https://docs.aws.amazon.com/AmazonECR/latest/userguide/images.html) in the *Amazon ECR User Guide*.

- For API details, see [BatchGetImage](https://docs.aws.amazon.com/cli/latest/reference/ecr/batch-get-image.html) in *AWS CLI Command Reference*.

### complete-layer-upload

The following code example shows how to use `complete-layer-upload`.

**AWS CLI**

To complete an image layer upload

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```bash
aws ecr complete-layer-upload \
  --repository-name layer-test \
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
  --layer-digests 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9:48074e6d3a68b39aad8ccc002cdddd912a418c0f92b3729323e
```

Output:

```json
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "layerDigest": "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",
    "repositoryName": "layer-test",
    "registryId": "130757420319"
}
```
create-repository

The following code example shows how to use create-repository.

AWS CLI

**Example 1: To create a repository**

The following create-repository example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \\
   --repository-name project-a/nginx-web-app
```

Output:

```
{
   "repository": {
      "registryId": "123456789012",
      "repositoryName": "sample-repo",
      "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/nginx-web-app"
   }
}
```

For more information, see [Creating a Repository](https://docs.aws.amazon.com/AmazonECR/latest/userguide/creating-repository.html) in the *Amazon ECR User Guide*.

**Example 2: To create a repository configured with image tag immutability**

The following create-repository example creates a repository configured for tag immutability in the default registry for an account.

```
aws ecr create-repository \\
   --repository-name sample-repo \\
   --image-tag-mutability IMMUTABLE
```

Output:

```
Example 3: To create a repository configured with a scanning configuration

The following create-repository example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```
aws ecr create-repository \
  --repository-name sample-repo \
  --image-scanning-configuration scanOnPush=true
```

Output:

```
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
    "imageScanningConfiguration": {
      "scanOnPush": true
    }
  }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.
AWS CLI

To delete the lifecycle policy for a repository

The following delete-lifecycle-policy example deletes the lifecycle policy for the hello-world repository.

```
aws ecr delete-lifecycle-policy \
  --repository-name hello-world
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "hello-world",
  "lifecyclePolicyText": "{"rules": [{"rulePriority":1,"description":"Remove untagged images.","selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":10},"action":{"type":"expire"}]}],
  "lastEvaluatedAt": 0.0
}
```

- For API details, see [DeleteLifecyclePolicy](https://docs.aws.amazon.com/cli/latest/reference/ecr/delete-lifecycle-policy.html) in [AWS CLI Command Reference](https).

### delete-repository-policy

The following code example shows how to use delete-repository-policy.

AWS CLI

To delete the repository policy for a repository

The following delete-repository-policy example deletes the repository policy for the cluster-autoscaler repository.

```
aws ecr delete-repository-policy \
  --repository-name cluster-autoscaler
```

Output:

```
{
  "registryId": "012345678910",
```
"repositoryName": "cluster-autoscaler",
"policyText": "{
  "Version" : "2008-10-17",
  "Statement" : [{
    "Sid" : "allow public pull",
    "Effect" : "Allow",
    "Principal" : "*",
    "Action" : [ "ecr:BatchCheckLayerAvailability", "ecr:BatchGetImage",
                    "ecr:GetDownloadUrlForLayer"]
  }]
}
}

- For API details, see [DeleteRepositoryPolicy](#) in *AWS CLI Command Reference*.

**delete-repository**

The following code example shows how to use `delete-repository`.

**AWS CLI**

To delete a repository

The following `delete-repository` example command force deletes the specified repository in the default registry for an account. The `--force` flag is required if the repository contains images.

```bash
aws ecr delete-repository \
  --repository-name ubuntu \
  --force
```

Output:

```json
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "ubuntu",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
  }
}
```

For more information, see [Deleting a Repository](#) in the *Amazon ECR User Guide*.

- For API details, see [DeleteRepository](#) in *AWS CLI Command Reference*.

**describe-image-scan-findings**

The following code example shows how to use `describe-image-scan-findings`.

Actions and scenarios
AWS CLI

To describe the scan findings for an image

The following describe-image-scan-findings example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```
aws ecr describe-image-scan-findings \
    --repository-name sample-repo \
    --image-id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```json
{
    "imageScanFindings": {
        "findings": [
            {
                "name": "CVE-2019-5188",
                "description": "A code execution vulnerability exists in the directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4 directory can cause an out-of-bounds write on the stack, resulting in code execution. An attacker can corrupt a partition to trigger this vulnerability.",
                "severity": "MEDIUM",
                "attributes": [
                    {
                        "key": "package_version",
                        "value": "1.44.1-1ubuntu1.1"
                    },
                    {
                        "key": "package_name",
                        "value": "e2fsprogs"
                    },
                    {
                        "key": "CVSS2_VECTOR",
                        "value": "AV:L/AC:L/Au:N/C:P/I:P/A:P"
                    },
                    {
                        "key": "CVSS2_SCORE",
                        "value": "4.6"
                    }
                ]
            }
        ]
    }
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see DescribefImageScanFindings in AWS CLI Command Reference.

**describe-images**

The following code example shows how to use describe-images.

**AWS CLI**

**To describe an image in a repository**

The following describe-images example displays details about an image in the cluster-autoscaler repository with the tag v1.13.6.

```
aws ecr describe-images \
   --repository-name cluster-autoscaler \
   --image-ids imageTag=v1.13.6
```

Output:

```
{
```
For API details, see DescribeImages in AWS CLI Command Reference.

**describe-repositories**

The following code example shows how to use describe-repositories.

### AWS CLI

**To describe the repositories in a registry**

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
    "repositories": [
    {
        "registryId": "012345678910",
        "repositoryName": "ubuntu",
        "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
    },
    {
        "registryId": "012345678910",
        "repositoryName": "test",
```
For API details, see `DescribeRepositories` in *AWS CLI Command Reference*.

**get-authorization-token**

The following code example shows how to use `get-authorization-token`.

**AWS CLI**

**To get an authorization token for your default registry**

The following `get-authorization-token` example command gets an authorization token for your default registry.

```
aws ecr get-authorization-token
```

Output:

```
{
   "authorizationData": [
   {
   "authorizationToken": "QVdTOkN...",
   "expiresAt": 1448875853.241,
   "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
   }
   ]
}
```

For API details, see `GetAuthorizationToken` in *AWS CLI Command Reference*.

**get-download-url-for-layer**

The following code example shows how to use `get-download-url-for-layer`.

**AWS CLI**

**To get the download URL of a layer**
The following `get-download-url-for-layer` example displays the download URL of a layer with the digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
  --repository-name cluster-autoscaler \
  --layer-digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
  "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

**get-lifecycle-policy-preview**

The following code example shows how to use `get-lifecycle-policy-preview`.

**AWS CLI**

To retrieve details for a lifecycle policy preview

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```
aws ecr get-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample"
```

Actions and scenarios
get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To retrieve a lifecycle policy

The following get-lifecycle-policy example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```bash
aws ecr get-lifecycle-policy \
   --repository-name "project-a/amazon-ecs-sample"
```

Output:

```json
{
   "registryId": "123456789012",
   "repositoryName": "project-a/amazon-ecs-sample",
   "lifecyclePolicyText": "{"rules": [{
   "rulePriority": 1,
   "description": "Expire images older than 14 days",
   "selection": {
      "tagStatus": "untagged",
      "countType": "sinceImagePushed",
      "countUnit": "days",
      "countNumber": 14
   },
   "action": {
      "type": "expire"
   }
}]
}
",
"status": "COMPLETE",
"previewResults": [],
"summary": {
   "expiringImageTotalCount": 0
}
}
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicyPreview in AWS CLI Command Reference.

```bash
get-lifecycle-policy
```

The following code example shows how to use get-lifecycle-policy.
"lifecyclePolicyText": "{"rules":[{"rulePriority":1,"description":"Expire images older than 14 days","selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":14},"action":{"type":"expire"}}]}",
"lastEvaluatedAt": 1504295007.0
}

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-login-password

The following code example shows how to use get-login-password.

AWS CLI

To retrieve a password to authenticate to a registry

The following get-login-password displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

aws ecr get-login-password

Output:

<password>

To use with the Docker CLI, pipe the output of the get-login-password command to the docker login command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

aws ecr get-login-password \
  --region <region> \
  | docker login \
  --username AWS \
  --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com

For more information, see Registry Authentication in the Amazon ECR User Guide.
get-login

The following code example shows how to use get-login.

AWS CLI

To retrieve a Docker login command to your default registry

This example prints a command that you can use to log in to your default Amazon ECR registry.

Command:

```bash
aws ecr get-login
```

Output:

```bash
docker login -u AWS -p <password> -e none https://
<aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

Command:

```bash
aws ecr get-login --registry-ids 012345678910 023456789012
```

Output:

```bash
docker login -u <username> -p <token-1> -e none <endpoint-1>
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

get-repository-policy

The following code example shows how to use get-repository-policy.

• For API details, see GetLogin in AWS CLI Command Reference.
To retrieve the repository policy for a repository

The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```
aws ecr get-repository-policy \
  --repository-name cluster-autoscaler
```

Output:
```
{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
}
```

- For API details, see `GetRepositoryPolicy` in AWS CLI Command Reference.

initiate-layer-upload

The following code example shows how to use `initiate-layer-upload`.

AWS CLI

To initiate an image layer upload

The following `initiate-layer-upload` example initiates an image layer upload to the `layer-test` repository.

```
aws ecr initiate-layer-upload \
  --repository-name layer-test
```

Output:
```
{
  "partSize": 10485760,
}
For API details, see [InitiateLayerUpload](#) in **AWS CLI Command Reference**.

**list-images**

The following code example shows how to use list-images.

**AWS CLI**

**To list the images in a repository**

The following list-images example displays a list of the images in the `cluster-autoscaler` repository.

```bash
aws ecr list-images \
  --repository-name cluster-autoscaler
```

**Output:**

```json
{
    "imageIds": [
      {
        "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
        "imageTag": "v1.13.8"
      },
      {
        "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
        "imageTag": "v1.13.7"
      },
      {
        "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
        "imageTag": "v1.13.6"
      }
    ]
}
```

For API details, see [ListImages](#) in **AWS CLI Command Reference**.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for repository

The following list-tags-for-resource example displays a list of the tags associated with the hello-world repository.

```
aws ecr list-tags-for-resource \
```

Output:

```
{
    "tags": [
    
    {
       "Key": "Stage",
       "Value": "Integ"
    }
    
    ]
}
```

• For API details, see ListTagsForResource in AWS CLI Command Reference.

put-image-scanning-configuration

The following code example shows how to use put-image-scanning-configuration.

AWS CLI

To update the image scanning configuration for a repository

The following put-image-scanning-configuration example updates the image scanning configuration for the specified repository.

```
aws ecr put-image-scanning-configuration \
  --repository-name sample-repo \
```
--image-scanning-configuration scanOnPush=true

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageScanningConfiguration": {
    "scanOnPush": true
  }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see PutImageScanningConfiguration in AWS CLI Command Reference.

put-image-tag-mutability

The following code example shows how to use put-image-tag-mutability.

AWS CLI

To update the image tag mutability setting for a repository

The following put-image-tag-mutability example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```
aws ecr put-image-tag-mutability \ 
  --repository-name hello-repository \ 
  --image-tag-mutability IMMUTABLE
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

- For API details, see PutImageTagMutability in AWS CLI Command Reference.
put-image

The following code example shows how to use put-image.

AWS CLI

To retag an image with its manifest

The following put-image example creates a new tag in the hello-world repository with an existing image manifest.

```
aws ecr put-image \
    --repository-name hello-world \
    --image-tag 2019.08 \
    --image-manifest file://hello-world.manifest.json
```

Contents of hello-world.manifest.json:

```json
{
    "schemaVersion": 2,

      }
    ]
  }
}
```
For API details, see PutImage in AWS CLI Command Reference.

put-lifecycle-policy

The following code example shows how to use put-lifecycle-policy.

AWS CLI

To create a lifecycle policy

The following put-lifecycle-policy example creates a lifecycle policy for the specified repository in the default registry for an account.

```
aws ecr put-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of policy.json:

```
{
  "rules": [
    {
      "actions": ["tag", "delete"]
    ]
  ]
}
```
Output:

```json
{
    "registryId": "<aws_account_id>",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":{\"type\":\"expire\"}}]}
}
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

### set-repository-policy

The following code example shows how to use set-repository-policy.

**AWS CLI**

**To set the repository policy for a repository**

The following set-repository-policy example attaches a repository policy contained in a file to the cluster-autoscaler repository.

```
aws ecr set-repository-policy \
```
--repository-name cluster-autoscaler \
--policy-text file://my-policy.json

Contents of my-policy.json:

```json
{
    "Version": "2008-10-17",
    "Statement": [
        {
            "Sid": "allow public pull",
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```

Output:

```json
{
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{"Version": "2008-10-17","Statement": [{"Sid": "allow public pull","Effect": "Allow","Principal": "*","Action": ["ecr:BatchCheckLayerAvailability","ecr:BatchGetImage","ecr:GetDownloadUrlForLayer"]}],}
```

- For API details, see SetRepositoryPolicy in AWS CLI Command Reference.

### start-image-scan

The following code example shows how to use start-image-scan.

### AWS CLI

To start an image vulnerability scan
The following start-image-scan example starts an image scan for and specified by the image digest in the specified repository.

```
aws ecr start-image-scan \
   --repository-name sample-repo \
   --image-id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbd5ea706abe0318726e885e6
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "sample-repo",
   "imageId": {
      "imageDigest": "sha256:74b2c688c700ec95a93e478cdb959737c148df3fbd5ea706abe0318726e885e6"
   },
   "imageScanStatus": {
      "status": "IN_PROGRESS"
   }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see StartImageScan in AWS CLI Command Reference.

---

**start-lifecycle-policy-preview**

The following code example shows how to use start-lifecycle-policy-preview.

**AWS CLI**

To create a lifecycle policy preview

The following start-lifecycle-policy-preview example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```
aws ecr start-lifecycle-policy-preview \
   --repository-name "project-a/amazon-ecs-sample" \
   --lifecycle-policy-text "file://policy.json"
```

Contents of policy.json:
For API details, see [StartLifecyclePolicyPreview](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a repository
The following `tag-resource` example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.

```bash
aws ecr tag-resource \
   --tags Key=Stage,Value=Integ
```

This command produces no output.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To untag a repository**

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```bash
aws ecr untag-resource \
   --tag-keys Stage
```

This command produces no output.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**upload-layer-part**

The following code example shows how to use `upload-layer-part`.

**AWS CLI**

**To upload a layer part**

This following `upload-layer-part` uploads an image layer part to the `layer-test` repository.

```bash
aws ecr upload-layer-part \
```
--repository-name layer-test \
--upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
--part-first-byte 0 \
--part-last-byte 8323314 \
--layer-part-blob file:///var/lib/docker/image/overlay2/layerdb/sha256/ff986b10a018b48074e6d3a68b39aad8ccc002c9ad912d4148c0f92b3729323e/layer.b64

Output:

```json
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "registryId": "012345678910",
    "lastByteReceived": 8323314,
    "repositoryName": "layer-test"
}
```

- For API details, see [UploadLayerPart](#) in *AWS CLI Command Reference*.

**Amazon ECS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

create-capacity-provider

The following code example shows how to use create-capacity-provider.
AWS CLI

To create a capacity provider

The following create-capacity-provider example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```bash
aws ecs create-capacity-provider \
   --name "MyCapacityProvider" \
```

Output:

```json
{
   "capacityProvider": {
      "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/MyCapacityProvider",
      "name": "MyCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000,
            "instanceWarmupPeriod": 300
         },
         "managedTerminationProtection": "ENABLED"
      },
      "tags": []
   }
}
```

For more information, see [Amazon ECS cluster auto scaling](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-auto-scaling.html) in the *Amazon ECS Developer Guide*. For API details, see [CreateCapacityProvider](https://docs.aws.amazon.com/cli/latest/reference/ecs/create-capacity-provider.html) in *AWS CLI Command Reference*. 
create-cluster

The following code example shows how to use create-cluster.

AWS CLI

Example 1: To create a new cluster

The following create-cluster example creates a cluster.

```bash
aws ecs create-cluster \
  --cluster-name MyCluster
```

Output:

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": []
  }
}
```

For more information, see Creating a Cluster in the Amazon ECS Developer Guide.

Example 2: To create a new cluster using capacity providers

The following create-cluster example creates a cluster and associates two existing capacity providers with it. The create-capacity-provider command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named MyCluster and associate the MyCapacityProvider1 and MyCapacityProvider2 capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```bash
aws ecs create-cluster --cluster-name MyCluster --capacity-providers MyCapacityProvider1 MyCapacityProvider2 --default-capacity-
```
provider-strategy capacityProvider=MyCapacityProvider1,weight=1
capacityProvider=MyCapacityProvider2,weight=1

Output:

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "PROVISIONING",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ],
    "capacityProviders": [
      "MyCapacityProvider1",
      "MyCapacityProvider2"
    ],
    "defaultCapacityProviderStrategy": [
      {
        "capacityProvider": "MyCapacityProvider1",
        "weight": 1,
        "base": 0
      },
      {
        "capacityProvider": "MyCapacityProvider2",
        "weight": 1,
        "base": 0
      }
    ],
    "attachments": [
      {
        "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
        "type": "asp",
        "status": "PRECREATED",
        "details": []
      }
    ]
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

Example 3: To create a new cluster with multiple tags

The following create-cluster example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see Using Shorthand Syntax with the AWS Command Line Interface in the AWS CLI User Guide.

```bash
aws ecs create-cluster \
   --cluster-name MyCluster \
   --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```
Output:

```
{
    "cluster": {
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [
            {
                "key": "key1",
                "value": "value1"
            },
            {
                "key": "key2",
                "value": "value2"
            },
            {
                "key": "key3",
                "value": "value3"
            }
        ]
    }
}
```

For more information, see Creating a Cluster in the Amazon ECS Developer Guide.

- For API details, see CreateCluster in AWS CLI Command Reference.

create-service

The following code example shows how to use create-service.

AWS CLI

Example 1: To create a service with a Fargate task

The following create-service example shows how to create a service using a Fargate task.
```bash
aws ecs create-service \
   --cluster MyCluster \
   --service-name MyService \
   --task-definition sample-fargate:1 \
   --desired-count 2 \
   --launch-type FARGATE \
   --platform-version LATEST \
   --network-configuration "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp=ENABLED}" \
   --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3

Output:

{
   "service": {
      "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
      "serviceName": "MyService",
      "loadBalancers": [],

    "value": "value2"
  },
Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```bash
aws ecs create-service \
  --cluster MyCluster \
  --service-name ecs-simple-service \
  --task-definition sleep360:2 \
  --desired-count 1
```

Output:

```json
{
    "service": {
        "serviceName": "ecs-simple-service",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        }
    }
}
```
Example 3: To create a service that uses an external deployment controller

The following create-service example creates a service that uses an external deployment controller.

```bash
call
aws ecs create-service \
  --cluster MyCluster \
  --service-name MyService \
  --deployment-controller type=EXTERNAL \
  --desired-count 1
```

Output:

```json
{
  "service": {
    "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
    "serviceName": "MyService",
```
Example 4: To create a new service behind a load balancer

The following create-service example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the --cli-input-json option and a JSON input file called ecs-simple-service-elb.json with the following content:

```json
{
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
        }
    ]
}
```
"containerPort": 80
},
"desiredCount": 10,
"role": "ecsServiceRole"
}

Command:

```bash
aws ecs create-service \
  --cluster MyCluster \
  --service-name ecs-simple-service-elb \
  --cli-input-json file://ecs-simple-service-elb.json
```

Output:

```json
{
  "service": {
    "status": "ACTIVE",
    "pendingCount": 0,
    "loadBalancers": [
      {
        "containerName": "ecs-demo",
        "containerPort": 80,
        "loadBalancerName": "EC2Contai-EcsElast-123456789012"
      }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
    "desiredCount": 10,
    "serviceName": "ecs-simple-service-elb",
    "deployments": [
      {
        "status": "PRIMARY",
        "pendingCount": 0,
        "createdAt": 1428100239.123,
        "desiredCount": 10,
```
create-task-set

The following code example shows how to use create-task-set.

AWS CLI

To create a task set

The following create-task-set example creates a task set in a service that uses an external deployment controller.

```bash
aws ecs create-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-definition MyTaskDefinition:2 \
  --network-configuration "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "ACTIVE",
    "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/MyTaskDefinition:2",
    "runningCount": 0
  }
}
```
For API details, see [CreateTaskSet](#) in [AWS CLI Command Reference](#).

### delete-account-setting

The following code example shows how to use delete-account-setting.

**AWS CLI**

**To delete the account settings for a specific IAM user or IAM role**

The following example `delete-account-setting` deletes the account settings for the specific IAM user or IAM role.

```bash
aws ecs delete-account-setting --name serviceLongArnFormat
```
--principal-arn arn:aws:iam::123456789012:user/MyUser

Output:

```json
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.

- For API details, see DeleteAccountSetting in AWS CLI Command Reference.

**delete-attributes**

The following code example shows how to use delete-attributes.

**AWS CLI**

To delete one or more custom attributes from an Amazon ECS resource

The following delete-attributes deletes an attribute with the name stack from a container instance.

```bash
aws ecs delete-attributes \
    --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```json
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
            "value": "production"
        }
    ]
}
```
• For API details, see DeleteAttributes in AWS CLI Command Reference.

delete-capacity-provider

The following code example shows how to use delete-capacity-provider.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following delete-capacity-provider example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the status of the capacity provider deletion can be retrieved using the describe-capacity-providers command.

```bash
aws ecs delete-capacity-provider \
```

Output:

```json
{
   "capacityProvider": {
      "name": "ExampleCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000
         },
         "managedTerminationProtection": "DISABLED"
   }
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

Example 2: To delete a capacity provider using the name

The following delete-capacity-provider example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the describe-capacity-providers command.

```bash
aws ecs delete-capacity-provider \
   --capacity-provider ExampleCapacityProvider
```

Output:

```json
{}
"capacityProvider": {
   "name": "ExampleCapacityProvider",
   "status": "ACTIVE",
   "autoScalingGroupProvider": {
      "managedScaling": {
         "status": "ENABLED",
         "targetCapacity": 100,
         "minimumScalingStepSize": 1,
         "maximumScalingStepSize": 10000
      },
      "managedTerminationProtection": "DISABLED"
   },
   "updateStatus": "DELETE_IN_PROGRESS",
   "tags": []
}
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCapacityProvider](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/api-delete-capacity-provider.html) in *AWS CLI Command Reference*.

### delete-cluster

The following code example shows how to use `delete-cluster`.

**AWS CLI**

**To delete an empty cluster**

The following `delete-cluster` example deletes the specified empty cluster.

```
aws ecs delete-cluster --cluster MyCluster
```

**Output:**

```json
{
  
  "cluster": {
    "status": "INACTIVE",
    "clusterName": "MyCluster",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0
    "statistics": [],
    "tags": []
  }
}
```

For more information, see [Deleting a Cluster](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCluster](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/api-delete-cluster.html) in *AWS CLI Command Reference*.

### delete-service

The following code example shows how to use `delete-service`.

**AWS CLI**

**To delete a service**
The following `ecs delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```bash
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see [Deleting a Service](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteService](#) in *AWS CLI Command Reference*.

### delete-task-definitions

The following code example shows how to use `delete-task-definitions`.

**AWS CLI**

**To delete a task definition**

The following `delete-task-definitions` example deletes an INACTIVE task definition.

```bash
aws ecs delete-task-definitions
   --task-definition curltest:1
```

**Output:**

```json
{
   "taskDefinitions": [
      {
         "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/curltest:1",
         "containerDefinitions": [
            {
               "name": "ctest",
               "image": "mreferre/eksutils",
               "cpu": 0,
               "portMappings": [],
               "essential": true,
               "entryPoint": [
                  "sh",
                  "-c"
               ],
```
"command": [
    "curl ${ECS_CONTAINER_METADATA_URI_V4}/task"

],
"failures": []
}

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DeleteTaskDefinitions in AWS CLI Command Reference.
The following code example shows how to use delete-task-set.

AWS CLI

To delete a task set

The following delete-task-set example shows how to delete a task set. You can include the --force parameter to delete a task set even if it has not been scaled to zero.

```
aws ecs delete-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
  --force
```

Output:

```
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "DRAINING",
    "computedDesiredCount": 0,

      "awsvpcConfiguration": {
        "subnets": [
          "subnet-12345678"
        ],
        "securityGroups": [
          "sg-12345678"
        ],
        "assignPublicIp": "DISABLED"
      }
    }
  }
}
```
For API details, see [DeleteTaskSet](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ecs/delete-task-set.html) in *AWS CLI Command Reference*.

---

**deregister-container-instance**

The following code example shows how to use `deregister-container-instance`.

**AWS CLI**

To deregister a container instance from a cluster

The following `deregister-container-instance` example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the `--force` option.

```bash
aws ecs deregister-container-instance \
  --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
  --force
```

Output:

```json
{
  "containerInstance": {
    "remainingResources": [
      {
        "integerValue": 1024,
        "doubleValue": 0.0,

For more information, see [Deregister a Container Instance](https://docs.aws.amazon.com/ecs/latest/userguide/deregister-container-instance.html) in the [ECS Developer Guide](https://docs.aws.amazon.com/ecs/latest/userguide/deregister-container-instance.html).

**deregister-task-definition**

The following code example shows how to use `deregister-task-definition`.

**AWS CLI**

**To deregister a task definition**

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region.

```bash
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows INACTIVE:
For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DeregisterTaskDefinition in AWS CLI Command Reference.

**describe-capacity-providers**

The following code example shows how to use describe-capacity-providers.

**AWS CLI**

**Example 1: To describe all capacity providers**

The following describe-capacity-providers example retrieves details about all capacity providers.
aws ecs describe-capacity-providers

Output:

```json
{
    "capacityProviders": [
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
            "name": "MyCapacityProvider",
            "status": "ACTIVE",
            "autoScalingGroupProvider": {
                "managedScaling": {
                    "status": "ENABLED",
                    "targetCapacity": 100,
                    "minimumScalingStepSize": 1,
                    "maximumScalingStepSize": 1000
                },
                "managedTerminationProtection": "ENABLED"
            },
            "tags": []
        },
        {
            "name": "FARGATE",
            "status": "ACTIVE",
            "tags": []
        },
        {
            "name": "FARGATE_SPOT",
            "status": "ACTIVE",
            "tags": []
        }
    ]
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

Example 2: To describe a specific capacity providers

The following describe-capacity-providers example retrieves details about a specific capacity provider. Using the --include TAGS parameter will add the tags associated with the capacity provider to the output.

```
aws ecs describe-capacity-providers \
   --capacity-providers MyCapacityProvider \
   --include TAGS
```

Output:

```
{
   "capacityProviders": [
      {
         "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
         "name": "MyCapacityProvider",
         "status": "ACTIVE",
         "autoScalingGroupProvider": {
            "managedScaling": {
               "status": "ENABLED",
               "targetCapacity": 100,
               "minimumScalingStepSize": 1,
               "maximumScalingStepSize": 1000
            },
            "managedTerminationProtection": "ENABLED"
         },
         "tags": [
            {
               "key": "environment",
               "value": "production"
            }
         ]
      }
   ]
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

- For API details, see DescribeCapacityProviders in AWS CLI Command Reference.

describe-clusters

The following code example shows how to use describe-clusters.

AWS CLI

Example 1: To describe a cluster

The following describe-clusters example retrieves details about the specified cluster.

```bash
aws ecs describe-clusters \
   --cluster default
```

Output:

```
{
   "clusters": [
       {
           "status": "ACTIVE",
           "clusterName": "default",
           "registeredContainerInstancesCount": 0,
           "pendingTasksCount": 0,
           "runningTasksCount": 0,
           "activeServicesCount": 1,
           "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
       }
   ],
   "failures": []
}
```

For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

Example 2: To describe a cluster with the attachment option

The following describe-clusters example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.
aws ecs describe-clusters \
   --include ATTACHMENTS \
   --clusters sampleCluster

Output:

```json
{
   "clusters": [
      {
        "clusterName": "sampleCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [],
        "capacityProviders": [
          "sampleCapacityProvider"
        ],
        "defaultCapacityProviderStrategy": [],
        "attachments": [
          {
            "id": "a1b2c3d4-5678-901b-cdef-EXAMPLE22222",
            "type": "as_policy",
            "status": "CREATED",
            "details": [
              {
                "name": "capacityProviderName",
                "value": "sampleCapacityProvider"
              },
              {
                "name": "scalingPolicyName",
                "value": "ECSManagedAutoScalingPolicy-3048e262-fe39-4eaf-826d-6f975d303188"
              }
            ]
          }]
        "attachmentsStatus": "UPDATE_COMPLETE"
      }
```
For more information, see [Amazon ECS Clusters](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeClusters](https://docs.aws.amazon.com/cli/latest/reference/ecs/describe-clusters.html) in *AWS CLI Command Reference*.

### describe-container-instances

The following code example shows how to use `describe-container-instances`.

#### AWS CLI

**To describe container instance**

The following `describe-container-instances` example retrieves details for a container instance in the update cluster, using the container instance UUID as an identifier.

```bash
aws ecs describe-container-instances 
  --cluster update 
  --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

**Output:**

```json
{
  "failures": [],
  "containerInstances": [
    {
      "status": "ACTIVE",
      "registeredResources": [
        {
          "integerValue": 2048,
          "longValue": 0,
          "type": "INTEGER",
          "name": "CPU",
          "doubleValue": 0.0
        },
        {
          "integerValue": 3955,
          "longValue": 0,
          "type": "INTEGER",
          "name": "NetworkInterfaces",
          "doubleValue": 0.0
        }
      ]
    }
  ]
}
```

For more information, see [Amazon ECS Container Instances](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/container-instances.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeContainerInstances](https://docs.aws.amazon.com/cli/latestreferer.html) in *AWS CLI Command Reference*.

### describe-services

The following code example shows how to use `describe-services`.

**AWS CLI**

**To describe a service**

The following `describe-services` example retrieves details for the my-http-service service in the default cluster.

```
aws ecs describe-services --services my-http-service
```

Output:

```
{
  "services": [
    {
      "status": "ACTIVE",
```
For more information, see Services in the Amazon ECS Developer Guide.

- For API details, see DescribeServices in AWS CLI Command Reference.

**describe-task-definition**

The following code example shows how to use describe-task-definition.
**AWS CLI**

**To describe a task definition**

The following `describe-task-definition` example retrieves the details of a task definition.

```bash
aws ecs describe-task-definition 
  --task-definition hello_world:8
```

**Output:**

```json
{
  "tasks": [
    {
      "attachments": [
        {
          "id": "17f3dff6-a9e9-4d83-99a9-7eb5193c2634",

- For API details, see DescribeTaskDefinition in AWS CLI Command Reference.
describe-task-sets

The following code example shows how to use describe-task-sets.

AWS CLI

To describe a task set

The following describe-task-sets example describes a task set in a service that uses an external deployer.

```
aws ecs describe-task-sets \
  --cluster MyCluster \
  --service MyService \
```

Output:

```
{
  "taskSets": [
    {
      "id": "ecs-svc/1234567890123456789",
      "status": "ACTIVE",

      }
    }
  ]
}
```
describe-tasks

The following code example shows how to use describe-tasks.

AWS CLI

Example 1: To describe a single task

The following describe-tasks example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```bash
aws ecs describe-tasks \
   --cluster MyCluster \
   --tasks arn:aws:ecs:us-east-1:123456789012:task/MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```
{
    "tasks": [ 
    {
      "attachments": [],
      "attributes": [ 
      
    ]
  ]
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DescribeTasks in AWS CLI Command Reference.

**execute-command**

The following code example shows how to use `execute-command`.

**AWS CLI**

**To run an interactive /bin/sh command**

The following `execute-command` example runs an interactive `/bin/sh` command against a container named MyContainer for a task with an id of `arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \
  --cluster MyCluster \
  --task arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE \
  --container MyContainer \
  --interactive \
  --command "/bin/sh"
```

This command produces no output.

For more information, see Using Amazon ECS Exec for debugging in the Amazon ECS Developer Guide.
list-account-settings

The following code example shows how to use list-account-settings.

**AWS CLI**

**Example 1: To view the account settings for an account**

The following list-account-settings example displays the effective account settings for an account.

```bash
aws ecs list-account-settings --effective-settings
```

**Output:**

```json
{
   "settings": [
   {
      "name": "containerInstanceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
   },
   {
      "name": "serviceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
   },
   {
      "name": "taskLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
   }
   ]
}
```

**Example 2: To view the account settings for a specific IAM user or IAM role**

The following list-account-settings example displays the account settings for the specified IAM user or IAM role.
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser

Output:

```
{
    "settings": [
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:user/MyUser"
        }
    ]
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.

- For API details, see ListAccountSettings in AWS CLI Command Reference.

**list-attributes**

The following code example shows how to use list-attributes.

**AWS CLI**

To list the container instances that contain a specific attribute

The following example lists the attributes for container instances that have the stack=production attribute in the default cluster.

```
aws ecs list-attributes \
    --target-type container-instance \
    --attribute-name stack \
    --attribute-value production \
    --cluster default
```

Output:

```
{
    "attributes": [
        {
```
For more information, see Amazon ECS Container Agent Configuration in the Amazon ECS Developer Guide.

- For API details, see ListAttributes in AWS CLI Command Reference.

**list-clusters**

The following code example shows how to use `list-clusters`.

**AWS CLI**

**To list your available clusters**

The following `list-clusters` example lists all of the available clusters.

```bash
aws ecs list-clusters
```

Output:

```json
{
   "clusterArns": [
      "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
   ]
}
```

For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

- For API details, see ListClusters in AWS CLI Command Reference.

**list-container-instances**

The following code example shows how to use `list-container-instances`.

```json
"name": "stack",
   "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
   "value": "production"
]
}]
```
AWS CLI

To list the container instances in a cluster

The following `list-container-instances` example lists all of the available container instances in a cluster.

```bash
aws ecs list-container-instances --cluster MyCluster
```

Output:

```json
{
  "containerInstanceArns": [
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
  ]
}
```

For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.

- For API details, see ListContainerInstances in AWS CLI Command Reference.

list-services-by-namespace

The following code example shows how to use `list-services-by-namespace`.

AWS CLI

To list the services in a namespace

The following `list-services-by-namespace` example lists all of the services configured for the specified namespace in your default Region.

```bash
aws ecs list-services-by-namespace \
  --namespace service-connect
```

Output:

```json
{
  "serviceArns": [
```
]
}

For more information, see Service Connect in the Amazon ECS Developer Guide.
- For API details, see ListServicesByNamespace in AWS CLI Command Reference.

list-services

The following code example shows how to use list-services.

AWS CLI

To list the services in a cluster

The following list-services example shows how to list the services running in a cluster.

```
aws ecs list-services --cluster MyCluster
```

Output:

```
{
    "serviceArns": [
      "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
    ]
}
```

For more information, see Services in the Amazon ECS Developer Guide.
- For API details, see ListServices in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a resource

The following list-tags-for-resource example lists the tags for a specific cluster.
aws ecs list-tags-for-resource \

Output:

{  
   "tags": [  
      {  
         "key": "key1",  
         "value": "value1"  
      },  
      {  
         "key": "key2",  
         "value": "value2"  
      },  
      {  
         "key": "key3",  
         "value": "value3"  
      }  
   ]  
}

• For API details, see [ListTagsForResource](https://aws.amazon.com/documentation/awscli/command-reference/) in *AWS CLI Command Reference*.

### list-task-definition-families

The following code example shows how to use `list-task-definition-families`.

**AWS CLI**

**Example 1: To list the registered task definition families**

The following `list-task-definition-families` example lists all of the registered task definition families.

```bash
aws ecs list-task-definition-families
```

Output:

```json
{}
```
Example 2: To filter the registered task definition families

The following `list-task-definition-families` example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```

Output:

```
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Task Definition Parameters in the Amazon ECS Developer Guide.

- For API details, see ListTaskDefinitionFamilies in AWS CLI Command Reference.

list-task-definitions

The following code example shows how to use list-task-definitions.

AWS CLI

Example 1: To list the registered task definitions

The following `list-task-definitions` example lists all of the registered task definitions.

```
aws ecs list-task-definitions
```

Output:
Example 2: To list the registered task definitions in a family

The following list-task-definitions example lists the task definition revisions of a specified family.

```
aws ecs list-task-definitions --family-prefix wordpress
```

Output:

```
{
    "taskDefinitionArns": [
    ]
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see ListTaskDefinitions in AWS CLI Command Reference.

list-tasks

The following code example shows how to use list-tasks.

AWS CLI

Example 1: To list the tasks in a cluster

The following list-tasks example lists all of the tasks in a cluster.
aws ecs list-tasks --cluster default

Output:

```json
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
   ]
}
```

Example 2: To list the tasks on a particular container instance

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```bash
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```json
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
   ]
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see ListTasks in AWS CLI Command Reference.

put-account-setting-default

The following code example shows how to use put-account-setting-default.

AWS CLI

To modify the default account settings
The following put-account-setting-default example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:root"
    }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.

- For API details, see PutAccountSettingDefault in AWS CLI Command Reference.

**put-account-setting**

The following code example shows how to use put-account-setting.

**AWS CLI**

**To modify the account setting for your IAM user account**

The following put-account-setting example enables the serviceLongArnFormat account setting for your IAM user account.

```
aws ecs put-account-setting --name serviceLongArnFormat --value enabled
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::130757420319:user/your_username"
    }
}
For more information, see Modifying Account Settings in the Amazon ECS Developer Guide.

- For API details, see PutAccountSetting in AWS CLI Command Reference.

put-account-settings

The following code example shows how to use put-account-settings.

**AWS CLI**

To modify the account settings for an IAM user or IAM role

The following put-account-setting example modifies the account settings for the specified IAM user or IAM role.

```bash
aws ecs put-account-setting \\
  --name serviceLongArnFormat \\
  --value enabled \\
  --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```json
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}
```

- For API details, see PutAccountSettings in AWS CLI Command Reference.

put-attributes

The following code example shows how to use put-attributes.

**AWS CLI**

To create an attribute and associate it with an Amazon ECS resource
The following `put-attributes` applies an attribute with the name `stack` and the value `production` to a container instance.

```
aws ecs put-attributes \
  --attributes name=stack,value=production,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
  "attributes": [
    {
      "name": "stack",
      "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
      "value": "production"
    }
  ]
}
```

- For API details, see `PutAttributes` in `AWS CLI Command Reference`.

**put-cluster-capacity-providers**

The following code example shows how to use `put-cluster-capacity-providers`.

**AWS CLI**

**Example 1: To add an existing capacity provider to a cluster**

The following `put-cluster-capacity-providers` example adds an existing capacity provider to a cluster. The `create-capacity-provider` command is used to create a capacity provider. The `describe-clusters` command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the `MyCluster` cluster has the `MyCapacityProvider1` capacity provider associated with it and you want to add the `MyCapacityProvider2` capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.
```bash
aws ecs put-cluster-capacity-providers \
  --cluster MyCluster \ 
  --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \ 
  --default-capacity-provider-strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,weight=1
```

**Output:**

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ],
    "capacityProviders": [
      "MyCapacityProvider1",
      "MyCapacityProvider2"
    ],
    "defaultCapacityProviderStrategy": [
      {
        "capacityProvider": "MyCapacityProvider1",
        "weight": 1,
        "base": 0
      },
      {
        "capacityProvider": "MyCapacityProvider2",
        "weight": 1,
        "base": 0
      }
    ],
    "attachments": [
      {
```
Example 2: To remove a capacity provider from a cluster

The following `put-cluster-capacity-providers` example removes a capacity provider from a cluster. The `describe-clusters` command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must
specify the capacity providers you want to remain associated with the cluster as well as the
default capacity provider strategy to associate with the cluster. In this example, the cluster has
the MyCapacityProvider1 and MyCapacityProvider2 capacity providers associated with it and you want to remove the MyCapacityProvider2 capacity provider, so you specify only
MyCapacityProvider1 in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers
  --cluster MyCluster
  --capacity-providers MyCapacityProvider1
  --default-capacity-provider-strategy capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ],
    "capacityProviders": [
      "MyCapacityProvider1"
    ],
    "defaultCapacityProviderStrategy": [
      "capacityProvider": "MyCapacityProvider1",
      "weight": 1,
      "base": 0
    ],
    "attachments": [
      {
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/ecs/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

**Example 3: To remove all capacity providers from a cluster**

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.
aws ecs put-cluster-capacity-providers \
   --cluster MyCluster \
   --capacity-providers [] \
   --default-capacity-provider-strategy []

Output:

{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "runningTasksCount": 0,
      "pendingTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ],
      "capacityProviders": [],
      "defaultCapacityProviderStrategy": [],
      "attachments": [
         {
            "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
            "type": "as_policy",
            "status": "DELETING",
            "details": [
               {
                  "name": "capacityProviderName",
                  "value": "MyCapacityProvider1"
               },
               {
                  "name": "scalingPolicyName",
                  "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
               }
            ]
         }
      ]
   }
}
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developer-guide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [PutClusterCapacityProviders](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/ecs-api-reference-put-cluster-capacity-providers.html) in *AWS CLI Command Reference*.

### register-task-definition

The following code example shows how to use `register-task-definition`.

**AWS CLI**

**Example 1: To register a task definition with a JSON file**

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```bash
aws ecs register-task-definition \
  --cli-input-json file://<path_to_json_file>/sleep360.json
```

Contents of `sleep360.json`:

```json
{
}
```
"containerDefinitions": [
    {
      "name": "sleep",
      "image": "busybox",
      "cpu": 10,
      "command": ["sleep", "360"],
      "memory": 10,
      "essential": true
    }
  ],
  "family": "sleep360"
}

Output:

{
  "taskDefinition": {
    "status": "ACTIVE",
    "family": "sleep360",
    "placementConstraints": [],
    "compatibilities": ["EXTERNAL", "EC2"],
    "volumes": [],
    "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/sleep360:1",
    "containerDefinitions": [
      {
        "environment": [],
        "name": "sleep",
        "mountPoints": [],
        "image": "busybox",
        "cpu": 10,
        "portMappings": [],
        "command": ["sleep", "360"],
        "memory": 10,
      }
    ]
  }
}
For more information, see [Example task definitions](#) in the Amazon ECS Developer Guide.

**Example 2: To register a task definition with a JSON string parameter**

The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```bash
aws ecs register-task-definition \
  --family sleep360 \
  --container-definitions "{"name":"sleep","image":"busybox","cpu":10, \n  "command":["sleep","360"],"memory":10,"essential":true}"
```

The output is identical to the previous example.

For more information, see [Creating a Task Definition](#) in the Amazon ECS Developer Guide.

- For API details, see [RegisterTaskDefinition](#) in AWS CLI Command Reference.

**Run-task**

The following code example shows how to use `run-task`.

**AWS CLI**

**To run a task on your default cluster**

The following `run-task` example runs a task on the default cluster and uses a client token.

```bash
aws ecs run-task \
  --cluster default \
  --task-definition sleep360:1 \
  --client-token 550e8400-e29b-41d4-a716-446655440000
```

Output:
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-east-1b",
            "capacityProviderName": "example-capacity-provider",
            "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/default",
            "containerInstanceArn": "arn:aws:ecs:us-east-1:123456789012:container-instance/default/bc4d2ec611d04bb7bb97e83ceEXAMPLE",
            "containers": [
                {
                    "containerArn": "arn:aws:ecs:us-east-1:123456789012:container/default/d6f51cc5bb94a47969c92035e9f66f8/75853d2d-711e-458a-8362-0f0aEXAMPLE",
                    "taskArn": "arn:aws:ecs:us-east-1:123456789012:task/default/d6f51cc5bb94a47969c9203EXAMPLE",
                    "name": "sleep",
                    "image": "busybox",
                    "lastStatus": "PENDING",
                    "networkInterfaces": [],
                    "cpu": "10",
                    "memory": "10"
                }
            ],
            "cpu": "10",
            "createdAt": "2023-11-21T16:59:34.403000-05:00",
            "desiredStatus": "RUNNING",
            "enableExecuteCommand": false,
            "group": "family:sleep360",
            "lastStatus": "PENDING",
            "launchType": "EC2",
            "memory": "10",
            "overrides": {
                "containerOverrides": [
                    {
                        "name": "sleep"
                    }
                ]
            }
        }
    ]
}
The following code example shows how to use `start-task`.

**AWS CLI**

To start a new task

The following `start-task` starts a task using the latest revision of the `sleep360` task definition on the specified container instance in the default cluster.

```
aws ecs start-task \
  --task-definition sleep360 \
  --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

**Output:**

```
{
  "tasks": [
    {
      "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4e3dee8f8",
      "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
    }
  ],
  "failures": []
}
```

For more information, see [Running Tasks](https://docs.aws.amazon.com/ecs/latest/userguide/running-tasks.html) in the Amazon ECS Developer Guide.

- For API details, see [RunTask](https://docs.aws.amazon.com/cli/latest/reference/ecs/run-task.html) in AWS CLI Command Reference.
stop-task

The following code example shows how to use stop-task.

• For API details, see StartTask in AWS CLI Command Reference.
AWS CLI

To stop a task

The following stop-task stops the specified task from running in the default cluster.

```
aws ecs stop-task \
  --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

Output:

```json
{
    "task": {
        "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4eeee8f8",
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
        "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",
        "overrides": {
            "containerOverrides": []
        },
        "lastStatus": "STOPPED",
        "desiredStatus": "STOPPED",
        "cpu": "128",
        "memory": "128",
        "containers": [],
        "version": 2,
        "stoppedReason": "TaskFailedToStart",
        "stopCode": "TaskFailedToStart",
        "connectivity": "CONNECTED",
        "connectivityAt": 1563421494.186,
        "pullStartedAt": 1563421494.252,
        "pullStoppedAt": 1563421496.252,
        "executionStoppedAt": 1563421497,
        "createdAt": 1563421494.186,
        "stoppingAt": 1563421497.252,
        "stoppedAt": 1563421497.252,
        "group": "family:sleep360",
        "launchType": "EC2",
        "attachments": [],
        "tags": []
    }
}
```
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource example adds a single tag to the specified resource.

```bash
aws ecs tag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tags key=key1,value=value1
```

This command produces no output.

To add multiple tags to a resource

The following tag-resource example adds multiple tags to the specified resource.

```bash
aws ecs tag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource
The following `untag-resource` example removes the listed tags from the specified resource.

```bash
aws ecs untag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tag-keys key1,key2
```

This command produces no output.

### update-cluster-settings

The following code example shows how to use `update-cluster-settings`.

**AWS CLI**

**To modify the settings for your cluster**

The following `update-cluster-settings` example enables CloudWatch Container Insights for the default cluster.

```bash
aws ecs update-cluster-settings \
  --cluster default \
  --settings name=containerInsights,value=enabled
```

**Output:**

```json
{
  "cluster": {
    "clusterName": "default",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ]
  }
}
```
For more information, see Modifying Account Settings in the Amazon ECS Developer Guide.

- For API details, see UpdateClusterSettings in AWS CLI Command Reference.

**update-container-agent**

The following code example shows how to use `update-container-agent`.

**AWS CLI**

**To update the container agent on an Amazon ECS container instance**

The following `update-container-agent` example updates the container agent on the specified container instance in the default cluster.

```bash
aws ecs update-container-agent --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "containerInstance": {
        "status": "ACTIVE",
        ...
        "agentUpdateStatus": "PENDING",
        "versionInfo": {
            "agentVersion": "1.0.0",
            "agentHash": "4023248",
            "dockerVersion": "DockerVersion: 1.5.0"
        }
    }
}
```

For more information, see Updating the Amazon ECS Container Agent in the Amazon ECS Developer Guide.

- For API details, see UpdateContainerAgent in AWS CLI Command Reference.
update-container-instances-state

The following code example shows how to use `update-container-instances-state`.

**AWS CLI**

**To update the state of a container instance**

The following `update-container-instances-state` updates the state of the specified container instance to **DRAINING** which will remove it from the cluster is it registered to.

```
aws ecs update-container-instances-state \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4 \
    --status DRAINING
```

**Output:**

```json
{
    "containerInstances": [
        {
            "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",
            "ec2InstanceId": "i-013d87fbb4d513bf",
            "version": 4390,
            "versionInfo": {
                "agentVersion": "1.29.0",
                "agentHash": "a190a73f",
                "dockerVersion": "DockerVersion:18.06.1-ce"
            },
            "remainingResources": [
                {

For API details, see [UpdateContainerInstancesState](https://docs.aws.amazon.com/cli/latest/reference/ecs/update-container-instances-state.html) in *AWS CLI Command Reference*.

**update-service-primary-task-set**

The following code example shows how to use `update-service-primary-task-set`.

**AWS CLI**

To update the primary task set for a service

The following `update-service-primary-task-set` example updates the primary task set for the specified service.

```bash
aws ecs update-service-primary-task-set \
  --cluster MyCluster \
  --service MyService \
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
```
For API details, see UpdateServicePrimaryTaskSet in AWS CLI Command Reference.

update-service

The following code example shows how to use update-service.

AWS CLI

Example 1: To change the task definition used in a service
The following update-service example updates the my-http-service service to use the amazon-ecs-sample task definition.

```
aws ecs update-service --service my-http-service --task-definition amazon-ecs-sample
```

**Example 2: To change the number of tasks in a service**

The following update-service example updates the desired task count of the service my-http-service to 3.

```
aws ecs update-service --service my-http-service --desired-count 3
```

For more information, see [Updating a Service](#) in the Amazon ECS Developer Guide.  
- For API details, see [UpdateService](#) in AWS CLI Command Reference.

**update-task-set**

The following code example shows how to use update-task-set.

**AWS CLI**

**To update a task set**

The following update-task-set example updates a task set to adjust the scale.

```
aws ecs update-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
  --scale value=50,unit=PERCENT
```

Output:

```
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
```

Actions and scenarios
For API details, see UpdateTaskSet in AWS CLI Command Reference.

Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

create-file-system

The following code example shows how to use create-file-system.

AWS CLI

To create an encrypted file system

The following create-file-system example creates an encrypted file system using the default CMK. It also adds the tag Name=my-file-system.

```bash
aws efs create-file-system \
   --performance-mode generalPurpose \n   --throughput-mode bursting \n   --encrypted \n   --tags Key=Name,Value=my-file-system
```

Output:

```
{
   "OwnerId": "123456789012",
   "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
   "FileSystemId": "fs-c7a0456e",
   "CreationTime": 1595286880.0,
   "LifeCycleState": "creating",
   "Name": "my-file-system",
   "NumberOfMountTargets": 0,
   "SizeInBytes": {
```

Actions and scenarios
For more information, see [Creating Amazon EFS file systems](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [CreateFileSystem](#) in *AWS CLI Command Reference*.

**create-mount-target**

The following code example shows how to use `create-mount-target`.

**AWS CLI**

**To create a mount target**

The following `create-mount-target` example creates a mount target for the specified file system.

```
aws efs create-mount-target \
  --file-system-id fs-c7a0456e \
  --subnet-id subnet-02bf4c428bexemple \
  --security-groups sg-068f739363example
```

**Output:**

```
{
  "OwnerId": "123456789012",
```
For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see CreateMountTarget in AWS CLI Command Reference.

**delete-file-system**

The following code example shows how to use delete-file-system.

**AWS CLI**

**To delete a file system**

The following delete-file-system example deletes the specified file system.

```bash
aws efs delete-file-system \
--file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the Amazon Elastic File System User Guide.

- For API details, see DeleteFileSystem in AWS CLI Command Reference.

**delete-mount-target**

The following code example shows how to use delete-mount-target.

**AWS CLI**

**To delete a mount target**
The following delete-mount-target example deletes the specified mount target.

```
aws efs delete-mount-target \
   --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see DeleteMountTarget in AWS CLI Command Reference.

describe-file-systems

The following code example shows how to use describe-file-systems.

**AWS CLI**

To describe a file system

The following describe-file-systems example describes the specified file system.

```
aws efs describe-file-systems \
   --file-system-id fs-c7a0456e
```

Output:

```json
{
   "FileSystems": [
   {
     "OwnerId": "123456789012",
     "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
     "FileSystemId": "fs-c7a0456e",
     "CreationTime": 1595286880.0,
     "LifeCycleState": "available",
     "Name": "my-file-system",
     "NumberOfMountTargets": 3,
     "SizeInBytes": {
       "Value": 6144,
       "Timestamp": 1600991437.0,
```
For more information, see Managing Amazon EFS file systems in the Amazon Elastic File System User Guide.

- For API details, see DescribeFileSystems in AWS CLI Command Reference.

describe-mount-targets

The following code example shows how to use describe-mount-targets.

AWS CLI

To describe a mount target

The following describe-mount-targets example describes the specified mount target.

```
aws efs describe-mount-targets \    
--mount-target-id fsmt-f9a14450
```

Output:

```
{
    "MountTargets": [
    {
        "OwnerId": "123456789012",
    }
    ]
}
```
For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see DescribeMountTargets in AWS CLI Command Reference.

describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags for a file system

The following describe-tags example describes the tags for the specified file system.

```bash
aws efs describe-tags \
--file-system-id fs-c7a0456e
```

Output:

```
{
   "Tags": [
   {
      "Key": "Name",
      "Value": "my-file-system"
   },
   {
      "Key": "Department",
      "Value": "Business Intelligence"
   }
}
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To retrieve the tags for a resource

The following `list-tags-for-resource` example retrieves the tags associated with the specified file system.

```
aws efs list-tags-for-resource \\n   --resource-id fs-c7a0456e
```

Output:

```
{
   "Tags": [
      {
         "Key": "Name",
         "Value": "my-file-system"
      },
      {
         "Key": "Department",
         "Value": "Business Intelligence"
      }
   ]
}
```

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource example adds the tag Department=Business Intelligence to the specified file system.

```bash
aws efs tag-resource \\
   --resource-id fs-c7a0456e \\
   --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes the tag with the Department tag key from the specified file system.

```bash
aws efs untag-resource \\
   --resource-id fs-c7a0456e \\
   --tag-keys Department
```

This command produces no output.

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.
Amazon EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

associate-encryption-config

The following code example shows how to use `associate-encryption-config`.

AWS CLI

To associates an encryption configuration to an existing cluster

The following `associate-encryption-config` example enables encryption on an existing EKS clusters that do not already have encryption enabled.

```
aws eks associate-encryption-config \
  --cluster-name my-eks-cluster \
  --encryption-config '[["resources": ["secrets"], "provider": 
  {"keyArn": "arn:aws:kms:region-code:account:key/key"}]]'
```

Output:

```
{
  "update": {
    "id": "3141b835-8103-423a-8e68-12c2521ffa4d",
    "status": "InProgress",
```
associate-identity-provider-config

The following code example shows how to use `associate-identity-provider-config`.

AWS CLI

Associate identity provider to your Amazon EKS Cluster

The following `associate-identity-provider-config` example associates an identity provider to your Amazon EKS Cluster.

```bash
aws eks associate-identity-provider-config \
  --cluster-name my-eks-cluster \
  --oidc 'identityProviderConfigName=my-identity-provider,issuerUrl=https://oidc.eks.us-east-2.amazonaws.com/id/38D6A4619A0A69E342B113ED7F1A7652,clientId=kubernetes,usernameClaim=email,usernamePrefix=my-username-prefix,groupsClaim=my-claim,groupsPrefix=my-groups-prefix,requiredClaims={Claim1=value1,Claim2=value2}' \
  --tags env=dev
```

Output:

```json
{
    "update": {
        "id": "8c6c1bef-61fe-42ac-a242-89412387b8e7",
```
For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Associate an OIDC identity provider in the Amazon EKS User Guide.

- For API details, see $\text{AssociateIdentityProviderConfig}$ in AWS CLI Command Reference.

**create-addon**

The following code example shows how to use create-addon.

**AWS CLI**

**Example 1: To create an Amazon EKS add-on with default compatible version for the respective EKS cluster version**

The following create-addon example command creates an Amazon EKS add-on with default compatible version for the respective EKS cluster version.

```
aws eks create-addon \  --cluster-name my-eks-cluster \  --addon-name my-eks-addon \  --service-account-role-arn arn:aws:iam::111122223333:role/role-name
```

Output:

```
{
    "addon": {
```
"addonName": "my-eks-addon",
"clusterName": "my-eks-cluster",
"status": "CREATING",
"addonVersion": "v1.15.1-eksbuild.1",
"health": {
  "issues": []
},
"addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/1ec71ee1-b9c2-8915-4e17-e8be0a55a149",
"createdAt": "2024-03-14T12:20:03.264000-04:00",
"modifiedAt": "2024-03-14T12:20:03.283000-04:00",
"serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
"tags": {}}

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

Example 2: To create an Amazon EKS add-on with specific add-on version

The following create-addon example command creates an Amazon EKS add-on with specific add-on version.

```bash
aws eks create-addon \  
   --cluster-name my-eks-cluster \  
   --addon-name my-eks-addon \  
   --service-account-role-arn arn:aws:iam::111122223333:role/role-name \  
   --addon-version v1.16.4-eksbuild.2
```

Output:

```json
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
  }
}
```
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

Example 3: To create an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolves conflicts details.

```bash
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values '{"resources":{"limits":{"cpu":"100m"}}}' \
  --resolve-conflicts OVERWRITE
```

Output:

```json
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/a6c71ee9-0304-9237-1be8-25af1b0f1ff6",
    "createdAt": "2024-03-14T12:35:58.313000-04:00",

    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "tags": {},
    "configurationValues": "{\"resources\":{\"limits\":{\"cpu\":\"100m\"}}}"
  }
}
```
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

Example 4: To create an Amazon EKS add-on with custom JSON configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```bash
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values 'file://configuration-values.json' \
  --resolve-conflicts OVERWRITE \
  --tags '{"eks-addon-key-1": "value-1", "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.json`:

```json
{
    "resources": {
        "limits": {
            "cpu": "150m"
        }
    },
    "env": {
        "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
    }
}
```

Output:

```json
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        }
    }
}
```
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

**Example 5: To create an Amazon EKS add-on with custom YAML configuration values file**

The following create-addon example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```bash
aws eks create-addon \\
--cluster-name my-eks-cluster \\
--addon-name my-eks-addon \\
--service-account-role-arn arn:aws:iam::111122223333:role/role-name \\
--addon-version v1.16.4-eksbuild.2 \\
--configuration-values 'file://configuration-values.yaml' \\
--resolve-conflicts OVERWRITE \\
--tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.yaml`:

```yaml
resources:
  limits:
    cpu: '100m'
  env:
    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

- For API details, see CreateAddon in AWS CLI Command Reference.

create-cluster

The following code example shows how to use create-cluster.

AWS CLI

To create a new cluster

This example command creates a cluster named prod in your default region.

Command:

```
aws eks create-cluster --name prod \
--role-arn arn:aws:iam::012345678910:role/eks-service-role-
AWSFServiceRoleForAmazonEKS-J7ONKE3BQ4PI \
```
To create a new cluster with private endpoint access and logging enabled

This example command creates a cluster named example in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

Command:

```
aws eks create-cluster --name example --kubernetes-version 1.12
--role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q
--resources-vpc-config subnetIds=subnet-0a188dccd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,
```
--logging '{"clusterLogging": [{"types": ["api", "audit", "authenticator", "controllerManager", "scheduler"], "enabled": true}]}'

Output:

```json
{
  "cluster": {
    "name": "example",
    "createdAt": 1565804921.901,
    "version": "1.12",
    "roleArn": "arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q",
    "resourcesVpcConfig": {
      "subnetIds": [
        "subnet-0a188dcd2f9a632f",
        "subnet-09290d93da4278664",
        "subnet-0f21dd86e0e91134a",
        "subnet-0173dead68481a583",
        "subnet-051f70a57ed6fcb6",
        "subnet-01322339c5c7de9b4"
      ],
      "securityGroupIds": [
        "sg-0c5b580845a031c10"
      ],
      "vpcId": "vpc-0f622c01f68d4afec",
      "endpointPublicAccess": false,
      "endpointPrivateAccess": true
    },
    "logging": {
      "clusterLogging": [
        {
          "types": [
            "api",
            "audit",
            "authenticator",
            "controllerManager",
            "scheduler"
          ],
          "enabled": true
        }
      ]
    }
  }
}
```
• For API details, see `CreateCluster` in AWS CL! Command Reference.

create-fargate-profile

The following code example shows how to use `create-fargate-profile`.

**AWS CLI**

**Example 1: Create EKS Fargate Profile for a selector with a namespace**

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[["namespace": "default"]]
```

Output:

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:38:47.368000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
    
```
For more information, see [AWS Fargate profile - Creating a Fargate profile](https://docs.aws.amazon.com/eks/latest/userguide/) in the *Amazon EKS User Guide*.

**Example 2: Create EKS Fargate Profile for a selector with a namespace and labels**

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace and labels.

```bash
aws eks create-fargate-profile
  --cluster-name my-eks-cluster
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name
  --fargate-profile-name my-fargate-profile
  --selectors '[{"namespace": "default", "labels": {"labelname1": "labelvalue1"}}]'
```

Output:

```json
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/my-fargate-profile/88c72bc7-e8a4-fa34-44e4-2f1397224bb3",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:33:48.125000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      {
        "namespace": "default",
        "labels": {
          "labelname1": "labelvalue1"
        }
      }
    ]
  }
}
```
For more information, see [AWS Fargate profile - Creating a Fargate profile](https://docs.aws.amazon.com/eks/latest/userguide/fargate-profile.html) in the [Amazon EKS User Guide](https://docs.aws.amazon.com/eks/latest/userguide/).

**Example 3: Create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.**

The following `create-fargate-profile` example create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

```bash
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[["namespace": "default", "labels": {"labelname1": "labelvalue1"}]]' \
  --subnets '[["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d", "subnet-0e2907431c9988b72"]]
```

Output:

```json
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:35:58.640000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
```

---

**Actions and scenarios**

2774
For more information, see [AWS Fargate profile - Creating a Fargate profile](https://docs.aws.amazon.com/eks/latest/userguide/ecs-fargate.html) in the [Amazon EKS User Guide](https://docs.aws.amazon.com/eks/latest/userguide).

**Example 4: Create EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into**

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \

    }
}
```
create-nodegroup

The following code example shows how to use create-nodegroup.

**AWS CLI**

**Example 1: Creates a managed node group for an Amazon EKS cluster**

The following create-nodegroup example creates a managed node group for an Amazon EKS cluster.

```
aws eks create-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --node-role arn:aws:iam::111122223333:role/role-name \
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a" \
  --scaling-config minSize=1,maxSize=3,desiredSize=1 \
  --region us-east-2
```

Output:

```
{
  "nodegroup": {
    "nodeName": "my-eks-nodegroup",
    "clusterName": "my-eks-cluster",
    "version": "1.26",
    "createdAt": "2024-04-04T13:19:32.260000-04:00",
    "modifiedAt": "2024-04-04T13:19:32.260000-04:00",
    "status": "CREATING",
    "capacityType": "ON_DEMAND",
    "scalingConfig": {
      "minSize": 1,
      "maxSize": 3,
      "desiredSize": 1
    }
  }
}```
For more information, see Creating a managed node group in the Amazon EKS User Guide.

Example 2: Creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size

The following create-nodegroup example creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size.

```
aws eks create-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --node-role arn:aws:iam::111122223333:role/role-name \
  --subnets subnet-0e2907431c9988b72,subnet-04ad87f71c6e5ab4d,subnet-09d912bb63ef21b9a \
  --scaling-config minSize=1,maxSize=3,desiredSize=1 \
  --capacity-type ON_DEMAND \
  --instance-types 'm5.large' \
  --disk-size 50 \
  --region us-east-2
```
Output:

```json
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "clusterName": "my-eks-cluster",
        "version": "1.26",
        "releaseVersion": "1.26.12-20240329",
        "createdAt": "2024-04-04T13:46:07.595000-04:00",
        "modifiedAt": "2024-04-04T13:46:07.595000-04:00",
        "status": "CREATING",
        "capacityType": "ON_DEMAND",
        "scalingConfig": {
            "minSize": 1,
            "maxSize": 3,
            "desiredSize": 1
        },
        "instanceTypes": ["m5.large"],
        "subnets": [
            "subnet-0e2907431c9988b72",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-09d912bb63ef21b9a"
        ],
        "amiType": "AL2_x86_64",
        "nodeRole": "arn:aws:iam::111122223333:role/role-name",
        "diskSize": 50,
        "health": {
            "issues": []
        },
        "updateConfig": {
            "maxUnavailable": 1
        },
        "tags": {}
    }
}
```

For more information, see [Creating a managed node group](https://docs.aws.amazon.com/eks/userguide) in the *Amazon EKS User Guide*. 
Example 3: Creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

```bash
aws eks create-nodegroup \\
  --cluster-name my-eks-cluster \\
  --nodegroup-name my-eks-nodegroup \\
  --node-role arn:aws:iam::111122223333:role/role-name \\
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a" \\
  --scaling-config minSize=1,maxSize=5,desiredSize=4 \\
  --instance-types 't3.large' \\
  --disk-size 50 \\
  --ami-type AL2_x86_64 \\
  --capacity-type SPOT \\
  --update-config maxUnavailable=2 \\
  --labels '"my-eks-nodegroup-label-1": "value-1" , "my-eks-nodegroup-label-2": "value-2"'} \\
  --taints '{"key": "taint-key-1" , "value": "taint-value-1", "effect": "NO_EXECUTE"}'} \\
  --tags '{"my-eks-nodegroup-key-1": "value-1" , "my-eks-nodegroup-key-2": "value-2"}'}
```

Output:

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "clusterName": "my-eks-cluster",
    "version": "1.26",
    "releaseVersion": "1.26.12-20240329",
    "createdAt": "2024-04-04T14:05:07.940000-04:00",
    "modifiedAt": "2024-04-04T14:05:07.940000-04:00",
    "status": "CREATING",
    "capacityType": "SPOT",
    "scalingConfig": {
```

Actions and scenarios 2781
For more information, see [Creating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide/managed-node-groups.html) in the Amazon EKS User Guide.

- For API details, see [CreateNodegroup](https://docs.aws.amazon.com/cli/latest/reference/eks/create-nodegroup.html) in AWS CLI Command Reference.
delete-addon

The following code example shows how to use delete-addon.

AWS CLI

Example 1. To deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster

The following delete-addon example command deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster.

```bash
aws eks delete-addon \
   --cluster-name my-eks-cluster \
   --addon-name my-eks-addon \
   --preserve
```

Output:

```
{
   "addon": {
      "addonName": "my-eks-addon",
      "clusterName": "my-eks-cluster",
      "status": "DELETING",
      "addonVersion": "v1.9.3-eksbuild.7",
      "health": {
         "issues": []
      },
      "createdAt": "2024-03-14T11:49:09.009000-04:00",

```

For more information, see [Managing Amazon EKS add-ons - Deleting an add-on](https://docs.aws.amazon.com/eks/latest/userguide/efs-storage-class.html) in the Amazon EKS.

Example 2. To deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster
The following delete-addon example command deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster.

```
aws eks delete-addon
   --cluster-name my-eks-cluster
   --addon-name my-eks-addon
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
        "createdAt": "2024-03-14T11:45:31.983000-04:00",

**delete-fargate-profile**

The following code example shows how to use delete-fargate-profile.

**AWS CLI**

**Example 1: Create EKS Fargate Profile for a selector with a namespace**

The following delete-fargate-profile example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks delete-fargate-profile \
    --cluster-name my-eks-cluster \
    --fargate-profile-name my-fargate-profile
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T11:48:39.975000-04:00",

                }
            }
        ]
    }
}
```
For more information, see [AWS Fargate profile - Deleting a Fargate](#) in the [Amazon EKS User Guide](#).

- For API details, see [DeleteFargateProfile](#) in AWS CLI Command Reference.

### delete-nodegroup

The following code example shows how to use `delete-nodegroup`.

