      "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
      "Enabled": true
   }
}
```

For more information, see [Working with Events and Notifications](#) in the AWS Database Migration Service User Guide.

- For API details, see [DeleteEventSubscription](#) in AWS CLI Command Reference.

**delete-replication-instance**

The following code example shows how to use `delete-replication-instance`.

**AWS CLI**

**To delete a replication instance**

The following `delete-replication-instance` example deletes a replication instance.

```bash
aws dms delete-replication-instance \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```json
{
   "ReplicationInstance": {
      "ReplicationInstanceIdentifier": "my-repl-instance",
      "ReplicationInstanceClass": "dms.t2.micro",
      "ReplicationInstanceStatus": "deleting",
      "AllocatedStorage": 5,
      "InstanceCreateTime": 1590011235.952,
      "VpcSecurityGroups": [
      ]
   }
}
```
"VpcSecurityGroupId": "sg-f839b688",
"Status": "active"
],
"AvailabilityZone": "us-east-1e",
"ReplicationSubnetGroup": {
  "ReplicationSubnetGroupIdentifier": "default",
  "ReplicationSubnetGroupDescription": "default",
  "VpcId": "vpc-136a4c6a",
  "SubnetGroupStatus": "Complete",
  "Subnets": [
    {
      "SubnetIdentifier": "subnet-da327bf6",

"172.31.75.90"
],
"PubliclyAccessible": true,
"SecondaryAvailabilityZone": "us-east-1b"
}
}

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationInstance in AWS CLI Command Reference.

**delete-replication-subnet-group**

The following code example shows how to use delete-replication-subnet-group.
AWS CLI

To delete a subnet group

The following delete-replication-subnet-group example deletes a subnet group.

```
aws dms delete-replication-subnet-group \\n   --replication-subnet-group-identifier my-subnet-group
```

Output:

```
(None)
```

For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationSubnetGroup in AWS CLI Command Reference.

delete-replication-task

The following code example shows how to use delete-replication-task.

AWS CLI

To delete a replication task

The following delete-replication-task example deletes a replication task.

```
aws dms delete-replication-task \\
```

Output:

```
{
   "ReplicationTask": {
       "ReplicationTaskIdentifier": "moveit2",
       "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCEYHIBGAGZT3QEC5U",
   }
}
```
For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see DeleteReplicationTask in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe account attributes

The following describe-account-attributes example lists the attributes for your AWS account.

aws dms describe-account-attributes

Output:

```json
{
   "AccountQuotas": [
      {
         "AccountQuotaName": "ReplicationInstances",
         "Used": 1,
         "Max": 20
      },
      {
```
• For API details, see `DescribeAccountAttributes` in *AWS CLI Command Reference*.

describe-certificates

The following code example shows how to use `describe-certificates`.

**AWS CLI**

**To list the available certificates**

The following `describe-certificates` example lists the available certificates in your AWS account.

```bash
aws dms describe-certificates
```

Output:

```json
{
   "Certificates": [
      {
         "CertificateIdentifier": "my-cert",
         "CertificateCreationDate": 1543259542.506,
         "CertificatePem": "-----BEGIN CERTIFICATE-----
MIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ...U"
      }...
      ... remaining output omitted ...
   ]
}
```
For more information, see Using SSL in the AWS Database Migration Service User Guide.

- For API details, see DescribeCertificates in AWS CLI Command Reference.

**describe-connections**

The following code example shows how to use describe-connections.

**AWS CLI**

**To describe connections**

The following describe-connections example lists the connections that you have tested between a replication instance and an endpoint.

```
aws dms describe-connections
```

Output:

```
{
   "Connections": [ 
      {
       "Status": "successful",
       "ReplicationInstanceIdentifier": "test",
       "EndpointIdentifier": "testsrc1",
       "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:6UTDJGB0US3VI3SUWA66XFJCJQ"
      }
   ]
}
```

For more information, see Creating Source and Target Endpoints in the AWS Database Migration Service User Guide.

- For API details, see DescribeConnections in AWS CLI Command Reference.

**describe-endpoint-types**

The following code example shows how to use describe-endpoint-types.
AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```
aws dms describe-endpoint-types \
  --filters "Name=engine-name,Values=mysql"
```

Output:

```
{
  "SupportedEndpointTypes": [
    {
      "EngineName": "mysql",
      "SupportsCDC": true,
      "EndpointType": "source",
      "EngineDisplayName": "MySQL"
    },
    {
      "EngineName": "mysql",
      "SupportsCDC": true,
      "EndpointType": "target",
      "EngineDisplayName": "MySQL"
    }
  ]
}
```

For more information, see Working with AWS DMS Endpoints [https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html](https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html) in the AWS Database Migration Service User Guide.

- For API details, see `DescribeEndpointTypes` in AWS CLI Command Reference.

describe-endpoints

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints
The following `describe-endpoints` example lists the endpoints in your AWS account:

```bash
aws dms describe-endpoints
```

Output:

```json
{
  "Endpoints": [
    {
      "Username": "dms",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:SF2W0FLWYWKVEOHID2EKLP3SJI",
      "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/94d5c4e7-4e4c-44be-b58a-c8da7adf57cd",
      "DatabaseName": "test",
      "EngineName": "mysql",
      "EndpointIdentifier": "pri100",
      "Port": 8193
    },
    {
      "Username": "admin",
      "Status": "active",
      "ServerName": "test.example.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/2431021b-1cf2-a2d4-77b2-59a9e4bce323",
      "DatabaseName": "EMPL",
      "EngineName": "oracle",
      "EndpointIdentifier": "test",
      "Port": 1521
    }
  ]
}
```

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/working-endpoints.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-endpoints.html) in *AWS CLI Command Reference*. 
describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories

The following describe-event-categories example lists the available event categories.

```bash
aws dms describe-event-categories
```

Output:

```json
{
   "EventCategoryGroupList": [
       {
            "SourceType": "replication-instance",
            "EventCategories": [
                "low storage",
                "configuration change",
                "maintenance",
                "deletion",
                "creation",
                "failover",
                "failure"
            ]
       },
       {
            "SourceType": "replication-task",
            "EventCategories": [
                "configuration change",
                "state change",
                "deletion",
                "creation",
                "failure"
            ]
       }
   ]
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.
describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

The following describe-event-subscriptions example lists the event subscriptions to an Amazon SNS topic.

```
aws dms describe-event-subscriptions
```

Output:

```json
{
   "EventSubscriptionsList": [
      {
         "CustomerAwsId": "123456789012",
         "CustSubscriptionId": "my-dms-events",
         "Status": "deleting",
         "Enabled": true
      }
   ]
}
```

For more information, see [Working with Events and Notifications](https://docs.aws.amazon.com/dms/latest/UserGuide/dms-events.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEventSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-event-subscriptions.html) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list DMS events
The following describe-events example lists the events that originated from a replication instance.

```
aws dms describe-events 
  --source-type "replication-instance"
```

Output:

```
{
  "Events": [
    {
      "SourceIdentifier": "my-repl-instance",
      "SourceType": "replication-instance",
      "Message": "Replication application shutdown",
      "EventCategories": [],
      "Date": 1590771645.776
    }
  ]
}
```

For more information, see [Working with Events and Notifications](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Events.html) in the [AWS Database Migration Service User Guide](https://docs.aws.amazon.com/dms/latest/userguide/).

- For API details, see [DescribeEvents](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-events.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-events.html).

### describe-orderable-replication-instances

The following code example shows how to use describe-orderable-replication-instances.

#### AWS CLI

**To describe orderable replication instances**

The following describe-orderable-replication-instances example lists replication instance types that you can order.

```
aws dms describe-orderable-replication-instances
```

Output:

```
{
```
"OrderableReplicationInstances": [
  {
    "EngineVersion": "3.3.2",
    "ReplicationInstanceClass": "dms.c4.2xlarge",
    "StorageType": "gp2",
    "MinAllocatedStorage": 5,
    "MaxAllocatedStorage": 6144,
    "DefaultAllocatedStorage": 100,
    "IncludedAllocatedStorage": 100,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1c",
      "us-east-1d",
      "us-east-1e",
      "us-east-1f"
    ]
  },
  {
    "EngineVersion": "3.3.2",
    "ReplicationInstanceClass": "dms.c4.4xlarge",
    "StorageType": "gp2",
    "MinAllocatedStorage": 5,
    "MaxAllocatedStorage": 6144,
    "DefaultAllocatedStorage": 100,
    "IncludedAllocatedStorage": 100,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1c",
      "us-east-1d",
      "us-east-1e",
      "us-east-1f"
    ]
  }
],

...remaining output omitted...

**describe-refresh-schemas-status**

The following code example shows how to use describe-refresh-schemas-status.

**AWS CLI**

**To list the refresh status for an endpoint**

The following describe-refresh-schemas-status example returns the status of a previous refresh request.

```shell
aws dms describe-refresh-schemas-status
```

**Output:**

```json
{
   "RefreshSchemasStatus": {
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZ7FG7JRNUE",
      "Status": "successful",
      "LastRefreshDate": 1590786544.605
   }
}
```

- For API details, see [DescribeRefreshSchemasStatus](#) in AWS CLI Command Reference.

**describe-replication-instances**

The following code example shows how to use describe-replication-instances.

**AWS CLI**

**To describe replication instances**

The following describe-replication-instances example lists the replication instances in your AWS account.

```shell
aws dms describe-replication-instances
```
Output:

```json
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-east-1e",
            "ReplicationSubnetGroup": {
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",
                "VpcId": "vpc-136a4c6a",
                "SubnetGroupStatus": "Complete",
                "Subnets": [
                    {
                        "SubnetIdentifier": "subnet-da327bf6",
                        "SubnetAvailabilityZone": {
                            "Name": "us-east-1a"
                        },
                        "SubnetStatus": "Active"
                    },
                    {
                        "SubnetIdentifier": "subnet-42599426",
                        "SubnetAvailabilityZone": {

"ReplicationInstancePrivateIpAddresses": ["172.31.75.90"],
"PubliclyAccessible": true,
"FreeUntil": 1590194829.267
The following code example shows how to use `describe-replication-subnet-groups`.

### AWS CLI

**To display the available subnet groups**

The following `describe-replication-subnet-groups` example lists the available subnet groups.

```bash
dms describe-replication-subnet-groups \
  --filter "Name=replication-subnet-group-id,Values=my-subnet-group"
```

**Output:**

```json
{
  "ReplicationSubnetGroups": [
    {
      "ReplicationSubnetGroupIdentifier": "my-subnet-group",
      "ReplicationSubnetGroupDescription": "my subnet group",
      "VpcId": "vpc-136a4c6a",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-da327bf6",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-bac383e0",
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationSubnetGroups in AWS CLI Command Reference.

describe-replication-task-assessment-results

The following code example shows how to use describe-replication-task-assessment-results.

AWS CLI

To list the results of replication task assessmentss

The following describe-replication-task-assessment-results example lists the results of a prior task assessment.

aws dms describe-replication-task-assessment-results

Output:

```json
{
   "ReplicationTaskAssessmentResults": [
   {
      "SubnetAvailabilityZone": { "Name": "us-east-1c" },
      "SubnetStatus": "Active"
   },
   {
      "SubnetIdentifier": "subnet-d7c825e8",
      "SubnetAvailabilityZone": { "Name": "us-east-1e" },
      "SubnetStatus": "Active"
   }
   ]
}
```
For more information, see Creating a Task Assessment Report in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationTaskAssessmentResults in AWS CLI Command Reference.

**describe-replication-tasks**

The following code example shows how to use describe-replication-tasks.

**AWS CLI**

**To describe a replication task**

The following describe-replication-tasks example describes current replication tasks.

```bash
aws dms describe-replication-tasks
```

Output:

```json
{
   "ReplicationTasks": [ 
   {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:E0M45FKCZEHYZBFGAGT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF73PGJRNUE",
      "MigrationType": "full-load",
      "TableMappings": ...output omitted...
   }
   ]
}
```
For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/userguide/working-with-dms-tasks.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationTasks](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-replication-tasks.html) in *AWS CLI Command Reference*.

**describe-schemas**

The following code example shows how to use `describe-schemas`.

**AWS CLI**

To describe database schemas

The following `describe-schemas` example lists the available tables at an endpoint.

```
aws dms describe-schemas \
```

Output:
For more information, see This is the topic title in the AWS Database Migration Service User Guide.

- For API details, see DescribeSchemas in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a resource

The following list-tags-for-resource example lists the tags for a replication instance.

```bash
aws dms list-tags-for-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```json
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "dbMigration"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see Tagging Resources in the AWS Database Migration Service User Guide.
For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/dms/list-tags-for-resource) in AWS CLI Command Reference.

**modify-endpoint**

The following code example shows how to use modify-endpoint.

**AWS CLI**

**To modify an endpoint**

The following modify-endpoint example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
   --endpoint-arn "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U" \
   --extra-connection-attributes "compressionType=GZIP"
```

**Output:**

```
{
   "Endpoint": {
      "EndpointIdentifier": "src-endpoint",
      "EndpointType": "SOURCE",
      "EngineName": "s3",
      "EngineDisplayName": "Amazon S3",
      "ExtraConnectionAttributes": "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\n;",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U",
      "SslMode": "none",
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
      "S3Settings": {
         "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
         "CsvRowDelimiter": "\n",
         "CsvDelimiter": ",",
         "BucketFolder": "",
         "BucketName": "",
         "CompressionType": "GZIP",
         "EnableStatistics": true
      }
   }
}
```
modify-event-subscription

The following code example shows how to use modify-event-subscription.

AWS CLI

To modify an event subscription

The following modify-event-subscription example changes the source type of an event subscription.

```
aws dms modify-event-subscription \
   --subscription-name "my-dms-events" \
   --source-type replication-task
```

Output:

```
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "modifying",
      "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
      "SourceType": "replication-task",
      "Enabled": true
   }
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.
modify-replication-instance

The following code example shows how to use modify-replication-instance.

AWS CLI

To modify a replication instance

The following modify-replication-instance example modifies a replication instance so that it uses a Multi-AZ deployment.

```
aws dms modify-replication-instance \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZFGJRNUE \
   --multi-az
```

Output:

```
{
   "ReplicationInstance": {
      "ReplicationInstanceIdentifier": "my-repl-instance",
      "ReplicationInstanceClass": "dms.t2.micro",
      "ReplicationInstanceStatus": "available",
      "AllocatedStorage": 5,
      "InstanceCreateTime": 1590011235.952,

      ...output omitted...

      "PendingModifiedValues": {
         "MultiAZ": true
      },
      "MultiAZ": false,
      "EngineVersion": "3.3.2",
      "AutoMinorVersionUpgrade": true,
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9fae-e8494fa3921a",

      ...output omitted...
   }
}
```
• For API details, see ModifyReplicationInstance in AWS CLI Command Reference.

**modify-replication-subnet-group**

The following code example shows how to use modify-replication-subnet-group.

**AWS CLI**

**To modify a subnet group**

The following modify-replication-subnet-group example changes the lists of subnets associated with a subnet group.

```bash
aws dms modify-replication-subnet-group \
   --replication-subnet-group-identifier my-subnet-group \ 
   --subnet-id subnet-da327bf6 subnet-bac383e0
```

Output:

```json
{
   "ReplicationSubnetGroup": {
      "ReplicationSubnetGroupIdentifier": "my-subnet-group",
      "ReplicationSubnetGroupDescription": "my subnet group",
      "VpcId": "vpc-136a4c6a",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-da327bf6",
            "SubnetAvailabilityZone": {
               "Name": "us-east-1a"
            },
            "SubnetStatus": "Active"
         },
         {
            "SubnetIdentifier": "subnet-bac383e0",
            "SubnetAvailabilityZone": {
               "Name": "us-east-1c"
            }
         }
      ]
   }
}
```

```
{
  "SubnetStatus": "Active"
}
```

For more information, see [Setting Up a Network for a Replication Instance](#) in the *AWS Database Migration Service User Guide*.  

- For API details, see [ModifyReplicationSubnetGroup](#) in *AWS CLI Command Reference*.

### modify-replication-task

The following code example shows how to use modify-replication-task.

**AWS CLI**

**To modify a replication task**

The following modify-replication-task example changes the table mappings for a task.

```
aws dms modify-replication-task \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
   --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```
{
  "rules": [
    {
      "rule-type": "selection",
      "rule-id": "1",
      "rule-name": "1",
      "object-locator": {
        "schema-name": "prodrep",
        "table-name": "ACCT_%"
      },
      "rule-action": "include",
      "filters": []
    }
  ]
}
```
Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKZECYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...
        "ReplicationTaskSettings": ...output omitted...
        "Status": "modifying",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/userguide/working-with-tasks.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationTask](https://docs.aws.amazon.com/cli/latest/reference/dms/modify-replication-task.html) in *AWS CLI Command Reference*.

---

**reboot-replication-instance**

The following code example shows how to use `reboot-replication-instance`.

**AWS CLI**

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance \
```

---
The following code example shows how to use `refresh-schemas`.

**AWS CLI**

To refresh database schemas

The following `refresh-schemas` example requests that AWS DMS refresh the list of schemas at an endpoint.

```bash
aws dms refresh-schemas \
  --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE \
```

Output:

```json
{
  "RefreshSchemasStatus": {
  ...
  }
}
```
"EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:6GGI6YPWGYUVLKIB73KEVWA",
"ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVF7P5GJRNUE",
"Status": "refreshing",
"LastRefreshDate": 1590019949.103
}
}

- For API details, see **RefreshSchemas** in *AWS CLI Command Reference*.

### reload-tables

The following code example shows how to use `reload-tables`.

**AWS CLI**

**To refresh the list of tables available at an endpoint**

The following `reload-tables` example reloads the list of available tables at an endpoint.

```bash
aws dms reload-tables \
    --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHJINIA45FII" \
    --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

**Output:**

```json
{
    "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHJINIA45FII"
}
```

- For API details, see **ReloadTables** in *AWS CLI Command Reference*.

### remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

**AWS CLI**

**To remove tags from a replication instance**

```bash
aws dms remove-tags-from-resource --resource-id "arn:aws:dms:us-east-1:123456789012:report:" \
    --tags "TagKey=TagValue"
```

**Output:**

```json
{
    "Tags": null
}
```

- For API details, see **RemoveTagsFromResource** in *AWS CLI Command Reference*. 

Actions and scenarios
The following `remove-tags-from-resource` example removes tags from a replication instance.

```
aws dms remove-tags-from-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE \
  --tag-keys Environment Project
```

This command produces no output.

For more information, see [Tagging Resources](https://docs.aws.amazon.com/dms/latest/userguide/AWS-Database-Migration-Service-Tagging.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [RemoveTagsFromResource](https://docs.aws.amazon.com/cli/latest/reference/dms/remove-tags-from-resource.html) in *AWS CLI Command Reference*.

### start-replication-task-assessment

The following code example shows how to use `start-replication-task-assessment`.

#### AWS CLI

**To start a task assessment**

The following `start-replication-task-assessment` example starts a replication task assessment.

```
aws dms start-replication-task-assessment \
```

**Output:**

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEYHZBFAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
```
"TableMappings": ...output omitted...
"ReplicationTaskSettings": ...output omitted...
"Status": "testing",
"StopReason": "Stop Reason FULL_LOADONLYFINISHED",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590789988.677,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
} 

For more information, see Creating a Task Assessment Report in the AWS Database Migration Service User Guide.

- For API details, see StartReplicationTaskAssessment in AWS CLI Command Reference.

**start-replication-task**

The following code example shows how to use start-replication-task.

**AWS CLI**

To start a replication task

The following command-name example lists the available widgets in your AWS account.

```bash
aws dms start-replication-task \
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
  --start-replication-task-type reload-target
```

Output:

```json
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:E0M45FKCZEYHZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
    ...
  }
)
```
"MigrationType": "full-load",
"TableMappings": ...output omitted...
"ReplicationTaskSettings": ...output omitted...
"Status": "starting",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590619805.212,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
}

For more information, see [Working with AWS DMS Tasks](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [StartReplicationTask](#) in [AWS CLI Command Reference](#).

**stop-replication-task**

The following code example shows how to use `stop-replication-task`.

**AWS CLI**

To stop a task

The following `stop-replication-task` example stops a task.

```
aws dms stop-replication-task
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEYHZBFAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
    "MigrationType": "full-load",
```
For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/userguide/working-with-tasks.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [StopReplicationTask](https://docs.aws.amazon.com/cli/latest/reference/dms/stop-replication-task.html) in *AWS CLI Command Reference*.

**test-connection**

The following code example shows how to use test-connection.

**AWS CLI**

**To test a connection to an endpoint**

The following test-connection example tests whether an endpoint can be accessed from a replication instance.

```bash
aws dms test-connection \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
```

**Output:**

```json
{
   "Connection": {
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
      "Status": "testing",
```

Actions and scenarios
For more information, see Creating source and target endpoints in the AWS Database Migration Service User Guide.

- For API details, see TestConnection in AWS CLI Command Reference.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

To add one or more tags to a specified resource

The following add-tags-to-resource example adds three tags to sample-cluster. One tag (CropB) has a key name but no value.
aws docdb add-tags-to-resource \
  --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"

This command produces no output.

For more information, see Tagging Amazon DocumentDB Resources in the Amazon DocumentDB Developer Guide.

- For API details, see AddTagsToResource in AWS CLI Command Reference.

**apply-pending-maintenance-action**

The following code example shows how to use apply-pending-maintenance-action.

**AWS CLI**

To have pending maintenance actions take place during the next maintenance window

The following apply-pending-maintenance-action example causes all system-update actions to be performed during the next scheduled maintenance window.

aws docdb apply-pending-maintenance-action \
  --apply-action system-update \
  --opt-in-type next-maintenance

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the Amazon DocumentDB Developer Guide.

- For API details, see ApplyPendingMaintenanceAction in AWS CLI Command Reference.

**copy-db-cluster-parameter-group**

The following code example shows how to use copy-db-cluster-parameter-group.

**AWS CLI**

To duplicate an existing DB cluster parameter group
The following `copy-db-cluster-parameter-group` example makes a copy of the parameter group `custom-docdb3-6` named `custom-docdb3-6-copy`. When making the copy it adds tags to the new parameter group.

```
aws docdb copy-db-cluster-parameter-group \
   --source-db-cluster-parameter-group-identifier custom-docdb3-6 \
   --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
   --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
   --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```
{
   "DBClusterParameterGroup": {
      "DBParameterGroupFamily": "docdb3.6",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-pg:custom-docdb3-6-copy",
      "DBClusterParameterGroupName": "custom-docdb3-6-copy",
      "Description": "Copy of custom-docdb3-6"
   }
}
```

For more information, see [Copying an Amazon DocumentDB Cluster Parameter Group](https://docs.aws.amazon.com/documentdb/latest/developerguide/copy-db-cluster-pg.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CopyDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/docdb/copy-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

**copy-db-cluster-snapshot**

The following code example shows how to use `copy-db-cluster-snapshot`.

**AWS CLI**

**To create a copy of a snapshot**

The following `copy-db-cluster-snapshot` example makes a copy of `sample-cluster-snapshot` named `sample-cluster-snapshot-copy`. The copy has all the tags of the original plus a new tag with the key name `CopyNumber`.

```
aws docdb copy-db-cluster-snapshot \
   --source-db-cluster-snapshot-identifier sample-cluster-snapshot \
   --target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
   --target-db-cluster-snapshot-description "Copy of sample-cluster-snapshot"
   --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```
--target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
--copy-tags \
--tags Key="CopyNumber",Value="1"

This command produces no output.

For more information, see Copying a Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see CopyDbClusterSnapshot in AWS CLI Command Reference.

create-db-cluster-parameter-group

The following code example shows how to use create-db-cluster-parameter-group.

AWS CLI

To create an Amazon DocumentDB cluster parameter group

The following create-db-cluster-parameter-group example creates the DB cluster parameter group sample-parameter-group using the docdb3.6 family.

```bash
aws docdb create-db-cluster-parameter-group \
   --db-cluster-parameter-group-name sample-parameter-group \
   --db-parameter-group-family docdb3.6 \
   --description "Sample parameter group based on docdb3.6"
```

Output:

```json
{
   "DBClusterParameterGroup": {
      "Description": "Sample parameter group based on docdb3.6",
      "DBParameterGroupFamily": "docdb3.6",
      "DBClusterParameterGroupName": "sample-parameter-group"
   }
}
```

For more information, see Creating an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.
create-db-cluster-snapshot

The following code example shows how to use create-db-cluster-snapshot.

AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following create-db-cluster-snapshot example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```
aws docdb create-db-cluster-snapshot \
  --db-cluster-identifier sample-cluster \
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
  "DBClusterSnapshot": {
    "MasterUsername": "master-user",
    "AvailabilityZones": [
      "us-west-2a",
      "us-west-2b",
      "us-west-2c",
      "us-west-2d",
      "us-west-2e",
      "us-west-2f"
    ],
    "SnapshotType": "manual",
    "EngineVersion": "3.6.0",
    "PercentProgress": 0,
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
    "Engine": "docdb",
    "DBClusterIdentifier": "sample-cluster",
    "Status": "creating",
    "Port": 0,
  }
}```
For more information, see [Creating a Manual Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbClusterSnapshot](#) in *AWS CLI Command Reference*.

**create-db-cluster**

The following code example shows how to use create-db-cluster.

**AWS CLI**

**To create an Amazon DocumentDB cluster**

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named sample-cluster with the preferred maintenance window on Sundays between 20:30 and 11:00.

```bash
aws docdb create-db-cluster \
    --db-cluster-identifier sample-cluster \ 
    --engine docdb \ 
    --master-username master-user \ 
    --master-user-password password \ 
    --preferred-maintenance-window Sun:20:30-Sun:21:00
```

**Output:**

```json
{
    "DBCluster": {
        "DBClusterParameterGroup": "default.docdb3.6",
        "AssociatedRoles": [],
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
        "Status": "creating",
        "Port": 27017,
        "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
        "HostedZoneId": "ZNKXH85TT8WV",
        "DBClusterMembers": []
    }
}
```
"Engine": "docdb",
"DBClusterIdentifier": "sample-cluster",
"PreferredBackupWindow": "10:12-10:42",
"AvailabilityZones": [
  "us-west-2d",
  "us-west-2f",
  "us-west-2e"

  }
}
```
For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbInstance in AWS CLI Command Reference.

create-db-subnet-group

The following code example shows how to use create-db-subnet-group.

```json
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-53ab3636"
},
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-991cb8d0"
},
"DBSubnetGroupDescription": "default",
"SubnetGroupStatus": "Complete",
"VpcId": "vpc-91280df6",
"DBSubnetGroupName": "default"
},
"DBInstanceClass": "db.r4.xlarge",
"VpcSecurityGroups": [
    {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
    }
],
"DbiResourceId": "db-XEKJLEMGRV5ZKCARUVA4H03ITE"
}
```
AWS CLI

**To create an Amazon DocumentDB subnet group**

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.

```bash
aws docdb create-db-subnet-group \
  --db-subnet-group-description "a sample subnet group" \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

**Output:**

```json
{
  "DBSubnetGroup": {
    "SubnetGroupStatus": "Complete",
    "DBSubnetGroupName": "sample-subnet-group",
    "DBSubnetGroupDescription": "a sample subnet group",
    "VpcId": "vpc-91280df6",
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-53ab3636",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2d"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-991cb8d0",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2b"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-29ab1025",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2c"
        }
      }
    ]
  }
}
```
For more information, see Creating an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbSubnetGroup in AWS CLI Command Reference.

delete-db-cluster-parameter-group

The following code example shows how to use delete-db-cluster-parameter-group.

AWS CLI

To delete an Amazon DocumentDB cluster parameter group

The following delete-db-cluster-parameter-group example deletes the Amazon DocumentDB parameter group sample-parameter-group.

```bash
aws docdb delete-db-cluster-parameter-group \
   --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbClusterParameterGroup in AWS CLI Command Reference.

delete-db-cluster-snapshot

The following code example shows how to use delete-db-cluster-snapshot.

AWS CLI

To delete an Amazon DocumentDB cluster snapshot

The following delete-db-cluster-snapshot example deletes the Amazon DocumentDB cluster snapshot sample-cluster-snapshot.

```bash
aws docdb delete-db-cluster-snapshot \
   --db-cluster-snapshot-name sample-cluster-snapshot
```
Output:

```json
{
   "DBClusterSnapshot": {
      "DBClusterIdentifier": "sample-cluster",
      "AvailabilityZones": [
         "us-west-2a",
         "us-west-2b",
         "us-west-2c",
         "us-west-2d"
      ],
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
      "VpcId": "vpc-91280df6",
      "EngineVersion": "3.6.0",
      "Engine": "docdb",
      "Status": "available",
      "MasterUsername": "master-user",
      "PercentProgress": 100,
      "StorageEncrypted": false,
      "SnapshotType": "manual",
      "Port": 0
   }
}
```

For more information, see [Deleting a Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/DeleteClusterSnapshot.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-cluster-snapshot.html) in *AWS CLI Command Reference*.

**delete-db-cluster**

The following code example shows how to use `delete-db-cluster`.

**AWS CLI**

To delete an Amazon DocumentDB cluster
The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \
  --db-cluster-identifier sample-cluster \
  --skip-final-snapshot
```

Output:

```
{
  "DBCluster": {
    "DBClusterIdentifier": "sample-cluster",
    "DBSubnetGroup": "default",
    "EngineVersion": "3.6.0",
    "Engine": "docdb",
    "LatestRestorableTime": "2019-03-18T18:24:610Z",
    "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
    "StorageEncrypted": false,
    "EarliestRestorableTime": "2019-03-18T18:24:610Z",
    "Port": 27017,
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ],
    "MultiAZ": false,
    "MasterUsername": "master-user",
    "Status": "available",
    "PreferredBackupWindow": "10:12-10:42",
    "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
    "AvailabilityZones": [
      "us-west-2c",
      "us-west-2b",
      "us-west-2a"
    ],
    "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
    "DbClusterResourceId": "cluster-L3R4YR5BUYDP4GLMTJ2WF5GH5Q",
    "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
```

Actions and scenarios
For more information, see Deleting an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbCluster in AWS CLI Command Reference.

### delete-db-instance

The following code example shows how to use delete-db-instance.

**AWS CLI**

**To delete an Amazon DocumentDB instance**

The following delete-db-instance example deletes the Amazon DocumentDB instance sample-cluster-instance-2.

```
aws docdb delete-db-instance \
    --db-instance-identifier sample-cluster-instance-2
```

**Output:**

```
{
    "DBInstance": {
        "DBSubnetGroup": {
            "Subnets": [
            {
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-4e26d263"
            },
            {
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                }
            }
        }
    }
}
```

For more information, see Deleting an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbInstance in AWS CLI Command Reference.

**delete-db-subnet-group**

The following code example shows how to use delete-db-subnet-group.

**AWS CLI**

**To delete an Amazon DocumentDB subnet group**

The following delete-db-subnet-group example deletes the Amazon DocumentDB subnet group sample-subnet-group.

```
aws docdb delete-db-subnet-group 
   --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbSubnetGroup in AWS CLI Command Reference.
describe-db-cluster-parameter-groups

The following code example shows how to use `describe-db-cluster-parameter-groups`.

**AWS CLI**

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example displays details for the Amazon DocumentDB cluster parameter group `custom3-6-param-grp`.

```
aws docdb describe-db-cluster-parameter-groups \
  --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
  "DBClusterParameterGroups": [
    {
      "DBParameterGroupFamily": "docdb3.6",
      "Description": "Custom docdb3.6 parameter group",
      "DBClusterParameterGroupName": "custom3-6-param-grp"
    }
  ]
}
```

For more information, see [Viewing Amazon DocumentDB Cluster Parameter Groups](https://docs.aws.amazon.com/documentdb/latest/developerguide/working-with-parameter-groups.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbClusterParameterGroups](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-cluster-parameter-groups.html) in AWS CLI Command Reference.

describe-db-cluster-parameters

The following code example shows how to use `describe-db-cluster-parameters`.

**AWS CLI**

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following `describe-db-cluster-parameters` example lists the parameters for the Amazon DocumentDB parameter group `custom3-6-param-grp`.
aws docdb describe-db-cluster-parameters \
  --db-cluster-parameter-group-name custom3-6-param-grp

Output:

```json
{
   "Parameters": [
       {
           "DataType": "string",
           "ParameterName": "audit_logs",
           "IsModifiable": true,
           "ApplyMethod": "pending-reboot",
           "Source": "system",
           "ApplyType": "dynamic",
           "AllowedValues": "enabled,disabled",
           "Description": "Enables auditing on cluster.",
           "ParameterValue": "disabled"
       },
       {
           "DataType": "string",
           "ParameterName": "tls",
           "IsModifiable": true,
           "ApplyMethod": "pending-reboot",
           "Source": "system",
           "ApplyType": "static",
           "AllowedValues": "disabled,enabled",
           "Description": "Config to enable/disable TLS",
           "ParameterValue": "enabled"
       },
       {
           "DataType": "string",
           "ParameterName": "ttl_monitor",
           "IsModifiable": true,
           "ApplyMethod": "pending-reboot",
           "Source": "user",
           "ApplyType": "dynamic",
           "AllowedValues": "disabled,enabled",
           "Description": "Enables TTL Monitoring",
           "ParameterValue": "enabled"
       }
   ]
}
```
describe-db-cluster-snapshot-attributes

The following code example shows how to use describe-db-cluster-snapshot-attributes.

AWS CLI

To list an Amazon DocumentDB snapshot attribute names and values

The following describe-db-cluster-snapshot-attributes example lists the attribute names and values for the Amazon DocumentDB snapshot sample-cluster-snapshot.

```bash
aws docdb describe-db-cluster-snapshot-attributes
   --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```json
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": []
         }
      ],
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
   }
}
```

For more information, see DescribeDBClusterSnapshotAttributes in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDBClusterSnapshotAttributes in AWS CLI Command Reference.

describe-db-cluster-snapshots

The following code example shows how to use describe-db-cluster-snapshots.
AWS CLI

To describe Amazon DocumentDB snapshots

The following describe-db-cluster-snapshots example displays details for the Amazon DocumentDB snapshot sample-cluster-snapshot.

```
aws docdb describe-db-cluster-snapshots \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
   "DBClusterSnapshots": [
   {
      "AvailabilityZones": [
         "us-west-2a",
         "us-west-2b",
         "us-west-2c",
         "us-west-2d"
      ],
      "Status": "available",
      "SnapshotType": "manual",
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
      "DBClusterIdentifier": "sample-cluster",
      "MasterUsername": "master-user",
      "StorageEncrypted": false,
      "VpcId": "vpc-91280df6",
      "EngineVersion": "3.6.0",
      "PercentProgress": 100,
      "Port": 0,
      "Engine": "docdb",
      "ClusterCreateTime": "2019-03-15T20:29:58.836Z"
   }
   ]
}
```

For more information, see DescribeDBClusterSnapshots in the Amazon DocumentDB Developer Guide.
describe-db-clusters

The following code example shows how to use describe-db-clusters.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following describe-db-clusters example displays details for the Amazon DocumentDB cluster sample-cluster. By omitting the --db-cluster-identifier parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters
   --db-cluster-identifier sample-cluster
```

Output:

```
{
   "DBClusters": [
     {
       "DBClusterParameterGroup": "default.docdb3.6",
       "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
       "PreferredBackupWindow": "00:00-00:30",
       "DBClusterIdentifier": "sample-cluster",
       "LatestRestorableTime": "2019-03-18T20:28:03.239Z",
       "MasterUsername": "master-user",
       "DBClusterMembers": [
         {
           "PromotionTier": 1,
           "DBClusterParameterGroupStatus": "in-sync",
           "IsClusterWriter": false,
           "DBInstanceIdentifier": "sample-cluster"
         },
         {
           "PromotionTier": 1,
           "DBClusterParameterGroupStatus": "in-sync",
           "IsClusterWriter": true,
           "DBInstanceIdentifier": "sample-cluster2"
         }
       ]
     }
   ]
}```
For more information, see [Describing Amazon DocumentDB Clusters](https://docs.aws.amazon.com/documentdb/2019-01-01/userguide/rds-documentdb-creating-clusters.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbClusters](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-clusters.html) in AWS CLI Command Reference.
describe-db-engine-versions

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

**To list available Amazon DocumentDB engine versions**

The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```bash
aws docdb describe-db-engine-versions \
   --engine docdb
```

Output:

```json
{
  "DBEngineVersions": [
    {
      "DBEngineVersionDescription": "DocDB version 1.0.200837",
      "DBParameterGroupFamily": "docdb3.6",
      "EngineVersion": "3.6.0",
      "ValidUpgradeTarget": [],
      "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
      "SupportsLogExportsToCloudwatchLogs": true,
      "Engine": "docdb",
      "ExportableLogTypes": [
        "audit"
      ]
    }
  ]
}
```

For more information, see [DescribeDBEngineVersions](https://docs.aws.amazon.com/aurora/latest/userguide/aurora-cluster-db-engine-versions.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbEngineVersions](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-engine-versions.html) in AWS CLI Command Reference.

describe-db-instances

The following code example shows how to use `describe-db-instances`.
AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.

```bash
code
aws docdb describe-db-instances \
   --db-instance-identifier sample-cluster-instance
```

Output:

```json
{
   "DBInstances": [
      {
         "Endpoint": {
            "HostedZoneId": "ZNKXH85TT8WVW",
            "Address": "sample-cluster-instance.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
            "Port": 27017
         },
         "PreferredBackupWindow": "00:00-00:30",
         "DBInstanceStatus": "available",
         "DBInstanceClass": "db.r4.large",
         "EnabledCloudwatchLogsExports": [
            "audit"
         ],
         "DBInstanceIdentifier": "sample-cluster-instance",
         "DBSubnetGroup": {
            "Subnets": [
               {
                  "SubnetStatus": "Active",
                  "SubnetIdentifier": "subnet-4e26d263",
                  "SubnetAvailabilityZone": {
                     "Name": "us-west-2a"
                  }
               },
               {
                  "SubnetStatus": "Active",
                  "SubnetIdentifier": "subnet-afc329f4",
                  "SubnetAvailabilityZone": {
                     "Name": "us-west-2c"
                  }
               }
            ]
         }
      }
   ]
}
```

```json
{
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-53ab3636",
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    }
},
{
    "SubnetStatus": "Active",

Describe DB Subnet Groups

The following code example shows how to use describe-db-subnet-groups.

**AWS CLI**

To retrieve a list of Amazon DocumentDB subnet descriptions

The following describe-db-subnet-groups example describes details for the Amazon DocumentDB subnet named default.

```bash
aws docdb describe-db-subnet-groups \
--db-subnet-group-name default
```

Output:

```json
{
  "DBSubnetGroups": [
    {
      "VpcId": "vpc-91280df6",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-4e26d263",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        },
        {
          "SubnetIdentifier": "subnet-afc329f4",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
```

For more information, see [Describing Amazon DocumentDB Instances](https://docs.aws.amazon.com/documentdb-developer-guide/using-network.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbInstances](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-instances.html) in *AWS CLI Command Reference*.
"Name": "us-west-2c"
},
{

        "Name": "us-west-2b"
    }
}
],
"DBSubnetGroupName": "default",
"DBSubnetGroupStatus": "Complete",
"DBSubnetGroupDescription": "default"
]
}

For more information, see [Describing Subnet Groups](#) in the [Amazon DocumentDB Developer Guide](#).

- For API details, see [DescribeDbSubnetGroups](#) in [AWS CLI Command Reference](#).

describe-engine-default-cluster-parameters

The following code example shows how to use `describe-engine-default-cluster-parameters`.

**AWS CLI**

To describe the default engine and system parameter information for Amazon DocumentDB

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group `docdb3.6`.
aws docdb describe-engine-default-cluster-parameters \
   --db-parameter-group-family docdb3.6

Output:

```
{
    "EngineDefaults": {
        "DBParameterGroupFamily": "docdb3.6",
        "Parameters": [
            {
                "ApplyType": "dynamic",
                "ParameterValue": "disabled",
                "Description": "Enables auditing on cluster.",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "enabled,disabled",
                "ParameterName": "audit_logs",
                "IsModifiable": true
            },
            {
                "ApplyType": "static",
                "ParameterValue": "enabled",
                "Description": "Config to enable/disable TLS",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "tls",
                "IsModifiable": true
            },
            {
                "ApplyType": "dynamic",
                "ParameterValue": "enabled",
                "Description": "Enables TTL Monitoring",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "ttl_monitor",
                "IsModifiable": true
            }
        ]
    }
}
```
For more information, see `DescribeEngineDefaultClusterParameters` in the Amazon DocumentDB Developer Guide.

- For API details, see `DescribeEngineDefaultClusterParameters` in AWS CLI Command Reference.

**describe-event-categories**

The following code example shows how to use `describe-event-categories`.

**AWS CLI**

**To describe all Amazon DocumentDB event categories**

The following `describe-event-categories` example lists all categories for the Amazon DocumentDB event source type `db-instance`.

```bash
aws docdb describe-event-categories \
  --source-type db-cluster
```

Output:

```json
{
  "EventCategoriesMapList": [
    {
      "SourceType": "db-cluster",
      "EventCategories": [
        "failover",
        "maintenance",
        "notification",
        "failure"
      ]
    }
  ]
}
```

For more information, see Viewing Event Categories in the Amazon DocumentDB Developer Guide.

- For API details, see `DescribeEventCategories` in AWS CLI Command Reference.
**describe-events**

The following code example shows how to use `describe-events`.

**AWS CLI**

**To list Amazon DocumentDB events**

The following `describe-events` example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```bash
aws docdb describe-events \\
  --duration 1440
```

This command produces no output. Output:

```json
{
    "Events": [
        {
            "EventCategories": [
                "failover"
            ],

For more information, see Viewing Amazon DocumentDB Events in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

describe-orderable-db-instance-options

The following code example shows how to use describe-orderable-db-instance-options.

AWS CLI

To find the Amazon DocumentDB instance options you can order
The following `describe-orderable-db-instance-options` example lists all instance options for Amazon DocumentDB for a region.