#### AWS CLI

**Example 1: Delete a managed node group for an Amazon EKS cluster**

The following `delete-nodegroup` example deletes a managed node group for an Amazon EKS cluster.

```shell
aws eks delete-nodegroup
  --cluster-name my-eks-cluster
  --nodegroup-name my-eks-nodegroup
```

**Output:**

```json
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-nodegroup/1ec75f5f-0e21-dcc0-b46e-f9c442685cd8",
    "clusterName": "my-eks-cluster",
    "version": "1.26",

}

- For API details, see `DeleteNodegroup` in AWS CLI Command Reference.

deregister-cluster

The following code example shows how to use `deregister-cluster`.
AWS CLI

To deregisters a connected cluster to remove it from the Amazon EKS control plane

The following deregister-cluster example deregisters a connected cluster to remove it from the Amazon EKS control plane.

```bash
aws eks deregister-cluster \
    --name my-eks-anywhere-cluster
```

Output:

```
{
    "cluster": {
        "name": "my-eks-anywhere-cluster",
        "createdAt": "2024-04-12T12:38:37.561000-04:00",
        "status": "DELETING",
        "tags": {},
        "connectorConfig": {
            "activationId": "dfb5ad28-13c3-4e26-8a19-5b2457638c74",
            "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
            "provider": "EKS_ANYWHERE",
            "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Deregistering a cluster in the Amazon EKS User Guide.

- For API details, see DeregisterCluster in AWS CLI Command Reference.

**describe-addon-configuration**

The following code example shows how to use describe-addon-configuration.

**AWS CLI**

Example 1: Configuration options available when creating or updating Amazon vpc-cni AddOns
The following `describe-addon-configuration` example returns all the available configuration schema you use when an add-on is created or updated for vpc-cni add-on with respective version.

```bash
aws eks describe-addon-configuration
    --addon-name vpc-cni
    --addon-version v1.15.1-eksbuild.1
```

Output:

```json
{
    "addonName": "vpc-cni",
    "addonVersion": "v1.15.1-eksbuild.1",
    "configurationSchema": "{ "$ref": "/#definitions/VpcCni" ,
    "$schema": "http://json-schema.org/draft-06/schema#" ,

            "ENABLE_V4_EGRESS": { "format": "boolean", "type": "string" }
        }
```
Example 2: Configuration options available when creating or updating Amazon coredns AddOns

The following describe-addon-configuration example returns all the available configuration schema you use when an add-on is created or updated for coredns add-on with respective version.
aws eks describe-addon-configuration
   --addon-name coredns \
   --addon-version v1.8.7-eksbuild.4

Output:

{
   "addonName": "coredns",
   "addonVersion": "v1.8.7-eksbuild.4",
   "configurationSchema": "{"$ref":"#/definitions/Coredns","$schema
":"http://json-schema.org/draft-06/schema#","definitions":{"Coredns":
   {"additionalProperties":false,"properties":{"computeType":{"type":"stable"},
   "corefile":{"description":"Entire corefile contents to use with
   installation"},{"type":"string"},"nodeSelector":{"additionalProperties":
   {"type":"string"},{"type":"object"},"replicaCount":{"type":"integer
   "},"resources":{"$ref":"#/definitions/Resources"}},"title":"Coredns",
   
   type":"object"},"Limits":{"additionalProperties":false,"properties":
   {"cpu":{"type":"string"},"memory":{"type":"string"}},"title":"Limits
   
   type":"object"},"Resources":{"additionalProperties":false,"properties
   
   :{"limits":{"$ref":"#/definitions/Limits"},"requests":{"$ref":"#/definitions/Limits"}},"title":"Resources"}}
   }"}}
}

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the Amazon EKS.

- For API details, see DescribeAddonConfiguration in AWS CLI Command Reference.

describe-addon-versions

The following code example shows how to use describe-addon-versions.

AWS CLI

Example 1: List all the available addons for EKS Cluster

The following describe-addon-versions example list all the available AWS addons.
## Output:

```bash
$ aws eks describe-addon-versions --output table

### describe-fargate-profile

The following code example shows how to use `describe-fargate-profile`.

**AWS CLI**

**Describe a Fargate profile**

The following `describe-fargate-profile` example describes a Fargate profile.

```
aws eks describe-fargate-profile \
  --cluster-name my-eks-cluster \
  --fargate-profile-name my-fargate-profile
```

**Output:**

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
  
```

describe-identity-provider-config

The following code example shows how to use `describe-identity-provider-config`.

**AWS CLI**

Describe an identity provider configuration associated to your Amazon EKS Cluster
The following describe-identity-provider-config example describes an identity provider configuration associated to your Amazon EKS Cluster.

```bash
aws eks describe-identity-provider-config \\
   --cluster-name my-eks-cluster \\
   --identity-provider-config type=oidc,name=my-identity-provider
```

Output:

```
{
   "identityProviderConfig": {
      "oidc": {
         "identityProviderConfigName": "my-identity-provider",
         "clusterName": "my-eks-cluster",

            "env": "dev"
         },
         "status": "ACTIVE"
      }
   }
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider](https://docs.aws.amazon.com/eks/latest/userguide/identity-provider.html) in the [Amazon EKS User Guide](https://docs.aws.amazon.com/eks/latest/userguide/)

**describe-nodegroup**

The following code example shows how to use `describe-nodegroup`.

**AWS CLI**

**Describe a managed node group for an Amazon EKS cluster**

The following `describe-nodegroup` example describes a managed node group for an Amazon EKS cluster.

```bash
aws eks describe-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup
```

Output:

```json
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-nodegroup/a8c75f2f-df78-a72f-4063-4b69af3de5b1",

}

- For API details, see [DescribeNodegroup](#) in [AWS CLI Command Reference](#).

**describe-update**

The following code example shows how to use `describe-update`.

**AWS CLI**

**Example 1: To describe an update for a cluster**

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
 --name my-eks-cluster \
 --update-id 10bddd13-a71b-425a-b0a6-71cd03e59161
```

Output:

```
{
    "update": {
        "id": "10bddd13-a71b-425a-b0a6-71cd03e59161",
```
"status": "Successful",
"type": "EndpointAccessUpdate",
"params": [
  {
    "type": "EndpointPublicAccess",
    "value": "false"
  },
  {
    "type": "EndpointPrivateAccess",
    "value": "true"
  }
],
"createdAt": "2024-03-14T10:01:26.297000-04:00",
"errors": []
}

For more information, see [Updating an Amazon EKS cluster Kubernetes version](http://example.com) in the *Amazon EKS User Guide*.

**Example 2: To describe an update for a cluster**

The following `describe-update` example describes an update for a cluster named.

```bash
aws eks describe-update
  --name my-eks-cluster
  --update-id e4994991-4c0f-475a-a040-427e6da52966
```

**Output:**

```json
{
  "update": {
    "id": "e4994991-4c0f-475a-a040-427e6da52966",
    "status": "Successful",
    "type": "AssociateEncryptionConfig",
    "params": [
      {
        "type": "EncryptionConfig",
        "value": "[["resources":["secrets"],"provider":{"keyArn":"
        arn:aws:kms:region-code:account:key/key"}}]]"
      }
    ],
```
Example 3: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
  --name my-eks-cluster \
  --update-id b5f0ba18-9a87-4450-b5a0-825e6e84496f
```

Output:

```json
{
  "update": {
    "id": "b5f0ba18-9a87-4450-b5a0-825e6e84496f",
    "status": "Successful",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.29"
      },
      {
        "type": "PlatformVersion",
        "value": "eks.1"
      }
    ],
    "createdAt": "2024-03-14T12:05:26.297000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](https://docs.aws.amazon.com/eks/latest/userguide/cluster-update-kubectl.html) in the *Amazon EKS User Guide*.

- For API details, see [DescribeUpdate](https://docs.aws.amazon.com/cli/latest/reference/eks/describe-update.html) in *AWS CLI Command Reference*.
disassociate-identity-provider-config

The following code example shows how to use disassociate-identity-provider-config.

AWS CLI

Disassociate identity provider to your Amazon EKS Cluster

The following disassociate-identity-provider-config example disassociates an identity provider to your Amazon EKS Cluster.

```
aws eks disassociate-identity-provider-config \
  --cluster-name my-eks-cluster \
  --identity-provider-config 'type=oidc,name=my-identity-provider'
```

Output:

```
{
  "update": {
    "id": "5f78d14e-c57b-4857-a3e4-cf664ae20949",
    "status": "InProgress",
    "type": "DisassociateIdentityProviderConfig",
    "params": [
      {
        "type": "IdentityProviderConfig",
        "value": "[]"
      }
    ],
    "createdAt": "2024-04-11T13:53:43.314000-04:00",
    "errors": []
  }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Disassociate an OIDC identity provider from your cluster in the Amazon EKS User Guide.

- For API details, see DisassociateIdentityProviderConfig in AWS CLI Command Reference.

get-token

The following code example shows how to use get-token.
AWS CLI

Example 1: Get an authentication token for an Amazon EKS Cluster named `my-eks-cluster`

The following get-token example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster.

```
aws eks get-token \
   --cluster-name my-eks-cluster
```

Output:

```json
{
   "kind": "ExecCredential",
   "apiVersion": "client.authentication.k8s.io/v1beta1",
   "spec": {},
   "status": {
      "expirationTimestamp": "2024-04-11T20:59:56Z",
      "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
   }
}
```

Example 2: Gets an authentication token for an Amazon EKS Cluster named `my-eks-cluster` by assuming this roleARN for credentials when signing the token

The following get-token example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster by assuming this roleARN for credentials when signing the token.

```
aws eks get-token \
   --cluster-name my-eks-cluster \
   --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```json
{
   "kind": "ExecCredential",
   "apiVersion": "client.authentication.k8s.io/v1beta1",
   "spec": {},
   "status": {
      "expirationTimestamp": "2024-04-11T21:05:26Z",
      "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
   }
}
```
AWS Command Line Interface

User Guide for Version 2

For API details, see GetToken in AWS CLI Command Reference.

list-addons

The following code example shows how to use list-addons.

AWS CLI

List all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following list-addons example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

```bash
aws eks list-addons \
--cluster-name my-eks-cluster
```

Output:

```json
{
    "addons": [
        "kube-proxy",
        "vpc-cni"
    ]
}
```

For API details, see ListAddons in AWS CLI Command Reference.

list-clusters

The following code example shows how to use list-clusters.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following list-clusters example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.
aws eks list-clusters

Output:

```
{
    "clusters": [
        "prod",
        "qa",
        "stage",
        "my-eks-cluster"
    ]
}
```

- For API details, see ListClusters in AWS CLI Command Reference.

**list-fargate-profiles**

The following code example shows how to use list-fargate-profiles.

**AWS CLI**

To list all the fargate profiles in your Amazon EKS cluster named `my-eks-cluster`

The following list-fargate-profiles example lists all the fargate profiles in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-fargate-profiles \\--cluster-name my-eks-cluster
```

Output:

```
{
    "fargateProfileNames": [
        "my-fargate-profile"
    ]
}
```

- For API details, see ListFargateProfiles in AWS CLI Command Reference.
**list-identity-provider-configs**

The following code example shows how to use `list-identity-provider-configs`.

**AWS CLI**

**List identity providers associated to an Amazon EKS Cluster**

The following `list-identity-provider-configs` example lists identity provider associated to an Amazon EKS Cluster.

```
aws eks list-identity-provider-configs \
  --cluster-name my-eks-cluster
```

Output:

```
{
  "identityProviderConfigs": [ 
    
    { 
      "type": "oidc",
      "name": "my-identity-provider"
    }
  
  ]
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider](https://docs.aws.amazon.com/eks/latest/userguide/authenticate-users-with-openid-connect.html) in the *Amazon EKS User Guide*.

- For API details, see [ListIdentityProviderConfigs](https://docs.aws.amazon.com/cli/latest/reference/eks/list-identity-provider-configs.html) in *AWS CLI Command Reference*.

**list-nodegroups**

The following code example shows how to use `list-nodegroups`.

**AWS CLI**

**List all the node groups in an Amazon EKS cluster**

The following `list-nodegroups` example list all the node groups in an Amazon EKS cluster.

```
aws eks list-nodegroups \
```
Output:

```json
{
   "nodegroups": [
      "my-eks-managed-node-group",
      "my-eks-nodegroup"
   ]
}
```

- For API details, see ListNodegroups in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

#### Example 1: To list all the tags for an Amazon EKS Cluster ARN

The following list-tags-for-resource example lists all the tags for an Amazon EKS Cluster ARN.

```bash
aws eks list-tags-for-resource \\
```

Output:

```json
{
   "tags": {
      "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
      "alpha.eksctl.io/cluster-name": "my-eks-cluster",
      "karpenter.sh/discovery": "my-eks-cluster",
      "auto-delete": "no",
      "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
      "EKS-Cluster-Name": "my-eks-cluster",
      "alpha.eksctl.io/cluster-oidc-enabled": "true",
```

---

**Actions and scenarios**

2814
Example 2: To list all the tags for an Amazon EKS Node group ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Node group ARN.

```
aws eks list-tags-for-resource \
```

Output:

```
{
   "tags": {
      "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-nodegroup-my-eks-managed-node-group",
      "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
      "EKS-Cluster-Name": "my-eks-cluster",
      "alpha.eksctl.io/nodegroup-type": "managed",
      "NodeGroup Name 1": "my-eks-managed-node-group",
      "k8s.io/cluster-autoscaler/enabled": "true",
      "nodegroup-role": "worker",
      "alpha.eksctl.io/cluster-name": "my-eks-cluster",
      "alpha.eksctl.io/nodegroup-name": "my-eks-managed-node-group",
      "karpenter.sh/discovery": "my-eks-cluster",
      "NodeGroup Name 2": "AmazonLinux-Linux-Managed-NG-v1-26-v1",
      "auto-delete": "no",
      "k8s.io/cluster-autoscaler/my-eks-cluster": "owned",
      "aws:cloudformation:logical-id": "ManagedNodeGroup",
      "alpha.eksctl.io/eksctl-version": "0.173.0-dev+a7ee89342.2024-03-01T03:40:57Z"
   }
}
```
Example 3: To list all the tags on an Amazon EKS Fargate profile ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Fargate profile ARN.

```bash
aws eks list-tags-for-resource \
```

Output:

```json
{
  "tags": {
    "eks-fargate-profile-key-2": "value-2",
    "eks-fargate-profile-key-1": "value-1"
  }
}
```

Example 4: To list all the tags for an Amazon EKS Add-on ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```bash
aws eks list-tags-for-resource \
  --resource-arn arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f
```

Output:

```json
{
  "tags": {
    "eks-addon-key-2": "value-2",
    "eks-addon-key-1": "value-1"
  }
}
```

Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```bash
aws eks list-tags-for-resource \
```

```bash
```
Output:

```json
{
   "tags": {
       "my-identity-provider": "test"
   }
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/eks/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### list-update

The following code example shows how to use `list-update`.

**AWS CLI**

**Example 1: To lists the updates associated with an Amazon EKS Cluster name**

The following `list-updates` example lists all the update IDs for an Amazon EKS Cluster name.

```bash
aws eks list-updates \
   --name my-eks-cluster
```

Output:

```json
{
   "updateIds": [
      "5f78d14e-c57b-4857-a3e4-cf664ae20949",
      "760e5a3f-adad-48c7-88d3-7ac283c09c26",
      "cd4ec863-bc55-47d5-a377-3971502f529b",
      "f12657ce-e869-4f17-b158-a82ab8b7d937"
   ]
}
```

**Example 2: To list all the update IDs for an Amazon EKS Node group**

The following `list-updates` example lists all the update IDs for an Amazon EKS Node group.
aws eks list-updates \
   --name my-eks-cluster \
   --nodegroup-name my-eks-managed-node-group

Output:

```json
{
   "updateIds": [
      "8c6c1bef-61fe-42ac-a242-89412387b8e7"
   ]
}
```

Example 3: To list all the update IDs on an Amazon EKS Add-one

The following list-updates example lists all the update IDs for an Amazon EKS Add-on.

aws eks list-updates \
   --name my-eks-cluster \
   --addon-name vpc-cni

Output:

```json
{
   "updateIds": [
      "9cdba8d4-79fb-3c83-afe8-00b508d33268"
   ]
}
```

- For API details, see ListUpdate in AWS CLI Command Reference.

list-updates

The following code example shows how to use list-updates.

AWS CLI

To list the updates for a cluster

This example command lists the current updates for a cluster named example in your default region.
Command:

```
aws eks list-updates --name example
```

Output:

```
{
  "updateIds": [
    "10bddd13-a71b-425a-b0a6-71cd03e59161"
  ]
}
```

- For API details, see `ListUpdates` in *AWS CLI Command Reference*.

**register-cluster**

The following code example shows how to use `register-cluster`.

**AWS CLI**

**Example 1: Register an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS**

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
  --name my-eks-anywhere-cluster \
  --connector-config 'roleArn=arn:aws:iam::111122223333:role/\n  AmazonEKSClusterAgentRole,provider=EKS_ANYWHERE'
```

Output:

```
{
  "cluster": {
    "name": "my-eks-anywhere-cluster",
    "createdAt": "2024-04-12T12:38:37.561000-04:00",
    "status": "PENDING",
    "tags": {},
    "connectorConfig": {
```
"activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
"activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
"activationExpiry": "2024-04-15T12:38:37.082000-04:00",
"provider": "EKS_ANYWHERE",
"roleArn": "arn:aws:iam::111122223333:role/AmazonEKSSConnectorAgentRole"
}
]
}

For more information, see Connecting an external cluster in the Amazon EKS User Guide.

Example 2: Register any external Kubernetes cluster to Amazon EKS

The following register-cluster example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```bash
aws eks register-cluster \
   --name my-eks-anywhere-cluster \
   --connector-config 'roleArn=arn:aws:iam::111122223333:role/AmazonEKSSConnectorAgentRole,provider=OTHER'
```

Output:

```json
{
   "cluster": {
      "name": "my-onprem-k8s-cluster",
      "createdAt": "2024-04-12T12:42:10.861000-04:00",
      "status": "PENDING",
      "tags": {},
      "connectorConfig": {
         "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
         "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
         "activationExpiry": "2024-04-15T12:42:10.339000-04:00",
         "provider": "OTHER",
         "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSSConnectorAgentRole"
      }
   }
}
```

For more information, see Connecting an external cluster in the Amazon EKS User Guide.

- For API details, see RegisterCluster in AWS CLI Command Reference.
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**Example 1: To add the specified tags to an Amazon EKS Cluster**

The following `tag-resource` example adds the specified tags to an Amazon EKS Cluster.

```
aws eks tag-resource \
   --tag 'my-eks-cluster-test-1=test-value-1,my-eks-cluster-dev-1=dev-value-2'
```

This command produces no output.

**Example 2: To add the specified tags to an Amazon EKS Node group**

The following `tag-resource` example adds the specified tags to an Amazon EKS Node group.

```
aws eks tag-resource \
   --tag 'my-eks-nodegroup-test-1=test-value-1,my-eks-nodegroup-dev-1=dev-value-2'
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**Example 1: To deletes the specified tags from an Amazon EKS Cluster**

The following `untag-resource` example deletes the specified tags from an Amazon EKS Cluster.

```
aws eks untag-resource \
   --tag-keys "my-eks-cluster-test-1" "my-eks-cluster-dev-1"
```
This command produces no output.

**Example 2: To deletes the specified tags from an Amazon EKS Node group**

The following `untag-resource` example deletes the specified tags from an Amazon EKS Node group.

```
aws eks untag-resource \
  --tag-keys "my-eks-nodegroup-test-1" "my-eks-nodegroup-dev-1"
```

This command produces no output.

**update-addon**

The following code example shows how to use `update-addon`.

**AWS CLI**

**Example 1. To update an Amazon EKS add-on with service account role ARN**

The following `update-addon` example command updates an Amazon EKS add-on with service account role ARN.

```
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm
```

Output:

```
{
    "update": {
        "id": "c00d2de2-c2e4-3d30-929e-46b8edec2ce4",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
        ]
    }
}
```
"type": "ServiceAccountRoleArn",
"value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
}
],
"updatedAt": "2024-04-12T16:04:55.614000-04:00",
"errors": []
}
}

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

**Example 2. To update an Amazon EKS add-on with specific add-on version**

The following `update-addon` example command updates an Amazon EKS add-on with specific add-on version.

```bash
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
  --addon-version v1.16.4-eksbuild.2
```

Output:

```json
{
  "update": {
    "id": "f58dc0b0-2b18-34bd-bc6a-e4abc0011f36",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.16.4-eksbuild.2"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
      }
    ],
```
Example 3. To update an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `update-addon` example command updates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks update-addon \
   --cluster-name my-eks-cluster \
   --addon-name vpc-cni \
   --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-Yfakrq0C1UTm \
   --addon-version v1.16.4-eksbuild.2 \
   --configuration-values '{"resources": {"limits":{"cpu":"100m"}, "requests": {"cpu":"50m"}}}'} \
   --resolve-conflicts PRESERVE
```

Output:

```
{
   "update": {
      "id": "cd9f2173-a8d8-3004-a90f-032f14326520",
      "status": "InProgress",
      "type": "AddonUpdate",
      "params": [ 
         { 
            "type": "AddonVersion",
            "value": "v1.16.4-eksbuild.2"
         }, 
         { 
            "type": "ServiceAccountRoleArn",
            "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-Yfakrq0C1UTm"
         }
      ]
   }
}
```
"type": "ResolveConflicts",
  "value": "PRESERVE"
},
{
  "type": "ConfigurationValues",
  "value": "{\"resources\": {\"limits\": {\"cpu\": \"100m\"}, \"requests \": {\"cpu\": \"50m\"}}}" 
},
"createdAt": "2024-04-12T16:16:27.363000-04:00",
"errors": []
}
}

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

Example 4. To update an Amazon EKS add-on with custom JSON configuration values file

The following update-addon example command updates an Amazon EKS add-on with custom JSON configuration values and resolve conflicts details.

```bash
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-Yfakrq0C1UTm \
  --addon-version v1.17.1-eksbuild.1 \
  --configuration-values 'file://configuration-values.json' \
  --resolve-conflicts PRESERVE
```

Contents of configuration-values.json:

```json
{
  "resources": {
    "limits": {
      "cpu": "100m"
    },
    "requests": {
      "cpu": "50m"
    }
  },
  "createdAt": "2024-04-12T16:27:36.300000-04:00",
  "errors": []
}
```
"env": {
    "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
  }
}

Output:

```json
{
  "update": {
    "id": "6881a437-174f-346b-9a63-6e91763507cc",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.17.1-eksbuild.1"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
      },
      {
        "type": "ResolveConflicts",
        "value": "PRESERVE"
      },
      {
        "type": "ConfigurationValues",
        "value": "{\n            "resources": {\n                "limits": {\n                    "cpu": "100m"
                },\n                "requests": {\n                    "cpu": "50m"
                }
            },\n            "env": {\n                "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
            }
        }\n        
      }
    ],
    "createdAt": "2024-04-12T16:22:55.519000-04:00",
    "errors": []
  }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

**Example 5. To update an Amazon EKS add-on with custom YAML configuration values file**
The following update-addon example command updates an Amazon EKS add-on with custom YAML configuration values and resolve conflicts details.

```bash
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
  --addon-version v1.18.0-eksbuild.1 \
  --configuration-values 'file://configuration-values.yaml' \
  --resolve-conflicts PRESERVE
```

Contents of configuration-values.yaml:

```yaml
resources:
  limits:
    cpu: '100m'
  requests:
    cpu: '50m'
env:
  AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```json
{
  "update": {
    "id": "a067a4c9-69d0-3769-ace9-d235c5b16701",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.18.0-eksbuild.1"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
      },
      {
        "type": "ResolveConflicts",
        "value": "PRESERVE"
      }
    ]
  }
}
```
For more information, see [Managing Amazon EKS add-ons - Updating an add-on](https://docs.aws.amazon.com/eks/latest/userguide/add-ons-update.html) in the *Amazon EKS User Guide*.

- For API details, see [UpdateAddon](https://docs.aws.amazon.com/cli/latest/reference/eks/update-addon.html) in *AWS CLI Command Reference*.

### update-cluster-config

The following code example shows how to use `update-cluster-config`.

**AWS CLI**

**To update cluster endpoint access**

This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:

```
aws eks update-cluster-config --name example \n   --resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```
{
   "update": {
      "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
      "status": "InProgress",
      "type": "EndpointAccessUpdate",
      "params": [
      
```

Actions and scenarios
To enable logging for a cluster

This example command enables all cluster control plane logging types for a cluster named example.

Command:

```
aws eks update-cluster-config --name example
--logging '{"clusterLogging":{{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}}}'
```

Output:

```
{
   "update": {
       "id": "7551c64b-1d27-4b1e-9f8e-c45f056eb6fd",
       "status": "InProgress",
       "type": "LoggingUpdate",
       "params": [
           {
               "type": "ClusterLogging",
               "value": "{\"clusterLogging\":{{\"types\":[{\"api\",\"audit\",\"authenticator\",\"controllerManager\",\"scheduler\"},\"enabled\":true]]}}"
           },
           "createdAt": 1565807210.37,
           "errors": []
       ]
   }
}
```
For API details, see UpdateClusterConfig in AWS CLI Command Reference.

**update-cluster-version**

The following code example shows how to use `update-cluster-version`.

**AWS CLI**

To updates an Amazon EKS cluster named `my-eks-cluster` to the specified Kubernetes version

The following `update-cluster-version` example updates an Amazon EKS cluster to the specified Kubernetes version.

```
aws eks update-cluster-version  
  --name my-eks-cluster  
  --kubernetes-version 1.27
```

Output:

```
{
  "update": {
    "id": "e4091a28-ea14-48fd-a8c7-975aeb469e8a",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.27"
      },
      {
        "type": "PlatformVersion",
        "value": "eks.16"
      }
    ],
    "createdAt": "2024-04-12T16:56:01.082000-04:00",
    "errors": []
  }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the Amazon EKS User Guide.
• For API details, see `UpdateClusterVersion` in `AWS CLI Command Reference`.

`update-kubeconfig`

The following code example shows how to use `update-kubeconfig`.

**AWS CLI**

**Example 1:** Configures your `kubectl` by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```bash
aws eks update-kubeconfig \
  --name my-eks-cluster
```

Output:

```
```

For more information, see `Creating or updating a kubeconfig file for an Amazon EKS cluster` in the Amazon EKS User Guide.

**Example 2:** Configures your `kubectl` by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```bash
aws eks update-kubeconfig \
  --name my-eks-cluster \
  --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTlqtnM
```

Output:

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the [Amazon EKS User Guide](#).

**Example 3:** Configures your `kubectl` by creating or updating the `kubeconfig` (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the `kubeconfig` (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks update-kubeconfig \
--name my-eks-cluster \
--role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM \
--alias stage-eks-cluster \n--user-alias john
```

**Output:**

Updated context stage-eks-cluster in /Users/dubaria/.kube/config

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the [Amazon EKS User Guide](#).

**Example 4:** Print kubeconfig file entries for review and configures your `kubectl` so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the `kubeconfig` (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks update-kubeconfig \
--name my-eks-cluster \n```

**Actions and scenarios**
--role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM \
--alias stage-eks-cluster \
--user-alias john \
--verbose

Output:

Updated context stage-eks-cluster in /Users/dubaria/.kube/config
Entries:
context:
user: john
name: stage-eks-cluster

name: john
user:
exec:
  apiVersion: client.authentication.k8s.io/v1beta1
  args:
    - --region
    - us-east-2
    - eks

    - --cluster-name
    - my-eks-cluster
    - --output
    - json
    - --role
    - arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM
  command: aws

cluster:
certificate-authority-data: xxx_CA_DATA_xxx
server: https://DALSJ343KE23J3RN45653DSKJTT647TYD.yl4.us-east-2.eks.amazonaws.com

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the Amazon EKS User Guide.

• For API details, see UpdateKubeconfig in AWS CLI Command Reference.
The following code example shows how to use `update-nodegroup-config`.

**AWS CLI**

**Example 1: Update a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster**

The following `update-nodegroup-config` example updates a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster.

```bash
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'addOrUpdateLabels={my-eks-nodegroup-label-1=value-1,my-eks-nodegroup-label-2=value-2}' \
  --taints 'addOrUpdateTaints=[[key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE]]'
```

Output:

```json
{
  "update": {
    "id": "e66d21d3-bd8b-3ad1-a5aa-b196dc08c7c1",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToAdd",
        "value": "{my-eks-nodegroup-label-2":"value-2","my-eks-nodegroup-label-1":"value-1"}"
      },
      {
        "type": "TaintsToAdd",
        "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",\"key\":\"taint-key-1\"}]"
      }
    ],
    "createdAt": "2024-04-08T12:05:19.161000-04:00",
    "errors": []
  }
}
```
Example 2: Update a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster.

```bash
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \
  --taints 'removeTaints=[{"key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE}]'
```

Output:

```json
{
  "update": {
    "id": "67a08692-9e59-3ace-a916-13929f44cec3",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToRemove",
        "value": "["my-eks-nodegroup-label-1","my-eks-nodegroup-label-2"]"
      },
      {
        "type": "TaintsToRemove",
        "value": "[{"effect":"NO_EXECUTE","value":"taint-value-1","key":"taint-key-1"}]"
      }
    ],
    "createdAt": "2024-04-08T12:17:31.817000-04:00",
    "errors": []
  }
}```

Example 3: Update a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster

For more information, see [Updating a managed node group](#) in the [Amazon EKS User Guide](#).
The following update-nodegroup-config example updates a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --taints 'addOrUpdateTaints=[[key=taint-new-key-1,value=taint-new-value-1,effect=PREFER_NO_SCHEDULE]],removeTaints=[[key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE]]'
```

Output:

```
{
  "update": {
    "id": "4a9c8c45-6ac7-3115-be71-d6412a2339b7",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToAdd",
        "value": "{"my-eks-nodegroup-new-label-1":"new-value-1","my-eks-nodegroup-new-label-2":"new-value-2"}"
      },
      {
        "type": "LabelsToRemove",
        "value": "{"my-eks-nodegroup-label-1","my-eks-nodegroup-label-2"}"
      },
      {
        "type": "TaintsToAdd",
        "value": "{"effect":"PREFER_NO_SCHEDULE","value":"taint-new-value-1","key":"taint-new-key-1"}"
      },
      {
        "type": "TaintsToRemove",
        "value": "{"effect":"NO_EXECUTE","value":"taint-value-1","key":"taint-key-1"}"
      }
    ],
    "createdAt": "2024-04-08T12:30:55.486000-04:00",
  }
}
```
For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

**Example 4: Update a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster**

The following `update-nodegroup-config` example updates a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster.

```bash
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --scaling-config minSize=1,maxSize=5,desiredSize=2 \
  --update-config maxUnavailable=2
```

**Output:**

```json
{
  "update": {
    "id": "a977160f-59bf-3023-805d-c9826e460aea",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "MinSize",
        "value": "1"
      },
      {
        "type": "MaxSize",
        "value": "5"
      },
      {
        "type": "DesiredSize",
        "value": "2"
      },
      {
        "type": "MaxUnavailable",
        "value": "2"
      }
    ]
  }
}
```
For more information, see Updating a managed node group in the Amazon EKS User Guide.  
- For API details, see UpdateNodegroupConfig in AWS CLI Command Reference.

update-nodegroup-version

The following code example shows how to use update-nodegroup-version.

AWS CLI

Example 1: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following update-nodegroup-version example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version for your Kubernetes cluster.

```bash
aws eks update-nodegroup-version \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --no-force
```

Output:

```json
{
  "update": {
    "id": "a94ebfc3-6bf8-307a-89e6-7dbaa36421f7",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.26"
      },
      {
        "type": "ReleaseVersion",
      }
    ]
  }
}
```
For more information, see [Updating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide) in the *Amazon EKS User Guide*.

### Example 2: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the specified AMI release version.

```
aws eks update-nodegroup-version \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --kubernetes-version '1.26' \
  --release-version '1.26.12-20240307' \
  --no-force
```

**Output:**

```
{
  "update": {
    "id": "4db06fe1-088d-336b-bdcd-3f0db9495fb7",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.26"
      },
      {
        "type": "ReleaseVersion",
        "value": "1.26.12-20240307"
      }
    ],
    "createdAt": "2024-04-08T13:13:58.595000-04:00",
    "errors": []
  }
}
```
Elastic Beanstalk examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

* **Actions**
  
  **abort-environment-update**
  
  The following code example shows how to use *abort-environment-update*.
  
  **AWS CLI**
  
  **To abort a deployment**
  
  The following command aborts a running application version deployment for an environment named *my-env*:

  ```bash
  aws elasticbeanstalk abort-environment-update --environment-name my-env
  ```

  • For API details, see *AbortEnvironmentUpdate* in *AWS CLI Command Reference*. 

For more information, see Updating a managed node group - [Amazon EKS User Guide](https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html) in the Amazon EKS User Guide.

• For API details, see *UpdateNodegroupVersion* in *AWS CLI Command Reference*. 

---

Actions and scenarios  

2840
check-dns-availability

The following code example shows how to use check-dns-availability.

AWS CLI

To check the availability of a CNAME

The following command checks the availability of the subdomain my-cname.elasticbeanstalk.com:

```
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname
```

Output:

```
{
    "Available": true,
    "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

- For API details, see CheckDnsAvailability in AWS CLI Command Reference.

create-application-version

The following code example shows how to use create-application-version.

AWS CLI

To create a new application version

The following command creates a new version, "v1" of an application named "MyApp":

```
aws elasticbeanstalk create-application-version --application-name MyApp
    --version-label v1 --description MyAppv1 --source-bundle S3Bucket="my-bucket",S3Key="sample.war" --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "my-bucket" that contains the Apache Tomcat sample application.

Output:
create-application

The following code example shows how to use create-application.

AWS CLI

To create a new application

The following command creates a new application named "MyApp":

```
aws elasticbeanstalk create-application --application-name MyApp --description "my application"
```

The create-application command only configures the application's name and description. To upload source code for the application, create an initial version of the application using create-application-version. create-application-version also has an auto-create-application option that lets you create the application and the application version in one step.

Output:

```
{
    "Application": {
        "ApplicationName": "MyApp",
        "ConfigurationTemplates": [],
    }
}
```
create-configuration-template

The following code example shows how to use create-configuration-template.

AWS CLI

To create a configuration template

The following command creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`:

```
aws elasticbeanstalk create-configuration-template --application-name my-app --template-name my-app-v1 --environment-id e-rpqsewtp2j
```

Output:

```
{
   "ApplicationName": "my-app",
   "TemplateName": "my-app-v1",
   "DateCreated": "2015-08-12T18:40:39Z",
   "DateUpdated": "2015-08-12T18:40:39Z",
   "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For API details, see [CreateConfigurationTemplate](#) in AWS CLI Command Reference.

create-environment

The following code example shows how to use create-environment.

AWS CLI

To create a new environment for an application
The following command creates a new environment for version "v1" of a java application named "my-app":

```bash
aws elasticbeanstalk create-environment --application-name my-app --environment-name my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
```

Output:

```json
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "VersionLabel": "v1",
   "Status": "Launching",
   "EnvironmentId": "e-izqpassy4h",
   "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
   "CNAME": "my-app.elasticbeanstalk.com",
   "Health": "Grey",
   "Tier": {
      "Type": "Standard",
      "Name": "WebServer",
      "Version": ""
   },
   "DateUpdated": "2015-02-03T23:04:54.479Z",
   "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

v1 is the label of an application version previously uploaded with create-application-version.

To specify a JSON file to define environment configuration options

The following create-environment command specifies that a JSON file with the name myoptions.json should be used to override values obtained from the solution stack or the configuration template:

```bash
aws elasticbeanstalk create-environment --environment-name sample-env --application-name sampleapp --option-settings file://myoptions.json
```

myoptions.json is a JSON object defining several settings:

```json
[
]
```
For more information, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [CreateEnvironment](#) in *AWS CLI Command Reference*.

**create-storage-location**

The following code example shows how to use `create-storage-location`.

**AWS CLI**

**To create a storage location**

The following command creates a storage location in Amazon S3:

```bash
aws elasticbeanstalk create-storage-location
```

Output:

```json
{
    "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```
delete-application-version

The following code example shows how to use delete-application-version.

AWS CLI

To delete an application version

The following command deletes an application version named 22a0-stage-150819_182129 for an application named my-app:

```
aws elasticbeanstalk delete-application-version --version-label 22a0-stage-150819_182129 --application-name my-app
```

- For API details, see DeleteApplicationVersion in AWS CLI Command Reference.

delete-application

The following code example shows how to use delete-application.

AWS CLI

To delete an application

The following command deletes an application named my-app:

```
aws elasticbeanstalk delete-application --application-name my-app
```

- For API details, see DeleteApplication in AWS CLI Command Reference.

delete-configuration-template

The following code example shows how to use delete-configuration-template.

AWS CLI

To delete a configuration template
The following command deletes a configuration template named `my-template` for an application named `my-app`:

```
aws elasticbeanstalk delete-configuration-template --template-name my-template --application-name my-app
```

- For API details, see `DeleteConfigurationTemplate` in *AWS CLI Command Reference*.

### delete-environment-configuration

The following code example shows how to use `delete-environment-configuration`.

**AWS CLI**

**To delete a draft configuration**

The following command deletes a draft configuration for an environment named `my-env`:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --application-name my-app
```

- For API details, see `DeleteEnvironmentConfiguration` in *AWS CLI Command Reference*.

### describe-application-versions

The following code example shows how to use `describe-application-versions`.

**AWS CLI**

**To view information about an application version**

The following command retrieves information about an application version labeled `v2`:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --version-label "v2"
```

Output:

```
{
   "ApplicationVersions": [
      {
```
For API details, see `DescribeApplicationVersions` in *AWS CLI Command Reference*.

**describe-applications**

The following code example shows how to use `describe-applications`.

**AWS CLI**

**To view a list of applications**

The following command retrieves information about applications in the current region:

```
aws elasticbeanstalk describe-applications
```

Output:

```
{
   "Applications": [
   {
```
For API details, see DescribeApplications in AWS CLI Command Reference.

describe-configuration-options

The following code example shows how to use describe-configuration-options.

AWS CLI

To view configuration options for an environment

The following command retrieves descriptions of all available configuration options for an environment named my-env:
aws elasticbeanstalk describe-configuration-options --environment-name my-env --application-name my-app

Output (abbreviated):

```json
{
   "Options": [
      {
         "Name": "JVMOptions",
         "UserDefined": false,
         "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
         "ChangeSeverity": "RestartApplicationServer",
         "Namespace": "aws:cloudformation:template:parameter",
         "ValueType": "KeyValueList"
      },
      {
         "Name": "Interval",
         "UserDefined": false,
         "DefaultValue": "30",
         "ChangeSeverity": "NoInterruption",
         "Namespace": "aws:elb:healthcheck",
         "MaxValue": 300,
         "MinValue": 5,
         "ValueType": "Scalar"
      },
      ...,
      {
         "Name": "LowerThreshold",
         "UserDefined": false,
         "DefaultValue": "2000000",
         "ChangeSeverity": "NoInterruption",
         "Namespace": "aws:autoscaling:trigger",
         "MinValue": 0,
         "ValueType": "Scalar"
      },
      {
         "Name": "ListenerEnabled",
         "UserDefined": false,
         "DefaultValue": "true",
         "ChangeSeverity": "Unknown",
         "Namespace": "aws:elb:listener",
         "ValueType": "Boolean"
      }
   ]
}```
Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationOptions in AWS CLI Command Reference.

**describe-configuration-settings**

The following code example shows how to use describe-configuration-settings.

**AWS CLI**

**To view configurations settings for an environment**

The following command retrieves configuration settings for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --application-name my-app
```

Output (abbreviated):

```json
{
   "ConfigurationSettings": [
      {
         "ApplicationName": "my-app",
         "EnvironmentName": "my-env",
         "Description": "Environment created from the EB CLI using "eb create \"
"",
         "DeploymentStatus": "deployed",
         "DateCreated": "2015-08-13T19:16:25Z",
         "OptionSettings": [
            {
               "OptionName": "Availability Zones",
               "ResourceName": "AWSEBAutoScalingGroup",
               "Namespace": "aws:autoscaling:asg",
               "Value": "Any"
            },
            {
               "OptionName": "Cooldown",
               "ResourceName": "AWSEBAutoScalingGroup",
```

"Namespace": "aws:autoscaling:asg",
"Value": "360"
},
...

{  
"OptionName": "ConnectionDrainingTimeout",
"ResourceName": "AWSEBLoadBalancer",
"Namespace": "aws:elb:policies",
"Value": "20"
},
{  
"OptionName": "ConnectionSettingIdleTimeout",
"ResourceName": "AWSEBLoadBalancer",
"Namespace": "aws:elb:policies",
"Value": "60"
}
],
"DateUpdated": "2015-08-13T23:30:07Z",
"SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
]
}
}

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see **DescribeConfigurationSettings** in **AWS CLI Command Reference**.

describe-environment-health

The following code example shows how to use describe-environment-health.

AWS CLI

**To view environment health**

The following command retrieves overall health information for an environment named **my-env**:

```
aws elasticbeanstalk describe-environment-health --environment-name my-env --attribute-names All
```
Output:

```json
{
  "Status": "Ready",
  "EnvironmentName": "my-env",
  "Color": "Green",
  "ApplicationMetrics": {
    "Duration": 10,
    "Latency": {
      "P99": 0.004,
      "P75": 0.002,
      "P90": 0.003,
      "P95": 0.004,
      "P85": 0.003,
      "P10": 0.001,
      "P999": 0.004,
      "P50": 0.001
    },
    "RequestCount": 45,
    "StatusCodes": {
      "Status3xx": 0,
      "Status2xx": 45,
      "Status5xx": 0,
      "Status4xx": 0
    }
  },
  "RefreshedAt": "2015-08-20T21:09:18Z",
  "HealthStatus": "Ok",
  "InstancesHealth": {
    "Info": 0,
    "Ok": 1,
    "Unknown": 0,
    "Severe": 0,
    "Warning": 0,
    "Degraded": 0,
    "NoData": 0,
    "Pending": 0
  },
  "Causes": []
}
```
Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic Beanstalk Developer Guide.

- For API details, see `DescribeEnvironmentHealth` in AWS CLI Command Reference.

**describe-environment-resources**

The following code example shows how to use `describe-environment-resources`.

**AWS CLI**

To view information about the AWS resources in your environment

The following command retrieves information about resources in an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

Output:

```json
{
   "EnvironmentResources": {
      "EnvironmentName": "my-env",
      "AutoScalingGroups": [
         {
            "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-QSB2Z088SXZT"
         }
      ],
      "Triggers": [],
      "LoadBalancers": [
         {
            "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
         }
      ],
      "Queues": [],
      "Instances": [
         {
            "Id": "i-0c91c786"
         }
      ],
      "LaunchConfigurations": [
```
• For API details, see DescribeEnvironmentResources in AWS CLI Command Reference.

describe-environments

The following code example shows how to use describe-environments.

AWS CLI

To view information about an environment

The following command retrieves information about an environment named my-env:

```
aws elasticbeanstalk describe-environments --environment-names my-env
```

Output:

```
{
  "Environments": [
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "VersionLabel": "7f58-stage-150812_025409",
      "Status": "Ready",
      "EnvironmentId": "e-rpqsewtp2j",
      "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-west-2.elb.amazonaws.com",
      "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
      "CNAME": "my-env.elasticbeanstalk.com",
      "Health": "Green",
      "AbortableOperationInProgress": false,
      "Tier": {
        "Version": "",
        "Type": "Standard",

      }
    }
  ]
}
```
describe-events

The following code example shows how to use describe-events.

AWS CLI

To view events for an environment

The following command retrieves events for an environment named my-env:

```bash
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```json
{
    "Events": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Message": "Environment health has transitioned from Info to Ok.",
            "EventDate": "2015-08-20T07:06:53.535Z",
            "Severity": "INFO"
        },
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "b7f3960b-4709-11e5-ba1e-07e16200da41",
            "Message": "Environment update completed successfully.",
            "EventDate": "2015-08-20T07:06:02.049Z"
        }
    ]
}
```

- For API details, see [DescribeEnvironments](#) in *AWS CLI Command Reference*.
For API details, see `DescribeEvents` in `AWS CLI Command Reference`.

**describe-instances-health**

The following code example shows how to use `describe-instances-health`.

**AWS CLI**

**To view environment health**

The following command retrieves health information for instances in an environment named `my-env`:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --attribute-names All
```

Output:

```
{
   "InstanceHealthList": [
   {
      "InstanceId": "i-08691cc7",
      "ApplicationMetrics": {
         "Duration": 10,
      }
   }
   ]
}
```
"Latency": {
    "P99": 0.006,
    "P75": 0.002,
    "P90": 0.004,
    "P95": 0.005,
    "P85": 0.003,
    "P10": 0.0,
    "P999": 0.006,
    "P50": 0.001
},
"RequestCount": 48,
"StatusCodes": {

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeInstancesHealth in AWS CLI Command Reference.

**list-available-solution-stacks**

The following code example shows how to use list-available-solution-stacks.

**AWS CLI**

**To view solution stacks**

The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

```
aws elasticbeanstalk list-available-solution-stacks
```

Output (abbreviated):

```
{
  "SolutionStacks": [
    "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Puma)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Passenger Standalone)",
    "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 1.9.3",
    "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
    "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 7",
    "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 6",
    "64bit Windows Server Core 2012 R2 running IIS 8.5",
    "64bit Windows Server 2012 R2 running IIS 8.5",
  ]
}```
"64bit Windows Server 2012 running IIS 8",
"64bit Windows Server 2008 R2 running IIS 7.5",
"64bit Amazon Linux 2015.03 v2.0.0 running Docker 1.6.2",
"64bit Amazon Linux 2015.03 v2.0.0 running Multi-container Docker 1.6.2 (Generic)",
"64bit Debian jessie v2.0.0 running GlassFish 4.1 Java 8 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running GlassFish 4.0 Java 7 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running Go 1.4 (Preconfigured - Docker)",

"64bit Debian jessie v2.0.0 running Python 3.4 (Preconfigured - Docker)",
],
"SolutionStackDetails": [
{
 "PermittedFileTypes": ["zip"],
 "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Node.js"
},
...
]

• For API details, see ListAvailableSolutionStacks in AWS CLI Command Reference.

rebuild-environment

The following code example shows how to use rebuild-environment.

AWS CLI

To rebuild an environment

The following command terminates and recreates the resources in an environment named my-env:

aws elasticbeanstalk rebuild-environment --environment-name my-env

• For API details, see RebuildEnvironment in AWS CLI Command Reference.
**request-environment-info**

The following code example shows how to use `request-environment-info`.

**AWS CLI**

**To request tailed logs**

The following command requests logs from an environment named `my-env`:

```bash
aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail
```

After requesting logs, retrieve their location with `retrieve-environment-info`.

- For API details, see [RequestEnvironmentInfo](#) in [AWS CLI Command Reference](#).

**restart-app-server**

The following code example shows how to use `restart-app-server`.

**AWS CLI**

**To restart application servers**

The following command restarts application servers on all instances in an environment named `my-env`:

```bash
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see [RestartAppServer](#) in [AWS CLI Command Reference](#).

**retrieve-environment-info**

The following code example shows how to use `retrieve-environment-info`.

**AWS CLI**

**To retrieve tailed logs**

The following command retrieves a link to logs from an environment named `my-env`:
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail

Output:

```
{
    "EnvironmentInfo": [
    {
        "SampleTimestamp": "2015-08-20T22:23:17.703Z",
        "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqju3yjs/i-09c1c867/TailLogs-1440109397703.out?AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n%2BEalOV6A2HIOx4Rcfb7LT16bBM%3D",
        "InfoType": "tail",
        "Ec2InstanceId": "i-09c1c867"
    }
    ]
}
```

View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

- For API details, see RetrieveEnvironmentInfo in AWS CLI Command Reference.

swap-environment-cnames

The following code example shows how to use swap-environment-cnames.

AWS CLI

To swap environment CNAMES

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue --destination-environment-name my-env-green
```

- For API details, see SwapEnvironmentCnames in AWS CLI Command Reference.
**terminate-environment**

The following code example shows how to use `terminate-environment`.

**AWS CLI**

**To terminate an environment**

The following command terminates an Elastic Beanstalk environment named `my-env`:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Status": "Terminating",
    "EnvironmentId": "e-fh2eravpns",
    "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": false,
    "Tier": {
        "Version": "",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-08-12T19:05:54.744Z",
    "DateCreated": "2015-08-12T18:52:53.622Z"
}
```

- For API details, see [TerminateEnvironment](#) in *AWS CLI Command Reference*.

**update-application-version**

The following code example shows how to use `update-application-version`.

Actions and scenarios
AWS CLI

To change an application version's description

The following command updates the description of an application version named 22a0-stage-150819_185942:

```
aws elasticbeanstalk update-application-version --version-label 22a0-stage-150819_185942 --application-name my-app --description "new description"
```

Output:

```
{
   "ApplicationVersion": {
      "ApplicationName": "my-app",
      "VersionLabel": "22a0-stage-150819_185942",
      "Description": "new description",
      "DateCreated": "2015-08-19T18:59:17.646Z",
      "DateUpdated": "2015-08-20T22:53:28.871Z",
      "SourceBundle": {
         "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012",
         "S3Key": "my-app/22a0-stage-150819_185942.war"
      }
   }
}
```

update-application

The following code example shows how to use update-application.

AWS CLI

To change an application's description

The following command updates the description of an application named my-app:

```
aws elasticbeanstalk update-application --application-name my-app --description "my Elastic Beanstalk application"
```

Output:
For API details, see UpdateApplication in AWS CLI Command Reference.

**update-configuration-template**

The following code example shows how to use update-configuration-template.

**AWS CLI**

To update a configuration template

The following command removes the configured CloudWatch custom health metrics configuration ConfigDocument from a saved configuration template named my-template:

```bash
aws elasticbeanstalk update-configuration-template --template-name my-template --application-name my-app --options-to-remove Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```json
{
  "ApplicationName": "my-app",
  "TemplateName": "my-template",
  "DateCreated": "2015-08-20T22:39:31Z",
  "DateUpdated": "2015-08-20T22:43:11Z",
}
```
For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see UpdateConfigurationTemplate in AWS CLI Command Reference.

**update-environment**

The following code example shows how to use update-environment.

**AWS CLI**

To update an environment to a new version

The following command updates an environment named "my-env" to version "v2" of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "v2",
    "Status": "Updating",
    "EnvironmentId": "e-sqipays4h",
    "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUAO-0123456789.us-west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "Tier": {
        "Version": "",
        "Type": "Standard",
        "Name": "WebServer"
    }
}
```
To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```bash
aws elasticbeanstalk update-environment --environment-name my-env --option-settings Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=ParamValue
```

The option-settings parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

To configure option settings from a file

The following command configures several options in the aws:elb:loadbalancer namespace from a file:

```bash
aws elasticbeanstalk update-environment --environment-name my-env --option-settings file://options.json
```

options.json is a JSON object defining several settings:

```json
[
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Interval",
        "Value": "15"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Timeout",
        "Value": "8"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "HealthyThreshold",
        "Value": "2"
    }
]
```
The following code example shows how to use validate-configuration-settings.

**AWS CLI**

To validate configuration settings
The following command validates a CloudWatch custom metrics config document:

```
aws elasticbeanstalk validate-configuration-settings --application-name my-app --environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON document that includes one or more configuration settings to validate:

```
[
  {
    "Namespace": "aws:elasticbeanstalk:healthreporting:system",
    "OptionName": "ConfigDocument",
    "Value": "{"CloudWatchMetrics": {"Environment": {
      "ApplicationLatencyP99.9": null, "InstancesSevere": 60,
      "ApplicationLatencyP90": 60, "ApplicationLatencyP99": null,
      "ApplicationLatencyP95": 60, "InstancesUnknown": 60,
      "ApplicationLatencyP85": 60, "InstancesInfo": null,
      "ApplicationRequests2xx": null, "InstancesDegraded": null,
      "InstancesWarning": 60, "ApplicationLatencyP50": 60,
      "ApplicationRequestsTotal": null, "InstancesNoData": null,
      "InstancesPending": 60, "ApplicationLatencyP10": null,
      "ApplicationRequests5xx": null, "ApplicationLatencyP75": null,
      "InstancesOk": 60, "ApplicationRequests3xx": null,
      "ApplicationRequests4xx": null, "Instance": {
        "ApplicationLatencyP99.9": null, "CPUUser": 60,
        "ApplicationLatencyP90": null, "ApplicationRequests2xx": null,
        "CPUIdle": null, "ApplicationLatencyP99": null,
        "ApplicationRequestsP5xx": null, "CPUOwait": null,
        "LoadAverage1min": null, "CPUIrq": null, "CPUNice": 60,
        "LoadAverage5min": null, "CPUIowait": 60,
        "ApplicationRequestsP10": null, "LoadAverage5min": null,
        "ApplicationRequests5xx": null, "CPUSystem": 60,
        "ApplicationRequestsP75": 60, "CPUOsoftirq": 60,
        "ApplicationRequests4xx": null, "InstanceHealth": null,
        "CPUOsoftirq": 60},
      "Version": 1}"
  }
]
```

If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array:

```
{
  "Messages": []
}
```

If validation fails, the response will include information about the error:
{  
    "Messages": [  
        {  
            "OptionName": "ConfigDocumet",  
            "Message": "Invalid option specification (Namespace: 'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocumet'): Unknown configuration setting.",  
            "Namespace": "aws:elasticbeanstalk:healthreporting:system",  
            "Severity": "error"  
        }  
    ]  
}  

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see ValidateConfigurationSettings in AWS CLI Command Reference.

Elastic Load Balancing - Version 1 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 1.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- Actions

**Actions**

**add-tags**

The following code example shows how to use add-tags.
AWS CLI

To add a tag to a load balancer

This example adds tags to the specified load balancer.

Command:

```
aws elb add-tags --load-balancer-name my-load-balancer --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see AddTags in AWS CLI Command Reference.

apply-security-groups-to-load-balancer

The following code example shows how to use apply-security-groups-to-load-balancer.

AWS CLI

To associate a security group with a load balancer in a VPC

This example associates a security group with the specified load balancer in a VPC.

Command:

```
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer --security-groups sg-fc448899
```

Output:

```
{
   "SecurityGroups": [
      "sg-fc448899"
   ]
}
```

- For API details, see ApplySecurityGroupsToLoadBalancer in AWS CLI Command Reference.

attach-load-balancer-to-subnets

The following code example shows how to use attach-load-balancer-to-subnets.
AWS CLI

To attach subnets to a load balancer

This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:

```
{
  "Subnets": [
    "subnet-15aaab61",
    "subnet-0ecac448"
  ]
}
```

- For API details, see [AttachLoadBalancerToSubnets](#) in AWS CLI Command Reference.

configure-health-check

The following code example shows how to use configure-health-check.

AWS CLI

To specify the health check settings for your backend EC2 instances

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:
For API details, see [ConfigureHealthCheck](#) in *AWS CLI Command Reference*.

### create-app-cookie-stickiness-policy

The following code example shows how to use `create-app-cookie-stickiness-policy`.

**AWS CLI**

**To generate a stickiness policy for your HTTPS load balancer**

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

Command:

```bash
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-app-cookie-policy --cookie-name my-app-cookie
```

For API details, see [CreateAppCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

### create-lb-cookie-stickiness-policy

The following code example shows how to use `create-lb-cookie-stickiness-policy`.

**AWS CLI**

**To generate a duration-based stickiness policy for your HTTPS load balancer**

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

```json
{
  "HealthCheck": {
    "HealthyThreshold": 2,
    "Interval": 30,
    "Target": "HTTP:80/png",
    "Timeout": 3,
    "UnhealthyThreshold": 2
  }
}
```
Command:

```
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy --cookie-expiration-period 60
```

- For API details, see CreateLbCookieStickinessPolicy in AWS CLI Command Reference.

**create-load-balancer-listeners**

The following code example shows how to use create-load-balancer-listeners.

**AWS CLI**

To create HTTP listeners for a load balancer

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

To create HTTPS listeners for a load balancer

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

- For API details, see CreateLoadBalancerListeners in AWS CLI Command Reference.

**create-load-balancer-policy**

The following code example shows how to use create-load-balancer-policy.

**AWS CLI**

To create a policy that enables Proxy Protocol on a load balancer

This example creates a policy that enables Proxy Protocol on the specified load balancer.
Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-attributes AttributeName=ProxyProtocol,AttributeValue=true
```

To create an SSL negotiation policy using the recommended security policy

This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

To create an SSL negotiation policy using a custom security policy

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-SHA256,AttributeValue=true AttributeName=Server-Defined-Cipher-Order,AttributeValue=true
```

To create a public key policy

This example creates a public key policy.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-attributes AttributeName=PublicKey,AttributeValue=MIIBljANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAwAYUjnfyEyXr1pxjhFWBpMlggUcqoi3kl+dS74kj/c6x7R0tusUaeQCTgIUkayttRDWchuqo1pHC1u
```
To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-authentication-policy --policy-type-name BackendServerAuthenticationPolicyType --policy-attributes AttributeName=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

- For API details, see CreateLoadBalancerPolicy in AWS CLI Command Reference.

create-load-balancer

The following code example shows how to use create-load-balancer.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.
**Command:**

```bash
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
--availability-zones us-west-2a us-west-2b
```

**Output:**

```json
{
   "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

**To create an HTTPS load balancer**

This example creates a load balancer with an HTTPS listener in a VPC.

**Command:**

```bash
aws elb create-load-balancer --load-balancer-name my-load-balancer --
--subnets subnet-15aaab61
--security-groups sg-a61988c3
```

**Output:**

```json
{
   "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

**Command:**

```bash
aws elb create-load-balancer --load-balancer-name my-load-balancer --
--availability-zones us-west-2a us-west-2b
```

**Output:**

```json
{
   "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```
To create an internal load balancer

This example creates an internal load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
--scheme internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
   "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

- For API details, see CreateLoadBalancer in AWS CLI Command Reference.

delete-load-balancer-listeners

The following code example shows how to use delete-load-balancer-listeners.

AWS CLI

To delete a listener from your load balancer

This example deletes the listener for the specified port from the specified load balancer.

Command:

```
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-balancer-ports 80
```

- For API details, see DeleteLoadBalancerListeners in AWS CLI Command Reference.

delete-load-balancer-policy

The following code example shows how to use delete-load-balancer-policy.

AWS CLI

To delete a policy from your load balancer
This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```  

- For API details, see [DeleteLoadBalancerPolicy](https://docs.aws.amazon.com/cli/latest/reference/elb/delete-load-balancer-policy.html) in *AWS CLI Command Reference*.

### delete-load-balancer

The following code example shows how to use `delete-load-balancer`.

**AWS CLI**

**To delete a load balancer**

This example deletes the specified load balancer.

Command:

```
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```  

- For API details, see [DeleteLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elb/delete-load-balancer.html) in *AWS CLI Command Reference*.

### deregister-instances-from-load-balancer

The following code example shows how to use `deregister-instances-from-load-balancer`.

**AWS CLI**

**To deregister instances from a load balancer**

This example deregisters the specified instance from the specified load balancer.

Command:

```
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```  

Output:
For API details, see `DeregisterInstancesFromLoadBalancer` in `AWS CLI Command Reference`.

**describe-account-limits**

The following code example shows how to use `describe-account-limits`.

**AWS CLI**

To describe your Classic Load Balancer limits

The following `describe-account-limits` example displays details about the Classic Load Balancer limits for your AWS account.

```bash
aws elb describe-account-limits
```

Output:

```json
{
  "Limits": [
    {
      "Name": "classic-load-balancers",
      "Max": "20"
    },
    {
      "Name": "classic-listeners",
      "Max": "100"
    },
    {
      "Name": "classic-registered-instances",
      "Max": "1000"
    }
  ]
}
```
For API details, see DescribeAccountLimits in AWS CLI Command Reference.

**describe-instance-health**

The following code example shows how to use describe-instance-health.

**AWS CLI**

**To describe the health of the instances for a load balancer**

This example describes the health of the instances for the specified load balancer.

Command:

```bash
aws elb describe-instance-health --load-balancer-name my-load-balancer
```

Output:

```json
{
  "InstanceStates": [
    {
      "InstanceId": "i-207d9717",
      "ReasonCode": "N/A",
      "State": "InService",
      "Description": "N/A"
    },
    {
      "InstanceId": "i-afefb49b",
      "ReasonCode": "N/A",
      "State": "InService",
      "Description": "N/A"
    }
  ]
}
```

**To describe the health of an instance for a load balancer**

This example describes the health of the specified instance for the specified load balancer.
Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer --instances i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "ELB",
            "State": "OutOfService",
            "Description": "Instance registration is still in progress."
        }
    ]
}
```

The following is an example response for an unhealthy instance.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "Instance",
            "State": "OutOfService",
            "Description": "Instance has failed at least the UnhealthyThreshold number of health checks consecutively."
        }
    ]
}
```

- For API details, see DescribeInstanceHealth in AWS CLI Command Reference.

**describe-load-balancer-attributes**

The following code example shows how to use describe-load-balancer-attributes.
AWS CLI

To describe the attributes of a load balancer

This example describes the attributes of the specified load balancer.

Command:

```bash
aws elb describe-load-balancer-attributes --load-balancer-name my-load-balancer
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": false,
         "Timeout": 300
      },
      "CrossZoneLoadBalancing": {
         "Enabled": true
      },
      "ConnectionSettings": {
         "IdleTimeout": 30
      },
      "AccessLog": {
         "Enabled": false
      }
   }
}
```

- For API details, see [DescribeLoadBalancerAttributes](#) in [AWS CLI Command Reference](#).

**describe-load-balancer-policies**

The following code example shows how to use `describe-load-balancer-policies`.

AWS CLI

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.
Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer
```

Output:

```
{
   "PolicyDescriptions": [
       {
           "PolicyAttributeDescriptions": [
               {
                   "AttributeName": "ProxyProtocol",
                   "AttributeValue": "true"
               }
           ],
           "PolicyName": "my-ProxyProtocol-policy",
           "PolicyTypeName": "ProxyProtocolPolicyType"
       },
       {
           "PolicyAttributeDescriptions": [
               {
                   "AttributeName": "CookieName",
                   "AttributeValue": "my-app-cookie"
               }
           ],
           "PolicyName": "my-app-cookie-policy",
           "PolicyTypeName": "AppCookieStickinessPolicyType"
       },
       {
           "PolicyAttributeDescriptions": [
               {
                   "AttributeName": "CookieExpirationPeriod",
                   "AttributeValue": "60"
               }
           ],
           "PolicyName": "my-duration-cookie-policy",
           "PolicyTypeName": "LBCookieStickinessPolicyType"
       }
   ]
}
```
To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --policy-name my-authentication-policy
```

Output:

```json
{
   "PolicyDescriptions": [
      {
         "PolicyAttributeDescriptions": [
            {
               "AttributeName": "PublicKeyPolicyName",
               "AttributeValue": "my-PublicKey-policy"
            }
         ],
         "PolicyName": "my-authentication-policy",
         "PolicyTypeName": "BackendServerAuthenticationPolicyType"
      }
   ]
}
```

- For API details, see `DescribeLoadBalancerPolicies` in *AWS CLI Command Reference*.

describe-load-balancer-policy-types

The following code example shows how to use `describe-load-balancer-policy-types`.

**AWS CLI**

To describe the load balancer policy types defined by Elastic Load Balancing

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```
Output:

```json
{
    "PolicyTypeDescriptions": [
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "ProxyProtocol",
                    "AttributeType": "Boolean"
                }
            ],
            "PolicyTypeName": "ProxyProtocolPolicyType",
            "Description": "Policy that controls whether to include the IP address and port of the originating request for TCP messages. This policy operates on TCP/SSL listeners only"
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "PublicKey",
                    "AttributeType": "String"
                }
            ],
            "PolicyTypeName": "PublicKeyPolicyType",
            "Description": "Policy containing a list of public keys to accept when authenticating the back-end server(s). This policy cannot be applied directly to back-end servers or listeners but must be part of a BackendServerAuthenticationPolicyType."
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "CookieName",
                    "AttributeType": "String"
                }
            ],
            "PolicyTypeName": "AppCookieStickinessPolicyType",
            "Description": "Stickiness policy with session lifetimes controlled by the lifetime of the application-generated cookie. This policy can be associated only with HTTP/HTTPS listeners."
        }
    ]
}
```

- For API details, see [DescribeLoadBalancerPolicyTypes](#) in [AWS CLI Command Reference](#).
describe-load-balancers

The following code example shows how to use describe-load-balancers.

AWS CLI

To describe your load balancers

This example describes all of your load balancers.

Command:

```
aws elb describe-load-balancers
```

To describe one of your load balancers

This example describes the specified load balancer.

Command:

```
aws elb describe-load-balancers --load-balancer-name my-load-balancer
```

The following example response is for an HTTPS load balancer in a VPC.

Output:

```json
{
   "LoadBalancerDescriptions": [ 
   {
       "Subnets": [ 
          "subnet-15aaab61"
       ],
       "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
       "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",
       "ListenerDescriptions": [ 
       {
           "Listener": {
               "InstancePort": 80,
               "LoadBalancerPort": 80,
               "Protocol": "HTTP",
               "InstanceProtocol": "HTTP"
           },
           "PolicyNames": []
       }]
   }
}
```
{
  "Listener": {
    "InstancePort": 443,
    "SSLCertificateId": "arn:aws:iam::123456789012:server-certificate/my-server-cert",

}
],
]

• For API details, see DescribeLoadBalancers in AWS CLI Command Reference.

describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:
aws elb describe-tags --load-balancer-name my-load-balancer

Output:

```json
{
    "TagDescriptions": [
        {
            "Tags": [
                {
                    "Value": "lima",
                    "Key": "project"
                },
                {
                    "Value": "digital-media",
                    "Key": "department"
                }
            ],
            "LoadBalancerName": "my-load-balancer"
        }
    ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

**detach-load-balancer-from-subnets**

The following code example shows how to use `detach-load-balancer-from-subnets`.

**AWS CLI**

**To detach load balancers from subnets**

This example detaches the specified load balancer from the specified subnet.

Command:

```
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:
In the provided code snippet:

```json
{
   "Subnets": [
      "subnet-15aaab61"
   ]
}
```

For API details, see `DetachLoadBalancerFromSubnets` in AWS CLI Command Reference.

### disable-availability-zones-for-load-balancer

The following code example shows how to use `disable-availability-zones-for-load-balancer`.

**AWS CLI**

**To disable Availability Zones for a load balancer**

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```bash
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```json
{
   "AvailabilityZones": [
      "us-west-2b"
   ]
}
```

For API details, see `DisableAvailabilityZonesForLoadBalancer` in AWS CLI Command Reference.

### enable-availability-zones-for-load-balancer

The following code example shows how to use `enable-availability-zones-for-load-balancer`.

**Actions and scenarios**
**AWS CLI**

**To enable Availability Zones for a load balancer**

This example adds the specified Availability Zone to the specified load balancer.

Command:

```bash
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

Output:

```json
{
   "AvailabilityZones": [
      "us-west-2a",
      "us-west-2b"
   ]
}
```

- For API details, see [EnableAvailabilityZonesForLoadBalancer](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

**modify-load-balancer-attributes**

The following code example shows how to use `modify-load-balancer-attributes`.

**AWS CLI**

**To modify the attributes of a load balancer**

This example modifies the `CrossZoneLoadBalancing` attribute of the specified load balancer.

Command:

```bash
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{"CrossZoneLoadBalancing":{"Enabled":true}}"
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "CrossZoneLoadBalancing": {
      }
   }
}
```
This example modifies the ConnectionDraining attribute of the specified load balancer.

Command:

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer
   --load-balancer-attributes "{"ConnectionDraining":{"Enabled":true,"Timeout ":300}}"
```

Output:

```
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": true,
         "Timeout": 300
      }
   },
   "LoadBalancerName": "my-load-balancer"
}
```

- For API details, see [ModifyLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

### register-instances-with-load-balancer

The following code example shows how to use `register-instances-with-load-balancer`.

**AWS CLI**

**To register instances with a load balancer**

This example registers the specified instance with the specified load balancer.

Command:

```
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer
   --instances i-d6f6fae3
```
Output:

```json
{
    "Instances": [
    {
        "InstanceId": "i-d6f6fae3"
    },
    {
        "InstanceId": "i-207d9717"
    },
    {
        "InstanceId": "i-afefb49b"
    }
    ]
}
```

- For API details, see [RegisterInstancesWithLoadBalancer](#) in *AWS CLI Command Reference*.

### remove-tags

The following code example shows how to use `remove-tags`.

**AWS CLI**

**To remove tags from a load balancer**

This example removes a tag from the specified load balancer.

Command:

```bash
aws elb remove-tags --load-balancer-name my-load-balancer --tags project
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

### set-load-balancer-listener-ssl-certificate

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

**AWS CLI**

**To update the SSL certificate for an HTTPS load balancer**
This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```bash
```

**set-load-balancer-policies-for-backend-server**

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

**AWS CLI**

**To replace the policies associated with a port for a backend instance**

This example replaces the policies that are currently associated with the specified port.

Command:

```bash
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```

**To remove all policies that are currently associated with a port on your backend instance**

This example removes all policies associated with the specified port.

Command:

```bash
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

set-load-balancer-policies-of-listener

The following code example shows how to use set-load-balancer-policies-of-listener.

**AWS CLI**

To replace the policies associated with a listener

This example replaces the policies that are currently associated with the specified listener.

Command:

```bash
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
--load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

To remove all policies associated with your listener

This example removes all policies that are currently associated with the specified listener.

Command:

```bash
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
--load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the describe-load-balancer-policies command.

- For API details, see [SetLoadBalancerPoliciesOfListener](https://docs.aws.amazon.com/cli/latest/reference/elb/set-load-balancer-policies-of-listener) in *AWS CLI Command Reference*.

---

**Elastic Load Balancing - Version 2 examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- Actions

Actions

add-listener-certificates

The following code example shows how to use `add-listener-certificates`.

AWS CLI

To add a certificate to a secure listener

This example adds the specified certificate to the specified secure listener.

Command:

```bash
```

Output:

```json
{
   "Certificates": [
   {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
      "IsDefault": false
   }
   ]
}
```

- For API details, see `AddListenerCertificates` in **AWS CLI Command Reference**.

add-tags

The following code example shows how to use `add-tags`.

AWS CLI

**To add tags to a load balancer**

The following add-tags example adds the project and department tags to the specified load balancer.

```bash
aws elbv2 add-tags \
  --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

**create-listener**

The following code example shows how to use create-listener.

**Example 1: To create an HTTP listener**

The following create-listener example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --protocol HTTP \
  --port 80 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](#) in the *User Guide for Application Load Balancers*.

**Example 2: To create an HTTPS listener**

The following create-listener example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools,
get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --protocol HTTPS \
  --port 443 \
  --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
  --ssl-policy ELBSecurityPolicy-2016-08 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see Add an HTTPS listener in the User Guide for Application Load Balancers.

**Example 3: To create a TCP listener**

The following create-listener example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ece11e \
  --protocol TCP \
  --port 80 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

**Example 4: To create a TLS listener**

The following create-listener example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
```

Actions and scenarios 2900
For more information, see TLS listeners for your Network Load Balancer in the User Guide for Network Load Balancers.

Example 5: To create a UDP listener

The following create-listener example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
--load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ee11e \
--protocol UDP \
--port 53 \
--default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

Example 6: To create a listener for the specified gateway and forwarding

The following create-listener example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
--load-balancer-arn arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \
--default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```json
{
}
"Listeners": [
  {
    "ListenerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/afc127db15f925de",
    "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
    "DefaultActions": [
      {
        "Type": "forward",
        "ForwardConfig": {
          "TargetGroups": [
            {
              "TargetGroupArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
            }
          ]
        }
      }
    ]
  }
]

For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the User Guide for Gateway Load Balancers.

- For API details, see CreateListener in AWS CLI Command Reference.

create-load-balancer

The following code example shows how to use create-load-balancer.

**AWS CLI**

**Example 1: To create an Internet-facing load balancer**

The following create-load-balancer example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer
```
Output:

```json
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internet-facing",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CreatedTime": "2017-08-25T21:26:12.920Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
        }
    ]
}
```

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

Example 2: To create an internal load balancer
The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
  --name my-internal-load-balancer \
  --scheme internal \
  --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
  "LoadBalancers": [
    {
      "Type": "application",
      "Scheme": "internal",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
        {
          "ZoneName": "us-west-2a",
          "SubnetId": "subnet-8360a9e7"
        },
        {
          "ZoneName": "us-west-2b",
          "SubnetId": "subnet-b7d581c0"
        }
      ],
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
      "DNSName": "internal-my-internal-load-balancer-1529930873.us-west-2.elb.amazonaws.com",
      "SecurityGroups": [
        "sg-5943793c"
      ],
      "LoadBalancerName": "my-internal-load-balancer",
      "State": {
        "Code": "provisioning"
      },
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"
    }
  ]
}
```
For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

Example 3: To create a Network Load Balancer

The following `create-load-balancer` example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```bash
aws elbv2 create-load-balancer \
   --name my-network-load-balancer \
   --type network \
   --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```
{
   "LoadBalancers": [
      {
         "Type": "network",
         "Scheme": "internet-facing",
         "IpAddressType": "ipv4",
         "VpcId": "vpc-3ac0fb5f",
         "AvailabilityZones": [
            {
               "LoadBalancerAddresses": [
                  {
                     "IpAddress": "35.161.207.171",
                     "AllocationId": "eipalloc-64d5890a"
                  }
               ],
               "ZoneName": "us-west-2b",
               "SubnetId": "subnet-5264e837"
            }
         ],
         "CanonicalHostedZoneId": "Z2P70J7EXAMPE",
         "DNSName": "my-network-load-balancer-5d1b75f4f1ce11e.elb.us-west-2.amazonaws.com",
```
For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

Example 4: To create a Gateway Load Balancer

The following create-load-balancer example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```bash
aws elbv2 create-load-balancer \
   --name my-gateway-load-balancer \
   --type gateway \
   --subnets subnet-dc83f691 subnet-a62583f9
```

Output:

```json
{
   "LoadBalancers": [
   {
      "Type": "gateway",
      "VpcId": "vpc-838475fe",
      "AvailabilityZones": [
      {
         "ZoneName": "us-east-1b",
         "SubnetId": "subnet-a62583f9"
      },
      {
         "ZoneName": "us-east-1a",
         "SubnetId": "subnet-dc83f691"
      }
      ],
      "CreatedTime": "2021-07-14T19:33:43.324000+00:00",
      "LoadBalancerName": "my-gateway-load-balancer",
      "State": {
```
create-rule

The following code example shows how to use create-rule.

AWS CLI

Example 1: To create a rule using a path condition and a forward action

The following create-rule example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```
aws elbv2 create-rule
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
    --priority 5
    --conditions file://conditions-pattern.json
    --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8067
```

Contents of conditions-pattern.json:

```
[
    {
        "Field": "path-pattern",
        "PathPatternConfig": {
            "Values": ["/images/**"]
        }
    }
]
```
Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
  --priority 10 \
  --conditions file://conditions-host.json \n  --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```
[
  {
    "Field": "host-header",
    "HostHeaderConfig": {
      "Values": ["*.example.com"]
    }
  }
]
```

Contents of `actions-fixed-response.json`

```
[
  {
    "Type": "fixed-response",
    "FixedResponseConfig": {
      "MessageBody": "Hello world",
      "StatusCode": "200",
      "ContentType": "text/plain"
    }
  }
]
```

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.
aws elbv2 create-rule
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
  --priority 20
  --conditions file://conditions-source-ip.json
  --actions file://actions-authenticate.json

Contents of conditions-source-ip.json

```
[
  {
    "Field": "source-ip",
    "SourceIpConfig": {
      "Values": ["192.0.2.0/24", "198.51.100.10/32"]
    }
  }
]
```

Contents of actions-authenticate.json

```
[
  {
    "Type": "authenticate-oidc",
    "AuthenticateOidcConfig": {
      "Issuer": "https://idp-issuer.com",
      "TokenEndpoint": "https://token-endpoint.com",
      "UserInfoEndpoint": "https://user-info-endpoint.com",
      "ClientId": "abcdefghijklmnopqrstuvwxyz123456789",
      "ClientSecret": "123456789012345678901234567890",
      "SessionCookieName": "my-cookie",
      "SessionTimeout": 3600,
      "Scope": "email",
      "AuthenticationRequestExtraParams": {
        "display": "page",
        "prompt": "login"
      },
      "OnUnauthenticatedRequest": "deny"
    }
  },
  {
    "Order": 1
  }
]
```
For API details, see CreateRule in AWS CLI Command Reference.

create-target-group

The following code example shows how to use create-target-group.

AWS CLI

Example 1: To create a target group for an Application Load Balancer

The following create-target-group example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is instance). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```bash
aws elbv2 create-target-group \
  --name my-targets \
  --protocol HTTP \
  --port 80 \
  --target-type instance \
  --vpc-id vpc-3ac0fb5f
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
      "Protocol": "HTTP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
```
"HealthCheckEnabled": true,
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 5,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
   "HttpCode": "200"
},
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
}

For more information, see [Create a target group](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/balancers-load-balance-target-groups.html) in the User Guide for Application Load Balancers.

**Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function**

The following `create-target-group` example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is `lambda`). Health checks are disabled for this target group by default.

```
aws elbv2 create-target-group \
   --name my-lambda-target \
   --target-type lambda
```

Output:

```
{
   "TargetGroups": [
      {
         "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
         "TargetGroupName": "my-lambda-target",
         "HealthCheckEnabled": false,
         "HealthCheckIntervalSeconds": 35,
         "HealthCheckTimeoutSeconds": 30,
         "HealthyThresholdCount": 5,
         "UnhealthyThresholdCount": 2,
```
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
    "HttpCode": "200"
},
"TargetType": "lambda",
"IpAddressType": "ipv4"
}
]

For more information, see [Lambda functions as targets](#) in the *User Guide for Application Load Balancers*.

**Example 3: To create a target group for a Network Load Balancer**

The following `create-target-group` example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is `ip`). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```bash
aws elbv2 create-target-group \
    --name my-ip-targets \
    --protocol TCP \
    --port 80 \
    --target-type ip \
    --vpc-id vpc-3ac0fb5f
```

Output:

```json
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
            "TargetGroupName": "my-ip-targets",
            "Protocol": "TCP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckEnabled": true,
            "HealthCheckProtocol": "TCP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckIntervalSeconds": 30,
```
For more information, see Create a target group in the User Guide for Network Load Balancers.

**Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer**

The following create-target-group example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is alb).

```
aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f
```

Output:

```
{
   "TargetGroups": [
       {
           "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
           "TargetGroupName": "my-alb-target",
           "Protocol": "TCP",
           "Port": 80,
           "VpcId": "vpc-838475fe",
           "HealthCheckProtocol": "HTTP",
           "HealthCheckPort": "traffic-port",
           "HealthCheckEnabled": true,
           "HealthCheckIntervalSeconds": 30,
           "HealthCheckTimeoutSeconds": 6,
           "HealthyThresholdCount": 5,
           "UnhealthyThresholdCount": 2,
           "HealthCheckPath": "/",
           "Matcher": {
               "HttpCode": "200-399"
           },
           "TargetType": "alb",
           "IpAddressType": "ipv4"
       }
   ]
}
```
For more information, see Create a target group with an Application Load Balancer as the target in the User Guide for Network Load Balancers.

Example 5: To create a target group for a Gateway Load Balancer

The following create-target-group example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```bash
aws elbv2 create-target-group \\  --name my-glb-targetgroup \\  --protocol GENEVE \\  --port 6081 \\  --target-type instance \\  --vpc-id vpc-838475fe
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57ead6f40b6f",
      "TargetGroupName": "my-glb-targetgroup",
      "Protocol": "GENEVE",
      "Port": 6081,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "80",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 10,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "TargetType": "instance"
    }
  ]
}
```
For more information, see Create a target group <https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html>`__ in the Gateway Load Balancer User Guide.

- For API details, see CreateTargetGroup in AWS CLI Command Reference.

**delete-listener**

The following code example shows how to use delete-listener.

**AWS CLI**

To delete a listener

The following delete-listener example deletes the specified listener.

```
aws elbv2 delete-listener \\
  --listener-arn arn:aws:elasticloadbalancing:ua-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see DeleteListener in AWS CLI Command Reference.

**delete-load-balancer**

The following code example shows how to use delete-load-balancer.

**AWS CLI**

To delete a load balancer

The following delete-load-balancer example deletes the specified load balancer.

```
aws elbv2 delete-load-balancer \\
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

- For API details, see DeleteLoadBalancer in AWS CLI Command Reference.

**delete-rule**

The following code example shows how to use delete-rule.
AWS CLI

**To delete a rule**

The following delete-rule example deletes the specified rule.

```bash
aws elbv2 delete-rule \
   --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

For API details, see [DeleteRule](#) in *AWS CLI Command Reference*.

**delete-target-group**

The following code example shows how to use delete-target-group.

AWS CLI

**To delete a target group**

The following delete-target-group example deletes the specified target group.

```bash
aws elbv2 delete-target-group \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see [Delete a load balancer](#) in the *Application Load Balancer Guide*.

For API details, see [DeleteTargetGroup](#) in *AWS CLI Command Reference*.

**deregister-targets**

The following code example shows how to use deregister-targets.

AWS CLI

**Example 1: To deregister a target from a target group**

The following deregister-targets example removes the specified instance from the specified target group.
Example 2: To deregister a target registered using port overrides

The following deregister-targets example removes an instance from a target group that was registered using port overrides.

```
aws elbv2 deregister-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
    --targets Id=i-1234567890abcdef0,Port=80  Id=i-1234567890abcdef0,Port=766
```

For API details, see [DeregisterTargets](#) in AWS CLI Command Reference.

describe-account-limits

The following code example shows how to use describe-account-limits.

AWS CLI

To describe your Elastic Load Balancing limits

The following describe-account-limits example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```
aws elbv2 describe-account-limits
```

Output:

```
{
    "Limits": [
        {
            "Name": "target-groups",
            "Max": "3000"
        },
        {
            "Name": "targets-per-application-load-balancer",
            "Max": "1000"
        }
    ]
}
```

```json
{
    "Name": "listeners-per-application-load-balancer",
    "Max": "50"
},
{
    "Name": "rules-per-application-load-balancer",

{
    "Name": "targets-per-availability-zone-per-gateway-load-balancer",
    "Max": "300"
}
}```
For more information, see Quotas in the AWS General Reference.

- For API details, see DescribeAccountLimits in AWS CLI Command Reference.

**describe-listener-certificates**

The following code example shows how to use describe-listener-certificates.

**AWS CLI**

To describe the certificates for a secure listener

This example describes the certificates for the specified secure listener.

Command:

```bash
aws elbv2 describe-listener-certificates --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```json
{
   "Certificates": [
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-059ba72f705",
         "IsDefault": false
      },
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557",
         "IsDefault": false
      },
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/fe59da96-6f58-4a22-8eed-6d0d50477e1d",
         "IsDefault": true
      }
   ]
}
```

- For API details, see DescribeListenerCertificates in AWS CLI Command Reference.
describe-listeners

The following code example shows how to use describe-listeners.

AWS CLI

To describe a listener

This example describes the specified listener.

Command:

```bash
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```json
{
    "Listeners": [
        {
            "Port": 80,
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

To describe the listeners for a load balancer

This example describe the listeners for the specified load balancer.

Command:
aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188

Output:

```json
{
    "Listeners": [
        {
            "Port": 443,
            "Protocol": "HTTPS",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-server-cert"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
        },
        {
            "Port": 80,
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

For API details, see describe-listeners in AWS CLI Command Reference.

describe-load-balancer-attributes

The following code example shows how to use describe-load-balancer-attributes.

AWS CLI

To describe load balancer attributes

The following describe-load-balancer-attributes example displays the attributes of the specified load balancer.

```
aws elbv2 describe-load-balancer-attributes \\
   --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

The following example output show the attributes for an Application Load Balancer.

```
{
   "Attributes": [
   {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.bucket"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.prefix"
   },
   {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
   },
   {
```
The following example output includes the attributes for a Network Load Balancer.

```
{
    "Attributes": [
    {
        "Value": "false",
        "Key": "access_logs.s3.enabled"
    },
    {
        "Value": 
    },
    {
        "Value": "",
        "Key": "access_logs.s3.bucket"
    },
    {
        "Value": "",
        "Key": "access_logs.s3.prefix"
    },
    {
        "Value": "false",
        "Key": "deletion_protection.enabled"
    },
    {
        "Value": "false",
        "Key": "load_balancing.cross_zone.enabled"
    }
    ]
}
```

- For API details, see [DescribeLoadBalancerAttributes](https://docs.aws.amazon.com/cli/latest/reference/elb/describe-load-balancers.html) in *AWS CLI Command Reference*.

**describe-load-balancers**

The following code example shows how to use describe-load-balancers.
AWS CLI

To describe a load balancer

This example describes the specified load balancer.

Command:

```
aws elbv2 describe-load-balancers --load-balancer-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
   "LoadBalancers": [
   {
      "Type": "application",
      "Scheme": "internet-facing",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
      {
         "ZoneName": "us-west-2a",
         "SubnetId": "subnet-8360a9e7"
      },
      {
         "ZoneName": "us-west-2b",
         "SubnetId": "subnet-b7d581c0"
      }
   ],
   "CreatedTime": "2016-03-25T21:26:12.920Z",
   "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
   "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
   "SecurityGroups": [
      "sg-5943793c"
   ],
   "LoadBalancerName": "my-load-balancer",
   "State": {
      "Code": "active"
   },
   "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
   }
   ]
}
```
To describe all load balancers

This example describes all of your load balancers.

Command:

```bash
aws elbv2 describe-load-balancers
```

- For API details, see `DescribeLoadBalancers` in *AWS CLI Command Reference*.

**describe-rules**

The following code example shows how to use `describe-rules`.

**AWS CLI**

**Example 1: To describe a rule**

The following `describe-rules` example displays details for the specified rule.

```bash
aws elbv2 describe-rules \
  --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

**Example 2: To describe the rules for a listener**

The following `describe-rules` example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```bash
aws elbv2 describe-rules \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see `DescribeRules` in *AWS CLI Command Reference*.

**describe-ssl-policies**

The following code example shows how to use `describe-ssl-policies`.
Example 1: To list the policies used for SSL negotiation by load balancer type

The following `describe-ssl-policies` example displays the names of the policies that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
   --load-balancer-type application \
   --query SslPolicies[*].Name
```

Output:

```
[  "ELBSecurityPolicy-2016-08",  
  "ELBSecurityPolicy-TLS13-1-2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-0-2021-06",  
  "ELBSecurityPolicy-TLS13-1-3-2021-06",  
  "ELBSecurityPolicy-TLS-1-2-2017-01",  
  "ELBSecurityPolicy-TLS-1-1-2017-01",  
  "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",  
  "ELBSecurityPolicy-FS-2018-06",  
  "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```

Example 2: To list the policies that support a specific protocol

The following `describe-ssl-policies` example displays the names of the policies that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
```

Actions and scenarios
Example 3: To display the ciphers for a policy

The following describe-ssl-policies example displays the names of the ciphers for the specified policy. The example uses the --query parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```
aws elbv2 describe-ssl-policies \
   --names ELBSecurityPolicy-TLS13-1-2-2021-06 \
   --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
[  
   "TLS_AES_128_GCM_SHA256",
   "TLS_AES_256_GCM_SHA384",
   "TLS_CHACHA20_POLY1305_SHA256",
   "ECDHE-ECDSA-AES128-GCM-SHA256",
   "ECDHE-RSA-AES128-GCM-SHA256",
   "ECDHE-ECDSA-AES128-SHA256",
   "ECDHE-RSA-AES128-SHA256",
   "ECDHE-ECDSA-AES256-GCM-SHA384",
   "ECDHE-RSA-AES256-GCM-SHA384",
   "ECDHE-ECDSA-AES256-SHA384",
   "ECDHE-RSA-AES256-SHA384"
]
```

For more information, see Security policies in the User Guide for Application Load Balancers.
For API details, see `DescribeSslPolicies` in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

**AWS CLI**

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```bash
aws elbv2 describe-tags --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```json
{
   "TagDescriptions": [
      {
         "ResourceArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
         "Tags": [
            {
               "Value": "lima",
               "Key": "project"
            },
            {
               "Value": "digital-media",
               "Key": "department"
            }
         ]
      }
   ]
}
```

For API details, see `DescribeTags` in *AWS CLI Command Reference*. 

Actions and scenarios
describe-target-group-attributes

The following code example shows how to use describe-target-group-attributes.

AWS CLI

To describe target group attributes

The following describe-target-group-attributes example displays the attributes of the specified target group.

```
aws elbv2 describe-target-group-attributes \\
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is instance or ip.

```
{
  "Attributes": [
    {
      "Value": "false",
      "Key": "stickiness.enabled"
    },
    {
      "Value": "300",
      "Key": "deregistration_delay.timeout_seconds"
    },
    {
      "Value": "lb_cookie",
      "Key": "stickiness.type"
    },
    {
      "Value": "86400",
      "Key": "stickiness.lb_cookie.duration_seconds"
    },
    {
      "Value": "0",
      "Key": "slow_start.duration_seconds"
    }
  ]
}
```
The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is lambda.

```
{
   "Attributes": [
      {
         "Value": "false",
         "Key": "lambda.multi_value_headers.enabled"
      }
   ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```
{
   "Attributes": [
      {
         "Value": "false",
         "Key": "proxy_protocol_v2.enabled"
      },
      {
         "Value": "300",
         "Key": "deregistration_delay.timeout_seconds"
      }
   ]
}
```

- For API details, see [DescribeTargetGroupAttributes](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/elbv2/describe-target-group-attributes.html) in *AWS CLI Command Reference*.

**describe-target-groups**

The following code example shows how to use describe-target-groups.

**AWS CLI**

**Example 1: To describe a target group**

The following describe-target-groups example displays details for the specified target group.

```bash
aws elbv2 describe-target-groups
```
--target-group-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067

Output:

```json
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "TargetGroupName": "my-targets",
            "Protocol": "HTTP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "LoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
            ],
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

Example 2: To describe all target groups for a load balancer

The following describe-target-groups example displays details for all target groups for the specified load balancer. The example uses the --query parameter to display only the target group names.

```bash
aws elbv2 describe-target-groups
```
--load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
--query TargetGroups[*].TargetGroupName

Output:

```
[  
  "my-instance-targets",  
  "my-ip-targets",  
  "my-lambda-target"
]
```

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see DescribeTargetGroups in AWS CLI Command Reference.

**describe-target-health**

The following code example shows how to use describe-target-health.

**AWS CLI**

**Example 1: To describe the health of the targets for a target group**

The following describe-target-health example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
   "TargetHealthDescriptions": [
   
   
   "HealthCheckPort": "80",
   "Target": {
   "Id": "i-ceddcd4d",
   "Port": 80
   }],
   "TargetHealth": {
   
   ```
Example 2: To describe the health of a target

The following describe-target-health example displays health details for the specified target. This target is healthy.

```
aws elbv2 describe-target-health \
    --targets Id=i-0f76fade,Port=80 \
    --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [ 
    {
        "HealthCheckPort": "80",
        "Target": {
            "Id": "i-0f76fade",
            "Port": 80
        },
        "TargetHealth": {
            "State": "healthy"
        }
    }
    ]
}
```
The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```json
{
    "TargetHealthDescriptions": [
    {
        "HealthCheckPort": "80",
        "Target": {
            "Id": "i-0f76fade",
            "Port": 80
        },
        "TargetHealth": {
            "State": "unused",
            "Reason": "Target.NotInUse",
            "Description": "Target group is not configured to receive traffic from the load balancer"
        }
    }
]
}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```json
{
    "TargetHealthDescriptions": [
    {
        "HealthCheckPort": "80",
        "Target": {
            "Id": "i-0f76fade",
            "Port": 80
        },
        "TargetHealth": {
            "State": "initial",
            "Reason": "Elb.RegistrationInProgress",
            "Description": "Target registration is in progress"
        }
    }
]
}
```

The following example output is for an unhealthy target.
The following example output is for a target that is a Lambda function and health checks are disabled.

```json
{
    "TargetHealthDescriptions": [
        {
            "Target": {
                "AvailabilityZone": "all",
            },
            "TargetHealth": {
                "State": "unavailable",
                "Reason": "Target.HealthCheckDisabled",
                "Description": "Health checks are not enabled for this target"
            }
        }
    ]
}
```

- For API details, see [DescribeTargetHealth](https://docs.aws.amazon.com/cli/latest/reference/elb/describe-target-health.html) in *AWS CLI Command Reference*.

**modify-listener**

The following code example shows how to use `modify-listener`. 
**Example 1: To change the default action to a forward action**

The following `modify-listener` example changes the default action (to a `forward` action) for the specified listener.

```bash
aws elbv2 modify-listener \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{
  "Listeners": [
    {
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "Type": "forward"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Port": 80,
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```

**Example 2: To change the default action to a redirect action**

The following `modify-listener` example changes the default action to a `redirect` action for the specified listener.

```bash
aws elbv2 modify-listener \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
```

Actions and scenarios 2937
Output:

```json
{
  "Listeners": [
    {
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "Type": "redirect"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Port": 80,
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```

Example 3: To change the server certificate

This example changes the server certificate for the specified HTTPS listener.

```
aws elbv2 modify-listener
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65
```

Output:

```json
{
  "Listeners": [
    {
      "Protocol": "HTTPS",
      "DefaultActions": [
        {
        }
      ]
    }
  ]
}
```
For API details, see ModifyListener in AWS CLI Command Reference.

modify-load-balancer-attributes

The following code example shows how to use modify-load-balancer-attributes.

AWS CLI

To enable deletion protection

This example enables deletion protection for the specified load balancer.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
  --attributes Key=deletion_protection.enabled,Value=true
```

Output:

```
{
  "Attributes": [
```
To change the idle timeout

This example changes the idle timeout value for the specified load balancer.

Command:

```bash
```

Output:

```json
{
    "Attributes": [
        {
            "Value": "30",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        }
    ]
}
```
To enable access logs

This example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=access_logs.s3.enabled,Value=true Key=access_logs.s3.bucket,Value=my-loadbalancer-logs Key=access_logs.s3.prefix,Value=myapp
```

Output:

```json
{
   "Attributes": [
   {
      "Value": "true",
      "Key": "access_logs.s3.enabled"
   },
   {
      "Value": "my-load-balancer-logs",
      "Key": "access_logs.s3.bucket"
   }
]}
```
modify-rule

The following code example shows how to use modify-rule.

AWS CLI

To modify a rule

The following modify-rule example updates the actions and conditions for the specified rule.

```
aws elbv2 modify-rule \
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \n  --conditions Field=path-pattern,Values='/images/*' \n  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
  "Rules": [
    {
      "Priority": "10",
      "Conditions": [
        {
          "Field": "path-pattern",
```
modify-target-group-attributes

The following code example shows how to use modify-target-group-attributes.

AWS CLI

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```
aws elbv2 modify-target-group-attributes --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 --attributes Key=deregistration_delay_timeout_seconds,Value=600
```

Output:

```
{

```

```
"Attributes": [  
  {  
    "Value": "false",  
    "Key": "stickiness.enabled"
  },  
  {  
    "Value": "600",  
    "Key": "deregistration_delay.timeout_seconds"
  },  
  {  
    "Value": "lb_cookie",  
    "Key": "stickiness.type"
  },  
  {  
    "Value": "86400",  
    "Key": "stickiness.lb_cookie.duration_seconds"
  }
]

For API details, see ModifyTargetGroupAttributes in AWS CLI Command Reference.

modify-target-group

The following code example shows how to use modify-target-group.

AWS CLI

To modify the health check configuration for a target group

The following modify-target-group example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the --matcher option with single quotes instead of double quotes.

```
aws elbv2 modify-target-group \  
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \  
  --health-check-protocol HTTPS \  
  --health-check-port 443 \  
  --matcher HttpCode='200,299'
```
Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupName": "my-https-targets",
            "Protocol": "HTTPS",
            "Port": 443,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTPS",
            "HealthCheckPort": "443",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "Matcher": {
                "HttpCode": "200,299"
            },
            "LoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
            ],
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see ModifyTargetGroup in AWS CLI Command Reference.

### register-targets

The following code example shows how to use register-targets.

#### AWS CLI

**Example 1: To register targets with a target group by instance ID**
The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of instance.

```bash
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
   --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

**Example 2: To register targets with a target group using port overrides**

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```bash
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
   --targets Id=i-0598c7d356eba48d7,Port=80 Id=i-0598c7d356eba48d7,Port=766
```

**Example 3: To register targets with a target group by IP address**

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```bash
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
   --targets Id=10.0.1.15 Id=10.0.1.23
```

**Example 4: To register a Lambda function as a target**

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```bash
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
   --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see [RegisterTargets] in [AWS CLI Command Reference].
remove-listener-certificates

The following code example shows how to use remove-listener-certificates.

**AWS CLI**

**To remove a certificate from a secure listener**

This example removes the specified certificate from the specified secure listener.

Command:

```bash
```

remove-tags

The following code example shows how to use remove-tags.

**AWS CLI**

**To remove tags from a load balancer**

The following remove-tags example removes the project and department tags from the specified load balancer.

```bash
aws elbv2 remove-tags --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --tag-keys project department
```

set-ip-address-type

The following code example shows how to use set-ip-address-type.
AWS CLI

To set the address type of a load balancer

This example sets the address type of the specified load balancer to dualstack. The load balancer subnets must have associated IPv6 CIDR blocks.

Command:

```bash
aws elbv2 set-ip-address-type --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc49c0c9188 --ip-address-type dualstack
```

Output:

```json
{
   "IpAddressType": "dualstack"
}
```

- For API details, see `SetIpAddressType` in AWS CLI Command Reference.

set-rule-priorities

The following code example shows how to use set-rule-priorities.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```bash
```

Output:

```json
{
   "Rules": [
```

Actions and scenarios
For API details, see [SetRulePriorities](#) in [AWS CLI Command Reference](#).

**set-security-groups**

The following code example shows how to use `set-security-groups`.

**AWS CLI**

**To associate a security group with a load balancer**

This example associates the specified security group with the specified load balancer.

**Command:**

```
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-groups sg-5943793c
```

**Output:**
set-subnets

The following code example shows how to use set-subnets.

AWS CLI

To enable Availability Zones for a load balancer

This example enables the Availability Zone for the specified subnet for the specified load balancer.

Command:

```bash
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```json
{
   "AvailabilityZones": [
      {
         "SubnetId": "subnet-8360a9e7",
         "ZoneName": "us-west-2a"
      },
      {
         "SubnetId": "subnet-b7d581c0",
         "ZoneName": "us-west-2b"
      }
   ]
}
```

For API details, see SetSubnets in AWS CLI Command Reference.
Elastic Transcoder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Transcoder.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job for ElasticTranscoder

This cancels the specified job for ElasticTranscoder.

Command:

```
aws elastictranscoder cancel-job --id 3333333333333-abcde3
```

• For API details, see CancelJob in AWS CLI Command Reference.

date-job

The following code example shows how to use create-job.
To create a job for ElasticTranscoder

The following `create-job` example creates a job for ElasticTranscoder.

```
aws elastictranscoder create-job \
  --pipeline-id 1111111111111-abcde1 \
  --inputs file://inputs.json \

CreateJob in AWS CLI Command Reference.

create-pipeline

The following code example shows how to use create-pipeline.

AWS CLI

To create a pipeline for ElasticTranscoder

The following create-pipeline example creates a pipeline for ElasticTranscoder.

```bash
aws elastictranscoder create-pipeline \
  --name Default \
  --input-bucket salesoffice.example.com-source \
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:1112233344:ETS_Errors \
  --content-config file://content-config.json \
  --thumbnail-config file://thumbnail-config.json
```

Contents of content-config.json:

```json
{
  "Bucket":"salesoffice.example.com-public-promos",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Permission":"READ"
    }
  ]
}
```
Contents of thumbnail-config.json:

```json
{
  "Bucket": "salesoffice.example.com-public-promos-thumbnails",
  "Permissions": [
    {
      "GranteeType": "Email",
      "Grantee": "marketing-promos@example.com",
      "Access": [
        "FullControl"
      ]
    }
  ],
  "StorageClass": "ReducedRedundancy"
}
```

Output:

```json
{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "salesoffice.example.com-public-promos",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ],
      "Name": "Default"
    }
  }
}
```
"ThumbnailConfig": {
"Bucket": "salesoffice.example.com-public-promos-thumbnails",
"StorageClass": "ReducedRedundancy",
"Permissions": [
{
"Access": [
"FullControl"
],
"Grantee": "marketing-promos@example.com",
"GranteeType": "Email"
}
],

**create-preset**

The following code example shows how to use create-preset.
AWS CLI

To create a preset for ElasticTranscoder

The following `create-preset` example creates a preset for ElasticTranscoder.

```bash
aws elastictranscoder create-preset \
  --name DefaultPreset \
  --description "Use for published videos" \
  --container mp4 \
  --video file://video.json \
  --audio file://audio.json \
  --thumbnails file://thumbnails.json
```

Contents of `video.json`:

```json
{
  "Codec":"H.264",
  "CodecOptions":{
    "Profile":"main",
    "Level":"2.2",
    "MaxReferenceFrames":"3",
    "MaxBitRate":"",
    "BufferSize":"",
    "InterlacedMode":"Progressive",
    "ColorSpaceConversionMode":"None"
  },
  "KeyframesMaxDist":"240",
  "FixedGOP":"false",
  "BitRate":"1600",
  "FrameRate":"auto",
  "MaxFrameRate":"30",
  "MaxWidth":"auto",
  "MaxHeight":"auto",
  "SizingPolicy":"Fit",
  "PaddingPolicy":"Pad",
  "DisplayAspectRatio":"auto",
  "Watermarks":[
    {
      "Id":"company logo",
      "MaxWidth":"20%",
      "MaxHeight":"20%",
      "SizingPolicy":"ShrinkToFit",
    }
  ]
}
```
Contents of audio.json:

```json
{
    "Codec": "AAC",
    "CodecOptions": {
        "Profile": "AAC-LC"
    },
    "SampleRate": "44100",
    "BitRate": "96",
    "Channels": "2"
}
```

Contents of thumbnails.json:

```json
{
    "Format": "png",
    "Interval": "120",
    "MaxWidth": "auto",
    "MaxHeight": "auto",
    "SizingPolicy": "Fit",
    "PaddingPolicy": "Pad"
}
```

Output:

```json
{
    "Preset": {
        "Thumbnails": {
            "SizingPolicy": "Fit",
            "MaxWidth": "auto",
            "Format": "png",
            "PaddingPolicy": "Pad",
```
"Interval": "120",
"MaxHeight": "auto"
},
"Container": "mp4",
"Description": "Use for published videos",

"Name": "DefaultPreset"
},
"Warning": ""
}

• For API details, see CreatePreset in AWS CLI Command Reference.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete the specified ElasticTranscoder pipeline

This deletes the specified ElasticTranscoder pipeline.

Command:

aws elastictranscoder delete-pipeline --id 1111111111111-abcde1

Output:

{
    "Success":"true"
}

• For API details, see DeletePipeline in AWS CLI Command Reference.

delete-preset

The following code example shows how to use delete-preset.
AWS CLI

To delete the specified ElasticTranscoder preset

This deletes the specified ElasticTranscoder preset.

Command:

```
aws elastictranscoder delete-preset --id 5555555555555-abcde5
```

• For API details, see DeletePreset in AWS CLI Command Reference.

list-jobs-by-pipeline

The following code example shows how to use list-jobs-by-pipeline.

AWS CLI

To retrieve a list of ElasticTranscoder jobs in the specified pipeline

This example retrieves a list of ElasticTranscoder jobs in the specified pipeline.

Command:

```
aws elastictranscoder list-jobs-by-pipeline --pipeline-id 1111111111111-abcde1
```

Output:

```
{
  "Jobs": []
}
```

• For API details, see ListJobsByPipeline in AWS CLI Command Reference.

list-jobs-by-status

The following code example shows how to use list-jobs-by-status.

AWS CLI

To retrieve a list of ElasticTranscoder jobs with a status of Complete
This example retrieves a list of ElasticTranscoder jobs with a status of Complete.

Command:

```
aws elastictranscoder list-jobs-by-status --status Complete
```

Output:

```
{
   "Jobs": []
}
```

• For API details, see [ListJobsByStatus](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/elastictranscoder/list-jobs-by-status.html) in *AWS CLI Command Reference*.

### list-pipelines

The following code example shows how to use `list-pipelines`.

**AWS CLI**

**To retrieve a list of ElasticTranscoder pipelines**

This example retrieves a list of ElasticTranscoder pipelines.

Command:

```
aws elastictranscoder list-pipelines
```

Output:

```
{
   "Pipelines": [
      {
         "Status": "Active",
         "ContentConfig": {
            "Bucket": "ets-example",
            "Permissions": []
         },
         "Name": "example-pipeline",
         "ThumbnailConfig": {
            "Bucket": "ets-example",
            "Permissions": []
         }
      }
   ]
}
```
"Notifications": {
    "Warning": "",
    "Progressing": "",
    "Error": ""
},

        "Warning": "",
        "Progressing": "",
        "Error": ""
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "ets-example",
    "OutputBucket": "ets-example",
    "Id": "3333333333333-abcde2",
},
{
    "Status": "Active",
    "ContentConfig": {
        "Bucket": "ets-west-output",
        "Permissions": []
    }
}
For API details, see ListPipelines in AWS CLI Command Reference.

list-presets

The following code example shows how to use list-presets.

AWS CLI

To retrieve a list of ElasticTranscoder presets

This example retrieves a list of ElasticTranscoder presets.

Command:

```bash
aws elastictranscoder list-presets --max-items 2
```

Output:

```json
{
    "Presets": [
        {
            "Container": "mp4",
```
"Name": "KindleFireHD-preset",
"Video": {
  "Resolution": "1280x720",
  "FrameRate": "30",
  "KeyframesMaxDist": "90",
  "FixedGOP": "false",
  "Codec": "H.264",
  "Watermarks": [],
  "CodecOptions": {
    "Profile": "main",
    "MaxReferenceFrames": "3",
    "ColorSpaceConversionMode": "None",
    "InterlacedMode": "Progressive",
    "Level": "4"
  },
  "AspectRatio": "16:9",
  "BitRate": "2200"
},
"Audio": {
  "Channels": "2",
  "CodecOptions": {
    "Profile": "AAC-LC"
  },
  "SampleRate": "48000",
  "Codec": "AAC",
  "BitRate": "160"
},
"Type": "Custom",
"Id": "3333333333333-abcde2",
"Thumbnails": {
  "AspectRatio": "16:9",
  "Interval": "60",
  "Resolution": "192x108",
  "Format": "png"
}
},
{
"Thumbnails": {
  "AspectRatio": "16:9",
  "Interval": "60",
  "Resolution": "192x108",
  "Format": "png"}
For API details, see ListPresets in AWS CLI Command Reference.
**read-job**

The following code example shows how to use **read-job**.

**AWS CLI**

To retrieve an ElasticTranscoder job

This example retrieves the specified ElasticTranscoder job.

Command:

```bash
aws elastictranscoder read-job --id 1533838012294-example
```

Output:

```json
{
   "Job": {
      "Status": "Progressing",
      "Inputs": [
         {
            "Container": "mp4",
            "FrameRate": "auto",
            "Key": "ETS_example_file.mp4",
            "AspectRatio": "auto",
            "Resolution": "auto",
            "Interlaced": "auto"
         }
      ],
      "Playlists": [],
      "Outputs": [
         {

            "Watermarks": [],
            "Key": "webm/ETS_example_file-kindlefirehd.webm",
            "Id": "1"
         }
      ],
      "PipelineId": "3333333333333-abcde3",
      "OutputKeyPrefix": "recipes/",
      "UserMetadata": {
         "Cook book": "recipe notebook",
      }
   }
}
```
... "Food type": "Italian"

"Output": {
    "Status": "Progressing",
    "Rotate": "0",
    "PresetId": "1351620000001-100250",
    "Watermarks": [],
    "Key": "webm/ETS_example_file-kindlifirehd.webm",
    "Id": "1"
},

"Timing": {
    "SubmitTimeMillis": 1533838012298,
    "StartTimeMillis": 1533838013786
},

"Input": {
    "Container": "mp4",
    "FrameRate": "auto",
    "Key": "ETS_example_file.mp4",
    "AspectRatio": "auto",
    "Resolution": "auto",
    "Interlaced": "auto"
},

"Id": "1533838012294-example",

"Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:job/1533838012294-example"
}

- For API details, see ReadJob in AWS CLI Command Reference.

**read-pipeline**

The following code example shows how to use read-pipeline.

**AWS CLI**

To retrieve an ElasticTranscoder pipeline

This example retrieves the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder read-pipeline --id 3333333333333-abcde3
```
Output:

```json
{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
                {

update-pipeline-notifications

The following code example shows how to use update-pipeline-notifications.

AWS CLI

To update the notifications of an ElasticTranscoder pipeline
This example updates the notifications of the specified ElasticTranscoder pipeline.

Command:

```sh
```

Output:

```json
{
   "Pipeline": {
      "Status": "Active",
      "ContentConfig": {
         "Bucket": "ets-example",
         "StorageClass": "Standard",
         "Permissions": [
            {
               "Access": ["FullControl"],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      },
      "Name": "Default",
      "ThumbnailConfig": {
         "Bucket": "ets-example",
         "StorageClass": "ReducedRedundancy",
         "Permissions": [
            {
               "Access": ["FullControl"],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      },
      "Notifications": {
```
The following code example shows how to use the `update-pipeline-status` command.

**AWS CLI**

**To update the status of an ElasticTranscoder pipeline**

This example updates the status of the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder update-pipeline-status --id 111111111111-abcd1 --status Paused
```

Output:

```
{
    "Pipeline": {
        "Status": "Paused",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
                {
                    "Access": ["FullControl"
                }
            ]
        }"Pipeline": {
```
update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update an ElasticTranscoder pipeline
The following update-pipeline example updates the specified ElasticTranscoder pipeline.

```bash
aws elastictranscoder update-pipeline \
  --id 1111111111111-abcde1 \
  --name DefaultExample \
  --input-bucket salesoffice.example.com-source \
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
  --content-config file://content-config.json \
  --thumbnail-config file://thumbnail-config.json
```

Contents of `content-config.json`:

```json
{
  "Bucket":"salesoffice.example.com-public-promos",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
  ],
  "StorageClass":"Standard"
}
```

Contents of `thumbnail-config.json`:

```json
{
  "Bucket":"salesoffice.example.com-public-promos-thumbnails",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
  ],
  "StorageClass":"ReducedRedundancy"
}
```
Output:

```json
{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
                {
                    "Access": ["FullControl"],
                    "Grantee": "marketing-promos@example.com",
                    "GranteeType": "Email"
                }
            ],
            "Name": "DefaultExample",
            "ThumbnailConfig": {
                "Bucket": "ets-example",
                "StorageClass": "ReducedRedundancy",
                "Permissions": [
                    {
                        "Access": ["FullControl"],
                        "Grantee": "marketing-promos@example.com",
                        "GranteeType": "Email"
                    }
                ],
                "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
                "InputBucket": "ets-example",
                "Id": "3333333333333-abcde3",
                "Notifications": {
                    "Completed": "",
                    "Warning": "",
                    "Progressing": "",
                    "Error": "arn:aws:sns:us-east-1:11122333444:ETS_Errors"
                }
            }
        }
    }
}
```
},
 "Warnings": [
  {
    "Message": "The SNS notification topic for Error events and the pipeline are in different regions, which increases processing time for jobs in the pipeline and can incur additional charges. To decrease processing time and prevent cross-regional charges, use the same region for the SNS notification topic and the pipeline.",
    "Code": "6006"
  }
]
}

- For API details, see [UpdatePipeline](#) in *AWS CLI Command Reference*.

### ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

*add-tags-to-resource*

The following code example shows how to use add-tags-to-resource.
AWS CLI

To add tags to a resource

The following add-tags-to-resource example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```bash
code
aws elasticache add-tags-to-resource \
    --resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-cluster" \
    --tags '{"20150202":15, "ElastiCache":"Service"}'
```

Output:

```json
{
    "TagList": [
        {
            "Value": "20150202",
            "Key": "APIVersion"
        },
        {
            "Value": "ElastiCache",
            "Key": "Service"
        }
    ]
}
```

For more information, see Monitoring Costs with Cost Allocation Tags in the Elasticache User Guide.

• For API details, see AddTagsToResource in AWS CLI Command Reference.

authorize-cache-security-group-ingress

The following code example shows how to use authorize-cache-security-group-ingress.

AWS CLI

To authorize cache security group for ingress

The following authorize-cache-security-group-ingress example allows network ingress to a cache security group.
aws elasticache authorize-cache-security-group-ingress \
  --cache-security-group-name "my-sec-grp" \
  --ec2-security-group-name "my-ec2-sec-grp" \
  --ec2-security-group-owner-id "1234567890"

The command produces no output.

For more information, see Self-Service Updates in Amazon ElastiCache in the Elasticache User Guide.

- For API details, see AuthorizeCacheSecurityGroupIngress in AWS CLI Command Reference.

**batch-apply-update-action**

The following code example shows how to use batch-apply-update-action.

**AWS CLI**

**To apply a service update**

The following batch-apply-update-action example applies a service update to a Redis cluster.

```bash
aws elasticache batch-apply-update-action \
  --service-update-name elc-xxxxx406-xxx \
  --replication-group-ids test-cluster
```

Output:

```json
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "waiting-to-start"
        }
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the Elasticache User Guide.
batch-stop-update-action

The following code example shows how to use batch-stop-update-action.

AWS CLI

To stop a service update

The following batch-stop-update-action example applies a service update to a Redis cluster.

```bash
aws elasticache batch-stop-update-action \
   --service-update-name elc-xxxxx406-xxx \
   --replication-group-ids test-cluster
```

Output:

```json
{
   "ProcessedUpdateActions": [
   {
      "ReplicationGroupId": "pat-cluster",
      "ServiceUpdateName": "elc-xxxxx406-xxx",
      "UpdateActionStatus": "stopping"
   }
   ],
   "UnprocessedUpdateActions": []
}
```

copy-snapshot

The following code example shows how to use copy-snapshot.

AWS CLI

To copy a snapshot
The following copy-snapshot example makes a copy of an existing snapshot.

```bash
aws elasticache copy-snapshot \
    --source-snapshot-name "my-snapshot" \
    --target-snapshot-name "my-snapshot-copy"
```

Output:

```json
{
    "Snapshot": {
        "Engine": "redis",
        "CacheParameterGroupName": "default.redis3.2",
        "VpcId": "vpc-3820329f3",
        "CacheClusterId": "my-redis4",
        "SnapshotRetentionLimit": 7,
        "NumCacheNodes": 1,
        "SnapshotName": "my-snapshot-copy",
        "CacheClusterCreateTime": "2016-12-21T22:24:04.955Z",
        "AutoMinorVersionUpgrade": true,
        "PreferredAvailabilityZone": "us-east-1c",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "SnapshotWindow": "07:00-08:00",
        "EngineVersion": "3.2.4",
        "NodeSnapshots": [
            {
                "CacheSize": "3 MB",
                "SnapshotCreateTime": "2016-12-28T07:00:52Z",
                "CacheNodeId": "0001",
                "CacheNodeCreateTime": "2016-12-21T22:24:04.955Z"
            }
        ],
        "CacheSubnetGroupName": "default",
        "Port": 6379,
        "PreferredMaintenanceWindow": "tue:09:30-tue:10:30",
        "CacheNodeType": "cache.m3.large"
    }
}
```

For more information, see [Exporting a Backup](Elasticache User Guide) in the Elasticache User Guide.

- For API details, see [CopySnapshot](AWS CLI Command Reference) in AWS CLI Command Reference.
create-cache-cluster

The following code example shows how to use create-cache-cluster.

AWS CLI

To create a cache cluster

The following create-cache-cluster example creates a cache cluster using the Redis engine.

```
aws elasticache create-cache-cluster \
   --cache-cluster-id "cluster-test" \
   --engine redis \
   --cache-node-type cache.m5.large \
   --num-cache-nodes 1
```

Output:

```
{
   "CacheCluster": {
      "CacheClusterId": "cluster-test",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.m5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "creating",
      "NumCacheNodes": 1,
      "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
      "PendingModifiedValues": {},
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "default.redis5.0",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdsToReboot": []
      },
      "CacheSubnetGroupName": "default",
      "AutoMinorVersionUpgrade": true,
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:30-07:30",
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```
create-cache-parameter-group

The following code example shows how to use create-cache-parameter-group.

AWS CLI

To create a cache parameter group

The following create-cache-parameter-group example creates a new Amazon ElastiCache cache parameter group.

```
aws elasticache create-cache-parameter-group \
    --cache-parameter-group-family "redis5.0" \
    --cache-parameter-group-name "mygroup" \
    --description "mygroup"
```

Output:

```
{
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "CacheParameterGroupFamily": "redis5.0",
        "Description": "my group"
    }
}
```

For more information, see Creating a Parameter Group in the Elasticache User Guide.

• For API details, see CreateCacheParameterGroup in AWS CLI Command Reference.

create-cache-subnet-group

The following code example shows how to use create-cache-subnet-group.
AWS CLI

To create a cache subnet group

The following create-cache-subnet-group example creates a new cache subnet group.

```bash
aws elasticache create-cache-subnet-group \
    --cache-subnet-group-name "mygroup" \
    --cache-subnet-group-description "my subnet group" \
    --subnet-ids "subnet-xxxxec4f"
```

Output:

```json
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "mygroup",
        "CacheSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-a3e97cdb",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-xxxxec4f",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                }
            }
        ]
    }
}
```

For more information, see Creating a Cache Subnet Group in the Elasticache User Guide.

- For API details, see CreateCacheSubnetGroup in AWS CLI Command Reference.

create-global-replication-group

The following code example shows how to use create-global-replication-group.

AWS CLI

To create a global replication group

The following create-global-replication-group example creates a new global replication group.
aws elasticache create-global-replication-group \
--global-replication-group-id-suffix my-global-replication-group \
--primary-replication-group-id my-primary-cluster

Output:

```json
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "sgau1-my-global-replication-group",
    "GlobalReplicationGroupDescription": "",
    "Status": "creating",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
      {
        "ReplicationGroupId": "my-primary-cluster",
        "ReplicationGroupRegion": "us-west-2",
        "Role": "PRIMARY",
        "AutomaticFailover": "enabled",
        "Status": "associating"
      }
    ],
    "ClusterEnabled": true,
    "GlobalNodeGroups": [
      {
        "GlobalNodeGroupId": "sgau1-my-global-replication-group-0001",
        "Slots": "0-16383"
      }
    ],
    "AuthTokenEnabled": false,
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
  }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/replication-across-regions.html) in the *Elasticache User Guide*.

- For API details, see [CreateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-global-replication-group.html) in *AWS CLI Command Reference*. 
create-replication-group

The following code example shows how to use create-replication-group.

AWS CLI

To create a replication group

The following create-replication-group example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```bash
aws elasticache create-replication-group \
    --replication-group-id "mygroup" \
    --replication-group-description "my group" \
    --engine "redis" \
    --cache-node-type "cache.m5.large"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "Status": "creating",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mygroup-001"
        ],
        "AutomaticFailover": "disabled",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:00-07:00",
        "ClusterEnabled": false,
        "CacheNodeTypeInfo": "cache.m5.large",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Creating a Redis Replication Group in the Elasticache User Guide.

- For API details, see CreateReplicationGroup in AWS CLI Command Reference.
create-snapshot

The following code example shows how to use create-snapshot.

AWS CLI

To create a snapshot

The following create-snapshot example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \
   --snapshot-name mysnapshot \
   --cache-cluster-id cluster-test
```

Output:

```json
{
   "Snapshot": {
      "SnapshotName": "mysnapshot",
      "CacheClusterId": "cluster-test",
      "SnapshotStatus": "creating",
      "SnapshotSource": "manual",
      "CacheNodeType": "cache.m5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "NumCacheNodes": 1,
      "PreferredAvailabilityZone": "us-west-2b",
      "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
      "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
      "Port": 6379,
      "CacheParameterGroupName": "default.redis5.0",
      "CacheSubnetGroupName": "default",
      "VpcId": "vpc-a3e97cdb",
      "AutoMinorVersionUpgrade": true,
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:30-07:30",
      "NodeSnapshots": [
         {
            "CacheNodeId": "0001",
            "CacheSize": "",
            "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
         }
      ]
   }
}
```
create-user-group

The following code example shows how to use create-user-group.

AWS CLI

To create a user group

The following create-user-group example creates a new user group.

```bash
aws elasticache create-user-group \
   --user-group-id myusergroup \
   --engine redis \
   --user-ids default
```

Output:

```json
{
   "UserGroupId": "myusergroup",
   "Status": "creating",
   "Engine": "redis",
   "UserIds": [
       "default"
   ],
   "ReplicationGroups": [],
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.
create-user

The following code example shows how to use create-user.

AWS CLI

To create a user

The following create-user example creates a new user.

```bash
aws elasticache create-user \
   --user-id user1 \
   --user-name myUser \
   --passwords mYnuUzrpAxAw2rdzx \
   --engine redis \
   --access-string "on ~app::* -@all +@read"
```

Output:

```
{
  "UserId": "user2",
  "UserName": "myUser",
  "Status": "active",
  "Engine": "redis",
  "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
  "UserGroupIds": [],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/misc/security.html) in the Elasticache User Guide.

- For API details, see [CreateUser](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-user.html) in AWS CLI Command Reference.
**decrease-node-groups-in-global-replication-group**

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

**AWS CLI**

To decrease the number of node groups in a global replication group

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```bash
aws elasticache decrease-node-groups-in-global-replication-group
   --global-replication-group-id sgaui-test
   --node-group-count 1
   --apply-immediately
   --global-node-groups-to-retain sgaui-test-0003
```

Output:

```
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgau-test",
      "GlobalReplicationGroupDescription": "test",
      "Status": "modifying",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "Members": [
         {
            "ReplicationGroupId": "test-2",
            "ReplicationGroupRegion": "us-east-1",
            "Role": "SECONDARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
         },
         {
            "ReplicationGroupId": "test-1",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
         }
      ]
   }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the Elasticache User Guide.

- For API details, see [DecreaseNodeGroupsInGlobalReplicationGroup](#) in AWS CLI Command Reference.

### decrease-replica-count

The following code example shows how to use `decrease-replica-count`.

#### AWS CLI

**To decrease replica count**

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes.
in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count
   --replication-group-id my-cluster
   --apply-immediately
   --new-replica-count 2
```

Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "my-cluster",
      "Description": "",
      "Status": "modifying",
      "PendingModifiedValues": {},
      "MemberClusters": [
         "myrepliace",
         "my-cluster-001",
         "my-cluster-002",
         "my-cluster-003"
      ],
      "NodeGroups": [
         {
            "NodeGroupId": "0001",
            "Status": "modifying",
            "PrimaryEndpoint": {
               "Address": "my-cluster.xxxxx.ng.0001.usw2.cache.amazonaws.com",
               "Port": 6379
            },
            "ReaderEndpoint": {
               "Address": "my-cluster-ro.xxxxx.ng.0001.usw2.cache.amazonaws.com",
               "Port": 6379
            },
            "NodeGroupMembers": [
               {
                  "CacheClusterId": "myrepliace",
                  "CacheNodeId": "0001",
                  "ReadEndpoint": {
                     "Address": "myrepliace.xxxxx.0001.usw2.cache.amazonaws.com",
                     "Port": 6379
                  }
               }
            ]
         }
      ]
   }
}
```

```
{
  "PreferredAvailabilityZone": "us-west-2a",

"AtRestEncryptionEnabled": false
}
}

For more information, see Changing the Number of Replicas in the Elasticache User Guide.

- For API details, see DecreaseReplicaCount in AWS CLI Command Reference.

delete-cache-cluster

The following code example shows how to use delete-cache-cluster.

AWS CLI

To delete a cache cluster

The following delete-cache-cluster example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints, and the cluster itself. When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clusters
A cluster that is the last read replica of a replication group
A node group (shard) that has Multi-AZ mode enabled
A cluster from a Redis (cluster mode enabled) replication group
A cluster that is not in the available state

aws elasticache delete-cache-cluster \
  --cache-cluster-id "my-cluster-002"

Output:

{
   "CacheCluster": {
       "CacheClusterId": "my-cluster-002",
       "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
       "CacheNodeType": "cache.r5.xlarge",
       "Engine": "redis",
       "EngineVersion": "5.0.5",
   }
}
For more information, see Deleting a Cluster in the Elasticache User Guide.

- For API details, see DeleteCacheCluster in AWS CLI Command Reference.

delete-cache-parameter-group

The following code example shows how to use delete-cache-parameter-group.
AWS CLI

To delete a cache parameter group

The following delete-cache-parameter-group example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```
aws elasticache delete-cache-parameter-group \
   --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see Deleting a Parameter Group in the Elasticache User Guide.

- For API details, see DeleteCacheParameterGroup in AWS CLI Command Reference.

delete-cache-subnet-group

The following code example shows how to use delete-cache-subnet-group.

AWS CLI

To delete a cache subnet group

The following delete-cache-subnet-group example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```
aws elasticache delete-cache-subnet-group \
   --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see Deleting a Subnet Group in the Elasticache User Guide.

- For API details, see DeleteCacheSubnetGroup in AWS CLI Command Reference.

delete-global-replication-group

The following code example shows how to use delete-global-replication-group.
**AWS CLI**

To delete a global replication group

The following `delete-global-replication-group` example deletes a new global replication group.

```
aws elasticache delete-global-replication-group \
   --global-replication-group-id my-global-replication-group \
   --retain-primary-replication-group
```

Output:

```
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgaui-my-grg",
      "GlobalReplicationGroupDescription": "my-grg",
      "Status": "deleting",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "Members": [
         {
            "ReplicationGroupId": "my-cluster-grg",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
         }
      ],
      "ClusterEnabled": false,
      "AuthTokenEnabled": false,
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

- For API details, see [DeleteGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-global-replication-group.html) in AWS CLI Command Reference.
delete-replication-group

The following code example shows how to use delete-replication-group.

AWS CLI

To delete a replication group

The following delete-replication-group example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true.

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \\
   --replication-group-id "mygroup"
```

Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "mygroup",
      "Description": "my group",
      "Status": "deleting",
      "PendingModifiedValues": {},
      "AutomaticFailover": "disabled",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:00-07:00",
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

- For API details, see DeleteReplicationGroup in AWS CLI Command Reference.

delete-snapshot

The following code example shows how to use delete-snapshot.
AWS CLI

To delete a snapshot

The following delete-snapshot example deleted a snapshot using the Redis engine.

```bash
aws elasticache delete-snapshot \
   --snapshot-name mysnapshot
```

Output:

```json
{
   "Snapshot": {
      "SnapshotName": "my-cluster-snapshot",
      "ReplicationGroupId": "mycluster",
      "ReplicationGroupDescription": "mycluster",
      "SnapshotStatus": "deleting",
      "SnapshotSource": "manual",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "PreferredMaintenanceWindow": "thu:12:00-thu:13:00",
      "Port": 6379,
      "CacheParameterGroupName": "default.redis5.0.cluster.on",
      "CacheSubnetGroupName": "default",
      "VpcId": "vpc-a3e97cdb",
      "AutoMinorVersionUpgrade": true,
      "SnapshotRetentionLimit": 1,
      "SnapshotWindow": "13:00-14:00",
      "NumNodeGroups": 4,
      "AutomaticFailover": "enabled",
      "NodeSnapshots": [
      {
         "CacheClusterId": "mycluster-0002-003",
         "NodeGroupId": "0002",
         "CacheNodeId": "0001",
         "CacheSize": "6 MB",
         "CacheNodeCreateTime": "2020-06-18T00:05:44.719000+00:00",
         "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
      },
      {
         "CacheClusterId": "mycluster-0003-003",
```
For more information, see [Backup and Restore for ElastiCache for Redis](#) in the Elasticache User Guide.

- For API details, see [DeleteSnapshot](#) in AWS CLI Command Reference.

### delete-user-group

The following code example shows how to use delete-user-group.

#### AWS CLI

**To delete a user group**

The following delete-user-group example deletes a user group.

```bash
aws elasticache delete-user-group \
   --user-group-id myusergroup
```
Output:

```json
{
    "UserGroupId": "myusergroup",
    "Status": "deleting",
    "Engine": "redis",
    "UserIds": [
      "default"
    ],
    "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/migrationguide/rbac.html) in the *Elasticache User Guide*.

- For API details, see [DeleteUserGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-user-group.html) in *AWS CLI Command Reference*.

**delete-user**

The following code example shows how to use `delete-user`.

### AWS CLI

**To delete a user**

The following `delete-user` example deletes a user.

```bash
aws elasticache delete-user \
  --user-id user2
```

Output:

```json
{
    "UserId": "user1",
    "UserName": "myUser",
    "Status": "deleting",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [
      "myusergroup"
    ],
    "Authentication": {
```
Finer details

"Type": "password",
"PasswordCount": 1
},
"ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see DeleteUser in AWS CLI Command Reference.

**describe-cache-clusters**

The following code example shows how to use describe-cache-clusters.

**AWS CLI**

**To describe a cache cluster**

The following describe-cache-clusters example describes a cache cluster.

```bash
aws elasticache describe-cache-clusters
```

**Output:**

```json
{
    "CacheClusters": [
        {
            "CacheClusterId": "my-cluster-003",
            "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
            "CacheNodeType": "cache.r5.large",
            "Engine": "redis",
            "EngineVersion": "5.0.5",
            "CacheClusterStatus": "available",
            "NumCacheNodes": 1,
            "PreferredAvailabilityZone": "us-west-2a",
            "CacheClusterCreateTime": "2019-11-26T01:22:52.396Z",
            "PreferredMaintenanceWindow": "mon:17:30-mon:18:30",
            "PendingModifiedValues": {},
            "NotificationConfiguration": {
                "TopicStatus": "active"
            }
        }
    ]
}```
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeCacheClusters in AWS CLI Command Reference.
describe-cache-engine-versions

The following code example shows how to use describe-cache-engine-versions.

AWS CLI

To describe a cache engine version

The following describe-cache-engine-versions example returns a list of the available cache engines and their versions.

```bash
aws elasticache describe-cache-engine-versions \
    --engine "Redis"
```

Output:

```json
{
    "CacheEngineVersions": [
        {
            "Engine": "redis",
            "EngineVersion": "2.6.13",
            "CacheParameterGroupFamily": "redis2.6",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.6.13"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.19",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.19"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.21",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.21"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.22",
            "CacheParameterGroupFamily": "redis2.8",
```
• For API details, see **DescribeCacheEngineVersions** in *AWS CLI Command Reference*. 
describe-cache-parameter-groups

The following code example shows how to use describe-cache-parameter-groups.

**AWS CLI**

To describe a cache parameter group

The following describe-cache-parameter-groups example returns a list of cache parameter group descriptions.

```bash
aws elasticache describe-cache-parameter-groups \
   --cache-parameter-group-name "mygroup"
```

Output:

```json
{
   "CacheParameterGroups": [
      {
         "CacheParameterGroupName": "mygroup",
         "CacheParameterGroupFamily": "redis5.0",
         "Description": ""
      }
   ]
}
```

For more information, see Configuring Engine Parameters Using Parameter Groups in the Elasticache User Guide.

- For API details, see DescribeCacheParameterGroups in AWS CLI Command Reference.

describe-cache-parameters

The following code example shows how to use describe-cache-parameters.

**AWS CLI**

To describe cache parameters

The following "describe-cache-parameters" example returns the detailed parameter list for the specified cache parameter group.
aws elasticache describe-cache-parameters \
   --cache-parameter-group-name "myparamgroup"

Output:

```json
{
   "Parameters": [

   {
       "ParameterName": "activedefrag",
       "ParameterValue": "yes",
       "Description": "Enabled active memory defragmentation",

- For API details, see DescribeCacheParameters in AWS CLI Command Reference.

**describe-cache-subnet-groups**

The following code example shows how to use describe-cache-subnet-groups.

**AWS CLI**

To describe cache subnet groups

The following describe-cache-subnet-groups example returns a list of subnet groups.

```
aws elasticache describe-cache-subnet-groups
```

Output:

```
{
    "CacheSubnetGroups": [
        {
            "CacheSubnetGroupName": "default",
            "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
            "VpcId": "vpc-a3e97cdb",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-8d4bacf5",
                }
            ]
        }
    ]
}
```
"SubnetAvailabilityZone": {
    "Name": "us-west-2b"
  },
],
{  
  "SubnetIdentifier": "subnet-dde21380",
  "SubnetAvailabilityZone": {
    "Name": "us-west-2c"
  }
},
{  
  "SubnetIdentifier": "subnet-6485ec4f",
  "SubnetAvailabilityZone": {
    "Name": "us-west-2d"
  }
},
{  
  "SubnetIdentifier": "subnet-b4ebebff",
  "SubnetAvailabilityZone": {
    "Name": "us-west-2a"
  }
}];
},
{  
  "CacheSubnetGroupName": "kxkxk",
  "CacheSubnetGroupDescription": "mygroup",
  "VpcId": "vpc-a3e97cdb",
  "Subnets": [
    {  
      "SubnetIdentifier": "subnet-b4ebebff",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2a"
      }
    }
  ]
},
{  
  "CacheSubnetGroupName": "test",
  "CacheSubnetGroupDescription": "test",
  "VpcId": "vpc-a3e97cdb",
  "Subnets": [
  {  
    "SubnetIdentifier": "subnet-b4ebebff",
  }}]
"SubnetAvailabilityZone": [  "Name": "us-west-2a" ]}

For more information, see Subnets and Subnet Groups in the Elasticache User Guide or Subnets and Subnet Groups in the ElastiCache for Memcached User Guide.

- For API details, see DescribeCacheSubnetGroups in AWS CLI Command Reference.

describe-engine-default-parameters

The following code example shows how to use describe-engine-default-parameters.

AWS CLI

To describe engine default parameters

The following describe-engine-default-parameters example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
--cache-parameter-group-family "redis5.0"
```

Output:

```json
{
  "EngineDefaults": {
    "Parameters": [
      {

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events of a replication group

The following describe-events example returns a list of events for a replication group.

```
aws elasticache describe-events \
   --source-identifier test-cluster \
   --source-type replication-group
```

Output:

```
{
   "Events": [
   {
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Automatic failover has been turned on for replication group test-cluster",
      "Date": "2020-03-18T23:51:34.457Z"
   },
   {
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Replication group test-cluster created",
      "Date": "2020-03-18T23:50:31.378Z"
   }
   ]
}
```

For more information, see Monitoring Events in the Elasticache User Guide.
describe-global-replication-groups

The following code example shows how to use describe-global-replication-groups.

AWS CLI

To describe global replication groups

The following describe-global-replication-groups example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \
   --global-replication-group-id my-grg
```

Output:

```
{
   "GlobalReplicationGroups": [
       {
         "GlobalReplicationGroupId": "my-grg",
         "GlobalReplicationGroupDescription": "my-grg",
         "Status": "creating",
         "CacheNodeType": "cache.r5.large",
         "Engine": "redis",
         "EngineVersion": "5.0.6",
         "ClusterEnabled": false,
         "AuthTokenEnabled": false,
         "TransitEncryptionEnabled": false,
         "AtRestEncryptionEnabled": false
       }
   ]
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

For API details, see DescribeGlobalReplicationGroups in AWS CLI Command Reference.
**describe-replication-groups**

The following code example shows how to use `describe-replication-groups`.