```
aws docdb describe-orderable-db-instance-options \
   --engine docdb \
   --region us-east-1
```

Output:

```
{
   "OrderableDBInstanceOptions": [
   {
      "Vpc": true,
      "AvailabilityZones": [
      {
         "Name": "us-east-1a"

The following code example shows how to use `describe-pending-maintenance-actions`.

**AWS CLI**

To list your pending Amazon DocumentDB maintenance actions

The following `describe-pending-maintenance-actions` example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```
{
   "PendingMaintenanceActions": []
}
```

For more information, see [Maintaining Amazon DocumentDB](https://docs.aws.amazon.com/documentdb/latest/developerguide/maintaining.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribePendingMaintenanceActions](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-pending-maintenance-actions.html) in *AWS CLI Command Reference*.

**failover-db-cluster**

The following code example shows how to use `failover-db-cluster`.

```bash
aws docdb failover-db-cluster
```

For more information, see [Adding an Amazon DocumentDB Instance to a Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/cluster-add.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [FailoverDBCluster](https://docs.aws.amazon.com/cli/latest/reference/docdb/failover-db-cluster.html) in *AWS CLI Command Reference*.
AWS CLI

To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster `sample-cluster` to failover to a replica.

```bash
aws docdb failover-db-cluster \
   --db-cluster-identifier sample-cluster
```

Output:

```json
{
   "DBCluster": {
      "AssociatedRoles": [],
      "DBClusterIdentifier": "sample-cluster",
      "EngineVersion": "3.6.0",
      "DBSubnetGroup": "default",
      "MasterUsername": "master-user",
      "EarliestRestorableTime": "2019-03-15T20:30:47.020Z",
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
      "AvailabilityZones": [
         "us-west-2a",
         "us-west-2c",
         "us-west-2b"
      ],
      "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
      "PreferredBackupWindow": "00:00-00:30",
      "Port": 27017,
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sg-77186e0d",
            "Status": "active"
         }
      ],
      "StorageEncrypted": false,
      "MultiAZ": true,
      "Status": "available",
      "DBClusterMembers": [
         {
         }
      ]
   }
}
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list all the tags on an Amazon DocumentDB resource

The following `list-tags-for-resource` example lists all tags on the Amazon DocumentDB cluster sample-cluster.

```
aws docdb list-tags-for-resource
```
Output:

```json
{
   "TagList": [
      {
         "Key": "A",
         "Value": "ALPHA"
      },
      {
         "Key": "B",
         "Value": ""
      },
      {
         "Key": "C",
         "Value": "CHARLIE"
      }
   ]
}
```

For more information, see [Listing Tags on an Amazon DocumentDB Resource](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-db-cluster-parameter-group

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

**To modify an Amazon DocumentDB DB cluster parameter group**

The following `modify-db-cluster-parameter-group` example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```bash
aws docdb modify-db-cluster-parameter-group \
   --db-cluster-parameter-group-name custom3-6-param-grp \
   --parameters ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-reboot \
```

Actions and scenarios
ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot

Output:

```
{
   "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see Modifying an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbClusterParameterGroup in AWS CLI Command Reference.

**modify-db-cluster-snapshot-attribute**

The following code example shows how to use modify-db-cluster-snapshot-attribute.

**AWS CLI**

**Example 1: To add an attribute to an Amazon DocumentDB snapshot**

The following modify-db-cluster-snapshot-attribute example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
   --db-cluster-snapshot-identifier sample-cluster-snapshot \
   --attribute-name restore \
   --values-to-add 123456789011 123456789012 123456789013
```

Output:

```
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "123456789011",
               "123456789012",
               "123456789013"
```

Actions and scenarios
Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following modify-db-cluster-snapshot-attribute example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
  --db-cluster-snapshot-identifier sample-cluster-snapshot \ 
  --attribute-name restore \ 
  --values-to-remove 123456789012
```

Output:

```
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "123456789011",
          "123456789013"
        ]
      }
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
  }
}
```

For more information, see ModifyDBClusterSnapshotAttribute in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbClusterSnapshotAttribute in AWS CLI Command Reference.

modify-db-cluster

The following code example shows how to use modify-db-cluster.
To modify an Amazon DocumentDB cluster

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```
aws docdb modify-db-cluster \
   --db-cluster-identifier sample-cluster \
   --no-apply-immediately \
   --backup-retention-period 7 \
   --preferred-backup-window 18:00-18:30 \
   --preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```
{
   "DBCluster": {
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
      "DBClusterMembers": [
         {
            "DBClusterParameterGroupStatus": "in-sync",
            "DBInstanceIdentifier": "sample-cluster",
            "IsClusterWriter": true,
            "PromotionTier": 1
         },
         {
            "DBClusterParameterGroupStatus": "in-sync",
            "DBInstanceIdentifier": "sample-cluster2",
            "IsClusterWriter": false,
            "PromotionTier": 2
         }
      ],
      "HostedZoneId": "ZNKXH85TT8WVW",
      "StorageEncrypted": false,
      "PreferredBackupWindow": "18:00-18:30",
      "MultiAZ": true,
      "EngineVersion": "3.6.0",
      "MasterUsername": "master-user",
   }
}
For more information, see [Modifying an Amazon DocumentDB Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/modify-cluster-endpoints.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster.html) in *AWS CLI Command Reference*.

**modify-db-instance**

The following code example shows how to use `modify-db-instance`.

```json
"ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"DBSubnetGroup": "default",
"EarliestRestorableTime": "2019-03-15T20:30:47.020Z",
"PreferredMaintenanceWindow": "sun:20:00-sun:20:30",
"AssociatedRoles": [],
"EnabledCloudwatchLogsExports": ["audit"],
"Engine": "docdb",
"DBClusterParameterGroup": "default.docdb3.6",
"BackupRetentionPeriod": 7,
"DBClusterIdentifier": "sample-cluster",
"AvailabilityZones": ["us-west-2a", "us-west-2c", "us-west-2b"],
"Status": "available",
"DbClusterResourceId": "cluster-UP4EF2PVDFVHHDJQTYDAIGHLE",
"VpcSecurityGroups": [
  {
    "VpcSecurityGroupId": "sg-77186e0d",
    "Status": "active"
  }
],
"Port": 27017
}
```
AWS CLI

To modify an Amazon DocumentDB instance

The following `modify-db-instance` example modifies the Amazon DocumentDB instance `sample-cluster2` by changing its instance class to `db.r4.4xlarge` and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```bash
aws docdb modify-db-instance \
   --db-instance-identifier sample-cluster2 \
   --apply-immediately \
   --db-instance-class db.r4.4xlarge \
   --promotion-tier 5
```

Output:

```json
{
   "DBInstance": {
      "EngineVersion": "3.6.0",
      "StorageEncrypted": false,
      "DBInstanceClass": "db.r4.large",

},
For more information, see Modifying an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbInstance in AWS CLI Command Reference.

modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following modify-db-subnet-group example modifies the subnet group sample-subnet-group by adding the specified subnets and a new description.

```
aws docdb modify-db-subnet-group \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
  --db-subnet-group-description "New subnet description"
```

Output:

```json
{
   "DBSubnetGroup": {
      "DBSubnetGroupName": "sample-subnet-group",
      "SubnetGroupStatus": "Complete",
      "VpcId": "vpc-91280df6",
      "DBSubnetGroupDescription": "New subnet description",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-b3806e8f",
            "SubnetStatus": "Active",
            "SubnetAvailabilityZone": {
               "Name": "us-west-2a"
            }
         }
      ]
   }
}
```
For more information, see [Modifying an Amazon DocumentDB Subnet Group](#) in the [Amazon DocumentDB Developer Guide](#).

- For API details, see [ModifyDbSubnetGroup](#) in [AWS CLI Command Reference](#).

**reboot-db-instance**

The following code example shows how to use `reboot-db-instance`.

**AWS CLI**

To reboot an Amazon DocumentDB instance

The following `reboot-db-instance` example reboots the Amazon DocumentDB instance `sample-cluster2`.

```bash
aws docdb reboot-db-instance \
--db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```json
{
    "DBInstance": {
        "PreferredBackupWindow": "18:00-18:30",
```
"DBInstanceIdentifier": "sample-cluster2",
"VpcSecurityGroups": [
    {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
    }
],
"DBSubnetGroup": {
    "VpcId": "vpc-91280df6",
    "Subnets": [
        {
            "SubnetStatus": "Active",
            "SubnetAvailabilityZone": {
                "Name": "us-west-2a"
            },
            "SubnetIdentifier": "subnet-4e26d263"
        },
        {
            "SubnetStatus": "Active",
            "SubnetAvailabilityZone": {
                "Name": "us-west-2c"
            },
            "SubnetIdentifier": "subnet-afc329f4"
        },
        {
            "SubnetStatus": "Active",
            "SubnetAvailabilityZone": {
                "Name": "us-west-2d"
            },
            "SubnetIdentifier": "subnet-53ab3636"
        },
        {
            "SubnetStatus": "Active",
            "SubnetAvailabilityZone": {
                "Name": "us-west-2b"
            },
            "SubnetIdentifier": "subnet-991cb8d0"
        }
    ],
    "SubnetGroupStatus": "Complete",
    "DBSubnetGroupName": "default",
    "DBSubnetGroupDescription": "default"
},
"PendingModifiedValues": {}}
For more information, see [Rebooting an Amazon DocumentDB Instance](https://docs.aws.amazon.com/documentdb/latest/developerguide) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RebootDbInstance](https://docs.aws.amazon.com/cli/latest/reference/docdb/reboot-database-instance.html) in *AWS CLI Command Reference*.

### `remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

#### AWS CLI

**To remove tags from an Amazon DocumentDB resource**

The following `remove-tags-from-resource` example removes the tag with the key named `B` from the Amazon DocumentDB cluster `sample-cluster`.

```bash
aws docdb remove-tags-from-resource \
```
This command produces no output.

For more information, see Removing Tags from an Amazon DocumentDBResource in the Amazon DocumentDB Developer Guide.

- For API details, see RemoveTagsFromResource in AWS CLI Command Reference.

**reset-db-cluster-parameter-group**

The following code example shows how to use reset-db-cluster-parameter-group.

**AWS CLI**

**To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group**

The following reset-db-cluster-parameter-group example resets the parameter `ttl_monitor` in the Amazon DocumentDB parameter group `custom3-6-param-grp` to its default value.

```bash
aws docdb reset-db-cluster-parameter-group \
   --db-cluster-parameter-group-name custom3-6-param-grp \
   --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```json
{
   "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the Amazon DocumentDB Developer Guide.

**To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group**

The following reset-db-cluster-parameter-group example resets all parameters in the Amazon DocumentDB parameter group `custom3-6-param-grp` to their default value.

```bash
aws docdb reset-db-cluster-parameter-group \
```
--db-cluster-parameter-group-name custom3-6-param-grp \
--reset-all-parameters

Output:

{
  "DBClusterParameterGroupName": "custom3-6-param-grp"
}

For more information, see Resetting an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see ResetDbClusterParameterGroup in AWS CLI Command Reference.

**restore-db-cluster-from-snapshot**

The following code example shows how to use `restore-db-cluster-from-snapshot`.

**AWS CLI**

To restore an Amazon DocumentDB cluster from an automatic or manual snapshot

The following `restore-db-cluster-from-snapshot` example creates a new Amazon DocumentDB cluster named `sample-cluster-2019-03-16-00-01-restored` from the snapshot `rds:sample-cluster-2019-03-16-00-01`.

```
aws docdb restore-db-cluster-from-snapshot \
  --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
  --engine docdb \
  --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```
{
  "DBCluster": {
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Engine": "docdb",
    "DBClusterMembers": [],
    "MultiAZ": false,
    "AvailabilityZones": [
      "us-west-2a",
```

```
For more information, see [Restoring from a Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterFromSnapshot](#) in *AWS CLI Command Reference*.

### restore-db-cluster-to-point-in-time

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot
The following `restore-db-cluster-to-point-in-time` example uses the sample-cluster-snapshot to create a new Amazon DocumentDB cluster, sample-cluster-pit, using the latest restorable time.

```bash
aws docdb restore-db-cluster-to-point-in-time \
    --db-cluster-identifier sample-cluster-pit \
    --use-latest-restorable-time
```

Output:

```json
{
    "DBCluster": {
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 3,
        "MasterUsername": "master-user",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "PreferredBackupWindow": "00:00-00:30",
        "MultiAZ": false,
        "DBClusterIdentifier": "sample-cluster-pit",
        "DBSubnetGroup": "default",
        "AssociatedRoles": [],
        "DBClusterParameterGroup": "default.docdb3.6",
        "DBClusterMembers": [],
        "Status": "creating",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
            "us-west-2b"
        ],
        "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017,
        "Engine": "docdb",
        "EngineVersion": "3.6.0",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-77186e0d",
                "Status": "active"
            }
        ]
    }
}
```
"PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
"Endpoint": "sample-cluster-pit.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"DbClusterResourceId": "cluster-NLCABBXOSE2QPQ4GOLZIFWEPLM",
}
}
}

For more information, see [Restoring a Snapshot to a Point in Time](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterToPointInTime](#) in *AWS CLI Command Reference*.

### start-db-cluster

The following code example shows how to use `start-db-cluster`.

**AWS CLI**

**To start a stopped Amazon DocumentDB cluster**

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```bash
aws docdb start-db-cluster \
  --db-cluster-identifier sample-cluster
```

**Output:**

```json
{
  "DBCluster": {
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Engine": "docdb",
    "DBClusterMembers": [],
    "MultiAZ": false,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1c",
      "us-east-1f"
    ],
    "StorageEncrypted": false,
  }
}```
For more information, see [Stopping and Starting an Amazon DocumentDB Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/howto-stop-cluster.html) in the [Amazon DocumentDB Developer Guide](https://docs.aws.amazon.com/documentdb/latest/developerguide/).

**stop-db-cluster**

The following code example shows how to use stop-db-cluster.

**AWS CLI**

**To stop a running Amazon DocumentDB cluster**

The following stop-db-cluster example stops the specified Amazon DocumentDB cluster.

```bash
aws docdb stop-db-cluster
```
--db-cluster-identifier sample-cluster

Output:

```json
{
   "DBCluster": {
      "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
      "HostedZoneId": "ZNKXH85TT8WVW",
      "Engine": "docdb",
      "DBClusterMembers": [],
      "MultiAZ": false,
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1c",
         "us-east-1f"
      ],
      "StorageEncrypted": false,
      "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjozrlsfc.us-east-1.docdb.amazonaws.com",
      "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjozrlsfc.us-east-1.docdb.amazonaws.com",
      "Port": 27017,
      "PreferredBackupWindow": "00:00-00:30",
      "DBSubnetGroup": "default",

         }
      ]
   }
}
```
DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- **Actions**

### Actions

**batch-get-item**

The following code example shows how to use `batch-get-item`.

### AWS CLI

**To retrieve multiple items from a table**

The following `batch-get-items` example reads multiple items from the `MusicCollection` table using a batch of three `GetItem` requests, and requests the number of read capacity units consumed by the operation. The command returns only the `AlbumTitle` attribute.

```
aws dynamodb batch-get-item \
 --request-items file://request-items.json \
 --return-consumed-capacity TOTAL
```
Contents of request-items.json:

```
{
    "MusicCollection": {
        "Keys": [
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Scared of My Shadow"
            }
        ],
        "ProjectionExpression":"AlbumTitle"
    }
}
```

Output:

```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Blue Sky Blues"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Louder Than Ever"
                }
            }
        ]
    }
}
```
For more information, see Batch Operations in the Amazon DynamoDB Developer Guide.

- For API details, see BatchGetItem in AWS CLI Command Reference.

**batch-write-item**

The following code example shows how to use batch-write-item.

**AWS CLI**

**To add multiple items to a table**

The following batch-write-item example adds three new items to the MusicCollection table using a batch of three PutItem requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```bash
aws dynamodb batch-write-item \
   --request-items file://request-items.json \
   --return-consumed-capacity INDEXES \
   --return-item-collection-metrics SIZE
```

Contents of request-items.json:

```json
{
   "MusicCollection": [
      {
         "PutRequest": {
            "Item": {
               "Artist": {"S": "No One You Know"},
               "SongTitle": {"S": "Call Me Today"},
               "AlbumTitle": {"S": "Somewhat Famous"}
            }
         }
      }
   ]
}
```
Output:

```json
{
   "UnprocessedItems": {},
   "ItemCollectionMetrics": {
      "MusicCollection": [
         {
            "ItemCollectionKey": {
               "Artist": {
                  "S": "No One You Know"
               },
               "SongTitle": {
                  "S": "Scared of My Shadow"
               },
               "AlbumTitle": {
                  "S": "Blue Sky Blues"
               }
            },
            "SizeEstimateRangeGB": [
               0.0,
               1.0
            ]
         }
      ]
   }
}
```
For more information, see [Batch Operations](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [BatchWriteItem](#) in *AWS CLI Command Reference*.

**create-backup**

The following code example shows how to use create-backup.

**AWS CLI**

*To create a backup for an existing DynamoDB table*

The following `create-backup` example creates a backup of the MusicCollection table.

```
aws dynamodb create-backup
   --table-name MusicCollection
```
--backup-name MusicCollectionBackup

Output:

```json
{
   "BackupDetails": {

**create-global-table**

The following code example shows how to use create-global-table.

**AWS CLI**

To create a global table

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```
aws dynamodb create-global-table \
   --global-table-name MusicCollection \
   --replication-group RegionName=us-east-2 RegionName=us-east-1 \
   --region us-east-2
```

Output:

```json
{
}
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.
• For API details, see CreateGlobalTable in AWS CLI Command Reference.

create-table

The following code example shows how to use create-table.

AWS CLI

Example 1: To create a table with tags

The following create-table example uses the specified attributes and key schema to create a table named MusicCollection. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of Owner and a value of blueTeam.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S \
  AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH \
  AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --tags Key=Owner,Value=blueTeam
```
Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "TableName": "MusicCollection",
        "TableStatus": "CREATING",
        "KeySchema": [
            {
                "KeyType": "HASH",
                "AttributeName": "Artist"
            },
            {
                "KeyType": "RANGE",
                "AttributeName": "SongTitle"
            }
        ],
        "ItemCount": 0,
        "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

**Example 2: To create a table in On-Demand Mode**
The following example creates a table called `MusicCollection` using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=Artist,AttributeType=S \
    AttributeName=SongTitle,AttributeType=S \
    --key-schema AttributeName=Artist,KeyType=HASH \
    AttributeName=SongTitle,KeyType=RANGE \ 
    --billing-mode PAY_PER_REQUEST
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 0,
            "WriteCapacityUnits": 0
        }
    }
}
```
For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To create a table and encrypt it with a Customer Managed CMK**

The following example creates a table named `MusicCollection` and encrypts it using a customer managed CMK.

```bash
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-a123-ab1234a1b234
```

**Output:**

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
```

```json
```
"TableName": "MusicCollection",
"KeySchema": [
    {
        "AttributeName": "Artist",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
    }
],
"TableStatus": "CREATING",

"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"SSEDescription": {
    "Status": "ENABLED",
    "SSEType": "KMS",
    "KMSMasterKeyArn": "arn:aws:kms:us-west-2:123456789012:key/abcd1234-abcd-1234-abcd-1234-ab1234ab1234"
}
}

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named MusicCollection with a Local Secondary Index named AlbumTitleIndex.

```bash
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S AttributeName=AlbumTitle,AttributeType=S
```
--key-schema AttributeName=Artist,KeyType=HASH
AttributeName=SongTitle,KeyType=RANGE \
--provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
--local-secondary-indexes \
"[
  
  
  "IndexName": "AlbumTitleIndex",
  "KeySchema": [
    
    {"AttributeName": "Artist","KeyType":"HASH"},
    {"AttributeName": "AlbumTitle","KeyType":"RANGE"}
  ],
  "Projection": {
    
    "ProjectionType": "INCLUDE",
    "NonKeyAttributes": ["Genre", "Year"]
  }
}
]"

Output:

```json
{  "TableDescription": {
    "AttributeDefinitions": [
      
      {"AttributeName": "AlbumTitle",  
        "AttributeType": "S"
      },
      
      {"AttributeName": "Artist",  
        "AttributeType": "S"
      },
      
      {"AttributeName": "SongTitle",  
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      
      {"AttributeName": "Artist",  
        "KeyType": "HASH"
      },
      
      {}
    ]
  }
```

Actions and scenarios
"AttributeName": "SongTitle",
  "KeyType": "RANGE"

  }
]"
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

**Example 5: To create a table with a Global Secondary Index**

The following example creates a table named GameScores with a Global Secondary Index called GameTitleIndex. The base table has a partition key of UserId and a sort key of GameTitle, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of GameTitle and a sort key of TopScore, allowing you to quickly find the overall highest score for a particular game.

```
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \
  AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \
  --key-schema AttributeName=UserId,KeyType=HASH \
  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --global-secondary-indexes \"
  [ 
    {
      "IndexName": "GameTitleIndex",
      "KeySchema": [
        {
          "AttributeName": "GameTitle",
          "KeyType": "HASH"
        },
        {
          "AttributeName": "TopScore",
          "KeyType": "RANGE"
        }
      ],
      "Projection": {
        "ProjectionType": "INCLUDE",
        "NonKeyAttributes": ["UserId"]
      },
      "ProvisionedThroughput": {
        "ReadCapacityUnits": 10,
        "WriteCapacityUnits": 5
      }
    }
  ]"
```

**Output:**

```
{
  "TableDescription": {
    "AttributeDefinitions": [ 
```
[
  {
    "AttributeName": "GameTitle",
    "AttributeType": "S"
  },
  {
    "AttributeName": "TopScore",
    "AttributeType": "N"
  },
  {
    "AttributeName": "UserId",
    "AttributeType": "S"
  }
],
"TableName": "GameScores",
"KeySchema": [
  {
    "AttributeName": "UserId",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "GameTitle",
    "KeyType": "RANGE"
  }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T17:28:15.602000-07:00",
"ProvisionedThroughput": {
  "NumberOfDecreasesToday": 0,
  "ReadCapacityUnits": 10,
  "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"GlobalSecondaryIndexes": [
  {
    "IndexName": "GameTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "TopScore",
        "KeyType": "N"
      }
    ]
  }
]
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 6: To create a table with multiple Global Secondary Indexes at once

The following example creates a table named GameScores with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```
aws dynamodb create-table \
  --table-name GameScores \n  --attribute-definitions AttributeName=UserId,AttributeType=S \n  AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \n  AttributeName=Date,AttributeType=S \n  --key-schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \n  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \n  --global-secondary-indexes file://gsi.json
```
Contents of gsi.json:

```json
[
    {
        "IndexName": "GameTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "TopScore",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        }
    },
    {
        "IndexName": "GameDateIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "Date",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        }
    }
]
```
Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Date",
            "AttributeType": "S"
         },
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "TopScore",
            "AttributeType": "N"
         },

]
Example 7: To create a table with Streams enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \
  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH \
  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    },
    "IndexStatus": "CREATING",
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    },
    "IndexSizeBytes": 0,
    "ItemCount": 0,
    "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores/index/GameDateIndex"
  }
}
```
Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.
aws dynamodb create-table
   --table-name GameScores
   --attribute-definitions AttributeName=UserId,AttributeType=S
   AttributeName=GameTitle,AttributeType=S 
   --key-schema AttributeName=UserId,KeyType=HASH
   AttributeName=GameTitle,KeyType=RANGE 
   --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 
   --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY

Output:

{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "UserId",
            "AttributeType": "S"
         }
      ],
      "TableName": "GameScores",
      "KeySchema": [
         {
            "AttributeName": "UserId",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "GameTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 10,
         "WriteCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "ItemCount": 0,
   },
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"StreamSpecification": {
  "StreamEnabled": true,
  "StreamViewType": "KEYS_ONLY"
},
"LatestStreamLabel": "2023-05-25T18:45:34.140",
"DeletionProtectionEnabled": false
}
}

For more information, see Change data capture for DynamoDB Streams in the Amazon DynamoDB Developer Guide.

**Example 9: To create a table with the Standard Infrequent Access class**

The following example creates a table called GameScores and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \n  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH \n  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      }
    ],
    "AttributeDefinitions": [
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ]
  }
}
```
For more information, see Table classes in the Amazon DynamoDB Developer Guide.

Example 10: To Create a table with Delete Protection enabled

The following example creates a table called GameScores and enables deletion protection.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S 
  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH 
  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
```
Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T23:02:17.093000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeletionProtectionEnabled": true
    }
}
```

For more information, see [Using deletion protection](https://docs.aws.amazon.com/amazon-dynamodb/latest/developerguide/using-deletion-protection.html) in the *Amazon DynamoDB Developer Guide*. 
• For API details, see CreateTable in AWS CLI Command Reference.

delete-backup

The following code example shows how to use delete-backup.

AWS CLI

To delete an existing DynamoDB backup

The following delete-backup example deletes the specified existing backup.

```bash
aws dynamodb delete-backup \
   --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```

Output:

```json
{
   "BackupDescription": {
      "BackupDetails": {
         "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
         "BackupName": "MusicCollectionBackup",
         "BackupSizeBytes": 0,
         "BackupStatus": "DELETED",
         "BackupType": "USER",
         "BackupCreationDateTime": 1576616366.715
      },
      "SourceTableDetails": {
         "TableName": "MusicCollection",
         "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
         "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
         "TableSizeBytes": 0,
         "KeySchema": [
            {
               "AttributeName": "Artist",
               "KeyType": "HASH"
            },
            {
               "AttributeName": "SongTitle",
               "KeyType": "RANGE"
            }
         ]
      }
   }
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DeleteBackup in AWS CLI Command Reference.

**delete-item**

The following code example shows how to use delete-item.

**AWS CLI**

**Example 1: To delete an item**

The following delete-item example deletes an item from the MusicCollection table and requests details about the item that was deleted and the capacity used by the request.

```
aws dynamodb delete-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-values ALL_OLD \
  --return-consumed-capacity TOTAL \
  --return-item-collection-metrics SIZE
```

Contents of key.json:

```
{
  "Artist": {"S": "No One You Know"},
```
Example 2: To delete an item conditionally

The following example deletes an item from the ProductCatalog table only if its `ProductCategory` is either Sporting Goods or Gardening Supplies and its price is between 500 and 600. It returns details about the item that was deleted.

```
aws dynamodb delete-item \
```
--table-name ProductCatalog
--key '{"Id":{"N":"456"}}'
--condition-expression "((ProductCategory IN (:cat1, :cat2)) and (#P between :lo and :hi))"
--expression-attribute-names file://names.json
--expression-attribute-values file://values.json
--return-values ALL_OLD

Contents of names.json:

{
    "#P": "Price"
}

Contents of values.json:

{
    ":cat1": {"S": "Sporting Goods"},
    ":cat2": {"S": "Gardening Supplies"},
    ":lo": {"N": "500"},
    ":hi": {"N": "600"}
}

Output:

{
    "Attributes": {
        "Id": {
            "N": "456"
        },
        "Price": {
            "N": "550"
        },
        "ProductCategory": {
            "S": "Sporting Goods"
        }
    }
}

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteItem](#) in *AWS CLI Command Reference*. 
delete-table

The following code example shows how to use delete-table.

AWS CLI

To delete a table

The following delete-table example deletes the MusicCollection table.

```bash
aws dynamodb delete-table \
   --table-name MusicCollection
```

Output:

```json
{
   "TableDescription": {
      "TableStatus": "DELETING",
      "TableSizeBytes": 0,
      "ItemCount": 0,
      "TableName": "MusicCollection",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "WriteCapacityUnits": 5,
         "ReadCapacityUnits": 5
      }
   }
}
```

For more information, see Deleting a Table in the Amazon DynamoDB Developer Guide.

- For API details, see DeleteTable in AWS CLI Command Reference.

describe-backup

The following code example shows how to use describe-backup.

AWS CLI

To get information about an existing backup of a table

The following describe-backup example displays information about the specified existing backup.
aws dynamodb describe-backup
   --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a

Output:

{
  "BackupDescription": {
    "BackupDetails": {
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
      "BackupName": "MusicCollectionBackup",
      "BackupSizeBytes": 0,
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupCreationDateTime": 1576616366.715
    },
    "SourceTableDetails": {
      "TableName": "MusicCollection",
      "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "TableSizeBytes": 0,
      "KeySchema": [
        {
          "AttributeName": "Artist",
          "KeyType": "HASH"
        },
        {
          "AttributeName": "SongTitle",
          "KeyType": "RANGE"
        }
      ],
      "TableCreationDateTime": 1576615228.571,
      "ProvisionedThroughput": {
        "ReadCapacityUnits": 5,
        "WriteCapacityUnits": 5
      },
      "ItemCount": 0,
      "BillingMode": "PROVISIONED"
    },
    "SourceTableFeatureDetails": {}
  }
}
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/ondemand-backups-enable.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-backups.html) in *AWS CLI Command Reference*.

---

**describe-continuous-backups**

The following code example shows how to use `describe-continuous-backups`.

**AWS CLI**

**To get information about continuous backups for a DynamoDB table**

The following `describe-continuous-backups` example displays details about the continuous backup settings for the `MusicCollection` table.

```bash
aws dynamodb describe-continuous-backups \
  --table-name MusicCollection
```

**Output:**

```json
{
  "ContinuousBackupsDescription": {
    "ContinuousBackupsStatus": "ENABLED",
    "PointInTimeRecoveryDescription": {
      "PointInTimeRecoveryStatus": "DISABLED"
    }
  }
}
```

For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/pitr.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeContinuousBackups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-continuous-backups.html) in *AWS CLI Command Reference*.

---

**describe-contributor-insights**

The following code example shows how to use `describe-contributor-insights`.

---

Actions and scenarios
To view Contributor Insights settings for a DynamoDB table

The following describe-contributor-insights example displays the Contributor Insights settings for the MusicCollection table and the AlbumTitle-index global secondary index.

```
aws dynamodb describe-contributor-insights \
  --table-name MusicCollection \
  --index-name AlbumTitle-index
```

Output:

```
{
  "TableName": "MusicCollection",
  "IndexName": "AlbumTitle-index",
  "ContributorInsightsRuleList": [
    "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
  ],
  "ContributorInsightsStatus": "ENABLED",
  "LastUpdateDateTime": 1576629654.78
}
```

describe-endpoints

The following code example shows how to use describe-endpoints.

AWS CLI

To view regional endpoint information

The following describe-endpoints example displays details about the endpoints for the current AWS Region.
aws dynamodb describe-endpoints

Output:

```json
{
   "Endpoints": [
      {
         "Address": "dynamodb.us-west-2.amazonaws.com",
         "CachePeriodInMinutes": 1440
      }
   ]
}
```

For more information, see [Amazon DynamoDB Endpoints and Quotas](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/AmazonDynamoDB-Endpoints.html) in the *AWS General Reference*.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-endpoints.html) in *AWS CLI Command Reference*.

### describe-global-table-settings

The following code example shows how to use describe-global-table-settings.

**AWS CLI**

**To get information about a DynamoDB global table's settings**

The following describe-global-table-settings example displays the settings for the `MusicCollection` global table.

```
aws dynamodb describe-global-table-settings \
   --global-table-name MusicCollection
```

Output:

```json
{
   "GlobalTableName": "MusicCollection",
   "ReplicaSettings": [
      {
         "RegionName": "us-east-1",
         "ReplicaStatus": "ACTIVE",
         "ReplicaProvisionedReadCapacityUnits": 10,
         "ReplicaProvisionedReadCapacityAutoScalingSettings": {

```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeGlobalTableSettings in AWS CLI Command Reference.

**describe-global-table**

The following code example shows how to use describe-global-table.

**AWS CLI**

**To display information about a DynamoDB global table**

The following describe-global-table example displays details about the MusicCollection global table.

```bash
aws dynamodb describe-global-table \\
  --global-table-name MusicCollection
```

**Output:**

```json
{
  "AutoScalingDisabled": true,
  "ReplicaProvisionedWriteCapacityUnits": 5,
  "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
    "AutoScalingDisabled": true
  }
},
{
  "RegionName": "us-east-2",
  "ReplicaStatus": "ACTIVE",
  "ReplicaProvisionedReadCapacityUnits": 10,
  "ReplicaProvisionedReadCapacityAutoScalingSettings": {
    "AutoScalingDisabled": true
  },
  "ReplicaProvisionedWriteCapacityUnits": 5,
  "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
    "AutoScalingDisabled": true
  }
}
}
```
"GlobalTableDescription": {
   "ReplicationGroup": [
      {
         "RegionName": "us-east-2"
      },
      {
         "RegionName": "us-east-1"
      }
   ],
   "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
   "CreationDateTime": 1576625818.532,
   "GlobalTableStatus": "ACTIVE",
   "GlobalTableName": "MusicCollection"
}
}

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeGlobalTable in AWS CLI Command Reference.

describe-limits

The following code example shows how to use describe-limits.

AWS CLI

To view provisioned-capacity limits

The following describe-limits example displays provisioned-capacity limits for your account in the current AWS Region.

aws dynamodb describe-limits

Output:

{
   "AccountMaxReadCapacityUnits": 80000,
   "AccountMaxWriteCapacityUnits": 80000,
   "TableMaxReadCapacityUnits": 40000,
   "TableMaxWriteCapacityUnits": 40000
}
For more information, see Limits in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeLimits in AWS CLI Command Reference.

describe-table-replica-auto-scaling

The following code example shows how to use describe-table-replica-auto-scaling.

AWS CLI

To view auto scaling settings across replicas of a global table

The following describe-table-replica-auto-scaling example displays auto scaling settings across replicas of the MusicCollection global table.

```
aws dynamodb describe-table-replica-auto-scaling \\
  --table-name MusicCollection
```

Output:

```
{
  "TableAutoScalingDescription": {
    "TableName": "MusicCollection",
    "TableStatus": "ACTIVE",
    "Replicas": [
      {
        "RegionName": "us-east-1",
        "GlobalSecondaryIndexes": [],
        "ReplicaProvisionedReadCapacityAutoScalingSettings": {
          "MinimumUnits": 5,
          "MaximumUnits": 40000,
          "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/awsservice-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
          "ScalingPolicies": [
            {
              "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
              "TargetTrackingScalingPolicyConfiguration": {
                "TargetValue": 70.0
              }
            }
          ]
        }
      }
    ]
  }
}
```
"ReplicaProvisionedWriteCapacityAutoScalingSettings": {
    "MinimumUnits": 5,
    "MaximumUnits": 40000,

            "TargetTrackingScalingPolicyConfiguration": {
                "TargetValue": 70.0
            }
        }
    ]
}
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/DynamoDBGlobalTables.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTableReplicaAutoScaling](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-table-replica-auto-scaling) in *AWS CLI Command Reference*.

### describe-table

The following code example shows how to use describe-table.

**AWS CLI**

**To describe a table**

The following `describe-table` example describes the `MusicCollection` table.

```
aws dynamodb describe-table \
   --table-name MusicCollection
```

**Output:**

```json
{
   "Table": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
```

```
"AttributeName": "SongTitle",
  "AttributeType": "S"
 },
 "ProvisionedThroughput": {
   "NumberOfDecreasesToday": 0,
   "WriteCapacityUnits": 5,
   "ReadCapacityUnits": 5
 },
 "TableSizeBytes": 0,
 "TableName": "MusicCollection",
 "TableStatus": "ACTIVE",
 "KeySchema": [
   {
     "KeyType": "HASH",
     "AttributeName": "Artist"
   },
   {
     "KeyType": "RANGE",
     "AttributeName": "SongTitle"
   }
 ],
 "ItemCount": 0,
 "CreationDateTime": 1421866952.062
}
}

For more information, see Describing a Table in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTable in AWS CLI Command Reference.

describe-time-to-live

The following code example shows how to use describe-time-to-live.

AWS CLI

To view Time to Live settings for a table

The following describe-time-to-live example displays Time to Live settings for the MusicCollection table.

```
aws dynamodb describe-time-to-live
```
Output:

{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTimeToLive in AWS CLI Command Reference.

**get-item**

The following code example shows how to use get-item.

**AWS CLI**

**Example 1: To read an item in a table**

The following get-item example retrieves an item from the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --return-consumed-capacity TOTAL
```

Contents of key.json:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:
For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

Example 2: To read an item using a consistent read

The following example retrieves an item from the MusicCollection table using strongly consistent reads.

```
aws dynamodb get-item
  --table-name MusicCollection
  --key file://key.json
  --consistent-read
  --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
```
For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

Example 3: To retrieve specific attributes of an item

The following example uses a projection expression to retrieve only three attributes of the desired item.

```bash
aws dynamodb get-item \
    --table-name ProductCatalog \
    --key '{"Id": {"N": "102"}}' \
    --projection-expression "#T, #C, #P" \
    --expression-attribute-names file://names.json
```

Contents of names.json:

```json
{
    "#T": "Title",
    "#C": "ProductCategory",
    "#P": "Price"
}
```

Output:

```json
{
    "Item": {
```
list-backups

The following code example shows how to use list-backups.

AWS CLI

Example 1: To list all existing DynamoDB backups

The following list-backups example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```
{
   "BackupSummaries": [
   {
   "TableName": "MusicCollection",
   "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
   "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
   "BackupName": "MusicCollectionBackup1",
   "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
   "BackupStatus": "AVAILABLE",
   "BackupType": "USER",
```

For more information, see [Reading an Item](#) in the [Amazon DynamoDB Developer Guide](#).

- For API details, see [GetItem](#) in [AWS CLI Command Reference](#).
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To list user-created backups in a specific time range**

The following example lists only backups of the `MusicCollection` table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```
aws dynamodb list-backups \
    --table-name MusicCollection \
    --time-range-lower-bound 1577836800 \
    --time-range-upper-bound 1583020800 \
    --backup-type USER
```

Output:

```json
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

Example 3: To limit page size

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-backups \
   --page-size 1
```

Output:

```
{
   "BackupSummaries": [
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
   },
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
   }
   ]
}
```
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/AmazonDynamoDB/latest/DeveloperGuide/backup.html) in the *Amazon DynamoDB Developer Guide*.

### Example 4: To limit the number of items returned

The following example limits the number of items returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-backups
  --max-items 1
```

**Output:**

```
{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupName": "MusicCollectionBackup2",
      "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 400
    }
  ]
}
```
Example 5: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the list-backups command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-backups \
  --starting-token \
  abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

• For API details, see ListBackups in AWS CLI Command Reference.
list-contributor-insights

The following code example shows how to use list-contributor-insights.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following list-contributor-insights example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
  "ContributorInsightsSummaries": [
    {
      "TableName": "MusicCollection",
      "IndexName": "AlbumTitle-index",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "ProductCatalog",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Forum",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Reply",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Thread",
      "ContributorInsightsStatus": "ENABLED"
    }
  ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.
Example 2: To limit the number of items returned

The following example limits the number of items returned to 4. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-contributor-insights \
  --max-results 4
```

Output:

```
{
  "ContributorInsightsSummaries": [
  {
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsStatus": "ENABLED"
  },
  {
    "TableName": "ProductCatalog",
    "ContributorInsightsStatus": "ENABLED"
  },
  {
    "TableName": "Forum",
    "ContributorInsightsStatus": "ENABLED"
  }
  ],
  "NextToken": "abCDeFghijKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM5in0pqRSTuv3WxyZabC5dEFghI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/aws-cloudwatch-contributor-insights.html) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-contributor-insights \
  --max-results 4 \
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see ListContributorInsights in AWS CLI Command Reference.

**list-global-tables**

The following code example shows how to use list-global-tables.

**AWS CLI**

**To list existing DynamoDB global tables**

The following list-global-tables example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
    "GlobalTables": [
        {
            "GlobalTableName": "MusicCollection",
            "ReplicationGroup": [
```
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListGlobalTables](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-global-tables.html) in *AWS CLI Command Reference*.

### list-tables

The following code example shows how to use `list-tables`.

**AWS CLI**

**Example 1: To list tables**

The following `list-tables` example lists all of the tables associated with the current AWS account and Region.

```
aws dynamodb list-tables
```

**Output:**

```
{
  "TableNames": [ 
    "Forum",
    "ProductCatalog",
    "Reply",
    "Thread"
  ]
}
```

For more information, see [Listing Table Names](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To limit page size**
The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```bash
aws dynamodb list-tables \
   --page-size 1
```

Output:

```json
{
   "TableNames": [
      "Forum",
      "ProductCatalog",
      "Reply",
      "Thread"
   ]
}
```

For more information, see [Listing Table Names](#) in the Amazon DynamoDB Developer Guide.

**Example 3: To limit the number of items returned**

The following example limits the number of items returned to 2. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-tables \
   --max-items 2
```

Output:

```json
{
   "TableNames": [
      "Forum",
      "ProductCatalog"
   ],
   "NextToken":
      "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEF6hI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Listing Table Names](#) in the Amazon DynamoDB Developer Guide.
Example 4: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the `list-tables` command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-tables \
   --starting-token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxzY3abC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```json
{
   "TableNames": [
      "Reply",
      "Thread"
   ]
}
```

For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.

- For API details, see ListTables in AWS CLI Command Reference.

list-tags-of-resource

The following code example shows how to use list-tags-of-resource.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following list-tags-of-resource example displays tags for the MusicCollection table.

```bash
aws dynamodb list-tags-of-resource \
```

Output:

```json
{
   "Tags": [
```

Actions and scenarios
For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To limit the number of tags returned**

The following example limits the number of tags returned to 1. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-tags-of-resource \
 --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
 --max-items 1
```

Output:

```json
{
   "Tags": [
      {
         "Key": "Owner",
         "Value": "blueTeam"
      }
   ],
   "NextToken": "abCDeFGhiJKlmn0PqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxYZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To retrieve the next page of results**

The following command uses the NextToken value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.
aws dynamodb list-tags-of-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
   --starting-token abCDeFghiJKlmnOPqrSTuvwxYZ1aBCdEFghi jK7LM51nOpqRSTuv3WxY3ZabC5dEFGhiI2Jk3LmnoPQ6RST9

Output:

```
{
   "Tags": [
      {
         "Key": "Environment",
         "Value": "Production"
      }
   ]
}
```

For more information, see [Tagging for DynamoDB](http://aws.amazon.com) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListTagsOfResource](http://aws.amazon.com) in *AWS CLI Command Reference*.