**AWS CLI**

**To return a list of replication group details**

The following `describe-replication-groups` example returns the replication groups.

```bash
aws elasticache describe-replication-groups
```

**Output:**

```json
{
  "ReplicationGroups": [
    {
      "ReplicationGroupId": "my-cluster",
      "Description": "mycluster",
      "Status": "available",

    "Port": 6379
  },
  "PreferredAvailabilityZone": "us-west-2a",
  "CurrentRole": "replica"
}
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeReplicationGroups in AWS CLI Command Reference.

describe-reserved-cache-nodes-offerings

The following code example shows how to use describe-reserved-cache-nodes-offerings.

AWS CLI

To describe reserved-cache-nodes-offerings

The following describe-reserved-cache-nodes-offerings example returns details of a reserved-cache-node options.
aws elasticache describe-reserved-cache-nodes-offerings

Output:

```json
{
   "ReservedCacheNodesOfferings": [
   {
      "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbcde5",
      "CacheNodeType": "cache.t3.small",
      "Duration": 31536000,
      "FixedPrice": 97.0,
      "UsagePrice": 0.0,
      "ProductDescription": "memcached",
      "OfferingType": "Partial Upfront",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": 0.011,
            "RecurringChargeFrequency": "Hourly"
         }
      ]
   },
   {
      "ReservedCacheNodesOfferingId": "0443a27b-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "Duration": 31536000,
      "FixedPrice": 1772.0,
      "UsagePrice": 0.0,
      "ProductDescription": "redis",
      "OfferingType": "Heavy Utilization",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": 0.25,
            "RecurringChargeFrequency": "Hourly"
         }
      ]
   }
   ...
]
}
```

- For API details, see DescribeReservedCacheNodesOfferings in AWS CLI Command Reference.

describe-reserved-cache-nodes

The following code example shows how to use describe-reserved-cache-nodes.

AWS CLI

To describe reserved cache nodes

The following describe-reserved-cache-nodes example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```json
{
    "ReservedCacheNodes": [
        {
            "ReservedCacheNodeId": "mynode",
            "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxx71",
            "CacheNodeType": "cache.t3.small",
            "StartTime": "2019-12-06T02:50:44.003Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CacheNodeCount": 1,
            "ProductDescription": "redis",
            "OfferingType": "No Upfront",
            "State": "payment-pending",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.023,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
        }
    ]
}```
For more information, see Managing Costs with Reserved Nodes in the Elasticache User Guide.

- For API details, see DescribeReservedCacheNodes in AWS CLI Command Reference.

**describe-service-updates**

The following code example shows how to use describe-service-updates.

**AWS CLI**

To describe service updates

The following describe-service-updates example returns details about service updates.

```
aws elasticache describe-service-updates
```

Output:

```json
{
   "ServiceUpdates": [
   {
      "ServiceUpdateName": "elc-xxxxxxxxx7-001",
      "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

To describe snapshots

The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

aws elasticache describe-snapshots

Output:

```json
{
    "Snapshots": [
        {
            "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/migration/self-service-updates.html) in the *Elasticache User Guide*.

- For API details, see [DescribeUpdateActions](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-update-actions.html) in *AWS CLI Command Reference*.

**describe-user-groups**

The following code example shows how to use `describe-user-groups`.
To describe user-groups

The following `describe-user-groups` example returns a list of user groups.

```
aws elasticache describe-user-groups
```

Output:

```
{
   "UserGroups": [
   {
      "UserGroupId": "myusergroup",
      "Status": "active",
      "Engine": "redis",
      "UserIds": [
         "default"
      ],
      "ReplicationGroups": [],
   }
   ]
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)] in the Elasticache User Guide.

- For API details, see [DescribeUserGroups](#) in [AWS CLI Command Reference](#).

describe-users

The following code example shows how to use `describe-users`.

```
aws elasticache describe-users
```
Output:

```json
{
    "Users": [
    {
        "UserId": "default",
        "UserName": "default",
        "Status": "active",
        "Engine": "redis",
        "AccessString": "on ~* +@all",
        "UserGroupIds": [
            "myusergroup"
        ],
        "Authentication": {
            "Type": "no-password"
        },
        "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
    },
    {
        "UserId": "user1",
        "UserName": "myUser",
        "Status": "active",
        "Engine": "redis",
        "AccessString": "on ~* +@all",
        "UserGroupIds": [],
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
    },
    {
        "UserId": "user2",
        "UserName": "myUser",
        "Status": "active",
        "Engine": "redis",
        "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
        "UserGroupIds": [],
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        }
    }
    ]
}
"ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
]}
}

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](elasticache_user_guide) in the Elasticache User Guide.

- For API details, see [DescribeUsers](aws_cli_command_reference) in [AWS CLI Command Reference](aws_cli_command_reference).

disassociate-global-replication-group

The following code example shows how to use disassociate-global-replication-group.

**AWS CLI**

To dissociate a secondary cluster from a global replication group

The following disassociate-global-replication-group example removes a secondary cluster from a Global datastore

```
aws elasticache disassociate-global-replication-group \
  --global-replication-group-id my-grg \
  --replication-group-id my-cluster-grg-secondary \
  --replication-group-region us-east-1
```

Output:

```
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "my-grg",
    "GlobalReplicationGroupDescription": "my-grg",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
      {
        "ReplicationGroupId": "my-cluster-grg-secondary",
        "ReplicationGroupRegion": "us-east-1",
        "Role": "SECONDARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      }
    ]
  }
}
```

- For API details, see [DisassociateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/disassociate-global-replication-group.html) in AWS CLI Command Reference.

### increase-node-groups-in-global-replication-group

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

**AWS CLI**

**To increase the number of node groups in a global replication group**

The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```
aws elasticache increase-node-groups-in-global-replication-group  
  --global-replication-group-id sgauipat-test-4  
  --node-group-count 6  
  --apply-immediately
```

Output:

```
{
  "GlobalReplicationGroup": {
```
"GlobalReplicationGroupId": "sguai-test-4",
"GlobalReplicationGroupDescription": "test-4",
"Status": "modifying",
"CacheNodeType": "cache.r5.large",
"Engine": "redis",
"EngineVersion": "5.0.6",
"Members": [
{
  "ReplicationGroupId": "my-cluster-b",
  "ReplicationGroupRegion": "us-east-1",
  "Role": "SECONDARY",
  "AutomaticFailover": "enabled",
  "Status": "associated"
},
{
  "ReplicationGroupId": "my-cluster-a",
  "ReplicationGroupRegion": "us-west-2",
  "Role": "PRIMARY",
  "AutomaticFailover": "enabled",
  "Status": "associated"
}
],
"ClusterEnabled": true,
"GlobalNodeGroups": [
{
  "GlobalNodeGroupId": "sguai-test-4-0001",
  "Slots": "0-234,2420-5461"
},
{
  "GlobalNodeGroupId": "sguai-test-4-0002",
  "Slots": "5462-5904,6997-9830"
},
{
  "GlobalNodeGroupId": "sguai-test-4-0003",
  "Slots": "10923-11190,13375-16383"
},
{
  "GlobalNodeGroupId": "sguai-test-4-0004",
  "Slots": "235-2419,5905-6996"
},
{
  "GlobalNodeGroupId": "sguai-test-4-0005",
  "Slots": "9831-10922,11191-13374"
}
increase-replica-count

The following code example shows how to use increase-replica-count.

**AWS CLI**

To increase replica count

The following increase-replica-count example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache increase-replica-count \
   --replication-group-id "my-cluster" \
   --apply-immediately \
   --new-replica-count 3
```

Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "my-cluster",
      "Description": "",
      "Status": "modifying",
      "PendingModifiedValues": {},
      "MemberClusters": [
         "my-cluster-001",
```
"my-cluster-002",
"my-cluster-003",
"my-cluster-004"
],
"NodeGroups": [
{
"NodeGroupId": "0001",
"Status": "modifying",
"PrimaryEndpoint": {
"Address": "my-cluster.xxxxxih.ng.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"ReaderEndpoint": {
"Address": "my-cluster-ro.xxxxxxih.ng.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"NodeGroupMembers": [
{
"CacheClusterId": "my-cluster-001",
"CacheNodeId": "0001",
"ReadEndpoint": {
"Address": "my-cluster-001.xxxxxih.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"PreferredAvailabilityZone": "us-west-2a",
"CurrentRole": "primary"
},
{
"CacheClusterId": "my-cluster-003",
"CacheNodeId": "0001",
"ReadEndpoint": {
"Address": "my-cluster-003.xxxxxih.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"PreferredAvailabilityZone": "us-west-2a",
"CurrentRole": "replica"
}]
]};
For more information, see Increasing the Number of Replicas in a Shard in the Elasticache User Guide.

- For API details, see IncreaseReplicaCount in AWS CLI Command Reference.

list-allowed-node-type-modifications

The following code example shows how to use list-allowed-node-type-modifications.

AWS CLI

To list the allowed node modifications

The following list-allowed-node-type-modifications example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```
aws elasticache list-allowed-node-type-modifications \ 
  --replication-group-id "my-replication-group"
```

Output:

```json
{
  "ScaleUpModifications": [
    "cache.m5.12xlarge",
    "cache.m5.24xlarge",
    "cache.m5.4xlarge",
    "cache.r5.12xlarge",
    "cache.r5.24xlarge",
    "cache.r5.2xlarge",
    "cache.r5.4xlarge"
  ],
  "ScaleDownModifications": [
```
For more information, see Scaling ElastiCache for Redis Clusters in the Elasticache User Guide.

- For API details, see ListAllowedNodeTypeModifications in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list tags for a resource

The following list-tags-for-resource example lists tags for a resource.

```
aws elasticache list-tags-for-resource \ 
   --resource-name  "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

Output:

```
{
   "TagList": [
```

modify-cache-cluster

The following code example shows how to use modify-cache-cluster.

AWS CLI

To modify cache clusters

The following modify-cache-cluster example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
  --cache-cluster-id "my-cluster" \
  --num-cache-nodes 1
```

Output:

```
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
    "CacheNodeType": "cache.m5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
    "CacheClusterStatus": "available",
    "NumCacheNodes": 1,
    "PreferredAvailabilityZone": "us-west-2c",
    "CacheClusterCreateTime": "2019-12-04T18:24:56.652Z",
    "PreferredMaintenanceWindow": "sat:10:00-sat:11:00",
  }
}
```
The following code example shows how to use modify-cache-parameter-group.

AWS CLI

To modify a cache parameter group

The following modify-cache-parameter-group example modifies the parameters of the specified cache parameter group.

```
aws elasticache modify-cache-parameter-group \
  --cache-parameter-group-name "mygroup" \
  --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
  "CacheParameterGroupName": "mygroup"
}
```

For more information, see Modifying a Parameter Group in the Elasticache User Guide.
modify-cache-subnet-group

The following code example shows how to use modify-cache-subnet-group.

AWS CLI

To modify a cache subnet group

The following modify-cache-subnet-group example modifies the specified cache subnet group.

```bash
aws elasticache modify-cache-subnet-group \
  --cache-subnet-group-name kxkxk \
  --cache-subnet-group-description "mygroup"
```

Output:

```json
{
  "CacheSubnetGroup": {
    "CacheSubnetGroupName": "kxkxk",
    "CacheSubnetGroupDescription": "mygroup",
    "VpcId": "vpc-xxxxcdb",
    "Subnets": [
      {
        "SubnetIdentifier": "subnet-xxxxbff",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2a"
        }
      }
    ]
  }
}
```

For more information, see Modifying a Subnet Group in the Elasticache User Guide.

• For API details, see ModifyCacheSubnetGroup in AWS CLI Command Reference.

modify-global-replication-group

The following code example shows how to use modify-global-replication-group.

Actions and scenarios
**AWS CLI**

**To modify a global replication group**

The following `modify-global-replication-group` modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```bash
aws elasticache modify-global-replication-group \
    --global-replication-group-id sgaui-pat-group \
    --apply-immediately \
    --no-automatic-failover-enabled
```

**Output**

```
{
    "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "sgaui-test-group",
    "GlobalReplicationGroupDescription": "",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "ClusterEnabled": false,
    "AuthTokenEnabled": false,
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/metroguide/GlobalDatastore.html) in the Elasticache User Guide.

**modify-replication-group-shard-configuration**

The following code example shows how to use `modify-replication-group-shard-configuration`.

**AWS CLI**

**To modify a replication group shard configuration**

Actions and scenarios
The following `modify-replication-group-shard-configuration` decreases the node group count using the Redis engine.

```bash
aws elasticache modify-replication-group-shard-configuration \
    --replication-group-id mycluster \
    --node-group-count 3 \
    --apply-immediately \
    --node-groups-to-remove 0002
```

Output

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "mycluster",
        "GlobalReplicationGroupInfo": {},
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mycluster-0002-001",
            "mycluster-0002-002",
            "mycluster-0002-003",
            "mycluster-0003-001",
            "mycluster-0003-002",
            "mycluster-0003-003",
            "mycluster-0003-004",
            "mycluster-0004-001",
            "mycluster-0004-002",
            "mycluster-0004-003",
            "mycluster-0005-001",
            "mycluster-0005-002",
            "mycluster-0005-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0002",

modify-replication-group

The following code example shows how to use `modify-replication-group`.

**AWS CLI**

To modify a replication group

The following `modify-replication-group` disables Multi-AZ using the Redis engine.

```
aws elasticache modify-replication-group \
  --replication-group-id test-cluster \
  --no-multi-az-enabled \
  --apply-immediately
```

Output

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "test-cluster",
    "Description": "test-cluster",
    "GlobalReplicationGroupInfo": {
      "GlobalReplicationGroupId": "sgauipat-group",
      "GlobalReplicationGroupMemberRole": "PRIMARY"
    },
  }
}
```
"Status": "available",

        "CurrentRole": "replica"
      }
    ]
  }
]
For more information, see [Modifying a Replication Group](#) in the Elasticache User Guide.

- For API details, see [ModifyReplicationGroup](#) in AWS CLI Command Reference.

**modify-user-group**

The following code example shows how to use `modify-user-group`.

**AWS CLI**

To modify a user group

The following `modify-user-group` example adds a user to the user group.

```
aws elasticache modify-user-group \
  --user-group-id myusergroup \
  --user-ids-to-add user1
```
modify-user

The following code example shows how to use modify-user.

AWS CLI

To modify a user

The following modify-user example modifies a user's access string.

```
aws elasticache modify-user \
   --user-id user2 \
   --append-access-string "on ~* +@all"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],

"Authentication": {
   "Type": "password",
   "PasswordCount": 1
},
"ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxxxx52:user:user2"
}

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see ModifyUser in AWS CLI Command Reference.

**purchase-reserved-cache-nodes-offering**

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

**AWS CLI**

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```bash
aws elasticache purchase-reserved-cache-nodes-offering
   --reserved-cache-nodes-offering-id xxxxxxx-4da5-4b90-b92d-929fbd7abed2
```

Output

```json
{
   "ReservedCacheNode": {
      "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
      "ReservedCacheNodesOfferingId": "xxxxxxxx-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "StartTime": "2020-06-30T17:59:40.474000+00:00",
      "Duration": 31536000,
      "FixedPrice": 1772.0,
      "UsagePrice": 0.0,
      "CacheNodeCount": 1,
   }
}
```

- For API details, see [PurchaseReservedCacheNodesOffering](https://docs.aws.amazon.com/cli/latest/reference/elasticache/purchase-reserved-cache-nodes-offering.html) in *AWS CLI Command Reference*.

---

### reboot-cache-cluster

The following code example shows how to use `reboot-cache-cluster`.

**AWS CLI**

**To reboot a cache cluster**

The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to **REBOOTING**.

```bash
code example
aws elasticache reboot-cache-cluster \
  --cache-cluster-id "my-cluster-001" \
  --cache-node-ids-to-reboot "0001"
```

**Output:**

```json
{}
  "CacheCluster": {
    "CacheClusterId": "my-cluster-001",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:"
  }
```
"CacheNodeType": "cache.r5.xlarge",
"Engine": "redis",

"SecurityGroups": [
  {
    "SecurityGroupId": "sg-xxxxxxxxxxxxx836",
    "Status": "active"
  },
  {
    "SecurityGroupId": "sg-xxxxxxxx7b",
    "Status": "active"
  }
],
"ReplicationGroupId": "my-cluster",
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "07:30-08:30",
"TransitEncryptionEnabled": false,
"AtRestEncryptionEnabled": false
}

- For API details, see RebootCacheCluster in AWS CLI Command Reference.
reset-cache-parameter-group

The following code example shows how to use reset-cache-parameter-group.

AWS CLI

To reset a cache parameter group

The following reset-cache-parameter-group example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the --reset-all-parameters and --cache-parameter-group-name parameters.

```
aws elasticache reset-cache-parameter-group \
  --cache-parameter-group-name "mygroup" \
  --reset-all-parameters
```

Output:

```
{
  "CacheParameterGroupName": "mygroup"
}
```

- For API details, see ResetCacheParameterGroup in AWS CLI Command Reference.

start-migration

The following code example shows how to use start-migration.

AWS CLI

To start a migration

The following start-migration migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration \
  --replication-group-id test \
  --customer-node-endpoint-list "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```
Output

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test",
        "Description": "test",
        "GlobalReplicationGroupInfo": {},
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "test-001",
            "test-002",
            "test-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "available",
                "PrimaryEndpoint": {
                    "Address": "test.g2xbih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "ReaderEndpoint": {

                        }
                    }
                ]
            }
        ]
    }
}
```
For more information, see Online Migration to ElastiCache in the Elasticache User Guide.

- For API details, see StartMigration in AWS CLI Command Reference.

**test-failover**

The following code example shows how to use test-failover.

**AWS CLI**

To test failover of a node group
The following test-failover example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```bash
aws elasticache test-failover
   --replication-group-id "mycluster"
   --node-group-id "0001"
```

Output:

```json
{
   "ReplicationGroup": {
      "ReplicationGroupId": "mycluster",
      "Description": "My Cluster",
      "Status": "available",
      "PendingModifiedValues": {},

```
For API details, see TestFailover in AWS CLI Command Reference.

**MediaStore examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-container

The following code example shows how to use create-container.

AWS CLI

To create a container

The following create-container example creates a new, empty container.

```
aws mediastore create-container --container-name ExampleContainer
```

Output:

```
{
   "Container": {
      "AccessLoggingEnabled": false,
      "CreationTime": 1563557265,
      "Name": "ExampleContainer",
      "Status": "CREATING",
   }
}
```

For more information, see Creating a Container in the AWS Elemental MediaStore User Guide.

- For API details, see CreateContainer in AWS CLI Command Reference.

delete-container-policy

The following code example shows how to use delete-container-policy.

AWS CLI

To delete a container policy

The following delete-container-policy example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.
aws mediastore delete-container-policy \
   --container-name LiveEvents

This command produces no output.

For more information, see DeleteContainerPolicy in the AWS Elemental MediaStore API reference.

- For API details, see DeleteContainerPolicy in AWS CLI Command Reference.

delete-container

The following code example shows how to use delete-container.

AWS CLI

To delete a container

The following delete-container example deletes the specified container. You can delete a container only if it has no objects.

aws mediastore delete-container \
   --container-name=ExampleLiveDemo

This command produces no output.

For more information, see Deleting a Container in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteContainer in AWS CLI Command Reference.

delete-cors-policy

The following code example shows how to use delete-cors-policy.

AWS CLI

To delete a CORS policy

The following delete-cors-policy example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.
--container-name ExampleContainer

This command produces no output.

For more information, see Deleting a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteCorsPolicy in AWS CLI Command Reference.

delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete an object lifecycle policy

The following delete-lifecycle-policy example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

aws mediastore delete-lifecycle-policy \ 
   --container-name LiveEvents

This command produces no output.

For more information, see Deleting an Object Lifecycle Policy in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteLifecyclePolicy in AWS CLI Command Reference.

describe-container

The following code example shows how to use describe-container.

AWS CLI

To view the details of a container

The following describe-container example displays the details of the specified container.

aws mediastore describe-container \ 
   --container-name ExampleContainer
Output:

```
{
    "Container": {
        "CreationTime": 1563558086,
        "AccessLoggingEnabled": false,
        "Status": "ACTIVE",
        "Name": "ExampleContainer",
        "Endpoint": "https://aaabbbccdde.data.mediastore.us-west-2.amazonaws.com"
    }
}
```

For more information, see [Viewing the Details for a Container](https://aws.amazon.com/documentation/mediastore/mediastore-view-container-details) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeContainer](https://docs.aws.amazon.com/mediastore/latest/APIReference/API_DescribeContainer.html) in *AWS CLI Command Reference*.

**describe-object**

The following code example shows how to use `describe-object`.

**AWS CLI**

To view a list of objects and folders in a specific container

The following `describe-object` example displays items (objects and folders) stored in a specific container.

```
aws mediastore-data describe-object \
    --endpoint https://aaabbbccdde.data.mediastore.us-west-2.amazonaws.com \
    --path /folder_name/file1234.jpg
```

Output:

```
{
    "ContentType": "image/jpeg",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ContentLength": "2307346",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f555555555555da6d3"
}
```
For more information, see Viewing the Details of an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DescribeObject in AWS CLI Command Reference.

get-container-policy

The following code example shows how to use get-container-policy.

AWS CLI

To view a container policy

The following get-container-policy example displays the resource-based policy of the specified container.

```
aws mediastore get-container-policy
  --container-name ExampleLiveDemo
```

Output:

```
{
  "Policy": {
    "Version": "2012-10-17",
    "Statement": [{
      "Sid": "PublicReadOverHttps",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::111122223333:root"
      },
      "Action": ["mediastore:GetObject",
                 "mediastore:DescribeObject"
                ],
      "Condition": {
        "Bool": {
          "aws:SecureTransport": "true"
        }
      }
    }
  }
}
```
For more information, see [Viewing a Container Policy](#) in the [AWS Elemental MediaStore User Guide](#).

- For API details, see [GetContainerPolicy](#) in [AWS CLI Command Reference](#).

**get-cors-policy**

The following code example shows how to use `get-cors-policy`.

**AWS CLI**

**To view a CORS policy**

The following `get-cors-policy` example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore get-cors-policy \
  --container-name ExampleContainer \
  --region us-west-2
```

Output:

```json
{
   "CorsPolicy": [
      {
         "AllowedMethods": ["GET", "HEAD"],
         "MaxAgeSeconds": 3000,
         "AllowedOrigins": [""],
         "AllowedHeaders": [""],
      }
   ]
}
```
For more information, see Viewing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetCorsPolicy in AWS CLI Command Reference.

get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To view an object lifecycle policy

The following get-lifecycle-policy example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \
  --container-name LiveEvents
```

Output:

```
{
  "LifecyclePolicy": {
    "rules": [
      {
        "definition": {
          "path": [
            {
              "prefix": "Football/"
            },
            {
              "prefix": "Baseball/"
            }
          ],
          "days_since_create": [
            {
              "numeric": [
                ">",
                28
              ]
            }
          ]
        }
      }
    ]
  }
}
```
For more information, see Viewing an Object Lifecycle Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-object

The following code example shows how to use get-object.

AWS CLI

To download an object

The following get-object example download an object to the specified endpoint.

```bash
aws mediastore-data get-object \
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
  --path=/folder_name/README.md README.md
```

Output:

```
{
  "ContentLength": "2307346",
  "ContentType": "image/jpeg",
  "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
  "statusCode": 200
}
```

To download part of an object

The following get-object example downloads a portion an object to the specified endpoint.

```bash
aws mediastore-data get-object \
```
--endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com
--path /folder_name/README.md
--range="bytes=0-100" README2.md

Output:

```
{
    "StatusCode": 206,
    "ContentRange": "bytes 0-100/2307346",
    "ContentLength": "101",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ContentType": "image/jpeg",
    "ETag": "2aa33bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555555da6d3"
}
```

For more information, see [Downloading an Object](#) in the AWS Elemental MediaStore User Guide.

- For API details, see [GetObject](#) in AWS CLI Command Reference.

### list-containers

The following code example shows how to use list-containers.

**AWS CLI**

**To view a list of containers**

The following list-containers example displays a list of all containers that are associated with your account.

```bash
aws mediastore list-containers
```

Output:

```json
{
    "Containers": [
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "..."
        },
```
The following code example shows how to use `list-items`.

**AWS CLI**

**Example 1: To view a list of objects and folders in a specific container**

The following `list-items` example displays items (objects and folders) stored in the specified container.

```bash
aws mediastore-data list-items \
   --endpoint https://aaabbcccddeee.data.mediastore.us-west-2.amazonaws.com
```

**Output:**

```json
{
   "Items": [
      {
         "AccessLoggingEnabled": false,
         "Name": "ExampleLiveDemo"
      },
      {
         "CreationTime": 1506528818,
         "Endpoint": "https://fffgghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
         "Status": "ACTIVE",
         "AccessLoggingEnabled": false,
         "Name": "ExampleContainer"
      }
   ]
}
```

For more information, see [Viewing a List of Containers](https://aws.amazon.com/documentation/media-store/userguide/) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListContainers](https://aws.amazon.com/documentation/media-store/command-reference/) in *AWS CLI Command Reference*.

---

For more information, see [Viewing a List of Containers](https://aws.amazon.com/documentation/media-store/userguide/) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListContainers](https://aws.amazon.com/documentation/media-store/command-reference/) in *AWS CLI Command Reference*.

**list-items**

The following code example shows how to use `list-items`.

**AWS CLI**

**Example 1: To view a list of objects and folders in a specific container**

The following `list-items` example displays items (objects and folders) stored in the specified container.

```bash
aws mediastore-data list-items \
   --endpoint https://aaabbcccddeee.data.mediastore.us-west-2.amazonaws.com
```

**Output:**

```json
{
   "Items": [
      {
         "AccessLoggingEnabled": false,
         "Name": "ExampleLiveDemo"
      },
      {
         "CreationTime": 1506528818,
         "Endpoint": "https://fffgghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
         "Status": "ACTIVE",
         "AccessLoggingEnabled": false,
         "Name": "ExampleContainer"
      }
   ]
}
```
Example 2: To view a list of objects and folders in a specific folder

The following `list-items` example displays items (objects and folders) stored in a specific folder.

```
aws mediastore-data list-items \
   --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
   "Items": [
      {
         "ContentType": "image/jpeg",
         "LastModified": 1563571859.379,
         "Name": "filename.jpg",
         "Type": "OBJECT",
         "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
         "ContentLength": 3784
      },
      {
         "Type": "FOLDER",
         "Name": "ExampleLiveDemo"
      }
   ]
}
```
For more information, see View a List of Objects in the AWS Elemental MediaStore User Guide.

- For API details, see ListItems in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

#### To list tags for a container

The following list-tags-for-resource example displays the tag keys and values assigned to the specified container.

```bash
aws mediastore list-tags-for-resource \
```

**Output:**

```json
{
    "Tags": [
        {
            "Value": "Test",
            "Key": "Environment"
        },
        {
            "Value": "West",
            "Key": "Region"
        }
    ]
}
```

For more information, see ListTagsForResource in the AWS Elemental MediaStore API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

### put-container-policy

The following code example shows how to use put-container-policy.

---

**Actions and scenarios**

5095
To edit a container policy

The following `put-container-policy` example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named `LiveEventsContainerPolicy.json`.

```
aws mediastore put-container-policy \
  --container-name LiveEvents \
  --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see Editing a Container Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutContainerPolicy in AWS CLI Command Reference.

put-cors-policy

The following code example shows how to use `put-cors-policy`.

AWS CLI

**Example 1: To add a CORS policy**

The following `put-cors-policy` example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named `corsPolicy.json`.

```
aws mediastore put-cors-policy \
  --container-name ExampleContainer \
  --cors-policy file://corsPolicy.json
```

This command produces no output.

For more information, see Adding a CORS Policy to a Container in the AWS Elemental MediaStore User Guide.

**Example 2: To edit a CORS policy**
The following put-cors-policy example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named corsPolicy2.json.

For more information, see Editing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutCorsPolicy in AWS CLI Command Reference.

**put-lifecycle-policy**

The following code example shows how to use put-lifecycle-policy.

**AWS CLI**

**To create an object lifecycle policy**

The following put-lifecycle-policy example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named LiveEventsLifecyclePolicy.json.

```
aws mediastore put-lifecycle-policy \
  --container-name ExampleContainer \
  --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see Adding an Object Lifecycle Policy to a Container in the AWS Elemental MediaStore User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

**put-object**

The following code example shows how to use put-object.

**AWS CLI**

**To upload an object**
The following put-object example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```bash
aws mediastore-data put-object \
  --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com \
  --body README.md \
  --path /folder_name/README.md \
  --cache-control "max-age=6, public" \
  --content-type binary/octet-stream
```

Output:

```
{
  "ContentSHA256": "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",
  "StorageClass": "TEMPORAL",
  "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"
}
```

For more information, see [Uploading an Object](https://aws.amazon.com/documentation/mediastore/userguide/) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutObject](https://aws.amazon.com/documentation/mediastore/userguide/) in *AWS CLI Command Reference*.

### start-access-logging

The following code example shows how to use start-access-logging.

**AWS CLI**

To enable access logging on a container

The following start-access-logging example enable access logging on the specified container.

```bash
aws mediastore start-access-logging \
  --container-name LiveEvents
```

This command produces no output.
For more information, see Enabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.

- For API details, see StartAccessLogging in AWS CLI Command Reference.

stop-access-logging

The following code example shows how to use stop-access-logging.

AWS CLI

To disable access logging on a container

The following stop-access-logging example disables access logging on the specified container.

```bash
aws mediastore stop-access-logging
  --container-name LiveEvents
```

This command produces no output.

For more information, see Disabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.

- For API details, see StopAccessLogging in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a container

The following tag-resource example adds tag keys and values to the specified container.

```bash
aws mediastore tag-resource
  --tags '[["Key": "Region", "Value": "West"], ["Key": "Environment", "Value": "Test"]]'
```
This command produces no output.

For more information, see `TagResource` in the *AWS Elemental MediaStore API Reference*.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove tags from a container

The following `untag-resource` example removes the specified tag key and its associated value from a container.

```
aws mediastore untag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
    --tag-keys Region
```

This command produces no output.

For more information, see `UntagResource` in the *AWS Elemental MediaStore API Reference*.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**Amazon EMR examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- Actions

Actions

add-instance-fleet

The following code example shows how to use add-instance-fleet.

AWS CLI

To add a task instance fleet to a cluster

This example adds a new task instance fleet to the cluster specified.

Command:

```bash
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGH34JK' --instance-fleet
InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{TimeoutDurationMinutes=20,TimeoutAction=TERMINATE_CLUSTER}'},InstanceTypeConfigs=[{InstanceType=m3.xlarge,BidPrice=0.5}]
```

Output:

```json
{
  "ClusterId": "j-12ABCDEFGH34JK",
  "InstanceFleetId": "if-23ABCDEFGH45JJ"
}
```

- For API details, see [AddInstanceFleet](https://docs.aws.amazon.com/cli/latest/reference/emr/add-instance-fleet.html) in *AWS CLI Command Reference*.

add-steps

The following code example shows how to use add-steps.

AWS CLI

1. To add Custom JAR steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps
Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/
```
**mytest.jar,Args=arg1,arg2,arg3**

- `Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar`
- `MainClass=mymainclass,Args=arg1,arg2,arg3`

### Required parameters:

- **Jar**

### Optional parameters:

- **Type**, **Name**, **ActionOnFailure**, **Args**

### Output:

```json
{
   "StepIds": ["s-XXXXXXXX", "s-YYYYYYYY"]
}
```

### 2. To add Streaming steps to a cluster

**Command:**

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output]
```

### Required parameters:

- **Type**, **Args**

### Optional parameters:

- **Name**, **ActionOnFailure**

### JSON equivalent (contents of step.json):

```json
{
   "StepIds": ["s-XXXXXXXX", "s-YYYYYYYY"]
}
```
NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./step.json
```

Output:

```
{
   "StepIds": ["s-XXXXXXXX", "s-YYYYYYYY"
]
}
```

3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```
[
   {
      "Name": "JSON Streaming Step",
      "Type": "STREAMING",
      "ActionOnFailure": "CONTINUE",
```
Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./multiplefiles.json
```

Required parameters:

- **Type**, **Args**

Optional parameters:

- **Name**, **ActionOnFailure**

Output:

```json
{
   "StepIds": [
      "s-XXXXXXXX"
   ]
}
```

### 4. To add Hive steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/myhivescript.q,-d,INPUT=s3://mybucket/myhiveinput,-d,OUTPUT=s3://mybucket/myhiveoutput,arg1,arg2]
```

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive steps',ActionOnFailure=TERMINATE_ClUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
```
Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```json
{
   "StepIds": [
      "s-XXXXXXXX",
      "s-YYYYYYYY"
   ]
}
```

5. To add Pig steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/mypigscript.pig,-p,INPUT=s3://mybucket/mypiginput,-p,OUTPUT=s3://mybucket/mypigoutput,arg1,arg2]
Type=PIG,Name='Pig program',Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output,arg1,arg2]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```json
{
}
```
6. To add Impala steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=IMPALA,Name='Impala program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--console-output-path,s3://myimpala/output
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```json
{
   "StepIds": [
      "s-XXXXXXXX",
      "s-YYYYYYYY"
   ]
}
```

- For API details, see AddSteps in AWS CLI Command Reference.

add-tags

The following code example shows how to use add-tags.

AWS CLI

1. To add tags to a cluster
Command:

```
aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male address="123 East NW Seattle"
```

Output:

```
None
```

2. To list tags of a cluster

--Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
```

Output:

```
[
    {
      "Value": "male",
      "Key": "sex"
    },
    {
      "Value": "123 East NW Seattle",
      "Key": "address"
    },
    {
      "Value": "John Doe",
      "Key": "name"
    },
    {
      "Value": "29",
      "Key": "age"
    }
]
```

- For API details, see [AddTags](#) in AWS CLI Command Reference.

create-cluster-examples

The following code example shows how to use create-cluster-examples.
Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the --use-default-roles parameter when creating your cluster. For more information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the Amazon EMR Management Guide.

Example 1: To create a cluster

The following create-cluster example creates a simple EMR cluster.

```bash
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --instance-type m4.large \
    --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-groups configuration.

```bash
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-fleets configuration, specifying two instance types for each fleet and two EC2 Subnets.

```bash
aws emr create-cluster \
    --release-label emr-5.14.0 \
```

Actions and scenarios
Example 4: To create a cluster with default roles

The following create-cluster example uses the --use-default-roles parameter to specify the default service role and instance profile.

```bash
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --use-default-roles \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 5: To create a cluster and specify the applications to install

The following create-cluster example uses the --applications parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```bash
aws emr create-cluster \
  --applications Name=Hadoop Name=Hive Name=Pig \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 6: To create a cluster that includes Spark

The following example installs Spark.

```bash
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --applications Name=Spark \
  --ec2-attributes KeyName=myKey
```
Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```bash
aws emr create-cluster
--name "Cluster with My Custom AMI"
--custom-ami-id ami-a518e6df
--ebs-root-volume-size 20
--release-label emr-5.9.0
--use-default-roles
--instance-count 2
--instance-type m4.large
```

Example 8: To customize application configurations

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see [Configuring Applications](#) in the [Amazon EMR Release Guide](#).

Contents of `configurations.json`:

```json
[
  {
    "Classification": "mapred-site",
    "Properties": {
      "mapred.tasktracker.map.tasks.maximum": 2
    }
  },
  {
    "Classification": "hadoop-env",
    "Properties": {},
    "Configurations": [
      {
        "Classification": "export",
        "Properties": {
          "HADOOP_DATANODE_HEAPSIZE": 2048,
          "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"
        }
      }
    ]
  }
]
```
The following example references configurations.json as a local file.

```bash
aws emr create-cluster \
  --configurations file://configurations.json \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

The following example references configurations.json as a file in Amazon S3.

```bash
aws emr create-cluster \
  --configurations https://s3.amazonaws.com/myBucket/configurations.json \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 9: To create a cluster with master, core, and task instance groups

The following create-cluster example uses --instance-groups to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```bash
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --instance-groups Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1 Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2 Name=Task,InstanceGroupType=Task,InstanceType=m4.large,InstanceCount=2
```

Example 10: To specify that a cluster should terminate after completing all steps

The following create-cluster example uses --auto-terminate to specify that the cluster should shut down automatically after completing all steps.

```bash
aws emr create-cluster \
  --auto-terminate
```
Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups

The following create-cluster example creates a cluster with the Amazon EC2 key pair named myKey and a customized instance profile named myProfile. Key pairs are used to authorize SSH connections to cluster nodes, most often the master node. For more information, see Use an Amazon EC2 Key Pair for SSH Credentials in the Amazon EMR Management Guide.

```bash
aws emr create-cluster \
    --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \n    --release-label emr-5.9.0 \n    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large  \
    --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```bash
aws emr create-cluster \
    --ec2-attributes SubnetId=subnet-xxxxx \n    --release-label emr-5.9.0 \n    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large  \
    --auto-terminate
```

The following example creates a cluster in the us-east-1b availability zone.

```bash
aws emr create-cluster \
    --ec2-attributes AvailabilityZone=us-east-1b \n    --release-label emr-5.9.0 \n    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large  \
    --auto-terminate
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.
The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```
The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \ 
  --service-role myServiceRole \ 
  --ec2-attributes file://ec2_attributes.json \ 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Contents of `ec2_attributes.json`:

```
[
  {
    "SubnetId": "subnet-xxxxx",
    "KeyName": "myKey",
    "InstanceProfile": "myRole",
    "EmrManagedMasterSecurityGroup": "sg-master1",
    "EmrManagedSlaveSecurityGroup": "sg-slave1",
    "ServiceAccessSecurityGroup": "sg-service-access",
    "AdditionalMasterSecurityGroups": ["sg-addMaster1","sg-addMaster2","sg-addMaster3","sg-addMaster4"],
    "AdditionalSlaveSecurityGroups": ["sg-addSlave1","sg-addSlave2","sg-addSlave3","sg-addSlave4"]
  }
]
```

**Example 12: To enable debugging and specify a log URI**

The following `create-cluster` example uses the `--enable-debugging` parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The `--log-uri` parameter is required with `--enable-debugging`. 
aws emr create-cluster \
  --enable-debugging \n  --log-uri s3://myBucket/myLog \n  --release-label emr-5.9.0 \n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n  --auto-terminate

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following create-cluster example uses the --tags parameter to create three tags for a cluster, one with the key name name and the value Shirley Rodriguez, a second with the key name age and the value 29, and a third tag with the key name department and the value Analytics.

aws emr create-cluster \
  --tags name="Shirley Rodriguez" age=29 department="Analytics" \n  --release-label emr-5.32.0 \n  --instance-type m5.xlarge \n  --instance-count 3 \n  --use-default-roles

The following example lists the tags applied to a cluster.

aws emr describe-cluster \
  --cluster-id j-XXXXXXYY \n  --query Cluster.Tags

Example 14: To use a security configuration that enables encryption and other security features

The following create-cluster example uses the --security-configuration parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

aws emr create-cluster \
  --instance-type m4.large \n  --release-label emr-5.9.0 \n  --security-configuration mySecurityConfiguration
Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0  \
   --use-default-roles \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
   'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimized=true,EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=gp2,SizeInGB=100}},
   {VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}]}'
   \n   --auto-terminate
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0  \
   --use-default-roles \
   --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1, InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true, EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100, Iops=100}},
   {VolumeSpecification={VolumeType=standard, SizeInGB=50}, VolumesPerInstance=3}]}' InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge
   \n   --auto-terminate
```

Example 16: To create a cluster with an automatic scaling policy

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the Amazon EMR Management Guide.
When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the CORE instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster
   --release-label emr-5.9.0 \
   --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \
   --instance-groups "InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1 
                      InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constraints={MinCapacity=1,MaxCapacity=5} ... Metric,Namespace=EMR,Period=3,Statistic=MAXIMUM,Threshold=4.5,Unit=NONE,Dimensions=[{Key=TestKey,Value=TestValue}]}}}
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role EMR_DefaultRole \
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
   --instance-groups file://myfolder/instancegroupconfig.json \
   --auto-scaling-role EMR_AutoScaling_DefaultRole
```

**Contents of instancegroupconfig.json:**

```json
[
   {
      "InstanceCount": 1,
      "Name": "MyMasterIG",
      "InstanceGroupType": "MASTER",
      "InstanceType": "m4.large"
   },
   {
      "InstanceCount": 2,
      "Name": "MyCoreIG",
      "InstanceGroupType": "CORE",
      "InstanceType": "m4.large",
```

```
"AutoScalingPolicy": {
  "Constraints": {
    "MinCapacity": 2,
    "MaxCapacity": 10
  },
  "Rules": [
    {
      "Name": "Default-scale-out",
      "Description": "Replicates the default scale-out rule in the console for YARN memory."
    },
    "Action": {
      "SimpleScalingPolicyConfiguration": {
        "AdjustmentType": "CHANGE_IN_CAPACITY",
        "ScalingAdjustment": 1,
        "CoolDown": 300
      }
    },
    "Trigger": {
      "CloudWatchAlarmDefinition": {
        "ComparisonOperator": "LESS_THAN",
        "EvaluationPeriods": 1,
        "MetricName": "YARNMemoryAvailablePercentage",
        "Namespace": "AWS/ElasticMapReduce",
        "Period": 300,
        "Threshold": 15,
        "Statistic": "AVERAGE",
        "Unit": "PERCENT",
        "Dimensions": [
          {
            "Key": "JobFlowId",
            "Value": "${emr.clusterId}"
          }
        ]
      }
    }
  ]
}

Example 17: Add custom JAR steps when creating a cluster
The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```
aws emr create-cluster \
  --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,Args=arg1,arg2,arg3 \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE \
  --auto-terminate
```

**Example 18: To add streaming steps when creating a cluster**

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```
aws emr create-cluster \
  --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output] \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE \
  --auto-terminate
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple...
files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```bash
aws emr create-cluster \
   --steps file://./multiplefiles.json \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

Contents of `multiplefiles.json`:

```json
[
    {
        "Name": "JSON Streaming Step",
        "Args": [
            "-files",
            "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
            "-mapper",
            "wordSplitter.py",
            "-reducer",
            "aggregate",
            "-input",
            "s3://elasticmapreduce/samples/wordcount/input",
            "-output",
            "s3://mybucket/wordcount/output"
        ],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

**Example 19: To add Hive steps when creating a cluster**

The following example add Hive steps when creating a cluster. Hive steps require parameters `Type` and `Args`. Hive steps optional parameters are `Name` and `ActionOnFailure`.

```bash
aws emr create-cluster \
   --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
```
Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are Type and Args. Pig steps optional parameters are Name and ActionOnFailure.

```bash
aws emr create-cluster \
   --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output] \ 
   --applications Name=Pig \ 
   --release-label emr-5.3.1 \ 
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 21: To add bootstrap actions

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```bash
aws emr create-cluster \
   --bootstrap-actions Path=s3://mybucket/
myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/
myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \ 
   --release-label emr-5.3.1 \ 
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \ 
   --auto-terminate
```

Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```bash
aws emr create-cluster \
   --release-label emr-5.3.1 \ 
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \ 
   --auto-terminate
```
aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs Consistent=true,RetryCount=6,RetryPeriod=30

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named emrfsconfig.json.

aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs file://emrfsconfig.json

Contents of `emrfsconfig.json`:

```json
{
  "Consistent": true,
  "RetryCount": 6,
  "RetryPeriod": 30
}
```

**Example 23: To create a cluster with Kerberos configured**

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --security-configuration mySecurityConfiguration \
  --kerberos-attributes Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.
aws emr create-cluster \
   --instance-type m3.xlarge \
   --release-label emr-5.10.0 \
   --service-role EMR_DefaultRole \
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
   --security-configuration mySecurityConfiguration \
   --kerberos-attributes file://kerberos_attributes.json

Contents of kerberos_attributes.json:

```
{
    "Realm": "EC2.INTERNAL",
    "KdcAdminPassword": "123",
    "CrossRealmTrustPrincipalPassword": "123",
}
```

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-groups configuration and has a managed scaling policy.

aws emr create-cluster \
   --release-label emr-5.30.0 \
   --service-role EMR_DefaultRole \
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --managed-scaling-policy ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'

The following create-cluster example creates an Amazon EMR cluster that uses the "--log-encryption-kms-key-id" to define KMS key ID utilized for Log encryption.

aws emr create-cluster \
   --release-label emr-5.30.0 \
   --log-uri s3://myBucket/myLog \
   --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/dd559181-283e-45d7-99d1-66da348c4d33 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
The following `create-cluster` example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```bash
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.largeInstanceGroupType=CORE,\n  --placement-group-configs InstanceRole=MASTER
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

```bash
aws emr create-cluster \
  --release-label emr-5.34.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,\n  --auto-termination-policy IdleTimeout=100
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch

```bash
aws emr create-cluster \
  --release-label emr-6.6.0 \n  --os-release-label 2.0.20220406.1 \n  --service-role EMR_DefaultRole \n  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,\n```

**Example 24:** To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later
The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```bash
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \
   --custom-ami-id ami-a518e6df \
   --ebs-root-volume-size 20 \
   --ebs-root-volume-iops 3000 \
   --ebs-root-volume-throughput 125 \
   --release-label emr-6.15.0 \
   --use-default-roles \
   --instance-count 2 \
   --instance-type m4.large
```

- For API details, see [CreateClusterExamples](#) in *AWS CLI Command Reference*.

create-default-roles

The following code example shows how to use `create-default-roles`.

**AWS CLI**

1. To create the default IAM role for EC2

   Command:

   ```bash
   aws emr create-default-roles
   ```

   Output:

   If the role already exists then the command returns nothing.

   If the role does not exist then the output will be:

   ```json
   [
     {
       "RolePolicy": {
         "Version": "2012-10-17",
         "Statement": [
           { "Action": [ "cloudwatch:*" ],
           "Effect": "Allow" }
         ]
       }
     }
   ```

For API details, see CreateDefaultRoles in AWS CLI Command Reference.

create-security-configuration

The following code example shows how to use create-security-configuration.
AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "In TransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration": {
                "EncryptionKeyProviderType": "AwsKms",
                "AwsKmsKey": "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
            }
        }
    }
}'}
```

Output:

```
{
    "CreationDateTime": 1474070889.129,
    "Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
}
```
"EncryptionConfiguration": {
  "EnableInTransitEncryption": true,
  "EnableAtRestEncryption": true,
  "InTransitEncryptionConfiguration": {
    "TLSCertificateConfiguration": {
      "CertificateProviderType": "PEM",
      "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
    }
  },
  "AtRestEncryptionConfiguration": {
    "S3EncryptionConfiguration": {
      "EncryptionMode": "SSE-S3"
    },
    "LocalDiskEncryptionConfiguration": {
      "EncryptionKeyProviderType": "AwsKms",
      "AwsKmsKey": "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
    }
  }
}

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file:///./security_configuration.json
```

Output:

```
{
  "CreationDateTime": 1474070889.129,
  "Name": "MySecurityConfig"
}
```

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

Command:

```
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
  "AuthenticationConfiguration": {
```

"KerberosConfiguration": {  
  "Provider": "ClusterDedicatedKdc",  
  "ClusterDedicatedKdcConfiguration": {  
    "TicketLifetimeInHours": 24,  
    "CrossRealmTrustConfiguration": {  
      "Realm": "AD.DOMAIN.COM",  
      "Domain": "ad.domain.com",  
      "AdminServer": "ad.domain.com",  
      "KdcServer": "ad.domain.com"  
    }  
  }  
}  
}  

Output:

{
  "CreationDateTime": 1490225558.982,
  "Name": "MySecurityConfig"
}

JSON equivalent (contents of security_configuration.json):

{
  "AuthenticationConfiguration": {
    "KerberosConfiguration": {
      "Provider": "ClusterDedicatedKdc",
      "ClusterDedicatedKdcConfiguration": {
        "TicketLifetimeInHours": 24,
        "CrossRealmTrustConfiguration": {
          "Realm": "AD.DOMAIN.COM",
          "Domain": "ad.domain.com",
          "AdminServer": "ad.domain.com",
          "KdcServer": "ad.domain.com"
        }
      }
    }
  }
}

Command (using security_configuration.json):

Actions and scenarios
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json

Output:

```json
{
    "CreationDateTime": 1490225558.982,
    "Name": "MySecurityConfig"
}
```

- For API details, see CreateSecurityConfiguration in AWS CLI Command Reference.

**delete-security-configuration**

The following code example shows how to use delete-security-configuration.

**AWS CLI**

**To delete a security configuration in the current region**

Command:

```bash
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

None

- For API details, see DeleteSecurityConfiguration in AWS CLI Command Reference.

**describe-cluster**

The following code example shows how to use describe-cluster.

**AWS CLI**

Command:

```bash
aws emr describe-cluster --cluster-id j-XXXXXXXX
```
For release-label based uniform instance groups cluster:

```json
{
    "Cluster": {
        "Status": {
            "Timeline": {
                "ReadyDateTime": 1436475075.199,
                "CreationDateTime": 1436474656.563,
            },
            "State": "WAITING",
            "StateChangeReason": {
                "Message": "Waiting for steps to run"
            }
        },
        "Ec2InstanceAttributes": {
            "ServiceAccessSecurityGroup": "sg-xxxxxxxx",
            "EmrManagedMasterSecurityGroup": "sg-xxxxxxxx",

```
For API details, see DescribeCluster in AWS CLI Command Reference.

describe-step

The following code example shows how to use describe-step.
The following command describes a step with the step ID s-3LZC0QUT43AM in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

Output:

```
{
  "Step": {
    "Status": {
      "Timeline": {
        "EndDateTime": 1433200470.481,
        "CreationDateTime": 1433199926.597,
        "StartDateTime": 1433200404.959
      },
      "State": "COMPLETED",
      "StateChangeReason": {}
    },
    "Config": {
      "Args": [
        "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
        "--base-path",
        "s3://us-west-2.elasticmapreduce/libs/hive/",
        "--install-hive",
        "--hive-versions",
        "0.13.1"
      ],
      "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-runner.jar",
      "Properties": {}
    },
    "Id": "s-3LZC0QUT43AM",
    "ActionOnFailure": "TERMINATE_CLUSTER",
    "Name": "Setup hive"
  }
}
```

- For API details, see [DescribeStep](#) in [AWS CLI Command Reference](#).
**get**

The following code example shows how to use `get`.

**AWS CLI**

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /home/hadoop-examples.jar --dest ~
```

- For API details, see [Get](https://docs.aws.amazon.com/cli/latest/reference/emr/get.html) in *AWS CLI Command Reference*.

**list-clusters**

The following code example shows how to use `list-clusters`.

**AWS CLI**

The following command lists all active EMR clusters in the current region:

```bash
aws emr list-clusters --active
```

**Output:**

```
{
   "Clusters": [
   {
   "Status": {
   "Timeline": {
   "ReadyDateTime": 1433200405.353,
   "CreationDateTime": 1433199926.596
   },
   "State": "WAITING",
   "StateChangeReason": {
   "Message": "Waiting after step completed"
   }
   },
   "NormalizedInstanceHours": 6,
   "Id": "j-3SD91U2E1L2QX",
   "Name": "my-cluster"
   }
   }
}
```
list-instance-fleets

The following code example shows how to use list-instance-fleets.

AWS CLI

To get configuration details of instance fleets in a cluster

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

Output:

```
{
   "InstanceFleets": [
      {
         "Status": {
            "Timeline": {
               "ReadyDateTime": 1488759094.637,
               "CreationDateTime": 1488758719.817
            },
            "State": "RUNNING",
            "StateChangeReason": {
               "Message": ""
            }
         },
         "ProvisionedSpotCapacity": 6,
         "Name": "CORE",
         "InstanceFleetType": "CORE",
         "LaunchSpecifications": {
            "SpotSpecification": {
               "TimeoutDurationMinutes": 60,
               "TimeoutAction": "TERMINATE_CLUSTER"
            }
         }
      }
   ]
}
```

- For API details, see ListClusters in AWS CLI Command Reference.
For API details, see ListInstanceFleets in AWS CLI Command Reference.

list-instances

The following code example shows how to use list-instances.
AWS CLI

The following command lists all of the instances in a cluster with the cluster ID j-3C6XNQ39VR9WL:

```
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

Output:

```
For a uniform instance group based cluster
{
   "Instances": [
   {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1433200400.03,
            "CreationDateTime": 1433199960.152
         },
         "State": "RUNNING",
         "StateChangeReason": {}
      },
      "Ec2InstanceId": "i-f19ecfee",
      "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
      "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
      "PublicIpAddress": "52.52.41.150",
      "Id": "ci-3NNHQUQ2TWB6Y",
      "PrivateIpAddress": "172.21.11.216"
   },
   {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1433200400.031,
            "CreationDateTime": 1433199949.102
         },
         "State": "RUNNING",
         "StateChangeReason": {}
      },
      "Ec2InstanceId": "i-1feee4c2",
      "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",

            "Market": "SPOT",
            "PublicIpAddress": "xx.xx.xxx.xxx",
            "Id": "ci-2W3TDF847UAD",
            "PrivateIpAddress": "172.21.11.214"
        }
    ]
}
For API details, see `ListInstances` in *AWS CLI Command Reference*.

### list-security-configurations

The following code example shows how to use `list-security-configurations`.

**AWS CLI**

To list security configurations in the current region

Command:

```
aws emr list-security-configurations
```

Output:

```json
{
   "SecurityConfigurations": [
      {
         "CreationDateTime": 1473889697.417,
         "Name": "MySecurityConfig-1"
      },
      {
         "CreationDateTime": 1473889697.417,
         "Name": "MySecurityConfig-2"
      }
   ]
}
```

For API details, see `ListSecurityConfigurations` in *AWS CLI Command Reference*.

### list-steps

The following code example shows how to use `list-steps`.
AWS CLI

The following command lists all of the steps in a cluster with the cluster ID j-3SD91U2E1L2QX:

```bash
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see ListSteps in AWS CLI Command Reference.

modify-cluster-attributes

The following code example shows how to use modify-cluster-attributes.

AWS CLI

The following command sets the visibility of an EMR cluster with the ID j-301CDNY0J5XM4 to all users:

```bash
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-users
```

- For API details, see ModifyClusterAttributes in AWS CLI Command Reference.

modify-instance-fleet

The following code example shows how to use modify-instance-fleet.

AWS CLI

To change the target capacities of an instance fleet

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```bash
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

- For API details, see ModifyInstanceFleet in AWS CLI Command Reference.
The following code example shows how to use **put**.

**AWS CLI**

The following command uploads a file named `healthcheck.sh` to the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

- For API details, see [Put](#) in *AWS CLI Command Reference*.

The following code example shows how to use **remove-tags**.

**AWS CLI**

The following command removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

The following code example shows how to use **schedule-hbase-backup**.

**AWS CLI**

**Note:** This command can only be used with HBase on AMI version 2.x and 3.x

1. To schedule a full HBase backup >>>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

   Command:

   ```
   aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir
   ```
2. To schedule an incremental HBase backup

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXXXY --type incremental
--dir s3://myBucket/backup --interval 30 --unit minutes --start-time
2014-04-21T05:26:10Z --consistent
```

Output:

None

- For API details, see ScheduleHbaseBackup in AWS CLI Command Reference.

**socks**

The following code example shows how to use socks.

**AWS CLI**

The following command opens a socks connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

- For API details, see Socks in AWS CLI Command Reference.

**ssh**

The following code example shows how to use ssh.
The following command opens an ssh connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.
Last login: Mon Jun  1 23:15:38 2015

__|  __|_  )

Run "sudo yum update" to apply all updates.
```

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check /mnt/var/log/hadoop/steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

```
NameNode           lynx http://ip-172-21-11-216:9101/
```

```
[hadoop@ip-172-31-16-216 ~]$`

- For API details, see Ssh in AWS CLI Command Reference.
Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

update-role-trust-policy

The following code example shows how to use **update-role-trust-policy**.

**AWS CLI**

**To update the trust policy of an IAM Role to be used with Amazon EMR on EKS**

This example command updates the trust policy of a role named `example_iam_role` such that it can be used with Amazon EMR on EKS with `example_namespace` namespace from an EKS cluster named `example_cluster`.

**Command:**

```
aws emr-containers update-role-trust-policy \
   --cluster example_cluster \
   --namespace example_namespace \
   --role-name example_iam_role
```

**Output:**

If the trust policy has already been updated, then the output will be:
Trust policy statement already exists for role example_iam_role. No changes were made!

If the trust policy has not been updated yet, then the output will be:
Successfully updated trust policy of role example_iam_role.

• For API details, see UpdateRoleTrustPolicy in AWS CLI Command Reference.

EventBridge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

delete-rule

The following code example shows how to use delete-rule.

AWS CLI

To delete a CloudWatch Events rule

This example deletes the rule named EC2InstanceStateChanges:

```bash
aws events delete-rule --name "EC2InstanceStateChanges"
```

• For API details, see DeleteRule in AWS CLI Command Reference.
**describe-rule**

The following code example shows how to use `describe-rule`.

**AWS CLI**

**To display information about a CloudWatch Events rule**

This example displays information about the rule named DailyLambdaFunction:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see `DescribeRule` in AWS CLI Command Reference.

**disable-rule**

The following code example shows how to use `disable-rule`.

**AWS CLI**

**To disable a CloudWatch Events rule**

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

- For API details, see `DisableRule` in AWS CLI Command Reference.

**enable-rule**

The following code example shows how to use `enable-rule`.

**AWS CLI**

**To enable a CloudWatch Events rule**

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```
aws events enable-rule --name "DailyLambdaFunction"
```

- For API details, see `EnableRule` in AWS CLI Command Reference.
list-rule-names-by-target

The following code example shows how to use `list-rule-names-by-target`.

**AWS CLI**

**To display all the rules that have a specified target**

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

- For API details, see [ListRuleNamesByTarget](#) in AWS CLI Command Reference.

list-rules

The following code example shows how to use `list-rules`.

**AWS CLI**

**To display a list of all CloudWatch Events rules**

This example displays all CloudWatch Events rules in the region:

```
aws events list-rules
```

**To display a list of CloudWatch Events rules beginning with a certain string.**

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```
aws events list-rules --name-prefix "Daily"
```

- For API details, see [ListRules](#) in AWS CLI Command Reference.

list-targets-by-rule

The following code example shows how to use `list-targets-by-rule`.
AWS CLI

To display all the targets for a CloudWatch Events rule

This example displays all the targets of the rule named DailyLambdaFunction:

```
aws events list-targets-by-rule --rule "DailyLambdaFunction"
```

- For API details, see [ListTargetsByRule](https://docs.aws.amazon.com/cli/latest/reference/events/list-targets-by-rule.html) in *AWS CLI Command Reference*.

**put-events**

The following code example shows how to use `put-events`.

AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the `putevents.json` file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the `putevents.json` file:

```json
[
    {
      "Source": "com.mycompany.myapp",
      "Detail": "{ "key1": "value1", "key2": "value2" }",
      "Resources": [
        "resource1",
        "resource2"
      ],
      "DetailType": "myDetailType"
    },
    {
      "Source": "com.mycompany.myapp",
      "Detail": "{ "key1": "value3", "key2": "value4" }",
      "Resources": [
        "resource1",
        "resource2"
      ]
    }
]
```
For API details, see PutEvents in AWS CLI Command Reference.

put-rule

The following code example shows how to use put-rule.

AWS CLI

To create CloudWatch Events rules

This example creates a rule that triggers every day at 9:00am (UTC). If you use put-targets to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 * * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"]}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"], "detail": {"state": ["stopped", "terminated"]}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

For API details, see PutRule in AWS CLI Command Reference.

put-targets

The following code example shows how to use put-targets.
To add targets for CloudWatch Events rules

This example adds a Lambda function as the target of a rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
   "Id"="1","Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```
aws events put-targets --rule EC2InstanceStateChanges --targets
   "Id"="1","Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
   "Id"="Target1","Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/MyStream1","RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
   "Id"="Target2","Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/MyStream2","RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```

• For API details, see `PutTargets` in AWS CLI Command Reference.

remove-targets

The following code example shows how to use remove-targets.

AWS CLI

To remove a target for an event

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

• For API details, see `RemoveTargets` in AWS CLI Command Reference.
test-event-pattern

The following code example shows how to use test-event-pattern.

AWS CLI

To check whether an event pattern matches a specified event

This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```bash
aws events test-event-pattern --event-pattern "{"source":["com.mycompany.myapp"]}" --event "{"id":"1","source":"com.mycompany.myapp","detail-type":"myDetailType","account":"123456789012","region":"us-east-1","time":"2017-04-11T20:11:04Z"}"
```

• For API details, see TestEventPattern in AWS CLI Command Reference.

Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

associate-admin-account

The following code example shows how to use associate-admin-account.
AWS CLI

To set the Firewall Manager administrator account

The following associate-admin-account example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account --admin-account 123456789012
```

This command produces no output.

For more information, see [Set the AWS Firewall Manager Administrator Account](https://docs.aws.amazon.com/waf/latest/developerguide/aws-firewall-manager-admin-account.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.
- For API details, see [AssociateAdminAccount](https://docs.aws.amazon.com/cli/latest/reference/fms/associate-admin-account.html) in *AWS CLI Command Reference*.

delete-notification-channel

The following code example shows how to use delete-notification-channel.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following delete-notification-channel example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](https://docs.aws.amazon.com/waf/latest/developerguide/aws-firewall-manager-config-sns-alarm.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.
- For API details, see [DeleteNotificationChannel](https://docs.aws.amazon.com/cli/latest/reference/fms/delete-notification-channel.html) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a Firewall Manager policy
The following delete-policy example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \
   --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \ 
   --delete-all-policy-resources
```

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeletePolicy in AWS CLI Command Reference.

**disassociate-admin-account**

The following code example shows how to use disassociate-admin-account.

**AWS CLI**

**To remove the Firewall Manager administrator account**

The following disassociate-admin-account example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DisassociateAdminAccount in AWS CLI Command Reference.

**get-admin-account**

The following code example shows how to use get-admin-account.

**AWS CLI**

**To retrieve the Firewall Manager administrator account**

The following get-admin-account example retrieves the administrator account.
aws fms get-admin-account

Output:

```
{
  "AdminAccount": "123456789012",
  "RoleStatus": "READY"
}
```

For more information, see [AWS Firewall Manager Prerequisites](https://docs.aws.amazon.com/waf/latest/developerguide/awslabs-firewall-manager.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetAdminAccount](https://docs.aws.amazon.com/cli/latest/reference/fms/get-admin-account.html) in *AWS CLI Command Reference*.

get-compliance-detail

The following code example shows how to use `get-compliance-detail`.

**AWS CLI**

To retrieve the compliance information for an account

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \\
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \\
  --member-account 123456789012
```

Output:

```
{
  "PolicyComplianceDetail": {
    "EvaluationLimitExceeded": false,
    "IssueInfoMap": {},
    "MemberAccount": "123456789012",
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyOwner": "123456789012",
    "Violators": []
  }
}
```
For more information, see Viewing Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetComplianceDetail in AWS CLI Command Reference.

get-notification-channel

The following code example shows how to use get-notification-channel.

**AWS CLI**

To retrieve the SNS topic information for Firewall Manager logs

The following get-notification-channel example retrieves the SNS topic information.

```bash
aws fms get-notification-channel
```

Output:

```
{
   "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetNotificationChannel in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.

**AWS CLI**

To retrieve a Firewall Manager policy

The following get-policy example retrieves the policy with the specified ID.

```bash
aws fms get-policy \
```
--policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RprKr4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_COMMON",
            "ManagedServiceData": "{"type":"SECURITY_GROUPS_COMMON",
            "$false,"securityGroups":[${"id":"sg-045c43ccc9724e63e"}]}}",
            "ResourceType": "AWS::EC2::Instance",
            "ResourceTags": [],
            "ExcludeResourceTags": false,
            "RemediationEnabled": false
        },
        "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-
b2e0-7c620422ddc2"
    }
}
```

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

**list-compliance-status**

The following code example shows how to use list-compliance-status.

**AWS CLI**

To retrieve the policy compliance information for member accounts

The following list-compliance-status example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```
Output:

```json
{
   "PolicyComplianceStatusList": [
      {
         "PolicyOwner": "123456789012",
         "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "PolicyName": "test",
         "MemberAccount": "123456789012",
         "EvaluationResults": [
            {
               "ComplianceStatus": "COMPLIANT",
               "ViolatorCount": 0,
               "EvaluationLimitExceeded": false
            },
            {
               "ComplianceStatus": "NON_COMPLIANT",
               "ViolatorCount": 2,
               "EvaluationLimitExceeded": false
            }
         ],
         "LastUpdated": 1576283774.0,
         "IssueInfoMap": {}
      }
   ]
}
```

For more information, see [Viewing Resource Compliance with a Policy](#) in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see [ListComplianceStatus](#) in AWS CLI Command Reference.

**list-member-accounts**

The following code example shows how to use `list-member-accounts`.

**AWS CLI**

To retrieve the member accounts in the organization

The following list-member-accounts example lists all of the member accounts that are in the Firewall Manager administrator's organization.
aws fms list-member-accounts

Output:

```
{
   "MemberAccounts": [
      "222222222222",
      "333333333333",
      "444444444444"
   ]
}
```

For more information, see AWS Firewall Manager in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListMemberAccounts in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use list-policies.

**AWS CLI**

**To retrieve all Firewall Manager policies**

The following list-policies example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a NextToken that can be used as the value for the --starting-token parameter in the next list-policies call to get the next set of results for the list.

```
aws fms list-policies \
   --max-items 2
```

Output:

```
{
   "PolicyList": [
      {
         "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      }
   ]
}
```
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

put-notification-channel

The following code example shows how to use put-notification-channel.

AWS CLI

To set the SNS topic information for Firewall Manager logs

The following put-notification-channel example sets the SNS topic information.

```bash
aws fms put-notification-channel
--sns-role-name arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
• For API details, see PutNotificationChannel in AWS CLI Command Reference.

put-policy

The following code example shows how to use put-policy.

AWS CLI

To create a Firewall Manager policy

The following put-policy example creates a Firewall Manager security group policy.

```
aws fms put-policy \
   --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
   "Policy": {
      "PolicyName": "test",
      "SecurityServicePolicyData": {
         "Type": "SECURITY_GROUPS_USAGE_AUDIT",
         "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT","deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true}"
      },
      "ResourceType": "AWS::EC2::SecurityGroup",
      "ResourceTags": [],
      "ExcludeResourceTags": false,
      "RemediationEnabled": false
   },
   "TagList": [
      {
         "Key": "foo",
         "Value": "foo"
      }
   ]
}
```

Output:

```
{
```
"Policy": {
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyName": "test",
    "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
    "SecurityServicePolicyData": {
        "Type": "SECURITY_GROUPS_USAGE_AUDIT",
        "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT",
        "deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true,
        "optionalDelayForUnusedInMinutes":null}"
    },
    "ResourceType": "AWS::EC2::SecurityGroup",
    "ResourceTags": [],
    "ExcludeResourceTags": false,
    "RemediationEnabled": false
},
"PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutPolicy in AWS CLI Command Reference.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions
Actions

create-experiment-template

The following code example shows how to use create-experiment-template.

AWS CLI

To create an experiment template

The following create-experiment-template example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
--cli-input-json file://myfile.json
```

Contents of myfile.json:

```json
{
  "description": "experimentTemplate",
  "stopConditions": [
    {
      "source": "aws:cloudwatch:alarm",
      "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
    }
  ],
  "targets": {
    "Instances-Target-1": {
      "resourceType": "aws:ec2:instance",
      "resourceArns": [
        "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
      ],
      "selectionMode": "ALL"
    }
  },
  "actions": {
    "reboot": {
      "actionId": "aws:ec2:reboot-instances",
      "description": "reboot",
      "parameters": {},
      "targets": {
        "Instances": "Instances-Target-1"
      }
    }
  }
}
```
Output:

```json
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "experimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "description": "reboot",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "aws:cloudwatch:alarm",
                "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
            }
        ],
        "creationTime": 1616434850.659,
        "lastUpdateTime": 1616434850.659,
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "tags": {}
    }
}
```
delete-experiment-template

The following code example shows how to use delete-experiment-template.

**AWS CLI**

**To delete an experiment template**

The following delete-experiment-template example deletes the specified experiment template.

```bash
aws fis delete-experiment-template \
--id ABCDE1fgHIJkLmNop
```

**Output:**

```json
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        }
    }
}
```
For more information, see [Delete an experiment template](#) in the [AWS Fault Injection Simulator User Guide](#).

- For API details, see [DeleteExperimentTemplate](#) in [AWS CLI Command Reference](#).

**get-action**

The following code example shows how to use `get-action`.

**AWS CLI**

To get action details

The following `get-action` example gets the details of the specified action.

```
aws fis get-action \\
--id aws:ec2:stop-instances
```

Output:

```json
{
    "action": {
        "id": "aws:ec2:stop-instances",
        "description": "Stop the specified EC2 instances.",
        "parameters": {
            "startInstancesAfterDuration": {
                "description": "The time to wait before restarting the instances (ISO 8601 duration).",
                "required": false
            }
        }
    }
}
```
get-experiment-template

The following code example shows how to use get-experiment-template.

AWS CLI

To get experiment template details

The following get-experiment-template example gets the details of the specified experiment template.

```
aws fis get-experiment-template \
   --id ABCDE1fgHIJkLmNop
```

Output:

```
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIJkLmNop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ]
         }
      }
   }
}
```
For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.

• For API details, see GetExperimentTemplate in AWS CLI Command Reference.

get-experiment

The following code example shows how to use get-experiment.

AWS CLI

To get experiment details

The following get-experiment example gets the details of the specified experiment.

```bash
aws fis get-experiment \   --id ABC12DeFghI3jKLmNoP
```
Output:

```json
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJKLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "completed",
                    "reason": "Action was completed."
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432509.662,
        "startTime": 1616432509.962,
        "endTime": 1616432522.307,
        "tags": {}
    }
}
```
For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see GetExperiment in AWS CLI Command Reference.

**list-actions**

The following code example shows how to use list-actions.

**AWS CLI**

**To list actions**

The following list-actions example lists the available actions.

```bash
aws fis list-actions
```

Output:

```json
{
  "actions": [
    
    {
      "id": "aws:ec2:reboot-instances",
      "description": "Reboot the specified EC2 instances.",
      "targets": {
        "Instances": {
          "resourceType": "aws:ec2:instance"
        }
      },
      "tags": {}
    },
    {
      "id": "aws:ec2:stop-instances",
      "description": "Stop the specified EC2 instances.",
      "targets": {
        "Instances": {
          "resourceType": "aws:ec2:instance"
        }
      },
      "tags": {}
    }
  ]
}
```
{
  "id": "aws:ec2:terminate-instances",
  "description": "Terminate the specified EC2 instances.",
  "targets": {
    "Instances": {
      "resourceType": "aws:ec2:instance"
    }
  },
  "tags": {}
},
{
  "id": "aws:ecs:drain-container-instances",
  "description": "Drain percentage of underlying EC2 instances on an ECS cluster.",
  "targets": {
    "Clusters": {
      "resourceType": "aws:ecs:cluster"
    }
  },
  "tags": {}
},
{
  "id": "aws:eks:terminate-nodegroup-instances",
  "description": "Terminates a percentage of the underlying EC2 instances in an EKS cluster.",
  "targets": {
    "Nodegroups": {
      "resourceType": "aws:eks:nodegroup"
    }
  },
  "tags": {}
},
{
  "id": "aws:fis:inject-api-internal-error",
  "description": "Cause an AWS service to return internal error responses for specific callers and operations.",
  "targets": {
    "Roles": {
      "resourceType": "aws:iam:role"
    }
  },
  "tags": {}
}
"id": "aws:fis:inject-api-throttle-error",

  "Clusters": {
    "resourceType": "aws:rds:cluster"
  }
},
"tags": {}},
{
"id": "aws:rds:reboot-db-instances",
"description": "Reboot the specified DB instances.",
"targets": {
  "DBInstances": {
    "resourceType": "aws:rds:db"
  }
}
For more information, see Actions in the AWS Fault Injection Simulator User Guide.

- For API details, see ListActions in AWS CLI Command Reference.

**list-experiment-templates**

The following code example shows how to use list-experiment-templates.

**AWS CLI**

**To list experiment templates**

The following list-experiment-templates example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

**Output:**

```
{
  "experimentTemplates": [
    {
      "id": "ABCDE1fgHIJkLmNop",
      "description": "myExperimentTemplate",
      "creationTime": 1616017191.124,
      "lastUpdateTime": 1616017191.124,
    }
  ]
}
```
For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperimentTemplates in AWS CLI Command Reference.

**list-experiments**

The following code example shows how to use list-experiments.

**AWS CLI**

*To list experiments*

The following list-experiments example lists the experiments in your AWS account.

```
aws fis list-experiments
```

**Output:**

```
{
    "experiments": [
        {
            "id": "ABCdeF1GHijkLM23NO",
            "experimentTemplateId": "ABCDE1fgHIjkLmNop",
            "state": {
                "status": "running",
                "reason": "Experiment is running."
            },
            "creationTime": 1616017341.197,
            "tags": {
                "key": "value"
            }
        }
    ]
}
```
For more information, see Experiments in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperiments in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a resource

The following list-tags-for-resource example lists the tags for the specified resource.

```bash
aws fis list-tags-for-resource \
```

Output:

```json
{
  "tags": {
    "key1": "value1",
    "key2": "value2"
  }
}
```

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

start-experiment

The following code example shows how to use start-experiment.

AWS CLI

To start an experiment

The following start-experiment example starts the specified experiment.
aws fis start-experiment
   --experiment-template-id ABCDE1fgHIJkLmNop

Output:

{
   "experiment": {
      "id": "ABC12DeFGhI3jKLMNOP",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "roleArn": "arn:aws:iam::123456789012:role/myRole",
      "state": {
         "status": "initiating",
         "reason": "Experiment is initiating."
      },
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "parameters": {},
            "targets": {
               "Instances": "Instances-Target-1"
            },
            "state": {
               "status": "pending",
               "reason": "Initial state"
            }
         }
      },
      "stopConditions": [
         {
            "source": "none"
         }
      ],
      "creationTime": 1616432464.025,
   }
}
For more information, see [Experiments for AWS FIS](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [StartExperiment](#) in *AWS CLI Command Reference*.

### stop-experiment

The following code example shows how to use `stop-experiment`.

**AWS CLI**

**To stop an experiment**

The following `stop-experiment` example stops the specified experiment from running.

```shell
aws fis stop-experiment \
   --id ABC12DeFGh13jKLMNOP
```

**Output:**

```json
{
    "experiment": {
        "id": "ABC12DeFGh13jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIjKmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "stopping",
            "reason": "Stopping Experiment."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        }
    }
}
```
For more information, see [Experiments for AWS FIS](#) in the [AWS Fault Injection Simulator User Guide](#).

- For API details, see [StopExperiment](#) in [AWS CLI Command Reference](#).
tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example tags the specified resource.

```bash
aws fis tag-resource \
   --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see `TagResource` in AWS CLI Command Reference.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the tags from the specified resource.

```bash
aws fis untag-resource \
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see `UntagResource` in AWS CLI Command Reference.
update-experiment-template

The following code example shows how to use `update-experiment-template`.

AWS CLI

To update an experiment template

The following `update-experiment-template` example updates the description of the specified experiment template.

```
aws fis update-experiment-template \
  --id ABCDE1fgHIJkLmNop \
  --description myExperimentTemplate
```

Output:

```
{
  "experimentTemplate": {
    "id": "ABCDE1fgHIJkLmNop",
    "description": "myExperimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "testaction": {
        "actionId": "aws:ec2:stop-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ]
  }
}
```
For more information, see [Update an experiment template](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [UpdateExperimentTemplate](#) in *AWS CLI Command Reference*.

### Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- [Actions](#)

### Actions

**create-build**

The following code example shows how to use `create-build`. 
Example 1: To create a game build from files in an S3 bucket

The following create-build example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you’ve already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \
  --storage-location file://storage-loc.json \n  --name MegaFrogRaceServer.NA \n  --build-version 12345.678
```

Contents of `storage-loc.json`:

```
{
  "Bucket":"MegaFrogRaceServer_NA_build_files"
  "Key":"MegaFrogRaceServer_build_123.zip"
  "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
  "Build": {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTime": 1496708916.18,
    "Name": "MegaFrogRaceServer.NA",
    "OperatingSystem": "WINDOWS_2012",
    "SizeOnDisk": 479303,
    "Status": "INITIALIZED",
    "Version": "12345.678"
  },
  "StorageLocation": {
    "Bucket": "MegaFrogRaceServer_NA_build_files",
    "Key": "MegaFrogRaceServer_build_123.zip"
  }
}
```
Example2: To create a game build resource for manually uploading files to GameLift

The following create-build example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```bash
aws gamelift create-build \
   --name MegaFrogRaceServer.NA \
   --build-version 12345.678 \
   --operating-system AMAZON_LINUX
```

Output:

```
{
   "Build": {
       "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111111",
       "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111111",
       "CreationTime": 1496708916.18,
       "Name": "MegaFrogRaceServer.NA",
       "OperatingSystem": "AMAZON_LINUX",
       "SizeOnDisk": 0,
       "Status": "INITIALIZED",
       "Version": "12345.678"
   },
   "StorageLocation": {
       "Bucket": "gamelift-builds-us-west-2",
       "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
   },
   "UploadCredentials": {
       "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
       "SecretAccessKey": "wJalrXUtFEMI/K7MDENG/bPXRfICyEXAMPLEKEY",
       "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
   }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/upload-custom-server-build.html) in the *Amazon GameLift Developer Guide*. 

Actions and scenarios 3188
create-fleet

The following code example shows how to use create-fleet.

AWS CLI

Example 1: To create a basic Linux fleet

The following create-fleet example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using update-fleet.

```bash
aws gamelift create-fleet
    --name MegaFrogRaceServer.NA.v2
    --description 'Hosts for v2 North America'
    --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff
    --certificate-configuration 'CertificateType=GENERATED'
    --ec2-instance-type c4.large
    --fleet-type ON_DEMAND
    --runtime-configuration 'ServerProcesses=[[LaunchPath=/local/game/release-na/MegaFrogRace_Server.exe,ConcurrentExecutions=1]]'
```

Output:

```json
{
    "FleetAttributes": {
        "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "ON_DEMAND",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
```
Example 2: To create a basic Windows fleet

The following create-fleet example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using update-fleet.

```bash
aws gamelift create-fleet \
   --name MegaFrogRace.NA.v2 \
   --description 'Hosts for v2 North America' \
   --build-id build-2222aaaaa-33bb-44cc-55dd-6666eeee77ff \
   --certificate-configuration 'CertificateType=GENERATED' \
   --ec2-instance-type c4.large \n   --fleet-type SPOT \n   --runtime-configuration 'ServerProcesses=([{LaunchPath=C:\game Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```json
{
   "FleetAttributes": {
      "BuildId": "build-2222aaaaa-33bb-44cc-55dd-6666eeee77ff",
      "CertificateConfiguration": {
         "CertificateType": "GENERATED"
      },
      "CreationTime": 1496365885.44,
      "Description": "Hosts for v2 North America",
      "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666fffffff77aa",
      "FleetType": "SPOT",
      "InstanceType": "c4.large",
      "MetricGroups": ["default"],
      "Name": "MegaFrogRace.NA.v2",
      "NewGameSessionProtectionPolicy": "NoProtection",
      "OperatingSystem": "WINDOWS_2012",
      "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
      "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
      "Status": "NEW"
   }
}
```
Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
   --name MegaFrogRace.NA.v2 \
   --description 'Hosts for v2 North America' \
   --build-id build-2222aaaa-33bb-44cc-55dd-6666eeeee77ff \
   --certificate-configuration 'CertificateType=GENERATED' \
   --ec2-instance-type c4.large \
   --ec2-inbound-permissions 'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
   --fleet-type SPOT \
   --new-game-session-protection-policy FullProtection \
   --runtime-configuration file://runtime-config.json \
   --metric-groups default \
   --instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```
GameSessionActivationTimeoutSeconds=300,
MaxConcurrentGameSessionActivations=2,
ServerProcesses=[
   {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-debug,ConcurrentExecutions=1},
   {LaunchPath=C:\game\Bin64.Release.Dedicated \MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{
   "FleetAttributes": {
      "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
      "Status": "NEW",
      "InstanceType": "c4.large",
      "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
```
Example 4: To create a Realtime Servers fleet

The following create-fleet example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the Init() function located in the script file called MainScript.js. As shown, this file is identified as the launch script in the runtime configuration.

```bash
aws gamelift create-fleet
   --name MegaFrogRace.NA.realtime
   --description 'Mega Frog Race Realtime fleet'
   --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff
   --ec2-instance-type c4.large
   --fleet-type SPOT
   --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration
    'ServerProcesses=([{LaunchPath=/local/game/MainScript.js,Parameters=+map
    Winter444,ConcurrentExecutions=5}])'
```

Output:

```json
{}
```
"FleetAttributes": {
  "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
  "Status": "NEW",
  "CreationTime": 1569310745.212,
  "InstanceType": "c4.large",
  "NewGameSessionProtectionPolicy": "NoProtection",
  "CertificateConfiguration": {
    "CertificateType": "GENERATED"
  },
  "Name": "MegaFrogRace.NA.realtime",
  "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
  "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
  "FleetType": "SPOT",
  "MetricGroups": [
    "default"
  ],
  "Description": "Mega Frog Race Realtime fleet",
  "OperatingSystem": "AMAZON_LINUX"
}

- For API details, see CreateFleet in AWS CLI Command Reference.

create-game-session-queue

The following code example shows how to use create-game-session-queue.

AWS CLI

Example1: To set up an ordered game session queue

The following create-game-session-queue example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```bash
aws gamelift create-game-session-queue
  --name MegaFrogRaceServer-NA
  --destinations file://destinations.json
  --timeout-in-seconds 600
```
Contents of destinations.json:

```json
{
    "Destinations": [
        {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
        {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
    ]
}
```

Output:

```json
{
    "GameSessionQueues": [
        {
            "Name": "MegaFrogRaceServer-NA",
            "TimeoutInSeconds": 600,
            "Destinations": [
                {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
                {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
            ]
        }
    ]
}
```

Example 2: To set up a game session queue with player latency policies

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```bash
aws gamelift create-game-session-queue \
  --name MegaFrogRaceServer-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json \
  --timeout-in-seconds 180
```
Contents of destinations.json:

```json
{
   "Destinations": [
   { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
   { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
   ]
}
```

Contents of latency-policies.json:

```json
{
   "PlayerLatencyPolicies": [
   { "MaximumIndividualPlayerLatencyMilliseconds": 200 },
   { "MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds": 60 }
   ]
}
```

Output:

```json
{
   "GameSessionQueue": {
   "Name": "MegaFrogRaceServer-NA",
   "TimeoutInSeconds": 600,
   "PlayerLatencyPolicies": [
   { "MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds": 60 },
   { "MaximumIndividualPlayerLatencyMilliseconds": 200 }
   ],
   "Destinations": [
   { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
   { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
   ]
   }
}
```
For more information, see Create a Queue in the Amazon GameLift Developer Guide.  
• For API details, see CreateGameSessionQueue in AWS CLI Command Reference.

delete-build

The following code example shows how to use delete-build.

AWS CLI

To delete a custom game build

The following delete-build example removes a build from your Amazon GameLift account.  
After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```bash
aws gamelift delete-build \
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

• For API details, see DeleteBuild in AWS CLI Command Reference.

delete-fleet

The following code example shows how to use delete-fleet.

AWS CLI

To delete a fleet that is no longer in use

The following delete-fleet example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```bash
aws gamelift delete-fleet \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.
For more information, see Manage GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DeleteFleet in AWS CLI Command Reference.

**delete-game-session-queue**

The following code example shows how to use delete-game-session-queue.

**AWS CLI**

**To delete a game session queue**

The following delete-game-session-queue example deletes a specified game session queue.

```bash
aws gamelift delete-game-session-queue \
   --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see DeleteGameSessionQueue in AWS CLI Command Reference.

**describe-build**

The following code example shows how to use describe-build.

**AWS CLI**

**To get information on a custom game build**

The following describe-build example retrieves properties for a game server build resource.

```bash
aws gamelift describe-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Output:**

```json
{
   "Build": {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```
For more information, see [Upload a Custom Server Build to GameLift](#) in the [Amazon GameLift Developer Guide](#).

- For API details, see [DescribeBuild](#) in [AWS CLI Command Reference](#).

### describe-ec2-instance-limits

The following code example shows how to use `describe-ec2-instance-limits`.

**AWS CLI**

**To retrieve service limits for an EC2 instance type**

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```
aws gamelift describe-ec2-instance-limits \
  --ec2-instance-type m5.large
```

**Output:**

```json
{
  "EC2InstanceLimits": [
    {
      "EC2InstanceType": "m5.large",
      "CurrentInstances": 5,
      "InstanceLimit": 20
    }
  ]
}
```
describe-fleet-attributes

The following code example shows how to use describe-fleet-attributes.

AWS CLI

Example1: To view attributes for a list of fleets

The following describe-fleet-attributes example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

/aws gamelift describe-fleet-attributes \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222

Output:

```json
{
   "FleetAttributes": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "FleetType": "ON_DEMAND",
         "InstanceType": "c4.large",
         "Description": "On-demand hosts for v2 North America",
         "Name": "MegaFrogRaceServer.NA.v2-od",
         "CreationTime": 1568836191.995,
         "Status": "ACTIVE",
         "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
         "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
         "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
         "ServerLaunchParameters": "+gamelift_start_server",
         "NewGameSessionProtectionPolicy": "NoProtection",
         "OperatingSystem": "WINDOWS_2012",
         "MetricGroups": []
      }
   ]
}```
Example2: To request attributes for all fleets

The following describe-fleet-attributes returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```bash
aws gamelift describe-fleet-attributes \
   --limit 1
```

Output:

```json
{
```

Actions and scenarios
"FleetAttributes": [  
  {
    "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
    "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
    "FleetType": "SPOT",  
    "InstanceType": "c4.large",  
    "Description": "On-demand hosts for v2 North America",  
    "Name": "MegaFrogRaceServer.NA.v2-spot",  
    "CreationTime": 1568838275.379,  
    "Status": "ACTIVATING",  
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
    "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",  
    "NewGameSessionProtectionPolicy": "NoProtection",  
    "OperatingSystem": "WINDOWS_2012",  
    "MetricGroups": [  
      "default"  
    ],  
    "CertificateConfiguration": {  
      "CertificateType": "GENERATED"  
    }  
  },  
  "NextToken":  
  "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMiJ9"  
},

The output includes a NextToken value that you can use when you call the command a second time. Pass the value to the --next-token parameter to specify where to pick up the output. The following command returns the second result in the output.

```bash
aws gamelift describe-fleet-attributes \
  --limit 1 \
  --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMiJ9
```

Repeat until the response doesn't include a NextToken value.

For more information, see [Setting Up GameLift Fleets](https://docs.aws.amazon.com/gamelift/latest/developerguide/gameli-get-started.html) in the Amazon GameLift Developer Guide.

- For API details, see [DescribeFleetAttributes](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-fleet-attributes.html) in AWS CLI Command Reference.
describe-fleet-capacity

The following code example shows how to use describe-fleet-capacity.

AWS CLI

To view capacity status for a list of fleets

The following describe-fleet-capacity example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```json
{
    "FleetCapacity": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 10,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 10,
                "IDLE": 3,
                "TERMINATING": 0
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 13,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 15,
                "IDLE": 2,
                "TERMINATING": 2
            }
        }
    ]
}
```
For more information, see GameLift Metrics for Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetCapacity in AWS CLI Command Reference.

**describe-fleet-events**

The following code example shows how to use describe-fleet-events.

**AWS CLI**

**To request events for a specified time span**

The following describe-fleet-events example displays details of all fleet-related events that occurred during the specified time span.

```bash
aws gamelift describe-fleet-events \
   --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --start-time 1579647600 \
   --end-time 1579649400 \
   --limit 5
```

**Output:**

```
{
   "Events": [
      {
         "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",

Actions and scenarios

3204


describe-fleet-port-settings

The following code example shows how to use `describe-fleet-port-settings`.

**AWS CLI**

**To view inbound connection permissions for a fleet**

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```
aws gamelift describe-fleet-port-settings \
--fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

Output:

```
{
    "InboundPermissions": [
    {
        "FromPort": 33400,
        "ToPort": 33500,
        "IpRange": "0.0.0.0/0",
        "Protocol": "UDP"
    },
    {

```
For more information, see [Setting Up GameLift Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetPortSettings](#) in *AWS CLI Command Reference*.

**describe-fleet-utilization**

The following code example shows how to use `describe-fleet-utilization`.

**AWS CLI**

**Example1: To view usage data for a list of fleets**

The following `describe-fleet-utilization` example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

**Output:**

```
{
   "FleetUtilization": [ 
   
   
   {
   "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "ActiveServerProcessCount": 100,
   "ActiveGameSessionCount": 62,
   "CurrentPlayerSessionCount": 329,
   "MaximumPlayerSessionCount": 1000
   }
   ]

}
```

**Example2: To request usage data for all fleets**
The following describe-fleet-utilization returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```bash
aws gamelift describe-fleet-utilization \
   --limit 2
```

Output:

```json
{
   "FleetUtilization": [
      {
         "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 13,
         "CurrentPlayerSessionCount": 98,
         "MaximumPlayerSessionCount": 1000
      },
      {
         "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 62,
         "CurrentPlayerSessionCount": 329,
         "MaximumPlayerSessionCount": 1000
      }
   ],
   "NextToken": "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWY3NDc0N2JiIiwic2FmdGxlIjpcIkNvbWluZyBhiBvcnR5cyBhcyJ9LCJidWlsZElkIjpcIkNvbWluZyBhiBvcnR5cyBhcyJ9"
}
```

Call the command a second time, passing the NextToken value as the argument to the --next-token parameter to see the next two results.

```bash
aws gamelift describe-fleet-utilization \
   --limit 2 \
   --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJiZjI6MTc5NDk5NzU0MjQ2MjIwIiwic2FmdGxlIjpcIkNvbWluZyBhiBvcnR5cyBhcyJ9"
```

Repeat until the response no longer includes a NextToken value in the output.

For more information, see GameLift Metrics for Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetUtilization in AWS CLI Command Reference.
**describe-game-session-queues**

The following code example shows how to use `describe-game-session-queues`.

**AWS CLI**

**To view game session queues**

The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
   --names MegaFrogRace-NA MegaFrogRace-EU
```

**Output:**

```
{
   "GameSessionQueues": [
      [
         "Destinations": [
            {
               "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            },
            {
               "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            }
         ],
         "Name": "MegaFrogRace-NA",
         "TimeoutInSeconds": 600,
         "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/MegaFrogRace-NA",
         "PlayerLatencyPolicies": [
            {
               "MaximumIndividualPlayerLatencyMilliseconds": 200
            },
            {
               "MaximumIndividualPlayerLatencyMilliseconds": 100,
               "PolicyDurationSeconds": 60
            }
         ],
         "FilterConfiguration": {
            "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
         }
      },
      "PriorityConfiguration": {
```
"PriorityOrder": ["LOCATION“, "FLEET_TYPE“, "DESTINATION"],
"LocationOrder": ["us-west-2“, "ap-south-1“, "us-east-1"]
},
{
"Destinations": [[
"DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
]],
"Name": "MegaFrogRace-EU",
"TimeoutInSeconds": 600,
"GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/MegaFrogRace-EU"
}
}

For more information, see Using Multi-Region Queues in the Amazon GameLift Developer Guide. For API details, see DescribeGameSessionQueues in AWS CLI Command Reference.

describe-runtime-configuration

The following code example shows how to use describe-runtime-configuration.

AWS CLI

To request the runtime configuration for a fleet

The following describe-runtime-configuration example retrieves details about the current runtime configuration for a specified fleet.

```bash
aws gamelift describe-runtime-configuration \
--fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
"RuntimeConfiguration": {
"ServerProcesses": [
{
"LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
```
"Parameters": "+gamelift_start_server",
"ConcurrentExecutions": 3
},
{
    "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
    "Parameters": "+gamelift_start_server +debug",
    "ConcurrentExecutions": 1
}
],
"MaxConcurrentGameSessionActivations": 2147483647,
"GameSessionActivationTimeoutSeconds": 300
}
}

For more information, see Run Multiple Processes on a Fleet in the Amazon GameLift Developer Guide.

- For API details, see DescribeRuntimeConfiguration in AWS CLI Command Reference.

list-builds

The following code example shows how to use list-builds.

AWS CLI

Example1: To get a list of custom game builds

The following list-builds example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, Limit and NextToken, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a NextToken to indicate that more results are available.

aws gamelift list-builds \n    --limit 2

Output:

```json
{
    "Builds": [
    
```
You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```bash
aws gamelift list-builds \
  --limit 2 \
  --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMSIsLCJidWlsZElkIjoiaHR0cHM6Ly93d3cuc2FmcmVzaGF0ZS5jb20vdHlwZS9mb250YWN0IiwiZGVmYXVsdF90aW1lcyI6IjUwMDIzODA1ODM1MCJ9LCJidWlsZElkIjoiY3JvdXQifQ==
```

Repeat until the response doesn't include a `NextToken` value.

**Example2: To get a list of custom game builds in failure status**

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status FAILED.

```bash
aws gamelift list-builds \
  --filter "Status=FAILED"
```
--status FAILED

Output:

```
{
  "Builds": [
    {
      "BuildArn": "arn:aws:gamleift:us-west-2::build/build-a1b2c3d4-5678-90abcdef-EXAMPLE22222",
      "BuildId": "build-a1b2c3d4-5678-90abcdef-EXAMPLE22222",
      "CreationTime": 1495528748.555,
      "Name": "My_Game_Server_Build_Two",
      "OperatingSystem": "AMAZON_LINUX_2",
      "SizeOnDisk": 8567781,
      "Status": "FAILED",
      "Version": "23456.789"
    }
  ]
}
```

- For API details, see [ListBuilds](https://docs.aws.amazon.com/cli/latest/reference/gamelift/list-builds.html) in *AWS CLI Command Reference*.

**list-fleets**

The following code example shows how to use list-fleets.

**AWS CLI**

**Example1: To get a list of all fleets in a Region**

The following list-fleets example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a next-token attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
  --limit 2
```

Output:

```
{
  "FleetIds": [
```

Actions and scenarios
You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \
  --limit 2 \n  --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM5OCJ9LCJidWlsZC0xMjEzNzAwMjE1NjU2MThjZTljMjMxMjZkMjU2MjY3NjI1NjQwN2QyZTQ5NzNiNjJhM2YyN2QwNjIyMjI4N2I4MjIyN2IzNjJiYTVmYjIwNTM2Y2NiMmM4ZjIwNjI4ZjUwZEA=
```

**Example2: To get a list of all fleets in a Region with a specific build or script**

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

Output:

```
{
  "FleetIds": [
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE2222",
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE3333",
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE4444"
  ]
}
```

- For API details, see [ListFleets](https://docs.aws.amazon.com/cli/latest/reference/gamelift/list-fleets.html) in *AWS CLI Command Reference*.

**request-upload-credentials**

The following code example shows how to use `request-upload-credentials`.
AWS CLI

**To refresh access credentials for uploading a build**

The following create-build example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original CreateBuild request.

```bash
aws gamelift request-upload-credentials \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

Output:

```
{
   "StorageLocation": {
      "Bucket": "gamelift-builds-us-west-2",
      "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111"
   },
   "UploadCredentials": {
      "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
      "SecretAccessKey": "wJalrXUtntFEgK7MDENG/bPxFiCYEXmPLEKEY",
      "SessionToken": "AgoGb3JpZ2luENz...EXmPLETOKEN=="
   }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/upload-custom-server-build.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [RequestUploadCredentials](https://docs.aws.amazon.com/cli/latest/reference/gamelift/request-upload-credentials.html) in *AWS CLI Command Reference*.

**start-fleet-actions**

The following code example shows how to use `start-fleet-actions`.

AWS CLI

**To restart fleet automatic scaling activity**

The following start-fleet-actions example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling `stop-fleet-actions`. After starting, the scaling policies immediately begin tracking their respective metrics.
aws gamelift start-fleet-actions  
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  
    --actions AUTO_SCALING

This command produces no output.

- For API details, see StartFleetActions in AWS CLI Command Reference.

stop-fleet-actions

The following code example shows how to use stop-fleet-actions.

AWS CLI

To stop a fleet's automatic scaling activity

The following stop-fleet-actions example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

aws gamelift stop-fleet-actions  
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  
    --actions AUTO_SCALING

This command produces no output.

- For API details, see StopFleetActions in AWS CLI Command Reference.

update-build

The following code example shows how to use update-build.

AWS CLI

To update a custom game build

The following update-build example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

aws gamelift update-build  
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
Output:

```json
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA.east",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.east"
    }
}
```

For more information, see [Update Your Build Files](https://docs.aws.amazon.com/gamelift/latest/developerguide/update-build-files.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [UpdateBuild](https://docs.aws.amazon.com/cli/latest/reference/gamelift/update-build.html) in *AWS CLI Command Reference*.

### update-game-session-queue

The following code example shows how to use `update-game-session-queue`.

**AWS CLI**

**To update a game session queue configuration**

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
  --name MegaFrogRace-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```json
{
}
```
Contents of latency-policies.json:

```
{
    "PlayerLatencyPolicies": [
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 200,
            "PolicyDurationSeconds": 120
        },
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 150,
            "PolicyDurationSeconds": 120
        },
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 100,
            "PolicyDurationSeconds": 120
        }
    ]
}
```

Output:

```
{
    "GameSessionQueue": {
        "Destinations": [
            {
                "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
            {
                "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
            {
                "DestinationArn": "arn:aws:gamelift:us-east-1::alias/alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
            }
        ],
        "Name": "MegaFrogRace-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200,
                "PolicyDurationSeconds": 120
            },
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 150,
                "PolicyDurationSeconds": 120
            }
        ]
    }
}
```
For more information, see Using Multi-Region Queues in the Amazon GameLift Developer Guide.

- For API details, see UpdateGameSessionQueue in AWS CLI Command Reference.

**upload-build**

The following code example shows how to use upload-build.

**AWS CLI**

**Example1: To upload a Linux game server build**

The following upload-build example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```
aws gamelift upload-build \
  --name MegaFrogRaceServer.NA \n  --build-version 2.0.1 \n  --build-root ~/MegaFrogRace_Server/release-na \n  --operating-system AMAZON_LINUX_2 \n  --server-sdk-version 4.0.2
```

**Output:**

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Example2: To upload a Windows game server build**

The following upload-build example uploads Windows game server build files from a directory to the GameLift service and creates a build record.
aws gamelift upload-build \
   --name MegaFrogRaceServer.NA \
   --build-version 2.0.1 \
   --build-root C:\MegaFrogRace_Server\release-na \
   --operating-system WINDOWS_2012 \
   --server-sdk-version 4.0.2

Output:

Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

For more information, see Upload a Custom Server Build to GameLift in the Amazon GameLift Developer Guide.

- For API details, see UploadBuild in AWS CLI Command Reference.

Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions
Actions

add-custom-routing-endpoints

The following code example shows how to use `add-custom-routing-endpoints`.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator add-custom-routing-endpoints \\   --endpoint-group-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \\   --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```json
{
   "EndpointDescriptions": [
      {
         "EndpointId": "subnet-1234567890abcdef0"
      }
   ],
   "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AddCustomRoutingEndpoints in AWS CLI Command Reference.

advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.
AWS CLI

To advertise an address range

The following advertise-byoip-cidr example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
  --cidr 198.51.100.0/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "198.51.100.0/24",
      "State": "PENDING_ADVERTISING"
   }
}
```

For more information, see Bring Your Own IP Address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AdvertiseByoipCidr in AWS CLI Command Reference.

allow-custom-routing-traffic

The following code example shows how to use allow-custom-routing-traffic.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following allow-custom-routing-traffic example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
  --endpoint-group-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
  --endpoint-id subnet-abcd123example \
```
This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AllowCustomRoutingTraffic in AWS CLI Command Reference.

create-accelerator

The following code example shows how to use create-accelerator.

AWS CLI

To create an accelerator

The following create-accelerator example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
   --name ExampleAccelerator \
   --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
   --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```json
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleAccelerator",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ]
         }
      ]
   }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateAccelerator in AWS CLI Command Reference.

create-custom-routing-accelerator

The following code example shows how to use create-custom-routing-accelerator.

AWS CLI

To create a custom routing accelerator

The following create-custom-routing-accelerator example creates a custom routing accelerator with the tags Name and Project.

```bash
aws globalaccelerator create-custom-routing-accelerator \
  --name ExampleCustomRoutingAccelerator \
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
  --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```json
{
  "Accelerator": {
    "AcceleratorArn": 
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleCustomRoutingAccelerator",
    "Enabled": true,
```
"Status": "IN_PROGRESS",
"IpSets": [
  {
    "IpAddresses": [
      "192.0.2.250",
      "198.51.100.52"
    ],
    "IpFamily": "IPv4"
  }
],
"DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
"CreatedTime": 1542394847.0,
"LastModifiedTime": 1542394847.0
}
}

For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingAccelerator in AWS CLI Command Reference.

create-custom-routing-endpoint-group

The following code example shows how to use create-custom-routing-endpoint-group.

AWS CLI

To create an endpoint group for a custom routing accelerator

The following create-custom-routing-endpoint-group example creates an endpoint group for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-endpoint-group \\
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \\
  --endpoint-group-region us-east-2 \\
  --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```
{
  "EndpointGroup": {
```
  "EndpointGroupRegion": "us-east-2",
  "DestinationDescriptions": [
    {
      "FromPort": 80,
      "ToPort": 81,
      "Protocols": [
        "TCP",
        "UDP"
      ]
    }
  ],
  "EndpointDescriptions": []}
}

For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/endpoint-groups.html) in the AWS Global Accelerator Developer Guide.

- For API details, see [CreateCustomRoutingEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/create-custom-routing-endpoint-group.html) in AWS CLI Command Reference.

**create-custom-routing-listener**

The following code example shows how to use `create-custom-routing-listener`.

**AWS CLI**

**To create a listener for a custom routing accelerator**

The following create-custom-routing-listener example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-listener
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
  --port-ranges FromPort=5000,ToPort=10000
```

Output:

```
{
  "Listener": {
```
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingListener in AWS CLI Command Reference.

**create-endpoint-group**

The following code example shows how to use create-endpoint-group.

**AWS CLI**

To create an endpoint group

The following create-endpoint-group example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-1 \
  --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ],
    }
}
```
"EndpointGroupArn":
  "EndpointGroupRegion": "us-east-1"
}
}

For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/globa lạccelerator/latest/userguide/endpoint_groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/create-endpoint-group.html) in *AWS CLI Command Reference*.

### create-listener

The following code example shows how to use `create-listener`.

**AWS CLI**

**To create a listener**

The following `create-listener` example creates a listener with two ports.

```bash
aws globalaccelerator create-listener \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
  --protocol TCP
```

**Output:**

```json
{
  "Listener": {
    "PortRanges": [
      {
        "ToPort": 80,
        "FromPort": 80
      },
      {
        "ToPort": 81,
        "FromPort": 81
      }
    ],
    "ClientAffinity": "NONE",
    "ListenerPorts": null
  }
}
```
"Protocol": "TCP",
"ListenerArn":
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz"
}
}

For more information, see Listeners in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateListener in AWS CLI Command Reference.

deny-custom-routing-traffic

The following code example shows how to use deny-custom-routing-traffic.

**AWS CLI**

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following deny-custom-routing-traffic example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```shell
aws globalaccelerator deny-custom-routing-traffic \
   --endpoint-group-arn "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example" \
   --endpoint-id "subnet-abcd123example" \
   --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DenyCustomRoutingTraffic in AWS CLI Command Reference.

deprovision-byoip-cidr

The following code example shows how to use deprovision-byoip-cidr.
AWS CLI

To deprovision an address range

The following deprovision-byoip-cidr example releases the specified address range that you provisioned to use with your AWS resources.

```bash
aws globalaccelerator deprovision-byoip-cidr \
   --cidr "198.51.100.0/24"
```

Output:

```json
{
   "ByoipCidr": {
      "Cidr": "198.51.100.0/24",
      "State": "PENDING_DEPROVISIONING"
   }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://aws.amazon.com/global-accelerator/) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalsalecclerator/latest/dg/).

**describe-accelerator-attributes**

The following code example shows how to use describe-accelerator-attributes.

AWS CLI

To describe an accelerator's attributes

The following describe-accelerator-attributes example retrieves the attribute details for an accelerator.

```bash
aws globalaccelerator describe-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
}
```
"AcceleratorAttributes": {
    "FlowLogsEnabled": true,
    "FlowLogsS3Bucket": flowlogs-abc,
    "FlowLogsS3Prefix": bucketprefix-abc
}
}

For more information, see [Accelerators in AWS Global Accelerator](https://aws.amazon.com/global-accelerator/) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAcceleratorAttributes](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-accelerator-attribute.html) in *AWS CLI Command Reference*.

### describe-accelerator

The following code example shows how to use `describe-accelerator`.

**AWS CLI**

**To describe an accelerator**

The following `describe-accelerator` example retrieves the details about the specified accelerator.

```bash
aws globalaccelerator describe-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```json
{
    "Accelerator": {
        "AcceleratorArn":
            "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    ...,
                ]
            },
            ...
        ]
    }
}
```
For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/ga4/guide/index.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAccelerator](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-accelerator.html) in *AWS CLI Command Reference*.

### describe-custom-routing-accelerator-attributes

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

**AWS CLI**

**To describe a custom routing accelerator's attributes**

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator-attributes
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "AcceleratorAttributes": {
      "FlowLogsEnabled": false
   }
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/ga4/guide/index.html) in the *AWS Global Accelerator Developer Guide*. 
For API details, see `DescribeCustomRoutingAcceleratorAttributes` in `AWS CLI Command Reference`.

**describe-custom-routing-accelerator**

The following code example shows how to use `describe-custom-routing-accelerator`.

**AWS CLI**

**To describe a custom routing accelerator**

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingAccelerator in AWS CLI Command Reference.

**describe-custom-routing-endpoint-group**

The following code example shows how to use describe-custom-routing-endpoint-group.

**AWS CLI**

To describe an endpoint group for a custom routing accelerator

The following describe-custom-routing-endpoint-group example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \
    --endpoint-group-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 5000,
                "ToPort": 10000,
                "Protocols": ["UDP"
            ]
        ],
        "EndpointDescriptions": [
```

"EndpointId": "subnet-1234567890abcdef0"
]
]
}
}

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingEndpointGroup in AWS CLI Command Reference.

**describe-custom-routing-listener**

The following code example shows how to use describe-custom-routing-listener.

**AWS CLI**

**To describe a listener for a custom routing accelerator**

The following describe-custom-routing-listener example describes a listener for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-listener \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
    "Listener": {
        "PortRanges": [
            {
                "FromPort": 5000,
                "ToPort": 10000
            }
        ],
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.
For API details, see DescribeCustomRoutingListener in AWS CLI Command Reference.

**describe-endpoint-group**

The following code example shows how to use describe-endpoint-group.

**AWS CLI**

To describe an endpoint group

The following describe-endpoint-group example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example
```

Output:

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100.0,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "i-1234567890abcdef0"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
      }
    ],
    "EndpointGroupArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-endpoint-group.html) in *AWS CLI Command Reference*.

**describe-listener**

The following code example shows how to use describe-listener.

**AWS CLI**

To describe a listener

The following describe-listener example describes a listener.

```
aws globalaccelerator describe-listener \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
   "Listener": {
      "ListenerArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
      "PortRanges": [
      {
         "FromPort": 80,
         "ToPort": 80
      }
      ],
      "Protocol": "TCP",
      "ClientAffinity": "NONE"
   }
}
```
For more information, see Listeners in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeListener in AWS CLI Command Reference.

**list-accelerators**

The following code example shows how to use list-accelerators.

**AWS CLI**

To list your accelerators

The following list-accelerators example lists the accelerators in your AWS account. This account has two accelerators.

```bash
aws globalaccelerator list-accelerators
```

Output:

```json
{
   "Accelerators": [
      {
         "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-abcd-5555EXAMPLE1",
         "Name": "TestAccelerator",
         "IpAddressType": "IPV4",
         "Enabled": true,
         "IpSets": [
            {
               "IpFamily": "IPv4",
               "IpAddresses": [
                  "192.0.2.250",
                  "198.51.100.52"
               ]
            }
         ],
         "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
         "Status": "DEPLOYED",
         "CreatedTime": 1552424416.0,
         "LastModifiedTime": 1569375641.0
      }
   ]
}
```
For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/ga-createloadbalancer.htm) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListAccelerators](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-accelerators.html) in *AWS CLI Command Reference*.

**list-byoip-cidr**

The following code example shows how to use `list-byoip-cidr`.

**AWS CLI**

To list your address ranges

The following `list-byoip-cidr` example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

```bash
aws globalaccelerator list-byoip-cidrs
```
Output:

```json
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        },
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/BYoIP-address.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see `ListByoipCidr` in *AWS CLI Command Reference*.

### list-custom-routing-accelerators

The following code example shows how to use `list-custom-routing-accelerators`.

**AWS CLI**

**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```bash
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```json
{
    "Accelerators": [
        {
            "AcceleratorArn":
                "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-EXAMPLE1",
            "Name": "TestCustomRoutingAccelerator",
            "CustomRouting": {
                "RoutingRules": [
                    {
                        "RoutingConfig": {
                            "Route":{
                                "Destination": {"Cidr": "198.51.100.0/24"},
                                "Type": "IP"
                            },
                            "Weight": 1
                        }
                    }
                ]
            }
```
"IpAddressType": "IPV4",
"Enabled": true,
"IpSets": [
  {
    "IpFamily": "IPv4",
    "IpAddresses": [
      "192.0.2.250",
      "198.51.100.52"
    ]
  }
],
"DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
"Status": "DEPLOYED",
"CreatedTime": 1552424416.0,
"LastModifiedTime": 1569375641.0
},
{
  "AcceleratorArn": 
  "arn:aws:globalaccelerator::888888888888:accelerator/888abcd-abcd-8888-abcd-8888EXAMPLE2",
  "Name": "ExampleCustomRoutingAccelerator",
  "IpAddressType": "IPV4",
  "Enabled": true,
  "IpSets": [
    {
      "IpFamily": "IPv4",
      "IpAddresses": [
        "192.0.2.100",
        "198.51.100.10"
      ]
    }
  ],
  "DnsName": "6a6a6a6a6a6a6a6a.awsglobalaccelerator.com",
  "Status": "DEPLOYED",
  "CreatedTime": 1575585564.0,
  "LastModifiedTime": 1579809243.0
  }
}

For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingAccelerators in AWS CLI Command Reference.
list-custom-routing-endpoint-groups

The following code example shows how to use list-custom-routing-endpoint-groups.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following list-custom-routing-endpoint-groups example lists the endpoint groups for a listener in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-endpoint-groups \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
   "EndpointGroups": [
       {
           "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
           "EndpointGroupRegion": "eu-central-1",
           "DestinationDescriptions": [
               {
                   "FromPort": 80,
                   "ToPort": 80,
                   "Protocols": [
                       "TCP",
                       "UDP"
                   ]
               }
           ],
           "EndpointDescriptions": [
               {
                   "EndpointId": "subnet-abcd123example"
               }
           ]
       }
   ]
}
```
For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingEndpointGroups in AWS CLI Command Reference.

**list-custom-routing-listeners**

The following code example shows how to use list-custom-routing-listeners.

**AWS CLI**

**To list listeners for custom routing accelerators**

The following list-custom-routing-listeners example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn":
                "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingListeners in AWS CLI Command Reference.
list-custom-routing-port-mappings-by-destination

The following code example shows how to use list-custom-routing-port-mappings-by-destination.

AWS CLI

To list the port mappings for a specific custom routing accelerator destination

The following list-custom-routing-port-mappings-by-destination example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
  --endpoint-id subnet-abcd123example \
  --destination-address 198.51.100.52
```

Output:

```
{
  "DestinationPortMappings": [
    {
      "AcceleratorArn": "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-d750-4489-8919-3095f3c4b0a7",
      "AcceleratorSocketAddresses": [
        {
          "IpAddress": "192.0.2.250",
          "Port": 65514
        },
        {
          "IpAddress": "192.10.100.99",
          "Port": 65514
        }
      ],
      "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example",
      "EndpointId": "subnet-abcd123example",
      "EndpointGroupRegion": "us-west-2",
      "DestinationSocketAddress": {
        "IpAddress": "198.51.100.52",
      }
    }
  ]
}
```
For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://aws.amazon.com/global-accelerator/guides/deploying/working-with-custom-routing-accelerators/) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingPortMappingsByDestination](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-custom-routing-port-mappings-by-destination.html) in *AWS CLI Command Reference*.

**list-custom-routing-port-mappings**

The following code example shows how to use `list-custom-routing-port-mappings`.

### AWS CLI

**To list the port mappings in a custom routing accelerator**

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-port-mappings \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```json
{
    "PortMappings": [
        {
            "AcceleratorPort": 40480,
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
                "IpAddress": "192.0.2.250",
                "Port": 80
            }
        }
    ]
}
```
For more information, see How custom routing accelerators work in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingPortMappings in AWS CLI Command Reference.

**list-endpoint-groups**

The following code example shows how to use list-endpoint-groups.

**AWS CLI**

**To list endpoint groups**

The following list-endpoint-groups example lists the endpoint groups for a listener. This listener has two endpoint groups.

```bash
aws globalaccelerator --region us-west-2 list-endpoint-groups \
```
Output:

```json
{
    "EndpointGroups": [
    {
        "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
        "EndpointGroupRegion": "eu-central-1",
        "EndpointDescriptions": [],
        "TrafficDialPercentage": 100.0,
        "HealthCheckPort": 80,
        "HealthCheckProtocol": "TCP",
        "HealthCheckIntervalSeconds": 30,
        "ThresholdCount": 3
    },
    {
        "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",
        "EndpointGroupRegion": "us-east-1",
        "EndpointDescriptions": [],
        "TrafficDialPercentage": 50.0,
        "HealthCheckPort": 80,
        "HealthCheckProtocol": "TCP",
        "HealthCheckIntervalSeconds": 30,
        "ThresholdCount": 3
    }
    ]
}
```

For more information, see [Endpoint Groups in AWS Global Accelerator](https://docs.aws.amazon.com/gla/latest/dg/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/gla/latest/dg/endpoint-groups.html).

- For API details, see [ListEndpointGroups](https://docs.aws.amazon.com/cli/latest/reference/gla/list-endpoint-groups.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/gla/list-endpoint-groups.html).

**list-listeners**

The following code example shows how to use `list-listeners`.
AWS CLI

To list listeners

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
  "Listeners": [
    {
      "ListenerArn": 
        "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
      "PortRanges": [{
        "FromPort": 80,
        "ToPort": 80
      }],
      "Protocol": "TCP",
      "ClientAffinity": "NONE"
    }
  ]
}
```

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an accelerator
The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```bash
aws globalaccelerator list-tags-for-resource \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
  "Tags": [
    {
      "Key": "Project",
      "Value": "A123456"
    }
  ]
}
```

For more information, see [Tagging in AWS Global Accelerator](https://aws.amazon.com) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListTagsForResource](https://aws.amazon.com) in *AWS CLI Command Reference*.

### provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

**AWS CLI**

**To provision an address range**

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```bash
aws globalaccelerator provision-byoip-cidr \
  --cidr 192.0.2.250/24 \
  --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```json
{
}
```
"ByoipCidr": {  
    "Cidr": "192.0.2.250/24",  
    "State": "PENDING_PROVISIONING"  
}  
}  

For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag an accelerator

The following tag-resource example adds tags Name and Project to an accelerator, along with corresponding values for each.

```bash
aws globalaccelerator tag-resource  
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh  
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from an accelerator
The following `untag-resource` example removes the tags Name and Project from an accelerator.

```
aws globalaccelerator untag-resource \
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see [Tagging in AWS Global Accelerator](https://docs.aws.amazon.com/ga4v2/latest/userguide/tagging.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/untag-resource.html) in *AWS CLI Command Reference*.

**update-accelerator-attributes**

The following code example shows how to use `update-accelerator-attributes`.

**AWS CLI**

**To update an accelerator's attributes**

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the US-West-2 (Oregon) Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --flow-logs-enabled \
  --flow-logs-s3-bucket flowlogs-abc \
  --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
  "AcceleratorAttributes": {
    "FlowLogsEnabled": true
    "FlowLogsS3Bucket": flowlogs-abc
    "FlowLogsS3Prefix": bucketprefix-abc
  }
```
For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateAcceleratorAttributes](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/update-accelerator.html) in *AWS CLI Command Reference*.

**update-accelerator**

The following code example shows how to use `update-accelerator`.

**AWS CLI**

**To update an accelerator**

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the US-West-2 (Oregon) Region to create or update accelerators.

```bash
aws globalaccelerator update-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --name ExampleAcceleratorNew
```

**Output:**

```json
{
  "Accelerator": {
    "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleAcceleratorNew",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ],
        "IpFamily": "IPv4"
      }
    ]
  }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateAccelerator in AWS CLI Command Reference.

**update-custom-routing-accelerator-attributes**

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

**AWS CLI**

**To update a custom routing accelerator's attributes**

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --flow-logs-enabled \
  --flow-logs-s3-bucket flowlogs-abc \
  --flow-logs-s3-prefix bucketprefix-abc
```

**Output:**

```json
{
  "AcceleratorAttributes": {
    "FlowLogsEnabled": true
    "FlowLogsS3Bucket": flowlogs-abc
    "FlowLogsS3Prefix": bucketprefix-abc
  }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

**update-custom-routing-accelerator**

The following code example shows how to use update-custom-routing-accelerator.

**AWS CLI**

To update a custom routing accelerator

The following update-custom-routing-accelerator example modifies a custom routing accelerator to change the accelerator name.

```bash
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --name ExampleCustomRoutingAcceleratorNew
```

Output:

```
{
  "Accelerator": {
    "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleCustomRoutingAcceleratorNew",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ],
        "IpFamily": "IPv4"
      }
    ],
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
  }
}```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingAccelerator in AWS CLI Command Reference.

**update-custom-routing-listener**

The following code example shows how to use `update-custom-routing-listener`.

**AWS CLI**

To update a listener for a custom routing accelerator

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=10000,ToPort=20000
```

Output:

```
{
    "Listener": {
        "ListenerArn":
        "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz
        "PortRanges": [
            {
                "FromPort": 10000,
                "ToPort": 20000
            }
        ],
        "Protocol": "TCP"
    }
}
```
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingListener in AWS CLI Command Reference.

update-endpoint-group

The following code example shows how to use update-endpoint-group.

AWS CLI

To update an endpoint group

The following update-endpoint-group example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```
aws globalaccelerator update-endpoint-group \
  --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example \
  --endpoint-configurations \n    EndpointId=eipalloc-eip01234567890abc,Weight=128 \n    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz,Weight=128 \n    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100,
    "EndpointDescriptions": [
    {
      "Weight": 128,
      "EndpointId": "eip01234567890abc"
    },
    {
      "Weight": 128,
      "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
    },
    {
      "Weight": 128,
      "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
    }
  }
}
```
The following code example shows how to use `update-listener`.

**AWS CLI**

**To update a listener**

The following `update-listener` example updates a listener to change the port to 100.

```bash
aws globalaccelerator update-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --port-ranges FromPort=100,ToPort=100
```

**Output:**

```json
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz",
        "PortRanges": [
```
For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/listeners.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateListener](https://docs.aws.amazon.com/cli/latest/reference/global-accelerator/update-listener.html) in *AWS CLI Command Reference*.

### withdraw-byoip-cidr

The following code example shows how to use `withdraw-byoip-cidr`.

**AWS CLI**

**To withdraw an address range**

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```bash
aws globalaccelerator withdraw-byoip-cidr
   --cidr 192.0.2.250/24
```

Output:

```json
{
   "ByoipCidr": {
      "Cidr": "192.0.2.250/24",
      "State": "PENDING_WITHDRAWING"
   }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/byp passenger-ip-addresses.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [WithdrawByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/global-accelerator/withdraw-byoip-cidr.html) in *AWS CLI Command Reference*.  
  
```json
{  
    "FromPort": 100,  
    "ToPort": 100  
  },  
  "Protocol": "TCP",  
  "ClientAffinity": "NONE"
}
```
AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

batch-stop-job-run

The following code example shows how to use batch-stop-job-run.

AWS CLI

To stop job runs

The following batch-stop-job-run example stops a job runs.

aws glue batch-stop-job-run
  --job-name "my-testing-job"
  --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f

Output:

```json
{
  "SuccessfulSubmissions": [
  {
    "JobName": "my-testing-job",
    "JobRunId": "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
  }
}
```
create-connection

The following code example shows how to use create-connection.

AWS CLI

To create a connection for AWS Glue data stores

The following create-connection example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```bash
aws glue create-connection \
   --connection-input '{ \
     "Name":"conn-kafka-custom", \
     "Description":"kafka connection with ssl to custom kafka", \
     "ConnectionType":"KAFKA", \
     "ConnectionProperties":{ \
       "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \
       "KAFKA_SSL_ENABLED":"true", \
       "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \
     }, \
     "PhysicalConnectionRequirements":{ \
     }
   }
```
AWS Command Line Interface

User Guide for Version 2

create-database

The following code example shows how to use create-database.

AWS CLI

To create a database

The following create-database example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \
   --database-input "{""Name"":"tempdb"}" \
   --profile my_profile \
   --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the AWS Glue Developer Guide.

• For API details, see CreateDatabase in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.

AWS CLI

To create a job to transform data
The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job \
  --name my-testing-job \
  --role AWSGlueServiceRoleDefault \
  --command '{ \n    "Name": "gluestreaming", \n    "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/" \n  }' \
  --region us-east-1 \
  --output json \
  --default-arguments '{ \n    "--job-language": "scala", \n    "--class": "GlueApp" \n  }' \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```scala
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx = "datasource0"]
    // @return: datasource0
  }
}
```
val datasource0 = glueContext.getCatalogSource(database = "tempdb",
tableName = "s3-source",
redshiftTmpDir = "",
transformationContext = "datasource0").getDynamicFrame()

val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid", "int", "sensorid", "int"),
("currenttemperature", "int", "currenttemperature", "int"),
("status", "string", "status", "string")),
caseSensitive = false,
transformationContext = "applymapping1")

val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid", "currenttemperature", "status"),
transformationContext = "selectfields2")

val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName = Some("my-s3-sink"),
transformationContext = "resolvechoice3")

val datasink4 = glueContext.getCatalogSink(database = "tempdb",
tableName = "my-s3-sink",
redshiftTmpDir = "",
transformationContext = "datasink4").writeDynamicFrame(resolvechoice3)

Job.commit()
For more information, see Authoring Jobs in AWS Glue in the AWS Glue Developer Guide.

- For API details, see CreateJob in AWS CLI Command Reference.

**create-table**

The following code example shows how to use create-table.

**AWS CLI**

**Example 1: To create a table for a Kinesis data stream**

The following create-table example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```
aws glue create-table
   --database-name tempdb
   --table-input  
      '{"Name":"test-kinesis-input", "StorageDescriptor":{ 
         "Columns":[ 
            {"Name":"sensorid", "Type":"int"}, 
            {"Name":"currenttemperature", "Type":"int"}, 
            {"Name":"status", "Type":"string"}
         ], 
         "Location":"my-testing-stream", 
         "Parameters":{ 
            "typeOfData":"kinesis","streamName":"my-testing-stream", 
            "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" 
         }, 
         "SerdeInfo":{ 
            "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} 
      }, 
      "Parameters":{ 
         "classification":"json"} 
   }' 
   --profile my-profile 
   --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.
For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

**Example 2: To create a table for a Kafka data store**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```bash
aws glue create-table \
  --database-name tempdb \
  --table-input '{"Name":"test-kafka-input", "StorageDescriptor":{ \
    "Columns": [ \
      {"Name":"sensorid", "Type":"int"}, \
      {"Name":"currenttemperature", "Type":"int"}, \
      {"Name":"status", "Type":"string"} \n    ], \
    "Location":"glue-topic", \
    "Parameters":{ \
      "typeOfData":"kafka","topicName":"glue-topic", \
      "connectionName":"my-kafka-connection" \n    }, \
    "SerdeInfo":{ \n      "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde" \n    }, \
    "Parameters":{ \n      "separatorChar":"\"" \n    } \n  }', \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

**Example 3: To create a table for a AWS S3 data store**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```bash
aws glue create-table \
```

Actions and scenarios
This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](https://docs.aws.amazon.com/glue/latest/dg/how-to-create-table-definition.html) in the *AWS Glue Developer Guide*.

• For API details, see [CreateTable](https://docs.aws.amazon.com/cli/latest/reference/glue/create-table.html) in the *AWS CLI Reference*.

### delete-job

The following code example shows how to use delete-job.

**AWS CLI**

To delete a job

The following delete-job example deletes a job that is no longer needed.

```bash
aws glue delete-job 
  --job-name my-testing-job
```

Output:

```json
{
  "JobName": "my-testing-job"
}
```
For more information, see [Working with Jobs on the AWS Glue Console](https://docs.aws.amazon.com/glue/latest/dg/) in the *AWS Glue Developer Guide*.

- For API details, see [DeleteJob](https://docs.aws.amazon.com/cli/latest/reference/glue/delete-job.html) in *AWS CLI Command Reference*.

**get-databases**

The following code example shows how to use `get-databases`.

**AWS CLI**

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following `get-databases` example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

**Output:**

```
{
  "DatabaseList": [
    {
      "Name": "default",
      "Description": "Default Hive database",
      "LocationUri": "file:/spark-warehouse",
      "CreateTime": 1602084052.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "flights-db",
      "CreateTime": 1587072847.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    }
  ]
}
```
{
    "Principal": {
        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
    },
    "Permissions": [
        "ALL"
    ]
},
"CatalogId": "111122223333"
},
{
    "Name": "legislators",
    "CreateTime": 1601415625.0,
    "CreateTableDefaultPermissions": [
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
            },
            "Permissions": [
                "ALL"
            ]
        }
    ],
    "CatalogId": "111122223333"
},
{
    "Name": "tempdb",
    "CreateTime": 1601498566.0,
    "CreateTableDefaultPermissions": [
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
            },
            "Permissions": [

            ]
        }
    ],
    "CatalogId": "111122223333"
}
For more information, see [Defining a Database in Your Data Catalog](https://docs.aws.amazon.com/glue/latest/dg/how-defining-database.html) in the *AWS Glue Developer Guide*.

- For API details, see [GetDatabases](https://docs.aws.amazon.com/glue/latest/dg/aws-glue-api-database.html) in *AWS CLI Command Reference*.

### get-job-run

The following code example shows how to use `get-job-run`.

#### AWS CLI

**To get information about a job run**

The following `get-job-run` example retrieves information about a job run.

```
aws glue get-job-run \
  --job-name "Combine legislators data" \
  --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

**Output:**

```json
{
  "JobRun": {
    "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
    "Attempt": 0,
    "JobName": "Combine legislators data",
    "StartedOn": 1602873931.255,
    "LastModifiedOn": 1602874075.985,
    "CompletedOn": 1602874075.985,
    "JobRunState": "SUCCEEDED",
    "Arguments": {
      "--enable-continuous-cloudwatch-log": "true",
      "--enable-metrics": "",
      "--enable-spark-ui": "true",
      "--job-bookmark-option": "job-bookmark-enable",
      "--spark-event-logs-path": "s3://aws-glue-assets-111122223333-us-east-1/sparkHistoryLogs/"
    },
    "PredecessorRuns": [],
    "AllocatedCapacity": 10,
    "ExecutionTime": 117,
    "Timeout": 2880,
    "MaxCapacity": 10.0,
  }
}```
For more information, see [Job Runs](#) in the [AWS Glue Developer Guide](#).

- For API details, see [GetJobRun](#) in [AWS CLI Command Reference](#).

### get-job-runs

The following code example shows how to use `get-job-runs`.

---

**AWS CLI**

To get information about all job runs for a job

The following `get-job-runs` example retrieves information about job runs for a job.

```bash
aws glue get-job-runs \
--job-name "my-testing-job"
```

Output:

```json
{
  "JobRuns": [
  {
    "Id": "jr_012e176506505075ef94d76175e56c25586e1aad6f17d39f527e9140cf0c9a5e",

get-job

The following code example shows how to use get-job.

AWS CLI

To retrieve information about a job

The following get-job example retrieves information about a job.
**--job-name** `my-testing-job`

Output:

```
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,

    }
}
```

For more information, see Jobs in the AWS Glue Developer Guide.

- For API details, see GetJob in AWS CLI Command Reference.

**get-plan**

The following code example shows how to use get-plan.

**AWS CLI**

To get the generated code for mapping data from source tables to target tables

The following `get-plan` retrieves the generated code for mapping columns from the data source to the data target.
aws glue get-plan --mapping '[
  {
    "SourcePath":"sensorid",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"sensorid",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"currenttemperature",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"currenttemperature",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"status",
    "SourceTable":"anything",
    "SourceType":"string",
    "TargetPath":"status",
    "TargetTable":"anything",
    "TargetType":"string"
  }
]'
--source '{
  "DatabaseName":"tempdb",
  "TableName":"s3-source"
}'
--sinks ' [
  {
    "DatabaseName":"tempdb",
    "TableName":"my-s3-sink"
  }
]'
--language "scala"
--endpoint https://glue.us-east-1.amazonaws.com
--output "text"

Output:

import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite

    // @inputs: [frame = applymapping1]  
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",  
      "currenttemperature", "status"), transformationContext = "selectfields2")  
    // @type: ResolveChoice  
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-sink",  
    // transformation_ctx = "resolvechoice3"]  
    // @return: resolvechoice3
For more information, see [Editing Scripts in AWS Glue](https://docs.aws.amazon.com/glue/latest/dg/editing-scripts.html) in the [AWS Glue Developer Guide](https://docs.aws.amazon.com/glue/latest/dg/). For API details, see [GetPlan](https://docs.aws.amazon.com/cli/latest/reference/glue/get-plan.html) in *AWS CLI Command Reference*.

**get-tables**

The following code example shows how to use `get-tables`.

**AWS CLI**

To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```bash
aws glue get-tables --database-name 'tempdb'
```

Output:

```json
{
   "TableList": [
      {
         "Name": "my-s3-sink",
         "DatabaseName": "tempdb",

}

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see GetTables in AWS CLI Command Reference.

**start-crawler**

The following code example shows how to use start-crawler.

**AWS CLI**

To start a crawler

The following start-crawler example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

None
For more information, see Defining Crawlers in the AWS Glue Developer Guide.

- For API details, see StartCrawler in AWS CLI Command Reference.

start-job-run

The following code example shows how to use start-job-run.

AWS CLI

To start running a job

The following start-job-run example starts a job.

```bash
aws glue start-job-run \\
  --job-name my-job
```

Output:

```json
{
  "JobRunId": "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Authoring Jobs in the AWS Glue Developer Guide.

- For API details, see StartJobRun in AWS CLI Command Reference.

GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

• Actions

Actions

accept-invitation

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation  \\
  --detector-id 12abc34d567e8fa901bc2d34eexample  \\
  --master-id 123456789111  \\
  --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

• For API details, see `AcceptInvitation` in AWS CLI Command Reference.

archive-findings

The following code example shows how to use `archive-findings`.

AWS CLI

To archive findings in the current region

This example shows how to archive findings in the current region.

```
aws guardduty archive-findings  \\
  --detector-id 12abc34d567e8fa901bc2d34eexample  \\
  --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```
This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ArchiveFindings in AWS CLI Command Reference.

### create-detector

The following code example shows how to use create-detector.

**AWS CLI**

To enable GuardDuty in the current region

This example shows how to create a new detector, which enables GuardDuty, in the current region:

```bash
aws guardduty create-detector --enable
```

Output:

```json
{
  "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the GuardDuty User Guide.

- For API details, see CreateDetector in AWS CLI Command Reference.

### create-filter

The following code example shows how to use create-filter.

**AWS CLI**

To create a new filter for the current region

This example creates a filter that matches all portscan findings for instance created from a specific image:

```bash
aws guardduty create-filter
```
--detector-id b6b992d6d2f48e64bc59180bfexample \  
--action ARCHIVE \  
--name myFilter \  
--finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'

Output:

```
{
    "Name": "myFilter"
}
```

For more information, see Filtering findings in the GuardDuty User Guide.

- For API details, see CreateFilter in AWS CLI Command Reference.

create-ip-set

The following code example shows how to use create-ip-set.

AWS CLI

To create a trusted IP set

The following create-ip-set example creates and activates a trusted IP set in the current region.

```
aws guardduty create-ip-set \  
   --detector-id 12abc34d567e8fa901bc2d34eeexample \  
   --name new-ip-set \  
   --format TXT \  
   --location s3://AWSDOC-EXAMPLE-BUCKET/customtrustlist.csv \  
   --activate
```

Output:

```
{
    "IpSetId": "d4b94fc952d6912b8f3060768example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.
• For API details, see `CreateIpSet` in *AWS CLI Command Reference*.

**create-members**

The following code example shows how to use `create-members`.

**AWS CLI**

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --account-details AccountId=111122223333,Email=first+
   +member@example.com AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see [Managing multiple accounts](#) in the GuardDuty User Guide.

• For API details, see `CreateMembers` in *AWS CLI Command Reference*.

**create-publishing-destination**

The following code example shows how to use `create-publishing-destination`.

**AWS CLI**

To create a publishing destination to export GuardDuty findings in the current region to.

This example shows how to create a publishing destination for GuardDuty findings.

```
aws guardduty create-publishing-destination \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --destination-type S3 \n```
For more information, see Exporting findings in the GuardDuty User Guide.

For API details, see CreatePublishingDestination in AWS CLI Command Reference.

create-sample-findings

The following code example shows how to use create-sample-findings.

AWS CLI

To create sample GuardDuty findings in the current region.

This example shows how to create a sample finding of the provided types.

```bash
aws guardduty create-sample-findings \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see Sample findings in the GuardDuty User Guide.

For API details, see CreateSampleFindings in AWS CLI Command Reference.

create-threat-intel-set

The following code example shows how to use create-threat-intel-set.

AWS CLI

To create a new threat intel set in the current region.

This example shows how to upload a threat intel set to GuardDuty and activate it immediately.
aws guardduty create-threat-intel-set \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --name myThreatSet \
   --format TXT \
   --location s3://EXAMPLEBUCKET/threatlist.csv \
   --activate

Output:

```json
{
   "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see [Trusted IP and threat lists](https://docs.aws.amazon.com/guardduty/latest/userguide/trusted-ip-threat-lists.html) in the *GuardDuty User Guide*.

- For API details, see [CreateThreatIntelSet](https://docs.aws.amazon.com/cli/latest/reference/guardduty/create-threat-intel-set.html) in *AWS CLI Command Reference*.

### decline-invitations

The following code example shows how to use `decline-invitations`.

**AWS CLI**

To **decline an invitation to have Guardduty managed by another account in the current region**.

This example shows how to decline a membership invitation.

```bash
aws guardduty decline-invitations \
   --account-ids 111122223333
```

Output:

```json
{
   "UnprocessedAccounts": []
}
```

For more information, see [Managing GuardDuty accounts by invitation](https://docs.aws.amazon.com/guardduty/latest/userguide/managed-by-invitation.html) in the GuardDuty User Guide.