### put-item

The following code example shows how to use `put-item`.

**AWS CLI**

**Example 1: To add an item to a table**

The following `put-item` example adds a new item to the `MusicCollection` table.

```
aws dynamodb put-item \
   --table-name MusicCollection \
   --item file://item.json \
   --return-consumed-capacity TOTAL \
   --return-item-collection-metrics SIZE
```

Contents of `item.json`:

```
{
   "Artist": {"S": "No One You Know"},
   "SongTitle": {"S": "Call Me Today"},
```
"AlbumTitle": {"S": "Greatest Hits"}
}

Output:

{
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.0
   },
   "ItemCollectionMetrics": {
      "ItemCollectionKey": {
         "Artist": {
            "S": "No One You Know"
         }
      },
      "SizeEstimateRangeGB": [
         0.0,
         1.0
      ]
   }
}

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.

Example 2: To conditionally overwrite an item in a table

The following put-item example overwrites an existing item in the MusicCollection table only if that existing item has an AlbumTitle attribute with a value of Greatest Hits. The command returns the previous value of the item.

aws dynamodb put-item \
   --table-name MusicCollection \
   --item file://item.json \
   --condition-expression "#A = :A" \
   --expression-attribute-names file://names.json \
   --expression-attribute-values file://values.json \
   --return-values ALL_OLD

Contents of item.json:

{

Contents of `names.json`:

```
{
    "#A": "AlbumTitle"
}
```

Contents of `values.json`:

```
{
    ":A": {"S": "Greatest Hits"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Greatest Hits"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Call Me Today"
        }
    }
}
```

If the key already exists, you should see the following output:

A client error (ConditionalCheckFailedException) occurred when calling the PutItem operation: The conditional request failed.

For more information, see [Writing an Item](https://docs.aws.amazon.com/dynamodb/latest/developerguide/reading-writing-items.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [PutItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/put-item.html) in *AWS CLI Command Reference*. 
query

The following code example shows how to use `query`.

**AWS CLI**

**Example 1: To query a table**

The following query example queries items in the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```bash
aws dynamodb query \
   --table-name MusicCollection \
   --projection-expression "SongTitle" \
   --key-condition-expression "Artist = :v1" \
   --expression-attribute-values file://expression-attributes.json \
   --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```json
{
   "v1": {"S": "No One You Know"}
}
```

Output:

```json
{
   "Items": [
      {
         "SongTitle": {
            "S": "Call Me Today"
         },
         "SongTitle": {
            "S": "Scared of My Shadow"
         }
      }
   ],
   "Count": 2,
   "ScannedCount": 2,
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "ReadCapacityUnits": 2,
      "WriteCapacityUnits": 2
   }
}
```
"CapacityUnits": 0.5
}
}

For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query
    --table-name MusicCollection
    --projection-expression "SongTitle"
    --key-condition-expression "Artist = :v1"
    --expression-attribute-values file://expression-attributes.json
    --consistent-read
    --no-scan-index-forward
    --return-consumed-capacity TOTAL
```

Contents of expression-attributes.json:

```
{
    "v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
    {
        "SongTitle": {
            "S": "Scared of My Shadow"
        }
    },
    {
        "SongTitle": {
            "S": "Call Me Today"
        }
    }
}
```
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To filter out specific results**

The following example queries the MusicCollection but excludes results with specific values in the AlbumTitle attribute. Note that this does not affect the ScannedCount or ConsumedCapacity, because the filter is applied after the items have been read.

```bash
aws dynamodb query \
  --table-name MusicCollection \
  --key-condition-expression "#n1 = :v1" \
  --filter-expression "NOT (#n2 IN (:v2, :v3))" \
  --expression-attribute-names file://names.json \
  --expression-attribute-values file://values.json \
  --return-consumed-capacity TOTAL
```

**Contents of values.json:**

```json
{
  ":v1": {"S": "No One You Know"},
  ":v2": {"S": "Blue Sky Blues"},
  ":v3": {"S": "Greatest Hits"}
}
```

**Contents of names.json:**

```json
{
  "#n1": "Artist",
  "#n2": "AlbumTitle"
}
```

**Output:**
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 4: To retrieve only an item count**

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```bash
aws dynamodb query \
  --table-name MusicCollection \
  --select COUNT \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json
```

Contents of `expression-attributes.json`:

```json
{
  "v1": {"S": "No One You Know"}
}
```
Example 5: To query an index

The following example queries the local secondary index AlbumTitleIndex. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the \texttt{table-name} parameter.

```
aws dynamodb query \
  --table-name MusicCollection \
  --index-name AlbumTitleIndex \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json \
  --select ALL_PROJECTED_ATTRIBUTES \
  --return-consumed-capacity INDEXES
```

Contents of \texttt{expression-attributes.json}:

```json
{
  "\:v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Items": [
    {
      "AlbumTitle": {
        "S": "Blue Sky Blues"
      }
    }
  ]
}
```
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Query in AWS CLI Command Reference.

restore-table-from-backup

The following code example shows how to use restore-table-from-backup.
AWS CLI

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```bash
aws dynamodb restore-table-from-backup
   --target-table-name MusicCollection
   --backup-arn
arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "TableName": "MusicCollection2",
      "KeySchema": [
         {
            "AttributeName": "Artist",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "SongTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": 1576618274.326,
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 5,
         "WriteCapacityUnits": 5
      }
   }
}```
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/backup-restore-on-demand.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableFromBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/restore-table-from-backup.html) in *AWS CLI Command Reference*.

**restore-table-to-point-in-time**

The following code example shows how to use `restore-table-to-point-in-time`.

**AWS CLI**

To restore a DynamoDB table to a point in time

The following `restore-table-to-point-in-time` example restores the MusicCollection table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time
  --source-table-name MusicCollection
  --target-table-name MusicCollectionRestore
  --restore-date-time 1576622404.0
```

Output:
{
    "TableDescription": {
        "AttributeDefinitions": [
            
            {
              "AttributeName": "Artist",
              "AttributeType": "S"
            },
            
            {
              "AttributeName": "SongTitle",
              "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollectionRestore",
        "KeySchema": [
            
            {
              "AttributeName": "Artist",
              "KeyType": "HASH"
            },
            
            {
              "AttributeName": "SongTitle",
              "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576623311.86,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollectionRestore",
        "TableId": "befd9e0e-1843-4dc6-a147-d6d00e85cb1f",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED"
        },
        "RestoreSummary": {
            "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "RestoreDateTime": 1576622404.0,
            "RestoreInProgress": true
        }
    }
}

Actions and scenarios
For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/Point-in-Time-Recovery.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/restore-table-to-point-in-time.html) in *AWS CLI Command Reference*.

### scan

The following code example shows how to use `scan`.

**AWS CLI**

#### To scan a table

The following scan example scans the entire `MusicCollection` table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```bash
aws dynamodb scan \
   --table-name MusicCollection \
   --filter-expression "Artist = :a" \
   --projection-expression "#ST, #AT" \
   --expression-attribute-names file://expression-attribute-names.json \
   --expression-attribute-values file://expression-attribute-values.json
```

**Contents of `expression-attribute-names.json`:**

```json
{
   "#ST": "SongTitle",
   "#AT": "AlbumTitle"
}
```

**Contents of `expression-attribute-values.json`:**

```json
{
   ":a": {
      "S": "No One You Know"
   }
}
```
Output:

```json
{
    "Count": 2,
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "AlbumTitle": {
                "S": "Somewhat Famous"
            }
        },
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            },
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            }
        }
    ],
    "ScannedCount": 3,
    "ConsumedCapacity": null
}
```

For more information, see [Working with Scans in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/working-with-scans.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [Scan](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/scan.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a DynamoDB resource**

The following `tag-resource` example adds a tag key/value pair to the MusicCollection table.

```
aws dynamodb tag-resource
```
This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

transact-get-items

The following code example shows how to use transact-get-items.

AWS CLI

To retrieve multiple items atomically from one or more tables

The following transact-get-items example retrieves multiple items atomically.

```bash
aws dynamodb transact-get-items \
   --transact-items file://transact-items.json \
   --return-consumed-capacity TOTAL
```

Contents of transact-items.json:

```json
[
  {
    "Get": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "TableName": "MusicCollection"
    }
  },
  {
    "Get": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection"
    }
  }
]
```
Output:

```json
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 4.0,
            "ReadCapacityUnits": 4.0
        }
    ],
    "Responses": [
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Songs About Life"
                },
                "Artist": {
                    "S": "Acme Band"
                },
                "SongTitle": {
                    "S": "Happy Day"
                }
            }
        },
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                },
                "Artist": {
                    "S": "No One You Know"
                },
                "SongTitle": {
                    "S": "Call Me Today"
                }
            }
        }
    ]
}
```
For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

- For API details, see TransactGetItems in AWS CLI Command Reference.

**transact-write-items**

The following code example shows how to use transact-write-items.

**AWS CLI**

**Example 1: To write items atomically to one or more tables**

The following transact-write-items example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a Rating attribute.

```bash
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of the transact-items.json file:

```json
[
    {
        "Update": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "UpdateExpression": "SET AlbumTitle = :newval",
            "ExpressionAttributeValues": {
                ":newval": {"S": "Updated Album Title"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    },
    {
        "Delete": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "No One You Know"}
            }
        }
    }
]
```
"SongTitle": {"S": "Call Me Today"},

"TableName": "MusicCollection",
"ConditionExpression": "attribute_not_exists(Rating)"
}
]

Output:

{
  "ConsumedCapacity": [
    {
      "TableName": "MusicCollection",
      "CapacityUnits": 10.0,
      "WriteCapacityUnits": 10.0
    }
  ],
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        },
        "SizeEstimateRangeGB": [
          0.0,
          1.0
        ]
      },
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "Acme Band"
          }
        },
        "SizeEstimateRangeGB": [
          0.0,
          1.0
        ]
      }
    ]
  }
}
For more information, see [Managing Complex Workflows with DynamoDB Transactions](#) in the [Amazon DynamoDB Developer Guide](#).

**Example 2: To write items atomically using a client request token**

The following command uses a client request token to make the call to `transact-write-items` idempotent, meaning that multiple calls have the same effect as one single call.

```bash
aws dynamodb transact-write-items \
   --transact-items file://transact-items.json \
   --client-request-token abc123
```

**Contents of the `transact-items.json` file:**

```json
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  }
]
```
This command produces no output.

For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

- For API details, see TransactWriteItems in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

To remove a tag from a DynamoDB resource

The following untag-resource example removes the tag with the key Owner from the MusicCollection table.

```
aws dynamodb untag-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-continuous-backups

The following code example shows how to use update-continuous-backups.

**AWS CLI**

To update continuous backup settings for a DynamoDB table

The following update-continuous-backups example enables point-in-time recovery for the MusicCollection table.

```
aws dynamodb update-continuous-backups \
```

Actions and scenarios
**update-contributor-insights**

The following code example shows how to use `update-contributor-insights`.

**AWS CLI**

**To enable Contributor Insights on a table**

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb update-contributor-insights \ 
  --table-name MusicCollection \ 
  --index-name AlbumTitle-index \ 
  --contributor-insights-action ENABLE
```

**Output:**

```
{
  "TableName": "MusicCollection",
  "Actions": [],
  "Scenarios": []
}
```
For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

• For API details, see UpdateContributorInsights in AWS CLI Command Reference.

update-global-table-settings

The following code example shows how to use update-global-table-settings.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following update-global-table-settings example sets the provisioned write capacity of the MusicCollection global table to 15.

```
aws dynamodb update-global-table-settings \
  --global-table-name MusicCollection \
  --global-table-provisioned-write-capacity-units 15
```

Output:

```
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "eu-west-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
      
    }
  ]
}
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateGlobalTableSettings in AWS CLI Command Reference.

update-global-table

The following code example shows how to use update-global-table.

AWS CLI

To update a DynamoDB global table

The following update-global-table example adds a replica in the specified Region to the MusicCollection global table.

```bash
aws dynamodb update-global-table \  --global-table-name MusicCollection \
```
Output:

```json
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "eu-west-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/AmazonDynamoDB/latest/DeveloperGuide/DynamoDB-Global-Tables.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTable](https://docs.aws.amazon.com/AWSCommandLineInterface/latest/DG/aws-cli-update-global-table.html) in *AWS CLI Command Reference*.

### update-item

The following code example shows how to use `update-item`.

**AWS CLI**

**Example 1: To update an item in a table**

The following `update-item` example updates an item in the `MusicCollection` table. It adds a new attribute (Year) and modifies the `AlbumTitle` attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```bash
aws dynamodb update-item \
```
--table-name MusicCollection \
--key file://key.json \
--update-expression "SET #Y = :y, #AT = :t" \
--expression-attribute-names file://expression-attribute-names.json \
--expression-attribute-values file://expression-attribute-values.json \
--return-values ALL_NEW \
--return-consumed-capacity TOTAL \
--return-item-collection-metrics SIZE

Contents of key.json:

{
  "Artist": {"S": "Acme Band"},
  "SongTitle": {"S": "Happy Day"}
}

Contents of expression-attribute-names.json:

{
  "#Y": "Year", "#AT": "AlbumTitle"
}

Contents of expression-attribute-values.json:

{
  ":y": {"N": "2015"},
  ":t": {"S": "Louder Than Ever"}
}

Output:

{
  "Attributes": {
    "AlbumTitle": {
      "S": "Louder Than Ever"
    },
    "Awards": {
      "N": "10"
    },
    "Artist": {
      "S": "Acme Band"
    }
  }
}

Actions and scenarios

1945
For more information, see [Writing an Item](#) in the Amazon DynamoDB Developer Guide.

### Example 2: To update an item conditionally

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```
aws dynamodb update-item \
  --table-name MusicCollection \
  --key file://key.json \
  --update-expression "SET #Y = :y, #AT = :t" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json \
  --condition-expression "attribute_not_exists(#Y)"
```

Contents of `key.json`:

```json
{
  "Actions and scenarios": 1946
}
```
"Artist": {"S": "Acme Band"},
"SongTitle": {"S": "Happy Day"}
}

Contents of expression-attribute-names.json:

{
    "#Y": "Year",
    "#AT": "AlbumTitle"
}

Contents of expression-attribute-values.json:

{
    ":y": {"N": "2015"},
    ":t": {"S": "Louder Than Ever"}
}

If the item already has a Year attribute, DynamoDB returns the following output.

An error occurred (ConditionalCheckFailedException) when calling the UpdateItem operation: The conditional request failed

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateItem in AWS CLI Command Reference.

**update-table-replica-auto-scaling**

The following code example shows how to use update-table-replica-auto-scaling.

**AWS CLI**

**To update auto scaling settings across replicas of a global table**

The following update-table-replica-auto-scaling example updates write capacity auto scaling settings across replicas of the specified global table.

```
aws dynamodb update-table-replica-auto-scaling \
    --table-name MusicCollection \
    --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```
Contents of auto-scaling-policy.json:

```json
{
  "MinimumUnits": 10,
  "MaximumUnits": 100,
  "AutoScalingDisabled": false,
  "ScalingPolicyUpdate": {
    "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
    "TargetTrackingScalingPolicyConfiguration": {
      "TargetValue": 80
    }
  }
}
```

Output:

```json
{
  "TableAutoScalingDescription": {
    "TableName": "MusicCollection",
    "TableStatus": "ACTIVE",
    "Replicas": [
      {
        "RegionName": "eu-central-1",
        "GlobalSecondaryIndexes": [],
        "ReplicaProvisionedReadCapacityAutoScalingSettings": {
          "MinimumUnits": 5,
          "MaximumUnits": 40000,
          "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
          "ScalingPolicies": [
            {
              "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
              "TargetTrackingScalingPolicyConfiguration": {
                "TargetValue": 70.0
              }
            }
          ]

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTableReplicaAutoScaling in AWS CLI Command Reference.

update-table

The following code example shows how to use update-table.

AWS CLI

**Example 1: To modify a table's billing mode**

The following update-table example increases the provisioned read and write capacity on the MusicCollection table.

```
aws dynamodb update-table \
  --table-name MusicCollection \
  --billing-mode PROVISIONED \
  --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ]
  }
}
```
For more information, see [Updating a Table](https://docs.aws.amazon.com/dynamodb/latest/developerguide/Updates.html) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To create a global secondary index**

The following example adds a global secondary index to the `MusicCollection` table.

```bash
aws dynamodb update-table
  --table-name MusicCollection
  --attribute-definitions AttributeName=AlbumTitle,AttributeType=S
  --global-secondary-index-updates file://gsi-updates.json
```

**Contents of gsi-updates.json:**

```json
{};

]
For more information, see [Updating a Table](#) in the *Amazon DynamoDB Developer Guide*.

**Example 4: To enable server-side encryption**

The following example enables server-side encryption on the `MusicCollection` table.

```bash
code
aws dynamodb update-table
  --table-name MusicCollection
```
--sse-specification Enabled=true,SSEType=KMS

Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",

For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTable in AWS CLI Command Reference.

**update-time-to-live**

The following code example shows how to use update-time-to-live.

**AWS CLI**

To update Time to Live settings on a table

The following update-time-to-live example enables Time to Live on the specified table.

```
aws dynamodb update-time-to-live \
   --table-name MusicCollection \
   --time-to-live-specification Enabled=true,AttributeName=ttl
```

Output:
DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-stream

The following code example shows how to use describe-stream.

AWS CLI

To get information about a DynamoDB stream

The following describe-stream command displays information about the specific DynamoDB stream.

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTimeToLive in AWS CLI Command Reference.
aws dynamodbstreams describe-stream \

Output:

```json
{
   "StreamDescription": {
      "StreamLabel": "2019-10-22T18:02:01.576",
      "StreamStatus": "ENABLED",
      "StreamViewType": "NEW_AND_OLD_IMAGES",
      "CreationDateTime": 1571767321.571,
      "TableName": "Music",
      "KeySchema": [
         {
            "AttributeName": "Artist",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "SongTitle",
            "KeyType": "RANGE"
         }
      ],
      "Shards": [
         {
            "ShardId": "shardId-00000001571767321804-697ce3d2",
            "SequenceNumberRange": {
               "StartingSequenceNumber": "4000000000000642977831",
               "EndingSequenceNumber": "4000000000000642977831"
            }
         },
         {

            "SequenceNumberRange": {
               "StartingSequenceNumber": "757400000000005655171150"
            },
            "ParentShardId": "shardId-00000001571767321804-697ce3d2"
         }
      ]
   }
}
```
For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeStream in AWS CLI Command Reference.

get-records

The following code example shows how to use get-records.

AWS CLI

To get records from a DynamoDB stream

The following get-records command retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \\
```

Output:

```
{
    "Records": [
        {
            "eventID": "c3b5d798eef6215d42f8137b19a88e50",

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see GetRecords in AWS CLI Command Reference.

**get-shard-iterator**

The following code example shows how to use get-shard-iterator.
AWS CLI

To get a shard iterator

The following `get-shard-iterator` command retrieves a shard iterator for the specified shard.

```bash
aws dynamodbstreams get-shard-iterator \
  --shard-id shardId-0000001571780995058-40810d86 \
  --shard-iterator-type LATEST
```

Output:

```
{
  AAAAAAAAAGm3YZ89vLZZxjmoQeo33r9M4x3+zzmTLsiL86MfrF4+B4EbsByi52InVmiONmy6xVW4IRcIIbs1z07MNIDCjNP1qQjnyRSAw0WmKhlL1/KNPariWsf2odf780o0ObIDIIWRRMkt7+Hyzh9SD+hFxFAWR5C7QI10Xpc8mRBFNiazfVCjJK8/jsjCszqNyxKzJbhh+GXCoxYN+Kpmg4nyj1EAsYhbgL35muvHFOHjcyuybnsczbWaXNFThDwRAYvoTmc8XhHKtAWUbJiaVd82PtQwDsThCrIlmDRPIdmTRG+w/1EGS05ha1qNP+V14+tu7z2TRnnhJo/pny9GI/yGpce97mWvSPr5KPyw+Dtc5BHAYs+PVYHIAtiInF1t+LCwvaz1QH3MY3b8Ah05Z800wpktm60iQqtMeDwN4NX6FrcxR34JoFKGsgR8XkHVJzz2xr1xqSJI2ycpNTyHnndusw==
}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see GetShardIterator in AWS CLI Command Reference.

list-streams

The following code example shows how to use `list-streams`.

AWS CLI

To list DynamoDB streams

The following `list-streams` command lists all existing Amazon DynamoDB streams within the default AWS Region.
aws dynamodbstreams list-streams

Output:

```json
{
   "Streams": [
      {
         "TableName": "Music",
         "StreamLabel": "2019-10-22T18:02:01.576"
      }
   ]
}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

### Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions
Actions

accept-address-transfer

The following code example shows how to use accept-address-transfer.

AWS CLI

To accept an Elastic IP address transferred to your account

The following accept-address-transfer example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \
  --address 100.21.184.216
```

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:10.000Z",
        "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",
        "AddressTransferStatus": "accepted"
    }
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

- For API details, see AcceptAddressTransfer in AWS CLI Command Reference.

accept-reserved-instances-exchange-quote

The following code example shows how to use accept-reserved-instances-exchange-quote.

AWS CLI

To perform a Convertible Reserved Instance exchange

This example performs an exchange of the specified Convertible Reserved Instances.
Command:

```bash
aws ec2 accept-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:

```
{
  "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

- For API details, see [AcceptReservedInstancesExchangeQuote](#) in [AWS CLI Command Reference](#).

### accept-transit-gateway-peering-attachment

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

**AWS CLI**

#### To accept a transit gateway peering attachment

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```bash
aws ec2 accept-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
  --region us-east-2
```

Output:

```
{
  "TransitGatewayPeeringAttachment":{
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    }
  }
}```
For more information, see [Transit Gateway Peering Attachments](#) in the [Transit Gateways Guide](#).

- For API details, see [AcceptTransitGatewayPeeringAttachment](#) in [AWS CLI Command Reference](#).

**accept-transit-gateway-vpc-attachment**

The following code example shows how to use `accept-transit-gateway-vpc-attachment`.

**AWS CLI**

**To accept a request to attach a VPC to a transit gateway.**

The following `accept-transit-gateway-vpc-attachment` example accepts the request for the specified attachment.

```bash
aws ec2 accept-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": ["subnet-0752213d59EXAMPLE"],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
```
"Ipv6Support": "disable"
}
}
}

For more information, see Transit Gateway Attachments to a VPC in the Transit Gateways Guide.

- For API details, see AcceptTransitGatewayVpcAttachment in AWS CLI Command Reference.

accept-vpc-endpoint-connections

The following code example shows how to use accept-vpc-endpoint-connections.

**AWS CLI**

**To accept an interface endpoint connection request**

This example accepts the specified endpoint connection request for the specified endpoint service.

Command:

```bash
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```json
{
   "Unsuccessful": []
}
```

- For API details, see AcceptVpcEndpointConnections in AWS CLI Command Reference.

accept-vpc-peering-connection

The following code example shows how to use accept-vpc-peering-connection.

**AWS CLI**

**To accept a VPC peering connection**

This example accepts the specified VPC peering connection request.
Command:

```
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
   "VpcPeeringConnection": {
      "Status": {
         "Message": "Provisioning",
         "Code": "provisioning"
      },
      "Tags": [],
      "AccepterVpcInfo": {
         "OwnerId": "444455556666",
         "VpcId": "vpc-4445555666",
         "CidrBlock": "10.0.1.0/28"
      },
      "VpcPeeringConnectionId": "pcx-1a2b3c4d",
      "RequesterVpcInfo": {
         "OwnerId": "444455556666",
         "VpcId": "vpc-111abc45",
         "CidrBlock": "10.0.0.0/28"
      }
   }
}
```

### advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.

**AWS CLI**

**To advertise an address range**

The following `advertise-byoip-cidr` example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
```
--cidr 203.0.113.25/24

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "provisioned"
   }
}
```

- For API details, see [AdvertiseByoipCidr](#) in *AWS CLI Command Reference*.

**allocate-address**

The following code example shows how to use `allocate-address`.

**AWS CLI**

**Example 1: To allocate an Elastic IP address from Amazon's address pool**

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```
aws ec2 allocate-address
```

Output:

```
{
   "PublicIp": "70.224.234.241",
   "AllocationId": "eipalloc-01435ba59eEXAMPLE",
   "PublicIpv4Pool": "amazon",
   "NetworkBorderGroup": "us-west-2",
   "Domain": "vpc"
}
```

For more information, see [Elastic IP addresses](#) in the *Amazon EC2 User Guide*.

**Example 2: To allocate an Elastic IP address and associate it with a network border group**
The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```bash
aws ec2 allocate-address \
    --network-border-group us-west-2-lax-1
```

Output:

```json
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-e03dd489ceEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2-lax-1",
    "Domain": "vpc"
}
```

For more information, see [Elastic IP addresses](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/elastic-ip-addresses-vpc.html) in the Amazon EC2 User Guide.

**Example 3: To allocate an Elastic IP address from an address pool that you own**

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```bash
aws ec2 allocate-address \
    --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```json
{
    "AllocationId": "eipalloc-02463d08ceEXAMPLE",
    "NetworkBorderGroup": "us-west-2",
    "CustomerOwnedIp": "18.218.95.81",
    "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
    "Domain": "vpc",
    "NetworkBorderGroup": "us-west-2",
}
```

For more information, see [Elastic IP addresses](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/elastic-ip-addresses-vpc.html) in the Amazon EC2 User Guide.

- For API details, see [AllocateAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/allocate-address.html) in AWS CLI Command Reference.
**allocate-hosts**

The following code example shows how to use allocate-hosts.

**AWS CLI**

**Example 1: To allocate a Dedicated Host**

The following allocate-hosts example allocates a single Dedicated Host in the eu-west-1a Availability Zone, onto which you can launch m5.large instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --quantity 1
```

Output:

```json
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

**Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled**

The following allocate-hosts example allocates a single Dedicated Host in the eu-west-1a Availability Zone with auto-placement and host recovery enabled.

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --auto-placement on \
  --host-recovery on \
  --quantity 1
```

Output:

```json
{
  "HostIds": [
  
  ]
}
```
Example 3: To allocate a Dedicated Host with tags

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`.

```bash
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --quantity 1 \
  --tag-specifications 'ResourceType=dedicated-host,Tags={Key=purpose,Value=production}'
```

Output:

```json
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

For more information, see Allocating Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see AllocateHosts in AWS CLI Command Reference.

**allocate-ipam-pool-cidr**

The following code example shows how to use `allocate-ipam-pool-cidr`.

**AWS CLI**

To allocate a CIDR from an IPAM pool

The following `allocate-ipam-pool-cidr` example allocates a CIDR from an IPAM pool.

(Linux):

```bash
aws ec2 allocate-ipam-pool-cidr \
```
apply-security-groups-to-client-vpn-target-network

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

**AWS CLI**

To apply security groups to a target network for a Client VPN endpoint

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network
  --security-group-ids sg-01f6e627a89f4db32
  --vpc-id vpc-0e2110c2f324332e0
```
For more information, see Target Networks in the AWS Client VPN Administrator Guide.

• For API details, see ApplySecurityGroupsToClientVpnTargetNetwork in AWS CLI Command Reference.

**assign-ipv6-addresses**

The following code example shows how to use assign-ipv6-addresses.

**AWS CLI**

**To assign specific IPv6 addresses to a network interface**

This example assigns the specified IPv6 addresses to the specified network interface.

Command:

```bash
```

Output:

```json
{
   "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
   ],
   "NetworkInterfaceId": "eni-38664473"
}
```

**To assign IPv6 addresses that Amazon selects to a network interface**
This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

Command:

```bash
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2
```

Output:

```json
{
   "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
   ],
   "NetworkInterfaceId": "eni-38664473"
}
```

- For API details, see `AssignIpv6Addresses` in *AWS CLI Command Reference*.

### assign-private-ip-addresses

The following code example shows how to use `assign-private-ip-addresses`.

**AWS CLI**

**To assign a specific secondary private IP address a network interface**

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

**To assign secondary private IP addresses that Amazon EC2 selects to a network interface**

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the
CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --secondary-private-ip-address-count 2
```

- For API details, see AssignPrivateIpAddresses in AWS CLI Command Reference.

**assign-private-nat-gateway-address**

The following code example shows how to use assign-private-nat-gateway-address.

**AWS CLI**

**To assign private IP addresses to your private NAT gateway**

The following assign-private-nat-gateway-address example assigns two private IP addresses to the specified private NAT gateway.

```bash
aws ec2 assign-private-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \
   --private-ip-address-count 2
```

Output:

```json
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
      {
         "NetworkInterfaceId": "eni-0065a61b324d1897a",
         "IsPrimary": false,
         "Status": "assigning"
      },
      {
         "NetworkInterfaceId": "eni-0065a61b324d1897a",
         "IsPrimary": false,
         "Status": "assigning"
      }
   ]
}
```
associate-address

The following code example shows how to use `associate-address`.

**AWS CLI**

To associate an Elastic IP addresses in EC2-Classic

This example associates an Elastic IP address with an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-address --instance-id i-07ffe74c7330ebf53 --public-ip 198.51.100.0
```

To associate an Elastic IP address in EC2-VPC

This example associates an Elastic IP address with an instance in a VPC.

Command:

```bash
aws ec2 associate-address --instance-id i-0b263919b6498b123 --allocation-id eipalloc-64d5890a
```

Output:

```json
{
   "AssociationId": "eipassoc-2bebb745"
}
```

This example associates an Elastic IP address with a network interface.

Command:

```bash
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d
```
This example associates an Elastic IP with a private IP address that's associated with a network interface.

Command:

```bash
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d --private-ip-address 10.0.0.85
```

- For API details, see [AssociateAddress](#) in [AWS CLI Command Reference](#).

**associate-client-vpn-target-network**

The following code example shows how to use `associate-client-vpn-target-network`.

**AWS CLI**

To associate a target network with a Client VPN endpoint

The following `associate-client-vpn-target-network` example associates a subnet with the specified Client VPN endpoint.

```bash
aws ec2 associate-client-vpn-target-network \
    --subnet-id subnet-0123456789abcabca \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "associating"
    }
}
```

For more information, see [Target Networks](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [AssociateClientVpnTargetNetwork](#) in [AWS CLI Command Reference](#).

**associate-dhcp-options**

The following code example shows how to use `associate-dhcp-options`.

Actions and scenarios
AWS CLI

To associate a DHCP options set with your VPC

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```

To associate the default DHCP options set with your VPC

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see `AssociateDhcpOptions` in `AWS CLI Command Reference`.

associate-iam-instance-profile

The following code example shows how to use `associate-iam-instance-profile`.

AWS CLI

To associate an IAM instance profile with an instance

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcdef123`.

Command:

```bash
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcdef123 --iam-instance-profile Name=admin-role
```

Output:

```json
{
}
```
"IamInstanceProfileAssociation": {
    "InstanceId": "i-123456789abcdef0",  
    "State": "associating",  
    "AssociationId": "iip-assoc-0e7736511a163c209",  
    "IamInstanceProfile": {
        "Id": "AIPAJBLK7RKJKWDXVHIEC",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
    }
}

• For API details, see AssociateIamInstanceProfile in AWS CLI Command Reference.

associate-instance-event-window

The following code example shows how to use associate-instance-event-window.

AWS CLI

Example 1: To associate one or more instances with an event window

The following associate-instance-event-window example associates one or more instances with an event window.

aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceId=i-1234567890abcdef0,i-0598c7d356eba48d7"

Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {
            "InstanceIds": [
                "i-1234567890abcdef0",  
                "i-0598c7d356eba48d7"
            ],  
            "Tags": []
        }
    }
}
```
"DedicatedHostIds": [],
"State": "creating"
}
}

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 2: To associate instance tags with an event window

The following associate-instance-event-window example associates instance tags with an event window. Enter an instance-event-window-id parameter to specify the event window. To associate instance tags, specify the association-target parameter, and for the parameter value, specify one or more tags.

```bash
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[\{Key=k2,Value=v2\},\{Key=k1,Value=v1\}]"
```

Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [
                {
                    "Key": "k2",
                    "Value": "v2"
                },
                {
                    "Key": "k1",
                    "Value": "v1"
                }
            ],
            "DedicatedHostIds": []
        }
    }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 3: To associate a Dedicated Host with an event window

The following associate-instance-event-window example associates a Dedicated Host with an event window. Enter an instance-event-window-id parameter to specify the event window. To associate a Dedicated Host, specify the --association-target parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ],
            "State": "creating"
        }
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see AssociateInstanceEventWindow in AWS CLI Command Reference.
associate-ipam-resource-discovery

The following code example shows how to use associate-ipam-resource-discovery.

AWS CLI

To associate a resource discovery with an IPAM

In this example, you are an IPAM delegated admin and a resource discovery has been created and shared with you by another AWS account so that you can use IPAM to manage and monitor resource CIDRs owned by the other account.

Note

To complete this request, you'll need the resource discovery ID which you can get with describe-ipam-resource-discoveries and the IPAM ID which you can get with describe-ipams. The resource discovery that you are associating must have first been shared with your account using AWS RAM. The --region you enter must match the home Region of the IPAM you are associating it with.

The following associate-ipam-resource-discovery example associates a resource discovery with an IPAM.

```
aws ec2 associate-ipam-resource-discovery \
  --ipam-id ipam-005f921c17ebd5107 \
  --ipam-resource-discovery-id ipam-res-disco-03e0406de76a044ee \
  --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-center,Value=cc123}]' \
  --region us-east-1
```

Output:

```
{
  {
    "IpamResourceDiscoveryAssociation": {
      "OwnerId": "320805250157",
      "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-04382a6346357cf82",
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
    }
  }
}
```
Once you associate a resource discovery, you can monitor and/or manage the IP addresses of resources created by the other accounts. For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/) in the Amazon VPC IPAM User Guide.

- For API details, see [associate-nat-gateway-address](https://docs.aws.amazon.com/cli/latest/reference/ec2/associate-nat-gateway-address) in AWS CLI Command Reference.

### associate-nat-gateway-address

The following code example shows how to use `associate-nat-gateway-address`.

#### AWS CLI

**To associate an Elastic IP address with a public NAT gateway**

The following `associate-nat-gateway-address` example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```
aws ec2 associate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \n    --allocation-ids eipalloc-0be6ecac95EXAMPLE
```

**Output:**

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
    {
        "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
        "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
        "IsPrimary": false,
```
associate-route-table

The following code example shows how to use associate-route-table.

AWS CLI

To associate a route table with a subnet

This example associates the specified route table with the specified subnet.

Command:

```
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-id subnet-9d4a7b6c
```

Output:

```
{
   "AssociationId": "rtbassoc-781d0d1a"
}
```

For API details, see AssociateRouteTable in AWS CLI Command Reference.

associate-subnet-cidr-block

The following code example shows how to use associate-subnet-cidr-block.

AWS CLI

To associate an IPv6 CIDR block with a subnet

This example associates an IPv6 CIDR block with the specified subnet.
Command:

```
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-block 2001:db8:1234:1a00::/64
```

Output:

```
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": {
            "State": "associating"
        }
    }
}
```

- For API details, see [AssociateSubnetCidrBlock](#) in [AWS CLI Command Reference](#).

### associate-transit-gateway-multicast-domain

The following code example shows how to use `associate-transit-gateway-multicast-domain`.

**AWS CLI**

To associate a transit gateway with a multicast domain

The following `associate-transit-gateway-multicast-domain` example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e --subnet-ids subnet-000de86e3b49c932a --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
}
```
"Associations": {
  "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
  "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
  "ResourceId": "vpc-01128d2c240c09bd5",
  "ResourceType": "vpc",
  "Subnets": [
    {
      "SubnetId": "subnet-000de86e3b49c932a",
      "State": "associating"
    }
  ]
}

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see AssociateTransitGatewayMulticastDomain in AWS CLI Command Reference.

associate-transit-gateway-route-table

The following code example shows how to use associate-transit-gateway-route-table.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following example associates the specified transit gateway route table with the specified VPC attachment.

```
aws ec2 associate-transit-gateway-route-table \
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
  --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
  "Association": {
    "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
    "ResourceId": "vpc-0065acced4EXAMPLE",
    "ResourceType": "vpc",
    "State": "associating"
  }
}
```
For more information, see Associate a Transit Gateway Route Table in the AWS Transit Gateways Guide.

- For API details, see AssociateTransitGatewayRouteTable in AWS CLI Command Reference.

associate-vpc-cidr-block

The following code example shows how to use associate-vpc-cidr-block.

AWS CLI

**Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC**

The following associate-vpc-cidr-block example associates an IPv6 CIDR block with the specified VPC:

```bash
aws ec2 associate-vpc-cidr-block \
   --amazon-provided-ipv6-cidr-block \
   --ipv6-cidr-block-network-border-group us-west-2-lax-1  \
   --vpc-id vpc-8EXAMPLE
```

Output:

```json
{
   "Ipv6CidrBlockAssociation": {
      "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
      "Ipv6CidrBlockState": {
         "State": "associating"
      },
      "NetworkBorderGroup": "us-west-2-lax-1"
   },
   "VpcId": "vpc-8EXAMPLE"
}
```

**Example 2: To associate an additional IPv4 CIDR block with a VPC**

The following associate-vpc-cidr-block example associates the IPv4 CIDR block 10.2.0.0/16 with the specified VPC.
aws ec2 associate-vpc-cidr-block \
  --vpc-id vpc-1EXAMPLE \
  --cidr-block 10.2.0.0/16

Output:

```json
{
  "CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
    "CidrBlock": "10.2.0.0/16",
    "CidrBlockState": {
      "State": "associating"
    }
  },
  "VpcId": "vpc-1EXAMPLE"
}
```

- For API details, see [AssociateVpcCidrBlock](#) in *AWS CLI Command Reference*.

### attach-classic-link-vpc

The following code example shows how to use `attach-classic-link-vpc`.

**AWS CLI**

#### To link (attach) an EC2-Classic instance to a VPC

This example links instance i-1234567890abcdef0 to VPC vpc-88888888 through the VPC security group sg-12312312.

**Command:**

```
aws ec2 attach-classic-link-vpc --instance-id i-1234567890abcdef0 --vpc-id vpc-88888888 --groups sg-12312312
```

**Output:**

```json
{
  "Return": true
}
```
- For API details, see `AttachClassicLinkVpc` in *AWS CLI Command Reference*.

**attach-internet-gateway**

The following code example shows how to use `attach-internet-gateway`.

**AWS CLI**

**To attach an internet gateway to your VPC**

The following `attach-internet-gateway` example attaches the specified internet gateway to the specific VPC.

```bash
aws ec2 attach-internet-gateway \
  --internet-gateway-id igw-0d0fb496b3EXAMPLE \
  --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see *Internet gateways* in the *Amazon VPC User Guide*.

- For API details, see `AttachInternetGateway` in *AWS CLI Command Reference*.

**attach-network-interface**

The following code example shows how to use `attach-network-interface`.

**AWS CLI**

**Example 1: To attach a network interface to an instance**

The following `attach-network-interface` example attaches the specified network interface to the specified instance.

```bash
aws ec2 attach-network-interface \
  --network-interface-id eni-0dc56a8d4640ad10a \
  --instance-id i-1234567890abcdef0 \
  --device-index 1
```

Output:
Example 2: To attach a network interface to an instance with multiple network cards

The following `attach-network-interface` example attaches the specified network interface to the specified instance and network card.

```bash
aws ec2 attach-network-interface \
--network-interface-id eni-07483b1897541ad83 \
--instance-id i-01234567890abcdef \
--network-card-index 1 \
--device-index 1
```

Output:

```json
{
  "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}
```

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see AttachNetworkInterface in AWS CLI Command Reference.

**attach-verified-access-trust-provider**

The following code example shows how to use attach-verified-access-trust-provider.

**AWS CLI**

To attach a trust provider to an instance

The following `attach-verified-access-trust-provider` example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```bash
aws ec2 attach-verified-access-trust-provider \
  --verified-access-instance-id vai-0ce000c0b7643abea \
```

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.
Output:

```json
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:00:38"
    },
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "VerifiedAccessTrustProviders": [
            {
                "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                "TrustProviderType": "user",
                "UserTrustProviderType": "iam-identity-center"
            }
        ],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56"
    }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/awsverifiedaccess/latest/userguide/verified-access.html) in the *AWS Verified Access User Guide*.

- For API details, see [AttachVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/verified-access/attach-verified-access-trust-provider.html) in *AWS CLI Command Reference*.

### attach-volume

The following code example shows how to use `attach-volume`.

**AWS CLI**

**To attach a volume to an instance**

This example command attaches a volume (vol-1234567890abcdef0) to an instance (i-01474ef662b89480) as /dev/sdf.
Command:

```bash
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-id i-01474ef662b89480 --device /dev/sdf
```

Output:

```json
{
   "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
   "InstanceId": "i-01474ef662b89480",
   "VolumeId": "vol-1234567890abcdef0",
   "State": "attaching",
   "Device": "/dev/sdf"
}
```

- For API details, see [AttachVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-volume.html) in *AWS CLI Command Reference*.

### attach-vpn-gateway

The following code example shows how to use `attach-vpn-gateway`.

**AWS CLI**

**To attach a virtual private gateway to your VPC**

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```bash
aws ec2 attach-vpn-gateway \
   --vpn-gateway-id vgw-9a4cacf3 \
   --vpc-id vpc-a01106c2
```

Output:

```json
{
   "VpcAttachment": {
      "State": "attaching",
      "VpcId": "vpc-a01106c2"
   }
}
```
• For API details, see AttachVpnGateway in AWS CLI Command Reference.

authorize-client-vpn-ingress

The following code example shows how to use authorize-client-vpn-ingress.

AWS CLI

To add an authorization rule for a Client VPN endpoint

The following authorize-client-vpn-ingress example adds an ingress authorization rule that permits all clients to access the internet (0.0.0.0/0).

aws ec2 authorize-client-vpn-ingress
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
  --target-network-cidr 0.0.0.0/0
  --authorize-all-groups

Output:

{
  "Status": {
    "Code": "authorizing"
  }
}

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

• For API details, see AuthorizeClientVpnIngress in AWS CLI Command Reference.

authorize-security-group-egress

The following code example shows how to use authorize-security-group-egress.