- For API details, see [DeclineInvitations](https://docs.aws.amazon.com/cli/latest/reference/guardduty/decline-invitations.html) in *AWS CLI Command Reference*. 
**delete-detector**

The following code example shows how to use `delete-detector`.

**AWS CLI**

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```bash
aws guardduty delete-detector \
   --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see [Suspending or disabling GuardDuty](GuardDuty_User_Guide) in the GuardDuty User Guide.

- For API details, see [DeleteDetector](AWS_CLI_Command_Reference) in AWS CLI Command Reference.

**delete-filter**

The following code example shows how to use `delete-filter`.

**AWS CLI**

To delete an existing filter in the current region.

This example shows how to create delete a filter.

```bash
aws guardduty delete-filter \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --filter-name byebyeFilter
```

This command produces no output.

For more information, see [Filtering findings](GuardDuty_User_Guide) in the GuardDuty User Guide.

- For API details, see [DeleteFilter](AWS_CLI_Command_Reference) in AWS CLI Command Reference.

**disable-organization-admin-account**

The following code example shows how to use `disable-organization-admin-account`.
AWS CLI

**To remove an account as the delegated administrator for GuardDuty within your organization**

This example shows how to remove an account as the delegated administrator for GuardDuty.

```bash
aws guardduty disable-organization-admin-account \
   --admin-account-id 111122223333
```

This command produces no output.

For more information, see [Managing accounts with AWS organizations](https://docs.aws.amazon.com/guardduty/latest/userguide/organizational-accounts.html) in the *GuardDuty User Guide*.

- For API details, see [DisableOrganizationAdminAccount](https://docs.aws.amazon.com/cli/latest/reference/guardduty/disable-organization-admin-account.html) in *AWS CLI Command Reference*.

**disassociate-from-master-account**

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

**To disassociate from your current master account in the current region**

The following `disassociate-from-master-account` example disassociates your account from the current GuardDuty master account in the current AWS region.

```bash
aws guardduty disassociate-from-master-account \
   --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](https://docs.aws.amazon.com/guardduty/latest/userguide/concepts.html) in the *GuardDuty User Guide*.

- For API details, see [DisassociateFromMasterAccount](https://docs.aws.amazon.com/cli/latest/reference/guardduty/disassociate-from-master-account.html) in *AWS CLI Command Reference*.

**get-detector**

The following code example shows how to use `get-detector`.
AWS CLI

To retrieve details of a specific detector

The following get-detector example displays the configurations details of the specified detector.

```bash
aws guardduty get-detector \\
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
  "Status": "ENABLED",
  "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
  "Tags": {},
  "FindingPublishingFrequency": "SIX_HOURS",
  "UpdatedAt": "2018-11-07T03:24:22.938Z",
  "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see GetDetector in AWS CLI Command Reference.

get-findings

The following code example shows how to use get-findings.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following get-findings example retrieves the full JSON finding details of the specified finding.

```bash
aws guardduty get-findings \\
  --detector-id 12abc34d567e8fa901bc2d34eexample \\
  --finding-id 1ab92989eaf0e742df4a014d5example
```
Output:

```json
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",
                    "PrincipalId": "AIDACKCEVSQ6C2EXAMPLE",
                    "AccessKeyId": "ASIASZ4SI7REEEXAMPLE"
                }
            },

```
For more information, see Findings in the GuardDuty User Guide.

- For API details, see GetFindings in AWS CLI Command Reference.

**get-ip-set**

The following code example shows how to use get-ip-set.

**AWS CLI**

To list get details on a specified trusted IP set

The following get-ip-set example shows the status and details of the specified trusted IP set.

```
aws guardeduty get-ip-set \
  --detector-id 12abc34d567e8fa901bc2d34eexample \ 
  --ip-set-id d4b94fc952d6912b8f3060768example
```
Output:

```json
{
  "Status": "ACTIVE",
  "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customlist.csv",
  "Tags": {},
  "Format": "TXT",
  "Name": "test-ip-set"
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [GetIpSet](#) in [AWS CLI Command Reference](#).

### get-master-account

The following code example shows how to use `get-master-account`.

#### AWS CLI

**To retrieve details about your master account in the current region**

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \\
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```json
{
  "Master": {
    "InvitationId": "04b94d9704854a73f94e061e8example",
    "InvitedAt": "2020-06-09T22:23:04.970Z",
    "RelationshipStatus": "Enabled",
    "AccountId": "123456789111"
  }
}
```
For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [GetMasterAccount](#) in *AWS CLI Command Reference*.

**list-detectors**

The following code example shows how to use `list-detectors`.

**AWS CLI**

**To list the available detectors in the current region**

The following `list-detectors` example lists the available detectors in your current AWS region.

```
aws guardduty list-detectors
```

Output:

```
{
    "DetectorIds": [
        "12abc34d567e8fa901bc2d34eexample"
    ]
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [ListDetectors](#) in *AWS CLI Command Reference*.

**list-findings**

The following code example shows how to use `list-findings`.

**AWS CLI**

**Example 1: To list all findings for the current region**

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.
aws guardduty list-findings \
--detector-id 12abc34d567e8fa901bc2d34eexample \
--sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'

Output:

```
{
   "FindingIds": [
   "04b8ab50fd29c64fc771b232dexample",
   "5ab8ab50fd21373735c826d3aexample",
   "90b93de7aba69107f05bbe60bexample",
   ...
   ]
}
```

For more information, see Findings in the GuardDuty User Guide.

**Example 2: To list findings for the current region matching a specific finding criteria**

The following list-findings example displays a list of all findingIds that match a specified finding type.

aws guardduty list-findings \
--detector-id 12abc34d567e8fa901bc2d34eexample \
--finding-criteria '{"Criterion":{"type": "UnauthorizedAccess:EC2/SSHBruteForce"}}'}

Output:

```
{
   "FindingIds": [
   "90b93de7aba69107f05bbe60bexample",
   "6eb9430d7023d30774d6f05e3example",
   "2eb91a2d060ac9a21963a5848example",
   "44b8ab50fd2b0039a9e48f570example",
   "9eb8ab4cd2b7e5b66ba4f5e96example",
   "e0b8ab3a38e9b0312cc390ceexample"
   ]
}
```

For more information, see Findings in the GuardDuty User Guide.
Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following list-findings example displays a list of all findingIds that are not archived, and involve the IAM user named “testuser”, as specified in a JSON file.

```
aws guardduty list-findings \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --finding-criteria file://myfile.json
```

Contents of myfile.json:

```json
{"Criterion": {  
    "resource.accessKeyDetails.userName": {  
      "Eq": [  
        "testuser"  
      ]  
    },  
    "service.archived": {  
      "Eq": [  
        "false"  
      ]  
    }  
  }
}
```

Output:

```json
{
    "FindingIds": [
        "1ab92989eaf0e742df4a014d5example"
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

- For API details, see ListFindings in AWS CLI Command Reference.

list-invitations

The following code example shows how to use list-invitations.
AWS CLI

To list details on your invitations to become a member account in the current region

The following list-invitations example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
   "Invitations": [
   {
      "InvitationId": "d6b94fb03a66ff665f7db8764example",
      "InvitedAt": "2020-06-10T17:56:38.221Z",
      "RelationshipStatus": "Invited",
      "AccountId": "123456789111"
   }
   ]
}
```

For more information, see [Managing GuardDuty Accounts by Invitation](#) in the GuardDuty User Guide.

- For API details, see [ListInvitations](#) in AWS CLI Command Reference.

### list-ip-sets

The following code example shows how to use list-ip-sets.

AWS CLI

To list trusted IP sets in the current region

The following list-ip-sets example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
Actions and scenarios
```

- For API details, see [ListIpSets](https://docs.aws.amazon.com/cli/latest/reference/guardduty/list-ipsets.html) in *AWS CLI Command Reference*.

### list-members

The following code example shows how to use `list-members`.

**AWS CLI**

#### To list all members in the current region

The following `list-members` example lists all member accounts and their details for the current region.

```bash
aws guardduty list-members \
--detector-id 12abc34d567e8fa901bc2d34eexample
```

**Output:**

```json
{
    "Members": [
    {
        "RelationshipStatus": "Enabled",
        "InvitedAt": "2020-06-09T22:49:00.910Z",
        "MasterId": "123456789111",
        "DetectorId": "7ab8b2f61b256c87f793f6a86example",
        "UpdatedAt": "2020-06-09T23:08:22.512Z",
        "Email": "your+member@example.com",
        "AccountId": "123456789222"
        }
    ]
}
```
For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see ListMembers in AWS CLI Command Reference.

**update-ip-set**

The following code example shows how to use update-ip-set.

**AWS CLI**

**To update a trusted IP set**

The following update-ip-set example shows how to update the details of a trusted IP set.

```bash
aws guardduty update-ip-set \
  --detector-id 12abc34d567e8fa901bc2d34eexample \
  --ip-set-id d4b94fc952d6912b8f3060768example \
  --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see UpdateIpSet in AWS CLI Command Reference.

**AWS Health examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Actions and scenarios

Actions

describe-affected-entities

The following code example shows how to use describe-affected-entities.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following describe-affected-entities example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
  --filter "eventArns=arn:aws:health:global::event/BILLING/AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-EXAMPLE11145" \
  --region us-east-1
```

Output:

```
{
  "entities": [
    {
      "entityArn": "arn:aws:health:global:123456789012:entity/EXAMPLEimSMoULmWHpb",
      "eventArn": "arn:aws:health:global::event/BILLING/AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-EXAMPLE11145",
      "entityValue": "AWS_ACCOUNT",
      "awsAccountId": "123456789012",
      "lastUpdatedTime": 1588356454.08
    }
  ]
}
```

For more information, see Event log in the AWS Health User Guide.

- For API details, see DescribeAffectedEntities in AWS CLI Command Reference.
describe-event-details

The following code example shows how to use describe-event-details.

AWS CLI

To list information about an AWS Health event

The following describe-event-details example lists information about the specified AWS Health event.

```bash
aws health describe-event-details \
  --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
  --region us-east-1
```

Output:

```json
{
  "successfulSet": [
    {
      "event": {
        "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
        "service": "EC2",
        "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
        "eventTypeCategory": "issue",
        "region": "us-east-1",
        "startTime": 1587462325.096,
        "endTime": 1587464204.774,
        "lastUpdatedTime": 1587464204.865,
        "statusCode": "closed"
      },
      "eventDescription": {
        "latestDescription": "[RESOLVED] Increased API Error Rates and Latencies\n\n[02:45 AM PDT] We are investigating increased API error rates and latencies in the US-EAST-1 Region.\n\n[03:16 AM PDT] Between 2:10 AM and 2:59 AM PDT we experienced increased API error rates and latencies in the US-EAST-1 Region. The issue has been resolved and the service is operating normally."
      }
    }
  ],
  "failedSet": []
}
```
For more information, see Event details pane in the AWS Health User Guide.

- For API details, see DescribeEventDetails in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use `describe-events`.

**AWS CLI**

**Example 1: To list AWS Health events**

The following `describe-events` example lists recent AWS Health events.

```bash
aws health describe-events \
   --region us-east-1
```

**Output:**

```
{
   "events": [
   {
       "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/AWS_ECS_OPERATIONAL_ISSUE_KWQPY_EXAMPLE111",

  "service": "IAM"
For more information, see [Getting started with the AWS Personal Health Dashboard](#) in the *AWS Health User Guide*.

**Example 2: To list AWS Health events by service and event status code**

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```
aws health describe-events \\
  --filter "services=EC2, eventStatusCodes=closed"
```

Output:

```
{
  "events": [
    {
      "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
      "service": "EC2",
      "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
      "eventTypeCategory": "issue",
      "region": "us-east-1",
      "startTime": 1583881487.483,
      "endTime": 1583885056.785,
      "lastUpdatedTime": 1583885057.052,
      "statusCode": "closed",
      "eventScopeCode": "PUBLIC"
    }
  ]
}
```
For more information, see the [Getting started with the AWS Personal Health Dashboard](https://docs.aws.amazon.com/health/latest/monitoring/Getting-started-with-the-AWS-Personal-Health-Dashboard.html) in the [AWS Health User Guide](https://docs.aws.amazon.com/health/latest/monitoring/).

- For API details, see the [DescribeEvents](https://docs.aws.amazon.com/health/latest/APIReference/API_DescribeEvents.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/health/describe-events.html).
HealthImaging examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

copy-image-set

The following code example shows how to use copy-image-set.

AWS CLI

Example 1: To copy an image set without a destination.

The following copy-image-set code example makes a duplicate copy of an image set without a destination.

```bash
aws medical-imaging copy-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" }}'
```

Output:

```json
{
   "destinationImageSetProperties": {
```
Example 2: To copy an image set with a destination.

The following `copy-image-set` code example makes a duplicate copy of an image set with a destination.

```bash
aws medical-imaging copy-image-set \\
  --datastore-id 12345678901234567890123456789012 \\
  --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \\
  --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" }, \\
  "destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5", \\
  "latestVersionId": "1"} }'
```

Output:

```json
{
  "destinationImageSetProperties": {
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "COPYING",
    "updatedAt": 1680042505.135,
    "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
    "imageSetState": "LOCKED",
    "createdAt": 1680042357.432
  },
  "sourceImageSetProperties": {
    "latestVersionId": "1",
    "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
    "updatedAt": 1680042357.432,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436
  },
  "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see Copying an image set in the AWS HealthImaging Developer Guide.

• For API details, see CopyImageSet in AWS CLI Command Reference.

create-datastore

The following code example shows how to use create-datastore.

AWS CLI

To create a data store

The following create-datastore code example creates a data store with the name my-datastore.

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

For more information, see Creating a data store in the AWS HealthImaging Developer Guide.

• For API details, see CreateDatastore in AWS CLI Command Reference.

delete-datastore

The following code example shows how to use delete-datastore.
AWS CLI

To delete a data store

The following delete-datastore code example deletes a data store.

```
aws medical-imaging delete-datastore
   --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
   "datastoreId": "12345678901234567890123456789012",
   "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the AWS HealthImaging Developer Guide.

- For API details, see DeleteDatastore in AWS CLI Command Reference.

delete-image-set

The following code example shows how to use delete-image-set.

AWS CLI

To delete an image set

The following delete-image-set code example deletes an image set.

```
aws medical-imaging delete-image-set
   --datastore-id 12345678901234567890123456789012
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
   "imageSetWorkflowStatus": "DELETING",
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see Deleting an image set in the AWS HealthImaging Developer Guide.

- For API details, see DeletImageSet in AWS CLI Command Reference.

get-datastore

The following code example shows how to use get-datastore.

AWS CLI

To get a data store's properties

The following get-datastore code example gets a data store's properties.

```bash
aws medical-imaging get-datastore \
  --datastore-id 12345678901234567890123456789012
```

Output:

```json
{
  "datastoreProperties": {
    "datastoreId": "12345678901234567890123456789012",
    "datastoreName": "TestDatastore123",
    "datastoreStatus": "ACTIVE",
    "datastoreArn": "arn:aws:medical-imaging:us-east-1:12345678901234567890123456789012:datstore/12345678901234567890123456789012",
    "createdAt": "2022-11-15T23:33:09.643000+00:00",
    "updatedAt": "2022-11-15T23:33:09.643000+00:00"
  }
}
```

For more information, see Getting data store properties in the AWS HealthImaging Developer Guide.

- For API details, see GetDatastore in AWS CLI Command Reference.

get-dicom-import-job

The following code example shows how to use get-dicom-import-job.
### AWS CLI

#### To get a dicom import job's properties

The following `get-dicom-import-job` code example gets a dicom import job's properties.

```bash
aws medical-imaging get-dicom-import-job \
  --datastore-id "12345678901234567890123456789012" \
  --job-id "09876543210987654321098765432109"
```

Output:

```json
{
  "jobProperties": {
    "jobId": "09876543210987654321098765432109",
    "jobName": "my-job",
    "jobStatus": "COMPLETED",
    "datastoreId": "12345678901234567890123456789012",
    "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
    "endedAt": "2022-08-12T11:29:42.285000+00:00",
    "submittedAt": "2022-08-12T11:28:11.152000+00:00",
    "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
    "outputS3Uri": "s3://medical-imaging-output/job_output/12345678901234567890123456789012-DicomImport-09876543210987654321098765432109/"
  }
}
```

For more information, see [Getting import job properties](https://docs.aws.amazon.com/AmazonHealthImaging/latest/DeveloperGuide/GettingImportJobProperties.html) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDICOMImportJob](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/get-dicom-import-job.html) in *AWS CLI Command Reference*.

#### get-image-frame

The following code example shows how to use `get-image-frame`.

### AWS CLI

#### To get image set pixel data

The following `get-image-frame` code example gets an image frame.
aws medical-imaging get-image-frame \
   --datastore-id "12345678901234567890123456789012" \
   --image-set-id "98765412345612345678907890789012" \
   --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 \
   imageframe.jph

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the imageframe.jph file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the AWS HealthImaging Developer Guide.

- For API details, see GetImageFrame in AWS CLI Command Reference.

get-image-set-metadata

The following code example shows how to use get-image-set-metadata.

AWS CLI

Example 1: To get image set metadata without version

The following get-image-set-metadata code example gets metadata for an image set without specifying a version.

Note: outfile is a required parameter

aws medical-imaging get-image-set-metadata \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   studymetadata.json.gz

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
   "contentType": "application/json",
```
Example 2: To get image set metadata with version

The following get-image-set-metadata code example gets metadata for an image set with a specified version.

Note: outfile is a required parameter

```bash
aws medical-imaging get-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --version-id 1 \
  studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see Getting image set metadata in the AWS HealthImaging Developer Guide.

- For API details, see GetImageSetMetadata in AWS CLI Command Reference.

get-image-set

The following code example shows how to use get-image-set.

AWS CLI

To get image set properties

The following get-image-set code example gets the properties for an image set.
aws medical-imaging get-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id 18f88ac7870584f58d56256646b4d92b \
   --version-id 1

Output:

{
   "versionId": "1",
   "imageSetWorkflowStatus": "COPIED",
   "updatedAt": 1680027253.471,
   "imageSetId": "18f88ac7870584f58d56256646b4d92b",
   "imageSetState": "ACTIVE",
   "createdAt": 1679592510.753,
   "datastoreId": "12345678901234567890123456789012"
}

For more information, see [Getting image set properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetImageSet](#) in *AWS CLI Command Reference*.

### list-datastores

The following code example shows how to use list-datastores.

**AWS CLI**

**To list data stores**

The following list-datastores code example lists available data stores.

```bash
aws medical-imaging list-datastores
```

Output:

```json
{
   "datastoreSummaries": [
      {
         "datastoreId": "12345678901234567890123456789012",
```
"datastoreName": "TestDatastore123",
"datastoreStatus": "ACTIVE",
"datastoreArn": "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012",
"createdAt": "2022-11-15T23:33:09.643000+00:00",
"updatedAt": "2022-11-15T23:33:09.643000+00:00"
]
]

For more information, see Listing data stores in the AWS HealthImaging Developer Guide.

- For API details, see ListDatastores in AWS CLI Command Reference.

**list-dicom-import-jobs**

The following code example shows how to use list-dicom-import-jobs.

**AWS CLI**

**To list dicom import jobs**

The following list-dicom-import-jobs code example lists dicom import jobs.

```bash
aws medical-imaging list-dicom-import-jobs \ --datastore-id "12345678901234567890123456789012"
```

Output:

```json
{
    "jobSummaries": [
    {
        "jobId": "09876543210987654321098765432109",
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:21:56.504000+00:00",
        "submittedAt": "2022-08-12T11:20:21.734000+00:00"
    }
    ]
}
```
For more information, see [Listing import jobs](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListDICOMImportJobs](#) in AWS CLI Command Reference.

**list-image-set-versions**

The following code example shows how to use `list-image-set-versions`.

**AWS CLI**

To list image set versions

The following `list-image-set-versions` code example lists the version history for an image set.

```bash
aws medical-imaging list-image-set-versions \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```json
{
   "imageSetPropertiesList": [
      {
         "ImageSetWorkflowStatus": "UPDATED",
         "versionId": "4",
         "updatedAt": 1680029436.304,
         "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
         "imageSetState": "ACTIVE",
         "createdAt": 1680027126.436
      },
      {
         "ImageSetWorkflowStatus": "UPDATED",
         "versionId": "3",
         "updatedAt": 1680029163.325,
         "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
         "imageSetState": "ACTIVE",
         "createdAt": 1680027126.436
      },
      {
      }
   ]
}
```
For more information, see [Listing image set versions](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListImageSetVersions](#) in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**Example 1: To list resource tags for a data store**

The following `list-tags-for-resource` code example lists tags for a data store.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datadstore/12345678901234567890123456789012"
```

Output:

```
{
    "tags":{
        "Deployment":"Development"
    }
}
```
Example 2: To list resource tags for an image set

The following list-tags-for-resource code example lists tags for an image set.

```bash
aws medical-imaging list-tags-for-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```json
{
   "tags":{
      "Deployment":"Development"
   }
}
```

For more information, see [Tagging resources with AWS Health Imaging](https://docs.aws.amazon.com/healthimaging/latest/developerguide/tagging-enterprise.html) in the AWS Health Imaging Developer Guide.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/list-tags-for-resource.html) in AWS CLI Command Reference.

### search-image-sets

The following code example shows how to use search-image-sets.

**AWS CLI**

**Example 1: To search image sets with an EQUAL operator**

The following search-image-sets code example uses the EQUAL operator to search image sets based on a specific value.

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of search-criteria.json

```json

```
Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following search-image-sets code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
```
---search-criteria file://search-criteria.json

Contents of search-criteria.json

```json
{
    "filters": [{
        "values": [{
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "19900101",
                "DICOMStudyTime": "000000"
            }
        },
        {
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "20230101",
                "DICOMStudyTime": "000000"
            }
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```json
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "199911122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.9999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }
}
```
Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide createdAt in example format ("1985-04-12T23:20:50.52Z").

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
   "filters": [
      {
         "values": [
            {
               "createdAt": "1985-04-12T23:20:50.52Z"
            },
            {
               "createdAt": "2022-04-12T23:20:50.52Z"
            }
         ],
         "operator": "BETWEEN"
      }
   ]
}
```

Output:

```json
{
   "imageSetsMetadataSummaries": [
      {
         "imageSetId": "09876543210987654321098765432109",
         "createdAt": "2022-12-06T21:40:59.429000+00:00",
         "version": 1,
         "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.9999999.84710745.943275268089",
            ...
         }
      }
   ]
}
```
Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field

The following search-image-sets code example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
  --datastore-id 12345678901234567890123456789012 \
  --search-criteria file://search-criteria.json
```

Contents of search-criteria.json

```
{
  "filters": [
    {
      "values": [
        {
          "updatedAt": "2024-03-11T15:00:05.074000-07:00"
        },
        {
          "updatedAt": "2024-03-11T16:00:05.074000-07:00"
        }
      ],
      "operator": "BETWEEN"
    },
    {
      "values": [
        {
          "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
        }
      ],
      "operator": "EQUAL"
    }
  ],
  "sort": {
    
  }
}
```
For more information, see Searching image sets in the AWS HealthImaging Developer Guide.

- For API details, see SearchImageSets in AWS CLI Command Reference.

**start-dicom-import-job**

The following code example shows how to use start-dicom-import-job.

**AWS CLI**

**To start a dicom import job**

The following start-dicom-import-job code example starts a dicom import job.
```bash
aws medical-imaging start-dicom-import-job \
   --job-name "my-job" \
   --datastore-id "12345678901234567890123456789012" \
   --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
   --output-s3-uri "s3://medical-imaging-output/job_output/" \
   --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "jobId": "09876543210987654321098765432109",
   "jobStatus": "SUBMITTED",
   "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

For more information, see Starting an import job in the AWS HealthImaging Developer Guide.

- For API details, see StartDICOMImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**Example 1: To tag a data store**

The following tag-resource code examples tags a data store.

```bash
aws medical-imaging tag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datstore/12345678901234567890123456789012" \
   --tags '{"Deployment": "Development"}"
```

This command produces no output.

**Example 2: To tag an image set**

The following tag-resource code examples tags an image set.
This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](#) in the [AWS HealthImaging Developer Guide](#).

- For API details, see [TagResource](#) in [AWS CLI Command Reference](#).

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**Example 1: To untag a data store**

The following `untag-resource` code example untags a data store.

```bash
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b" \
    --tag-keys ['"Deployment"']
```

This command produces no output.

**Example 2: To untag an image set**

The following `untag-resource` code example untags an image set.

```bash
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b" \
    --tag-keys ['"Deployment"']
```

This command produces no output.
For more information, see Tagging resources with AWS HealthImaging in the AWS HealthImaging Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-image-set-metadata

The following code example shows how to use update-image-set-metadata.

AWS CLI

To insert or update an attribute in image set metadata

The following update-image-set-metadata code example inserts or updates an attribute in image set metadata.

```
aws medical-imaging update-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --latest-version-id 1 \
  --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of metadata-updates.json

```
{
    "DICOMUpdates": {
        "updatableAttributes": "eyJTY2hlbWFWZXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVudE5hbWUiOiJNWF5NWCJ9fX0=
    }
}
```

Note: updatableAttributes is a Base64 encoded JSON string. Here is the unencoded JSON string.

```
{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
}
```
To remove an attribute from image set metadata

The following `update-image-set-metadata` code example removes an attribute from image set metadata.

```bash
aws medical-imaging update-image-set-metadata 
   --datastore-id 12345678901234567890123456789012 
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e 
   --latest-version-id 1 
   --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```json
{
   "DICOMUpdates": {
      "removableAttributes": "e1NjaGVtYVZlcnNpb246MS4xLFN0dWR5OntESUNPTTp7U3R1ZHlEZXNjcmlwdGlvbjpDSEVTVH19fQo=
   }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string. The key and value must match the attribute to be removed.

```json
{"SchemaVersion":1.1,"Study":{"DICOM":{"StudyDescription":"CHEST"}}}
```

Output:

```json
{
   "latestVersionId": "2",
   "imageSetWorkflowStatus": "UPDATING",
   "updatedAt": 1680042257.908,
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "createdAt": 1680027126.436,
   "latestVersionId": "2",
   "imageSetWorkflowStatus": "UPDATING",
   "updatedAt": 1680042257.908,
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "createdAt": 1680027126.436,
}```
To remove an instance from image set metadata

The following `update-image-set-metadata` code example removes an instance from image set metadata.

```bash
aws medical-imaging update-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --latest-version-id 1 \
  --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```json
{
  "DICOMUpdates": {
    "removableAttributes": "eezEuMS4xLjEuMS4xLjEuMzQ1LjEyMzQ1Njc4OTAxMi4xMjMuMTIzNDU2Nzg5MDEyMzQuMTp7SW5zdGFuY2VzOnsxLjEuMS4xLjEuMzQ1LjEyMzQ1Njc4OTAxMjM0NS4xMjM0NTY3ODkwMTIuMTIzLjEyMzQ1Njc4OTAxMjM0LjE6e319fX19fQo="
  }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

```json
{"1.1.1.1.1.12345.123456789012.123.12345678901234.1":{"Instances": {}}}
```

Output:

```json
{
  "latestVersionId": "2",
  "imageSetWorkflowStatus": "UPDATING",
  "updatedAt": 1680042257.908,
  "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
  "imageSetState": "LOCKED",
  "createdAt": 1680027126.436,
  "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see Updating image set metadata in the AWS HealthImaging Developer Guide.

- For API details, see UpdateImageSetMetadata in AWS CLI Command Reference.

HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

create-fhir-datastore

The following code example shows how to use create-fhir-datastore.

AWS CLI

To create a FHIR Data Store.

The following create-fhir-datastore example demonstrates how to create a new Data Store in Amazon HealthLake.

```
aws healthlake create-fhir-datastore \
  --region us-east-1 \
  --datastore-type-version R4 \
  --datastore-type-version R4 \
```
Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "CREATING",
   "DatastoreId": "(Datastore ID)"
}
```

For more information, see [Creating and monitoring a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [CreateFhirDatastore](#) in *AWS CLI Command Reference*.

### delete-fhir-datastore

The following code example shows how to use `delete-fhir-datastore`.

**AWS CLI**

**To delete a FHIR Data Store**

The following `delete-fhir-datastore` example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```
aws healthlake delete-fhir-datastore \
   --datastore-id (Data Store ID) \ 
   --region us-east-1
```

Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "DELETING",
}
```
For more information, see Creating and monitoring a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the Amazon HealthLake Developer Guide.

- For API details, see DeleteFhirDatastore in AWS CLI Command Reference.

describe-fhir-datastore

The following code example shows how to use describe-fhir-datastore.

AWS CLI

To describe a FHIR Data Store

The following describe-fhir-datastore example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
    --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
    --region us-east-1
```

Output:

```
{
    "DatastoreProperties": {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "DatastoreName": "FhirTestDatastore",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
        "DatastoreStatus": "CREATING",
        "DatastoreTypeVersion": "R4",
        "DatastoreId": "(Datastore ID)"
    }
}
```
For more information, see Creating and monitoring a FHIR Data Stores in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirDatastore in AWS CLI Command Reference.

**describe-fhir-export-job**

The following code example shows how to use describe-fhir-export-job.

**AWS CLI**

**To describe a FHIR export job**

The following describe-fhir-export-job example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```bash
aws healthlake describe-fhir-export-job \
  --datastore-id (Datastore ID) \
  --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```json
{
  "ExportJobProperties": {
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "IN_PROGRESS",
    "JobId": "9009813e9d69ba7cf79bcb3468780f16",
    "SubmitTime": 1609175692.715,
    "OutputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/59593b2d0367ce252b5e66bf5fd6b574-FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"
    },
    "DatastoreId": "(Datastore ID)"
  }
}
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirExportJob in AWS CLI Command Reference.
describe-fhir-import-job

The following code example shows how to use describe-fhir-import-job.

AWS CLI

To describe a FHIR import job

The following describe-fhir-import-job example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```bash
aws healthlake describe-fhir-import-job \
  --datastore-id (Datastore ID) \
  --job-id c145fbb27b192af392f8ce6e7838e34f \
  --region us-east-1
```

Output:

```
{
  "ImportJobProperties": {
    "InputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"  
      { "arrayitem2": 2 }  
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Datastore ID)"
  }
}
```

For more information, see Importing files to a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirImportJob in AWS CLI Command Reference.

list-fhir-datastores

The following code example shows how to use list-fhir-datastores.
AWS CLI

To list FHIR Data Stores

The following `list-fhir-datastores` example shows how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```bash
aws healthlake list-fhir-datastores \
   --region us-east-1 \
   --filter DatastoreStatus=ACTIVE
```

Output:

```json
{
   "DatastorePropertiesList": [
     {
       "PreloadDataConfig": {
         "PreloadDataType": "SYNTHEA"
       },
       "DatastoreName": "FhirTestDatastore",
       "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/<Datastore ID>",
       "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/<Datastore ID>/r4/",
       "DatastoreStatus": "ACTIVE",
       "DatastoreTypeVersion": "R4",
       "CreatedAt": 1605574003.209,
       "DatastoreId": "<Datastore ID>"
     },
     {
       "DatastoreName": "Demo",
       "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/<Datastore ID>",
       "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/<Datastore ID>/r4/",
       "DatastoreStatus": "ACTIVE",
       "DatastoreTypeVersion": "R4",
       "CreatedAt": 1603761064.881,
       "DatastoreId": "<Datastore ID>"
     }
   ]
}
```
For more information, see Creating and monitoring a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see `ListFhirDatastores` in AWS CLI Command Reference.

list-fhir-export-jobs

The following code example shows how to use list-fhir-export-jobs.

**AWS CLI**

**To list all FHIR export jobs**

The following list-fhir-export-jobs example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \
   --datastore-id (Datastore ID) \
   --submitted-before (DATE like 2024-10-13T19:00:00Z) \
   --submitted-after (DATE like 2020-10-13T19:00:00Z) \
   --job-name "FHIR-EXPORT" \
   --job-status SUBMITTED \
   --max-results (Integer between 1 and 500)
```

Output:

```
{
    "ExportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "S3Configuration": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "KmsKeyId": "(KmsKey Id)"
            }
        },
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "COMPLETED",
        "JobId": "c145fbb27b192af392f8ce6e7838e34f",
        "JobName": "FHIR-EXPORT",
        "SubmitTime": 1606272542.161,
        "EndTime": 1606272609.497,
        "DatastoreId": "(Datastore ID)"
    }
}
```
For more information, see [Exporting files from a FHIR Data Store](#) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirExportJobs](#) in *AWS CLI Command Reference*.

### list-fhir-import-jobs

The following code example shows how to use `list-fhir-import-jobs`.

**AWS CLI**

**To list all FHIR import jobs**

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```bash
aws healthlake list-fhir-import-jobs \
   --datastore-id (Datastore ID) \
   --submitted-before (DATE like 2024-10-13T19:00:00Z) \
   --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
   --job-name "FHIR-IMPORT" \
   --job-status SUBMITTED \
   -max-results (Integer between 1 and 500)
```

**Output:**

```json
{
   "ImportJobProperties": {
      "OutputDataConfig": {
         "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
         "S3Configuration": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "KmsKeyId": "(KmsKey Id)"
         },
         "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
         "JobStatus": "COMPLETED",
      }
   }
}
```
For more information, see Importing files to FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirImportJobs in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a Data Store

The following list-tags-for-resource example lists the tags associated with the specified Data Store:

```bash
aws healthlake list-tags-for-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datstore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --region us-east-1
```

Output:

```json
{
    "tags": {
        "key": "value",
        "key1": "value1"
    }
}
```

For more information, see Tagging resources in Amazon HealthLake in the Amazon HealthLake Developer Guide.
• For API details, see ListTagsForResource in AWS CLI Command Reference.

**start-fhir-export-job**

The following code example shows how to use start-fhir-export-job.

**AWS CLI**

**To start a FHIR export job**

The following start-fhir-export-job example shows how to start a FHIR export job using Amazon HealthLake.

```bash
aws healthlake start-fhir-export-job \
    --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
    --datastore-id (Datastore ID) \
    --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```json
{
    "DatastoreId": "(Datastore ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

• For API details, see StartFhirExportJob in AWS CLI Command Reference.

**start-fhir-import-job**

The following code example shows how to use start-fhir-import-job.

**AWS CLI**

**To start a FHIR import job**

The following start-fhir-import-job example shows how to start a FHIR import job using Amazon HealthLake.
aws healthlake start-fhir-import-job \
  --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
  --datastore-id (Datastore ID) \
  --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \
  --region us-east-1

Output:

{
   "DatastoreId": "(Datastore ID)",
   "JobStatus": "SUBMITTED",
   "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}

For more information, see Importing files to a FHIR Data Store 'https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html in the Amazon HealthLake Developer Guide.

- For API details, see StartFhirImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To add a tag to Data Store

The following tag-resource example shows how to add a tag to a Data Store.

aws healthlake tag-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
  --tags '[{"Key": "key1", "Value": "value1"}]
  --region us-east-1

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>' in the Amazon HealthLake Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a Data Store.

The following untag-resource example shows how to remove tags from a Data Store.

```bash
aws healthlake untag-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/b91723d65c6fdeb1d26543a49d2ed1fa" \
  --tag-keys '['"key1"']' \
  --region us-east-1
```

This command produces no output.

For more information, see Removing tags from a Data Store in the Amazon HealthLake Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions
Actions

abort-multipart-read-set-upload

The following code example shows how to use `abort-multipart-read-set-upload`.

**AWS CLI**

To stop a multipart read set upload

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload
   --sequence-store-id 0123456789
   --upload-id 1122334455
```

This command produces no output.

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [AbortMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

accept-share

The following code example shows how to use `accept-share`.

**AWS CLI**

To accept a share of analytics store data

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```
aws omics accept-share
   ----share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
   "status": "ACTIVATING"
}
```
For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see AcceptShare in AWS CLI Command Reference.

**batch-delete-read-set**

The following code example shows how to use batch-delete-read-set.

**AWS CLI**

**To delete multiple read sets**

The following batch-delete-read-set example deletes two read sets.

```
aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```
{
   "errors": [
      {
         "code": "",
         "id": "0123456789",
         "message": "The specified readset does not exist."
      }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see BatchDeleteReadSet in AWS CLI Command Reference.

**cancel-annotation-import-job**

The following code example shows how to use cancel-annotation-import-job.

**AWS CLI**

**To cancel an annotation import job**
The following `cancel-annotation-import-job` example cancels an annotation import job with ID 04f57618-xmpl-4fd0-9349-e5a85aefb997.

```bash
aws omics cancel-annotation-import-job \
    --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CancelAnnotationImportJob in AWS CLI Command Reference.

**cancel-run**

The following code example shows how to use `cancel-run`.

**AWS CLI**

**To cancel a run**

The following `cancel-run` example cancels a run with ID 1234567.

```bash
aws omics cancel-run \
    --id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CancelRun in AWS CLI Command Reference.

**cancel-variant-import-job**

The following code example shows how to use `cancel-variant-import-job`.

**AWS CLI**

**To cancel a variant import job**

The following `cancel-variant-import-job` example cancels a variant import job with ID 69cb65d6-xmpl-4a4a-9025-4565794b684e.

```bash
aws omics cancel-variant-import-job \
    --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.
complete-multipart-read-set-upload

The following code example shows how to use complete-multipart-read-set-upload.

AWS CLI

To conclude a multipart upload once you have uploaded all of the components.

The following complete-multipart-read-set-upload example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --upload-id 1122334455 \
   --parts '[["checksum":"gaCBQMe+xpCFZxLp0P6gydBoXaKKDA/Vobh5zBDb4W4=","partNumber":1,"partSource":"SOURCE1"]]'
```

Output:

```
{
   "readSetId": "0000000001"
   "readSetId": "0000000002"
   "readSetId": "0000000003"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

create-annotation-store-version

The following code example shows how to use create-annotation-store-version.

AWS CLI

To create a new version of an annotation store

The following create-annotation-store-version example creates a new version of an annotation store.
aws omics create-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version

Output:

```json
{
   "creationTime": "2023-07-21T17:15:49.251040+00:00",
   "id": "3b93cdef69d2",
   "name": "my_annotation_store",
   "reference": {
   },
   "status": "CREATING",
   "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see CreateAnnotationStoreVersion in AWS CLI Command Reference.

create-annotation-store

The following code example shows how to use create-annotation-store.

AWS CLI

Example 1: To create a VCF annotation store

The following create-annotation-store example creates a VCF format annotation store.

```bash
aws omics create-annotation-store \
   --name my_ann_store \
   --store-format VCF \
```

Output:

```json
{
}
```
Example 2: To create a TSV annotation store

The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
   --name tsv_ann_store \
   --store-format TSV \
   --store-options file://tsv-store-options.json
```

tsv-store-options.json configures format options for annotations.

```json
{
   "tsvStoreOptions": {
       "annotationType": "CHR_START_END_ZERO_BASE",
       "formatToHeader": {
           "CHR": "chromosome",
           "START": "start",
           "END": "end"
       },
       "schema": [
           {
               "chromosome": "STRING"
           },
           {
               "start": "LONG"
           },
           {
               "end": "LONG"
           },
           {
               "CHR": "chromosome",
               "START": "start",
               "END": "end"
           }
       ]
   }
}
```
Output:

```json
{
  "creationTime": "2022-11-30T01:28:08.525586Z",
  "id": "861cxmpl96b0",
  "name": "tsv_ann_store",
  "reference": {
  },
  "status": "CREATING",
  "storeFormat": "TSV",
  "storeOptions": {
    "tsvStoreOptions": {
      "annotationType": "CHR_START_END_ZERO_BASE",
      "formatToHeader": {
        "CHR": "chromosome",
        "END": "end",
        "START": "start"
      },
      "schema": [
        {
          "chromosome": "STRING"
        },
        {
          "start": "LONG"
        },
        {
          "end": "LONG"
        },
        {
          "name": "STRING"
        }
      ]
    }
  }
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CreateAnnotationStore in AWS CLI Command Reference.

**create-multipart-read-set-upload**

The following code example shows how to use create-multipart-read-set-upload.

**AWS CLI**

**To begin a multipart read set upload.**

The following create-multipart-read-set-upload example initiates a multipart read set upload.

```bash
aws omics create-multipart-read-set-upload
   --sequence-store-id 0123456789
   --name HG00146
   --source-file-type FASTQ
   --subject-id mySubject
   --sample-id mySample
   --description "FASTQ for HG00146"
   --generated-from "1000 Genomes"
```

**Output:**

```json
{
   "description": "FASTQ for HG00146",
   "generatedFrom": "1000 Genomes",
   "name": "HG00146",
   "sampleId": "mySample",
   "sequenceStoreId": "0123456789",
   "sourceFileType": "FASTQ",
   "subjectId": "mySubject",
   "uploadId": "1122334455"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

- For API details, see CreateMultipartReadSetUpload in AWS CLI Command Reference.
**create-reference-store**

The following code example shows how to use create-reference-store.

**AWS CLI**

**To create a reference store**

The following create-reference-store example creates a reference store `my-ref-store`.

```bash
code
aws omics create-reference-store \
   --name my-ref-store
```

**Output:**

```
{
   "id": "1234567890",
   "name": "my-ref-store"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/APIReference/creating-omics-reference-store.html) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateReferenceStore](https://docs.aws.amazon.com/cli/latest/reference/omics/create-reference-store.html) in *AWS CLI Command Reference*.

**create-run-group**

The following code example shows how to use create-run-group.

**AWS CLI**

**To create a run group**

The following create-run-group example creates a run group named `cram-converter`.

```bash
code
aws omics create-run-group \
   --name cram-converter \
   --max-cpus 20 \
   --max-duration 600
```

**Actions and scenarios**
Output:

```json
{
    "id": "1234567",
    "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateRunGroup in AWS CLI Command Reference.

create-sequence-store

The following code example shows how to use create-sequence-store.

**AWS CLI**

**To create a sequence store**

The following create-sequence-store example creates a sequence store.

```bash
aws omics create-sequence-store \
    --name my-seq-store
```

Output:

```json
{
    "creationTime": "2022-11-23T01:24:33.629Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see CreateSequenceStore in AWS CLI Command Reference.

create-share

The following code example shows how to use create-share.
AWS CLI

To create a share of a HealthOmics analytics store

The following create-share example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```
aws omics create-share \\
  --principal-subscriber "123456789012" \\
  --name "my_Share-123"
```

Output:

```
{
  "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
  "name": "my_Share-123",
  "status": "PENDING"
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see CreateShare in AWS CLI Command Reference.

create-variant-store

The following code example shows how to use create-variant-store.

AWS CLI

To create a variant store

The following create-variant-store example creates a variant store named my_var_store.

```
aws omics create-variant-store \\
  --name my_var_store \\
```

Output:
create-workflow

The following code example shows how to use create-workflow.

AWS CLI

To create a workflow

The following create-workflow example creates a WDL workflow.

```
aws omics create-workflow \\
   --name cram-converter \\
   --engine WDL \\
   --definition-zip fileb://workflow-crambam.zip \\
   --parameter-template file://workflow-params.json
```

workflow-crambam.zip is a ZIP archive containing a workflow definition. workflow-params.json defines runtime parameters for the workflow.

```
{
    "ref_fasta" : {
        "description": "Reference genome fasta file",
        "optional": false
    },
    "ref_fasta_index" : {
        "description": "Index of the reference genome fasta file",
```
"optional": false
},
"ref_dict": {
"description": "dictionary file for 'ref_fasta'",
"optional": false
},
"input_cram": {
"description": "The Cram file to convert to BAM",
"optional": false
},
"sample_name": {
"description": "The name of the input sample, used to name the output BAM",
"optional": false
}
}

Output:

{
"id": "1234567",
"status": "CREATING",
"tags": {} 
}

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateWorkflow in AWS CLI Command Reference.

delete-annotation-store-versions

The following code example shows how to use delete-annotation-store-versions.

AWS CLI

To delete an annotation store version

The following delete-annotation-store-versions example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
   --name my_annotation_store \
```
--versions my_version

Output:

{
   "errors": []
}

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see DeleteAnnotationStoreVersions in AWS CLI Command Reference.

delete-annotation-store

The following code example shows how to use delete-annotation-store.

AWS CLI

To delete an annotation store

The following delete-annotation-store example deletes an annotation store named my_vcf_store.

```
aws omics delete-annotation-store \
   --name my_vcf_store
```

Output:

```
{
   "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteAnnotationStore in AWS CLI Command Reference.

delete-reference-store

The following code example shows how to use delete-reference-store.

Actions and scenarios
AWS CLI

To delete a reference store

The following `delete-reference-store` example deletes a reference store with ID 1234567890.

```bash
aws omics delete-reference-store \
    --id 1234567890
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReferenceStore](https://docs.aws.amazon.com/cli/latest/reference/aws-omics/delete-reference-store.html) in *AWS CLI Command Reference*.

delete-reference

The following code example shows how to use `delete-reference`.

AWS CLI

To delete a reference

The following `delete-reference` example deletes a reference.

```bash
aws omics delete-reference \
    --reference-store-id 1234567890 \n    --id 1234567890
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReference](https://docs.aws.amazon.com/cli/latest/reference/aws-omics/delete-reference.html) in *AWS CLI Command Reference*.

delete-run-group

The following code example shows how to use `delete-run-group`.

AWS CLI

To delete a run group

The following `delete-run-group` example deletes a run group with ID 1234567.
aws omics delete-run-group \
   --id 1234567

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see DeleteRunGroup in AWS CLI Command Reference.

delete-run

The following code example shows how to use delete-run.

AWS CLI

To delete a workflow run

The following delete-run example deletes a run with ID 1234567.

aws omics delete-run \
   --id 1234567

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see DeleteRun in AWS CLI Command Reference.

delete-sequence-store

The following code example shows how to use delete-sequence-store.

AWS CLI

To delete a sequence store

The following delete-sequence-store example deletes a sequence store with ID 1234567890.

aws omics delete-sequence-store \
   --id 1234567890

For more information, see Omics Storage in the Amazon Omics Developer Guide.
• For API details, see DeleteSequenceStore in AWS CLI Command Reference.
delete-share

The following code example shows how to use delete-share.

AWS CLI

To delete a share of HealthOmics analytics data

The following delete-share example deletes a cross-account share of analytics data.

```
aws omics delete-share \
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
   "status": "DELETING"
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see DeleteShare in AWS CLI Command Reference.

delete-variant-store

The following code example shows how to use delete-variant-store.

AWS CLI

To delete a variant store

The following delete-variant-store example deletes a variant store named my_var_store.

```
aws omics delete-variant-store \
  --name my_var_store
```

Output:

```
{
   "status": "DELETING"
}
```
For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteVariantStore](#) in *AWS CLI Command Reference*.

**delete-workflow**

The following code example shows how to use `delete-workflow`.

**AWS CLI**

**To delete a workflow**

The following `delete-workflow` example deletes a workflow with ID 1234567.

```bash
aws omics delete-workflow \
   --id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteWorkflow](#) in *AWS CLI Command Reference*.

**get-annotation-import-job**

The following code example shows how to use `get-annotation-import-job`.

**AWS CLI**

**To view an annotation import job**

The following `get-annotation-import-job` example gets details about an annotation import job.

```bash
aws omics get-annotation-import-job \
   --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

**Output:**

```json
{
    "creationTime": "2022-11-30T01:40:11.017746Z",
}
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetAnnotationImportJob in AWS CLI Command Reference.

get-annotation-store-version

The following code example shows how to use get-annotation-store-version.

AWS CLI

To retrieve the metadata for an annotation store version

The following get-annotation-store-version example retrieves the metadata for the requested annotation store version.

```bash
aws omics get-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version
```

Output:

```json
{
    "storeId": "4934045d1c6d",
    "id": "2a3f4a44aa7b",
    "status": "ACTIVE",
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see GetAnnotationStoreVersion in AWS CLI Command Reference.

get-annotation-store

The following code example shows how to use get-annotation-store.

AWS CLI

To view an annotation store

The following get-annotation-store example gets details about an annotation store named my_ann_store.

```bash
aws omics get-annotation-store \
   --name my_ann_store
```

Output:

```json
{
  "id": "0a91xmplc71f",
  "name": "my_ann_store",
  "reference": {
  },
  "status": "CREATING",
  "storeFormat": "VCF",
  "storeSizeBytes": 0,
  "tags": {}
}
```
get-read-set-activation-job

The following code example shows how to use get-read-set-activation-job.

AWS CLI

To view a read set activation job

The following get-read-set-activation-job example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
  --sequence-store-id 1234567890 \
  --id 1234567890
```

Output:

```
{
  "completionTime": "2022-12-06T22:33:42.828Z",
  "creationTime": "2022-12-06T22:32:45.213Z",
  "id": "1234567890",
  "sequenceStoreId": "1234567890",
  "sources": [
    {
      "readSetId": "1234567890",
      "status": "FINISHED",
      "statusMessage": "No activation needed as read set is already in ACTIVATING or ACTIVE state."
    }
  ],
  "status": "COMPLETED",
  "statusMessage": "The job completed successfully."
}
```

For more information, see [Omics Storage](https://aws.amazon.com) in the [Amazon Omics Developer Guide](https://aws.amazon.com).

- For API details, see [GetReadSetActivationJob](https://aws.amazon.com) in [AWS CLI Command Reference](https://aws.amazon.com).
get-read-set-export-job

The following code example shows how to use get-read-set-export-job.

AWS CLI

To view a read set export job

The following get-read-set-export-job example gets details about a read set export job.

```bash
aws omics get-read-set-export-job
   --sequence-store-id 1234567890
   --id 1234567890
```

Output:

```
{
   "completionTime": "2022-12-06T22:39:14.491Z",
   "creationTime": "2022-12-06T22:37:18.612Z",
   "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
   "id": "1234567890",
   "sequenceStoreId": "1234567890",
   "status": "COMPLETED",
   "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.
- For API details, see GetReadSetExportJob in AWS CLI Command Reference.

get-read-set-import-job

The following code example shows how to use get-read-set-import-job.

AWS CLI

To view a read set import job

The following get-read-set-import-job example gets details about a read set import job.

```bash
aws omics get-read-set-import-job
   --sequence-store-id 1234567890
   --id 1234567890
```
Output:

```json
{
   "creationTime": "2022-11-23T01:36:38.158Z",
   "id": "1234567890",
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
   "sequenceStoreId": "1234567890",
   "sources": [
      {
         "name": "HG00100",
         "sampleId": "bam-sample",
         "sourceFileType": "BAM",
         "sourceFiles": {
            "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam",
            "source2": ""
         },
         "status": "IN_PROGRESS",
         "statusMessage": "The source job is currently in progress.",
         "subjectId": "bam-subject",
         "tags": {
            "aws:omics:sampleId": "bam-sample",
            "aws:omics:subjectId": "bam-subject"
         }
      },
      {
         "name": "HG00146",
         "sampleId": "fastq-sample",
         "sourceFileType": "FASTQ",
         "sourceFiles": {
            "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/SRR233106_1.filt.fastq.gz",
            "source2": "s3://omics-artifacts-01d6xmpl4e72dd32/SRR233106_2.filt.fastq.gz"
         },
         "status": "IN_PROGRESS",
         "statusMessage": "The source job is currently in progress.",
         "subjectId": "fastq-subject",
         "tags": {
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetImportJob in AWS CLI Command Reference.

get-read-set-metadata

The following code example shows how to use get-read-set-metadata.

AWS CLI

To view a read set

The following get-read-set-metadata example gets details about a read set's files.

```bash
aws omics get-read-set-metadata
   --sequence-store-id 1234567890
```
Output:

```json
{
   "creationTime": "2022-11-23T21:55:00.515Z",
   "fileType": "FASTQ",
   "files": {
      "source1": {
         "contentLength": 310054739,
         "partSize": 104857600,
         "totalParts": 3
      },
      "source2": {
         "contentLength": 307846621,
         "partSize": 104857600,
         "totalParts": 3
      }
   },
   "id": "1234567890",
   "name": "HG00146",
   "sampleId": "fastq-sample",
   "sequenceInformation": {
      "alignment": "UNALIGNED",
      "totalBaseCount": 677717384,
      "totalReadCount": 8917334
   },
   "sequenceStoreId": "1234567890",
   "status": "ACTIVE",
   "subjectId": "fastq-subject"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developerguide) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSetMetadata](https://docs.aws.amazon.com/cli/latest/reference/omics/get-read-set-metadata) in *AWS CLI Command Reference*.

**get-read-set**

The following code example shows how to use get-read-set.
AWS CLI

To download a read set

The following get-read-set example downloads part 3 of a read set as 1234567890.3.bam.

```bash
aws omics get-read-set \
   --sequence-store-id 1234567890 \
   --id 1234567890 \
   --part-number 3 1234567890.3.bam
```

For more information, see Omics Storage in the Amazon Omics Developer Guide. For API details, see GetReadSet in AWS CLI Command Reference.

get-reference-import-job

The following code example shows how to use get-reference-import-job.

AWS CLI

To view a reference import job

The following get-reference-import-job example example gets details about a reference import job.

```bash
aws omics get-reference-import-job \
   --reference-store-id 1234567890 \
   --id 1234567890
```

Output:

```json
{
   "creationTime": "2022-11-22T22:25:41.124Z",
   "id": "1234567890",
   "referenceStoreId": "1234567890",
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
   "sources": [
   {
      "name": "assembly-38",
      "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
```
"status": "IN_PROGRESS",
"statusMessage": "The source job is currently in progress."
}
],
"status": "IN_PROGRESS",
"statusMessage": "The job is currently in progress."
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceImportJob in AWS CLI Command Reference.

get-reference-metadata

The following code example shows how to use get-reference-metadata.

AWS CLI

To view a reference

The following get-reference-metadata example gets details about a reference.

```bash
aws omics get-reference-metadata \
   --reference-store-id 1234567890 \
   --id 1234567890
```

Output:

```json
{
   "files": {
      "index": {
         "contentLength": 160928,
         "partSize": 104857600,
         "totalParts": 1
      },
      "source": {
         "contentLength": 3249912778,
         "partSize": 104857600,
         "totalParts": 31
      }
   }
}
```
get-reference-store

The following code example shows how to use get-reference-store.

AWS CLI

To view a reference store

The following get-reference-store example gets details about a reference store.

```shell
aws omics get-reference-store \  --id 1234567890
```

Output:

```json
{
   "creationTime": "2022-09-23T23:27:20.364Z",
   "id": "1234567890",
   "name": "my-rstore-0"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceStore in AWS CLI Command Reference.

get-reference

The following code example shows how to use get-reference.
AWS CLI

To download a genome reference

The following get-reference example downloads part 1 of a genome as hg38.1.fa.

```
aws omics get-reference \
  --reference-store-id 1234567890 \n  --id 1234567890 \n  --part-number 1 hg38.1.fa
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReference in AWS CLI Command Reference.

get-run-group

The following code example shows how to use get-run-group.

AWS CLI

To view a run group

The following get-run-group example gets details about a run group.

```
aws omics get-run-group \
  --id 1234567
```

Output:

```
{
  "creationTime": "2022-12-01T00:58:42.915219Z",
  "id": "1234567",
  "maxCpus": 20,
  "maxDuration": 600,
  "name": "cram-convert",
  "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see GetRunGroup in AWS CLI Command Reference.

**get-run-task**

The following code example shows how to use `get-run-task`.

**AWS CLI**

**To view a task**

The following `get-run-task` example gets details about a workflow task.

```bash
aws omics get-run-task \
  --id 1234567 \ 
  --task-id 1234567
```

Output:

```json
{
  "cpus": 1,
  "creationTime": "2022-11-30T23:13:00.718651Z",
  "memory": 15,
  "name": "CramToBamTask",
  "startTime": "2022-11-30T23:17:47.016Z",
  "status": "COMPLETED",
  "taskId": "1234567"
}
```

For more information, see [Omics Workflows](https://aws.amazon.com/omicsDeveloperGuide/) in the *Amazon Omics Developer Guide*.

• For API details, see GetRunTask in AWS CLI Command Reference.

**get-run**

The following code example shows how to use `get-run`.

**AWS CLI**

**To view a workflow run**
The following `get-run` example gets details about a workflow run.

```
aws omics get-run \
   --id 1234567
```

Output:

```
{
   "creationTime": "2022-11-30T22:58:22.615865Z",
   "digest": "sha256:c54bxmpl742dccc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",

### get-sequence-store

The following code example shows how to use `get-sequence-store`.

**AWS CLI**

**To view a sequence store**

The following `get-sequence-store` example gets details about a sequence store with ID 1234567890.

```
aws omics get-sequence-store
  --id 1234567890
```

Output:

```json
{
    "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetSequenceStore](#) in *AWS CLI Command Reference*.

---

### get-share

The following code example shows how to use `get-share`.

**AWS CLI**

**To retrieves the metadata about a share of a HealthOmics analytics data**

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.
aws omics get-share \
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"

Output:

```
{
  "share": {
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
    "name": "my_Share-123",
    "principalSubscriber": "123456789012",
    "ownerId": "555555555555",
    "status": "PENDING"
  }
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see GetShare in AWS CLI Command Reference.

get-variant-import-job

The following code example shows how to use get-variant-import-job.

**AWS CLI**

**To view a variant import job**

The following get-variant-import-job example gets details about a variant import job.

```
aws omics get-variant-import-job \
  --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```
{
  "creationTime": "2022-11-23T22:42:50.037812Z",
  "destinationName": "my_var_store",
  "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
  "items": [
```

Actions and scenarios 3372
The following code example shows how to use `get-variant-store`.

### AWS CLI

#### To view a variant store

The following `get-variant-store` example gets details about a variant store.

```
aws omics get-variant-store \
   --name my_var_store
```

**Output:**

```json
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "id": "02dexamplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "CREATING",
   "storeSizeBytes": 0,
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetVariantStore in AWS CLI Command Reference.

**get-workflow**

The following code example shows how to use get-workflow.

**AWS CLI**

**To view a workflow**

The following get-workflow example gets details about a workflow with ID 1234567.

```bash
aws omics get-workflow \
   --id 1234567
```

Output:

```json
{
   "digest": 
      "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
   "engine": "WDL",
   "id": "1234567",
   "main": "workflow-crambam.wdl",
   "name": "cram-converter",
   "parameterTemplate": {
      "ref_dict": {
         "description": "dictionary file for 'ref_fasta'",
         "ref_fasta_index": {
            "description": "Index of the reference genome fasta file"
         },
         "ref_fasta": {
            "description": "Reference genome fasta file"
         },
         "input_cram": {
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetWorkflow in AWS CLI Command Reference.

**list-annotation-import-jobs**

The following code example shows how to use `list-annotation-import-jobs`.

**AWS CLI**

**To get a list of annotation import jobs**

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```bash
aws omics list-annotation-import-jobs
```

**Output:**

```json
{
    "annotationImportJobs": [ 
    {
        "creationTime": "2022-11-30T01:39:41.478294Z",
        "destinationName": "gff_ann_store",
        "id": "18a9e792-xmpl-4869-a105-e5b602900444",
        "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
        "runLeftNormalization": false,
        "status": "COMPLETED",
```
The following code example shows how to use `list-annotation-store-versions`.

**AWS CLI**

To list all the versions of an annotation store.

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```
aws omics list-annotation-store-versions
  --name my_annotation_store
```

Output:

```json
{
    "annotationStoreVersions": [
        {
            "storeId": "4934045d1c6d",
            "id": "2a3f4a44aa7b",
            "status": "CREATING",
```
"name": "my_annotation_store",
"versionName": "my_version_2",
"creationTime": "2023-07-21T17:20:59.380043+00:00",
"versionSizeBytes": 0
},
{
    "storeId": "4934045d1c6d",
    "id": "4934045d1c6d",
    "status": "ACTIVE",
    "name": "my_annotation_store",
    "versionName": "my_version_1",
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "updateTime": "2023-07-21T17:15:56.434223+00:00",
    "statusMessage": "",
    "versionSizeBytes": 0
}
}

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see ListAnnotationStoreVersions in AWS CLI Command Reference.

**list-annotation-stores**

The following code example shows how to use list-annotation-stores.

**AWS CLI**

To get a list of annotation stores

The following list-annotation-stores example gets a list of annotation stores.

```bash
aws omics list-annotation-stores
```

Output:

```json
{
    "annotationStores": [
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListAnnotationStores in AWS CLI Command Reference.

**list-multipart-read-set-uploads**

The following code example shows how to use list-multipart-read-set-uploads.

**AWS CLI**

To list all multipart read set uploads and their statuses.

The following list-multipart-read-set-uploads example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
   --sequence-store-id 0123456789
```

Output:

```
{
   "uploads":
   [ ]
}
```
For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

- For API details, see ListMultipartReadSetUploads in AWS CLI Command Reference.
**list-read-set-activation-jobs**

The following code example shows how to use `list-read-set-activation-jobs`.

### AWS CLI

**To get a list of read set activation jobs**

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id 1234567890.

```bash
code
aws omics list-read-set-activation-jobs 
  --sequence-store-id 1234567890
```

**Output:**

```
{
  "activationJobs": [
    {
      "completionTime": "2022-12-06T22:33:42.828Z",
      "creationTime": "2022-12-06T22:32:45.213Z",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
    },
    {
      "creationTime": "2022-12-06T22:35:10.100Z",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "IN_PROGRESS"
    }
  ]
}
```

For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [ListReadSetActivationJobs](#) in [AWS CLI Command Reference](#).

**list-read-set-export-jobs**

The following code example shows how to use `list-read-set-export-jobs`.

For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [ListReadSetExportJobs](#) in [AWS CLI Command Reference](#).
To get a list of read set export jobs

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-export-jobs \
   --sequence-store-id 1234567890
```

Output:

```json
{
   "exportJobs": [
      {
         "completionTime": "2022-12-06T22:39:14.491Z",
         "creationTime": "2022-12-06T22:37:18.612Z",
         "destination": "s3://omics-artifacts-01d6xml472dd32/read-set-export/",
         "id": "1234567890",
         "sequenceStoreId": "1234567890",
         "status": "COMPLETED"
      },
      {
         "creationTime": "2022-12-06T22:38:04.871Z",
         "destination": "s3://omics-artifacts-01d6xml472dd32/read-set-export/",
         "id": "1234567890",
         "sequenceStoreId": "1234567890",
         "status": "IN_PROGRESS"
      }
   ]
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developer-guide/) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSetExportJobs](https://docs.aws.amazon.com/cli/latest/reference/omics/list-read-set-export-jobs.html) in *AWS CLI Command Reference*.

**list-read-set-import-jobs**

The following code example shows how to use `list-read-set-import-jobs`.

AWS CLI

To get a list of read set import jobs
The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-import-jobs \
   --sequence-store-id 1234567890
```

Output:

```
{
   "importJobs": [
       {
           "completionTime": "2022-11-29T18:17:49.244Z",
           "creationTime": "2022-11-29T17:32:47.700Z",
           "id": "1234567890",
           "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801Xmpl7QZ",
           "sequenceStoreId": "1234567890",
           "status": "COMPLETED"
       },
       {
           "completionTime": "2022-11-23T22:01:34.090Z",
           "creationTime": "2022-11-23T21:52:43.289Z",
           "id": "1234567890",
           "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801Xmpl7QZ",
           "sequenceStoreId": "1234567890",
           "status": "COMPLETED_WITH_FAILURES"
       }
   ]
}
```

For more information, see [Oomics Storage](https://docs.aws.amazon.com/omics/latest/developerguide/oms-storage.html) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSetImportJobs](https://docs.aws.amazon.com/omics/latest/APIReference/API_ListReadSetImportJobs.html) in *AWS CLI Command Reference*.

### list-read-set-upload-parts

The following code example shows how to use `list-read-set-upload-parts`.

**AWS CLI**

To list all parts in a requested multipart upload for a sequence store.
The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```bash
aws omics list-read-set-upload-parts \
   --sequence-store-id 0123456789 \
   --upload-id 1122334455 \
   --part-source SOURCE1
```

Output:

```json
{
    "parts": [
        {
            "partNumber": 1,
            "partSize": 94371840,
            "file": "SOURCE1",
            "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        },
        {
            "partNumber": 2,
            "partSize": 10471840,
            "file": "SOURCE1",
            "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
    ]
}
```

For more information, see [Direct upload to a sequence store](https://docs.aws.amazon.com/healthomics/latest/userguide/direct-upload-to-a-sequenced-store.html) in the *AWS HealthOmics User Guide*.

- For API details, see [ListReadSetUploadParts](https://docs.aws.amazon.com/cli/latest/reference/omics/list-read-set-upload-parts.html) in *AWS CLI Command Reference*.

### list-read-sets

The following code example shows how to use `list-read-sets`.
AWS CLI

To get a list of read sets

The following list-read-sets example gets a list of read sets for a sequence store with id 1234567890.

```bash
aws omics list-read-sets \
    --sequence-store-id 1234567890
```

Output:

```
{
    "readSets": [
        {
            "creationTime": "2022-11-23T21:55:00.515Z",
            "fileType": "FASTQ",
            "id": "1234567890",
            "name": "HG00146",
            "sampleId": "fastq-sample",
            "sequenceStoreId": "1234567890",
            "status": "ACTIVE",
            "subjectId": "fastq-subject"
        }
    ]
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/APIReference/API_Omics_Storage.html) in the [Amazon Omics Developer Guide](https://docs.aws.amazon.com/omics/latest/APIReference/).

- For API details, see [ListReadSets](https://docs.aws.amazon.com/omics/latest/APIReference/API_Omics_ListReadSets.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/).

list-reference-import-jobs

The following code example shows how to use list-reference-import-jobs.

AWS CLI

To get a list of reference import jobs
The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id `1234567890`.

```bash
aws omics list-reference-import-jobs \
   --reference-store-id 1234567890
```

Output:

```json
{
   "importJobs": [
      {
         "completionTime": "2022-11-23T19:54:58.204Z",
         "creationTime": "2022-11-23T19:53:20.729Z",
         "id": "1234567890",
         "referenceStoreId": "1234567890",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
         "status": "COMPLETED"
      },
      {
         "creationTime": "2022-11-23T20:34:03.250Z",
         "id": "1234567890",
         "referenceStoreId": "1234567890",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
         "status": "IN_PROGRESS"
      }
   ]
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the Amazon Omics Developer Guide.

- For API details, see [ListReferenceImportJobs](https://docs.aws.amazon.com/omics/latest/cli/) in AWS CLI Command Reference.

### list-reference-stores

The following code example shows how to use `list-reference-stores`.

**AWS CLI**

**To get a list of reference stores**

The following `list-reference-stores` example gets a list of reference stores.
aws omics list-reference-stores

Output:

```json
{
    "referenceStores": [
    {
        "id": "1234567890",
        "name": "my-ref-store"
    }
    ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceStores in AWS CLI Command Reference.

**list-references**

The following code example shows how to use list-references.

**AWS CLI**

**To get a list of references**

The following list-references example gets a list of genome references for a reference store with id 1234567890.

```
aws omics list-references \
    --reference-store-id 1234567890
```

Output:

```json
{
    "references": [
    {
        "id": "1234567890",
        "name": "my-ref-store"
    }
    ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferences in AWS CLI Command Reference.

**list-run-groups**

The following code example shows how to use list-run-groups.

**AWS CLI**

**To get a list of run groups**

The following list-run-groups example gets a list of run groups.

```bash
aws omics list-run-groups
```

**Output:**

```json
{
   "items": [
      {
         "creationTime": "2022-12-01T00:58:42.915219Z",
         "id": "1234567",
         "maxCpus": 20,
         "maxDuration": 600,
         "name": "cram-convert"
      }
   ]
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListRunGroups in AWS CLI Command Reference.

**list-run-tasks**

The following code example shows how to use list-run-tasks.

**AWS CLI**

**To get a list of tasks**

The following list-run-tasks example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \n   --id 1234567
```

Output:

```
{
  "items": [
    {
      "cpus": 1,
      "creationTime": "2022-11-30T23:13:00.718651Z",
      "memory": 15,
      "name": "CramToBamTask",
      "startTime": "2022-11-30T23:17:47.016Z",
      "status": "COMPLETED",
      "taskId": "1234567"
    },
    {
      "cpus": 1,
      "creationTime": "2022-11-30T23:18:32.315606Z",
      "memory": 4,
      "name": "ValidateSamFile",
      "startTime": "2022-11-30T23:23:40.165Z",
      "status": "COMPLETED",
      "taskId": "1234567"
    }
  ]
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListRunTasks in AWS CLI Command Reference.

**list-runs**

The following code example shows how to use list-runs.

**AWS CLI**

**To get a list of workflow runs**

The following list-runs example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```
{
   "items": [
   {
      "creationTime": "2022-12-02T23:20:01.202074Z",
      "id": "1234567",
      "name": "cram-to-bam",
      "priority": 1,
      "startTime": "2022-12-02T23:29:18.115Z",
      "status": "COMPLETED",
      "stopTime": "2022-12-02T23:57:54.428812Z",
      "storageCapacity": 10,
      "workflowId": "1234567"
   },
   {
      "creationTime": "2022-12-03T00:16:57.180066Z",
      "id": "1234567",
      "name": "cram-to-bam",
      "priority": 1,
      "startTime": "2022-12-03T00:26:50.233Z",
      "status": "FAILED",
```

Actions and scenarios
For more information, see [Omics Workflows](https://aws.amazon.com/omics/docs/developer-guide/) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRuns](https://docs.aws.amazon.com/cli/latest/reference/omics/list-runs.html) in *AWS CLI Command Reference*.

### list-sequence-stores

The following code example shows how to use `list-sequence-stores`.

**AWS CLI**

**To get a list of sequence stores**

The following `list-sequence-stores` example gets a list of sequence stores.

```bash
aws omics list-sequence-stores
```

**Output:**

```json
{
  "sequenceStores": [
    {
      "creationTime": "2022-11-23T01:24:33.629Z",
      "id": "1234567890",
      "name": "my-seq-store"
    }
  ]
}
```
For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListSequenceStores](#) in *AWS CLI Command Reference*.

**list-shares**

The following code example shows how to use `list-shares`.

**AWS CLI**

To list the available shares of a HealthOmics analytics data

The following `list-shares` example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
   --resource-owner SELF
```

Output:

```
{
   "shares": [
       {
         "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",
         "name": "myShare",
         "principalSubscriber": "123456789012",
         "ownerId": "555555555555",
         "status": "PENDING"
       },
       {
         "shareId": "39b65d0d-4368-4a19-9814-b0e31d73c10a",
         "name": "myShare3456",
         "principalSubscriber": "123456789012",
         "ownerId": "555555555555",
         "status": "ACTIVE"
       }
   ]
}
```
For more information, see [Cross-account sharing](https://docs.aws.amazon.com/healthomics/latest/userguide/Cross-account-sharing.html) in the *AWS HealthOmics User Guide*.

- For API details, see [ListShares](https://docs.aws.amazon.com/cli/latest/reference/omics/list-shares.html) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To get a list of tags**

The following `list-tags-for-resource` example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource \
```

Output:

```
{
   "tags": { 
      "department": "analytics"
   }
}
```

For more information, see [Tagging resources in Amazon Omics](https://docs.aws.amazon.com/omics/latest/userguide/Tagging-resources.html) in the *Amazon Omics Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/omics/list-tags-for-resource.html) in *AWS CLI Command Reference*.
list-variant-import-jobs

The following code example shows how to use list-variant-import-jobs.

AWS CLI

To get a list of variant import jobs

The following list-variant-import-jobs example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
   "variantImportJobs": [
     {
       "creationTime": "2022-11-23T22:47:02.514002Z",
       "destinationName": "my_var_store",
       "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
       "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
       "runLeftNormalization": false,
       "status": "COMPLETED",
       "updateTime": "2022-11-23T22:49:17.976597Z"
     },
     {
       "creationTime": "2022-11-23T22:42:50.037812Z",
       "destinationName": "my_var_store",
       "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
       "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
       "runLeftNormalization": false,
       "status": "COMPLETED",
       "updateTime": "2022-11-23T22:45:26.009880Z"
     }
   ]
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantImportJobs in AWS CLI Command Reference.
list-variant-stores

The following code example shows how to use list-variant-stores.

AWS CLI

To get a list of variant stores

The following list-variant-stores example gets a list of variant stores.

```
aws omics list-variant-stores
```

Output:

```json
{
  "variantStores": [
    {
      "creationTime": "2022-11-23T22:09:07.534499Z",
      "id": "02dexamplcfdd",
      "name": "my_var_store",
      "reference": {
      },
      "status": "CREATING",
      "storeSizeBytes": 0,
      "updateTime": "2022-11-23T22:09:24.931711Z"
    },
    {
      "creationTime": "2022-09-23T23:00:09.140265Z",
      "id": "8777xmpl1a24",
      "name": "myvstore0",
      "status": "ACTIVE",
      "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/myvstore0",
      "storeSizeBytes": 0,
      "updateTime": "2022-09-23T23:03:26.013220Z"
    }
  ]
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantStores in AWS CLI Command Reference.

**list-workflows**

The following code example shows how to use list-workflows.

**AWS CLI**

**To get a list of workflows**

The following list-workflows example gets a list of workflows.

```bash
aws omics list-workflows
```

Output:

```json
{
   "items": [
      {
         "creationTime": "2022-09-23T23:08:22.041227Z",
         "digest": "nSCNo/qMWFxmplXpUdokXJnwgeOaxyyyc2YOxVxrJTE=",
         "id": "1234567",
         "name": "my-wkflow-0",
         "status": "ACTIVE",
         "type": "PRIVATE"
      },
      {
         "digest": "sha256:c54bxmpl1742dccc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
         "id": "1234567",
         "name": "cram-converter",
         "status": "ACTIVE",
         "type": "PRIVATE"
      }
   ]
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see ListWorkflows in AWS CLI Command Reference.

**start-annotation-import-job**

The following code example shows how to use start-annotation-import-job.

**AWS CLI**

To import annotations

The following start-annotation-import-job example imports annotations from Amazon S3.

```
aws omics start-annotation-import-job \
   --destination-name tsv_ann_store \
   --no-run-left-normalization \
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
   --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{
   "jobId": "984162c7-xmpl-4d23-ab47-286f7950bf6b"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

• For API details, see StartAnnotationImportJob in AWS CLI Command Reference.

**start-read-set-activation-job**

The following code example shows how to use start-read-set-activation-job.

**AWS CLI**

To activate an archived read set

The following start-read-set-activation-job example activates two read sets.

```
aws omics start-read-set-activation-job \
```
--sequence-store-id 1234567890 \ 
--sources readSetId=1234567890 readSetId=1234567890

Output:

```
{
    "creationTime": "2022-12-06T22:35:10.100Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetActivationJob in AWS CLI Command Reference.

**start-read-set-export-job**

The following code example shows how to use start-read-set-export-job.

**AWS CLI**

**To export a read set**

The following start-read-set-export-job example exports two read sets to Amazon S3.

```
aws omics start-read-set-export-job \ 
    --sequence-store-id 1234567890 \ 
    --sources readSetId=1234567890 readSetId=1234567890 \ 
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMP7QZ \ 
    --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/
```

Output:

```
{
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetExportJob in AWS CLI Command Reference.

**start-read-set-import-job**

The following code example shows how to use start-read-set-import-job.

**AWS CLI**

**To import a read set**

The following start-read-set-import-job example imports a read set.

```
aws omics start-read-set-import-job \
  --sequence-store-id 1234567890 \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
  --sources file://readset-sources.json
```

readset-sources.json is a JSON document with the following content.

```
[
  {
    "sourceFiles":
    {
      "source1": "s3://omics-artifacts-01dxml4e72dd32/HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
    },
    "sourceFileType": "BAM",
    "subjectId": "bam-subject",
    "sampleId": "bam-sample",
    "name": "HG00100"
  }
]
```

Output:
The following code example shows how to use `start-reference-import-job`.

**AWS CLI**

To import a reference genome

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```bash/aws omics start-reference-import-job \
   --reference-store-id 1234567890 \
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ \
   --sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/
   Homo_sapiens_assembly38.fasta,name=assembly-38
```

Output:

```json
{
   "creationTime": "2022-11-22T22:25:41.124Z",
   "id": "1234567890",
   "referenceStoreId": "1234567890",
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
   "status": "SUBMITTED"
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReferenceImportJob in AWS CLI Command Reference.

**start-run**

The following code example shows how to use start-run.

**AWS CLI**

**To run a workflow**

The following start-run example runs a workflow with ID 1234567.

```
aws omics start-run \
  --workflow-id 1234567 \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ \
  --name 'cram-to-bam' \
  --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
  --run-group-id 1234567 \
  --priority 1 \
  --storage-capacity 10 \
  --log-level ALL \
  --parameters file://workflow-inputs.json
```

workflow-inputs.json is a JSON document with the following content.

```
{
  "sample_name": "NA12878",
  "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
  "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
  Homo_sapiens_assembly38.dict",
  "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/
  Homo_sapiens_assembly38.fasta",
  "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/
  Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```
{
}
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

To load source files from Amazon Omics

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see StartRun in AWS CLI Command Reference.

**start-variant-import-job**

The following code example shows how to use start-variant-import-job.

**AWS CLI**

**To import a variant file**

The following start-variant-import-job example imports a VCF format variant file.

```
aws omics start-variant-import-job \
    --destination-name my_var_store \n    --no-run-left-normalization \
```
Output:

```json
{
   "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartVariantImportJob](#) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a resource

The following tag-resource example adds a department tag to a workflow with id 1234567.

```
aws omics tag-resource  
    --tags department=analytics
```

For more information, see [Tagging resources in Amazon Omics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

To remove a tag from a resource
The following untag-resource example removes the department tag from a workflow.

```
aws omics untag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tag-keys department
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-annotation-store**

The following code example shows how to use update-annotation-store.

**AWS CLI**

**To update an annotation store**

The following update-annotation-store example updates the description of an annotation store named my_vcf_store.

```
aws omics update-annotation-store \
    --name my_vcf_store \
    --description "VCF annotation store"
```

**Output:**

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.
update-run-group

The following code example shows how to use update-run-group.

AWS CLI

To update a run group

The following update-run-group example updates the settings of a run group with id 1234567.

```
aws omics update-run-group \\n  --id 1234567 \\n  --max-cpus 10
```

Output:

```
{
  "creationTime": "2022-12-01T00:58:42.915219Z",
  "id": "1234567",
  "maxCpus": 10,
  "maxDuration": 600,
  "name": "cram-convert",
  "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

update-variant-store

The following code example shows how to use update-variant-store.

AWS CLI

To update a variant store
The following update-variant-store example updates the description of a variant store named `my_var_store`.

```bash
aws omics update-variant-store \
   --name my_var_store \
   --description "variant store"
```

Output:

```json
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "description": "variant store",
   "id": "02dexmplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "ACTIVE",
   "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see UpdateVariantStore in AWS CLI Command Reference.

### update-workflow

The following code example shows how to use `update-workflow`.

#### AWS CLI

**To update a workflow**

The following `update-workflow` example updates the description of a workflow with ID 1234567.

```bash
aws omics update-workflow \
   --id 1234567 \
   --description "copy workflow"
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.
For API details, see UpdateWorkflow in AWS CLI Command Reference.

**upload-read-set-part**

The following code example shows how to use upload-read-set-part.

**AWS CLI**

**To upload a read set part.**

The following upload-read-set-part example uploads a specified part of a read set.

```bash
aws omics upload-read-set-part \
  --sequence-store-id 0123456789 \
  --upload-id 1122334455 \
  --part-source SOURCE1 \
  --part-number 1 \
  --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```json
{
  "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

For API details, see UploadReadSetPart in AWS CLI Command Reference.

**IAM examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

add-client-id-to-open-id-connect-provider

The following code example shows how to use add-client-id-to-open-id-connect-provider.

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following add-client-id-to-open-id-connect-provider command adds the client ID my-application-ID to the OIDC provider named server.example.com.

```
aws iam add-client-id-to-open-id-connect-provider \\n  --client-id my-application-ID \\n  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

This command produces no output.

To create an OIDC provider, use the create-open-id-connect-provider command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see AddClientIdToOpenIdConnectProvider in AWS CLI Command Reference.

add-role-to-instance-profile

The following code example shows how to use add-role-to-instance-profile.

AWS CLI

To add a role to an instance profile
The following add-role-to-instance-profile command adds the role named S3Access to the instance profile named Webserver.

```bash
aws iam add-role-to-instance-profile \\
  --role-name S3Access \\
  --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the create-instance-profile command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the AWS IAM User Guide.

- For API details, see AddRoleToInstanceProfile in AWS CLI Command Reference.

**add-user-to-group**

The following code example shows how to use add-user-to-group.

**AWS CLI**

**To add a user to an IAM group**

The following add-user-to-group command adds an IAM user named Bob to the IAM group named Admins.

```bash
aws iam add-user-to-group \\
  --user-name Bob \\
  --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

- For API details, see AddUserToGroup in AWS CLI Command Reference.

**attach-group-policy**

The following code example shows how to use attach-group-policy.
AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
  --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachGroupPolicy in AWS CLI Command Reference.

attach-role-policy

The following code example shows how to use `attach-role-policy`.

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
  --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachRolePolicy in AWS CLI Command Reference.

attach-user-policy

The following code example shows how to use `attach-user-policy`.

Actions and scenarios
AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named Alice.

```
aws iam attach-user-policy \
  --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
  --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see `AttachUserPolicy` in AWS CLI Command Reference.

change-password

The following code example shows how to use change-password.

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \
  --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called `change-password.json` that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
```
Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called `change-password.json`.

```bash
aws iam change-password \
    --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see [How an IAM user changes their own password](https://docs.aws.amazon.com/IAM/latest/userguide/IAM_users_change_password.html) in the [AWS IAM User Guide](https).

- For API details, see [ChangePassword](https://docs.aws.amazon.com/cli/latest/reference/iam/change-password.html) in [AWS CLI Command Reference](https).

### create-access-key

The following code example shows how to use `create-access-key`.

**AWS CLI**

**To create an access key for an IAM user**

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```bash
aws iam create-access-key \
    --user-name Bob
```

Output:

```json
{
    "AccessKey": {
        "UserName": "Bob",
```
Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see CreateAccessKey in AWS CLI Command Reference.

create-account-alias

The following code example shows how to use create-account-alias.

AWS CLI

To create an account alias

The following create-account-alias command creates the alias examplecorp for your AWS account.

```
aws iam create-account-alias \
   --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see CreateAccountAlias in AWS CLI Command Reference.

create-group

The following code example shows how to use create-group.

AWS CLI

To create an IAM group
The following `create-group` command creates an IAM group named `Admins`.

```bash
aws iam create-group \
   --group-name Admins
```

Output:

```json
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9R04H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the AWS IAM User Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.

### create-instance-profile

The following code example shows how to use `create-instance-profile`.

**AWS CLI**

**To create an instance profile**

The following `create-instance-profile` command creates an instance profile named `Webserver`.

```bash
aws iam create-instance-profile \
   --instance-profile-name Webserver
```

Output:

```json
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
    }
}
```
To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](https://docs.aws.amazon.com/IdentityAndAccessManagement/latest/UserGuide/using-iam-roles-for-saml-apps.html) in the *AWS IAM User Guide*.

- For API details, see [CreateInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/create-instance-profile.html) in *AWS CLI Command Reference*.

### create-login-profile

The following code example shows how to use `create-login-profile`.

**AWS CLI**

**To create a password for an IAM user**

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
  --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called `create-login-profile.json` that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
  "UserName": "Bob",
  "Password": "&l-3a6u:RA0djs",
  "PasswordResetRequired": true
}
```
Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called `create-login-profile.json`.

```
aws iam create-login-profile \
    --cli-input-json file:///create-login-profile.json
```

Output:

```
{
   "LoginProfile": {
       "UserName": "Bob",
       "CreateDate": "2015-03-10T20:55:40.274Z",
       "PasswordResetRequired": true
   }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

- For API details, see [CreateLoginProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/create-login-profile.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam/index.html).

**create-open-id-connect-provider**

The following code example shows how to use `create-open-id-connect-provider`.

**AWS CLI**

To create an OpenID Connect (OIDC) provider
To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called `create-open-id-connect-provider.json` that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [ 
        "example-application-ID"
    ],
    "ThumbprintList": [ 
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called `create-open-id-connect-provider.json`.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
```
"OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/server.example.com"
}

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the AWS IAM User Guide.

• For API details, see CreateOpenIdConnectProvider in AWS CLI Command Reference.

create-policy-version

The following code example shows how to use create-policy-version.

AWS CLI

To create a new version of a managed policy

This example creates a new v2 version of the IAM policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy and makes it the default version.

aws iam create-policy-version
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy
   --set-as-default

Output:

{
   "PolicyVersion": {
       "CreateDate": "2015-06-16T18:56:03.721Z",
       "VersionId": "v2",
       "IsDefaultVersion": true
   }
}

For more information, see Versioning IAM policies in the AWS IAM User Guide.

• For API details, see CreatePolicyVersion in AWS CLI Command Reference.
**create-policy**

The following code example shows how to use `create-policy`.

**AWS CLI**

**Example 1: To create a customer managed policy**

The following command creates a customer managed policy named `my-policy`.

```bash
aws iam create-policy  
  --policy-name my-policy  
  --policy-document file://policy
```

The file `policy` is a JSON document in the current folder that grants read only access to the shared folder in an Amazon S3 bucket named `my-bucket`.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:Get*",
        "s3:List*"
      ],
      "Resource": [
        "arn:aws:s3:::my-bucket/shared/*"
      ]
    }
  ]
}
```

**Output:**

```json
{
  "Policy": {
    "PolicyName": "my-policy",
    "CreateDate": "2015-06-01T19:31:18.620Z",
    "AttachmentCount": 0,
    "IsAttachable": true,
  }
}
```
For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the AWS CLI User Guide.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named my-policy with an immutable description:

```bash
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json \
  --description "This policy grants access to all Put, Get, and List actions for my-bucket"
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named my-bucket.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:ListBucket*",
            "s3:PutBucket*",
            "s3:GetBucket*
         ],
         "Resource": [
            "arn:aws:s3:::my-bucket"
         ]
      }
   ]
}
```
Output:

```json
{
   "Policy": {
      "PolicyName": "my-policy",
      "PolicyId": "ANPAWGSUGIDPEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:policy/my-policy",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 0,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2023-05-24T22:38:47+00:00",
      "UpdateDate": "2023-05-24T22:38:47+00:00"
   }
}
```

**Example 3: To Create a customer managed policy with tags**

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `{"Key": "Department", "Value": "Accounting"}` `{"Key": "Location", "Value": "Seattle"}`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```
aws iam create-policy \
   --policy-name my-policy \
   --policy-document file://policy.json \
   --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
```
"Action": [
    "s3:ListBucket*",
    "s3:PutBucket*",
    "s3:GetBucket*
],
"Resource": [
    "arn:aws:s3:::my-bucket"
]
}

Output:

{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}

For more information on Tagging policies, see [Tagging customer managed policies](https://docs.aws.amazon.com/iam/latest/userguide/tag-policies.html) in the AWS IAM User Guide.

- For API details, see [CreatePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/create-policy.html) in AWS CLI Command Reference.
create-role

The following code example shows how to use create-role.

**AWS CLI**

**Example 1: To create an IAM role**

The following `create-role` command creates a role named Test-Role and attaches a trust policy to it.

```
aws iam create-role \
  --role-name Test-Role \
  --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
  "Role": {
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
    "RoleId": "AKIAIOSFODNN7EXAMPLE",
    "CreateDate": "2013-06-07T20:43:32.821Z",
    "RoleName": "Test-Role",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
  }
}
```

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

**Example 2: To create an IAM role with specified maximum session duration**

The following `create-role` command creates a role named Test-Role and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
```

For more information, see Creating IAM roles in the AWS IAM User Guide.
**Example 3: To create an IAM Role with tags**

The following command creates an IAM Role Test-Role with tags. This example uses the --tags parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"} ' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
code
aws iam create-role \
--role-name Test-Role \
--assume-role-policy-document file:///Test-Role-Trust-Policy.json \
--max-session-duration 7200
```
For more information, see Tagging IAM roles in the AWS IAM User Guide.

- For API details, see CreateRole in AWS CLI Command Reference.
create-saml-provider

The following code example shows how to use create-saml-provider.

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named MySAMLProvider. It is described by the SAML metadata document found in the file SAMLMetaData.xml.

```bash
aws iam create-saml-provider \
  --saml-metadata-document file://SAMLMetaData.xml \
  --name MySAMLProvider
```

Output:

```json
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see CreateSAMLProvider in AWS CLI Command Reference.

create-service-linked-role

The following code example shows how to use create-service-linked-role.

AWS CLI

To create a service-linked role

The following create-service-linked-role example creates a service-linked role for the specified AWS service and attaches the specified description.

```bash
aws iam create-service-linked-role \
  --aws-service-name lex.amazonaws.com \
  --description "My service-linked role to support Lex"
```

Output:
For more information, see Using service-linked roles in the AWS IAM User Guide.

- For API details, see CreateServiceLinkedRole in AWS CLI Command Reference.

create-service-specific-credential

The following code example shows how to use create-service-specific-credential.

AWS CLI

Create a set of service-specific credentials for a user

The following create-service-specific-credential example creates a username and password that can be used to access only the configured service.

    aws iam create-service-specific-credential \
create-user

The following code example shows how to use `create-user`.

AWS CLI

Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
  --user-name Bob
```

Output:

```
{
  "User": {
    "UserName": "Bob",
    "Path": "/",
  }
}
```
Example 2: To create an IAM user at a specified path

The following create-user command creates an IAM user named Bob at the specified path.

```bash
aws iam create-user \
  --user-name Bob \
  --path /division_abc/subdivision_xyz/
```

Output:

```json
{
  "User": {
    "Path": "/division_abc/subdivision_xyz/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:user/division_abc/subdivision_xyz/Bob",
    "CreateDate": "2023-05-24T18:20:17+00:00"
  }
}
```

Example 3: To Create an IAM User with tags

The following create-user command creates an IAM user named Bob with tags. This example uses the --tags parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
aws iam create-user \
  --user-name Bob \
```
Output:

```json
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see [Tagging IAM users](https://docs.aws.amazon.com/IAM/docs/tagging.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users.html).

**Example 3: To create an IAM user with a set permissions boundary**

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
  --user-name Bob \
  --permissions-boundary arn/aws/iam/aws:policy/AmazonS3FullAccess
```

Output:

```json
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```
The following code example shows how to use **create-virtual-mfa-device**.

**AWS CLI**

**To create a virtual MFA device**

This example creates a new virtual MFA device called BobsMFADevice. It creates a file that contains bootstrap information called QRCODE.png and places it in the C:/ directory. The bootstrap method used in this example is QRCODEPNG.

```
aws iam create-virtual-mfa-device \
  --virtual-mfa-device-name BobsMFADevice \
  --outfile C:/QRCODE.png \
  --bootstrap-method QRCODEPNG
```

Output:

```
{
  "VirtualMFADevice": {
    "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
  }
}
```

- For API details, see [CreateVirtualMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/create-virtual-mfa-device.html) in *AWS CLI Command Reference*. 

---

For more information, see [Permissions boundaries for IAM entities](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-auth-profile-permissions-boundary.html) in the *AWS IAM User Guide*.

- For API details, see [CreateUser](https://docs.aws.amazon.com/cli/latest/reference/iam/create-user.html) in *AWS CLI Command Reference*. 

---

**create-virtual-mfa-device**

The following code example shows how to use **create-virtual-mfa-device**.
**deactivate-mfa-device**

The following code example shows how to use `deactivate-mfa-device`.

**AWS CLI**

**To deactivate an MFA device**

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```bash
aws iam deactivate-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

- For API details, see [DeactivateMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/deactivate-mfa-device.html) in AWS CLI Command Reference.

**decode-authorization-message**

The following code example shows how to use `decode-authorization-message`.

**AWS CLI**

**To decode a authorization failure message**

The following `decode-authorization-message` example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```bash
aws sts decode-authorization-message \
  --encoded-message lxzA8VEjEvu-s0TTt3PgyCXik9Yak0qsxFJGRZR98xNcyWAxwRq14xIvd-npzbgTevuuftCtjbeBAaADARg9cbTK1rJbg3awM330-Vy3ebPErE2-mWR9hVYdvX-0zKgV0WF9pWjZaJSMqxB-aLXo-I_8TTvBq88x81FPbMAxNdpu0IjxDjzf22PF3S0E3XvIQ-_PE00aUqhHCCcs5szFtxvm6yQD1nbm6VTIVxrfafa0Bzy8lsoMo7SjIaJ2r5vph6SY5vCCwg6o2JKer3hIHTa8zRzDbZSFMcXx9AYAAIr6bhcis7C__bZh4dIAWooHFGKgfoJcWgwdzgbu9hWyVvKTpeot5hsb8qANYjJRCPXTKpi6PZfdijIkw6gq-
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.
For more information, see How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch? in AWS re:Post.

- For API details, see DecodeAuthorizationMessage in AWS CLI Command Reference.

delete-access-key

The following code example shows how to use delete-access-key.

AWS CLI

To delete an access key for an IAM user

The following delete-access-key command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
  --access-key-id AKIDPMS9R04H3FEXAMPLE \
```
This command produces no output.

To list the access keys defined for an IAM user, use the list-access-keys command.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccessKey in AWS CLI Command Reference.

delete-account-alias

The following code example shows how to use delete-account-alias.

AWS CLI

To delete an account alias

The following delete-account-alias command removes the alias mycompany for the current account.

```bash
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see DeleteAccountAlias in AWS CLI Command Reference.

delete-account-password-policy

The following code example shows how to use delete-account-password-policy.

AWS CLI

To delete the current account password policy

The following delete-account-password-policy command removes the password policy for the current account.

```bash
aws iam delete-account-password-policy
```
This command produces no output.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccountPasswordPolicy in AWS CLI Command Reference.

deleate-group-policy

The following code example shows how to use delete-group-policy.

AWS CLI

To delete a policy from an IAM group

The following delete-group-policy command deletes the policy named ExamplePolicy from the group named Admins.

```
aws iam delete-group-policy \
  --group-name Admins \
  --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the list-group-policies command.

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see DeleteGroupPolicy in AWS CLI Command Reference.

deleate-group

The following code example shows how to use delete-group.

AWS CLI

To delete an IAM group

The following delete-group command deletes an IAM group named MyTestGroup.

```
aws iam delete-group \
  --group-name MyTestGroup
```
This command produces no output.

For more information, see Deleting an IAM user group in the AWS IAM User Guide.

- For API details, see DeleteGroup in AWS CLI Command Reference.

delete-instance-profile

The following code example shows how to use delete-instance-profile.

**AWS CLI**

**To delete an instance profile**

The following delete-instance-profile command deletes the instance profile named ExampleInstanceProfile.

```
aws iam delete-instance-profile \
   --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see DeleteInstanceProfile in AWS CLI Command Reference.

delete-login-profile

The following code example shows how to use delete-login-profile.

**AWS CLI**

**To delete a password for an IAM user**

The following delete-login-profile command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
   --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.
delete-open-id-connect-provider

The following code example shows how to use delete-open-id-connect-provider.

**AWS CLI**

*To delete an IAM OpenID Connect identity provider*

This example deletes the IAM OIDC provider that connects to the provider example.oidcprovider.com.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/idCreateDateDeleteOpenIdConnectProvider.html) in the *AWS IAM User Guide*.

• For API details, see [DeleteOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-open-id-connect-provider.html) in *AWS CLI Command Reference*.

delete-policy-version

The following code example shows how to use delete-policy-version.

**AWS CLI**

*To delete a version of a managed policy*

This example deletes the version identified as v2 from the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

• For API details, see DeletePolicyVersion in AWS CLI Command Reference.

**delete-policy**

The following code example shows how to use delete-policy.

**AWS CLI**

**To delete an IAM policy**

This example deletes the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```bash
aws iam delete-policy \
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

• For API details, see DeletePolicy in AWS CLI Command Reference.

**delete-role-permissions-boundary**

The following code example shows how to use delete-role-permissions-boundary.

**AWS CLI**

**To delete a permissions boundary from an IAM role**

The following delete-role-permissions-boundary example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the put-role-permissions-boundary command.

```bash
aws iam delete-role-permissions-boundary \
   --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

• For API details, see DeleteRolePermissionsBoundary in AWS CLI Command Reference.
delete-role-policy

The following code example shows how to use delete-role-policy.

AWS CLI

To remove a policy from an IAM role

The following delete-role-policy command removes the policy named ExamplePolicy from the role named Test-Role.

```
aws iam delete-role-policy \\
    --role-name Test-Role \\
    --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see DeleteRolePolicy in AWS CLI Command Reference.

delete-role

The following code example shows how to use delete-role.

AWS CLI

To delete an IAM role

The following delete-role command removes the role named Test-Role.

```
aws iam delete-role \\
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (remove-role-from-instance-profile), detach any managed policies (detach-role-policy) and delete any inline policies that are attached to the role (delete-role-policy).

For more information, see Creating IAM roles and Using instance profiles in the AWS IAM User Guide.
For API details, see DeleteRole in AWS CLI Command Reference.

**delete-saml-provider**

The following code example shows how to use delete-saml-provider.

**AWS CLI**

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```bash
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

For API details, see DeleteSAMLProvider in AWS CLI Command Reference.

**delete-server-certificate**

The following code example shows how to use delete-server-certificate.

**AWS CLI**

To delete a server certificate from your AWS account

The following delete-server-certificate command removes the specified server certificate from your AWS account.

```bash
aws iam delete-server-certificate \
--server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the list-server-certificates command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.
For API details, see **DeleteServerCertificate** in *AWS CLI Command Reference*.

**delete-service-linked-role**

The following code example shows how to use delete-service-linked-role.

**AWS CLI**

**To delete a service-linked role**

The following delete-service-linked-role example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```bash
aws iam delete-service-linked-role \
  --role-name AWSServiceRoleForLexBots
```

Output:

```
{
  "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdEXAMPLE"
}
```

For more information, see [Using service-linked roles](https://docs.aws.amazon.com/iam/latest/userguide/servicelinkedroles-account.html) in the *AWS IAM User Guide*.

For API details, see **DeleteServiceLinkedRole** in *AWS CLI Command Reference*.

**delete-service-specific-credential**

The following code example shows how to use delete-service-specific-credential.

**AWS CLI**

**Example 1: Delete a service-specific credential for the requesting user**

The following delete-service-specific-credential example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.
aws iam delete-service-specific-credential \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE

This command produces no output.

**Example 2: Delete a service-specific credential for a specified user**

The following delete-service-specific-credential example deletes the specified service-specific credential for the specified user. The service-specific-credential-id is provided when you create the credential and you can retrieve it by using the list-service-specific-credentials command.

aws iam delete-service-specific-credential \
   --user-name sofia \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE

This command produces no output.

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](https://docs.aws.amazon.com/codecommit/latest/userguide/reference-cli-create-github-url-associate-bucket.html) in the *AWS CodeCommit User Guide*.

- For API details, see [DeleteServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-service-specific-credential.html) in *AWS CLI Command Reference*.

delete-signing-certificate

The following code example shows how to use delete-signing-certificate.

**AWS CLI**

To delete a signing certificate for an IAM user

The following delete-signing-certificate command deletes the specified signing certificate for the IAM user named Bob.

aws iam delete-signing-certificate \
   --user-name Bob \
   --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE

This command produces no output.

To get the ID for a signing certificate, use the list-signing-certificates command.
For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see DeleteSigningCertificate in AWS CLI Command Reference.

**delete-ssh-public-key**

The following code example shows how to use delete-ssh-public-key.

**AWS CLI**

To delete an SSH public keys attached to an IAM user

The following delete-ssh-public-key command deletes the specified SSH public key attached to the IAM user sofia.

```
aws iam delete-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see DeleteSshPublicKey in AWS CLI Command Reference.

**delete-user-permissions-boundary**

The following code example shows how to use delete-user-permissions-boundary.

**AWS CLI**

To delete a permissions boundary from an IAM user

The following delete-user-permissions-boundary example deletes the permissions boundary attached to the IAM user named intern. To apply a permissions boundary to a user, use the put-user-permissions-boundary command.

```
aws iam delete-user-permissions-boundary \
   --user-name intern
```

This command produces no output.
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeleteUserPermissionsBoundary in AWS CLI Command Reference.

delete-user-policy

The following code example shows how to use delete-user-policy.

AWS CLI

To remove a policy from an IAM user

The following delete-user-policy command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
  --user-name Bob \n  --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the list-user-policies command.

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see DeleteUserPolicy in AWS CLI Command Reference.

delete-user

The following code example shows how to use delete-user.

AWS CLI

To delete an IAM user

The following delete-user command removes the IAM user named Bob from the current account.

```
aws iam delete-user \
  --user-name Bob
```

This command produces no output.
For more information, see Deleting an IAM user in the AWS IAM User Guide.

- For API details, see DeleteUser in AWS CLI Command Reference.

delete-virtual-mfa-device

The following code example shows how to use delete-virtual-mfa-device.

AWS CLI

To remove a virtual MFA device

The following delete-virtual-mfa-device command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \\
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the AWS IAM User Guide.

- For API details, see DeleteVirtualMfaDevice in AWS CLI Command Reference.

detach-group-policy

The following code example shows how to use detach-group-policy.

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN
arn:aws:iam::123456789012:policy/TesterAccessPolicy from the group called Testers.

```
aws iam detach-group-policy \\
    --group-name Testers \\
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.
For more information, see Managing IAM user groups in the AWS IAM User Guide.  

- For API details, see DetachGroupPolicy in AWS CLI Command Reference.

detach-role-policy

The following code example shows how to use detach-role-policy.

AWS CLI

To detach a policy from a role

This example removes the managed policy with the ARN 
arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy from the role 
called FedTesterRole.

```bash
aws iam detach-role-policy \
  --role-name FedTesterRole \
  --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.  

- For API details, see DetachRolePolicy in AWS CLI Command Reference.

detach-user-policy

The following code example shows how to use detach-user-policy.

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN 

```bash
aws iam detach-user-policy \
  --user-name Bob \
  --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.
For more information, see Changing permissions for an IAM user in the AWS IAM User Guide.

- For API details, see DetachUserPolicy in AWS CLI Command Reference.

enable-mfa-device

The following code example shows how to use enable-mfa-device.

AWS CLI

To enable an MFA device

After you use the create-virtual-mfa-device command to create a new virtual MFA device, you can assign the MFA device to a user. The following enable-mfa-device example assigns the MFA device with the serial number arn:aws:iam::210987654321:mfa/BobsMFADevice to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
    --user-name Bob \ 
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \ 
    --authentication-code1 123456 \ 
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see EnableMfaDevice in AWS CLI Command Reference.

generate-credential-report

The following code example shows how to use generate-credential-report.

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```
For more information, see Getting credential reports for your AWS account in the AWS IAM User Guide.

• For API details, see GenerateCredentialReport in AWS CLI Command Reference.

generate-organizations-access-report

The following code example shows how to use generate-organizations-access-report.

AWS CLI

Example 1: To generate an access report for a root in an organization

The following generate-organizations-access-report example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the get-organizations-access-report command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
    "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

Example 2: To generate an access report for an account in an organization

The following generate-organizations-access-report example starts a background job to create an access report for account ID 123456789012 in the organization o-4fxmplt198. You can display the report after it's created by running the get-organizations-access-report command.
**aws iam generate-organizations-access-report \**
  **--entity-path o-4fxmplt198/r-c3xb/123456789012**

Output:

```json
{
  "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"
}
```

**Example 3: To generate an access report for an account in an organizational unit in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 234567890123 in organizational unit ou-c3xb-lmu7j2yg in the organization o-4fxmplt198. You can display the report after it's created by running the `get-organizations-access-report` command.

```bash
aws iam generate-organizations-access-report \
--entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```json
{
  "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

**generate-service-last-accessed-details**

The following code example shows how to use `generate-service-last-accessed-details`.
Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

Example 2: To generate a service access report for the AWS managed `AdministratorAccess` policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GenerateServiceLastAccessedDetails in AWS CLI Command Reference.
get-access-key-last-used

The following code example shows how to use get-access-key-last-used.

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
  --access-key-id ABCDEXAMPLE
```

Output:

```
{
  "UserName": "Bob",
  "AccessKeyLastUsed": {
    "Region": "us-east-1",
    "ServiceName": "iam",
    "LastUsedDate": "2015-06-16T22:45:00Z"
  }
}
```

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.
- For API details, see GetAccessKeyLastUsed in AWS CLI Command Reference.

get-account-authorization-details

The following code example shows how to use get-account-authorization-details.

AWS CLI

To list an AWS accounts IAM users, groups, roles, and policies

The following get-account-authorization-details command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```
Output:

```json
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "RoleId": "AROA1234567890EXAMPLE",
            "CreateDate": "2014-07-30T17:09:20Z",

  ]
}
get-account-password-policy

The following code example shows how to use get-account-password-policy.

AWS CLI

To see the current account password policy
The following get-account-password-policy command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a NoSuchEntity error.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see GetAccountPasswordPolicy in AWS CLI Command Reference.

get-account-summary

The following code example shows how to use get-account-summary.

**AWS CLI**

To get information about IAM entity usage and IAM quotas in the current account

The following get-account-summary command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
    "SummaryMap": {
```
The following code example shows how to use get-context-keys-for-custom-policy.

**AWS CLI**

**Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line**

The following get-context-keys-for-custom-policy command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands.
simulate-custom-policy and simulate-custom-policy. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the get-context-keys-for-custom-policy command. Parameter values that begin with file:// instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```bash
aws iam get-context-keys-for-custom-policy \
  --policy-input-list '{"Version": "2012-10-17", "Statement": 
  {"aws:CurrentTime": "2015-08-16T12:00:00Z"}}}'
```

Output:

```json
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

**Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input**

The following get-context-keys-for-custom-policy command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```bash
[ "Policy1",
  "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ".

```bash
```

`
This file can then be submitted to the following command.

```bash
aws iam get-context-keys-for-custom-policy \
--policy-input-list file://policyfile.json
```

Output:

```json
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

For more information, see [Using the IAM Policy Simulator (AWS CLI and AWS API)](https://docs.aws.amazon.com/IAM/latest/userguide/using-iam-policesimulate.html) in the [AWS IAM User Guide](https).

### get-context-keys-for-principal-policy

The following code example shows how to use `get-context-keys-for-principal-policy`.

**AWS CLI**

**To list the context keys referenced by all policies associated with an IAM principal**

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```bash
aws iam get-context-keys-for-principal-policy \
--policy-source-arn arn:aws:iam::123456789012:user/saanvi
```
Output:

```json
{
   "ContextKeyNames": [
      "aws:username",
      "aws:CurrentTime"
   ]
}
```

For more information, see [Using the IAM Policy Simulator (AWS CLI and AWS API)](https://docs.aws.amazon.com/iam/latest/userguide/get-context-keys-for-principal-policy.html) in the [AWS IAM User Guide](https).

### get-credential-report

The following code example shows how to use `get-credential-report`.

**AWS CLI**

**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```json
{
   "GeneratedTime": "2015-06-17T19:11:50Z",
   "ReportFormat": "text/csv"
}
```

For more information, see [Getting credential reports for your AWS account](https://docs.aws.amazon.com/iam/latest.userguide/get-credential-report.html) in the [AWS IAM User Guide](https).

### get-group-policy

The following code example shows how to use `get-group-policy`.

**Actions and scenarios**
AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named Test-Group.

```
aws iam get-group-policy \\
    --group-name Test-Group \\
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": ["s3:Get*", "s3:List*"],
                "Resource": "*",
                "Effect": "Allow"
            }
        ],
        "PolicyName": "S3-ReadOnly-Policy"
    }
}
```

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see GetGroupPolicy in AWS CLI Command Reference.

get-group

The following code example shows how to use `get-group`.

AWS CLI

To get an IAM group

This example returns details about the IAM group Admins.
aws iam get-group \
--group-name Admins

Output:

{
  "Group": {
    "Path": "/",
    "CreateDate": "2015-06-16T19:41:48Z",
    "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:group/Admins",
    "GroupName": "Admins"
  },
  "Users": []
}

For more information, see IAM Identities (users, user groups, and roles) in the AWS IAM User Guide.

- For API details, see GetGroup in AWS CLI Command Reference.

get-instance-profile

The following code example shows how to use get-instance-profile.

AWS CLI

To get information about an instance profile

The following get-instance-profile command gets information about the instance profile named ExampleInstanceProfile.

aws iam get-instance-profile \
--instance-profile-name ExampleInstanceProfile

Output:

{
  "InstanceProfile": {
    "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
    "Roles": [

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see GetInstanceProfile in AWS CLI Command Reference.

**get-login-profile**

The following code example shows how to use get-login-profile.

**AWS CLI**

To get password information for an IAM user

The following get-login-profile command gets information about the password for the IAM user named Bob.

```bash
aws iam get-login-profile \
   --user-name Bob
```

Output:

```json
{
   "LoginProfile": {
      "UserName": "Bob",
      "CreateDate": "2012-09-21T23:03:39Z"
   }
}
```
The get-login-profile command can be used to verify that an IAM user has a password. The command returns a NoSuchEntity error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (update-login-profile) for the user. Alternatively, you can delete the login profile (delete-login-profile) for the user and then create a new one (create-login-profile).

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see GetLoginProfile in AWS CLI Command Reference.

get-mfa-device

The following code example shows how to use get-mfa-device.

AWS CLI

To retrieve information about a FIDO security key

The following get-mfa-device command example retrieves information about the specified FIDO security key.

```bash/aws iam get-mfa-device \\--serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```json
{
   "UserName": "alice",
   "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE",
   "EnableDate": "2023-09-19T01:49:18+00:00",
   "Certifications": {
      "FIDO": "L1"
   }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.
get-open-id-connect-provider

The following code example shows how to use get-open-id-connect-provider.

AWS CLI

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is arn:aws:iam::123456789012:oidc-provider/server.example.com.

```bash
aws iam get-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```
{
   "Url": "server.example.com",
   "CreateDate": "2015-06-16T19:41:48Z",
   "ThumbprintList": [
      "12345abcdefghijk67890lmnopqrst987example"
   ],
   "ClientIDList": [
      "example-application-ID"
   ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see GetOpenIdConnectProvider in AWS CLI Command Reference.

get-organizations-access-report

The following code example shows how to use get-organizations-access-report.

AWS CLI

To retrieve an access report
The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```
aws iam get-organizations-access-report \
   --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

Output:

```
{
   "JobStatus": "COMPLETED",
   "JobCreationDate": "2019-09-30T06:53:36.187Z",
   "JobCompletionDate": "2019-09-30T06:53:37.547Z",
   "NumberOfServicesAccessible": 188,
   "NumberOfServicesNotAccessed": 171,
   "AccessDetails": [
      {
         "ServiceName": "Alexa for Business",
         "ServiceNamespace": "a4b",
         "TotalAuthenticatedEntities": 0
      },
      ...
   ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GetOrganizationsAccessReport in AWS CLI Command Reference.

get-policy-version

The following code example shows how to use get-policy-version.

**AWS CLI**

**To retrieve information about the specified version of the specified managed policy**

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
```
get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve information about the specified managed policy

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

### get-role-policy

The following code example shows how to use `get-role-policy`.

**AWS CLI**

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```bash
aws iam get-role-policy \
   --role-name Test-Role \
   --policy-name ExamplePolicy
```

Output:

```json
{
   "RoleName": "Test-Role",
   "PolicyDocument": {
      "Statement": [
         {
            "Action": ["s3:ListBucket",
            ...
        }
```

### get-role

The following code example shows how to use get-role.

**AWS CLI**

**To get information about an IAM role**

The following `get-role` command gets information about the role named Test-Role.

```
aws iam get-role \
    --role-name Test-Role
```

**Output:**

```json
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
```
The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the list-role-policies command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see GetRole in AWS CLI Command Reference.

get-saml-provider

The following code example shows how to use get-saml-provider.

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

aws iam get-saml-provider \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS

Output:

```json
{
   "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
   "CreateDate": "2017-03-06T22:29:46+00:00",
   "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
   "Tags": [
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      {
```
For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see GetSamlProvider in AWS CLI Command Reference.

get-server-certificate

The following code example shows how to use get-server-certificate.

AWS CLI

To get details about a server certificate in your AWS account

The following get-server-certificate command retrieves all of the details about the specified server certificate in your AWS account.

aws iam get-server-certificate \\n    --server-certificate-name myUpdatedServerCertificate

Output:

{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----
MIICiTCCAfICCQD6m7oRw0uX0jANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMCVVMx
CzAJBgNVBAgTAldBMRAwDgYDVQQHEwdTZWF0dGxlMQ8wDQYDVQQKEwZBbWF6b2Jq
b25zb2xlMRIwEAYDVQQDEwlUZXN0Q2lsYWMxHzAd
BgkqhkiG9w0BCQEWEWEG5vb251QGFTYXpvbi5jb20wHhcNMTEwNDI1MjA0NTIxWhcN
-----END CERTIFICATE-----"
    }
}
To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

For API details, see GetServerCertificate in AWS CLI Command Reference.

get-service-last-accessed-details-with-entities

The following code example shows how to use get-service-last-accessed-details-with-entities.

AWS CLI

To retrieve a service access report with details for a service
The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities
  --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916
  --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
        {
            "EntityInfo": {
                " Arn": "arn:aws:iam::123456789012:user/developer",
                " Name": "developer",
                " Type": "USER",
                " Id": "AIDAIBEYXMPL2YEXAMPLE",
                " Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.
get-service-last-accessed-details

The following code example shows how to use get-service-last-accessed-details.

AWS CLI

To retrieve a service access report

The following get-service-last-accessed-details example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the generate-service-last-accessed-details command.

```bash
aws iam get-service-last-accessed-details \
   --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdefdc
```

Output:

```
{
   "JobStatus": "COMPLETED",
   "JobCreationDate": "2019-10-01T03:50:35.929Z",
   "ServicesLastAccessed": [
   ...
   {
      "ServiceName": "AWS Lambda",
      "LastAuthenticated": "2019-09-30T23:02:00Z",
      "ServiceNamespace": "lambda",
      "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
      "TotalAuthenticatedEntities": 6
   },
   ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

• For API details, see GetServiceLastAccessedDetails in AWS CLI Command Reference.
get-service-linked-role-deletion-status

The following code example shows how to use get-service-linked-role-deletion-status.

AWS CLI

To check the status of a request to delete a service-linked role

The following get-service-linked-role-deletion-status example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a DeletionTaskId value that you provide as a parameter for this command.

```bash
aws iam get-service-linked-role-deletion-status \
   --deletion-task-id task/aws-service-role/lex.amazonaws.com/
   AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```json
{
   "Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the AWS IAM User Guide.

• For API details, see GetServiceLinkedRoleDeletionStatus in AWS CLI Command Reference.

get-ssh-public-key

The following code example shows how to use get-ssh-public-key.

AWS CLI

Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form

The following get-ssh-public-key command retrieves the specified SSH public key from the IAM user sofia. The output is in SSH encoding.

```bash
aws iam get-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE \
```
--encoding SSH

Output:

```json
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user sofia. The output is in PEM encoding.

```bash
aws iam get-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA123456789EXAMPLE \
  --encoding PEM
```

Output:

```json
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "SSHPublicKeyBody": "-----BEGIN PUBLIC KEY-----\n<<long encoded PEM string>>\n-----END PUBLIC KEY-----\n",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see GetSshPublicKey in AWS CLI Command Reference.
**get-user-policy**

The following code example shows how to use `get-user-policy`.

**AWS CLI**

**To list policy details for an IAM user**

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```bash
aws iam get-user-policy \
  --user-name Bob \
  --policy-name ExamplePolicy
```

Output:

```json
{
  "UserName": "Bob",
  "PolicyName": "ExamplePolicy",
  "PolicyDocument": {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Action": "*",
        "Resource": "*",
        "Effect": "Allow"
      }
    ]
  }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see GetUserPolicy in AWS CLI Command Reference.

**get-user**

The following code example shows how to use `get-user`.
AWS CLI

To get information about an IAM user

The following `get-user` command gets information about the IAM user named Paulo.

```bash
aws iam get-user \
    --user-name Paulo
```

Output:

```
{
    "User": {
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the AWS IAM User Guide.
- For API details, see GetUser in AWS CLI Command Reference.

list-access-keys

The following code example shows how to use `list-access-keys`.

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```bash
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
```
You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the create-access-keys command.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see ListAccessKeys in AWS CLI Command Reference.

list-account-aliases

The following code example shows how to use list-account-aliases.

AWS CLI

To list account aliases

The following list-account-aliases command lists the aliases for the current account.

aws iam list-account-aliases

Output:

{
   "AccountAliases": [
      "mycompany"
   ]
}
For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see ListAccountAliases in AWS CLI Command Reference.

list-attached-group-policies

The following code example shows how to use list-attached-group-policies.

AWS CLI

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named Admins in the AWS account.

```bash
aws iam list-attached-group-policies \
--group-name Admins
```

Output:

```
{
   "AttachedPolicies": [
      {
         "PolicyName": "AdministratorAccess",
         "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
      },
      {
         "PolicyName": "SecurityAudit",
         "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
      }
   ],
   "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListAttachedGroupPolicies in AWS CLI Command Reference.

list-attached-role-policies

The following code example shows how to use list-attached-role-policies.
AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named SecurityAuditRole in the AWS account.

```
aws iam list-attached-role-policies \
   --role-name SecurityAuditRole
```

Output:

```
{
   "AttachedPolicies": [
   {
      "PolicyName": "SecurityAudit",
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
   }
   ],
   "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListAttachedRolePolicies in AWS CLI Command Reference.

list-attached-user-policies

The following code example shows how to use list-attached-user-policies.

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
   --user-name Bob
```

Output:
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListAttachedUserPolicies in AWS CLI Command Reference.

**list-entities-for-policy**

The following code example shows how to use list-entities-for-policy.

**AWS CLI**

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy arn:aws:iam::123456789012:policy/TestPolicy attached.

```
aws iam list-entities-for-policy \
   --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```json
{
   "PolicyGroups": [
   {
       "GroupName": "Admins",
       "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
   }
   ],
   "IsTruncated": false
}
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListEntitiesForPolicy in AWS CLI Command Reference.

list-group-policies

The following code example shows how to use list-group-policies.

AWS CLI

To list all inline policies that are attached to the specified group

The following list-group-policies command lists the names of inline policies that are attached to the IAM group named Admins in the current account.

```
aws iam list-group-policies \
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```
For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see ListGroupPolicies in AWS CLI Command Reference.

**list-groups-for-user**

The following code example shows how to use list-groups-for-user.

**AWS CLI**

To list the groups that an IAM user belongs to

The following list-groups-for-user command displays the groups that the IAM user named Bob belongs to.

```bash
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```json
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }]
}
```

For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see ListGroupsForUser in AWS CLI Command Reference.
list-groups

The following code example shows how to use list-groups.

AWS CLI

To list the IAM groups for the current account

The following list-groups command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
    {
        "Path": "/",
        "CreateDate": "2013-06-04T20:27:27.972Z",
        "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    {
        "Path": "/",
        "CreateDate": "2013-04-16T20:30:42Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
        "GroupName": "S3-Admins"
    }
    ]
}
```

For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see ListGroups in AWS CLI Command Reference.

list-instance-profile-tags

The following code example shows how to use list-instance-profile-tags.
AWS CLI

To list the tags attached to an instance profile

The following list-instance-profile-tags command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
   --instance-profile-name deployment-role
```

Output:

```
{
   "Tags": [
   {
      "Key": "DeptID",
      "Value": "123456"
   },
   {
      "Key": "Department",
      "Value": "Accounting"
   }
   ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListInstanceProfileTags in AWS CLI Command Reference.

---

list-instance-profiles-for-role

The following code example shows how to use list-instance-profiles-for-role.

AWS CLI

To list the instance profiles for an IAM role

The following list-instance-profiles-for-role command lists the instance profiles that are associated with the role Test-Role.

```
aws iam list-instance-profiles-for-role \
   --role-name Test-Role
```
Output:

```json
{
  "InstanceProfiles": [
    {
      "InstanceProfileId": "AIDGPMS9R04H3EXAMPLE",
      "Roles": [
        {
          "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
          "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
          "CreateDate": "2013-06-07T20:42:15Z",
          "RoleName": "Test-Role",
          "Path": "/",
          "Arn": "arn:aws:iam::123456789012:role/Test-Role"
        }
      ],
      "CreateDate": "2013-06-07T21:05:24Z",
      "InstanceProfileName": "ExampleInstanceProfile",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/ExampleInstanceProfile"
    }
  ]
}
```

- For API details, see [ListInstanceProfilesForRole](https://docs.aws.amazon.com/cli/latest/reference/iam/list-instance-profiles.html) in *AWS CLI Command Reference*.

### list-instance-profiles

The following code example shows how to use list-instance-profiles.

**AWS CLI**

**To lists the instance profiles for the account**

The following list-instance-profiles command lists the instance profiles that are associated with the current account.

```
aws iam list-instance-profiles
```

Output:

{
    "InstanceProfiles": [
    {
        "Path": "/",
        "InstanceProfileName": "example-dev-role",
        "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
        "CreateDate": "2023-09-21T18:41+00:00",
        "Roles": [
            {
                "Path": "/",
                "RoleName": "example-dev-role",
                "RoleId": "AROAJO20TH44H7LEXAMPLE",
                "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                "CreateDate": "2023-09-21T18:40+00:00",
                "AssumeRolePolicyDocument": {
                    "Version": "2012-10-17",
                    "Statement": [
                        {
                            "Effect": "Allow",
                            "Principal": {
                                "Service": "ec2.amazonaws.com"
                            },
                            "Action": "sts:AssumeRole"
                        }
                    ]
                }
            }
        ]
    },

                "Service": "ec2.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}

For more information, see Using instance profiles in the AWS IAM User Guide.

• For API details, see ListInstanceProfiles in AWS CLI Command Reference.

list-mfa-device-tags

The following code example shows how to use list-mfa-device-tags.

AWS CLI

To list the tags attached to an MFA device

The following list-mfa-device-tags command retrieves the list of tags associated with the specified MFA device.

```bash
aws iam list-mfa-device-tags \
    --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```json
{
   "Tags": [
       {
           "Key": "DeptID",
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListMfaDeviceTags in AWS CLI Command Reference.

**list-mfa-devices**

The following code example shows how to use list-mfa-devices.

**AWS CLI**

**To list all MFA devices for a specified user**

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
   --user-name Bob
```

**Output:**

```
{
   "MFADevices": [
   {
      "UserName": "Bob",
      "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
      "EnableDate": "2019-10-28T20:37:09+00:00"
   },
   {
      "UserName": "Bob",
      "SerialNumber": "GAKT12345678",
      "EnableDate": "2023-02-18T21:44:42+00:00"
   },
   {
      "UserName": "Bob",
      "SerialNumber": "example-serial-number",
      "EnableDate": "2022-05-15T10:20:00+00:00"
   }
   ]
}
```
For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see ListMfaDevices in AWS CLI Command Reference.

**list-open-id-connect-provider-tags**

The following code example shows how to use list-open-id-connect-provider-tags.

**AWS CLI**

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following list-open-id-connect-provider-tags command retrieves the list of tags associated with the specified OIDC identity provider.

```
aws iam list-open-id-connect-provider-tags \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
```
"Key": "Department",
"Value": "Accounting"
}
]
}

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListOpenIdConnectProviderTags in AWS CLI Command Reference.

**list-open-id-connect-providers**

The following code example shows how to use list-open-id-connect-providers.

**AWS CLI**

**To list information about the OpenID Connect providers in the AWS account**

This example returns a list of ARNs of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
   "OpenIDConnectProviderList": [
      {
         "Arn": "arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com"
      }
   ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see ListOpenIdConnectProviders in AWS CLI Command Reference.

**list-policies-granting-service-access**

The following code example shows how to use list-policies-granting-service-access.
AWS CLI

To list the policies that grant a principal access to the specified service

The following list-policies-granting-service-access example retrieves the list of policies that grant the IAM user sofia access to AWS CodeCommit service.

```bash
aws iam list-policies-granting-service-access \
--arn arn:aws:iam::123456789012:user/sofia \
--service-namespaces codecommit
```

Output:

```json
{
   "PoliciesGrantingServiceAccess": [
   {
      "ServiceNamespace": "codecommit",
      "Policies": [
      {
         "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
         "PolicyType": "INLINE",
         "EntityName": "sofia"
      }
      ]
   },
   "IsTruncated": false
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the AWS IAM User Guide.

- For API details, see ListPoliciesGrantingServiceAccess in AWS CLI Command Reference.

list-policies

The following code example shows how to use list-policies.

AWS CLI

To list managed policies that are available to your AWS account
This example returns a collection of the first two managed policies available in the current AWS account.

```bash
aws iam list-policies \
  --max-items 3
```

Output:

```json
{
  "Policies": [
    {
      "PolicyName": "AWSCloudTrailAccessPolicy",
      "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 0,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2019-09-04T17:43:42+00:00",
      "UpdateDate": "2019-09-04T17:43:42+00:00"
    },
    {
      "PolicyName": "AdministratorAccess",
      "PolicyId": "ANPAIWMBCKSKE64ZLYK",
      "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 6,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2015-02-06T18:39:46+00:00",
      "UpdateDate": "2015-02-06T18:39:46+00:00"
    },
    {
      "PolicyName": "PowerUserAccess",
      "PolicyId": "ANPAJYRXTHIB4FOV53ZXS",
      "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
      "Path": "/",
      "DefaultVersionId": "v5",
      "AttachmentCount": 1,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

list-policy-tags

The following code example shows how to use list-policy-tags.

AWS CLI

To list the tags attached to a managed policy

The following list-policy-tags command retrieves the list of tags associated with the specified managed policy.

```bash
aws iam list-policy-tags \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
    "Tags": [
    {
        "Key": "DeptID",
        "Value": "123456"
    },
    {
        "Key": "Department",
        "Value": "Accounting"
    }
    ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListPolicyTags in AWS CLI Command Reference.
list-policy-versions

The following code example shows how to use list-policy-versions.

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```bash
aws iam list-policy-versions \
--policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```json
{
  "IsTruncated": false,
  "Versions": [
    {
      "VersionId": "v2",
      "IsDefaultVersion": true,
      "CreateDate": "2015-06-02T23:19:44Z"
    },
    {
      "VersionId": "v1",
      "IsDefaultVersion": false,
      "CreateDate": "2015-06-02T22:30:47Z"
    }
  ]
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListPolicyVersions in AWS CLI Command Reference.

list-role-policies

The following code example shows how to use list-role-policies.

AWS CLI

To list the policies attached to an IAM role
The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
   --role-name Test-Role
```

Output:

```
{
   "PolicyNames": [
      "ExamplePolicy"
   ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see ListRolePolicies in AWS CLI Command Reference.

**list-role-tags**

The following code example shows how to use `list-role-tags`.

**AWS CLI**

**To list the tags attached to a role**

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
   --role-name production-role
```

Output:

```
{
   "Tags": [
      {
         "Key": "Department",
         "Value": "Accounting"
      }
   ]
}
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListRoleTags in AWS CLI Command Reference.

list-roles

The following code example shows how to use list-roles.

AWS CLI

To list IAM roles for the current account

The following list-roles command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```json
{
  "Roles": [
    {
      "Path": "/",
      "RoleName": "ExampleRole",
      "RoleId": "AROAJ52OTH4H7LEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
      "CreateDate": "2017-09-12T19:23:36+00:00",
      "AssumeRolePolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
              "Service": "ec2.amazonaws.com"
            }
          }
        ]
      }
    }
  ]
}
```

```
{
  "Path": "/example_path/",
  "RoleName": "ExampleRoleWithPath",
  "RoleId": "AROAI4QRP7UFT7EXAMPLE",
  "Arn": "arn:aws:iam::123456789012:role/example_path/ExampleRoleWithPath",
  "CreateDate": "2023-09-21T20:29:38+00:00",
  "AssumeRolePolicyDocument": {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Sid": "",
        "Effect": "Allow",
        "Principal": {
          "Service": "ec2.amazonaws.com"
        },
        "Action": "sts:AssumeRole"
      }
    ],
    "MaxSessionDuration": 3600
  }
}
``` 

For more information, see [Creating IAM roles](#) in the AWS IAM User Guide.

- For API details, see [ListRoles](#) in AWS CLI Command Reference.

### list-saml-provider-tags

The following code example shows how to use `list-saml-provider-tags`.

**AWS CLI**

To list the tags attached to a SAML provider
The following `list-saml-provider-tags` command retrieves the list of tags associated with the specified SAML provider.

```
aws iam list-saml-provider-tags \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tagging.html) in the AWS IAM User Guide.

- For API details, see [ListSamlProviderTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-saml-provider-tags.html) in AWS CLI Command Reference.

### list-saml-providers

The following code example shows how to use `list-saml-providers`.

#### AWS CLI

**To list the SAML providers in the AWS account**

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
```
{  
  "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
  "ValidUntil": "2015-06-05T22:45:14Z",
  "CreateDate": "2015-06-05T22:45:14Z"
}

For more information, see [Creating IAM SAML identity providers](https://docs.aws.amazon.com/iam/latest/userguide/creating-saml-identity-providers.html) in the *AWS IAM User Guide*.

- For API details, see [ListSAMLProviders](http://docs.aws.amazon.com/cli/latest/reference/iam/list-saml-providers.html) in *AWS CLI Command Reference*.

### list-server-certificate-tags

The following code example shows how to use `list-server-certificate-tags`.

**AWS CLI**

**To list the tags attached to a server certificate**

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
--server-certificate-name ExampleCertificate
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
      "Key": "Department",
      "Value": "Accounting"
    }
  ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/iam/latest/userguide/creating-resource-tags.html) in the *AWS IAM User Guide*. 
• For API details, see ListServerCertificateTags in AWS CLI Command Reference.

list-server-certificates

The following code example shows how to use list-server-certificates.

AWS CLI

To list the server certificates in your AWS account

The following list-server-certificates command lists all of the server certificates stored and available for use in your AWS account.

```bash
aws iam list-server-certificates
```

Output:

```json
{
    "ServerCertificateMetadataList": [
        {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        {
            "Path": "/cloudfront/",
            "ServerCertificateName": "MyTestCert",
            "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyTestCert",
            "UploadDate": "2015-04-21T18:14:16+00:00",
            "Expiration": "2018-01-14T17:52:36+00:00"
        }
    ]
}
```

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

• For API details, see ListServerCertificates in AWS CLI Command Reference.
list-service-specific-credential

The following code example shows how to use list-service-specific-credential.

AWS CLI

Example 1: List the service-specific credentials for a user

The following list-service-specific-credentials example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \ 
  --user-name sofia
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: List the service-specific credentials for a user filtered to a specified service

The following list-service-specific-credentials example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \ 
  --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredential in AWS CLI Command Reference.

list-service-specific-credentials

The following code example shows how to use list-service-specific-credentials.

AWS CLI

To retrieve a list of credentials

The following list-service-specific-credentials example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named developer.

```bash
aws iam list-service-specific-credentials \
  --user-name developer \
  --service-name codecommit.amazonaws.com
```

Output:

```json
{
  "ServiceSpecificCredentials": [
    {
      "UserName": "developer",
      "Status": "Inactive",
      "ServiceUserName": "developer-at-123456789012",
      "CreateDate": "2019-10-01T04:31:41Z",
      "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFP7DZE",
      "ServiceName": "codecommit.amazonaws.com"
    },
    {
      "UserName": "developer",
      "Status": "Active"
    }
  ]
}
```
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredentials in AWS CLI Command Reference.

list-signing-certificates

The following code example shows how to use list-signing-certificates.

AWS CLI

To list the signing certificates for an IAM user

The following list-signing-certificates command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```
{
    "Certificates": [
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
            "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
            "UploadDate": "2013-06-06T21:40:08Z"
        }
    ]
}
```
For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see ListSigningCertificates in AWS CLI Command Reference.

**list-ssh-public-keys**

The following code example shows how to use list-ssh-public-keys.

**AWS CLI**

To list the SSH public keys attached to an IAM user

The following list-ssh-public-keys example lists the SSH public keys attached to the IAM user sofia.

```
aws iam list-ssh-public-keys \
   --user-name sofia
```

Output:

```
{
   "SSHPublicKeys": [
      {
         "UserName": "sofia",
         "SSHPublicKeyId": "APKA1234567890EXAMPLE",
         "Status": "Inactive",
         "UploadDate": "2019-04-18T17:04:49+00:00"
      }
   ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see ListSshPublicKeys in AWS CLI Command Reference.

**list-user-policies**

The following code example shows how to use list-user-policies.

**AWS CLI**

To list policies for an IAM user
The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
   --user-name Bob
```

Output:

```
{
   "PolicyNames": [
      "ExamplePolicy",
      "TestPolicy"
   ]
}
```

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see ListUserPolicies in AWS CLI Command Reference.

**list-user-tags**

The following code example shows how to use `list-user-tags`.

AWS CLI

**To list the tags attached to a user**

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
   --user-name alice
```

Output:

```
{
   "Tags": [
      {
         "Key": "Department",
         "Value": "Accounting"
      },
      {
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListUserTags in AWS CLI Command Reference.

**list-users**

The following code example shows how to use list-users.

**AWS CLI**

To list IAM users

The following list-users command lists the IAM users in the current account.

```
aws iam list-users
```

Output:

```
{
  "Users": [
    {
      "UserName": "Adele",
      "Path": "/",
      "CreateDate": "2013-03-07T05:14:48Z",
      "UserId": "AKIAI44QH8DHBEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Adele"
    },
    {
      "UserName": "Bob",

      "UserId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
  ]
}
```
For more information, see Listing IAM users in the AWS IAM User Guide.

- For API details, see ListUsers in AWS CLI Command Reference.

list-virtual-mfa-devices

The following code example shows how to use list-virtual-mfa-devices.

AWS CLI

To list virtual MFA devices

The following list-virtual-mfa-devices command lists the virtual MFA devices that have been configured for the current account.

aws iam list-virtual-mfa-devices

Output:

```
{
    "VirtualMFADevices": [ 
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see ListVirtualMfaDevices in AWS CLI Command Reference.

put-group-policy

The following code example shows how to use put-group-policy.

AWS CLI

To add a policy to a group
The following `put-group-policy` command adds a policy to the IAM group named Admins.

```bash
aws iam put-group-policy \
  --group-name Admins \
  --policy-document file://AdminPolicy.json \
  --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see PutGroupPolicy in AWS CLI Command Reference.

**put-role-permissions-boundary**

The following code example shows how to use `put-role-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM role**

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
  --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
  --role-name lambda-application-role
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role**

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
  --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess
```
This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_manage.html) in the *AWS IAM User Guide*.

- For API details, see [PutRolePermissionsBoundary](https://docs.aws.amazon.com/cli/latest/reference/iam/put-role-permissions-boundary.html) in *AWS CLI Command Reference*.

---

**put-role-policy**

The following code example shows how to use `put-role-policy`.

**AWS CLI**

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named Test-Role.

```bash
aws iam put-role-policy \\
  --role-name Test-Role \\
  --policy-name ExamplePolicy \\
  --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_manage.html) in the *AWS IAM User Guide*.

- For API details, see [PutRolePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/put-role-policy.html) in *AWS CLI Command Reference*.

---

**put-user-permissions-boundary**

The following code example shows how to use `put-user-permissions-boundary`.