AWS CLI

To add a rule that allows outbound traffic to a specific address range

This example command adds a rule that grants access to the specified address ranges on TCP port 80.

Command (Linux):
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='{{CidrIp=10.0.0.0/16}}'

Command (Windows):

aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]

To add a rule that allows outbound traffic to a specific security group

This example command adds a rule that grants access to the specified security group on TCP port 80.

Command (Linux):

aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='{{GroupId=sg-4b51a32f}}'

Command (Windows):

aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[{GroupId=sg-4b51a32f}]

- For API details, see [AuthorizeSecurityGroupEgress](#) in [AWS CLI Command Reference](#).

**authorize-security-group-ingress**

The following code example shows how to use authorize-security-group-ingress.

**AWS CLI**

**Example 1: To add a rule that allows inbound SSH traffic**

The following authorize-security-group-ingress example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \\
    --group-id sg-1234567890abcdef0 \\
    --protocol tcp \\
    --port 22 \\
```
Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following `authorize-security-group-ingress` example adds a rule that allows inbound access on TCP port 80 from the source security group `sg-1a2b3c4d`. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```bash
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 80 \
    --source-group sg-1a2b3c4d
```

Output:

```json
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01f4be99110f638a7",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv4": "203.0.113.0/24"
        }
    ]
}
```
Example 3: To add multiple rules in the same call

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=172.31.0.0/16}]"
IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges="[{CidrIp=172.31.0.0/16}]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "172.31.0.0/16"
   },
   {
      "SecurityGroupRuleId": "sgr-0a133dd4493944b87",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "172.31.0.0/16"
   }
   ]
}```
Example 4: To add a rule for ICMP traffic

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4) from anywhere.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges="[CidrIp=0.0.0.0/0]"
```

Output:

```json
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupId": "sg-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

Example 5: To add a rule for IPv6 traffic

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range 2001:db8:1234:1a00::/64.
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges="[{CidrIpv6=2001:db8:1234:1a00::/64}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv6": "2001:db8:1234:1a00::/64"
        }
    ]
}
```

**Example 6: To add a rule for ICMPv6 traffic**

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmpv6,Ipv6Ranges="[{CidrIpv6=::/0}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmpv6",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0"
        }
    ]
}
```

Example 7: Add a rule with a description

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[
{CidrIp=203.0.113.0/24,Description='RDP access from NY office'}"]
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [ 
   {
      "SecurityGroupRuleId": "sgr-0397bbcc01e974db3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "203.0.113.0/24",
      "Description": "RDP access from NY office"
   }
   ]
}
```

Example 8: To add an inbound rule that uses a prefix list

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-04a351bfe432d4e71 --ip-permissions
IpProtocol=all,PrefixListIds="[
{PrefixListId=pl-002dc3ec097de1514}]
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [ 
   {
      "SecurityGroupRuleId": "sgr-0397bbcc01e974db3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "203.0.113.0/24",
      "Description": "RDP access from NY office"
   }
   ]
}
```
For more information, see Security groups in the Amazon VPC User Guide.

- For API details, see AuthorizeSecurityGroupIngress in AWS CLI Command Reference.

bundle-instance

The following code example shows how to use bundle-instance.

AWS CLI

To bundle an instance

This example bundles instance i-1234567890abcdef0 to a bucket called bundletasks. Before you specify values for your access key IDs, review and follow the guidance in Best Practices for Managing AWS Access Keys.

Command:

```
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```json
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "PrefixListId": "pl-0721453c7ac4ec009"
        }
    ]
}
```
"BundleTask": {
  "UpdateTime": "2015-09-15T13:30:35.000Z",
  "InstanceId": "i-1234567890abcdef0",
  "Storage": {
    "S3": {
      "Prefix": "winami",
      "Bucket": "bundletasks"
    }
  },
  "State": "pending",
  "StartTime": "2015-09-15T13:30:35.000Z",
  "BundleId": "bun-294e041f"
}

- For API details, see BundleInstance in AWS CLI Command Reference.

cancel-bundle-task

The following code example shows how to use cancel-bundle-task.

**AWS CLI**

**To cancel a bundle task**

This example cancels bundle task bun-2a4e041c.

**Command:**

```
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

**Output:**

```
{
  "BundleTask": {
    "UpdateTime": "2015-09-15T13:27:40.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "Storage": {
      "S3": {
        "Prefix": "winami",
        "Bucket": "bundletasks"
      }
    },
    "State": "pending",
    "BundleId": "bun-2a4e041f"
  }
}
```
For API details, see `CancelBundleTask` in *AWS CLI Command Reference*.

**Cancel Capacity Reservation Fleets**

The following code example shows how to use `cancel-capacity-reservation-fleets`.

**AWS CLI**

To cancel a Capacity Reservation Fleet

The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to `cancelled`, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```bash
aws ec2 cancel-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```json
{
   "SuccessfulFleetCancellations": [
       {
           "CurrentFleetState": "cancelling",
           "PreviousFleetState": "active",
           "CapacityReservationFleetId": "crf-abcdef01234567890"
       }
   ],
   "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

- For API details, see `CancelCapacityReservationFleets` in *AWS CLI Command Reference*.  
- For API details, see `CancelBundleTask` in *AWS CLI Command Reference*.  

cancel-capacity-reservation

The following code example shows how to use cancel-capacity-reservation.

AWS CLI

To cancel a capacity reservation

The following cancel-capacity-reservation example cancels the specified capacity reservation.

```bash
aws ec2 cancel-capacity-reservation \\
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Canceling a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelCapacityReservation](#) in *AWS CLI Command Reference*.

cancel-conversion-task

The following code example shows how to use cancel-conversion-task.

AWS CLI

To cancel an active conversion of an instance or a volume

This example cancels the upload associated with the task ID import-i-fh95npoc. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see [CancelConversionTask](#) in *AWS CLI Command Reference*.  

---

Actions and scenarios  
2009
cancel-export-task

The following code example shows how to use cancel-export-task.

**AWS CLI**

To cancel an active export task

This example cancels an active export task with the task ID export-i-fgelt0i7. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```

- For API details, see [CancelExportTask](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-export-task.html) in *AWS CLI Command Reference*.

cancel-image-launch-permission

The following code example shows how to use cancel-image-launch-permission.

**AWS CLI**

To cancel having an AMI shared with your Amazon Web Services account

The following cancel-image-launch-permission example removes your account from the specified AMI's launch permissions.

```bash
aws ec2 cancel-image-launch-permission \\  --image-id ami-0123456789example \\  --region us-east-1
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Cancel having an AMI shared with your Amazon Web Services account](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/AMIManagementOverview.html) in the *Amazon EC2 User Guide*.

- For API details, see [CancelImageLaunchPermission](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-image-launch-permission.html) in *AWS CLI Command Reference*.
cancel-import-task

The following code example shows how to use cancel-import-task.

AWS CLI

To cancel an import task

The following cancel-import-task example cancels the specified import image task.

```bash
aws ec2 cancel-import-task \
   --import-task-id import-ami-1234567890abcdef0
```

Output:

```json
{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "PreviousState": "active",
   "State": "deleting"
}
```

- For API details, see `CancelImportTask` in AWS CLI Command Reference.

cancel-reserved-instances-listing

The following code example shows how to use cancel-reserved-instances-listing.

AWS CLI

To cancel a Reserved Instance listing

The following cancel-reserved-instances-listing example cancels the specified Reserved Instance listing.

```bash
aws ec2 cancel-reserved-instances-listing \
   --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see `CancelReservedInstancesListing` in AWS CLI Command Reference.

cancel-spot-fleet-requests

The following code example shows how to use cancel-spot-fleet-requests.
Example 1: To cancel a Spot fleet request and terminate the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
   --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \ 
   --terminate-instances
```

Output:

```json
{
   "SuccessfulFleetRequests": [ 
   {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
      "CurrentSpotFleetRequestState": "cancelled_terminating",
      "PreviousSpotFleetRequestState": "active"
   }],
   "UnsuccessfulFleetRequests": []
}
```

For more information, see [Cancel a Spot Fleet request](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/SpotFleetRequests.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To cancel a Spot fleet request without terminating the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
   --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \ 
   --no-terminate-instances
```

Output:

```json
{
   "SuccessfulFleetRequests": [ 
   {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
      "CurrentSpotFleetRequestState": "cancelled",
      "PreviousSpotFleetRequestState": "active"
   }]
}
```
"CurrentSpotFleetRequestState": "cancelled_running",
"PreviousSpotFleetRequestState": "active"
},
"UnsuccessfulFleetRequests": []
}

For more information, see [Cancel a Spot Fleet request](https://aws.amazon.com/documentation/ec2/spot-fleet-request/) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelSpotFleetRequests](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-spot-fleet-requests.html) in *AWS CLI Command Reference*.

### cancel-spot-instance-requests

The following code example shows how to use `cancel-spot-instance-requests`.

#### AWS CLI

**To cancel Spot Instance requests**

This example command cancels a Spot Instance request.

**Command:**

```
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```

**Output:**

```
{
   "CancelledSpotInstanceRequests": [
      {
         "State": "cancelled",
         "SpotInstanceRequestId": "sir-08b93456"
      }
   ]
}
```

- For API details, see [CancelSpotInstanceRequests](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-spot-instance-requests.html) in *AWS CLI Command Reference*.

### confirm-product-instance

The following code example shows how to use `confirm-product-instance`.

---

**Actions and scenarios**

2013
AWS CLI

To confirm the product instance

This example determines whether the specified product code is associated with the specified instance.

Command:

```
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-id i-1234567890abcdef0
```

Output:

```
{
   "OwnerId": "123456789012"
}
```

- For API details, see [ConfirmProductInstance](https://docs.aws.amazon.com/cli/latest/reference/ec2/confirm-product-instance.html) in *AWS CLI Command Reference*.

**copy-fpga-image**

The following code example shows how to use copy-fpga-image.

**AWS CLI**

To copy an Amazon FPGA image

This example copies the specified AFI from the us-east-1 region to the current region (eu-west-1).

Command:

```
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc --source-region us-east-1 --region eu-west-1
```

Output:

```
{
   "FpgaImageId": "afi-0b12350a123fbabc"
}
```
For API details, see CopyFpgImage in AWS CLI Command Reference.

**copy-image**

The following code example shows how to use `copy-image`.

**AWS CLI**

**Example 1: To copy an AMI to another Region**

The following `copy-image` example command copies the specified AMI from the us-west-2 Region to the us-east-1 Region and adds a short description.

```bash
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-066877671789bd71b \
    --description "This is my copied image."
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the Amazon EC2 User Guide.

**Example 2: To copy an AMI to another Region and encrypt the backing snapshot**

The following `copy-image` command copies the specified AMI from the us-west-2 Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```bash
aws ec2 copy-image \
    --source-region us-west-2 \
    --name ami-name \
    --source-image-id ami-066877671789bd71b \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:
For more information, see Copy an AMI in the Amazon EC2 User Guide.

Example 3: To include your user-defined AMI tags when copying an AMI

The following copy-image command uses the --copy-image-tags parameter to copy your user-defined AMI tags when copying the AMI.

```bash
aws ec2 copy-image
  --region us-east-1
  --name ami-name
  --source-region us-west-2
  --source-image-id ami-066877671789bd71b
  --description "This is my copied image."
  --copy-image-tags
```

Output:

```json
{
   "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the Amazon EC2 User Guide.

- For API details, see CopyImage in AWS CLI Command Reference.

**copy-snapshot**

The following code example shows how to use copy-snapshot.

**AWS CLI**

**Example 1: To copy a snapshot to another Region**

The following copy-snapshot example command copies the specified snapshot from the us-west-2 Region to the us-east-1 Region and adds a short description.

```bash
aws ec2 copy-snapshot
```
--region us-east-1 \
--source-region us-west-2 \
--source-snapshot-id snap-066877671789bd71b \
--description "This is my copied snapshot."

Output:

```json
{
   "SnapshotId": "snap-066877671789bd71b"
}
```

For more information, see [Copy an Amazon EBS snapshot](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-snapshot.html) in the *Amazon EC2 User Guide*.

**Example 2: To copy an unencrypted snapshot and encrypt the new snapshot**

The following `copy-snapshot` command copies the specified unencrypted snapshot from the us-west-2 Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \
   --source-region us-west-2 \
   --source-snapshot-id snap-066877671789bd71b \
   --encrypted \
   --kms-key-id alias/my-kms-key
```

Output:

```json
{
   "SnapshotId": "snap-066877671789bd71b"
}
```

For more information, see [Copy an Amazon EBS snapshot](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-snapshot.html) in the *Amazon EC2 User Guide*.

- For API details, see [CopySnapshot](https://docs.aws.amazon.com/cli/latest/reference/ec2/copy-snapshot.html) in *AWS CLI Command Reference*.

---

**create-capacity-reservation-fleet**

The following code example shows how to use `create-capacity-reservation-fleet`.

**AWS CLI**

To create a Capacity Reservation Fleet

---

Actions and scenarios 2017
The following `create-capacity-reservation-fleet` example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```bash
aws ec2 create-capacity-reservation-fleet \
  --total-target-capacity 24 \ 
  --allocation-strategy prioritized \ 
  --instance-match-criteria open \ 
  --tenancy default \ 
  --end-date 2022-12-31T23:59:59.000Z \ 
  --instance-type-specifications file://instanceTypeSpecification.json
```

Contents of `instanceTypeSpecification.json`:

```json
[
  {
    "InstanceType": "m5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "Weight": 3.0,
    "AvailabilityZone": "us-east-1a",
    "EbsOptimized": true,
    "Priority": 1
  }
]
```

Output:

```json
{
  "Status": "submitted",
  "TotalFulfilledCapacity": 0.0,
  "CapacityReservationFleetId": "crf-abcdef01234567890",
  "TotalTargetCapacity": 24
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacityreservation-fleets.html) in the Amazon EC2 User Guide.

For more information about instance type weight and total target capacity, see [Instance type weight](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-type-weight.html) and [Total target capacity](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-type-weight.html) in the Amazon EC2 User Guide.
For more information about designating priority for specified instance types, see Allocation strategy and Instance type priority in the Amazon EC2 User Guide.

- For API details, see CreateCapacityReservationFleet in AWS CLI Command Reference.

create-capacity-reservation

The following code example shows how to use create-capacity-reservation.

AWS CLI

**Example 1: To create a Capacity Reservation**

The following create-capacity-reservation example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three t2.medium instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```bash
aws ec2 create-capacity-reservation \
   --availability-zone eu-west-1a \
   --instance-type t2.medium \
   --instance-platform Linux/UNIX \
   --instance-count 3
```

Output:

```json
{
   "CapacityReservation": {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T09:27:35.000Z",
      "AvailableInstanceCount": 3,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 3,
      "State": "active",
      "Tenancy": "default",
      "EbsOptimized": false,
      "InstanceType": "t2.medium"
   }
}
```
Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three m5.large instances running a Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \n    --end-date-type limited \n    --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "limited",
        "AvailabilityZone": "eu-west-1a",
        "EndDate": "2019-08-31T23:59:59.000Z",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:15:53.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

Example 3: To create a Capacity Reservation that accepts only targeted instance launches
The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```bash
code
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

**Output:**

```json
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

For more information, see [Creating a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/creating-a-capacity-reservation.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateCapacityReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-capacity-reservation.html) in *AWS CLI Command Reference*.

---

**create-carrier-gateway**

The following code example shows how to use `create-carrier-gateway`.

**AWS CLI**

To create a carrier gateway
The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```bash
aws ec2 create-carrier-gateway \
  --vpc-id vpc-0c529aEXAMPLE1111
```

Output:

```json
{
  "CarrierGateway": {
    "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
    "VpcId": "vpc-0c529aEXAMPLE1111",
    "State": "pending",
    "OwnerId": "123456789012"
  }
}
```

For more information, see Carrier gateways in the AWS Wavelength User Guide.

- For API details, see `CreateCarrierGateway` in AWS CLI Command Reference.

`create-client-vpn-endpoint`

The following code example shows how to use `create-client-vpn-endpoint`.

**AWS CLI**

**To create a Client VPN endpoint**

The following `create-client-vpn-endpoint` example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```bash
aws ec2 create-client-vpn-endpoint \
  --client-cidr-block "172.31.0.0/16" \
  --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
  --authentication-options Type=certificate-authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} \
  --connection-log-options Enabled=false
```
Output:

```json
{
    "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
    "Status": {
        "Code": "pending-associate"
    },
    "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com"
}
```

For more information, see [Client VPN Endpoints](https://aws.amazon.com/en_us/services/client-vpn/administrator-guide) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-client-vpn-endpoint) in *AWS CLI Command Reference*.

### create-client-vpn-route

The following code example shows how to use `create-client-vpn-route`.

**AWS CLI**

**To create a route for a Client VPN endpoint**

The following `create-client-vpn-route` example adds a route to the internet (0.0.0.0/0) for the specified subnet of the Client VPN endpoint.

```
aws ec2 create-client-vpn-route \ 
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \ 
    --destination-cidr-block 0.0.0.0/0 \ 
    --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```json
{
    "Status": {
        "Code": "creating"
    }
}
```

For more information, see [Routes](https://aws.amazon.com/en_us/services/client-vpn/administrator-guide) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnRoute](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-client-vpn-route) in *AWS CLI Command Reference*.  

create-coip-cidr

The following code example shows how to use `create-coip-cidr`.

**AWS CLI**

**To create a range of customer-owned IP (CoIP) addresses**

The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```bash
aws ec2 create-coip-cidr \
   --cidr 15.0.0.0/24 \ 
   --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

**Output:**

```json
{
   "CoipCidr": {
      "Cidr": "15.0.0.0/24",
      "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
   }
}
```

For more information, see [Customer-owned IP addresses](aws-outposts-user-guide) in the *AWS Outposts User Guide*.

- For API details, see [CreateCoipCidr](aws-cli-command-reference) in *AWS CLI Command Reference*.

create-coip-pool

The following code example shows how to use `create-coip-pool`.

**AWS CLI**

**To create a pool of customer-owned IP (CoIP) addresses**

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```bash
aws ec2 create-coip-pool \
   --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```
Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcd1234567890",
    }
}
```

- For API details, see [CreateCoipPool](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-coip-pool.html) in *AWS CLI Command Reference*.

### create-customer-gateway

The following code example shows how to use `create-customer-gateway`.

**AWS CLI**

**To create a customer gateway**

This example creates a customer gateway with the specified IP address for its outside interface.

**Command:**

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

**Output:**

```
{
    "CustomerGateway": {
        "CustomerGatewayId": "cgw-0e11f167",
        "IpAddress": "12.1.2.3",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65534"
    }
}
```

- For API details, see [CreateCustomerGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-customer-gateway.html) in *AWS CLI Command Reference*. 

**create-default-subnet**

The following code example shows how to use `create-default-subnet`.

**AWS CLI**

**To create a default subnet**

This example creates a default subnet in Availability Zone us-east-2a.

Command:

```bash
aws ec2 create-default-subnet --availability-zone us-east-2a
```

```json
{
    "Subnet": {
        "AvailabilityZone": "us-east-2a",
        "Tags": [],
        "AvailableIpAddressCount": 4091,
        "DefaultForAz": true,
        "Ipv6CidrBlockAssociationSet": [],
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "MapPublicIpOnLaunch": true,
        "SubnetId": "subnet-1122aabb",
        "CidrBlock": "172.31.32.0/20",
        "AssignIpv6AddressOnCreation": false
    }
}
```

• For API details, see [CreateDefaultSubnet](#) in *AWS CLI Command Reference*.

**create-default-vpc**

The following code example shows how to use `create-default-vpc`.

**AWS CLI**

**To create a default VPC**

This example creates a default VPC.

Command:
aws ec2 create-default-vpc

Output:

```json
{
    "Vpc": {
        "VpcId": "vpc-8eaae5ea",
        "InstanceTenancy": "default",
        "Tags": [],
        "Ipv6CidrBlockAssociationSet": [],
        "State": "pending",
        "DhcpOptionsId": "dopt-af0c32c6",
        "CidrBlock": "172.31.0.0/16",
        "IsDefault": true
    }
}
```

- For API details, see [CreateDefaultVpc](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/create-default-vpc.html) in *AWS CLI Command Reference*.

### create-dhcp-options

The following code example shows how to use `create-dhcp-options`.

**AWS CLI**

**To create a set of DHCP options**

The following `create-dhcp-options` example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```bash
aws ec2 create-dhcp-options \
    --dhcp-configuration \ 
        "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \ 
        "Key=domain-name,Values=example.com" \ 
        "Key=netbios-node-type,Values=2"
```

Output:

```json
{
    "DhcpOptions": {
        "DhcpConfigurations": [
            
        ]
    }
}
```
For API details, see [CreateDhcpOptions](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-dhcp-options.html) in *AWS CLI Command Reference*.

**create-egress-only-internet-gateway**

The following code example shows how to use `create-egress-only-internet-gateway`.

**AWS CLI**

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.
Command:

```
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468
```

Output:

```
{
    "EgressOnlyInternetGateway": {
        "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
        "Attachments": [
            {
                "State": "attached",
                "VpcId": "vpc-0c62a468"
            }
        ]
    }
}
```

- For API details, see [CreateEgressOnlyInternetGateway](https://awscli.amazonaws.com/cog) in *AWS CLI Command Reference*.

**create-fleet**

The following code example shows how to use `create-fleet`.

**AWS CLI**

**Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
--cli-input-json file://file_name.json
```
### Contents of file_name.json:

```json
{
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateId": "lt-0e8c754449b27161c",
            "Version": "1"
        }
    },
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}]
}
```

### Output:

```json
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

**Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is on-demand, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

### Contents of file_name.json:

```json
{
}
```
"LaunchTemplateConfigs": [ 
  { 
    "LaunchTemplateSpecification": { 
      "LaunchTemplateId": "lt-0e8c754449b27161c", 
      "Version": "1" 
    } 
  }, 
  
  "TargetCapacitySpecification": { 
    "TotalTargetCapacity": 2, 
    "DefaultTargetCapacityType": "on-demand" 
  } 
]

Output:

{ 
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE" 
}

Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following create-fleet example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

aws ec2 create-fleet \
  --cli-input-json file://file_name.json

Contents of file_name.json:

{ 
  "LaunchTemplateConfigs": [ 
  { 

"LaunchTemplateSpecification": {
  "LaunchTemplateId": "lt-0e8c754449b27161c",
  "Version": "1"
}

"TargetCapacitySpecification": {
  "TotalTargetCapacity": 2,
  "OnDemandTargetCapacity": 1,
  "DefaultTargetCapacityType": "spot"
}

Output:

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is `lowest-price`, is used. The following `create-fleet` example creates an EC2 Fleet using the `lowest-price` allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is `spot`. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```json
{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
      }...
    }
  ]
}
```
"Version": "1",
"Overrides": [
    {
        "InstanceType": "c4.large",
        "WeightedCapacity": 1,
        "SubnetId": "subnet-a4f6c5d3"
    },
    {
        "InstanceType": "c3.large",
        "WeightedCapacity": 1,
        "SubnetId": "subnet-a4f6c5d3"
    },
    {
        "InstanceType": "c5.large",
        "WeightedCapacity": 1,
        "SubnetId": "subnet-a4f6c5d3"
    }
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "DefaultTargetCapacityType": "spot"
}
}

Output:

{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}

- For API details, see [CreateFleet](https://aws.amazon.com/cli/command-reference) in *AWS CLI Command Reference*.

### create-flow-logs

The following code example shows how to use `create-flow-logs`.

#### AWS CLI

**Example 1: To create a flow log**
The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```bash
aws ec2 create-flow-logs \
  --resource-type NetworkInterface \
  --resource-ids eni-1122344556677889 \
  --traffic-type REJECT \
  --log-group-name my-flow-logs \
  --deliver-logs-permission-arn arn:aws:iam::123456789101:role/publishFlowLogs
```

Output:

```json
{
  "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
  "FlowLogIds": [
    "fl-12345678901234567"
  ],
  "Unsuccessful": []
}
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPCFlowLogs.html) in the *Amazon VPC User Guide*.

**Example 2: To create a flow log with a custom format**

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```bash
aws ec2 create-flow-logs \
  --resource-type VPC \
  --resource-ids vpc-00112233344556677 \
  --traffic-type ALL \
  --log-destination-type s3 \
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
  --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr} ${pkt-dstaddr}'
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPCFlowLogs.html) in the *Amazon VPC User Guide*. 
Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```
aws ec2 create-flow-logs 
  --resource-type VPC 
  --resource-ids vpc-001223344556677 
  --traffic-type ALL 
  --log-destination-type s3 
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ 
  --max-aggregation-interval 60
```

For more information, see VPC Flow Logs in the Amazon VPC User Guide.

- For API details, see CreateFlowLogs in AWS CLI Command Reference.

create-fpga-image

The following code example shows how to use `create-fpga-image`.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

```
aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```
{
  "FpgaImageId": "afi-0d123e123bfc85abc",
  "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}
```
create-image

The following code example shows how to use create-image.

AWS CLI

Example 1: To create an AMI from an Amazon EBS-backed instance

The following create-image example creates an AMI from the specified instance.

```bash
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \n    --name "My server" \n    --description "An AMI for my server"
```

Output:

```json
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the Amazon EC2 User Guide.

Example 2: To create an AMI from an Amazon EBS-backed instance without reboot

The following create-image example creates an AMI and sets the --no-reboot parameter, so that the instance is not rebooted before the image is created.

```bash
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \n    --name "My server" \n    --no-reboot
```

Output:

```json
{
    "ImageId": "ami-abcdef01234567890"
}
```
For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

**Example 3: To tag an AMI and snapshots on creation**

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```bash
aws ec2 create-image \
  --instance-id i-123456789abedef0 \
  --name "My server" \
  --tag-specifications "ResourceType=image,Tags=[{Key=cost-center,Value=cc123}]" \
  "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

Output:

```json
{
  "ImageId": "ami-abcdef01234567890"
}
```

For more information about tagging your resources on creation, see [Add tags on resource creation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

- For API details, see [CreateImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-image.html) in *AWS CLI Command Reference*.

**create-instance-connect-endpoint**

The following code example shows how to use `create-instance-connect-endpoint`.

**AWS CLI**

**To create an EC2 Instance Connect Endpoint**

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```bash
aws ec2 create-instance-connect-endpoint \
  --region us-east-1 \
  --subnet-id subnet-0123456789example
```

Output:
For more information, see Create an EC2 Instance Connect Endpoint in the Amazon EC2 User Guide.

- For API details, see CreateInstanceConnectEndpoint in AWS CLI Command Reference.

create-instance-event-window

The following code example shows how to use create-instance-event-window.

AWS CLI

Example 1: To create an event window with a time range

The following create-instance-event-window example creates an event window with a time range. You can't also specify the cron-expression parameter.

```bash
aws ec2 create-instance-event-window
```
--region us-east-1 \
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
--tag-specifications "ResourceType=instance-event-window,Tags=[[Key=K1,Value=V1]]" \
--name myEventWindowName

Output:

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
        "EndWeekDay": "wednesday",
        "EndHour": 8
      }
    ],
    "Name": "myEventWindowName",
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To create an event window with a cron expression**

The following create-instance-event-window example creates an event window with a cron expression. You can't also specify the time-range parameter.

```bash
aws ec2 create-instance-event-window \
  --region us-east-1 \
  --cron-expression "* 21-23 * * 2,3" \
  --tag-specifications "ResourceType=instance-event-window,Tags=[[Key=K1,Value=V1]]"
```
--name myEventWindowName

Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

- For API details, see [CreateInstanceEventWindow](#) in [AWS CLI Command Reference](#).

### create-instance-export-task

The following code example shows how to use `create-instance-export-task`.

**AWS CLI**

**To export an instance**

This example command creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

**Command:**

```bash
aws ec2 create-instance-export-task --description "RHEL5 instance" --instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

**Output:**

---

Actions and scenarios
create-internet-gateway

The following code example shows how to use create-internet-gateway.

AWS CLI

To create an internet gateway

The following create-internet-gateway example creates an internet gateway with the tag Name=my-igw.

```
aws ec2 create-internet-gateway \
  --tag-specifications ResourceType=internet-gateway,Tags= [{Key=Name,Value=my-igw}]
```

Output:

```json
{
  "InternetGateway": {
    "Attachments": [],
    "InternetGatewayId": "igw-0d0fb496b3994d755",
  }
}
```
For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see CreateInternetGateway in AWS CLI Command Reference.

**create-ipam-pool**

The following code example shows how to use create-ipam-pool.

**AWS CLI**

**To create an IPAM pool**

The following create-ipam-pool example creates an IPAM pool.

**(Linux):**

```bash
aws ec2 create-ipam-pool \
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --address-family ipv4 \
  --auto-import \
  --allocation-min-netmask-length 16 \
  --allocation-max-netmask-length 26 \
  --allocation-default-netmask-length 24 \
  --allocation-resource-tags "Key=Environment,Value=Preprod" \
  --tag-specifications 'ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod pool"}]
```

**(Windows):**

```cmd
aws ec2 create-ipam-pool ^
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --address-family ipv4 ^
```
--auto-import ^
--allocation-min-netmask-length 16 ^
--allocation-max-netmask-length 26 ^
--allocation-default-netmask-length 24 ^
--allocation-resource-tags "Key=Environment,Value=Preprod" ^
--tag-specifications ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod pool"}]

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-0533048da7d823723",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "create-in-progress",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 16,
        "AllocationMaxNetmaskLength": 26,
        "AllocationDefaultNetmaskLength": 24,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "Preprod pool"
            }
        ]
    }
}
```
create-ipam-resource-discovery

The following code example shows how to use create-ipam-resource-discovery.

AWS CLI

To create a resource discovery

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin in the other organization can manage and monitor the IP addresses of resources in your organization.

Important

This example includes both the --region and --operating-regions options because, while they are optional, they must be configured in a particular way to successfully integrate a resource discovery with an IPAM. *--operating-regions must match the Regions where you have resources that you want IPAM to discover. If there are Regions where you do not want IPAM to manage the IP addresses (for example for compliance reasons), do not include them. *--region must match the home Region of the IPAM you want to associate it with. You must create the resource discovery in the same Region that the IPAM was created in. For example, if the IPAM you are associating with was created in us-east-1, include --region us-east-1 in the request. Both the --region and --operating-regions options default to the Region you're running the command in if you don't specify them.

In this example, the operating Regions of the IPAM we're integrating with include us-west-1, us-west-2, and ap-south-1. When we create the resource discovery, we want IPAM to discover the resource IP addresses in us-west-1 and us-west-2 but not ap-south-1. So we are including only --operating-regions RegionName='us-west-1' RegionName='us-west-2' in the request.

The following create-ipam-resource-discovery example creates an IPAM resource discovery.

```bash
aws ec2 create-ipam-resource-discovery \
    --description 'Example-resource-discovery'
```
Output:

```json
{
   "IpamResourceDiscovery": {
      "OwnerId": "149977607591",
      "IpamResourceDiscoveryId": "ipam-res-disco-0257046d8aa78b8bc",
      "IpamResourceDiscoveryRegion": "us-east-1",
      "Description": "Example-resource-discovery",
      "OperatingRegions": [
         { "RegionName": "us-west-1" },
         { "RegionName": "us-west-2" },
         { "RegionName": "us-east-1" }
      ],
      "IsDefault": false,
      "State": "create-in-progress",
      "Tags": [
         { "Key": "cost-center",
           "Value": "cc123"
         }
      ]
   }
}
```

Once you create a resource discovery, you may want to share it with another IPAM delegated admin, which you can do with `create-resource-share`. For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/vpc-ipam/latest/userguide/) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreatelpamResourceDiscovery](https://docs.aws.amazon.com/cli/latest/reference/create-ipam-scope.html) in *AWS CLI Command Reference*.

### create-ipam-scope

The following code example shows how to use `create-ipam-scope`.

### AWS CLI

To create an IPAM scope
The following `create-ipam-scope` example creates an IPAM scope.

(Linux):

```bash
aws ec2 create-ipam-scope \
    --ipam-id ipam-08440e7a3acde3908 \
    --description "Example description" \
    --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]
```

(Windows):

```bash
aws ec2 create-ipam-scope ^
    --ipam-id ipam-08440e7a3acde3908 ^
    --description "Example description" ^
    --tag-specifications ResourceType=ipam-scope,Tags=[[Key=Name,Value="Example name value"]]
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "IpamScopeType": "private",
        "IsDefault": false,
        "Description": "Example description",
        "PoolCount": 0,
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "Name",
                "Value": "Example name value"
            }
        ]
    }
}
```
create-ipam

The following code example shows how to use create-ipam.

AWS CLI

To create an IPAM

The following create-ipam example creates an IPAM.

(Windows):

```bash
aws ec2 create-ipam ^
   --description "Example description" ^
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
   --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```bash
aws ec2 create-ipam ^
   --description "Example description" ^
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
   --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

Output:

```json
{
   "Ipam": {
      "OwnerId": "123456789012",
      "IpamId": "ipam-036486dfa6af58ee0",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
      "IpamRegion": "us-east-1",
      "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
      "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
      "ScopeCount": 2,
      "OperatingRegions": [
         {
            "RegionName": "us-east-2"
```
create-key-pair

The following code example shows how to use create-key-pair.

AWS CLI

To create a key pair

This example creates a key pair named MyKeyPair.

Command:

```bash
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see Using Key Pairs in the AWS Command Line Interface User Guide.

• For API details, see CreateKeyPair in AWS CLI Command Reference.
create-launch-template-version

The following code example shows how to use create-launch-template-version.

AWS CLI

To create a launch template version

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

Command:

```bash
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123 --version-description WebVersion2 --source-version 1 --launch-template-data '{"ImageId":"ami-c998b6b2"}'
```

Output:

```json
{
   "LaunchTemplateVersion": {
      "VersionDescription": "WebVersion2",
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "VersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "LaunchTemplateData": {
         "ImageId": "ami-c998b6b2",
         "InstanceType": "t2.micro",
         "NetworkInterfaces": [
            {
               "Ipv6Addresses": [
                  {
                     "Ipv6Address": "2001:db8:1234:1a00::123"
                  }
               ],
               "DeviceIndex": 0,
               "SubnetId": "subnet-7b16de0c",
               "AssociatePublicIpAddress": true
            }
         ],
         "DefaultVersion": false,
         "CreateTime": "2017-12-01T13:35:46.000Z"
   }
}
```
For API details, see [CreateLaunchTemplateVersion](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-launch-template-version.html) in *AWS CLI Command Reference*.

### create-launch-template

The following code example shows how to use `create-launch-template`.

**AWS CLI**

**Example 1: To create a launch template**

The following `create-launch-template` example creates a launch template that specifies the subnet in which to launch the instance, assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForWebServer \
  --version-description WebVersion1 \
  --launch-template-data '{"NetworkInterfaces": ["AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b16de0c"],"ImageId":"ami-8c1be5f6","InstanceType":"t2.small","TagSpecifications": [{"ResourceType":"instance","Tags": [{"Key":"purpose","Value":"webserver"}]}]}'
```

**Output:**

```
{
   "LaunchTemplate": {
      "LatestVersionNumber": 1,
      "LaunchTemplateId": "lt-01238c059e3466abc",
      "LaunchTemplateName": "TemplateForWebServer",
      "DefaultVersionNumber": 1,
      "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
      "CreateTime": "2019-01-27T09:13:24.000Z"
   }
}
```

For more information, see Launching an Instance from a Launch Template in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 2: To create a launch template for Amazon EC2 Auto Scaling**
The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```
aws ec2 create-launch-template \
   --launch-template-name TemplateForAutoScaling \
   --version-description AutoScalingVersion1 \
   --launch-template-data '{"NetworkInterfaces": ["DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups": ["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-b42209de","InstanceType":"m4.large","TagSpecifications": ["ResourceType":"instance","Tags":["Key":"environment","Value":"production"],"Key":"purpose","Value":"webserver"]},"ResourceType":"volume","Tags": ["Key":"environment","Value":"production"],"Key":"cost-center","Value":"cc123"}],"BlockDeviceMappings": ["DeviceName":"/dev/sda1","Ebs": {"VolumeSize":100}]}' --region us-east-1
```

Output:

```
{
   "LaunchTemplate": {
      "LatestVersionNumber": 1,
      "LaunchTemplateId": "lt-0123c79c33a54e0abc",
      "LaunchTemplateName": "TemplateForAutoScaling",
      "DefaultVersionNumber": 1,
      "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
      "CreateTime": "2019-04-30T18:16:06.000Z"
   }
}
```

For more information, see Creating a Launch Template for an Auto Scaling Group in the Amazon EC2 Auto Scaling User Guide. For information about quoting JSON-formatted parameters, see Quoting Strings in the AWS Command Line Interface User Guide.

**Example 3: To create a launch template that specifies encryption of EBS volumes**

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the "Encrypted" option as
shown in the following example. If you use the "KmsKeyId" option to specify a customer managed CMK, you also must specify the "Encrypted" option even if encryption by default is enabled.

```bash
aws ec2 create-launch-template \
  --launch-template-name TemplateForEncryption \
  --launch-template-data file://config.json
```

Contents of `config.json`:

```json
{
  "BlockDeviceMappings": [
    {
      "DeviceName": "/dev/sda1",
      "Ebs": {
        "VolumeType": "gp2",
        "DeleteOnTermination": true,
        "SnapshotId": "snap-066877671789bd71b",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
      }
    }
  ],
  "ImageId": "ami-00068cd7555f543d5",
  "InstanceType": "c5.large",
  "TagSpecifications": [
    {
      "ResourceType": "volume",
      "Tags": [
        {
          "Key": "encrypted",
          "Value": "yes"
        }
      ]
    }
  ]
}
```

Output:

```json
{
}
```
"LaunchTemplate": {
    "LatestVersionNumber": 1,
    "LaunchTemplateId": "lt-0d5bd51bcf8530abc",
    "LaunchTemplateName": "TemplateForEncryption",
    "DefaultVersionNumber": 1,
    "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
    "CreateTime": "2020-01-07T19:08:36.000Z"
}
}

For more information, see Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default in the Amazon Elastic Compute Cloud User Guide.

- For API details, see [CreateLaunchTemplate](#) in AWS CLI Command Reference.

**create-local-gateway-route-table-virtual-interface-group-association**

The following code example shows how to use create-local-gateway-route-table-virtual-interface-group-association.

**AWS CLI**

**To associate a local gateway route table with a virtual interfaces (VIFs) group**

The following create-local-gateway-route-table-virtual-interface-group-association example creates an association between the specified local gateway route table and VIF group.

```
aws ec2 create-local-gateway-route-table-virtual-interface-group-association \
  --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \n  --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd
```

**Output:**

```json
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
        "LocalGatewayId": "lgw-exampleid11223344",
        "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
    }
}
```
The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

**AWS CLI**

To associate a VPC with a route table

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```bash
aws ec2 create-local-gateway-route-table-vpc-association \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
  --vpc-id vpc-07ef66ac71EXAMPLE
```

Output:

```json
{

"LocalGatewayRouteTableVpcAssociation": {
  "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
  "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
  "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
  "VpcId": "vpc-07ef66ac71EXAMPLE",
  "State": "associated"

}
}
```
create-local-gateway-route-table

The following code example shows how to use create-local-gateway-route-table.

AWS CLI

To create a local gateway route table

The following create-local-gateway-route-table example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 create-local-gateway-route-table \
  --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
  --mode direct-vpc-routing
```

Output:

```
{
  "LocalGatewayRouteTable": {
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
    "OwnerId": "111122223333",
    "State": "pending",
    "Tags": [],
    "Mode": "direct-vpc-routing"
  }
}
```

For more information, see Local gateway route tables in the AWS Outposts User Guide.

create-local-gateway-route

The following code example shows how to use create-local-gateway-route.

• For API details, see CreateLocalGatewayRouteTable in AWS CLI Command Reference.
AWS CLI

To create a static route for a local gateway route table

The following create-local-gateway-route example creates the specified route in the specified local gateway route table.

```bash
aws ec2 create-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```json
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
    }
}
```

- For API details, see CreateLocalGatewayRoute in AWS CLI Command Reference.

create-managed-prefix-list

The following code example shows how to use create-managed-prefix-list.

AWS CLI

To create a prefix list

The following create-managed-prefix-list example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```bash
aws ec2 create-managed-prefix-list \
    --address-family IPv4 \
    --max-entries 10 \
    --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b \
    --prefix-list-name vpc-cidrs
```
create-nat-gateway

The following code example shows how to use create-nat-gateway.

AWS CLI

Example 1: To create a public NAT gateway

The following create-nat-gateway example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
  --subnet-id subnet-0250c25a1fEXAMPLE \
  --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
  "NatGateway": {
    "CreateTime": "2021-12-01T22:22:38.000Z",
  }
}
```
"NatGatewayAddresses": [
    
    
   "AllocationId": "eipalloc-09ad461b0dEXAMPLE"

   
  ],

  "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
  "State": "pending",
  "SubnetId": "subnet-0250c25a1fEXAMPLE",
  "VpcId": "vpc-0a60eb65b4EXAMPLE",
  "ConnectivityType": "public"

  }

}

For more information, see [NAT gateways](#) in the Amazon VPC User Guide.