**AWS CLI**

Example 1: To apply a permissions boundary based on a custom policy to an IAM user
The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
   --user-name intern
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user**

The following `put-user-permissions-boundary` example applies the AWS managed policy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
   --user-name developer
```

This command produces no output.

For more information, see [Adding and removing IAM identity permissions](https://docs.aws.amazon.com/IAM/latest/UserGuide/idPermissionsOverview.html) in the *AWS IAM User Guide*.

- For API details, see [PutUserPermissionsBoundary](https://docs.aws.amazon.com/cli/latest/reference/iam/put-user-permissions-boundary.html) in *AWS CLI Command Reference*.

**put-user-policy**

The following code example shows how to use `put-user-policy`.

**AWS CLI**

**To attach a policy to an IAM user**

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
   --user-name Bob \
   --policy-name ExamplePolicy \
   --policy-document file://AdminPolicy.json
```

This command produces no output.
The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see [Adding and removing IAM identity permissions](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [PutUserPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/put-user-policy.html) in *AWS CLI Command Reference*.

### remove-client-id-from-open-id-connect-provider

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

**AWS CLI**

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
    --client-id My-TestApp-3 \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [RemoveClientIdFromOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/remove-client-id-from-open-id-connect-provider.html) in *AWS CLI Command Reference*.

### remove-role-from-instance-profile

The following code example shows how to use `remove-role-from-instance-profile`.

**AWS CLI**

To remove a role from an instance profile

```
aws iam remove-role-from-instance-profile
    --instance-profile-name my-instance-profile \
    --role-name My-Roll
```
The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see [Using instance profiles](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_use.html) in the AWS IAM User Guide.

- For API details, see [RemoveRoleFromInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/remove-role-from-instance-profile.html) in AWS CLI Command Reference.

### remove-user-from-group

The following code example shows how to use `remove-user-from-group`.

**AWS CLI**

**To remove a user from an IAM group**

The following `remove-user-from-group` command removes the user named `Bob` from the IAM group named `Admins`.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see [Adding and removing users in an IAM user group](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_add_remove.html) in the AWS IAM User Guide.

- For API details, see [RemoveUserFromGroup](https://docs.aws.amazon.com/cli/latest/reference/iam/remove-user-from-group.html) in AWS CLI Command Reference.

### reset-service-specific-credential

The following code example shows how to use `reset-service-specific-credential`.

**AWS CLI**

**Example 1: Reset the password for a service-specific credential attached to the user making the request**

...
The following reset-service-specific-credential example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```bash
aws iam reset-service-specific-credential \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```json
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcQzGcK0ayTmE3LnAmAmH4=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

Example 2: Reset the password for a service-specific credential attached to a specified user

The following reset-service-specific-credential example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```bash
aws iam reset-service-specific-credential \
   --user-name sofia \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```json
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcQzGcK0ayTmE3LnAmAmH4=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
```
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ResetServiceSpecificCredential in AWS CLI Command Reference.

resync-mfa-device

The following code example shows how to use resync-mfa-device.

AWS CLI

To synchronize an MFA device

The following resync-mfa-device example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is arn:aws:iam::123456789012:mfa/BobsMFADevice with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
  --authentication-code1 123456 \
  --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see ResyncMfaDevice in AWS CLI Command Reference.

set-default-policy-version

The following code example shows how to use set-default-policy-version.

AWS CLI

To set the specified version of the specified policy as the policy's default version.
This example sets the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy as the default active version.

```
aws iam set-default-policy-version \
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
  --version-id v2
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
- For API details, see SetDefaultPolicyVersion in AWS CLI Command Reference.

**set-security-token-service-preferences**

The following code example shows how to use set-security-token-service-preferences.

**AWS CLI**

**To set the global endpoint token version**

The following set-security-token-service-preferences example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```
aws iam set-security-token-service-preferences \
  --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see Managing AWS STS in an AWS Region in the AWS IAM User Guide.
- For API details, see SetSecurityTokenServicePreferences in AWS CLI Command Reference.

**simulate-custom-policy**

The following code example shows how to use simulate-custom-policy.

**AWS CLI**

**Example 1: To simulate the effects of all IAM policies associated with an IAM user or role**

The following simulate-custom-policy shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation
succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```bash
aws iam simulate-custom-policy \
  --policy-input-list '{"Version": "2012-10-17", "Statement": 
  {"Effect": "Allow", "Action": "dynamodb:*", "Resource": ",", "Condition": 
    {"DateGreaterThan": {"aws:CurrentTime": "2018-08-16T12:00:00Z"}}}}' \
  --action-names dynamodb:CreateBackup \
  --context-entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```json
{
  "EvaluationResults": [
    {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [
        {
          "SourcePolicyId": "PolicyInputList.1",
          "StartPosition": {
            "Line": 1,
            "Column": 38
          },
          "EndPosition": {
            "Line": 1,
            "Column": 167
          }
        }
      ],
      "MissingContextValues": []
    }
  ]
}
```

**Example 2: To simulate a command that is prohibited by the policy**

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.
aws iam simulate-custom-policy \
     --policy-input-list '{"Version":"2012-10-17","Statement":
     {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
     {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}' \
     --action-names dynamodb:CreateBackup \
     --context-entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=",ContextKeyName=",ContextKeyValues=",ContextKeyType=",

Output:

{
   "EvaluationResults": [
   {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "implicitDeny",
      "MatchedStatements": [],
      "MissingContextValues": []
   }
   ]
}

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.

- For API details, see SimulateCustomPolicy in AWS CLI Command Reference.

**simulate-principal-policy**

The following code example shows how to use simulate-principal-policy.

**AWS CLI**

**Example 1: To simulate the effects of an arbitrary IAM policy**

The following simulate-principal-policy shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the codecommit:ListRepositories action.

```
aws iam simulate-principal-policy \
```
Example 2: To simulate the effects of a prohibited command

The following simulate-custom-policy example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an \texttt{aws:CurrentTime} value that is earlier than the policy's condition permits.

```bash
aws iam simulate-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
   --action-names dynamodb:CreateBackup \
   --context-entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKey..."
```
Output:

```
{
   "EvaluationResults": [
   {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "implicitDeny",
      "MatchedStatements": [],
      "MissingContextValues": []
   }
   ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.

- For API details, see SimulatePrincipalPolicy in AWS CLI Command Reference.

**tag-instance-profile**

The following code example shows how to use tag-instance-profile.

**AWS CLI**

**To add a tag to an instance profile**

The following tag-instance-profile command adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
   --instance-profile-name deployment-role \
   --tags '[["Key": "Department", "Value": "Accounting"]]
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagInstanceProfile in AWS CLI Command Reference.

**tag-mfa-device**

The following code example shows how to use tag-mfa-device.
AWS CLI

To add a tag to an MFA device

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \
  --serial-number arn:aws:iam::123456789012:mfa/alice \
  --tags '[["Key": "Department", "Value": "Accounting"]]
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
- For API details, see TagMfaDevice in AWS CLI Command Reference.

tag-open-id-connect-provider

The following code example shows how to use `tag-open-id-connect-provider`.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
  --tags '[["Key": "Department", "Value": "Accounting"]]
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
- For API details, see TagOpenIdConnectProvider in AWS CLI Command Reference.

tag-policy

The following code example shows how to use `tag-policy`.
To add a tag to a customer managed policy

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```
aws iam tag-policy
   --policy-arn arn:aws:iam::123456789012:policy/billing-access
   --tags 
      

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

• For API details, see TagPolicy in AWS CLI Command Reference.

tag-role

The following code example shows how to use `tag-role`.

AWS CLI

To add a tag to a role

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role
   --tags 

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

• For API details, see TagRole in AWS CLI Command Reference.

tag-saml-provider

The following code example shows how to use `tag-saml-provider`.

AWS CLI

To add a tag to a SAML provider
The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tags '[]
        "Key": "Department", "Value": "Accounting"
          ']'
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagSamlProvider in AWS CLI Command Reference.

**tag-server-certificate**

The following code example shows how to use `tag-server-certificate`.

**AWS CLI**

**To add a tag to a server certificate**

The following `tag-saml-provider` command adds a tag with a Department name to the specified server certificate.

```
aws iam tag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tags '[]
        "Key": "Department", "Value": "Accounting"
          ']'
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagServerCertificate in AWS CLI Command Reference.

**tag-user**

The following code example shows how to use `tag-user`.

**AWS CLI**

**To add a tag to a user**
The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
  --user-name alice \
  --tags '{"Key": "Department", "Value": "Accounting"}''
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [TagUser](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-user.html) in *AWS CLI Command Reference*.

---

**untag-instance-profile**

The following code example shows how to use `untag-instance-profile`.

**AWS CLI**

**To remove a tag from an instance profile**

The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-instance-profile \
  --instance-profile-name deployment-role \
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [UntagInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-instance-profile.html) in *AWS CLI Command Reference*.

---

**untag-mfa-device**

The following code example shows how to use `untag-mfa-device`.

**AWS CLI**

**To remove a tag from an MFA device**
The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```bash
aws iam untag-mfa-device \
  --serial-number arn:aws:iam::123456789012:mfa/alice \
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [UntagMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-mfa-device.html) in *AWS CLI Command Reference*.

`untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

**AWS CLI**

**To remove a tag from an OIDC identity provider**

The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```bash
aws iam untag-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [UntagOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-open-id-connect-provider.html) in *AWS CLI Command Reference*.

`untag-policy`

The following code example shows how to use `untag-policy`.

**AWS CLI**

**To remove a tag from a customer managed policy**
The following untag-policy command removes any tag with the key name 'Department' from the specified customer managed policy.

```bash
aws iam untag-policy \
    --policy-arn arn:aws:iam::452925170507:policy/billing-access \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagPolicy in AWS CLI Command Reference.

untag-role

The following code example shows how to use untag-role.

**AWS CLI**

**To remove a tag from a role**

The following untag-role command removes any tag with the key name 'Department' from the specified role.

```bash
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagRole in AWS CLI Command Reference.

untag-saml-provider

The following code example shows how to use untag-saml-provider.

**AWS CLI**

**To remove a tag from a SAML provider**
The following `untag-saml-provider` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-saml-provider \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
   --tag-keys Department
```

This command produces no output.

For more information, see `Tagging IAM resources` in the *AWS IAM User Guide*.
- For API details, see `UntagSamlProvider` in *AWS CLI Command Reference*.

**untag-server-certificate**

The following code example shows how to use `untag-server-certificate`.

**AWS CLI**

**To remove a tag from a server certificate**

The following `untag-server-certificate` command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
   --server-certificate-name ExampleCertificate \
   --tag-keys Department
```

This command produces no output.

For more information, see `Tagging IAM resources` in the *AWS IAM User Guide*.
- For API details, see `UntagServerCertificate` in *AWS CLI Command Reference*.

**untag-user**

The following code example shows how to use `untag-user`.

**AWS CLI**

**To remove a tag from a user**
The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```bash
aws iam untag-user \
   --user-name alice \
   --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagUser](#) in *AWS CLI Command Reference*.

### update-access-key

The following code example shows how to use `update-access-key`.

**AWS CLI**

**To activate or deactivate an access key for an IAM user**

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```bash
aws iam update-access-key \
   --access-key-id AKIAIOSFODNN7EXAMPLE \
   --status Inactive \
   --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateAccessKey](#) in *AWS CLI Command Reference*.

### update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

Actions and scenarios
AWS CLI

To set or change the current account password policy

The following update-account-password-policy command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```bash
aws iam update-account-password-policy
   --minimum-password-length 8
   --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see UpdateAccountPasswordPolicy in AWS CLI Command Reference.

update-assume-role-policy

The following code example shows how to use update-assume-role-policy.

AWS CLI

To update the trust policy for an IAM role

The following update-assume-role-policy command updates the trust policy for the role named Test-Role.

```bash
aws iam update-assume-role-policy
   --role-name Test-Role
   --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the Test-Role-Trust-Policy.json file. (The file name and extension do not have significance.) The trust policy must specify a principal.
To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](#) in the [AWS IAM User Guide](#).

- For API details, see [UpdateAssumeRolePolicy](#) in [AWS CLI Command Reference](#).

**update-group**

The following code example shows how to use `update-group`.

**AWS CLI**

**To rename an IAM group**

The following `update-group` command changes the name of the IAM group Test to Test-1.

```
aws iam update-group \
  --group-name Test \
  --new-group-name Test-1
```

This command produces no output.

For more information, see [Renaming an IAM user group](#) in the [AWS IAM User Guide](#).

- For API details, see [UpdateGroup](#) in [AWS CLI Command Reference](#).

**update-login-profile**

The following code example shows how to use `update-login-profile`.

**AWS CLI**

**To update the password for an IAM user**

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
  --user-name Bob \
  --password <password>
```
This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see [Managing passwords for IAM users](#) in the [AWS IAM User Guide](#).

- For API details, see [UpdateLoginProfile](#) in [AWS CLI Command Reference](#).

### update-open-id-connect-provider-thumbprint

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

#### AWS CLI

**To replace the existing list of server certificate thumbprints with a new list**

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```bash
aws iam update-open-id-connect-provider-thumbprint \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com \
  --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see [Creating OpenID Connect (OIDC) identity providers](#) in the [AWS IAM User Guide](#).

- For API details, see [UpdateOpenIdConnectProviderThumbprint](#) in [AWS CLI Command Reference](#).
**update-role-description**

The following code example shows how to use `update-role-description`.

**AWS CLI**

**To change an IAM role's description**

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
   --role-name production-role \
   --description 'Main production role'
```

Output:

```
{
   "Role": {
       "Path": "/",
       "RoleName": "production-role",
       "RoleId": "AROA1234567890EXAMPLE",
       "Arn": "arn:aws:iam::123456789012:role/production-role",
       "CreateDate": "2017-12-06T17:16:37+00:00",
       "AssumeRolePolicyDocument": {
           "Version": "2012-10-17",
           "Statement": [
               {
                   "Effect": "Allow",
                   "Principal": {
                       "AWS": "arn:aws:iam::123456789012:root"
                   },
                   "Action": "sts:AssumeRole",
                   "Condition": {}
               }
           ]
       },
       "Description": "Main production role"
   }
}
```

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/idelman-modify-role.html) in the *AWS IAM User Guide*. 
update-role

The following code example shows how to use update-role.

AWS CLI

To change an IAM role's description or session duration

The following update-role command changes the description of the IAM role production-role to Main production role and sets the maximum session duration to 12 hours.

```bash
aws iam update-role \
   --role-name production-role \
   --description 'Main production role' \
   --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

update-saml-provider

The following code example shows how to use update-saml-provider.

AWS CLI

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is arn:aws:iam::123456789012:saml-provider/SAMLADFS with a new SAML metadata document from the file SAMLMetaData.xml.

```bash
aws iam update-saml-provider \
   --saml-metadata-document file://SAMLMetaData.xml \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:
For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.
- For API details, see UpdateSamlProvider in AWS CLI Command Reference.

update-server-certificate

The following code example shows how to use update-server-certificate.

AWS CLI

To change the path or name of a server certificate in your AWS account

The following update-server-certificate command changes the name of the certificate from myServerCertificate to myUpdatedServerCertificate. It also changes the path to /cloudfront/ so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the list-server-certificates command.

```
aws-iam update-server-certificate \
   --server-certificate-name myServerCertificate \
   --new-server-certificate-name myUpdatedServerCertificate \
   --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.
- For API details, see UpdateServerCertificate in AWS CLI Command Reference.

update-service-specific-credential

The following code example shows how to use update-service-specific-credential.

AWS CLI

Example 1: To update the status of the requesting user's service-specific credential
The following update-service-specific-credential example changes the status for the specified credential for the user making the request to Inactive.

```bash
aws iam update-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \ 
    --status Inactive
```

This command produces no output.

**Example 2: To update the status of a specified user's service-specific credential**

The following update-service-specific-credential example changes the status for the credential of the specified user to Inactive.

```bash
aws iam update-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \ 
    --status Inactive
```

This command produces no output.

For more information, see [Create Git Credentials for HTTPS Connections to CodeCommit](https://docs.aws.amazon.com/AWSCodeCommit/latest/userguide/create-github-credentials.html) in the *AWS CodeCommit User Guide*.

- For API details, see [UpdateServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/update-service-specific-credential.html) in *AWS CLI Command Reference*.

**update-signing-certificate**

The following code example shows how to use update-signing-certificate.

**AWS CLI**

**To activate or deactivate a signing certificate for an IAM user**

The following update-signing-certificate command deactivates the specified signing certificate for the IAM user named Bob.

```bash
aws iam update-signing-certificate \
    --certificate-id TA7 SMP42TDN5Z260BPJE7EXAMPLE \ 
    --status Inactive \ 
    --user-name Bob
```
To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see `UpdateSigningCertificate` in AWS CLI Command Reference.

**update-ssh-public-key**

The following code example shows how to use `update-ssh-public-key`.

**AWS CLI**

To change the status of an SSH public key

The following `update-ssh-public-key` command changes the status of the specified public key to Inactive.

```
aws iam update-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA1234567890EXAMPLE \
  --status Inactive
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see `UpdateSshPublicKey` in AWS CLI Command Reference.

**update-user**

The following code example shows how to use `update-user`.

**AWS CLI**

To change an IAM user's name

The following `update-user` command changes the name of the IAM user Bob to Robert.

```
aws iam update-user \
  --user-name Bob \
  --new-user-name Robert
```

This command produces no output.
For more information, see Renaming an IAM user group in the AWS IAM User Guide.

- For API details, see UpdateUser in AWS CLI Command Reference.

upload-server-certificate

The following code example shows how to use upload-server-certificate.

AWS CLI

To upload a server certificate to your AWS account

The following upload-server-certificate command uploads a server certificate to your AWS account. In this example, the certificate is in the file public_key_cert_file.pem, the associated private key is in the file my_private_key.pem, and the the certificate chain provided by the certificate authority (CA) is in the my_certificate_chain_file.pem file. When the file has finished uploading, it is available under the name myServerCertificate. Parameters that begin with file:// tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
  --server-certificate-name myServerCertificate \
  --certificate-body file://public_key_cert_file.pem \
  --private-key file://my_private_key.pem \
  --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the Using IAM guide.
• For API details, see UploadServerCertificate in AWS CLI Command Reference.

**upload-signing-certificate**

The following code example shows how to use upload-signing-certificate.

**AWS CLI**

To upload a signing certificate for an IAM user

The following upload-signing-certificate command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN52G6OBPJE7EXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named `certificate.pem` in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the Using IAM guide.

• For API details, see UploadSigningCertificate in AWS CLI Command Reference.

**upload-ssh-public-key**

The following code example shows how to use upload-ssh-public-key.
AWS CLI

To upload an SSH public key and associate it with a user

The following upload-ssh-public-key command uploads the public key found in the file sshkey.pub and attaches it to the user sofia.

```
aws iam upload-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-body file://sshkey.pub
```

Output:

```
{
  "SSHPublicKey": {
    "UserName": "sofia",
    "SSHPublicKeyId": "APKA1234567890EXAMPLE",
    "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen command>>",
    "Status": "Active",
    "UploadDate": "2019-04-18T17:04:49+00:00"
  }
}
```

For more information about how to generate keys in a format suitable for this command, see [SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit](https://docs.aws.amazon.com/AWSCore/latest/APIReference/API_UploadSshPublicKey.html) or [SSH and Windows: Set up the public and private keys for Git and CodeCommit](https://docs.aws.amazon.com/AWSCore/latest/APIReference/API_UploadSshPublicKey.html) in the [AWS CodeCommit User Guide](https://docs.aws.amazon.com/AWSCore/latest/APIReference/API_UploadSshPublicKey.html).

- For API details, see [UploadSshPublicKey](https://docs.aws.amazon.com/AWSCore/latest/APIReference/API_UploadSshPublicKey.html) in *AWS CLI Command Reference*.

**IAM Access Analyzer examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

apply-archive-rule

The following code example shows how to use apply-archive-rule.

AWS CLI

To apply an archive rule to existing findings that meet the archive rule criteria

The following apply-archive-rule example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \
  --rule-name MyArchiveRule
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see ApplyArchiveRule in AWS CLI Command Reference.

cancel-policy-generation

The following code example shows how to use cancel-policy-generation.

AWS CLI

To cancel the requested policy generation
The following `cancel-policy-generation` example cancels the requested policy generation job id.

```bash
aws accessanalyzer cancel-policy-generation \
  --job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbd6f2
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see `CancelPolicyGeneration` in AWS CLI Command Reference.

### check-access-not-granted

The following code example shows how to use `check-access-not-granted`.

**AWS CLI**

**To check whether the specified access isn't allowed by a policy**

The following `check-access-not-granted` example checks whether the specified access isn't allowed by a policy.

```bash
aws accessanalyzer check-access-not-granted \
  --policy-document file://myfile.json \
  --access actions="s3:DeleteBucket","s3:GetBucketLocation" \
  --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:ListBucket"
      ],
      "Resource": [
        "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
```
"arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
]
}
]
}

Output:

{
   "result": "PASS",
   "message": "The policy document does not grant access to perform the listed actions."
}

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CheckAccessNotGranted in AWS CLI Command Reference.

check-no-new-access

The following code example shows how to use check-no-new-access.

AWS CLI

To check whether new access is allowed for an updated policy when compared to the existing policy

The following check-no-new-access example checks whether new access is allowed for an updated policy when compared to the existing policy.

```bash
aws accessanalyzer check-no-new-access \
   --existing-policy-document file://existing-policy.json \
   --new-policy-document file://new-policy.json \
   --policy-type IDENTITY_POLICY
```

Contents of existing-policy.json:

```json
{
   "Version": "2012-10-17",
   "Statement": [
```
Contents of `new-policy.json`:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:GetObjectAcl",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
            ]
        }
    ]
}
```

Output:

```json
{
    "result": "FAIL",
    "message": "The modified permissions grant new access compared to your existing policy.",
    "reasons": [
        {
            "description": "New access in the statement with index: 0."
        }
    ]
}
```
For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CheckNoNewAccess in AWS CLI Command Reference.

create-access-preview

The following code example shows how to use create-access-preview.

AWS CLI

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following create-access-preview example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```bash
aws accessanalyzer create-access-preview \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --configurations file://myfile.json
```

Contents of `myfile.json`:

```json
{
  "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
    "s3Bucket": {
      "bucketPublicAccessBlock": {
        "ignorePublicAcls": true,
        "restrictPublicBuckets": true
      },
      "bucketAclGrants": [ }```
{ "grantee": {  "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be",  "permission": "READ" } }}

Output:

{ "id": "3c65eb13-6ef9-4629-8919-a32043619e6b" }

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CreateAccessPreview in AWS CLI Command Reference.

create-analyzer

The following code example shows how to use create-analyzer.

AWS CLI

To create an analyzer

The following create-analyzer example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
  --analyzer-name example \
  --type ACCOUNT
```

Output:

```
{ "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example" }
```
For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the AWS IAM User Guide.

- For API details, see CreateAnalyzer in AWS CLI Command Reference.

create-archive-rule

The following code example shows how to use create-archive-rule.

AWS CLI

To create an archive rule for the specified analyzer

The following create-archive-rule example creates an archive rule for the specified analyzer in your AWS account.

```bash
aws accessanalyzer create-archive-rule \
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyRule \
  --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see CreateArchiveRule in AWS CLI Command Reference.

delete-analyzer

The following code example shows how to use delete-analyzer.

AWS CLI

To delete the specified analyzer

The following delete-analyzer example deletes the specified analyzer in your AWS account.

```bash
aws accessanalyzer delete-analyzer \
  --analyzer-name example
```
This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteAnalyzer in AWS CLI Command Reference.

**delete-archive-rule**

The following code example shows how to use delete-archive-rule.

**AWS CLI**

To delete the specified archive rule

The following delete-archive-rule example deletes the specified archive rule in your AWS account.

```bash
aws accessanalyzer delete-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteArchiveRule in AWS CLI Command Reference.

**get-access-preview**

The following code example shows how to use get-access-preview.

**AWS CLI**

To retrieves information about an access preview for the specified analyzer

The following get-access-preview example retrieves information about an access preview for the specified analyzer in your AWS account.

```bash
aws accessanalyzer get-access-preview \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```
Output:

```
{
    "accessPreview": {
        "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
                        ConsoleAnalyzer-account",
        "configurations": {
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
                "s3Bucket": {
                },
                "bucketAclGrants": [
                    {
                        "permission": "READ",
                        "grantee": {
                            "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                        }
                    }
                ],
                "bucketPublicAccessBlock": {
                    "ignorePublicAcls": true,
                    "restrictPublicBuckets": true
                }
            }
        }
    },
    "createdAt": "2024-02-17T00:18:44+00:00",
    "status": "COMPLETED"
}
```

For more information, see [Previewing access with IAM Access Analyzer APIs](https://docs.aws.amazon.com/iam/latest/userguide/previewing-access-analyzer-apis.html) in the *AWS IAM User Guide*.

- For API details, see [GetAccessPreview](https://docs.aws.amazon.com/cli/latest/reference/access-analyzer/get-access-preview.html) in *AWS CLI Command Reference*.

**get-analyzed-resource**

The following code example shows how to use `get-analyzed-resource`. 

```bash
get-analyzed-resource
```
AWS CLI

To retrieve information about a resource that was analyzed

The following get-analyzed-resource example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --resource-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET
```

Output:

```
{
  "resource": {
    "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
    "isPublic": false,
    "resourceArn": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
    "resourceOwnerAccount": "111122223333",
    "resourceType": "AWS::S3::Bucket"
  }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see GetAnalyzedResource in AWS CLI Command Reference.

---

get-analyzer

The following code example shows how to use get-analyzer.

AWS CLI

To retrieve information about the specified analyzer

The following get-analyzer example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \
  --analyzer-name ConsoleAnalyzer-account
```
For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the [AWS IAM User Guide](#).

- For API details, see [GetAnalyzer](#) in [AWS CLI Command Reference](#).

### get-archive-rule

The following code example shows how to use `get-archive-rule`.

**AWS CLI**

**To retrieve information about an archive rule**

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```bash
aws accessanalyzer get-archive-rule \
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyArchiveRule
```

**Output:**

```json
{
  
}
```
The following code example shows how to use `get-finding-v2`.

**AWS CLI**

To retrieve information about the specified finding

The following `get-finding-v2` example retrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding-v2 \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-organization \
   --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
}
```
"findingDetails": [
  {
    "externalAccessDetails": {
      "action": [
        "sts:AssumeRoleWithWebIdentity"
      ],
      "condition": {
        "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
      },
      "isPublic": false,
      "principal": {
        "Federated": "cognito-identity.amazonaws.com"
      }
    }
  }
],
"resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",

"updatedAt": "2021-02-26T21:17:50.905000+00:00"
}

For more information, seeReviewing findings in the AWS IAM User Guide.

- For API details, seeGetFindingV2 in AWS CLI Command Reference.

get-finding

The following code example shows how to use get-finding.

AWS CLI

To retrieve information about the specified finding

The following get-finding example etrives information about the specified finding in your AWS account.
aws accessanalyzer get-finding \
   ConsoleAnalyzer-organization \
   --id 0910eedb-381e-4e95-adda-0d25c19e6e90

Output:

```
{
    "finding": {
        "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
        "principal": {
            "Federated": "cognito-identity.amazonaws.com"
        },
        "action": ["sts:AssumeRoleWithWebIdentity"],
        "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
        "isPublic": false,
        "resourceType": "AWS::IAM::Role",
        "condition": {
            "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
        },
        "createdAt": "2021-02-26T21:17:50.905000+00:00",
        "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
        "updatedAt": "2021-02-26T21:17:50.905000+00:00",
        "status": "ACTIVE",
        "resourceOwnerAccount": "111122223333"
    }
}
```

For more information, see [Reviewing findings](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_access-keys.html) in the *AWS IAM User Guide*.

- For API details, see [GetFinding](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/get-finding.html) in *AWS CLI Command Reference*.

**get-generated-policy**

The following code example shows how to use get-generated-policy.

**AWS CLI**

To retrieve the policy that was generated using the `StartPolicyGeneration` API
The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```bash
aws accessanalyzer get-generated-policy \
  --job-id c557dc4a-0338-4489-95dd-739014860ff9
```

Output:

```json
{
  "generatedPolicyResult": {
    "generatedPolicies": [
      {
      }
    ],
    "properties": {
      "cloudTrailProperties": {
        "endTime": "2024-02-14T22:44:40+00:00",
        "startTime": "2024-02-13T00:30:00+00:00",
        "trailProperties": [
          {
            "allRegions": true,
            "regions": []
          }
        ]
      },
      "isComplete": false,
      "principalArn": "arn:aws:iam::111122223333:role/Admin"
    }
  }
}
```

### list-access-preview-findings

The following code example shows how to use `list-access-preview-findings`.

#### AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following `list-access-preview-findings` example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```bash
aws accessanalyzer list-access-preview-findings \
  --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```

Output:

```json
{
  "findings": [
    {
      "id": "e22fc158-1c87-4c32-9464-e7f405ce8d74",
      "principal": {
        "AWS": "111122223333"
      },
      "action": [
        "s3:PutObject",
        "s3:PutObjectAcl"
      ]
    }
  ]
}
```
For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see ListAccessPreviewFindings in AWS CLI Command Reference.

list-access-previews

The following code example shows how to use list-access-previews.

AWS CLI

To retrieve a list of access previews for the specified analyzer

The following list-access-previews example retrieves a list of access previews for the specified analyzer in your AWS account.

```
aws accessanalyzer list-access-previews \
```

Output:

```
{
   "accessPreviews": [
}
```
For more information, see [Previewing access with IAM Access Analyzer APIs](guide) in the AWS IAM User Guide.

- For API details, see [ListAccessPreviews](reference) in AWS CLI Command Reference.

### list-analyzed-resources

The following code example shows how to use list-analyzed-resources.

**AWS CLI**

**To list the available widgets**

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```
aws accessanalyzer list-analyzed-resources \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --resource-type AWS::IAM::Role
```

Output:

```
{
  "analyzedResources": [
    {
      "resourceArn": "arn:aws:sns:us-west-2:111122223333:Validation-Email",
      "resourceOwnerAccount": "111122223333",
      "resourceType": "AWS::SNS::Topic"
    },
    {
      "resourceOwnerAccount": "111122223333",
```

### list-analyzers

The following code example shows how to use `list-analyzers`.

**AWS CLI**

To retrieve a list of analyzers

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```bash
aws accessanalyzer list-analyzers
```

Output:

```json
{
   "analyzers": [
      {
         "createdAt": "2024-02-15T00:46:40+00:00",
         "name": "UnusedAccess-ConsoleAnalyzer-organization",
         "status": "ACTIVE",
      }
   ]
}
```
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListAnalyzers in AWS CLI Command Reference.

**list-archive-rules**

The following code example shows how to use list-archive-rules.
AWS CLI

To retrieve a list of archive rules created for the specified analyzer

The following list-archive-rules example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```bash
aws accessanalyzer list-archive-rules \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```json
{
   "archiveRules": [
      {
         "createdAt": "2024-02-15T00:49:27+00:00",
         "filter": {
            "resource": {
               "contains": [
                  "Cognito"
               ],
            },
            "resourceType": {
               "eq": [
                  "AWS::IAM::Role"
               ]
            }
         },
         "ruleName": "MyArchiveRule",
         "updatedAt": "2024-02-15T00:49:27+00:00"
      },
      {
         "createdAt": "2024-02-15T23:27:45+00:00",
         "filter": {
            "findingType": {
               "eq": [
                  "UnusedIAMUserAccessKey"
               ]
            }
         },
         "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",
         "updatedAt": "2024-02-15T23:27:45+00:00"
      }
   ]
}
```
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListArchiveRules in AWS CLI Command Reference.

**list-findings-v2**

The following code example shows how to use list-findings-v2.

**AWS CLI**

**To retrieve a list of findings generated by the specified analyzer**

The following list-findings-v2 example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```
aws accessanalyzer list-findings-v2 \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

**Output:**

```
{
   "findings": [
      {
         "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
         "createdAt": "2021-02-26T21:17:24.710000+00:00",
         "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
         "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolUnauth_Role",
         "resourceType": "AWS::IAM::Role",
         "resourceOwnerAccount": "111122223333",
         "status": "ACTIVE",
         "updatedAt": "2021-02-26T21:17:24.710000+00:00",
         "findingType": "ExternalAccess"
      },
   ]
}
```

- For API details, see [ListFindingsV2](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/list-findings.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/list-findings.html).

### list-findings

The following code example shows how to use `list-findings`.

#### AWS CLI

**To retrieve a list of findings generated by the specified analyzer**

The following `list-findings` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```bash
aws accessanalyzer list-findings \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

**Output:**

```json
{
    "findings": [

    
```
"id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
"principal": {
    "Federated": "cognito-identity.amazonaws.com"
},
"action": [
    "sts:AssumeRoleWithWebIdentity"
],
"resource": "arn:aws:iam::111122223333:role/Cognito_testpoolUnauth_Role",
"isPublic": false,
"resourceType": "AWS::IAM::Role",
"condition": {
    "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
},
"createdAt": "2021-02-26T21:17:24.710000+00:00",
"analyzedAt": "2024-02-16T18:17:47.888000+00:00",
"updatedAt": "2021-02-26T21:17:24.710000+00:00",
"status": "ACTIVE",
"resourceOwnerAccount": "111122223333"
},
{
"id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
"principal": {
    "Federated": "cognito-identity.amazonaws.com"
},
"action": [
    "sts:AssumeRoleWithWebIdentity"
],
"resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
"isPublic": false,
"resourceType": "AWS::IAM::Role",
"condition": {
    "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
},
"createdAt": "2021-02-26T21:17:50.905000+00:00",
"analyzedAt": "2024-02-16T18:17:47.888000+00:00",
"updatedAt": "2021-02-26T21:17:50.905000+00:00",
"status": "ACTIVE",
"resourceOwnerAccount": "111122223333"
}
]
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListFindings in AWS CLI Command Reference.

**list-policy-generations**

The following code example shows how to use list-policy-generations.

**AWS CLI**

**To list all of the policy generations requested in the last seven days**

The following list-policy-generations example lists all of the policy generations requested in the last seven days in your AWS account.

```bash
aws accessanalyzer list-policy-generations
```

Output:

```json
{
  "policyGenerations": [
    {
      "completedOn": "2024-02-14T23:43:38+00:00",
      "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbc6f2",
      "principalArn": "arn:aws:iam::111122223333:role/Admin",
      "startedOn": "2024-02-14T23:43:02+00:00",
      "status": "CANCELED"
    },
    {
      "completedOn": "2024-02-14T22:47:01+00:00",
      "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
      "principalArn": "arn:aws:iam::111122223333:role/Admin",
      "startedOn": "2024-02-14T22:44:41+00:00",
      "status": "SUCCEEDED"
    }
  ]
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To retrieve a list of tags applied to the specified resource

The following list-tags-for-resource example retrieves a list of tags applied to the specified resource in your AWS account.

```
aws accessanalyzer list-tags-for-resource \\
```

Output:

```
{
   "tags": {
      "Zone-of-trust": "Account",
      "Name": "ConsoleAnalyzer"
   }
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

• For API details, see ListTagsForResource in AWS CLI Command Reference.

start-policy-generation

The following code example shows how to use start-policy-generation.

AWS CLI

To start a policy generation request

The following start-policy-generation example starts a policy generation request in your AWS account.
aws accessanalyzer start-policy-generation \
  --policy-generation-details '{"principalArn": "arn:aws:iam::111122223333:role/Admin"}' \
  --cloud-trail-details file://myfile.json

Contents of myfile.json:

```json
{
   "accessRole": "arn:aws:iam::111122223333:role/service-role/AccessAnalyzerMonitorServiceRole",
   "startTime": "2024-02-13T00:30:00Z",
   "trails": [
      {
         "allRegions": true,
      }
   ]
}
```

Output:

```json
{
   "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}
```

For more information, see [IAM Access Analyzer policy generation](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_access-analyzer-policy-generation.html) in the *AWS IAM User Guide*.

- For API details, see [StartPolicyGeneration](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/start-policy-generation.html) in *AWS CLI Command Reference*.

**start-resource-scan**

The following code example shows how to use `start-resource-scan`.

**AWS CLI**

To immediately start a scan of the policies applied to the specified resource

The following `start-resource-scan` example immediately starts a scan of the policies applied to the specified resource in your AWS account.
aws accessanalyzer start-resource-scan \\ 
   --resource-arn arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.
- For API details, see StartResourceScan in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add a tag to the specified resource

The following tag-resource example adds a tag to the specified resource in your AWS account.

aws accessanalyzer tag-resource \\ 
   --tags Environment=dev,Purpose=testing

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.
- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from the specified resources
The following `untag-resource` example removes tags from the specified resource in your AWS account.

```bash
aws accessanalyzer untag-resource \
   --tag-keys Environment Purpose
```

This command produces no output.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/api/accessanalyzer/untag-resource.html) in [AWS CLI Command Reference](https).

**update-archive-rule**

The following code example shows how to use `update-archive-rule`.

**AWS CLI**

**To update the criteria and values for the specified archive rule**

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```bash
aws accessanalyzer update-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyArchiveRule \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

This command produces no output.

For more information, see [Archive rules](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-access-analyzer.html) in the [AWS IAM User Guide](https).

- For API details, see [UpdateArchiveRule](https://docs.aws.amazon.com/cli/latest/api/accessanalyzer/update-archive-rule.html) in [AWS CLI Command Reference](https).

**update-findings**

The following code example shows how to use `update-findings`.
AWS CLI

To update the status for the specified findings

The following update-findings example updates the status for the specified findings in your AWS account.

```bash
aws accessanalyzer update-findings \
  --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500 \
  --status ARCHIVED
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see UpdateFindings in AWS CLI Command Reference.

validate-policy

The following code example shows how to use validate-policy.

AWS CLI

To request the validation of a policy and returns a list of findings

The following validate-policy example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty Sid element value and a mismatched policy principal due to the incorrect assume role action being used, sts:AssumeRole. The correct assume role action for use with Cognito is sts:AssumeRoleWithWebIdentity.

```bash
aws accessanalyzer validate-policy \
  --policy-document file://myfile.json \
  --policy-type RESOURCE_POLICY
```

Contents of myfile.json:
```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "Action": [
                "sts:AssumeRole",
                "sts:TagSession"
            ],
            "Condition": {
                "StringEquals": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
                }
            }
        }
    ]
}

Output:
```
```json
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element."
        }
    ],
    "findingType": "SUGGESTION",
    "issueCode": "EMPTY_SID_VALUE",
    "locations": [
        {
            "path": [
                {
                    "value": "Statement"
                },
                {
                    "index": 0
                }
            ]
        }
    ]
}
```
The `sts:AssumeRole` action is invalid with the following principal(s): `cognito-identity.amazonaws.com`. Use a SAML provider principal with the `sts:AssumeRoleWithSAML` action or use an OIDC provider principal with the `sts:AssumeRoleWithWebIdentity` action. Ensure the provider is Federated if you use either of the two options.

- **Finding Details**: The `sts:AssumeRole` action is invalid with the following principal(s): `cognito-identity.amazonaws.com`. Use a SAML provider principal with the `sts:AssumeRoleWithSAML` action or use an OIDC provider principal with the `sts:AssumeRoleWithWebIdentity` action. Ensure the provider is Federated if you use either of the two options.

- **Finding Type**: ERROR

- **Issue Code**: MISMATCHED_ACTION_FOR_PRINCIPAL

Actions and scenarios
The following actions: sts:TagSession are not supported by the condition key cognito-identity.amazonaws.com:aud. The condition will not be evaluated for these actions. We recommend that you move these actions to a different statement without this condition key.
For more information, see [Checks for validating policies](#) in the [AWS IAM User Guide](#).

- For API details, see [ValidatePolicy](#) in [AWS CLI Command Reference](#).

### Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

create-component

The following code example shows how to use create-component.

AWS CLI

To create a component

The following create-component example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
    --cli-input-json file://create-component.json
```

Contents of create-component.json:

```json
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
    "changeDescription": "Initial version.",
    "platform": "Windows",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```json
{
```

### create-distribution-configuration

The following code example shows how to use `create-distribution-configuration`.

**AWS CLI**

**To create a distribution configuration**

The following `create-distribution-configuration` example creates a distribution configuration using a JSON file.

```bash
aws imagebuilder create-distribution-configuration \
  --cli-input-json file:/create-distribution-configuration.json
```

Contents of `create-distribution-configuration.json`:

```json
{
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references",
                "amiTags": {
                    "KeyName": "{{ssm:parameter_name}}"
                },
                "launchPermission": {
                    "userIds": ["123456789012"
```
Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
   "distributionConfigurationArn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-configuration/myexampledistribution"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateDistributionConfiguration in AWS CLI Command Reference.

create-image-pipeline

The following code example shows how to use create-image-pipeline.

AWS CLI

To create an image pipeline
The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```
aws imagebuilder create-image-pipeline \
   --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```
{
   "name": "MyWindows2016Pipeline",
   "description": "Builds Windows 2016 Images",
   "imageTestsConfiguration": {
      "imageTestsEnabled": true,
      "timeoutMinutes": 60
   },
   "schedule": {
      "scheduleExpression": "cron(0 0 * * SUN)",
      "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
   },
   "status": "ENABLED"
}
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImagePipeline in AWS CLI Command Reference.
create-image-recipe

The following code example shows how to use `create-image-recipe`.

**AWS CLI**

**To create a recipe**

The following `create-image-recipe` example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```bash
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

Contents of `create-image-recipe.json`:

```json
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components": [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-english-full-base-x86/xxxx.x.x"
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
create-image

The following code example shows how to use create-image.

**AWS CLI**

To create an image

The following create-image example creates an image.

```bash
aws imagebuilder create-image \
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImageRecipe in AWS CLI Command Reference.

create-infrastructure-configuration

The following code example shows how to use create-infrastructure-configuration.
AWS CLI

To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \\
   --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateInfrastructureConfiguration in AWS CLI Command Reference.

delete-component

The following code example shows how to use delete-component.

AWS CLI

To delete a component

The following delete-component example deletes a component build version by specifying its ARN.

```bash
aws imagebuilder delete-component \
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

delete-image-pipeline

The following code example shows how to use delete-image-pipeline.

AWS CLI

To delete an image pipeline
The following delete-image-pipeline example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \\
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImagePipeline in AWS CLI Command Reference.

**delete-image-recipe**

The following code example shows how to use delete-image-recipe.

**AWS CLI**

To delete an image recipe

The following delete-image-recipe example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \\
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImageRecipe in AWS CLI Command Reference.

delete-image

The following code example shows how to use delete-image.

AWS CLI

To delete an image

The following delete-image example deletes an image build version by specifying its ARN.

```bash
aws imagebuilder delete-image \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImage in AWS CLI Command Reference.

delete-infrastructure-configuration

The following code example shows how to use delete-infrastructure-configuration.

AWS CLI

To delete an infrastructure configuration

The following delete-infrastructure-configuration example deletes an image pipeline by specifying its ARN.
aws imagebuilder delete-infrastructure-configuration \

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteInfrastructureConfiguration in AWS CLI Command Reference.

get-component-policy

The following code example shows how to use get-component-policy.

AWS CLI

To get component policy details

The following get-component-policy example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \
   --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-component/2019.12.03/1
```

Output:

```
{
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI <https://docs.aws.amazon.com/imagebuilder/latest/userguide/managing-image-builder-cli.html> in the EC2 Image Builder Users Guide.

- For API details, see `GetComponentPolicy` in AWS CLI Command Reference.

**get-component**

The following code example shows how to use `get-component`.

**AWS CLI**

**To get component details**

The following `get-component` example lists the details of a component by specifying its ARN.

```
aws imagebuilder get-component \
--component-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "component": {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1",
      "name": "component-name",
      "version": "1.0.0",
      "type": "TEST",
      "platform": "Linux",
      "owner": "123456789012",
      "data": "name: HelloWorldTestingDocument
description: This is hello world testing document.
schemaVersion: 1.0
 phases:
  - name: test
    steps:
      - name: HelloWorldStep
        action: ExecuteBash
        inputs:
          commands:
            - echo "Hello World! Test."
        encrypted: true,
        dateCreated": "2020-01-27T20:43:30.306Z",
        tags": {}
   }
```
get-distribution-configuration

The following code example shows how to use get-distribution-configuration.

AWS CLI

To get the details of a distribution configuration

The following get-distribution-configuration example displays the details of a distribution configuration by specifying its ARN.

```bash
aws imagebuilder get-distribution-configuration \
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfiguration": {
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1 and exports to S3",
    "distributions": [
      {
        "region": "us-west-2",
        "amiDistributionConfiguration": {
          "name": "Name {{imagebuilder:buildDate}}",
          "description": "An example image name with parameter references",
          "amiTags": {
            "KeyName": "{{ssm:parameter_name}}"
          },
          "launchPermission": {
            "userIds": [
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetDistributionConfiguration in AWS CLI Command Reference.

**get-image-pipeline**

The following code example shows how to use `get-image-pipeline`.

**AWS CLI**

To get image pipeline details

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
```
Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imagePipeline": {
    "name": "MyWindows2016Pipeline",
    "description": "Builds Windows 2016 Images",
    "platform": "Windows",
    "imageTestsConfiguration": {
      "imageTestsEnabled": true,
      "timeoutMinutes": 60
    },
    "schedule": {
      "scheduleExpression": "cron(0 0 * * SUN)",
      "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "ENABLED",
    "dateCreated": "2020-02-19T19:04:01.253Z",
    "dateUpdated": "2020-02-19T19:04:01.253Z",
    "tags": {}
  }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/get-image-pipeline) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetImagePipeline](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/get-image-pipeline) in *AWS CLI Command Reference*.

### get-image-policy

The following code example shows how to use `get-image-policy`.
AWS CLI

To get image policy details

The following get-image-policy example lists the details of an image policy by specifying its ARN.

```shell
aws imagebuilder get-image-policy \
```

Output:

```json
{
   "Policy": "{
      "Version": "2012-10-17",
      "Statement": [
         {
            "Effect": "Allow",
            "Principal": { "AWS": [ "123456789012" ] },
            "Action": [ "imagebuilder:GetImage", "imagebuilder:ListImages" ],
         }
      ]
   }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImagePolicy in AWS CLI Command Reference.

get-image-recipe-policy

The following code example shows how to use get-image-recipe-policy.

AWS CLI

To get image recipe policy details

The following get-image-recipe-policy example lists the details of an image recipe policy by specifying its ARN.

```shell
aws imagebuilder get-image-recipe-policy \
```

Output:
```json
{
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImageRecipePolicy in AWS CLI Command Reference.

get-image

The following code example shows how to use get-image.

**AWS CLI**

**To get image details**

The following get-image example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "image": {
      "name": "MyBasicRecipe",
      "version": "2019.12.03/1",
      "platform": "Windows",
      "state": {
         "status": "BUILDING"
      }
   }
}
```
  "name": "MyBasicRecipe",
  "description": "This example image recipe creates a Windows 2016 image.",
  "platform": "Windows",
  "version": "2019.12.03",
  "components": [
    {
      "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
    },
    {
      "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
    }
  ],
  "dateCreated": "2020-02-14T19:46:16.904Z",
  "tags": {}},
"infrastructureConfiguration": {
  "name": "MyExampleInfrastructure",
  "description": "An example that will retain instances of failed builds",
  "instanceTypes": [
    "m5.large",
    "m5.xlarge"
  ],
  "instanceProfileName": "EC2InstanceProfileForImageFactory",
  "securityGroupIds": [
    "sg-a1b2c3d4"
  ],
  "subnetId": "subnet-a1b2c3d4",
  "logging": {
    "s3Logs": {
      "s3BucketName": "bucket-name",
      "s3KeyPrefix": "bucket-path"
    }
  },
  "keyPair": "Sam",
  "terminateInstanceOnFailure": false,
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImage in AWS CLI Command Reference.

get-infrastructure-configuration

The following code example shows how to use get-infrastructure-configuration.

AWS CLI

To get infrastructure configuration details

The following get-infrastructure-configuration example lists the details of an infrastructure configuration by specifying its ARN.

```bash
aws imagebuilder get-infrastructure-configuration \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfiguration": {
    }
}
```
"name": "MyExampleInfrastructure",
"description": "An example that will retain instances of failed builds",
"instanceTypes": [
    "m5.large",
    "m5.xlarge"
],
"instanceProfileName": "EC2InstanceProfileForImageBuilder",
"securityGroupIds": [
    "sg-a48c95ef"
],
"subnetId": "subnet-a48c95ef",
"logging": {
    "s3Logs": {
        "s3BucketName": "bucket-name",
        "s3KeyPrefix": "bucket-path"
    }
},
"keyPair": "Name",
"terminateInstanceOnFailure": false,
"dateCreated": "2020-02-19T19:11:51.858Z",
"tags": {}
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetInfrastructureConfiguration in AWS CLI Command Reference.

import-component

The following code example shows how to use import-component.

AWS CLI

To import a component

The following import-component example imports a preexisting script using a JSON file.

aws imagebuilder import-component \
  --cli-input-json file://import-component.json
Contents of import-component.json:

```
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ImportComponent in AWS CLI Command Reference.

**list-component-build-versions**

The following code example shows how to use list-component-build-versions.

**AWS CLI**

**To list component build versions**

The following list-component-build-versions example lists the component build versions with a specific semantic version.

```
```
Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentSummaryList": [
        {
            "name": "MyExampleComponent",
            "version": "2019.12.02",
            "platform": "Windows",
            "type": "BUILD",
            "owner": "123456789012",
            "description": "An example component that builds, validates and tests an image",
            "changeDescription": "Initial version.",
            "dateCreated": "2020-02-19T18:53:45.940Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/AmazonLinuxImageBuilder/latest/UserGuide/EC2-Image-Builders-CLI.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponentBuildVersions](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-component-build-versions.html) in *AWS CLI Command Reference*.

### list-components

The following code example shows how to use `list-components`.

#### AWS CLI

**To list all of the component semantic versions**

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```bash
aws imagebuilder list-components
```
Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0",
            "name": "component-name",
            "version": "1.0.0",
            "platform": "Linux",
            "type": "TEST",
            "owner": "123456789012",
            "dateCreated": "2020-01-27T20:43:30.306Z"
        }
    ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/EC2_ImageBuilder.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponents](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/imagebuilder/list-components.html) in *AWS CLI Command Reference*.

**list-distribution-configurations**

The following code example shows how to use `list-distribution-configurations`.

**AWS CLI**

**To list distributions**

The following `list-distribution-configurations` example lists all of your distributions.

```bash
aws imagebuilder list-distribution-configurations
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfigurationSummaryList": [
        {
```

Actions and scenarios 3600
For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EC2-image-builder-image-pipeline.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListDistributionConfigurations](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-distribution-configurations.html) in *AWS CLI Command Reference*.

### list-image-build-versions

The following code example shows how to use `list-image-build-versions`.

#### AWS CLI

**To list image build versions**

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```bash
aws imagebuilder list-image-build-versions \
```

**Output:**

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imageSummaryList": [
    {
      "name": "MyBasicRecipe",
      "version": "2019.12.03/7",
      "platform": "Windows",
      "state": {
        "status": "FAILED",
```

An internal error has occurred.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

For API details, see ListImageBuildVersions in AWS CLI Command Reference.

**list-image-pipeline-images**

The following code example shows how to use list-image-pipeline-images.

**AWS CLI**

**To list image pipeline pipeline images**

The following list-image-pipeline-images example lists all images that were created by a specific image pipeline.

```
aws imagebuilder list-image-pipeline-images \
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imagePipelineList": [
   
   
   ]
}

    "KeyName": "KeyValue"
  }
}
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImagePipelineImages in AWS CLI Command Reference.

**list-image-recipes**

The following code example shows how to use list-image-recipes.

**AWS CLI**

**To list image recipes**

The following list-image-recipes example lists all of your image recipes.

```
aws imagebuilder list-image-recipes
```

**Output:**

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeSummaryList": [
        {
            "name": "MyBasicRecipe",
            "platform": "Windows",
            "owner": "123456789012",
            "dateCreated": "2020-02-19T18:54:25.975Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        },
        {
            ...
        }
    ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImageRecipes in AWS CLI Command Reference.

list-images

The following code example shows how to use list-images.

AWS CLI

To list images

The following list-images example lists all of the semantic versions you have access to.

```bash
aws imagebuilder list-images
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageVersionList": [
   {
      "name": "MyBasicRecipe",
      "version": "2019.12.03",
      "platform": "Windows",
   }
   ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImages in AWS CLI Command Reference.

list-infrastructure-configurations

The following code example shows how to use list-infrastructure-configurations.

AWS CLI

To list infrastructure configurations

The following list-infrastructure-configurations example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationSummaryList": [
        {
            "name": "MyExampleInfrastructure",
            "description": "An example that will retain instances of failed builds",
            "dateCreated": "2020-02-19T19:11:51.858Z",
            "tags": {}
        },
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/infrastructureconfiguration-name-a1b2c3d45678",
            "name": "infrastructureConfiguration-name-a1b2c3d45678",
            "dateCreated": "2019-12-16T18:19:01.038Z",
            "tags": {}
        }
    ]
}
```
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a specific resource**

The following list-tags-for-resource example lists all of the tags for a specific resource.

```bash
aws imagebuilder list-tags-for-resource \ 
```

Output:

```json
{
   "tags": {
      "KeyName": "KeyValue"
   }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-component-policy

The following code example shows how to use put-component-policy.
To apply a resource policy to a component

The following put-component-policy command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-component-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutComponentPolicy in AWS CLI Command Reference.

put-image-policy

The following code example shows how to use put-image-policy.

AWS CLI

To apply a resource policy to an image
The following put-image-policy command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```bash
aws imagebuilder put-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1 \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutImagePolicy in AWS CLI Command Reference.

put-image-recipe-policy

The following code example shows how to use put-image-recipe-policy.

AWS CLI

To apply a resource policy to an image recipe

The following put-image-recipe-policy command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-recipe-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.
**aws imagebuilder put-image-recipe-policy**

```
aws imagebuilder put-image-recipe-policy 
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-recipe/2019.12.02/1"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/ec2/latest/userguide/setting-up-managing-ec2-image-builder-image-pipeline-using-aws-cli.html) in the *EC2 Image Builder Users Guide*.

### start-image-pipeline-execution

The following code example shows how to use `start-image-pipeline-execution`.

**AWS CLI**

**To start an image pipeline manually**

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution 
```

Output:

```
{
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see StartImagePipelineExecution in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example adds and tags a resource to EC2 Image Builder using a JSON file.

```bash
aws imagebuilder tag-resource \
  --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```json
{
  "tags": {
    "KeyName": "KeyValue"
  }
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes a tag from a resource using a JSON file.

```bash
aws imagebuilder untag-resource \
  --cli-input-json file://tag-resource.json
```

Contents of untag-resource.json:

```json
{
    "tagKeys": [
      "KeyName"
    ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-distribution-configuration

The following code example shows how to use update-distribution-configuration.

AWS CLI

To update a distribution configuration

The following update-distribution-configuration example updates a distribution configuration using a JSON file.

```bash
aws imagebuilder update-distribution-configuration \
```
Contents of update-distribution-configuration.json:

```json
{
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image {{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateDistributionConfiguration in AWS CLI Command Reference.

update-image-pipeline

The following code example shows how to use update-image-pipeline.
AWS CLI

To update an image pipeline

The following update-image-pipeline example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \
   --cli-input-json file://update-image-pipeline.json
```

Contents of update-image-pipeline.json:

```json
{
   "imageTestsConfiguration": {
      "imageTestsEnabled": true,
      "timeoutMinutes": 120
   },
   "schedule": {
      "scheduleExpression": "cron(0 0 * * MON)",
      "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
   },
   "status": "DISABLED"
}
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateImagePipeline in AWS CLI Command Reference.
**update-infrastructure-configuration**

The following code example shows how to use `update-infrastructure-configuration`.

**AWS CLI**

To update an infrastructure configuration

The following `update-infrastructure-configuration` example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \
  --cli-input-json file:/update-infrastructure-configuration.json
```

Contents of `update-infrastructure-configuration.json`:

```
{
  "description": "An example that will terminate instances of failed builds",
  "instanceTypes": [
    "m5.large", "m5.2xlarge"
  ],
  "instanceProfileName": "EC2InstanceProfileForImageFactory",
  "securityGroupIds": [
    "sg-a48c95ef"
  ],
  "subnetId": "subnet-a48c95ef",
  "logging": {
    "s3Logs": {
      "s3BucketName": "bucket-name",
      "s3KeyPrefix": "bucket-path"
    }
  },
  "terminateInstanceOnFailure": true,
  "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```
Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

create-replication-set

The following code example shows how to use create-replication-set.

AWS CLI

To create the replication set

The following create-replication-set example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```
aws ssm-incidents create-replication-set 
```
--regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}, "us-east-2": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}}'

Output:

```json
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see CreateReplicationSet in AWS CLI Command Reference.

create-response-plan

The following code example shows how to use create-response-plan.

AWS CLI

To create a response plan

The following create-response-plan example creates a response plan with the specified details.

```bash
aws ssm-incidents create-response-plan \
    --chat-channel '{"chatbotSns": ["arn:aws:sns:us-east-1:111122223333:Standard_User"]}' \
    --display-name "Example response plan" \
    --incident-template '{"impact": 5, "title": "example-incident"}' \
    --name "example-response" \
    --actions '[["ssmAutomation": {"documentName": "AWSIncidents-CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT", "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"}]]' \
    --engagements '[["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]]
```
Output:

```json
{
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see [Incident preparation](#) in the [Incident Manager User Guide](#).

- For API details, see [CreateResponsePlan](#) in *AWS CLI Command Reference*.

### create-timeline-event

The following code example shows how to use `create-timeline-event`.

**AWS CLI**

**Example 1: To create a custom timeline event**

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
    --event-data ""example timeline event""" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```json
{
    "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

**Example 2: To create a timeline event with an incident note**

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
    --event-data "example timeline event" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```
Output:

```json
{
   "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
   "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d84308"
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see CreateTimelineEvent in AWS CLI Command Reference.

### delete-incident-record

The following code example shows how to use delete-incident-record.

**AWS CLI**

**To delete an incident record**

The following delete-incident-record example deletes the specified incident record.

```bash
aws ssm-incidents delete-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d84308"
```

This command produces no output.

For more information, see Incident tracking in the Incident Manager User Guide.

- For API details, see DeleteIncidentRecord in AWS CLI Command Reference.

### delete-replication-set

The following code example shows how to use delete-replication-set.
AWS CLI

**To delete the replication set**

The following `delete-replication-set` example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```bash
aws ssm-incidents delete-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteReplicationSet](#) in *AWS CLI Command Reference*.

**delete-resource-policy**

The following code example shows how to use `delete-resource-policy`.

AWS CLI

**To delete a resource policy**

The following `delete-resource-policy` example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```bash
aws ssm-incidents delete-resource-policy \
   --policy-id "be8b57191f0371f1c6827341aa3f0a03" \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

This command produces no output.

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*. 
For API details, see DeleteResourcePolicy in AWS CLI Command Reference.

**delete-response-plan**

The following code example shows how to use delete-response-plan.

**AWS CLI**

**To delete a response plan**

The following delete-response-plan example deletes the specified response plan.

```bash
aws ssm-incidents delete-response-plan \
   --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see Incident preparation in the Incident Manager User Guide.

For API details, see DeleteResponsePlan in AWS CLI Command Reference.

**delete-timeline-event**

The following code example shows how to use delete-timeline-event.

**AWS CLI**

**To delete a timeline event**

The following delete-timeline-event example deletes a custom timeline event from the specified incident record.

```bash
aws ssm-incidents delete-timeline-event \
   --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c" \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.
For API details, see `DeleteTimelineEvent` in *AWS CLI Command Reference*.

**get-incident-record**

The following code example shows how to use `get-incident-record`.

**AWS CLI**

**To get an incident record**

The following `get-incident-record` example gets details about the specified incident record.

```bash
aws ssm-incidents get-incident-record \
  --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

**Output:**

```json
{
  "incidentRecord": {
    "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
    "automationExecutions": [],
    "creationTime": "2021-05-21T18:16:57.579000+00:00",
    "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
    "impact": 5,
    "incidentRecordSource": {
      "createdBy": "arn:aws:iam::111122223333:user/draliatp",
      "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
      "source": "aws.ssm-incidents.custom"
    },
    "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",
    "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
    "notificationTargets": [],
    "status": "OPEN",
    "title": "Example-Incident"
  }
}
```

For more information, see [Incident details](Incident Manager User Guide) in the *Incident Manager User Guide*.

For API details, see `GetIncidentRecord` in *AWS CLI Command Reference*. 
get-replication-set

The following code example shows how to use get-replication-set.

AWS CLI

To get the replication set

The following get-replication-set example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

Output:

```
{
   "replicationSet": {
      "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
      "createdTime": "2021-05-14T17:57:22.010000+00:00",
      "deletionProtected": false,
      "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
      "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
      "regionMap": {
         "us-east-1": {
            "sseKmsKeyId": "DefaultKey",
            "status": "ACTIVE"
         },
         "us-east-2": {
            "sseKmsKeyId": "DefaultKey",
            "status": "ACTIVE",
            "statusMessage": "Tagging inaccessible"
         }
      },
      "status": "ACTIVE"
   }
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see GetReplicationSet in AWS CLI Command Reference.
get-resource-policies

The following code example shows how to use get-resource-policies.

AWS CLI

To list resource policies for a response plan

The following command-name example lists the resource policies associated with the specified response plan.

```bash
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{"resourcePolicies": [{
  "policyId": "be8b57191f0371f1c6827341aa3f0a03",
  "ramResourceShareRegion": "us-east-1"
}]
```

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see GetResourcePolicies in AWS CLI Command Reference.
get-response-plan

The following code example shows how to use get-response-plan.

AWS CLI

To get details of a response plan

The following command-name example gets details about a specified response plan in your AWS account.

```bash
aws ssm-incidents get-response-plan \
   --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
   "actions": [
       {
           "ssmAutomation": {
               "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
               "documentVersion": "$DEFAULT",
               "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
               "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
           }
       },
       {
           "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
           "chatChannel": {
               "chatbotSns": [
               ]
           },
           "displayName": "Example response plan",
           "engagements": [
               "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
           ],
           "incidentTemplate": {
               "impact": 5,
               "title": "Example-Incident"
           }
       }
   ]
}
```
"name": "Example-Response-Plan"
}

For more information, see Incident preparation in the Incident Manager User Guide.
• For API details, see GetResponsePlan in AWS CLI Command Reference.

get-timeline-event

The following code example shows how to use get-timeline-event.

AWS CLI

To get details of a timeline event

The following get-timeline-event example returns details of the specified timeline event.

```bash
aws ssm-incidents get-timeline-event \
   --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```json
{
    "event": {
        "eventData": "Incident Started",
        "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
        "eventTime": "2021-05-21T18:16:57+00:00",
        "eventType": "Custom Event",
        "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
        "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    }
}
```

For more information, see Incident details in the Incident Manager User Guide.
• For API details, see GetTimelineEvent in AWS CLI Command Reference.

list-incident-records

The following code example shows how to use list-incident-records.
AWS CLI

To list incident records

The following command-name example lists the incident records in your Amazon Web Services account.

```bash
aws ssm-incidents list-incident-records
```

Output:

```json
{
   "incidentRecordSummaries": [
   {
       "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
       "creationTime": "2021-05-21T18:16:57.579000+00:00",
       "impact": 5,
       "incidentRecordSource": {
           "createdBy": "arn:aws:iam::111122223333:user/draliatp",
           "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
           "source": "aws.ssm-incidents.custom"
        },
       "status": "OPEN",
       "title": "Example-Incident"
   }
   ]
}
```

For more information, see Incident list in the Incident Manager User Guide.

- For API details, see ListIncidentRecords in AWS CLI Command Reference.

list-related-items

The following code example shows how to use list-related-items.

AWS CLI

To list related items

The following list-related-items example lists the related items of the specified incident.
aws ssm-incidents list-related-items \\     --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"

Output:

```
{
  "relatedItems": [
    {
      "identifier": {
        "type": "OTHER",
        "value": {
          "url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"
        }
      },
      "title": "Example related item"
    },
    {
      "identifier": {
        "type": "PARENT",
        "value": {
          "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/oi-8084126392ac"
        }
      },
      "title": "parentItem"
    }
  ]
}
```

For more information, see [Incident details](Incident Manager User Guide) in the *Incident Manager User Guide*.

- For API details, see [ListRelatedItems](AWS CLI Command Reference) in *AWS CLI Command Reference*.

### list-replication-sets

The following code example shows how to use *list-replication-sets*.

**AWS CLI**

To list the replication set
The following `list-replication-set` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```bash
aws ssm-incidents list-replication-sets
```

Output:

```json
{
   "replicationSetArns": [
      "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
   ]
}
```

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [ListReplicationSets](#) in *AWS CLI Command Reference*.

### `list-response-plans`

The following code example shows how to use `list-response-plans`.

**AWS CLI**

**To list the available response plans**

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```bash
aws ssm-incidents list-response-plans
```

Output:

```json
{
   "responsePlanSummaries": [
      {
         "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
         "displayName": "Example response plan",
         "name": "Example-Response-Plan"
      }
   ]
}
```
For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see ListResponsePlans in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a response plan**

The following list-tags-for-resource example lists the tags associated with the specified response plan.

```bash
aws ssm-incidents list-tags-for-resource \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
   "tags": {
      "group1": "1"
   }
}
```

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**list-timeline-events**

The following code example shows how to use list-timeline-events.

**AWS CLI**

**To list timeline events of an incident**
The following command-name example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
  "eventSummaries": [
    {
      "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
      "eventTime": "2021-05-21T22:36:13.766000+00:00",
      "eventType": "SSM Incident Record Update",
      "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
      "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    },
    {
      "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
      "eventTime": "2021-05-21T18:58:46.443000+00:00",
      "eventType": "SSM Incident Record Update",
      "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
      "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    },
    {
      "eventId": "5abcc812-89c0-b0a8-9437-1c74223d4685",
      "eventTime": "2021-05-21T18:16:59.149000+00:00",
      "eventType": "SSM Incident Record Update",
      "eventUpdatedTime": "2021-05-21T18:16:59.149000+00:00",
      "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    },
    {
      "eventId": "06bcc812-8820-405e-4065-8d2b14d29b92",
      "eventTime": "2021-05-21T18:16:58+00:00",
      "eventType": "SSM Automation Execution Start Failure for Incident",
      "eventUpdatedTime": "2021-05-21T18:16:58.689000+00:00",
      "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    }
  ]
}
```
The following code example shows how to use `put-resource-policy`.

**AWS CLI**

**To share a response plan and incidents**

The following command-name example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```
aws ssm-incidents put-resource-policy \
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
```
The following code example shows how to use `start-incident`.

### AWS CLI

**To start an incident**

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \
```

Output:

```
{
  "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see [Incident creation](#) in the *Incident Manager User Guide*.

- For API details, see [StartIncident](#) in *AWS CLI Command Reference*.
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a response plan**

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```bash
aws ssm-incidents tag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
    --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see [Tagging](#) in the Incident Manager User Guide.

- For API details, see [TagResource](#) in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a response plan**

The following `untag-resource` example removes the specified tags from the response plan.

```bash
aws ssm-incidents untag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
    --tag-keys ['"group1"']
```

This command produces no output.

For more information, see [Tagging](#) in the Incident Manager User Guide.

- For API details, see [UntagResource](#) in AWS CLI Command Reference.
update-deletion-protection

The following code example shows how to use update-deletion-protection.

**AWS CLI**

To update replication set deletion protection

The following update-deletion-protection example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```bash
aws ssm-incidents update-deletion-protection \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
   --deletion-protected
```

This command produces no output.

- For API details, see [UpdateDeletionProtection](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/api-update-deletion-protection.html) in *AWS CLI Command Reference*.

update-incident-record

The following code example shows how to use update-incident-record.

**AWS CLI**

To update an incident record

The following command-name example resolves the specified incident.

```bash
aws ssm-incidents update-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