**Example 2: To create a private NAT gateway**

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```bash
aws ec2 create-nat-gateway \
   --subnet-id subnet-0250c25a1fEXAMPLE \
   --connectivity-type private
```

**Output:**

```json
{
   "NatGateway": {
      "CreateTime": "2021-12-01T22:26:00.000Z",
      "NatGatewayAddresses": [
         
         
        
      ],
      "NatGatewayId": "nat-011b568379EXAMPLE",
      "State": "pending",
      "SubnetId": "subnet-0250c25a1fEXAMPLE",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "ConnectivityType": "private"
   }

}
```

For more information, see [NAT gateways](#) in the Amazon VPC User Guide.

- For API details, see [CreateNatGateway](#) in AWS CLI Command Reference.
**create-network-acl-entry**

The following code example shows how to use `create-network-acl-entry`.

**AWS CLI**

To create a network ACL entry

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```

- For API details, see [CreateNetworkAclEntry](#) in *AWS CLI Command Reference*.

**create-network-acl**

The following code example shows how to use `create-network-acl`.

**AWS CLI**

To create a network ACL

This example creates a network ACL for the specified VPC.

Command:
aws ec2 create-network-acl --vpc-id vpc-a01106c2

Output:

```
{
    "NetworkAcl": {
        "Associations": [],
        "NetworkAclId": "acl-5fb85d36",
        "VpcId": "vpc-a01106c2",
        "Tags": [],
        "Entries": [
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": true,
                "RuleAction": "deny"
            },
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": false,
                "RuleAction": "deny"
            }
        ],
        "IsDefault": false
    }
}
```

- For API details, see [CreateNetworkAcl](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-acl.html) in *AWS CLI Command Reference*.

**create-network-insights-access-scope**

The following code example shows how to use `create-network-insights-access-scope`.

**AWS CLI**

**To create a Network Access Scope**

The following `create-network-insights-access-scope` example creates a Network Access Scope.
aws ec2 create-network-insights-access-scope \
   --cli-input-json file://access-scope-file.json

Contents of access-scope-file.json:

```json
{
   "MatchPaths": [
      {
         "Source": {
            "ResourceStatement": {
               "Resources": [
                  "vpc-abcd12e3"
               ]
            }
         }
      }
   ],
   "ExcludePaths": [
      {
         "Source": {
            "ResourceStatement": {
               "ResourceTypes": [
                  "AWS::EC2::InternetGateway"
               ]
            }
         }
      }
   ]
}
```

Output:

```json
{
   "NetworkInsightsAccessScope": {
      "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
      "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
      "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
   },
   "NetworkInsightsAccessScopeContent": {
      "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
```
"MatchPaths": [
    {
      "Source": {
        "ResourceStatement": {
          "Resources": [
            "vpc-abcd12e3"
          ]
        }
      }
    },
    "ExcludePaths": [
      {
        "Source": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::InternetGateway"
            ]
          }
        }
      }
    ]
  ],

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/networkaccess/latest/userguide/using-network-access-analyzer-with-aws-cli.html) in the Network Access Analyzer Guide.

**create-network-insights-path**

The following code example shows how to use create-network-insights-path.

**AWS CLI**

**To create a path**

The following create-network-insights-path example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the start-network-insights-analysis command.
aws ec2 create-network-insights-path \
  --source igw-0797cccdc9d73b0e5 \
  --destination i-0495d385ad28331c7 \
  --destination-port 22 \
  --protocol TCP

Output:

```
{
  "NetworkInsightsPaths": {
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
    "CreatedDate": "2021-01-20T22:43:46.933Z",
    "Source": "igw-0797cccdc9d73b0e5",
    "Destination": "i-0495d385ad28331c7",
    "Protocol": "tcp"
  }
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/get-started-cli.html) in the *Reachability Analyzer Guide*.

- For API details, see [CreateNetworkInsightsPath](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-insights-path.html) in *AWS CLI Command Reference*.

### create-network-interface-permission

The following code example shows how to use `create-network-interface-permission`.

**AWS CLI**

**To create a network interface permission**

This example grants permission to account 123456789012 to attach network interface eni-1a2b3c4d to an instance.

**Command:**

```
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

**Output:**
For API details, see CreateNetworkInterfacePermission in AWS CLI Command Reference.

**create-network-interface**

The following code example shows how to use create-network-interface.

**AWS CLI**

**Example 1: To specify an IPv4 address for a network interface**

The following create-network-interface example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my network interface" \
  --groups sg-09dfba7ed20cda78b \
  --private-ip-address 10.0.8.17
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ]
    }
}
```
Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following create-network-interface example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```
aws ec2 create-network-interface
  --subnet-id subnet-00a24d0d67acf6333
  --description "my dual stack network interface"
  --ipv6-address-count 1
  --groups sg-09dfba7ed20cda78b
```

Output:

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "OwnerID": "123456789012",
    "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.17",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.17"
      }
    ],
    "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
    "RequesterManaged": false,
    "SourceDestCheck": true,
    "Status": "pending",
    "SubnetId": "subnet-00a24d0d67acf6333",
    "TagSet": [],
    "VpcId": "vpc-02723a0fdee9d57b"
  }
}
```
"Description": "my dual stack network interface",
"Groups": [
  {
    "GroupName": "my-security-group",
    "GroupId": "sg-09dfba7ed20cda78b"
  }
],
"InterfaceType": "interface",
"Ipv6Addresses": [
  {
    "Ipv6Address": "2600:1f13:ca2d:3650:a1dc:237c:393a:4ba7",
    "IsPrimaryIpv6": false
  }
],
"MacAddress": "06:b8:68:d2:b2:2d",
"NetworkInterfaceId": "eni-05da417453f9a84bf",
"OwnerId": "123456789012",
"PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
"PrivateIpAddress": "10.0.8.18",
"PrivateIpAddresses": [
  {
    "Primary": true,
    "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.18"
  }
],
"RequesterId": "AIDA4Z3Y76XTMEXAMPLE",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-00a24d0d67ac6f333",
"TagSet": [],
"VpcId": "vpc-02723a0f6eeb9d57b",
"Ipv6Address": "2600:1f13:ca2d:3650:a1dc:237c:393a:4ba7"
}

Example 3: To create a network interface with connection tracking configuration options

The following create-network-interface example creates a network interface and configures the idle connection tracking timeouts.

```bash
aws ec2 create-network-interface
```
--subnet-id subnet-00a24d0d67acf6333 \
--groups sg-02e57d9cfe0331c1b \
--connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60

Output:

```json
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "ConnectionTrackingConfiguration": {
            "TcpEstablishedTimeout": 86400,
            "UdpTimeout": 60
        },
        "Description": "",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-02e57d9cfe0331c1b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "06:4c:53:de:6d:91",
        "NetworkInterfaceId": "eni-0c13358e08903d0b",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.94",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.94"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0fee9b9d57b"
    }
}
```
Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```
aws ec2 create-network-interface \\n  --interface-type efa \\n  --subnet-id subnet-00a24d0d67acf6333 \\n  --description "my efa" \\n  --groups sg-02e57dcbfe0331c1b
```

Output:

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "my efa",
    "Groups": [
      {
        "GroupName": "my-efa-sg",
        "GroupId": "sg-02e57dcbfe0331c1b"
      }
    ],
    "InterfaceType": "efa",
    "Ipv6Addresses": [],
    "MacAddress": "06:d7:a4:f7:4d:57",
    "NetworkInterfaceId": "eni-034acc2885e862b65",
    "OwnerId": "123456789012",
    "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.180",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.180"
      }
    ],
    "RequesterId": "AIDA4Z3Y76SXMTEXAMPLE",
    "RequesterManaged": false,
    "SourceDestCheck": true,
    "Status": "pending",
    "SubnetId": "subnet-00a24d0d67acf6333",
    "TagSet": [],
    "VpcId": "vpc-02723a0fdeeb9d57b"
  }
}```
For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see CreateNetworkInterface in AWS CLI Command Reference.

create-placement-group

The following code example shows how to use create-placement-group.

AWS CLI

To create a placement group

This example command creates a placement group with the specified name.

Command:

```bash
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

To create a partition placement group

This example command creates a partition placement group named HDFS-Group-A with five partitions.

Command:

```bash
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```

- For API details, see CreatePlacementGroup in AWS CLI Command Reference.

create-replace-root-volume-task

The following code example shows how to use create-replace-root-volume-task.

AWS CLI

Example 1: To restore a root volume to its initial launch state
The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to its initial launch state.

```bash
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa
```

Output:

```json
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-01112222333abc",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:06:38Z",
        "Tags": []
    }
}
```

For more information, see [Replace a root volume](https://docs.aws.amazon.com/AmazonElasticComputeCloud/UserGuide) in the *Amazon Elastic Compute Cloud User Guide*.

**Example 2: To restore a root volume to a specific snapshot**

The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to snapshot `snap-0abcdef1234567890`.

```bash
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa \
   --snapshot-id snap-0abcdef1234567890
```

Output:

```json
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-0555566677777abcd",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:16:28Z",
        "Tags": []
    }
}
```
For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

- For API details, see CreateReplaceRootVolumeTask in AWS CLI Command Reference.

**create-reserved-instances-listing**

The following code example shows how to use create-reserved-instances-listing.

**AWS CLI**

**To list a Reserved Instance in the Reserved Instance Marketplace**

The following create-reserved-instances-listing example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```bash
aws ec2 create-reserved-instances-listing \
  --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \
  --instance-count 3 \
  --price-schedules CurrencyCode=USD,Price=25.50 \
  --client-token 550e8400-e29b-41d4-a716-446655440000
```

- For API details, see CreateReservedInstancesListing in AWS CLI Command Reference.

**create-restore-image-task**

The following code example shows how to use create-restore-image-task.

**AWS CLI**

**To restore an AMI from an S3 bucket**

The following create-restore-image-task example restores an AMI from an S3 bucket. Use the values for S3ObjectKey ```` and ````Bucket from the describe-store-image-tasks output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```bash
aws ec2 create-restore-image-task \
```
Output:

```
{
   "ImageId": "ami-0eab20fe36f83e1a8"
}
```

- For API details, see CreateRestoreImageTask in AWS CLI Command Reference.

### create-route-table

The following code example shows how to use create-route-table.

**AWS CLI**

**To create a route table**

This example creates a route table for the specified VPC.

Command:

```
aws ec2 create-route-table --vpc-id vpc-a01106c2
```

Output:

```
{
   "RouteTable": {
      "Associations": [],
      "RouteTableId": "rtb-22574640",
      "VpcId": "vpc-a01106c2",
      "PropagatingVgws": [],
      "Tags": [],
      "Routes": [
         {
```
create-route

The following code example shows how to use create-route.

AWS CLI

To create a route

This example creates a route for the specified route table. The route matches all IPv4 traffic (0.0.0.0/0) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-111aaa22. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block 10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (:/:0) and routes it to the specified egress-only Internet gateway.

Command:
For API details, see CreateRoute in AWS CLI Command Reference.

**create-security-group**

The following code example shows how to use `create-security-group`.

**AWS CLI**

**To create a security group for EC2-Classic**

This example creates a security group named MySecurityGroup.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group"
```

Output:

```
{
   "GroupId": "sg-903004f8"
}
```

**To create a security group for EC2-VPC**

This example creates a security group named MySecurityGroup for the specified VPC.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group" --vpc-id vpc-1a2b3c4d
```

Output:

```
{
   "GroupId": "sg-903004f8"
}
```
For more information, see Using Security Groups in the *AWS Command Line Interface User Guide*.

- For API details, see `CreateSecurityGroup` in *AWS CLI Command Reference*.

**create-snapshot**

The following code example shows how to use `create-snapshot`.

**AWS CLI**

**To create a snapshot**

This example command creates a snapshot of the volume with a volume ID of `vol-1234567890abcdef0` and a short description to identify the snapshot.

**Command:**

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot"
```

**Output:**

```json
{
    "Description": "This is my root volume snapshot",
    "Tags": [],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:01.000Z",
    "Progress": ",",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-066877671789bd71b"
}
```

**To create a snapshot with tags**

This example command creates a snapshot and applies two tags: `purpose=prod` and `costcenter=123`.

**Command:**

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot" --tags purpose=prod costcenter=123
```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod}, {Key=costcenter,Value=123}]'

Output:

```json
{
    "Description": "Prod backup",
    "Tags": [
        {
            "Value": "prod",
            "Key": "purpose"
        },
        {
            "Value": "123",
            "Key": "costcenter"
        }
    ],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:06.000Z",
    "Progress": "",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-09ed24a70bc19bbe4"
}
```

- For API details, see [CreateSnapshot](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-snapshot.html) in *AWS CLI Command Reference*.

### create-snapshots

The following code example shows how to use `create-snapshots`.

### AWS CLI

**Example 1: To create a multi-volume snapshot**

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance.

```bash
aws ec2 create-snapshots
```
---instance-specification InstanceId=i-1234567890abcdef0 \
--description "This is snapshot of a volume from my-instance"

Output:

```json
{
   "Snapshots": [
   {
   "Description": "This is a snapshot of a volume from my-instance",
   "Tags": [],
   "Encrypted": false,
   "VolumeId": "vol-0a01d2d5a34697479",
   "State": "pending",
   "VolumeSize": 16,
   "StartTime": "2019-08-05T16:58:19.000Z",
   "Progress": "",
   "OwnerId": "123456789012",
   "SnapshotId": "snap-07f30e3909aa0045e"
   },
   {
   "Description": "This is a snapshot of a volume from my-instance",
   "Tags": [],
   "Encrypted": false,
   "VolumeId": "vol-02d0d4947008cb1a2",
   "State": "pending",
   "VolumeSize": 20,
   "StartTime": "2019-08-05T16:58:19.000Z",
   "Progress": "",
   "OwnerId": "123456789012",
   "SnapshotId": "snap-0ec20b602264aad48"
   }
   ...
]
}
```

**Example 2: To create a multi-volume snapshot with tags from the source volume**

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```bash
aws ec2 create-snapshots \
   --instance-specification InstanceId=i-1234567890abcdef0 \
   --copy-tags-from-source volume \
```
--description "This is snapshot of a volume from my-instance"

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is a snapshot of a volume from my-instance",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-volume"
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T16:53:04.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-053bfaeb821a458dd"
        }
    ]
}
```

Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.
aws ec2 create-snapshots \
  --instance-specification InstanceId=i-1234567890abcdef0 \
  --tag-specifications 'ResourceType=snapshot,Tags=[{Key=Name,Value=backup}, 
{Key=costcenter,Value=123}]'

See example 1 for sample output.

- For API details, see **CreateSnapshots** in *AWS CLI Command Reference*.

### create-spot-datafeed-subscription

The following code example shows how to use `create-spot-datafeed-subscription`.

**AWS CLI**

**To create a Spot Instance data feed**

The following `create-spot-datafeed-subscription` example creates a Spot Instance data feed.

```bash
aws ec2 create-spot-datafeed-subscription \
  --bucket my-bucket \
  --prefix spot-data-feed
```

**Output:**

```
{
  "SpotDatafeedSubscription": {
    "Bucket": "my-bucket",
    "OwnerId": "123456789012",
    "Prefix": "spot-data-feed",
    "State": "Active"
  }
}
```

The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
my-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-HH.n.abcd1234.gz
```
For more information, see Spot Instance data feed in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateSpotDatafeedSubscription in AWS CLI Command Reference.

create-store-image-task

The following code example shows how to use create-store-image-task.

AWS CLI

To store an AMI in an S3 bucket

The following create-store-image-task example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```bash
aws ec2 create-store-image-task \
   --image-id ami-1234567890abcdef0 \
   --bucket my-ami-bucket
```

Output:

```json
{
   "ObjectKey": "ami-1234567890abcdef0.bin"
}
```

For more information, see Store and restore an AMI using S3 in the Amazon EC2 User Guide.

- For API details, see CreateStoreImageTask in AWS CLI Command Reference.

create-subnet-cidr-reservation

The following code example shows how to use create-subnet-cidr-reservation.

AWS CLI

To create a subnet CIDR reservation

The following create-subnet-cidr-reservation example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```bash
aws ec2 create-subnet-cidr-reservation \
```
--subnet-id subnet-03c51e2eEXAMPLE \
--reservation-type prefix \
--cidr 10.1.0.20/26

Output:

```plaintext
{
  "SubnetCidrReservation": {
    "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
    "SubnetId": "subnet-03c51e2e6cEXAMPLE",
    "Cidr": "10.1.0.16/28",
    "ReservationType": "prefix",
    "OwnerId": "123456789012"
  }
}
```

For more information, see [Subnet CIDR reservations](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/amazon-vpc-subnet-cidr-reservation.html) in the *Amazon VPC User Guide*.

- For API details, see [CreateSubnetCidrReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-subnet-cidr-reservation.html) in *AWS CLI Command Reference*.

### create-subnet

The following code example shows how to use `create-subnet`.

**AWS CLI**

**Example 1: To create a subnet with an IPv4 CIDR block only**

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```shell
aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \
  --cidr-block 10.0.0.0/24 \
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-only-subnet}]
```

Output:

```plaintext
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
```

**Actions and scenarios**

2081
Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```bash
aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \
  --cidr-block 10.0.0.0/24 \
  --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-ipv6-subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
        "State": "available",
        "SubnetId": "subnet-0e99b93155EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv4-only-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0e99b93155EXAMPLE"
    }
}
```
Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```bash
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --ipv6-native \
    --ipv6-cidr-block 2600:1f16:115:200::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-subnet}]
```

Output:

```json
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
```

Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```bash
aws ec2 create-subnet \n    --vpc-id vpc-081ec835f3EXAMPLE \n    --ipv6-native \n    --ipv6-cidr-block 2600:1f16:115:200::/64 \n    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-subnet}]
```

Output:

```json
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
```
"AvailabilityZoneId": "usw2-az2",
"AvailableIpAddressCount": 0,
"DefaultForAz": false,
"MapPublicIpOnLaunch": false,
"State": "available",
"SubnetId": "subnet-03f720e7deEXAMPLE",
"VpcId": "vpc-081ec835f3EXAMPLE",
"OwnerId": "123456789012",
"AssignIpv6AddressOnCreation": true,
"Ipv6CidrBlockAssociationSet": [
    {
      "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
      "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
      "Ipv6CidrBlockState": {
        "State": "associating"
      }
    }
  ],
"Tags": [
    {
      "Key": "Name",
      "Value": "my-ipv6-only-subnet"
    }
  ],
"SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-03f720e7deEXAMPLE"
}

For more information, see VPCs and subnets in the Amazon VPC User Guide.

- For API details, see CreateSubnet in AWS CLI Command Reference.

create-tags

The following code example shows how to use create-tags.

AWS CLI

Example 1: To add a tag to a resource

The following create-tags example adds the tag Stack=production to the specified image, or overwrites an existing tag for the AMI where the tag key is Stack.
aws ec2 create-tags
   --resources ami-1234567890abcdef0
   --tags Key=Stack,Value=production

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 2: To add tags to multiple resources

The following create-tags example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (webserver) but no value (value is set to an empty string). The other tag has a key (stack) and a value (Production).

aws ec2 create-tags
   --resources ami-1a2b3c4d i-1234567890abcdef0
   --tags Key=webserver,Value=   Key=stack,Value=Production

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 3: To add tags containing special characters

The following create-tags example adds the tag [Group]=test for an instance. The square brackets ([ and ]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:

aws ec2 create-tags ^
   --resources i-1234567890abcdef0 ^
   --tags Key="[Group]",Value=test

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then surround the entire key and value structure with single quotes (’) as follows:

aws ec2 create-tags `^
   --resources i-1234567890abcdef0 `^
   --tags 'Key="[Group]",Value=test'
If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (') as follows:

```bash
aws ec2 create-tags 
   --resources i-1234567890abcdef0 
   --tags 'Key="[Group]",Value=test'
```

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateTags in AWS CLI Command Reference.

create-traffic-mirror-filter-rule

The following code example shows how to use create-traffic-mirror-filter-rule.

**AWS CLI**

**To create a filter rule for incoming TCP traffic**

The following create-traffic-mirror-filter-rule example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use create-traffic-mirror-filter to create the the Traffic Mirror filter.

```bash
aws ec2 create-traffic-mirror-filter-rule 
   --description "TCP Rule" 
   --destination-cidr-block 0.0.0.0/0 
   --protocol 6 
   --rule-action accept 
   --rule-number 1 
   --source-cidr-block 0.0.0.0/0 
   --traffic-direction ingress 
   --traffic-mirror-filter-id tmf-04812ff784b25ae67
```

Output:

```json
{
   "TrafficMirrorFilterRule": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
      "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",
      "SourceCidrBlock": "0.0.0.0/0",
```
For more information, see Create a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorFilterRule in AWS CLI Command Reference.

create-traffic-mirror-filter

The following code example shows how to use create-traffic-mirror-filter.

AWS CLI

To create a Traffic Mirror Filter

The following create-traffic-mirror-filter example creates a Traffic Mirror filter. After you create the filter, use create-traffic-mirror-filter-rule to add rules to the filter.

```
aws ec2 create-traffic-mirror-filter \
  --description "TCP Filter"
```

Output:

```
{
      "ClientToken": "28908518-100b-4987-8233-8c744EXAMPLE",
      "TrafficMirrorFilter": {
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "Description": "TCP Filter",
        "EgressFilterRules": [],
        "IngressFilterRules": [],
        "Tags": [],
        "NetworkServices": []
      }
}
```

For more information, see Create a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.
create-traffic-mirror-session

The following code example shows how to use create-traffic-mirror-session.

AWS CLI

To create a Traffic Mirror Session

The following create-traffic-mirror-session command creates a traffic mirror sessions for the specified source and target for 25 bytes of the packet.

```bash
aws ec2 create-traffic-mirror-session \
   --description "example session" \
   --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \
   --network-interface-id eni-070203f901EXAMPLE \
   --session-number 1 \
   --packet-length 25 \
   --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

Output:

```json
{
   "TrafficMirrorSession": {
      "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
      "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
      "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
      "NetworkInterfaceId": "eni-070203f901EXAMPLE",
      "OwnerId": "111122223333",
      "PacketLength": 25,
      "SessionNumber": 1,
      "VirtualNetworkId": 7159709,
      "Description": "example session",
      "Tags": []
   },
   "ClientToken": "5236cfff-ee13-4a32-bb5b-388d9da09d96"
}
```

For more information, see Create a Traffic Mirror Session in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorSession in AWS CLI Command Reference.
create-traffic-mirror-target

The following code example shows how to use create-traffic-mirror-target.

AWS CLI

To create a Network Load Balancer Traffic Mirror target

The following create-traffic-mirror-target example creates a Network Load Balancer Traffic Mirror target.

```sh
aws ec2 create-traffic-mirror-target \
  --description "Example Network Load Balancer Target" \
```

Output:

```
{
  "TrafficMirrorTarget": {
    "Type": "network-load-balancer",
    "Tags": [],
    "Description": "Example Network Load Balancer Target",
    "OwnerId": "111122223333",
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:724145273726:loadbalancer/net/NLB/7cdec873EXAMPLE",
    "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"
  },
  "ClientToken": "d5c090f5-8a0f-49c7-8281-72c796a21f72"
}
```

To create a network Traffic Mirror target

The following create-traffic-mirror-target example creates a network interface Traffic Mirror target.

```sh
aws ec2 create-traffic-mirror-target --description "Network interface target" --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{

```
For more information, see Create a Traffic Mirror Target in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorTarget in AWS CLI Command Reference.

create-transit-gateway-connect-peer

The following code example shows how to use create-transit-gateway-connect-peer.

**AWS CLI**

To create a Transit Gateway Connect peer

The following create-transit-gateway-connect-peer example creates a Connect peer.

```
aws ec2 create-transit-gateway-connect-peer \
  --transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
  --peer-address 172.31.1.11 \
  --inside-cidr-blocks 169.254.6.0/29
```

Output:

```
{
  "TransitGatewayConnectPeer": {
    "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
    "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
    "State": "pending",
    "CreationTime": "2021-10-13T03:35:17.000Z",
    "ConnectPeerConfiguration": {
      "TransitGatewayAddress": "10.0.0.234",
      "PeerAddress": "172.31.1.11",
      "InsideCidrBlocks": [
        "169.254.6.0/29"
      ]
    }
  }
}
```
"169.254.6.0/29",
   "Protocol": "gre",
   "BgpConfigurations": [
   {
      "TransitGatewayAsn": 64512,
      "PeerAsn": 64512,
      "TransitGatewayAddress": "169.254.6.2",
      "PeerAddress": "169.254.6.1",
      "BgpStatus": "down"
   },
   {
      "TransitGatewayAsn": 64512,
      "PeerAsn": 64512,
      "TransitGatewayAddress": "169.254.6.3",
      "PeerAddress": "169.254.6.1",
      "BgpStatus": "down"
   }
   ]
}

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

• For API details, see CreateTransitGatewayConnectPeer in AWS CLI Command Reference.

create-transit-gateway-connect

The following code example shows how to use create-transit-gateway-connect.

AWS CLI

 To create a transit gateway Connect attachment

The following create-transit-gateway-connect example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```bash
aws ec2 create-transit-gateway-connect \
   --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
   --options "Protocol=gre"
```
Output:

```json
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the [Transit Gateways Guide](#).

- For API details, see [CreateTransitGatewayConnect](#) in [AWS CLI Command Reference](#).

### create-transit-gateway-multicast-domain

The following code example shows how to use `create-transit-gateway-multicast-domain`.

**AWS CLI**

**Example 1: To create an IGMP multicast domain**

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```bash
aws ec2 create-transit-gateway-multicast-domain \
    --transit-gateway-id tgw-0bf0bfefaeEXAMPLE \
    --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```json
{
    "TransitGatewayMulticastDomain": {
    }
}
```
"TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
"TransitGatewayId": "tgw-0bf0bffe6fEXAMPLE",
"OwnerId": "123456789012",
"Options": {
  "Igmpv2Support": "enable",
  "StaticSourcesSupport": "disable",
  "AutoAcceptSharedAssociations": "disable"
},
"State": "pending",
"CreationTime": "2021-09-29T22:17:13.000Z"
}

Example 2: To create a static multicast domain

The following create-transit-gateway-multicast-domain example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

aws ec2 create-transit-gateway-multicast-domain \
  --transit-gateway-id tgw-0bf0bffe6fEXAMPLE \
  --options StaticSourcesSupport=enable,Igmpv2Support=disable

Output:

{
  "TransitGatewayMulticastDomain": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
    "TransitGatewayId": "tgw-0bf0bffe6fEXAMPLE",
    "OwnerId": "123456789012",
    "Options": {
      "Igmpv2Support": "disable",
      "StaticSourcesSupport": "enable",
      "AutoAcceptSharedAssociations": "disable"
    },
    "State": "pending",
"
create-transit-gateway-peering-attachment

The following code example shows how to use create-transit-gateway-peering-attachment.

AWS CLI

To create a transit gateway peering attachment

The following create-transit-gateway-peering-attachment example creates a peering attachment request between the two specified transit gateways.

```bash
aws ec2 create-transit-gateway-peering-attachment \
  --transit-gateway-id tgw-123abc05e04123abc \
  --peer-transit-gateway-id tgw-11223344aabbcc112 \
  --peer-account-id 123456789012 \
  --peer-region us-east-2
```

Output:

```json
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-445566778aabbccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    },
    "AccepterTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "initiatingRequest",
  }
}
```
create-transit-gateway-policy-table

The following code example shows how to use create-transit-gateway-policy-table.

**AWS CLI**

To create a transit gateway policy table

The following create-transit-gateway-policy-table example creates a transit gateway policy table for the specified transit gateway.

```
aws ec2 create-transit-gateway-policy-table \
   --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```json
{
   "TransitGatewayPolicyTable": {
      "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
      "TransitGatewayId": "tgw-067f8505c18f0bd6e",
      "State": "pending",
      "CreationTime": "2023-11-28T16:36:43+00:00"
   }
}
```

For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see CreateTransitGatewayPolicyTable in AWS CLI Command Reference.

create-transit-gateway-prefix-list-reference

The following code example shows how to use create-transit-gateway-prefix-list-reference.

```
aws ec2 create-transit-gateway-prefix-list-reference \
   --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```json
{
   "TransitGatewayPrefixListReference": {
      "PrefixListId": "pl-0a16f134b78668a81",
      "OwnerId": "123456789012",
      "Description": "Transit Gateway Prefix List Reference"
   }
}
```

For more information, see Transit Gateway Prefix Lists in the Transit Gateway User Guide.

- For API details, see CreateTransitGatewayPrefixListReference in AWS CLI Command Reference.
AWS CLI

To create a reference to a prefix list

The following `create-transit-gateway-prefix-list-reference` example creates a reference to the specified prefix list in the specified transit gateway route table.

```
aws ec2 create-transit-gateway-prefix-list-reference \
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
   --prefix-list-id pl-11111122222222333 \
   --transit-gateway-attachment-id tgw-attach-aaaaabbbbbbb11111
```

Output:

```
{
   "TransitGatewayPrefixListReference": {
      "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
      "PrefixListId": "pl-11111122222222333",
      "PrefixListOwnerId": "123456789012",
      "State": "pending",
      "Blackhole": false,
      "TransitGatewayAttachment": {
         "TransitGatewayAttachmentId": "tgw-attach-aaaaabbbbbbb11111",
         "ResourceType": "vpc",
         "ResourceId": "vpc-112233445566aabbc"
      }
   }
}
```

For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayPrefixListReference in AWS CLI Command Reference.

create-transit-gateway-route-table

The following code example shows how to use `create-transit-gateway-route-table`.

AWS CLI

To create a Transit Gateway Route Table

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.
Output:

```json
{
   "TransitGatewayRouteTable": {
      "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "State": "pending",
      "DefaultAssociationRouteTable": false,
      "DefaultPropagationRouteTable": false,
      "CreationTime": "2019-07-10T19:01:46.000Z"
   }
}
```

For more information, see Create a transit gateway route table in the Transit Gateways Guide.  
• For API details, see CreateTransitGatewayRouteTable in AWS CLI Command Reference.

**create-transit-gateway-route**

The following code example shows how to use create-transit-gateway-route.

**AWS CLI**

**To create a transit gateway route**

The following create-transit-gateway-route example creates a route, with the specified destination, for the specified route table.

```bash
aws ec2 create-transit-gateway-route \
   --destination-cidr-block 10.0.2.0/24 \
   --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
   --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```json
{
   "Route": {
      "DestinationCidrBlock": "10.0.2.0/24",
```
"TransitGatewayAttachments": [ 
  { 
    "ResourceId": "vpc-0065acced4EXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
    "ResourceType": "vpc"
  },
  
  "Type": "static",
  "State": "active"
]

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayRoute in AWS CLI Command Reference.

create-transit-gateway-vpc-attachment

The following code example shows how to use create-transit-gateway-vpc-attachment.

AWS CLI

Example 1: To associate a transit gateway with a VPC

The following create-transit-gateway-vpc-attachment example creates a transit gateway attachment to the specified VPC.

```bash
aws ec2 create-transit-gateway-vpc-attachment \
   --transit-gateway-id tgw-0262a0e521EXAMPLE \
   --vpc-id vpc-07e8fffd50f49335df \
   --subnet-id subnet-0752213d59EXAMPLE
```

Output:

```json
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8fffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [ 
```
"subnet-0752213d59EXAMPLE",
"CreationTime": "2019-07-10T17:33:46.000Z",
"Options": {
   "DnsSupport": "enable",
   "Ipv6Support": "disable"
}
}
}

For more information, see Create a transit gateway attachment to a VPC in the Transit Gateways Guide.

Example 2: To associate a transit gateway with multiple subnets in a VPC

The following create-transit-gateway-vpc-attachment example creates a transit gateway attachment to the specified VPC and subnets.

```
aws ec2 create-transit-gateway-vpc-attachment \
   --transit-gateway-id tgw-02f776b1a7EXAMPLE \
   --vpc-id vpc-3EXAMPLE \
   --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:

```
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0e141e0bebEXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "VpcId": "vpc-3EXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "pending",
      "SubnetIds": [
         "subnet-6EXAMPLE",
         "subnet-dEXAMPLE"
      ],
      "CreationTime": "2019-12-17T20:07:52.000Z",
      "Options": {
         "DnsSupport": "enable",
         "Ipv6Support": "disable"
      }
   }
}
```
For more information, see Create a transit gateway attachment to a VPC in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayVpcAttachment in AWS CLI Command Reference.

**create-transit-gateway**

The following code example shows how to use create-transit-gateway.

**AWS CLI**

**To create a transit gateway**

The following create-transit-gateway example creates a transit gateway.

```bash
aws ec2 create-transit-gateway \
    --description MyTGW \
    --options
    AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=enable,
    DefaultRouteTablePropagation=enable,VpnEcmpSupport=enable,DnsSupport=enable
```

Output:

```json
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "OwnerId": "111122223333",
        "Description": "MyTGW",
        "CreationTime": "2019-07-10T14:02:12.000Z",
        "Options": {
            "AmazonSideAsn": 64516,
            "AutoAcceptSharedAttachments": "enable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-018774ad6f3EXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-018774ad6f3EXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
}
```
create-verified-access-endpoint

The following code example shows how to use `create-verified-access-endpoint`.

AWS CLI

To create a Verified Access endpoint

The following `create-verified-access-endpoint` example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```
aws ec2 create-verified-access-endpoint \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --endpoint-type network-interface \
    --attachment-type vpc \
    --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE \
    --application-domain example.com \
    --endpoint-domain-prefix my-ava-app \
    --security-group-ids sg-004915970c4c8f13a \
    --network-interface-options
    NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 \
    --tag-specifications ResourceType=verified-access-endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
    }
}
```
"AttachmentType": "vpc",
"DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
"EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
"SecurityGroupIds": ["sg-004915970c4c8f13a"],
"NetworkInterfaceOptions": {
    "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
    "Protocol": "https",
    "Port": 443
},
"Status": {
    "Code": "pending"
},
"Description": "",
"CreationTime": "2023-08-25T20:54:43",
"LastUpdatedTime": "2023-08-25T20:54:43",
"Tags": [
    {
        "Key": "Name",
        "Value": "my-va-endpoint"
    }
]
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/userguide/endpoint-access.html) in the AWS Verified Access User Guide.

- For API details, see [CreateVerifiedAccessEndpoint](https://docs.aws.amazon.com/cli/latest/reference/verified-access/create-verified-access-endpoint.html) in AWS CLI Command Reference.

### create-verified-access-group

The following code example shows how to use create-verified-access-group.

**AWS CLI**

To create a Verified Access group

The following create-verified-access-group example creates a Verified Access group for the specified Verified Access instance.
```bash
aws ec2 create-verified-access-group \\
   --confirmed-access-instance-id vai-0ce000c0b7643abea \\
   --tag-specifications ResourceType=confirmed-access-group,Tags=([{Key=Name,Value=my-va-group}]
```

Output:

```json
{
   "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T19:55:19",
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-va-group"
         }
      ]
   }
}
```

For more information, see [Verified Access groups](https://aws.amazon.com/aws-verified-access-user-guide/) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessGroup](https://awscli.amazonaws.com/AWSCLIREFERENCE/2.0.95/en_us/developer_guide/verified-access-groups.html#create-verified-access-group) in *AWS CLI Command Reference*.

### create-verified-access-instance

The following code example shows how to use `create-verified-access-instance`.

**AWS CLI**

**To create a Verified Access instance**

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```bash
aws ec2 create-verified-access-instance \\
```
--tag-specifications ResourceType=verified-access-instance,Tags=[{Key=Name,Value=my-va-instance}]

Output:

```json
{
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "",
    "VerifiedAccessTrustProviders": [],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T18:27:56",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-instance"
      }
    ]
  }
}
```

For more information, see [Verified Access instances](#) in the AWS Verified Access User Guide.

- For API details, see [CreateVerifiedAccessInstance](#) in AWS CLI Command Reference.

**create-verified-access-trust-provider**

The following code example shows how to use create-verified-access-trust-provider.

**AWS CLI**

To create a Verified Access trust provider

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```bash
aws ec2 create-verified-access-trust-provider \
   --trust-provider-type user \
   --user-trust-provider-type iam-identity-center \
   --policy-reference-name idc \
   --tag-specifications ResourceType=verified-access-trust-provider,Tags=[{Key=Name,Value=my-va-trust-provider}]
```
Output:

```json
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36",
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-va-trust-provider"
         }
      ]
   }
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

**create-volume**

The following code example shows how to use `create-volume`.

**AWS CLI**

**To create an empty General Purpose SSD (gp2) volume**

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-east-1`, or you can add the `--region` parameter to specify the Region for the command.

```
aws ec2 create-volume \
   --volume-type gp2 \ 
   --size 80 \ 
   --availability-zone us-east-1a
```
Output:

```json
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```bash
aws ec2 create-volume
  --size 80\n  --availability-zone us-east-1a
```

**Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot**

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```bash
aws ec2 create-volume
  --volume-type io1
  --iops 1000
  --snapshot-id snap-066877671789bd71b
  --availability-zone us-east-1a
```

Output:

```json
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "io1",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 1000,
    "SnapshotId": "snap-066877671789bd71b",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 80
}
```
Example 3: To create an encrypted volume

The following create-volume example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the --encrypted parameter as follows.

```bash
aws ec2 create-volume \
  --size 80 \
  --encrypted \
  --availability-zone us-east-1a
```

Output:

```json
{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": true,
  "VolumeType": "gp2",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
  "Iops": 240,
  "SnapshotId": "",
  "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
  "Size": 80
}
```

If encryption by default is enabled, the following example command creates an encrypted volume, even without the --encrypted parameter.

```bash
aws ec2 create-volume \
  --size 80 \
  --availability-zone us-east-1a
```

If you use the --kms-key-id parameter to specify a customer managed CMK, you must specify the --encrypted parameter even if encryption by default is enabled.
aws ec2 create-volume \
   --volume-type gp2 \
   --size 80 \
   --encrypted \
   --kms-key-id 0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE \
   --availability-zone us-east-1a

Example 4: To create a volume with tags

The following create-volume example creates a volume and adds two tags:

aws ec2 create-volume \
   --availability-zone us-east-1a \
   --volume-type gp2 \
   --size 80 \
   --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production}, {Key=cost-center,Value=cc123}]

- For API details, see CreateVolume in AWS CLI Command Reference.

create-vpc-endpoint-connection-notification

The following code example shows how to use create-vpc-endpoint-connection-notification.

AWS CLI

To create an endpoint connection notification

This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

Command:

Output:
AWS Command Line Interface

For API details, see CreateVpcEndpointConnectionNotification in AWS CLI Command Reference.

create-vpc-endpoint-service-configuration

The following code example shows how to use create-vpc-endpoint-service-configuration.

AWS CLI

Example 1: To create an endpoint service configuration for an interface endpoint

The following create-vpc-endpoint-service-configuration example creates a VPC endpoint service configuration using the Network Load Balancer nlb-vpce. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
   --network-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \
   --acceptance-required
```

Output:

```
{
   "ServiceConfiguration": {
      "ConnectionNotification": {
         "ConnectionNotificationState": "Enabled",
         "ConnectionNotificationType": "Topic",
         "ServiceId": "vpce-svc-1237881c0d25a3abc",
         "ConnectionEvents": ["Accept", "Connect"],
         "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
      }
   }
}
```
Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following create-vpc-endpoint-service-configuration example creates a VPC endpoint service configuration using the Gateway Load Balancer GWLBService. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration \
  --gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc \
  --no-acceptance-required
```

Output:

```
{
  "ServiceConfiguration": {
    "ServiceType": [
      {
        "ServiceType": "GatewayLoadBalancer"
      }
    ],
    "NetworkLoadBalancerArns": [
      "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vcpe/e94221227f1ba532"
    ],
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-03d5ebb7d9579a2b3",
    "ServiceState": "Available",
    "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
    "AcceptanceRequired": true,
    "AvailabilityZones": [
      "us-east-1d"
    ],
    "BaseEndpointDnsNames": [
      "vpce-svc-03d5ebb7d9579a2b3.us-east-1.vpce.amazonaws.com"
    ]
  }
}
```
For more information, see [VPC endpoint services](http://example.com) in the [Amazon VPC User Guide](http://example.com).

- For API details, see [CreateVpcEndpointServiceConfiguration](http://example.com) in [AWS CLI Command Reference](http://example.com).

### create-vpc-endpoint

The following code example shows how to use `create-vpc-endpoint`.

**AWS CLI**

**Example 1: To create a gateway endpoint**

The following `create-vpc-endpoint` example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region, and associates route table `rtb-11aa22bb` with the endpoint.

```bash
aws ec2 create-vpc-endpoint \
  --vpc-id vpc-1a2b3c4d \
  --service-name com.amazonaws.us-east-1.s3 \
  --route-table-ids rtb-11aa22bb
```

**Output:**

```
{
    "VpcEndpoint": {
        "PolicyDocument": "{
          "Version": "2008-10-17",
          "Statement": [{
            "Sid": "",
            "Effect": "Allow",
            "Principal": "*",
            "Action": "*",
            "Resource": "*
          }]
        }
    }
}
```
"VpcId": "vpc-1a2b3c4d",
"State": "available",
"ServiceName": "com.amazonaws.us-east-1.s3",
"RouteTableIds": [
  "rtb-11aa22bb"
],
"VpcEndpointId": "vpc-1a2b3c4d",
"CreationTimestamp": "2015-05-15T09:40:50Z"
}

For more information, see Creating a gateway endpoint in the AWSPrivateLink Guide.

Example 2: To create an interface endpoint

The following create-vpc-endpoint example creates an interface VPC endpoint between VPC vpc-1a2b3c4d and Amazon S3 in the us-east-1 region. The command creates the endpoint in subnet subnet-1a2b3c4d, associates it with security group sg-1a2b3c4d, and adds a tag with a key of "Service" and a Value of "S3".

```
aws ec2 create-vpc-endpoint \
  --vpc-id vpc-1a2b3c4d \
  --vpc-endpoint-type Interface \
  --service-name com.amazonaws.us-east-1.s3 \
  --subnet-ids subnet-7b16de0c \
  --security-group-id sg-1a2b3c4d \
  --tag-specifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]
```

Output:

```
{
  "VpcEndpoint": {
    "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
    "VpcEndpointType": "Interface",
    "VpcId": "vpc-1a2b3c4d",
    "ServiceName": "com.amazonaws.us-east-1.s3",
    "State": "pending",
    "RouteTableIds": [],
    "SubnetIds": [
      "subnet-1a2b3c4d"
    ],
    "Groups": [}
For more information, see Creating an interface endpoint in the User Guide for AWSPrivateLink.

Example 3: To create a Gateway Load Balancer endpoint

The following create-vpc-endpoint example creates a Gateway Load Balancer endpoint between VPC vpc-111122223333aabbc and a service that is configured using a Gateway Load Balancer.

```bash
aws ec2 create-vpc-endpoint \
  --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \
  --network-interface-ids eni-0b16f0581c8ac6877 \
  --dns-entries \
    "DnsName": ".vpce-1a2b3c4d5e6f1a2b3-9hnenorg-s3.us-east-1.vpce.amazonaws.com", \
    "HostedZoneId": "Z7HUB22ULQXF" \
  ]
```
--vpc-endpoint-type GatewayLoadBalancer \
--vpc-id vpc-1112222333aabbcc \
--subnet-ids subnet-0011aabbcc2233445

Output:

```json
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-aabbaabbaabbaabbaa",
        "VpcEndpointType": "GatewayLoadBalancer",
        "VpcId": "vpc-1112222333aabbcc",
        "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
        "State": "pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "RequesterManaged": false,
        "NetworkInterfaceIds": [
            "eni-01010120203030405"
        ],
        "CreationTimestamp": "2020-11-11T08:06:03.522Z",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Gateway Load Balancer endpoints in the User Guide for AWSPrivateLink.

- For API details, see CreateVpcEndpoint in AWS CLI Command Reference.

create-vpc-peering-connection

The following code example shows how to use create-vpc-peering-connection.

AWS CLI

To create a VPC peering connection between your VPCs

This example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

Command:
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233

Output:

{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 444455556666",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "444455556666",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-111aaa111",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "444455556666",
            "VpcId": "vpc-11122233"
        }
    }
}

To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.

Command:

aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the us-west-2 region.

Command:
This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the us-west-2 region.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-region us-west-2
```

- For API details, see [CreateVpcPeeringConnection](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-peering-connection.html) in *AWS CLI Command Reference*.

**create-vpc**

The following code example shows how to use create-vpc.

**AWS CLI**

**Example 1: To create a VPC**

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```bash
aws ec2 create-vpc \
   --cidr-block 10.0.0.0/16 \
   --tag-specifications ResourceType=vpc,Tags=[{Key=Name,Value=MyVpc}]
```

Output:

```json
{
   "Vpc": {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-5EXAMPLE",
      "State": "pending",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "OwnerId": "123456789012",
      "InstanceTenancy": "default",
      "Ipv6CidrBlockAssociationSet": []
   }
}
```
"CidrBlockAssociationSet": [
    {
        "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {
            "State": "associated"
        }
    }
],
"IsDefault": false,
"Tags": [
    {
        "Key": "Name",
        "Value": "MyVpc"
    }
]
}

**Example 2: To create a VPC with dedicated tenancy**

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```
aws ec2 create-vpc
    --cidr-block 10.0.0.0/16
    --instance-tenancy dedicated
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-19edf471",
        "State": "pending",
        "VpcId": "vpc-0a53287fa4EXAMPLE",
        "OwnerId": "111122223333",
        "InstanceTenancy": "dedicated",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
            }
        ]
    }
}
```
Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```
aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --amazon-provided-ipv6-cidr-block
```

Output:

```
{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-dEXAMPLE",
    "State": "pending",
    "VpcId": "vpc-0fc5e3406bEXAMPLE",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
        "Ipv6CidrBlock": "",
        "Ipv6CidrBlockState": {
          "State": "associating"
        },
        "Ipv6Pool": "Amazon",
        "NetworkBorderGroup": "us-west-2"
      }
    ],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {
          "State": "associated"
        }
      }
    ]
  }
}
```
Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```
aws ec2 create-vpc \
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
   --tag-specifications ResourceType=vpc,Tags='[{{Key=Environment,Value="Preprod"},
   {Key=Owner,Value="Build Team"}]}'
```

Windows:

```
aws ec2 create-vpc ^
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
   --tag-specifications ResourceType=vpc,Tags=[{{Key=Environment,Value="Preprod"},
   {Key=Owner,Value="Build Team"}]}
```

Output:

```
{
   "Vpc": {
      "CidrBlock": "10.0.1.0/24",
      "DhcpOptionsId": "dopt-2afccf50",
      "State": "pending",
      "VpcId": "vpc-010e1791024eb0af9",
      "OwnerId": "123456789012",
      "InstanceTenancy": "default",
      "Ipv6CidrBlockAssociationSet": [],
      "CidrBlockAssociationSet": [
         {
            "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",
```
"CidrBlock": "10.0.1.0/24",
"CidrBlockState": {
    "State": "associated"
}
],
"IsDefault": false,
"Tags": [

{ "Key": "Environment",
  "Value": "Preprod"
},
{ "Key": "Owner",
  "Value": "Build Team"
}
]
}]

For more information, see Create a VPC that uses an IPAM pool CIDR in the Amazon VPC IPAM User Guide.

- For API details, see CreateVpc in AWS CLI Command Reference.

create-vpn-connection-route

The following code example shows how to use create-vpn-connection-route.

AWS CLI

To create a static route for a VPN connection

This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see CreateVpnConnectionRoute in AWS CLI Command Reference.
**create-vpn-connection**

The following code example shows how to use `create-vpn-connection`.

**AWS CLI**

**Example 1: To create a VPN connection with dynamic routing**

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection 
  --type ipsec.1 
  --customer-gateway-id cgw-00112334455aabbcc 
  --vpn-gateway-id vgw-1a1a1a1a1a2b2b2 
  --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]'
```

Output:

```
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "...configuration information...",
    "CustomerGatewayId": "cgw-00112334455aabbcc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": false,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [{}],
    },
    "Routes": [],
    "Tags": [
      
    ]
  }
}
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpc/latest/tutorials/bgp-connector.html) in the *AWS Site-to-Site VPN User Guide*.

### Example 2: To create a VPN connection with static routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```bash
aws ec2 create-vpn-connection \
  --type ipsec.1 \ 
  --customer-gateway-id cgw-001122334455aabbc \ 
  --vpn-gateway-id vgw-1a1a1a1a1a2b2b2 \ 
  --options "{"StaticRoutesOnly":true}"
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "..configuration information...",
      "CustomerGatewayId": "cgw-001122334455aabbc",
      "Category": "VPN",
      "State": "pending",
      "VpnConnectionId": "vpn-123123123123abcab",
      "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
      "Options": {
         "EnableAcceleration": false,
         "StaticRoutesOnly": true,
         "LocalIpv4NetworkCidr": "0.0.0.0/0",
         "RemoteIpv4NetworkCidr": "0.0.0.0/0",
         "TunnelInsideIpVersion": "ipv4",
         "TunnelOptions": []
      }
   }
}
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/sitetosite/create-vpn-connections-for-site-to-site-vpns.html) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpn/latest/sitetosite/index.html).

**Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key**

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```
aws ec2 create-vpn-connection
  --type ipsec.1
  --customer-gateway-id cgw-001122334455aabbc
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2
  --options
    TunnelOptions='[[TunnelInsideCidr=169.254.12.0/30,PreSharedKey=ExamplePreSharedKey1],
    [TunnelInsideCidr=169.254.13.0/30,PreSharedKey=ExamplePreSharedKey2]]'
```

Output:

```
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": false,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [
      ]
    }
  }
}
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/sitetosite-gateway-userguide/how-aws-site-to-site-vpn-works.html) in the *AWS Site-to-Site VPN User Guide*.

**Example 4: To create a VPN connection that supports IPv6 traffic**

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```bash
aws ec2 create-vpn-connection \
  --type ipsec.1 \ 
  --transit-gateway-id tgw-12312312312312312 \ 
  --customer-gateway-id cgw-001122334455aabbcc \ 
  --options TunnelInsideIpVersion=ipv6,TunnelOptions=[[StartupAction=start], \ 
  {StartupAction=start}]
```

**Output:**

```json
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbcc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-11111111222222222",
  },
  "OutsideIpAddress": "203.0.113.3",
  "TunnelInsideCidr": "169.254.12.0/30",
  "PreSharedKey": "ExamplePreSharedKey1"
},
{
  "OutsideIpAddress": "203.0.113.5",
  "TunnelInsideCidr": "169.254.13.0/30",
  "PreSharedKey": "ExamplePreSharedKey2"
},
"Routes": [],
"Tags": []
}```
For more information, see How AWS Site-to-Site VPN works in the AWS Site-to-Site VPN User Guide.

- For API details, see CreateVpnConnection in AWS CLI Command Reference.

**create-vpn-gateway**

The following code example shows how to use create-vpn-gateway.

**AWS CLI**

**To create a virtual private gateway**

This example creates a virtual private gateway.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:
To create a virtual private gateway with a specific Amazon-side ASN

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```
{
   "VpnGateway": {
      "AmazonSideAsn": 65001,
      "State": "available",
      "Type": "ipsec.1",
      "VpnGatewayId": "vgw-9a4cacf3",
      "VpcAttachments": []
   }
}
```

- For API details, see [CreateVpnGateway](#) in AWS CLI Command Reference.

### delete-carrier-gateway

The following code example shows how to use delete-carrier-gateway.

### AWS CLI

**To delete your carrier gateway**
The following delete-carrier-gateway example deletes the specified carrier gateway.

```
aws ec2 delete-carrier-gateway \
  --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{
  "CarrierGateway": {
    "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
    "VpcId": "vpc-0c529aEXAMPLE1111",
    "State": "deleting",
    "OwnerId": "123456789012"
  }
}
```

For more information, see Carrier gateways in the Amazon Virtual Private Cloud User Guide.

- For API details, see DeleteCarrierGateway in AWS CLI Command Reference.

**delete-client-vpn-endpoint**

The following code example shows how to use delete-client-vpn-endpoint.

**AWS CLI**

**To delete a Client VPN endpoint**

The following delete-client-vpn-endpoint example deletes the specified Client VPN endpoint.

```
aws ec2 delete-client-vpn-endpoint \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "Status": {
    "Code": "deleting"
  }
}
```
For more information, see [Client VPN Endpoints](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [DeleteClientVpnEndpoint](#) in [AWS CLI Command Reference](#).

### delete-client-vpn-route

The following code example shows how to use `delete-client-vpn-route`.

**AWS CLI**

To delete a route for a Client VPN endpoint

The following `delete-client-vpn-route` example deletes the `0.0.0.0/0` route for the specified subnet of a Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-route \
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
--destination-cidr-block 0.0.0.0/0 \
--target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```json
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see [Routes](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [DeleteClientVpnRoute](#) in [AWS CLI Command Reference](#).

### delete-coip-cidr

The following code example shows how to use `delete-coip-cidr`.

**AWS CLI**

To delete a range of customer-owned IP (CoIP) addresses

The following `delete-coip-cidr` example deletes the specified range of CoIP addresses in the specified CoIP pool.
aws ec2 delete-coip-cidr \
   --cidr 14.0.0.0/24 \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg

Output:

{
   "CoipCidr": {
      "Cidr": "14.0.0.0/24",
      "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
   }
}

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipCidr in AWS CLI Command Reference.

delete-coip-pool

The following code example shows how to use delete-coip-pool.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses

The following delete-coip-pool example deletes a CoIP pool of CoIP addresses.

aws ec2 delete-coip-pool \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg

Output:

{
   "CoipPool": {
      "PoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
   }
}
For more information, see *Customer-owned IP addresses* in the *AWS Outposts User Guide*.

- For API details, see *DeleteCoipPool* in *AWS CLI Command Reference*.

**delete-customer-gateway**

The following code example shows how to use *delete-customer-gateway*.

**AWS CLI**

**To delete a customer gateway**

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

- For API details, see *DeleteCustomerGateway* in *AWS CLI Command Reference*.

**delete-dhcp-options**

The following code example shows how to use *delete-dhcp-options*.

**AWS CLI**

**To delete a DHCP options set**

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebb
```

- For API details, see *DeleteDhcpOptions* in *AWS CLI Command Reference*.

**delete-egress-only-internet-gateway**

The following code example shows how to use *delete-egress-only-internet-gateway*.
**AWS CLI**

**To delete an egress-only Internet gateway**

This example deletes the specified egress-only Internet gateway.

Command:

```bash
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```
{
   "ReturnCode": true
}
```

- For API details, see [DeleteEgressOnlyInternetGateway](#) in *AWS CLI Command Reference*.

**delete-fleets**

The following code example shows how to use `delete-fleets`.

**AWS CLI**

**Example 1: To delete an EC2 Fleet and terminate the associated instances**

The following `delete-fleets` example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 delete-fleets \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --terminate-instances
```

Output:

```
{
   "SuccessfulFleetDeletions": [ 
      {
         "CurrentFleetState": "deleted_terminating",
         "PreviousFleetState": "active",
         "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
      }
   ]
}
```
For more information, see [Delete an EC2 Fleet](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/delete-fleet.html) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To delete an EC2 Fleet without terminating the associated instances**

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```bash/aws ec2 delete-fleets \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --no-terminate-instances
```

Output:

```json
{
   "SuccessfulFleetDeletions": [
      {
        "CurrentFleetState": "deleted_running",
        "PreviousFleetState": "active",
        "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
      }
   ],
   "UnsuccessfulFleetDeletions": []
}
```

For more information, see [Delete an EC2 Fleet](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/delete-fleet.html) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see [DeleteFleets](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-fleets.html) in AWS CLI Command Reference.

### delete-flow-logs

The following code example shows how to use `delete-flow-logs`.

**AWS CLI**

To delete a flow log

```bash
```

Actions and scenarios
The following `delete-flow-logs` example deletes the specified flow log.

```sh
aws ec2 delete-flow-logs --flow-log-id fl-1122344556677889
```

Output:

```json
{
    "Unsuccessful": []
}
```

---

**delete-fpga-image**

The following code example shows how to use `delete-fpga-image`.

**AWS CLI**

**To delete an Amazon FPGA image**

This example deletes the specified AFI.

**Command:**

```sh
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

**Output:**

```json
{
    "Return": true
}
```

---

**delete-instance-connect-endpoint**

The following code example shows how to use `delete-instance-connect-endpoint`.

**AWS CLI**

**To delete an EC2 Instance Connect Endpoint**
The following delete-instance-connect-endpoint example deletes the specified EC2 Instance Connect Endpoint.

```
aws ec2 delete-instance-connect-endpoint \
--instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```
{
   "InstanceConnectEndpoint": {
      "OwnerId": "111111111111",
      "InstanceConnectEndpointId": "eice-0123456789example",
      "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
      "State": "delete-in-progress",
      "StateMessage": "",
      "NetworkInterfaceIds": [],
      "VpcId": "vpc-0123abcd",
      "AvailabilityZone": "us-east-1d",
      "CreatedAt": "2023-02-07T12:05:37+00:00",
      "SubnetId": "subnet-0123abcd"
   }
}
```

For more information, see [Remove EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/RemoveEC2InstanceConnectEndpoint.html) in the *Amazon EC2 User Guide*.

- For API details, see [DeleteInstanceConnectEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-instance-connect-endpoint.html) in *AWS CLI Command Reference*.

### delete-instance-event-window

The following code example shows how to use `delete-instance-event-window`.

**AWS CLI**

**Example 1: To delete an event window**

The following `delete-instance-event-window` example deletes an event window.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
```
--instance-event-window-id iew-0abcdef1234567890

Output:

```json
{
   "InstanceEventWindowState": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "State": "deleting"
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

**Example 2: To force delete an event window**

The following `delete-instance-event-window` example force deletes an event window if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --force-delete
```

Output:

```json
{
   "InstanceEventWindowState": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "State": "deleting"
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

- For API details, see [DeleteInstanceEventWindow](#) in [AWS CLI Command Reference](#).

**delete-internet-gateway**

The following code example shows how to use `delete-internet-gateway`.

---

**Actions and scenarios**

2135
**AWS CLI**

**To delete an internet gateway**

The following `delete-internet-gateway` example deletes the specified internet gateway.

```bash
aws ec2 delete-internet-gateway
   --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/internet-gateway.html) in the *Amazon VPC User Guide*.

- For API details, see [DeleteInternetGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-internet-gateway.html) in *AWS CLI Command Reference*.

**delete-ipam-pool**

The following code example shows how to use `delete-ipam-pool`.

**AWS CLI**

**To delete an IPAM pool**

In this example, you're a IPAM delegated admin who wants to delete an IPAM pool that you no longer need, but the pool has a CIDR provisioned to it. You cannot delete a pool if it has CIDRs provisioned to it unless you use the `--cascade` option, so you'll use `--cascade`.

To complete this request:

You'll need the IPAM pool ID which you can get with `describe-ipam-pools`. The `--region` must be the IPAM home Region.

The following `delete-ipam-pool` example deletes an IPAM pool in your AWS account.

```bash
aws ec2 delete-ipam-pool
   --ipam-pool-id ipam-pool-050c886a3ca41cd5b
   --cascade
   --region us-east-1
```

Output:

```json
{
}
```
For more information, see [Delete a pool](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpamPool](#) in *AWS CLI Command Reference*.

### delete-ipam-resource-discovery

The following code example shows how to use `delete-ipam-resource-discovery`.

#### AWS CLI

**To delete a resource discovery**

In this example, you're a IPAM delegated admin who wants to delete a non-default resource discovery that you created to share with another IPAM admin during the process of integrating IPAM with accounts outside of your organization.

To complete this request:

The `--region` must be the Region where you created the resource discovery. You cannot delete a default resource discovery if `"IsDefault": true`. A default resource discovery is one that is created automatically in the account that creates an IPAM. To delete a default resource discovery, you have to delete the IPAM.
The following delete-ipam-resource-discovery example deletes a resource discovery.

```
aws ec2 delete-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0e39761475298ee0f \
    --region us-east-1
```

Output:

```
{
   "IpamResourceDiscovery": {
      "OwnerId": "149977607591",
      "IpamResourceDiscoveryId": "ipam-res-disco-0e39761475298ee0f",
      "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-discovery/ipam-res-disco-0e39761475298ee0f",
      "IpamResourceDiscoveryRegion": "us-east-1",
      "OperatingRegions": [
         {
            "RegionName": "us-east-1"
         }
      ],
      "IsDefault": false,
      "State": "delete-in-progress"
   }"'
}
```

For more information about resource discoveries, see [Work with resource discoveries](https://docs.aws.amazon.com/vpc-ipam/latest/userguide/) in the Amazon VPC IPAM User Guide.

delete-ipam-scope

The following code example shows how to use delete-ipam-scope.

AWS CLI

**To delete an IPAM scope**

The following delete-ipam-scope example deletes an IPAM.

```
aws ec2 delete-ipam-scope \
    --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```
Output:

```
{
  "IpamScope": {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "delete-in-progress"
  }
}
```

For more information, see [Delete a scope](#) in the Amazon VPC IPAM User Guide.

- For API details, see [DeleteIpamScope](#) in AWS CLI Command Reference.

---

delete-ipam

The following code example shows how to use delete-ipam.

**AWS CLI**

**To delete an IPAM**

The following delete-ipam example deletes an IPAM.

```
aws ec2 delete-ipam \
  --ipam-id ipam-036486dfa6af58ee0
```

Output:

```
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-036486dfa6af58ee0",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "delete-in-progress"
  }
}
```
"IpamRegion": "us-east-1",
"PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
"PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
"ScopeCount": 2,
"OperatingRegions": [
  {
    "RegionName": "us-east-1"
  },
  {
    "RegionName": "us-east-2"
  },
  {
    "RegionName": "us-west-1"
  }
],
"State": "delete-in-progress"
}

For more information, see [Delete an IPAM](#) in the [Amazon VPC IPAM User Guide](#).

- For API details, see [DeleteIpam](#) in [AWS CLI Command Reference](#).

delete-key-pair

The following code example shows how to use delete-key-pair.

**AWS CLI**

**To delete a key pair**

The following delete-key-pair example deletes the specified key pair.

```
aws ec2 delete-key-pair \
   --key-name my-key-pair
```

Output:

```
{
   "Return": true,
   "KeyPairId": "key-03c8d3aceb53b507"
}
```
For more information, see Create and delete key pairs in the AWS Command Line Interface User Guide.

- For API details, see DeleteKeyPair in AWS CLI Command Reference.

**delete-launch-template-versions**

The following code example shows how to use delete-launch-template-versions.

**AWS CLI**

**To delete a launch template version**

This example deletes the specified launch template version.

Command:

```bash
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --versions 1
```

Output:

```
{
    "UnsuccessfullyDeletedLaunchTemplateVersions": [],
    "SuccessfullyDeletedLaunchTemplateVersions": [
        {
            "LaunchTemplateName": "TestVersion",
            "VersionNumber": 1,
            "LaunchTemplateId": "lt-0abcd290751193123"
        }
    ]
}
```

- For API details, see DeleteLaunchTemplateVersions in AWS CLI Command Reference.

**delete-launch-template**

The following code example shows how to use delete-launch-template.

**AWS CLI**

**To delete a launch template**
This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
   "LaunchTemplate": {
       "LatestVersionNumber": 2,
       "LaunchTemplateId": "lt-0abcd290751193123",
       "LaunchTemplateName": "TestTemplate",
       "DefaultVersionNumber": 2,
       "CreatedBy": "arn:aws:iam::123456789012:root",
       "CreateTime": "2017-11-23T16:46:25.000Z"
   }
}
```

- For API details, see [DeleteLaunchTemplate](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-launch-template.html) in AWS CLI Command Reference.

### delete-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

**AWS CLI**

**To disassociate a local gateway route table from a virtual interfaces (VIFs) group**

The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association \
   --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-assoc-exampleid12345678
```

Output:

```
{
```

Actions and scenarios
"LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
    "LocalGatewayId": "lgw-exampleid11223344",
    "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
    "OwnerId": "111122223333",
    "State": "disassociating",
    "Tags": []
}
}

For more information, see VIF group associations in the AWS Outposts User Guide.

- For API details, see DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation in AWS CLI Command Reference.

delete-local-gateway-route-table-vpc-association

The following code example shows how to use delete-local-gateway-route-table-vpc-association.

AWS CLI

To disassociate a local gateway route table from a VPC

The following delete-local-gateway-route-table-vpc-association example deletes the association between the specified local gateway route table and VPC.

```bash
aws ec2 delete-local-gateway-route-table-vpc-association \
    --local-gateway-route-table-vpc-association-id vpc-example0123456789
```

Output:

```json
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-gateway-route-table/lgw-rtb-abcdefg1234567890",
        "OwnerId": "555555555555",
        "State": "disassociating",
        "Tags": []
    }
}
```
For more information, see [VPC associations](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVpcAssociation](#) in *AWS CLI Command Reference*.

### delete-local-gateway-route-table

The following code example shows how to use `delete-local-gateway-route-table`.

**AWS CLI**

**To delete a local gateway route table**

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 delete-local-gateway-route-table \
  --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

**Output:**

```json
{
  "LocalGatewayRouteTable": {
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
    "OwnerId": "111122223333",
    "State": "deleting",
    "Tags": [],
    "Mode": "direct-vpc-routing"
  }
}
```
For more information, see `Local gateway route tables` in the `AWS Outposts User Guide`.

- For API details, see `DeleteLocalGatewayRouteTable` in `AWS CLI Command Reference`.

**delete-local-gateway-route**

The following code example shows how to use `delete-local-gateway-route`.

**AWS CLI**

**To delete a route from a local gateway route table**

The following `delete-local-gateway-route` example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupIds": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
}
```

- For API details, see `DeleteLocalGatewayRoute` in `AWS CLI Command Reference`.

**delete-managed-prefix-list**

The following code example shows how to use `delete-managed-prefix-list`.

**AWS CLI**

**To delete a prefix list**

The following `delete-managed-prefix-list` example deletes the specified prefix list.
aws ec2 delete-managed-prefix-list \
  --prefix-list-id pl-0123456abcabcabc1

Output:

```
{
  "PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
    "AddressFamily": "IPv4",
    "State": "delete-in-progress",
    "PrefixListName": "test",
    "MaxEntries": 10,
    "Version": 1,
    "OwnerId": "123456789012"
  }
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see DeleteManagedPrefixList in AWS CLI Command Reference.

delete-nat-gateway

The following code example shows how to use delete-nat-gateway.

AWS CLI

To delete a NAT gateway

This example deletes NAT gateway nat-04ae55e711cec5680.

Command:

```
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```
{
  "NatGatewayId": "nat-04ae55e711cec5680"
}
```
For API details, see DeleteNatGateway in AWS CLI Command Reference.

delete-network-acl-entry

The following code example shows how to use delete-network-acl-entry.

AWS CLI

To delete a network ACL entry

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100
```

For API details, see DeleteNetworkAclEntry in AWS CLI Command Reference.

delete-network-acl

The following code example shows how to use delete-network-acl.

AWS CLI

To delete a network ACL

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

For API details, see DeleteNetworkAcl in AWS CLI Command Reference.

delete-network-insights-access-scope-analysis

The following code example shows how to use delete-network-insights-access-scope-analysis.
To delete a Network Access Scope analysis

The following `delete-network-insights-access-scope-analysis` example deletes the specified Network Access Scope analysis.

```
aws ec2 delete-network-insights-access-scope-analysis \
   --network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"
}
```

delete-network-insights-access-scope

The following code example shows how to use `delete-network-insights-access-scope`.

AWS CLI

To delete a Network Access Scope

The following `delete-network-insights-access-scope` example deletes the specified Network Access Scope.

```
aws ec2 delete-network-insights-access-scope \
   --network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{
   "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DeleteNetworkInsightsAccessScope in AWS CLI Command Reference.

**delete-network-insights-analysis**

The following code example shows how to use delete-network-insights-analysis.

**AWS CLI**

**To delete a path analysis**

The following delete-network-insights-analysis example deletes the specified analysis.

```bash
aws ec2 delete-network-insights-analysis \
   --network-insights-analysis-id nia-02207aa13eb480c7a
```

**Output:**

```
{
   "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"
}
```

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DeleteNetworkInsightsAnalysis in AWS CLI Command Reference.

**delete-network-insights-path**

The following code example shows how to use delete-network-insights-path.

**AWS CLI**

**To delete a path**

The following delete-network-insights-path example deletes the specified path. Before you can delete a path, you must delete all its analyses using the delete-network-insights-analysis command.

```bash
aws ec2 delete-network-insights-path \
```

Actions and scenarios 2149
--network-insights-path-id nip-0b26f224f1d131fa8

Output:

```json
{
   "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cecl/latest/userguide/getting-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsPath](https://docs.aws.amazon.com/cecl/latest/reference/API_DeleteNetworkInsightsPath.html) in *AWS CLI Command Reference*.

### delete-network-interface-permission

The following code example shows how to use `delete-network-interface-permission`.

**AWS CLI**

**To delete a network interface permission**

This example deletes the specified network interface permission.

**Command:**

```bash
aws ec2 delete-network-interface-permission --network-interface-permission-id eni-perm-06fd19020ede149ea
```

**Output:**

```json
{
   "Return": true
}
```

- For API details, see [DeleteNetworkInterfacePermission](https://docs.aws.amazon.com/cecl/latest/reference/API_DeleteNetworkInterfacePermission.html) in *AWS CLI Command Reference*.

### delete-network-interface

The following code example shows how to use `delete-network-interface`.

**AWS CLI**

**To delete a network interface**

```bash
dummy command
```

---

*Actions and scenarios*
This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

- For API details, see [DeleteNetworkInterface](#) in *AWS CLI Command Reference*.

`delete-placement-group`

The following code example shows how to use `delete-placement-group`.

**AWS CLI**

To delete a placement group

This example command deletes the specified placement group.

Command:

```bash
aws ec2 delete-placement-group --group-name my-cluster
```

- For API details, see [DeletePlacementGroup](#) in *AWS CLI Command Reference*.

`delete-queued-reserved-instances`

The following code example shows how to use `delete-queued-reserved-instances`.

**AWS CLI**

To delete a queued purchase

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```bash
aws ec2 delete-queued-reserved-instances \  --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```json
{
```
"SuccessfulQueuedPurchaseDeletions": [
  {
    "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
  }
],
"FailedQueuedPurchaseDeletions": []

- For API details, see DeleteQueuedReservedInstances in AWS CLI Command Reference.

**delete-route-table**

The following code example shows how to use delete-route-table.

**AWS CLI**

**To delete a route table**

This example deletes the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route-table --route-table-id rtb-22574640
```

- For API details, see DeleteRouteTable in AWS CLI Command Reference.

**delete-route**

The following code example shows how to use delete-route.

**AWS CLI**

**To delete a route**

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0
```
• For API details, see `DeleteRoute` in *AWS CLI Command Reference*.

**delete-security-group**

The following code example shows how to use `delete-security-group`.

### AWS CLI

**[EC2-Classic] To delete a security group**

This example deletes the security group named `MySecurityGroup`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-name MySecurityGroup
```

**[EC2-VPC] To delete a security group**

This example deletes the security group with the ID `sg-903004f8`. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-id sg-903004f8
```

For more information, see Using Security Groups in the *AWS Command Line Interface User Guide*.

• For API details, see `DeleteSecurityGroup` in *AWS CLI Command Reference*.

**delete-snapshot**

The following code example shows how to use `delete-snapshot`.

### AWS CLI

**To delete a snapshot**

This example command deletes a snapshot with the snapshot ID of `snap-1234567890abcdef0`. If the command succeeds, no output is returned.
Command:

```
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

**delete-spot-datafeed-subscription**

The following code example shows how to use `delete-spot-datafeed-subscription`.

**AWS CLI**

**To cancel a Spot Instance data feed subscription**

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-spot-datafeed-subscription
```

- For API details, see [DeleteSpotDatafeedSubscription](#) in *AWS CLI Command Reference*.

**delete-subnet-cidr-reservation**

The following code example shows how to use `delete-subnet-cidr-reservation`.

**AWS CLI**

**To delete a subnet CIDR reservation**

The following `delete-subnet-cidr-reservation` example deletes the specified subnet CIDR reservation.

```
aws ec2 delete-subnet-cidr-reservation \\
   --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

Output:

```
{
   "DeletedSubnetCidrReservation": {
```

Actions and scenarios 2154
For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see DeleteSubnetCidrReservation in AWS CLI Command Reference.

**delete-subnet**

The following code example shows how to use delete-subnet.

**AWS CLI**

**To delete a subnet**

This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see DeleteSubnet in AWS CLI Command Reference.

**delete-tags**

The following code example shows how to use delete-tags.

**AWS CLI**

**Example 1: To delete a tag from a resource**

The following delete-tags example deletes the tag Stack=Test from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```bash
aws ec2 delete-tags
  --resources ami-1234567890abcdef0
```

Actions and scenarios
It's optional to specify the value for a tag. The following delete-tags example deletes the tag with the key name purpose from the specified instance, regardless of the tag value for the tag.

```bash
aws ec2 delete-tags \
  --resources i-1234567890abcdef0 \
  --tags Key=purpose
```

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following delete-tags example specifies the empty string as the tag value for the tag to delete.

```bash
aws ec2 delete-tags \
  --resources i-1234567890abcdef0 \
  --tags Key=Name,Value=
```

**Example 2: To delete a tag from multiple resources**

The following delete-tags example deletes the tag `Purpose=Test` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```bash
aws ec2 delete-tags \
  --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
  --tags Key=Purpose
```

- For API details, see [DeleteTags](aws-ec2-cli-reference.html#delete-tags) in *AWS CLI Command Reference*.

**delete-traffic-mirror-filter-rule**

The following code example shows how to use delete-traffic-mirror-filter-rule.

**AWS CLI**

**To delete a traffic mirror filter rule**

The following delete-traffic-mirror-filter-rule example deletes the specified traffic mirror filter rule.

```bash
aws ec2 delete-traffic-mirror-filter-rule \
```
--traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE

Output:

```
{
   "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see Modify Your Traffic Mirror Filter Rules in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorFilterRule in AWS CLI Command Reference.

**delete-traffic-mirror-filter**

The following code example shows how to use `delete-traffic-mirror-filter`.

**AWS CLI**

**To delete a traffic mirror filter**

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```
aws ec2 delete-traffic-mirror-filter \
   --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```
{
   "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorFilter in AWS CLI Command Reference.

**delete-traffic-mirror-session**

The following code example shows how to use `delete-traffic-mirror-session`.

**Actions and scenarios**
**AWS CLI**

**To delete a traffic mirror session**

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```bash
aws ec2 delete-traffic-mirror-session \
   --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```json
{
   "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"
}
```

For more information, see [Delete a Traffic Mirror Session](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/traffic-mirror-session-delete.html) in the *AWS Traffic Mirroring Guide*.
- For API details, see [DeleteTrafficMirrorSession](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-traffic-mirror-session.html) in *AWS CLI Command Reference*.

**delete-traffic-mirror-target**

The following code example shows how to use `delete-traffic-mirror-target`.

**AWS CLI**

**To delete a traffic mirror target**

The following `delete-traffic-mirror-target` example deletes the specified traffic mirror target.

```bash
aws ec2 delete-traffic-mirror-target \
   --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```json
{
   "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see [Delete a Traffic Mirror Target](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/traffic-mirror-target-delete.html) in the *AWS Traffic Mirroring Guide*. 
• For API details, see DeleteTrafficMirrorTarget in AWS CLI Command Reference.

delete-transit-gateway-connect-peer

The following code example shows how to use delete-transit-gateway-connect-peer.

AWS CLI

To delete a Transit Gateway Connect peer

The following delete-transit-gateway-connect-peer example deletes the specified Connect peer.

```bash
aws ec2 delete-transit-gateway-connect-peer \
   --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```json
{
   "TransitGatewayConnectPeer": {
      "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
      "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
      "State": "deleting",
      "CreationTime": "2021-10-13T03:35:17.000Z",
      "ConnectPeerConfiguration": {
         "TransitGatewayAddress": "10.0.0.234",
         "PeerAddress": "172.31.1.11",
         "InsideCidrBlocks": [
            "169.254.6.0/29"
         ],
         "Protocol": "gre",
         "BgpConfigurations": [
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.2",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            },
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.2",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            }
         ]
   }
}
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnectPeer in AWS CLI Command Reference.

**delete-transit-gateway-connect**

The following code example shows how to use delete-transit-gateway-connect.

**AWS CLI**

**To delete a transit gateway Connect attachment**

The following delete-transit-gateway-connect example deletes the specified Connect attachment.

```
aws ec2 delete-transit-gateway-connect \
    --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE
```

Output:

```json
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnect in AWS CLI Command Reference.

**delete-transit-gateway-multicast-domain**

The following code example shows how to use delete-transit-gateway-multicast-domain.

AWS CLI

**To delete a transit gateway multicast domain**

The following delete-transit-gateway-multicast-domain example deletes the specified multicast domain.

```shell
aws ec2 delete-transit-gateway-multicast-domain \
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```json
{
   "TransitGatewayMulticastDomain": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",
      "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",
      "State": "deleting",
      "CreationTime": "2019-11-20T22:02:03.000Z"
   }
}
```

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayMulticastDomain in AWS CLI Command Reference.

**delete-transit-gateway-peering-attachment**

The following code example shows how to use delete-transit-gateway-peering-attachment.

AWS CLI

**To delete a transit gateway peering attachment**
The following delete-transit-gateway-peering-attachment example deletes the specified transit gateway peering attachment.

```bash
aws ec2 delete-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd
```

Output:

```json
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    },
    "AccepterTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "deleting",
    "CreationTime": "2019-12-09T11:38:31.000Z"
  }
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the [Transit Gateways Guide](#).

- For API details, see [DeleteTransitGatewayPeeringAttachment](#) in [AWS CLI Command Reference](#).

### delete-transit-gateway-policy-table

The following code example shows how to use delete-transit-gateway-policy-table.

**AWS CLI**

**To delete a transit gateway policy table**

The following delete-transit-gateway-policy-table example deletes the specified transit gateway policy table.

```bash
aws ec2 delete-transit-gateway-policy-table \
```

Actions and scenarios
AWS Command Line Interface

User Guide for Version 2

For more information, see [Transit gateway policy tables](https://docs.aws.amazon.com/transitgateway/latest/reference/management-commands.html) in the *Transit Gateway User Guide*.

- For API details, see [DeleteTransitGatewayPolicyTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-policy-table.html) in *AWS CLI Command Reference*.

### delete-transit-gateway-prefix-list-reference

The following code example shows how to use `delete-transit-gateway-prefix-list-reference`.

**AWS CLI**

#### To delete a prefix list reference

The following `delete-transit-gateway-prefix-list-reference` example deletes the specified prefix list reference.

```bash
aws ec2 delete-transit-gateway-prefix-list-reference
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123
  --prefix-list-id pl-1111112222222233
```

**Output:**

```json
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
    "TransitGatewayPrefixListId": "pl-1111112222222233",
    "DeleteRouteRequest": {
      "RouteTableId": "tgw-rtb-0123456789abcd123",
      "DestinationCidrBlock": "10.0.0.0/8",
      "TransitGatewayRouteTableId": "tgw-067f850518f0bd6e",
      "State": "deleting",
      "CreationTime": "2023-11-28T16:36:43+00:00",
      "Tags": []
    }
  }
}
```
"PrefixListId": "pl-1111112222222333",
"PrefixListOwnerId": "123456789012",
"State": "deleting",
"Blackhole": false,
"TransitGatewayAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
    "ResourceType": "vpc",
    "ResourceId": "vpc-112233445566aabbc"
}
}
}

For more information, see Prefix list references in the Transit Gateways Guide.
- For API details, see DeleteTransitGatewayPrefixListReference in AWS CLI Command Reference.

deleete-transit-gateway-route-table

The following code example shows how to use delete-transit-gateway-route-table.

AWS CLI

To delete a transit gateway route table

The following delete-transit-gateway-route-table example deletes the specified transit gateway route table.

aws ec2 delete-transit-gateway-route-table \
   --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE

Output:

{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-17T20:27:26.000Z"
    }
}
For more information, see [Delete a transit gateway route table](https://docs.aws.amazon.com/TransitGateways/latest/userguide/rg-delete-transit-gateway-route.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-route.html) in *AWS CLI Command Reference*.

**delete-transit-gateway-route**

The following code example shows how to use `delete-transit-gateway-route`.

**AWS CLI**

**To delete a CIDR block from a route table**

The following `delete-transit-gateway-route` example deletes the CIDR block from the specified transit gateway route table.

```bash
aws ec2 delete-transit-gateway-route \
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
  --destination-cidr-block 10.0.2.0/24
```

**Output:**

```json
{
  "Route": {
    "DestinationCidrBlock": "10.0.2.0/24",
    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceType": "vpc"
      }
    ],
    "Type": "static",
    "State": "deleted"
  }
}
```

For more information, see [Delete a static route](https://docs.aws.amazon.com/TransitGateways/latest/userguide/rg-delete-transit-gateway-route.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRoute](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-route.html) in *AWS CLI Command Reference*.

**delete-transit-gateway-vpc-attachment**

The following code example shows how to use `delete-transit-gateway-vpc-attachment`.

**Actions and scenarios**
To delete a transit gateway VPC attachment

The following `delete-transit-gateway-vpc-attachment` example deletes the specified VPC attachment.

```bash
aws ec2 delete-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-0d2c54b6bEXAMPLE
```

Output:

```json
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0d2c54b6b3EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "VpcId": "vpc-0065acced4f61c651",
      "VpcOwnerId": "111122223333",
      "State": "deleting",
      "CreationTime": "2019-07-17T16:04:27.000Z"
   }
}
```

For more information, see [Delete a VPC attachment](https://docs.aws.amazon.com/transit-gateway/latest/userguide/delete-vpc-attachment.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayVpcAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-vpc-attachment.html) in *AWS CLI Command Reference*.

delete-transit-gateway

The following code example shows how to use `delete-transit-gateway`.

AWS CLI

To delete a transit gateway

The following `delete-transit-gateway` example deletes the specified transit gateway.

```bash
aws ec2 delete-transit-gateway \
   --transit-gateway-id tgw-01f04542bEXAMPLE
```

Output:
For more information, see Delete a transit gateway in the Transit Gateways Guide.

- For API details, see DeleteTransitGateway in AWS CLI Command Reference.

**delete-verified-access-endpoint**

The following code example shows how to use delete-verified-access-endpoint.

**AWS CLI**

To delete a Verified Access endpoint

The following delete-verified-access-endpoint example deletes the specified Verified Access endpoint.

```bash
aws ec2 delete-verified-access-endpoint \
--verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{

}
```
"VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",

    },
    "Status": {
        "Code": "deleting"
    },
    "Description": "Testing Verified Access",
    "CreationTime": "2023-08-25T20:54:43",
    "LastUpdatedTime": "2023-08-25T22:46:32"
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/ug/) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessEndpoint](https://docs.aws.amazon.com/cli/latest/reference/verified-access/delete-verified-access-group.html) in *AWS CLI Command Reference*.

### delete-verified-access-group

The following code example shows how to use delete-verified-access-group.

**AWS CLI**

To delete a Verified Access group

The following delete-verified-access-group example deletes the specified Verified Access group.
aws ec2 delete-verified-access-group \
   --verified-access-group-id vagr-0dbe967baf14b7235

Output:

```
{
   "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T22:49:03",
      "DeletionTime": "2023-08-26T00:58:31"
   }
}
```

delete-verified-access-instance

The following code example shows how to use `delete-verified-access-instance`.

**AWS CLI**

**To delete a Verified Access instance**

The following `delete-verified-access-instance` example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \
   --verified-access-instance-id vai-0ce000c0b7643abea
```

Output:

```
{
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
   }
}
```
For more information, see Verified Access instances in the AWS Verified Access User Guide.

- For API details, see DeleteVerifiedAccessInstance in AWS CLI Command Reference.

**delete-verified-access-trust-provider**

The following code example shows how to use delete-verified-access-trust-provider.

**AWS CLI**

*To delete a Verified Access trust provider*

The following delete-verified-access-trust-provider example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider \
   --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

**Output:**

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36"
   }
}
```

For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see DeleteVerifiedAccessTrustProvider in AWS CLI Command Reference.
delete-volume

The following code example shows how to use delete-volume.

AWS CLI

To delete a volume

This example command deletes an available volume with the volume ID of vol-049df61146c4d7901. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-volume --volume-id vol-049df61146c4d7901
```

• For API details, see DeleteVolume in AWS CLI Command Reference.

delete-vpc-endpoint-connection-notifications

The following code example shows how to use delete-vpc-endpoint-connection-notifications.

AWS CLI

To delete an endpoint connection notification

This example deletes the specified endpoint connection notification.

Command:

```bash
aws ec2 delete-vpc-endpoint-connection-connection-notifications --connection-notification-ids vpce-nfn-008776de7e03f5abc
```

Output:

```json
{
    "Unsuccessful": []
}
```

• For API details, see DeleteVpcEndpointConnectionNotifications in AWS CLI Command Reference.
delete-vpc-endpoint-service-configurations

The following code example shows how to use delete-vpc-endpoint-service-configurations.

AWS CLI

To delete an endpoint service configuration

This example deletes the specified endpoint service configuration.

Command:

```
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
   "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointServiceConfigurations](#) in AWS CLI Command Reference.

delete-vpc-endpoints

The following code example shows how to use delete-vpc-endpoints.

AWS CLI

To delete an endpoint

This example deletes endpoints vpce-aa22bb33 and vpce-1a2b3c4d. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

Command:

```
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:
For API details, see [DeleteVpcEndpoints](#) in *AWS CLI Command Reference*.

**delete-vpc-peering-connection**

The following code example shows how to use `delete-vpc-peering-connection`.

**AWS CLI**

**To delete a VPC peering connection**

This example deletes the specified VPC peering connection.

Command:

```
aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "Return": true
}
```

For API details, see [DeleteVpcPeeringConnection](#) in *AWS CLI Command Reference*.

**delete-vpc**

The following code example shows how to use `delete-vpc`.

**AWS CLI**

**To delete a VPC**

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpc --vpc-id vpc-a01106c2
```
For API details, see DeleteVpc in AWS CLI Command Reference.

**delete-vpn-connection-route**

The following code example shows how to use `delete-vpn-connection-route`.

**AWS CLI**

**To delete a static route from a VPN connection**

This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

For API details, see DeleteVpnConnectionRoute in AWS CLI Command Reference.

**delete-vpn-connection**

The following code example shows how to use `delete-vpn-connection`.

**AWS CLI**

**To delete a VPN connection**

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

For API details, see DeleteVpnConnection in AWS CLI Command Reference.

**delete-vpn-gateway**

The following code example shows how to use `delete-vpn-gateway`.
AWS CLI

To delete a virtual private gateway

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```

- For API details, see `DeleteVpnGateway` in `AWS CLI Command Reference`.

deprovision-byoip-cidr

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To remove an IP address range from use

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr 
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-deprovision"
    }
}
```

- For API details, see `DeprovisionByoipCidr` in `AWS CLI Command Reference`.

deprovision-ipam-pool-cidr

The following code example shows how to use `deprovision-ipam-pool-cidr`.
To deprovision an IPAM pool CIDR

The following deprovision-ipam-pool-cidr example deprovisions a CIDR provisioned to an IPAM pool.

(Linux):

```bash
aws ec2 deprovision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
    --cidr 11.0.0.0/16
```

(Windows):

```bash
aws ec2 deprovision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
    --cidr 11.0.0.0/16
```

Output:

```json
{
    "IpamPoolCidr": {
        "Cidr": "11.0.0.0/16",
        "State": "pending-deprovision"
    }
}
```

For more information, see Deprovision pool CIDRs in the Amazon VPC IPAM User Guide.

- For API details, see DeprovisionIpamPoolCidr in AWS CLI Command Reference.

deregister-image

The following code example shows how to use deregister-image.

AWS CLI

To deregister an AMI

This example deregisters the specified AMI. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see [DeregisterImage](#) in *AWS CLI Command Reference*.

**deregister-instance-event-notification-attributes**

The following code example shows how to use `deregister-instance-event-notification-attributes`.

**AWS CLI**

**Example 1: To remove all tags from event notifications**

The following `deregister-instance-event-notification-attributes` example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to `false`.

```bash
aws ec2 deregister-instance-event-notification-attributes \
    --instance-tag-attribute IncludeAllTagsOfInstance=true
```

**Output:**

```json
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To remove specific tags from event notifications**

The following `deregister-instance-event-notification-attributes` example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use `describe-instance-event-notification-attributes`. 
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute InstanceTagKeys="tag-key2"

Output:

{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [
         "tag-key2"
      ],
      "IncludeAllTagsOfInstance": false
   }
}

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DeregisterInstanceEventNotificationAttributes in AWS CLI Command Reference.

deregister-transit-gateway-multicast-group-members

The following code example shows how to use deregister-transit-gateway-multicast-group-members.

AWS CLI

To deregister group members from a multicast group

This example deregisters the specified network interface group member from the transit gateway multicast group.

aws ec2 deregister-transit-gateway-multicast-group-members \
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \
--group-ip-address 224.0.1.0 \
--network-interface-ids eni-0e246d3269EXAMPLE

Output:

{

"DeregisteredMulticastGroupMembers": {
  "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
  "RegisteredNetworkInterfaceIds": [
    "eni-0e246d3269EXAMPLE"
  ],
  "GroupIpAddress": "224.0.1.0"
}

For more information, see Deregister Members from a Multicast Group in the AWS Transit Gateways Users Guide.

- For API details, see DeregisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.

deregister-transit-gateway-multicast-group-source

The following code example shows how to use deregister-transit-gateway-multicast-group-source.

**AWS CLI**

**To deregister a source from the transit gateway multicast group**

This example deregisters the specified network interface group source from the multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
  "DeregisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "DeregisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```
For more information, see Deregister Sources from a Multicast Group in the AWS Transit Gateways User Guide.

- For API details, see DeregisterTransitGatewayMulticastGroupSource in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe all the attributes for your AWS account

This example describes the attributes for your AWS account.

Command:

```
aws ec2 describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "vpc-max-security-groups-per-interface",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "max-instances",
            "AttributeValues": [
                {
                    "AttributeValue": "20"
                }
            ]
        }
    ]
}
```
To describe a single attribute for your AWS account

This example describes the supported-platforms attribute for your AWS account.

Command:
aws ec2 describe-account-attributes --attribute-names supported-platforms

Output:

```json
{
  "AccountAttributes": [
    {
      "AttributeName": "supported-platforms",
      "AttributeValues": [
        {
          "AttributeValue": "EC2"
        },
        {
          "AttributeValue": "VPC"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeAccountAttributes](#) in *[AWS CLI Command Reference]*.

**describe-address-transfers**

The following code example shows how to use `describe-address-transfers`.

**AWS CLI**

**To describe an Elastic IP address transfer**

The following `describe-address-transfers` example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
  --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```json
{
  "AddressTransfers": [
    {
      "AddressTransfers": [
```
For more information, see [Transfer Elastic IP addresses](https://docs.aws.amazon.com/vpc/latest/userguide/transfer-eip-addresses.html) in the *Amazon VPC User Guide*.

- For API details, see [DescribeAddressTransfers](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-address-transfers.html) in *AWS CLI Command Reference*.

### describe-addresses-attribute

The following code example shows how to use `describe-addresses-attribute`.

**AWS CLI**

**To view the attributes of the domain name associated with an elastic IP address**

The following `describe-addresses-attribute` examples return the attributes of the domain name associated with the elastic IP address.

**Linux:**

```bash
aws ec2 describe-addresses-attribute \
    --allocation-ids eipalloc-abcdef01234567890 \
    --attribute domain-name
```

**Output:**

```json
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            ...
        }
    ]
}
```
To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see Use reverse DNS for email applications in the Amazon EC2 User Guide or modify-address-attribute in the AWS CLI Command Reference.

- For API details, see DescribeAddressesAttribute in AWS CLI Command Reference.

describe-addresses

The following code example shows how to use describe-addresses.

AWS CLI

Example 1: To retrieve details about all of your Elastic IP addresses

The following describe_addresses example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

Output:

```
{
  "Addresses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "198.51.100.0",
      "PublicIpv4Pool": "amazon",
      "Domain": "standard"
    },
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
    }]
```
Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
--filters "Name=domain,Values=vpc"
```

Output:

```
{
  "Addresses": [
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
      "AllocationId": "eipalloc-12345678",
      "PrivateIpAddress": "10.0.1.241"
    }
  ]
}
```

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
--allocation-ids eipalloc-282d9641
```

Output:
Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following describe-addresses example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```bash
aws ec2 describe-addresses \
  --filters "Name=private-ip-address,Values=10.251.50.12"
```

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following describe-addresses example displays details about your Elastic IP addresses for use in EC2-Classic.

```bash
aws ec2 describe-addresses \
  --filters "Name=domain,Values=standard"
```

Output:

```json
{
   "Addresses": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "PublicIp": "203.0.113.25",
         "PublicIpv4Pool": "amazon",
         "AssociationId": "eipassoc-123abc12",
         "NetworkInterfaceOwnerId": "1234567891012",
         "PublicIp": "203.0.113.25",
         "AllocationId": "eipalloc-282d9641",
         "PrivateIpAddress": "10.251.50.12"
      }
   ]
}
```
Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following describe-addresses example displays details about the Elastic IP address with the value 203.0.110.25, which is associated with an instance in EC2-Classic.

```bash
aws ec2 describe-addresses \
--public-ips 203.0.110.25
```

Output:

```json
{
   "Addresses": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "PublicIp": "203.0.110.25",
         "PublicIpv4Pool": "amazon",
         "Domain": "standard"
      }
   ]
}
```

- For API details, see [DescribeAddresses](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-addresses.html) in *AWS CLI Command Reference*.

**describe-aggregate-id-format**

The following code example shows how to use describe-aggregate-id-format.

**AWS CLI**

To describe the longer ID format settings for all resource types in a Region

The following describe-aggregate-id-format example describes the overall long ID format status for the current Region. The Deadline value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The UseLongIdsAggregated value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.
aws ec2 describe-aggregate-id-format

Output:

```
{
    "UseLongIdsAggregated": true,
    "Statuses": [
        {
            "Deadline": "2018-08-13T02:00:00.000Z",
            "Resource": "network-interface-attachment",
            "UseLongIds": true
        },
        {
            "Deadline": "2016-12-13T02:00:00.000Z",
            "Resource": "instance",
            "UseLongIds": true
        },
        {
            "Deadline": "2018-08-13T02:00:00.000Z",
            "Resource": "elastic-ip-association",
            "UseLongIds": true
        },
        ...
    ]
}
```

- For API details, see [DescribeAggregateIdFormat](#) in *AWS CLI Command Reference*.

**describe-availability-zones**

The following code example shows how to use describe-availability-zones.

**AWS CLI**

**To describe your Availability Zones**

The following example describe-availability-zones displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2` (Oregon) Region.

```bash
aws ec2 describe-availability-zones
```
Output:

```json
{
    "AvailabilityZones": [
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2a",
        "ZoneId": "usw2-az1",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2b",
        "ZoneId": "usw2-az2",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2c",
        "ZoneId": "usw2-az3",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    },
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2d",
        "ZoneId": "usw2-az4",
        "GroupName": "us-west-2",
        "NetworkBorderGroup": "us-west-2"
    }
],
}```
For API details, see `DescribeAvailabilityZones` in *AWS CLI Command Reference*.

describe-aws-network-performance-metric-subscription

The following code example shows how to use `describe-aws-network-performance-metric-subscription`.

**AWS CLI**

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```json
{
  "Subscriptions": [
    {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
    }
  ]
}
```
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

**describe-aws-network-performance-metric-subscriptions**

The following code example shows how to use `describe-aws-network-performance-metric-subscriptions`.

**AWS CLI**

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```json
{
   "Subscriptions": [
       {
           "Source": "us-east-1",
           "Destination": "eu-west-1",
           "Metric": "aggregate-latency",
           "Statistic": "p50",
           "Period": "five-minutes"
       }
   ]
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscriptions in AWS CLI Command Reference.

**describe-bundle-tasks**

The following code example shows how to use `describe-bundle-tasks`.

```
```
AWS CLI

To describe your bundle tasks

This example describes all of your bundle tasks.

Command:

```sh
aws ec2 describe-bundle-tasks
```

Output:

```json
{
   "BundleTasks": [
   {
      "UpdateTime": "2015-09-15T13:26:54.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
        "S3": {
          "Prefix": "winami",
          "Bucket": "bundletasks"
        }
      },
      "State": "bundling",
      "StartTime": "2015-09-15T13:24:35.000Z",
      "Progress": "3%",
      "BundleId": "bun-2a4e041c"
    }
   ]
}
```

- For API details, see DescribeBundleTasks in AWS CLI Command Reference.

describe-byoip-cidrs

The following code example shows how to use describe-byoip-cidrs.

AWS CLI

To describe your provisioned address ranges

The following describe-byoip-cidrs example displays details about the public IPv4 address ranges that you provisioned for use by AWS.
aws ec2 describe-byoip-cidrs

Output:

```json
{
    "ByoipCidrs": [
        {
            "Cidr": "203.0.113.25/24",
            "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
            "State": "provisioned"
        }
    ]
}
```

- For API details, see [DescribeByoipCidrs](#) in [AWS CLI Command Reference](#).

**describe-capacity-reservation-fleets**

The following code example shows how to use `describe-capacity-reservation-fleets`.

**AWS CLI**

**To view a Capacity Reservation Fleet**

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet:

```bash
aws ec2 describe-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```json
{
    "CapacityReservationFleets": [
        {
            "Status": "active",
            "EndDate": "2022-12-31T23:59:59.000Z",
            "InstanceMatchCriteria": "open",
            "Tags": [],
            "CapacityReservationFleetId": "crf-abcdef01234567890"
        }
    ]
}
```

### describe-capacity-reservations

The following code example shows how to use `describe-capacity-reservations`.

**AWS CLI**

**Example 1: To describe one or more of your capacity reservations**

The following `describe-capacity-reservations` example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:
Example 2: To describe one or more of your capacity reservations

The following describe-capacity-reservations example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \\
```
**--capacity-reservation-ids cr-1234abcd56EXAMPLE**

Output:

```json
{
   "CapacityReservations": [
      {
         "CapacityReservationId": "cr-1234abcd56EXAMPLE",
         "EndDateType": "unlimited",
         "AvailabilityZone": "eu-west-1a",
         "InstanceMatchCriteria": "open",
         "Tags": [],
         "EphemeralStorage": false,
         "CreateDate": "2019-08-16T09:03:18.000Z",
         "AvailableInstanceCount": 1,
         "InstancePlatform": "Linux/UNIX",
         "TotalInstanceCount": 1,
         "State": "active",
         "Tenancy": "default",
         "EbsOptimized": true,
         "InstanceType": "a1.medium"
      }
   ]
}
```

For more information, see [Viewing a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AmazonVPC.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeCapacityReservations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-capacity-reservations.html) in *AWS CLI Command Reference*.

**describe-carrier-gateways**

The following code example shows how to use `describe-carrier-gateways`.

**AWS CLI**

**To describe all carrier gateways**

The following `describe-carrier-gateways` example lists all your carrier gateways.

```bash
aws ec2 describe-carrier-gateways
```

Output:
For more information, see Carrier gateways<https://docs.aws.amazon.com/vpc/latest/userguide/Carrier_Gateway.html> in the Amazon Virtual Private Cloud User Guide.

- For API details, see DescribeCarrierGateways in AWS CLI Command Reference.

describe-classic-link-instances

The following code example shows how to use describe-classic-link-instances.

AWS CLI

To describe linked EC2-Classic instances

This example lists all of your linked EC2-Classic instances.

Command:

```bash
aws ec2 describe-classic-link-instances
```

Output:

```json
{
    "Instances": [
    {
        "InstanceId": "i-1234567890abcdef0",
```
This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```bash
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```json
{
    "Instances": [
        {
```

Actions and scenarios
For API details, see `DescribeClassicLinkInstances` in *AWS CLI Command Reference*.

### describe-client-vpn-authorization-rules

The following code example shows how to use `describe-client-vpn-authorization-rules`.

**AWS CLI**

**To describe the authorization rules for a Client VPN endpoint**

The following `describe-client-vpn-authorization-rules` example displays details about the authorization rules for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-authorization-rules \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

**Output:**

```json
{
   "AuthorizationRules": [
      {
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "GroupId": "",
         "AccessAll": true,
         "DestinationCidr": "0.0.0.0/0",
```
The following code example shows how to use `describe-client-vpn-connections`.

**AWS CLI**

To describe the connections to a Client VPN endpoint

The following `describe-client-vpn-connections` example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \\
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
   "Connections": [
       {
           "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
           "Timestamp": "2019-08-12 07:58:34",
           "ConnectionId": "cvpn-connection-0e03eb24267165acd",
           "ConnectionEstablishedTime": "2019-08-12 07:57:14",
           "IngressBytes": "32302",
           "EgressBytes": "5696",
           "IngressPackets": "332",
           "EgressPackets": "67",
           "ClientIp": "172.31.0.225",
           "CommonName": "client1.domain.tld",
           "Status": {
               "Code": "terminated"
           }
       }
   ]
}
```
For more information, see Client Connections in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnConnections in AWS CLI Command Reference.

**describe-client-vpn-endpoints**

The following code example shows how to use describe-client-vpn-endpoints.

**AWS CLI**

To describe your Client VPN endpoints

The following describe-client-vpn-endpoints example displays details about all of your Client VPN endpoints.

```
aws ec2 describe-client-vpn-endpoints
```

Output:

```json
{
    "ClientVpnEndpoints": [
        {
```
"ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
"Description": "Endpoint for Admin access",
"Status": {
    "Code": "available"
},
"CreationTime": "2020-11-13T11:37:27",
"DnsName": "*.cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com",
"ClientCidrBlock": "172.31.0.0/16",
"DnsServers": [
    "8.8.8.8"
],
"SplitTunnel": false,
"VpnProtocol": "openvpn",
"TransportProtocol": "udp",
"VpnPort": 443,

"AuthenticationOptions": [
    {
        "Type": "certificate-authentication",
        "MutualAuthentication": {
            "ClientRootCertificateChain": "arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
        }
    }
],
"ConnectionLogOptions": {
    "Enabled": true,
    "CloudwatchLogGroup": "Client-vpn-connection-logs",
    "CloudwatchLogStream": "cvpn-endpoint-123456789123abcde-ap-south-1-2020/11/13-FCD8HEMVaCcw"
},
"Tags": [
    {
        "Key": "Name",
        "Value": "Client VPN"
    }
],
"SecurityGroupIds": [
    "sg-aabbcc1122344567"
],
"VpcId": "vpc-a87f92c1"
For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnEndpoints in AWS CLI Command Reference.

describe-client-vpn-routes

The following code example shows how to use describe-client-vpn-routes.

AWS CLI

To describe the routes for a Client VPN endpoint

The following describe-client-vpn-routes example displays details about the routes for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-routes \
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
   "Routes": [
       {
           "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
           "DestinationCidr": "10.0.0.0/16",
           "TargetSubnet": "subnet-0123456789abcabca",
           "Type": "Nat",
           "Origin": "associate",
           "Status": {
               "Code": "active"
           },
           "Description": "Default Route"
       }
   ]
}
```
{
  "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
  "DestinationCidr": "0.0.0.0/0",
  "TargetSubnet": "subnet-0123456789abcabca",
  "Type": "Nat",
  "Origin": "add-route",
  "Status": {
    "Code": "active"
  }
}
]

For more information, see [Routes](https://aws.amazon.com/clientvpn/) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnRoutes](https://aws.amazon.com/cli/) in *AWS CLI Command Reference*.

describe-client-vpn-target-networks

The following code example shows how to use `describe-client-vpn-target-networks`.

**AWS CLI**

To describe the target networks for a Client VPN endpoint

The following `describe-client-vpn-target-networks` example displays details about the target networks for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-target-networks \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
  "ClientVpnTargetNetworks": [
    {
      "AssociationId": "cvpn-assoc-012e837060753dc3d",
      "VpcId": "vpc-1111122222333333",
      "TargetNetworkId": "subnet-0123456789abcabca",
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Status": {
        "Code": "associating"
      }
    }
  ]
}
```
For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnTargetNetworks in AWS CLI Command Reference.

describe-coip-pools

The following code example shows how to use describe-coip-pools.

AWS CLI

**To describe customer-owned IP address pools**

The following describe-coip-pools example describes the customer-owned IP address pools in your AWS account.

```bash
aws ec2 describe-coip-pools
```

Output:

```json
{
    "CoipPools": [
    {
        "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
        "PoolCidrs": [
            "0.0.0.0/0"
        ],
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    }
    ]
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DescribeCoipPools in AWS CLI Command Reference.
describe-conversion-tasks

The following code example shows how to use describe-conversion-tasks.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```bash
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```

Output:

```json
{
  "ConversionTasks": [
    {
      "ConversionTaskId": "import-i-ffvko9js",
      "ImportInstance": {
        "InstanceId": "i-1234567890abcdef0",
        "Volumes": [
          {
            "Volume": {
              "Id": "vol-049df61146c4d7901",
              "Size": 16
            },
            "Status": "completed",
            "Image": {
              "Size": 1300687360,
              "ImportManifestUrl": "https://s3.amazonaws.com/myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=140EXAMPLE&Signature=XYNhznHNgCqsjDxL9wRL%2FJvEXAMPLE",
              "Format": "VMDK"
            },
            "BytesConverted": 1300682960,
            "AvailabilityZone": "us-east-1d"
          }
        ]
      },
      "State": "completed"
    }
  ]
}
```
For API details, see DescribeConversionTasks in AWS CLI Command Reference.

describe-customer-gateways

The following code example shows how to use describe-customer-gateways.

AWS CLI

To describe your customer gateways

This example describes your customer gateways.

Command:

```
aws ec2 describe-customer-gateways
```

Output:

```
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-b4dc3961",
            "IpAddress": "203.0.113.12",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65000"
        },
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65534"
        }
    ]
}
```

To describe a specific customer gateway
This example describes the specified customer gateway.

Command:

```bash
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```json
{
   "CustomerGateways": [
      {
         "CustomerGatewayId": "cgw-0e11f167",
         "IpAddress": "12.1.2.3",
         "State": "available",
         "Type": "ipsec.1",
         "BgpAsn": "65534"
      }
   ]
}
```

**describe-dhcp-options**

The following code example shows how to use `describe-dhcp-options`.

**AWS CLI**

**Example 1: To describe your DHCP options**

The following `describe-dhcp-options` example retrieves details about your DHCP options.

```bash
aws ec2 describe-dhcp-options
```

Output:

```json
{
   "DhcpOptions": [
      {
         "DhcpConfigurations": [
            {
               "Key": "domain-name",
               "Value": "example.com"
            }
         ]
      }
   ]
}
```
"Values": [
    {
        "Value": "us-east-2.compute.internal"
    }
],
"KeyId": "dopt-19edf471",
"OwnerId": "111122223333"
},
{
    "DhcpConfigurations": [
        {
            "Key": "domain-name",
            "Values": [
                {
                    "Value": "us-east-2.compute.internal"
                }
            ]
        },
        {
            "Key": "domain-name-servers",
            "Values": [
                {
                    "Value": "AmazonProvidedDNS"
                }
            ]
        }
    ],
    "DhcpOptionsId": "dopt-fEXAMPLE",
    "OwnerId": "111122223333"
}
For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

**Example 2: To describe your DHCP options and filter the output**

The following describe-dhcp-options example describes your DHCP options and uses a filter to return only DHCP options that have example.com for the domain name server. The example uses the --query parameter to display only the configuration information and ID in the output.

```bash
aws ec2 describe-dhcp-options \
  --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
  --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:

```json
[
  [
    {
      "Key": "domain-name",
      "Values": [
        {
          "Value": "example.com"
        }
      ]
    },
    {
      "Key": "domain-name-servers",
      "Values": [
        {
          "Value": "172.16.16.16"
        }
      ]
    }
  ],
  "dopt-001122334455667ab"
]
```

For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

- For API details, see DescribeDhcpOptions in AWS CLI Command Reference.
describe-egress-only-internet-gateways

The following code example shows how to use `describe-egress-only-internet-gateways`.

**AWS CLI**

**To describe your egress-only Internet gateways**

This example describes your egress-only Internet gateways.

Command:

```
aws ec2 describe-egress-only-internet-gateways
```

Output:

```
{
  "EgressOnlyInternetGateways": [
    {
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
      "Attachments": [
        {
          "State": "attached",
          "VpcId": "vpc-0c62a468"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeEgressOnlyInternetGateways](#) in *AWS CLI Command Reference*.

describe-elastic-gpus

The following code example shows how to use `describe-elastic-gpus`.

**AWS CLI**

**To describe an Elastic GPU**

Command:
For API details, see `DescribeElasticGpus` in *AWS CLI Command Reference*.

describe-export-image-tasks

The following code example shows how to use `describe-export-image-tasks`.

**AWS CLI**

To monitor an export image task

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

```bash
aws ec2 describe-export-image-tasks
   --export-image-task-ids export-ami-1234567890abcdef0
```

Output for an export image task that is in progress.

```json
{
   "ExportImageTasks": [
      {
         "ExportImageTaskId": "export-ami-1234567890abcdef0",
         "Progress": "21",
         "S3ExportLocation": {
            "S3Bucket": "my-export-bucket",
            "S3Prefix": "exports/
         }
      },
      "Status": "active",
      "StatusMessage": "updating"
   }
}
```

Output for an export image task that is completed.

```json
{
   "ExportImageTasks": [
```
For more information, see Export a VM from an AMI in the VM Import/Export User Guide.

- For API details, see DescribeExportImageTasks in AWS CLI Command Reference.

describe-export-tasks

The following code example shows how to use describe-export-tasks.

AWS CLI

To list details about an instance export task

This example describes the export task with ID export-i-fh8sjjsq.

Command:

aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq

Output:

```json
{
   "ExportTasks": [
      {
         "State": "active",
         "InstanceExportDetails": {
            "InstanceId": "i-1234567890abcdef0",
            "TargetEnvironment": "vmware"
         },
         "ExportToS3Task": {
            "S3Bucket": "myexportbucket",
            "S3Key": "RHEL5export-i-fh8sjjsq.ova",
            "DiskImageFormat": "vmdk"
         }
      }
   ]
}
```
describe-fast-launch-images

The following code example shows how to use describe-fast-launch-images.

AWS CLI

To describe the details for Windows AMIs that are configured for faster launching

The following describe-fast-launch-images example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```
aws ec2 describe-fast-launch-images
```

Output:

```
{
    "FastLaunchImages": [
        {
            "ImageId": "ami-01234567890abcedf",
            "ResourceType": "snapshot",
            "SnapshotConfiguration": {},
            "LaunchTemplate": {
                "LaunchTemplateId": "lt-01234567890abcedf",
                "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",
                "Version": "1"
            },
            "MaxParallelLaunches": 6,
            "OwnerId": "0123456789123",
            "State": "active",
            "StateChangeReason": "Created",
            "StateChangeTime": "2023-01-01T12:00:00Z"
        }
    ]
}
```
For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

- For API details, see DescribeFastLaunchImages in AWS CLI Command Reference.

describe-fast-snapshot-restores

The following code example shows how to use describe-fast-snapshot-restores.

AWS CLI

To describe fast snapshot restores

The following describe-fast-snapshot-restores example displays details for all fast snapshot restores with a state of disabled.

```bash
aws ec2 describe-fast-snapshot-restores \
   --filters Name=state,Values=disabled
```

Output:

```json
{
    "FastSnapshotRestores": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2c",
            "State": "disabled",
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z",
            "OptimizingTime": "2020-01-25T23:58:25.573Z",
            "EnabledTime": "2020-01-26T00:40:56.069Z",
            "DisablingTime": "2020-01-26T00:41:27.390Z"
        }
    ]
}
```
The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```bash
aws ec2 describe-fast-snapshot-restores
```

- For API details, see [DescribeFastSnapshotRestores](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fast-snapshot-restores.html) in *AWS CLI Command Reference*.

**describe-fleet-history**

The following code example shows how to use `describe-fleet-history`.

**AWS CLI**

**To describe EC2 Fleet history**

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```bash
aws ec2 describe-fleet-history \
   --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --start-time 2020-09-01T00:00:00Z
```

**Output:**

```json
{
   "HistoryRecords": [
      {
         "EventInformation": {
            "EventSubType": "submitted"
         },
         "EventType": "fleetRequestChange",
         "Timestamp": "2020-09-01T18:26:05.000Z"
      },
      {
         "EventInformation": {
            "EventSubType": "active"
         }
      }
   ]
}
```
"EventType": "fleetRequestChange",
"Timestamp": "2020-09-01T18:26:15.000Z"
},
{
  "EventInformation": {
    "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
    "EventSubType": "progress"
  },
  "EventType": "fleetRequestChange",
  "Timestamp": "2020-09-01T18:26:17.000Z"
},
{
  "EventInformation": {
    "EventDescription": "{"instanceType":"t2.small", ...
    "EventSubType": "launched",
    "InstanceId": "i-083a1c446e66085d2"
  },
  "EventType": "instanceChange",
  "Timestamp": "2020-09-01T18:26:17.000Z"
},
{
  "EventInformation": {
    "EventDescription": "{"instanceType":"t2.small", ...
    "EventSubType": "launched",
    "InstanceId": "i-090db02406cc3c2d6"
  },
  "EventType": "instanceChange",
  "Timestamp": "2020-09-01T18:26:17.000Z"
}
],
"LastEvaluatedTime": "2020-09-01T19:10:19.000Z",
"FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
"StartTime": "2020-08-31T23:53:20.000Z"
}

For more information, see [Managing an EC2 Fleet](https://aws.amazon.com/documentation/ec2/userguide/) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see [DescribeFleetHistory](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fleet-history.html) in AWS CLI Command Reference.

**describe-fleet-instances**

The following code example shows how to use describe-fleet-instances.
AWS CLI

To describe the running instances for an EC2 Fleet

The following `describe-fleet-instances` example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances \
   --fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
   "ActiveInstances": [
      {
         "InstanceId": "i-090db02406cc3c2d6",
         "InstanceType": "t2.small",
         "SpotInstanceRequestId": "sir-a43gtpfk",
         "InstanceHealth": "healthy"
      },
      {
         "InstanceId": "i-083a1c446e66085d2",
         "InstanceType": "t2.small",
         "SpotInstanceRequestId": "sir-iwcit2nj",
         "InstanceHealth": "healthy"
      }
   ],
   "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `DescribeFleetInstances` in AWS CLI Command Reference.

describe-fleets

The following code example shows how to use `describe-fleets`.

AWS CLI

To describe an EC2 Fleet
The following `describe-fleets` example describes the specified EC2 Fleet.

```bash/aws ec2 describe-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```json
{
    "Fleets": [
        {
            "ActivityStatus": "pending_fulfillment",
            "CreateTime": "2020-09-01T18:26:05.000Z",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
            "FleetState": "active",
            "ExcessCapacityTerminationPolicy": "termination",
            "FulfilledCapacity": 0.0,
            "FulfilledOnDemandCapacity": 0.0,
            "LaunchTemplateConfigs": [
                {
                    "LaunchTemplateSpecification": {
                        "LaunchTemplateId": "lt-0e632f2855a979cd5",
                        "Version": "1"
                    }
                }
            ],
            "TargetCapacitySpecification": {
                "TotalTargetCapacity": 2,
                "OnDemandTargetCapacity": 0,
                "SpotTargetCapacity": 2,
                "DefaultTargetCapacityType": "spot"
            },
            "TerminateInstancesWithExpiration": false,
            "Type": "maintain",
            "ReplaceUnhealthyInstances": false,
            "SpotOptions": {
                "AllocationStrategy": "lowestPrice",
                "InstanceInterruptionBehavior": "terminate",
                "InstancePoolsToUseCount": 1
            },
            "OnDemandOptions": {
                "AllocationStrategy": "lowestPrice"
            }
        }
    ]
}
```
describe-flow-logs

The following code example shows how to use describe-flow-logs.

AWS CLI

Example 1: To describe all of your flow logs

The following describe-flow-logs example displays details for all of your flow logs.

```
aws ec2 describe-flow-logs
```

Output:

```
{
  "FlowLogs": [
    {
      "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-role",
      "DeliverLogsStatus": "SUCCESS",
      "FlowLogId": "fl-aabbccdd112233445",
      "MaxAggregationInterval": 600,
      "FlowLogStatus": "ACTIVE",
      "LogGroupName": "FlowLogGroup",
      "ResourceId": "subnet-12345678901234567",
      "TrafficType": "ALL",
      "LogDestinationType": "cloud-watch-logs",
      "LogFormat": "${version} ${account-id} ${interface-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${packets} ${bytes} ${start} ${end} ${action} ${log-status}"
    },
    {
      "CreationTime": "2020-02-04T15:22:29.986Z",
```
Example 2: To describe a subset of your flow logs

The following describe-flow-logs example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```bash
aws ec2 describe-flow-logs \
  --filter "Name=log-group-name,Values=MyFlowLogs"
```

- For API details, see [DescribeFlowLogs](#) in AWS CLI Command Reference.

**describe-fpga-image-attribute**

The following code example shows how to use describe-fpga-image-attribute.

**AWS CLI**

**To describe the attributes of an Amazon FPGA image**

This example describes the load permissions for the specified AFI.

**Command:**

```bash
aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

**Output:**
For API details, see `DescribeFpgaImageAttribute` in *AWS CLI Command Reference*.

**describe-fpga-images**

The following code example shows how to use `describe-fpga-images`.

**AWS CLI**

**To describe Amazon FPGA images**

This example describes AFIs that are owned by account 123456789012.

**Command:**

```bash
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

**Output:**

```json
{
   "FpgaImages": [
      {
         "UpdateTime": "2017-12-22T12:09:14.000Z",
         "Name": "my-afi",
         "PciId": {
            "SubsystemVendorId": "0xfedd",
            "VendorId": "0x1d0f",
            "DeviceId": "0xf000",
            "SubsystemId": "0x1d51"
         },
         "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
      }
   ]
}
```
For API details, see [DescribeFpgaImages](#) in [AWS CLI Command Reference](#).

**describe-host-reservation-offerings**

The following code example shows how to use `describe-host-reservation-offerings`.

**AWS CLI**

To describe Dedicated Host Reservation offerings

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```bash
code
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```json
code
{
   "OfferingSet": [
      {
         "HourlyPrice": "1.499",
         "OfferingId": "hro-03f707bf363b6b324",
         "InstanceFamily": "m4",
         "PaymentOption": "NoUpfront",
         "UpfrontPrice": "0.000",
         "Duration": 31536000
      }
   ]
}
```
For API details, see `DescribeHostReservationOfferings` in `AWS CLI Command Reference`.
describe-host-reservations

The following code example shows how to use describe-host-reservations.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
   "HostReservationSet": [
   {
      "Count": 1,
      "End": "2019-01-10T12:14:09Z",
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "OfferingId": "hro-03f707bf363b6b324",
      "PaymentOption": "NoUpfront",
      "State": "active",
      "HostIdSet": [
         "h-013abcd2a00cbd123"
      ],
      "Start": "2018-01-10T12:14:09Z",
      "HostReservationId": "hr-0d418a3a4ff669ae",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
   }
   ]
}
```

• For API details, see DescribeHostReservations in AWS CLI Command Reference.

describe-hosts

The following code example shows how to use describe-hosts.
AWS CLI

To view details about Dedicated Hosts

The following describe-hosts example displays details for the available Dedicated Hosts in your AWS account.

```bash/aws ec2 describe-hosts --filter "Name=state,Values=available"
```

Output:

```json
{
    "Hosts": [
        {
            "HostId": "h-07879acf49EXAMPLE",
            "Tags": [
                {
                    "Value": "production",
                    "Key": "purpose"
                }
            ],
            "HostProperties": {
                "Cores": 48,
                "TotalVCpus": 96,
                "InstanceType": "m5.large",
                "Sockets": 2
            },
            "Instances": [],
            "State": "available",
            "AvailabilityZone": "eu-west-1a",
            "AvailableCapacity": {
                "AvailableInstanceCapacity": [
                    {
                        "AvailableCapacity": 48,
                        "InstanceType": "m5.large",
                        "TotalCapacity": 48
                    }
                ],
                "AvailableVCpus": 96
            },
            "HostRecovery": "on",
            "AllocationTime": "2019-08-19T08:57:44.000Z",
            "AutoPlacement": "off"
        }
    ]
}
```
For more information, see Viewing Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeHosts in AWS CLI Command Reference.

**describe-iam-instance-profile-associations**

The following code example shows how to use describe-iam-instance-profile-associations.

**AWS CLI**

**To describe IAM instance profile associations**

This example describes all of your IAM instance profile associations.

Command:

```
aws ec2 describe-iam-instance-profile-associations
```

Output:

```
{
   "IamInstanceProfileAssociations": [
   {
      "InstanceId": "i-09eb09efa73ec1dee",
      "State": "associated",
      "AssociationId": "iip-assoc-0db249b1f25fa24b8",
      "IamInstanceProfile": {
         "Id": "AIPAJVQN4F5WVLGJDRGM",
         "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
   },
   {
      "InstanceId": "i-0402909a2f4d8f4d14",
      "State": "associating",
      "AssociationId": "iip-assoc-0d1ec06278d29f44a",
      "IamInstanceProfile": {
         "Id": "AGJAJVQN4F5WVLGCMABC",
         "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
   }
   ]
}
```
For API details, see `DescribeIamInstanceProfileAssociations` in AWS CLI Command Reference.

**describe-id-format**

The following code example shows how to use `describe-id-format`.

**AWS CLI**

**Example 1: To describe the ID format of a resource**

The following `describe-id-format` example describes the ID format for security groups.

```
aws ec2 describe-id-format \
  --resource security-group
```

In the following example output, the Deadline value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```
{
    "Statuses": [
        {
            "Deadline": "2018-08-15T00:00:00.000Z",
            "Resource": "security-group",
            "UseLongIds": true
        }
    ]
}
```

**Example 2: To describe the ID format for all resources**

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```
For API details, see \texttt{DescribeIdFormat} in \textit{AWS CLI Command Reference}.

\texttt{describe-identity-id-format}

The following code example shows how to use \texttt{describe-identity-id-format}.

\textbf{AWS CLI}

\textbf{To describe the ID format for an IAM role}

The following \texttt{describe-identity-id-format} example describes the ID format received by instances created by the IAM role \texttt{EC2Role} in your AWS account.

\begin{verbatim}
aws ec2 describe-identity-id-format \\
  --principal-arn arn:aws:iam::123456789012:role/my-iam-role \\
  --resource instance
\end{verbatim}

The following output indicates that instances created by this role receive IDs in long ID format.

\begin{verbatim}
{
  "Statuses": [
    {
      "Deadline": "2016-12-15T00:00:00Z",
      "Resource": "instance",
      "UseLongIds": true
    }
  ]
}
\end{verbatim}

\textbf{To describe the ID format for an IAM user}

The following \texttt{describe-identity-id-format} example describes the ID format received by snapshots created by the IAM user \texttt{AdminUser} in your AWS account.

\begin{verbatim}
aws ec2 describe-identity-id-format \\
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \\
  --resource snapshot
\end{verbatim}

The output indicates that snapshots created by this user receive IDs in long ID format.

\begin{verbatim}
{
}
\end{verbatim}
"Statuses": [
  {
    "Deadline": "2016-12-15T00:00:00Z",
    "Resource": "snapshot",
    "UseLongIds": true
  }
]

- For API details, see [DescribeIdentityIdFormat](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/describe-image-attribute.html) in *AWS CLI Command Reference*.

**describe-image-attribute**

The following code example shows how to use describe-image-attribute.

**AWS CLI**

**To describe the launch permissions for an AMI**

This example describes the launch permissions for the specified AMI.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute launchPermission
```

Output:

```
{
  "LaunchPermissions": [
    {
      "UserId": "123456789012"
    }
  ],
  "ImageId": "ami-5731123e",
}
```

**To describe the product codes for an AMI**

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

Command:
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes

Output:

```
{
    "ProductCodes": [],
    "ImageId": "ami-5731123e",
}
```

- For API details, see [DescribeImageAttribute](#) in *AWS CLI Command Reference*.

### describe-images

The following code example shows how to use `describe-images`.

**AWS CLI**

**Example 1: To describe an AMI**

The following `describe-images` example describes the specified AMI in the specified Region.

```bash
aws ec2 describe-images \
--region us-east-1 \
--image-ids ami-1234567890EXAMPLE
```

Output:

```
{
    "Images": [
    {
        "VirtualizationType": "hvm",
        "Description": "Provided by Red Hat, Inc.",
        "PlatformDetails": "Red Hat Enterprise Linux",
        "EnaSupport": true,
        "Hypervisor": "xen",
        "State": "available",
        "SriovNetSupport": "simple",
        "ImageId": "ami-1234567890EXAMPLE",
        "UsageOperation": "RunInstances:0010",
        "BlockDeviceMappings": [
            {
                "DeviceName": "/dev/sda1",
            }
```

**Actions and scenarios**

2231
"Ebs": {
    "SnapshotId": "snap-11122233444aaabb",
    "DeleteOnTermination": true,
    "VolumeType": "gp2",
    "VolumeSize": 10,
    "Encrypted": false
},
"Architecture": "x86_64",
"ImageLocation": "123456789012/RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2",
"RootDeviceType": "ebs",
"OwnerId": "123456789012",
"RootDeviceName": "/dev/sda1",
"CreationDate": "2019-05-10T13:17:12.000Z",
"Public": true,
"ImageType": "machine",
"Name": "RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2"
}
]

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

**Example 2: To describe AMIs based on filters**

The following describe-images example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```bash
aws ec2 describe-images \
    --owners amazon \
    --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

For an example of the output for describe-images, see Example 1.

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

**Example 3: To describe AMIs based on tags**

The following describe-images example describes all AMIs that have the tag Type=Custom. The example uses the --query parameter to display only the AMI IDs.
aws ec2 describe-images \
    --filters "Name=tag:Type,Values=Custom" \
    --query 'Images[*].[ImageId]' \
    --output text

Output:

ami-1234567890EXAMPLE
ami-0abcdef1234567890

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribelImages in AWS CLI Command Reference.

describe-import-image-tasks

The following code example shows how to use describe-import-image-tasks.

AWS CLI

To monitor an import image task

The following describe-import-image-tasks example checks the status of the specified import image task.

aws ec2 describe-import-image-tasks \
    --import-task-ids import-ami-1234567890abcdef0

Output for an import image task that is in progress.

{
    "ImportImageTasks": [
        {
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "Progress": "28",
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "Status": "completed",
                }
            ]
        }
    ]
}
Output for an import image task that is completed. The ID of the resulting AMI is provided by ImageId.

```json
{
   "ImportImageTasks": [
      {
         "ImportTaskId": "import-ami-1234567890abcdef0",
         "ImageId": "ami-1234567890abcdef0",
         "SnapshotDetails": [
            {
               "DiskImageSize": 705638400.0,
               "Format": "ova",
               "SnapshotId": "snap-1234567890abcdef0"
            },
            {
               "S3Bucket": "my-import-bucket",
               "S3Key": "vms/my-server-vm.ova"
            }
         ],
         "Status": "completed"
      }
   ]
}
```

- For API details, see [DescribeImportImageTasks](#) in AWS CLI Command Reference.

**describe-import-snapshot-tasks**

The following code example shows how to use describe-import-snapshot-tasks.
AWS CLI

To monitor an import snapshot task

The following describe-import-snapshot-tasks example checks the status of the specified import snapshot task.

```bash
aws ec2 describe-import-snapshot-tasks \
--import-task-ids import-snap-1234567890abcdef0
```

Output for an import snapshot task that is in progress:

```json
{
   "ImportSnapshotTasks": [
      {
         "Description": "My server VMDK",
         "ImportTaskId": "import-snap-1234567890abcdef0",
         "SnapshotTaskDetail": {
            "Description": "My server VMDK",
            "DiskImageSize": "705638400.0",
            "Format": "VMDK",
            "Progress": "42",
            "Status": "active",
            "StatusMessage": "downloading/convertling",
            "UserBucket": {
               "S3Bucket": "my-import-bucket",
               "S3Key": "vms/my-server-vm.vmdk"
            }
         }
      }
   ]
}
```

Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by SnapshotId.

```json
{
   "ImportSnapshotTasks": [
      {
         "Description": "My server VMDK",
         "ImportTaskId": "import-snap-1234567890abcdef0",
         "SnapshotTaskDetail": {
```

Actions and scenarios
For API details, see DescribeImportSnapshotTasks in AWS CLI Command Reference.

describe-instance-attribute

The following code example shows how to use describe-instance-attribute.

AWS CLI

To describe the instance type

This example describes the instance type of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute instanceType
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0",
   "InstanceType": {
      "Value": "t1.micro"
   }
}
```

To describe the disableApiTermination attribute
This example describes the `disableApiTermination` attribute of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute disableApiTermination
```

Output:

```json
{
    "InstanceId": "i-1234567890abcdef0",
    "DisableApiTermination": {
        "Value": "false"
    }
}
```

To describe the block device mapping for an instance

This example describes the `blockDeviceMapping` attribute of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute blockDeviceMapping
```

Output:

```json
{
    "InstanceId": "i-1234567890abcdef0",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/sda1",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": true,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-05-17T22:42:34.000Z"
            }
        },
        {
            "DeviceName": "/dev/sdf",
            "Ebs": {
```
The following code example shows how to use describe-instance-connect-endpoints.

**AWS CLI**

**To describe an EC2 Instance Connect Endpoint**

The following describe-instance-connect-endpoints example describes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 describe-instance-connect-endpoints \
   --region us-east-1 \
   --instance-connect-endpoint-ids eice-0123456789example
```

**Output:**

```json
{
   "InstanceConnectEndpoints": [
   {
      "OwnerId": "111111111111",
      "InstanceConnectEndpointId": "eice-0123456789example",
      "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
      "State": "create-complete",
      "StateMessage": "",
      "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-endpoint.us-east-1.amazonaws.com",
      "NetworkInterfaceIds": [
         "eni-0123456789example"
      ]
   }
   ]
}
```

- For API details, see [DescribeInstanceAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-attribute.html) in *AWS CLI Command Reference*.
"VpcId": "vpc-0123abcd",
"AvailabilityZone": "us-east-1d",
"CreatedAt": "2023-02-07T12:05:37+00:00",
"SubnetId": "subnet-0123abcd",
"Tags": []
}]
}

For more information, see Create an EC2 Instance Connect Endpoint in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceConnectEndpoints in AWS CLI Command Reference.

describe-instance-credit-specifications

The following code example shows how to use describe-instance-credit-specifications.

**AWS CLI**

To describe the credit option for CPU usage of one or more instances

The following describe-instance-credit-specifications example describes the CPU credit option for the specified instance.

```bash
aws ec2 describe-instance-credit-specifications \
--instance-ids i-1234567890abcdef0
```

Output:

```json
{
   "InstanceCreditSpecifications": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "CpuCredits": "unlimited"
      }
   ]
}
```

For more information, see Work with burstable performance instances in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceCreditSpecifications in AWS CLI Command Reference.
describe-instance-event-notification-attributes

The following code example shows how to use describe-instance-event-notification-attributes.

AWS CLI

**To describe the tags for scheduled event notifications**

The following describe-instance-event-notification-attributes example describes the tags to appear in scheduled event notifications.

```
aws ec2 describe-instance-event-notification-attributes
```

Output:

```json
{
   "InstanceTagAttribute": {
       "InstanceTagKeys": [],
       "IncludeAllTagsOfInstance": true
   }
}
```

For more information, see [Scheduled events for your instances](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/scheduled-events.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeInstanceEventNotificationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-event-notification-attributes.html) in *AWS CLI Command Reference*.

describe-instance-event-windows

The following code example shows how to use describe-instance-event-windows.

AWS CLI

**Example 1: To describe all event windows**

The following describe-instance-event-windows example describes all event windows in the specified Region.

```
aws ec2 describe-instance-event-windows \
   --region us-east-1
```
Example 2: To describe a specific event window

The following `describe-instance-event-windows` example describes a specific event by using the `instance-event-window` parameter to describe a specific event window.

```bash
aws ec2 describe-instance-event-windows
   --region us-east-1
   --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
   "InstanceEventWindows": [
      {
         "InstanceEventWindowId": "iew-0abcdef1234567890",
         "Name": "myEventWindowName",
         "CronExpression": "* 21-23 * * 2,3",
         "AssociationTarget": {
            "InstanceIds": [
               "i-1234567890abcdef0",
               "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
         },
         "State": "active",
         "Tags": []
      }
   ],
   "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```
Example 3: To describe event windows that match one or more filters

The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```
aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --filters Name=instance-id,Values=i-1234567890abcdef0 \
  --max-results 100 \
  --next-token <next-token-value>
```

Output:

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",
      "TimeRanges": [
        {
          "StartWeekDay": "sunday",
          "StartHour": 2,
          "EndWeekDay": "sunday",
          "EndHour": 8
        }
      ]
    }
  ]
}
```
In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceEventWindows in AWS CLI Command Reference.

describe-instance-status

The following code example shows how to use describe-instance-status.

**AWS CLI**

**To describe the status of an instance**

The following describe-instance-status example describes the current status of the specified instance.

```bash
aws ec2 describe-instance-status \
   --instance-ids i-1234567890abcdef0
```

Output:

```json
{
   "InstanceStatuses": [ 
      { 
         "InstanceId": "i-1234567890abcdef0",
         "InstanceState": {
```

Actions and scenarios
For more information, see Monitor the status of your instances in the Amazon EC2 User Guide.

For API details, see DescribeInstanceStatus in AWS CLI Command Reference.

describe-instance-topology

The following code example shows how to use describe-instance-topology.

AWS CLI

To describe the instance topology of all your instances

The following describe-instance-topology example describes the topology of all your instances that match the supported instance types for this command.

aws ec2 describe-instance-topology \ 
   --region us-west-2
Output:

```json
{
    "Instances": [
        {
            "InstanceId": "i-111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "my-ml-cpg",
            "NetworkNodes": [
                "nn-111111111example",
                "nn-222222222example",
                "nn-333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-222222222example",
            "InstanceType": "p4d.24xlarge",
            "NetworkNodes": [
                "nn-111111111example",
                "nn-222222222example",
                "nn-333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-333333333example",
            "InstanceType": "trn1.32xlarge",
            "NetworkNodes": [
                "nn-121212121example",
                "nn-121112211example",
                "nn-1311133311example"
            ],
            "ZoneId": "usw2-az4",
            "AvailabilityZone": "us-west-2d"
        },
        {
            "InstanceId": "i-444444444example",
            "InstanceType": "trn1.2xlarge",
            "NetworkNodes": [
                "nn-111111111example",
                "nn-5434334334example"
            ]
        }
    ]
}
```
The following code example shows how to use `describe-instance-type-offerings`.

### AWS CLI

#### Example 1: To list the instance types offered in a Region

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```bash/aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```bash
/aws ec2 describe-instance-type-offerings \
--region us-east-2
```

Output:

```
{
   "InstanceTypeOfferings": [ 
   {
      "InstanceType": "m5.2xlarge",
      "LocationType": "region",
      "Location": "us-east-2"
   }
   ]
}
```
Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
  --location-type availability-zone \
  --filters Name=location,Values=us-east-2a \
  --region us-east-2
```

Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` command indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
  --filters Name=instance-type,Values=c5.xlarge \
  --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
  --filters Name=instance-type,Values=c5* \
  --query "InstanceTypeOfferings[].InstanceType" \
  --region us-east-2
```

Output:

```json
[
]
```
"c5d.12xlarge",
"c5d.9xlarge",
"c5n.xlarge",
"c5.xlarge",
"c5d.metal",
"c5n.metal",
"c5.large",
"c5d.2xlarge",
"c5n.4xlarge",
"c5.2xlarge",
"c5n.large",
"c5n.9xlarge",
"c5d.large",
"c5.18xlarge",
"c5d.18xlarge",
"c5.12xlarge",
"c5n.18xlarge",
"c5.metal",
"c5d.4xlarge",
"c5.24xlarge",
"c5d.xlarge",
"c5n.2xlarge",
"c5d.24xlarge",
"c5d.9xlarge",
"c5.4xlarge"
]  

- For API details, see DescribeInstanceTypeOfferings in AWS CLI Command Reference.

descibe-instance-types

The following code example shows how to use describe-instance-types.

AWS CLI

Example 1: To describe an instance type

The following describe-instance-types example displays details for the specified instance type.

```bash
aws ec2 describe-instance-types \   --instance-types t2.micro
```
Output:

```json
{
    "InstanceTypes": [
        {
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
            "Hypervisor": "xen",
            "ProcessorInfo": {
                "SupportedArchitectures": [
                    "i386",
                    "x86_64"
                ],
                "SustainedClockSpeedInGhz": 2.5
            },
            "VCpuInfo": {
                "DefaultVCpus": 1,
                "DefaultCores": 1,
                "DefaultThreadsPerCore": 1,
                "ValidCores": [1],
                "ValidThreadsPerCore": [1]
            },
            "MemoryInfo": {
                "SizeInMiB": 1024
            },
            "InstanceStorageSupported": false,
            "EbsInfo": {
                "EbsOptimizedSupport": "unsupported",
                "EncryptionSupport": "supported"
            },
            "NetworkInfo": {
```
For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To filter the available instance types**

You can specify a filter to scope the results to instance types that have a specific characteristic. The following describe-instance-types example lists the instance types that support hibernation.

```bash
aws ec2 describe-instance-types
   --filters Name=hibernation-supported,Values=true --query 'InstanceTypes[*].InstanceType'
```

**Output:**

```
[   "m5.8xlarge",
   "r3.large",
   "c3.8xlarge",
   "r5.large",
   "m4.4xlarge",
   "c4.large",
]```
For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeInstanceTypes in AWS CLI Command Reference.

**describe-instances**

The following code example shows how to use describe-instances.

**AWS CLI**

**Example 1: To describe an instance**

The following describe-instances example describes the specified instance.

```bash
aws ec2 describe-instances \  --instance-ids i-1234567890abcdef0
```

Output:

```json
{
  "Reservations": [
    {
      "Groups": [],
      "Instances": [
        {
          "AmiLaunchIndex": 0,

Example 2: To filter for instances with the specified type

The following `describe-instances` example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see [List and filter using the CLI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/list-filter-command.html) in the Amazon EC2 User Guide.

Example 3: To filter for instances with the specified type and Availability Zone

The following `describe-instances` example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-zone,Values=us-east-2c
```

For example output, see Example 1.

**Example 4: To filter for instances with the specified type and Availability Zone using a JSON file**
The following `describe-instances` example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```
aws ec2 describe-instances \
   --filters file://filters.json
```

**Contents of filters.json:**

```
[
  {
    "Name": "instance-type",
    "Values": ["t2.micro", "t3.micro"]
  },
  {
    "Name": "availability-zone",
    "Values": ["us-east-2c"]
  }
]
```

For example output, see Example 1.

**Example 5: To filter for instances with the specified Owner tag**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```
aws ec2 describe-instances \
   --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

**Example 6: To filter for instances with the specified my-team tag value**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```
aws ec2 describe-instances \
   --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.
Example 7: To filter for instances with the specified Owner tag and my-team value

The following describe-instances example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```
aws ec2 describe-instances \
   --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

Example 8: To display only instance and subnet IDs for all instances

The following describe-instances examples use the --query parameter to display only the instance and subnet IDs for all instances, in JSON format.

Linux and macOS:

```
aws ec2 describe-instances \
   --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}' \
   --output json
```

Windows:

```
aws ec2 describe-instances ^
   --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^
   --output json
```

Output:

```
[
  {
    "Instance": "i-057750d42936e468a",
    "Subnet": "subnet-069beee9b12030077"
  },
  {
    "Instance": "i-001efd250faaa6ffa",
    "Subnet": "subnet-0b715c6b7db68927a"
  },
  {
    "Instance": "i-027552a73f021f3bd",
    "Subnet": "subnet-0250c25a1f4e15235"
  }
]
Example 9: To filter instances of the specified type and only display their instance IDs

The following `describe-instances` example uses filters to scope the results to instances of the specified type and the `--query` parameter to display only the instance IDs.

```bash
aws ec2 describe-instances \
    --filters "Name=instance-type,Values=t2.micro" \
    --query "Reservations[*].Instances[*].[InstanceId]" \
    --output text
```

Output:

```
i-031c0dc19de2fb70c
i-00d8bfff789a736b75
i-0b715c6b7db68927a
i-0626d4edd54f1286d
i-00b8ae04f9f99908e
i-0fc71c25d2374130c
```

Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following `describe-instances` examples display the instance ID, Availability Zone, and the value of the `Name` tag for instances that have a tag with the name `tag-key`, in table format.

Linux and macOS:

```bash
aws ec2 describe-instances \
    --filters Name=tag-key,Values=Name \
    --query 'Reservations[*].Instances[*].{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`][0].Value}' \
    --output table
```

Windows:

```bash
aws ec2 describe-instances ^
```
```bash
--filters Name=tag-key,Values=Name ^
--query "Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name']|[0].Value}" ^
--output table
```

**Output:**

```
<table>
<thead>
<tr>
<th>DescribeInstances</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>AZ</td>
<td>Instance</td>
</tr>
<tr>
<td>-----</td>
<td>----------</td>
</tr>
<tr>
<td>us-east-2b</td>
<td>i-057750d42936e468a</td>
</tr>
<tr>
<td>us-east-2a</td>
<td>i-001efd250faaa6ffa</td>
</tr>
<tr>
<td>us-east-2a</td>
<td>i-027552a73f021f3bd</td>
</tr>
</tbody>
</table>
```

**Example 11: To describe instances in a partition placement group**

The following `describe-instances` example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```bash
aws ec2 describe-instances \\
--instance-ids i-0123a456700123456 \\
--query "Reservations[*].Instances[*].Placement"
```

**Output:**

```
[
    [
        {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 3,
            "Tenancy": "default"
        }
    ]
]
```
For more information, see [Describing instances in a placement group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/Describing_instances.html) in the *Amazon EC2 User Guide*.

**Example 12: To filter to instances with the specified placement group and partition number**

The following `describe-instances` example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \
  --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-partition-number,Values=7"
```

The following shows only the relevant information from the output.

```
"Instances": [
  {
    "InstanceId": "i-0123a456700123456",
    "InstanceType": "r4.large",
    "Placement": {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 7,
      "Tenancy": "default"
    }
  },
  {
    "InstanceId": "i-9876a543210987654",
    "InstanceType": "r4.large",
    "Placement": {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 7,
      "Tenancy": "default"
    }
  }
],
```

For more information, see [Describing instances in a placement group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/Describing_instances.html) in the *Amazon EC2 User Guide*.

**Example 13: To filter to instances that are configured to allow access to tags from instance metadata**
The following describe-instances example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```bash
aws ec2 describe-instances \
   --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
   --query "Reservations[*].Instances[*].InstanceId" \
   --output text
```

The following shows the expected output.

```
i-1234567890abcdefg
i-abcdefg1234567890
i-11111111aaaaa
i-aaaaaaaa11111111
```

For more information, see [Work with instance tags in instance metadata](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstances](#) in *AWS CLI Command Reference*.

### describe-internet-gateways

The following code example shows how to use describe-internet-gateways.

**AWS CLI**

**To describe an internet gateway**

The following describe-internet-gateways example describes the specified internet gateway.

```bash
aws ec2 describe-internet-gateways \
   --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

**Output:**

```json
{
  "InternetGateways": [
    {
      "Attachments": [ ...
```
For more information, see [Internet gateways](https://docs.aws.amazon.com/vpc/latest/userguide/internet-gateways.html) in the *Amazon VPC User Guide*.

- For API details, see [DescribeInternetGateways](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-internet-gateways.html) in *AWS CLI Command Reference*.

### describe-ipam-pools

The following code example shows how to use `describe-ipam-pools`.

**AWS CLI**

**To view the details for an IPAM pool**

The following `describe-ipam-pools` example shows the details for pools.

**(Linux):**

```bash
aws ec2 describe-ipam-pools \
   --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-scope-02fc38cd4c48e7d38
```

**(Windows):**

```bash
aws ec2 describe-ipam-pools ^
   --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-scope-02fc38cd4c48e7d38
```
Output:

```json
{
    "IpamPools": [
    {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-02ec043a19bbe5d08",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "create-complete",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 16,
        "AllocationMaxNetmaskLength": 26,
        "AllocationDefaultNetmaskLength": 24,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "Preprod pool"
            }
        ]
    }
    ]
}
```

- For API details, see [DescribeIpamPools](#) in *AWS CLI Command Reference*.

**describe-ipam-resource-discoveries**

The following code example shows how to use `describe-ipam-resource-discoveries`.
Example 1: View complete details of resource discoveries

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin can manage and monitor the IP addresses of resources in your organization.

This example may be useful if:

You tried to create a resource discovery, but you got an error that you've reached your limit of 1. You realize that you may have already created a resource discovery and you want to view it in your account. You have resources in a Region that are not being discovered by the IPAM. You want to view the `--operating-regions` defined for the resource and ensure that you've added the right Region as an operating Region so that the resources there can be discovered.

The following describe-ipam-resource-discoveries example lists the details of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
    --region us-east-1
```

Output:

```
{
   "IpamResourceDiscoveries": [ 
   {
      "OwnerId": "149977607591",
      "IpamResourceDiscoveryId": "ipam-res-disco-0f8bdee9067137c0d",
      "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-discovery/ipam-res-disco-0f8bdee9067137c0d",
      "IpamResourceDiscoveryRegion": "us-east-1",
      "OperatingRegions": [ 
         {
            "RegionName": "us-east-1"
         }
      ],
      "IsDefault": false,
      "State": "create-complete",
      "Tags": []
   }
   ]
}
```
For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/SrvIpm.html) in the [Amazon VPC IPAM User Guide](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/SrvIpm.html).

**Example 2: View only resource discovery IDs**

The following `describe-ipam-resource-discoveries` example lists the ID of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```bash
aws ec2 describe-ipam-resource-discoveries
   --query "IpamResourceDiscoveries[*].IpamResourceDiscoveryId"
   --output text
```

Output:

```
ipam-res-disco-0481e39b242860333
```

For more information, see [Integrate IPAM with accounts outside of your organization](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/SrvIpm.html) in the [Amazon VPC IPAM User Guide](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/SrvIpm.html).

- For API details, see [DescribeIpamResourceDiscoveries](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/api.html#CreateIpamResourceDiscoveries) in [AWS CLI Command Reference](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/).  

---

**describe-ipam-resource-discovery-associations**

The following code example shows how to use `describe-ipam-resource-discovery-associations`.

**AWS CLI**

**To view all resource discovery associations with your IPAM**

In this example, you're a IPAM delegated admin who has associated resource discoveries with your IPAM to integrate other accounts with your IPAM. You've noticed that your IPAM is not discovering the resources in the operating Regions of the resource discovery as expected. You want to check the status and state of the resource discovery to ensure that the account that created it is still active and the resource discovery is still being shared.

The `--region` must be the home Region of your IPAM.

The following `describe-ipam-resource-discovery-associations` example lists the resource discovery associations in your AWS account.
aws ec2 describe-ipam-resource-discovery-associations \
   --region us-east-1

Output:

```
{
   "IpamResourceDiscoveryAssociations": [
      {
         "OwnerId": "320805250157",
         "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-05e6b45eca5bf5cf7",
         "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-resource-discovery-association/ipam-res-disco-assoc-05e6b45eca5bf5cf7",
         "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
         "IpamId": "ipam-005f921c17ebd5107",
         "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
         "IpamRegion": "us-east-1",
         "IsDefault": true,
         "ResourceDiscoveryStatus": "active",
         "State": "associate-complete",
         "Tags": []
      },
      {
         "OwnerId": "149977607591",
         "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-0dfd21ae189ab5f62",
         "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::149977607591:ipam-resource-discovery-association/ipam-res-disco-assoc-0dfd21ae189ab5f62",
         "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
         "IpamId": "ipam-005f921c17ebd5107",
         "IpamArn": "arn:aws:ec2::149977607591:ipam/ipam-005f921c17ebd5107",
         "IpamRegion": "us-east-1",
         "IsDefault": false,
         "ResourceDiscoveryStatus": "active",
         "State": "create-complete",
         "Tags": []
      }
   ]
}
```

In this example, after running this command, you notice that you have one non-default resource discovery ("IsDefault": false) that is "ResourceDiscoveryStatus": "active".
"not-found" and "State": "create-complete". The resource discovery owner's account has been closed. If, in another case, you notice that is "ResourceDiscoveryStatus": "not-found" and "State": "associate-complete", this indicates that one of the following has happened:

The resource discovery was deleted by the resource discovery owner. The resource discovery owner unshared the resource discovery.

For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see DescribeIpamResourceDiscoveryAssociations in AWS CLI Command Reference.

describe-ipam-scopes

The following code example shows how to use describe-ipam-scopes.

**AWS CLI**

To view the details for an IPAM scope

The following describe-ipam-scopes example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \\
   --filters Name=owner-id,Values=123456789012 Name=ipam-id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
   "IpamScopes": [
     {
       "OwnerId": "123456789012",
       "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
       "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
       "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
       "IpamRegion": "us-east-1",
       "IpamScopeType": "private",
       "IsDefault": true,
       "PoolCount": 2,
     }
   ]
}
```
"State": "create-complete",
"Tags": []
},
{
  "OwnerId": "123456789012",
  "IpamScopeId": "ipam-scope-0b9eed026396dbc16",
  "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-0b9eed026396dbc16",
  "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
  "IpamRegion": "us-east-1",
  "IpamScopeType": "public",
  "IsDefault": true,
  "PoolCount": 0,
  "State": "create-complete",
  "Tags": []
},
{
  "OwnerId": "123456789012",
  "IpamScopeId": "ipam-scope-0f1aff29486355c22",
  "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-0f1aff29486355c22",
  "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
  "IpamRegion": "us-east-1",
  "IpamScopeType": "private",
  "IsDefault": false,
  "Description": "Example description",
  "PoolCount": 0,
  "State": "create-complete",
  "Tags": [
    {
      "Key": "Name",
      "Value": "Example name value"
    }
  ]
}
]
}

- For API details, see [DescribeIpamScopes](#) in [AWS CLI Command Reference](#).

**describe-ipams**

The following code example shows how to use describe-ipams.
AWS CLI

To view the details for an IPAM

The following describe-ipams example shows the details of an IPAM.

```
aws ec2 describe-ipams \
  --filters Name=owner-id,Values=123456789012
```

Output:

```json
{
  "Ipams": [
    {
      "OwnerId": "123456789012",
      "IpamId": "ipam-08440e7a3acde3908",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
      "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
      "ScopeCount": 3,
      "OperatingRegions": [
        {
          "RegionName": "us-east-1"
        },
        {
          "RegionName": "us-east-2"
        },
        {
          "RegionName": "us-west-1"
        }
      ],
      "State": "create-complete",
      "Tags": [
        {
          "Key": "Name",
          "Value": "ExampleIPAM"
        }
      ]
    }
  ]
}
```
• For API details, see Describlem in AWS CLI Command Reference.

**describe-ipv6-pools**

The following code example shows how to use describe-ipv6-pools.

**AWS CLI**

To describe your IPv6 address pools

The following describe-ipv6-pools example displays details for all of your IPv6 address pools.

```bash
aws ec2 describe-ipv6-pools
```

Output:

```json
{
    "Ipv6Pools": [
        {
            "PoolId": "ipv6pool-ec2-012345abc12345abc",
            "PoolCidrBlocks": [
                {
                    "Cidr": "2001:db8:123::/48"
                }
            ],
            "Tags": [
                {
                    "Key": "pool-1",
                    "Value": "public"
                }
            ]
        }
    ]
}
```

• For API details, see Describlem in AWS CLI Command Reference.

**describe-key-pairs**

The following code example shows how to use describe-key-pairs.
AWS CLI

To display a key pair

The following `describe-key-pairs` example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \\
   --key-names my-key-pair
```

Output:

```
{
   "KeyPairs": [
   {
      "KeyPairId": "key-0b94643da6EXAMPLE",
      "KeyName": "my-key-pair",
      "KeyType": "rsa",
      "Tags": [],
   }
   ]
}
```

For more information, see [Describe public keys](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/describe-public-keys.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeKeyPairs](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-key-pairs.html) in *AWS CLI Command Reference*.

**describe-launch-template-versions**

The following code example shows how to use `describe-launch-template-versions`.

**AWS CLI**

To describe launch template versions

This example describes the versions of the specified launch template.

Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```
Output:

```json
{
"LaunchTemplateVersions": [
{
"LaunchTemplateId": "lt-068f72b72934aff71",
"LaunchTemplateName": "Webservers",
"VersionNumber": 3,
"CreatedBy": "arn:aws:iam::123456789102:root",
"LaunchTemplateData": {
"KeyName": "kp-us-east",
"ImageId": "ami-6057e21a",
"InstanceType": "t2.small",
"NetworkInterfaces": [
{
"SubnetId": "subnet-7b16de0c",
"DeviceIndex": 0,
"Groups": [
"sg-7c227019"
]
}
]
,"DefaultVersion": false,
"CreateTime": "2017-11-20T13:19:54.000Z"
},
{
"LaunchTemplateId": "lt-068f72b72934aff71",
"LaunchTemplateName": "Webservers",
"VersionNumber": 2,
"CreatedBy": "arn:aws:iam::123456789102:root",
"LaunchTemplateData": {
"KeyName": "kp-us-east",
"ImageId": "ami-6057e21a",
"InstanceType": "t2.medium",
"NetworkInterfaces": [
{
"SubnetId": "subnet-1a2b3c4d",
"DeviceIndex": 0,
"Groups": [
"sg-7c227019"
]
}
]
}
}
```
For API details, see DescribeLaunchTemplateVersions in AWS CLI Command Reference.

**describe-launch-templates**

The following code example shows how to use describe-launch-templates.

**AWS CLI**

To describe launch templates

This example describes your launch templates.
Command:

aws ec2 describe-launch-templates

Output:

```json
{
    "LaunchTemplates": [
        {
            "LatestVersionNumber": 2,
            "LaunchTemplateId": "lt-0e06d290751193123",
            "LaunchTemplateName": "TemplateForWebServer",
            "DefaultVersionNumber": 2,
            "CreatedBy": "arn:aws:iam::123456789012:root",
            "CreateTime": "2017-11-27T09:30:23.000Z"
        },
        {
            "LatestVersionNumber": 6,
            "LaunchTemplateId": "lt-0c45b5e061ec98456",
            "LaunchTemplateName": "DBServersTemplate",
            "DefaultVersionNumber": 1,
            "CreatedBy": "arn:aws:iam::123456789012:root",
            "CreateTime": "2017-11-20T09:25:22.000Z"
        },
        {
            "LatestVersionNumber": 1,
            "LaunchTemplateId": "lt-0d47d774e8e52dabc",
            "LaunchTemplateName": "MyLaunchTemplate2",
            "DefaultVersionNumber": 1,
            "CreatedBy": "arn:aws:iam::123456789012:root",
            "CreateTime": "2017-11-02T12:06:21.000Z"
        },
        {
            "LatestVersionNumber": 3,
            "LaunchTemplateId": "lt-01e5f948eb4f589d6",
            "LaunchTemplateName": "testingtemplate2",
            "DefaultVersionNumber": 1,
            "CreatedBy": "arn:aws:sts::123456789012:assumed-role/AdminRole/i-03ee35176e2e5aabc",
            "CreateTime": "2017-12-01T08:19:48.000Z"
        }
    ]
}
```
describe-local-gateway-route-table-virtual-interface-group-associations

The following code example shows how to use describe-local-gateway-route-table-virtual-interface-group-associations.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following describe-local-gateway-route-table-virtual-interface-group-associations example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations

Output:

```json
{
   "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
      {
         "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-07145b276bEXAMPLE",
         "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
         "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
         "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
         "OwnerId": "123456789012",
         "State": "associated",
         "Tags": []
      }
   ]
}
```

For more information, see Working with local gateways in the AWS Outposts User Guide.

• For API details, see DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations in AWS CLI Command Reference.
describe-local-gateway-route-table-vpc-associations

The following code example shows how to use `describe-local-gateway-route-table-vpc-associations`.

**AWS CLI**

To describe the associations between VPCs and local gateway route tables

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \
    --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af15EXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "VpcId": "vpc-0efe9bde08EXAMPLE",
        "State": "associated"
    }
}
```

- For API details, see [DescribeLocalGatewayRouteTableVpcAssociations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-route-table-vpc-associations.html) in AWS CLI Command Reference.

describe-local-gateway-route-tables

The following code example shows how to use `describe-local-gateway-route-tables`.

**AWS CLI**

To describe your Local Gateway Route Tables
The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```json
{
   "LocalGatewayRouteTables": [
      {
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
         "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
         "State": "available"
      }
   ]
}
```

- For API details, see `DescribeLocalGatewayRouteTables` in `AWS CLI Command Reference`.

### `describe-local-gateway-virtual-interface-groups`

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

**AWS CLI**

**To describe local gateway virtual interface groups**

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interface-groups
```

Output:

```json
{
   "LocalGatewayVirtualInterfaceGroups": [
      {
         "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
         "LocalGatewayVirtualInterfaceGroups": [
            {
               "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
               "AssociateAction": "associate",
               "AssociateRouteTableId": "rtb-059615ef7deEXAMPLE",
               "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
               "State": " associates"
            }
         ]
      }
   ]
}
```
"LocalGatewayVirtualInterfaceIds": [  "lgw-vif-01a23bc4d5EXAMPLE",  "lgw-vif-543ab21012EXAMPLE" ],  "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",  "OwnerId": "123456789012",  "Tags": []  ]  ]  }

For more information, see Working with local gateways in the AWS Outposts User Guide.

- For API details, see DescribeLocalGatewayVirtualInterfaceGroups in AWS CLI Command Reference.

describe-local-gateway-virtual-interfaces

The following code example shows how to use describe-local-gateway-virtual-interfaces.

AWS CLI

To describe local gateway virtual interfaces

The following describe-local-gateway-virtual-interfaces example describes the local gateway virtual interfaces in your AWS account.

aws ec2 describe-local-gateway-virtual-interfaces

Output:

{
   "LocalGatewayVirtualInterfaces": [  {
       "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",  "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",  "Vlan": 2410,  "LocalAddress": "0.0.0.0/0",  "PeerAddress": "0.0.0.0/0",  "LocalBgpAsn": 65010,  "PeerBgpAsn": 65000,
   }  ]  }

Actions and scenarios 2278
For more information, see Working with local gateways in the AWS Outposts User Guide.

- For API details, see DescribeLocalGatewayVirtualInterfaces in AWS CLI Command Reference.

describe-local-gateways

The following code example shows how to use describe-local-gateways.

AWS CLI

To describe your Local Gateways

The following describe-local-gateways example displays details for the local gateways that are available to you.

```
aws ec2 describe-local-gateways
```

Output:

```
{
   "LocalGateways": [
   {
      "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
      "LocalAddress": "0.0.0.0/0",
      "PeerAddress": "0.0.0.0/0",
      "LocalBgpAsn": 65010,
      "PeerBgpAsn": 65000,
      "OwnerId": "123456789012",
      "Tags": []
   }]
}
```
For API details, see `DescribeLocalGateways` in *AWS CLI Command Reference*.

describe-locked-snapshots

The following code example shows how to use `describe-locked-snapshots`.

**AWS CLI**

To describe the lock status of a snapshot

The following `describe-locked-snapshots` example describes the lock status of the specified snapshot.

```
aws ec2 describe-locked-snapshots \\
    --snapshot-ids snap-0b5e733b4a8df6e0d
```

Output:

```
{
    "Snapshots": [
        {
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0b5e733b4a8df6e0d",
            "LockState": "governance",
            "LockDuration": 365,
            "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
            "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00",
            "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00"
        }
    ]
}
```

For more information, see `Snapshot lock` in the *Amazon EBS User Guide*.

For API details, see `DescribeLockedSnapshots` in *AWS CLI Command Reference*. 
describe-managed-prefix-lists

The following code example shows how to use describe-managed-prefix-lists.

**AWS CLI**

To describe managed prefix lists

The following describe-managed-prefix-lists example describes the prefix lists owned by AWS account 123456789012.

```
aws ec2 describe-managed-prefix-lists \
  --filters Name=owner-id,Values=123456789012
```

Output:

```json
{
  "PrefixLists": [
    {
      "PrefixListId": "pl-11223344556677aab",
      "AddressFamily": "IPv6",
      "State": "create-complete",
      "PrefixListName": "vpc-ipv6-cidrs",
      "MaxEntries": 25,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    },
    {
      "PrefixListId": "pl-0123456abcabc1",
      "AddressFamily": "IPv4",
      "State": "active",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    }
  ]
}```
For more information, see Managed prefix lists in the Amazon VPC User Guide.
- For API details, see DescribeManagedPrefixLists in AWS CLI Command Reference.

describe-moving-addresses

The following code example shows how to use describe-moving-addresses.

AWS CLI

To describe your moving addresses

This example describes all of your moving Elastic IP addresses.

Command:

```
aws ec2 describe-moving-addresses
```

Output:

```
{
   "MovingAddressStatuses": [
      {
         "PublicIp": "198.51.100.0",
         "MoveStatus": "MovingToVpc"
      }
   ]
}
```

This example describes all addresses that are moving to the EC2-VPC platform.

Command:

```
aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc
```

- For API details, see DescribeMovingAddresses in AWS CLI Command Reference.

describe-nat-gateways

The following code example shows how to use describe-nat-gateways.
AWS CLI

Example 1: To describe a public NAT gateway

The following `describe-nat-gateways` example describes the specified public NAT gateway.

```bash
aws ec2 describe-nat-gateways \
  --nat-gateway-id nat-01234567890abcdef
```

Output:

```json
{
  "NatGateways": [
    {
      "CreateTime": "2023-08-25T01:56:51.000Z",
      "NatGatewayAddresses": [
        {
          "AllocationId": "eipalloc-0790180cd2EXAMPLE",
          "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
          "PrivateIp": "10.0.0.211",
          "PublicIp": "54.85.121.213",
          "AssociationId": "eipassoc-04d295cc9b8815b24",
          "IsPrimary": true,
          "Status": "succeeded"
        },
        {
          "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
          "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
          "PrivateIp": "10.0.0.74",
          "PublicIp": "3.211.231.218",
          "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
          "IsPrimary": false,
          "Status": "succeeded"
        }
      ],
      "NatGatewayId": "nat-01234567890abcdef",
      "State": "available",
      "SubnetId": "subnet-655eab5f08EXAMPLE",
      "VpcId": "vpc-098eb5ef58EXAMPLE",
      "Tags": [
        {
          "Key": "Name",
          "Value": "public-nat"
        }
      ]
    }
  ]
}
```
Example 2: To describe a private NAT gateway

The following describe-nat-gateways example describes the specified private NAT gateway.

```bash
aws ec2 describe-nat-gateways \
   --nat-gateway-id nat-1234567890abcdef0
```

Output:

```json
{
   "NatGateways": [
      {
         "CreateTime": "2023-08-25T00:50:05.000Z",
         "NatGatewayAddresses": [
            {
               "NetworkInterfaceId": "eni-0065a61b324d1897a",
               "PrivateIp": "10.0.20.240",
               "IsPrimary": true,
               "Status": "succeeded"
            },
            {
               "NetworkInterfaceId": "eni-0065a61b324d1897a",
               "PrivateIp": "10.0.20.33",
               "IsPrimary": false,
               "Status": "succeeded"
            },
            {
               "NetworkInterfaceId": "eni-0065a61b324d1897a",
               "PrivateIp": "10.0.20.197",
               "IsPrimary": false,
               "Status": "succeeded"
            }
         ],
         "NatGatewayId": "nat-1234567890abcdef0",
         "State": "available",
```
For more information, see NAT gateways in the Amazon VPC User Guide.

- For API details, see DescribeNatGateways in AWS CLI Command Reference.

**describe-network-acls**

The following code example shows how to use describe-network-acls.

**AWS CLI**

**To describe your network ACLs**

The following describe-network-acls example retrieves details about your network ACLs.

```bash
aws ec2 describe-network-acls
```

**Output:**

```json
{
    "NetworkAcls": [
        {
            "Associations": [
                {
                    "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
                    "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
                    "SubnetId": "subnet-0931fc2fa5EXAMPLE"
                }
            ],
            "Entries": [
                {"IpPermissions": []}
            ]
        }
    ]
}
```
"CidrBlock": "0.0.0.0/0",
"Egress": true,
"Protocol": ":-1",
"RuleAction": "allow",
"RuleNumber": 100
},
{
    "CidrBlock": "0.0.0.0/0",
    "Egress": true,
    "Protocol": ":-1",
    "RuleAction": "deny",
    "RuleNumber": 32767
},
{
    "CidrBlock": "0.0.0.0/0",

}
]
}

For more information, see Network ACLs in the AWS VPC User Guide.

- For API details, see DescribeNetworkAcls in AWS CLI Command Reference.

describe-network-insights-access-scope-analyses

The following code example shows how to use describe-network-insights-access-scope-analyses.

AWS CLI

To describe Network Insights access scope analyses

The following describe-network-insights-access-scope-analyses example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses \
--region us-east-1
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalyses": [
      {
         "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
         "NetworkInsightsAccessScopeId": "nis-123456789222",
```
For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the [Network Access Analyzer Guide](#).

- For API details, see [DescribeNetworkInsightsAccessScopeAnalyses](#) in [AWS CLI Command Reference](#).

### describe-network-insights-access-scopes

The following code example shows how to use `describe-network-insights-access-scopes`.

**AWS CLI**

**To describe Network Insights access scopes**

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```bash
aws ec2 describe-network-insights-access-scopes
  --region us-east-1
```

**Output:**

```json
{
  "NetworkInsightsAccessScopes": [
    {
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "CreatedDate": "2021-11-29T21:12:41.416000+00:00",
      "UpdatedDate": "2021-11-29T21:12:41.416000+00:00",
      "Tags": []
    }
  ]
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DescribeNetworkInsightsAccessScopes in AWS CLI Command Reference.

describe-network-insights-analyses

The following code example shows how to use describe-network-insights-analyses.

AWS CLI

To view the results of a path analysis

The following describe-network-insights-analyses example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (Status is succeeded) and the path is not reachable (NetworkPathFound is false). The explanation code ENI_SG_RULES_MISMATCH indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```sh
aws ec2 describe-network-insights-analyses \
  --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```json
{
  "NetworkInsightsAnalyses": [
    {
      "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
      "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
      "StartDate": "2021-01-20T22:58:37.495Z",
      "Status": "succeeded",
      "NetworkPathFound": false,
      "Explanations": [
        {
          "Direction": "ingress",
          "ExplanationCode": "ENI_SG_RULES_MISMATCH",
          "NetworkInterface": {
            "Id": "eni-0a25edef15a6cc08c",
          }
        }
      ]
    }
  ]
}
```
"Arn": "arn:aws:ec2:us-east-1:123456789012:network-interface/eni-0a25edef15a6cc08c",
    "SecurityGroups": [
        {
            "Id": "sg-02f0d35a850ba727f",
            "Arn": "arn:aws:ec2:us-east-1:123456789012:security-group.sg-02f0d35a850ba727f"
        }
    ],
    "Subnet": {
        "Id": "subnet-004ff41ecbb4d1194",
        "Arn": "arn:aws:ec2:us-east-1:123456789012:subnet/subnet-004ff41ecbb4d1194"
    },
    "Vpc": {
        "Id": "vpc-f1663d98ad28331c7",
        "Arn": "arn:aws:ec2:us-east-1:123456789012:vpc/vpc-f1663d98ad28331c7"
    }
},
"Tags": []
]}

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DescribeNetworkInsightsAnalyses in AWS CLI Command Reference.

**describe-network-insights-paths**

The following code example shows how to use describe-network-insights-paths.

**AWS CLI**

**To describe a path**

The following describe-network-insights-paths example describes the specified path.

```bash
aws ec2 describe-network-insights-paths \
  --network-insights-path-ids nip-0b26f224f1d131fa8
```
Output:

```json
{
   "NetworkInsightsPaths": [
   {
      "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
      "CreatedDate": "2021-01-20T22:43:46.933Z",
      "Source": "igw-0797ccc7cd9d73b0e5",
      "Destination": "i-0495d385ad28331c7",
      "Protocol": "tcp"
   }
   ]
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/reference/cli.html) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsPaths](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-insights-paths.html) in *AWS CLI Command Reference*.

### describe-network-interface-attribute

The following code example shows how to use `describe-network-interface-attribute`.

**AWS CLI**

**To describe the attachment attribute of a network interface**

This example command describes the attachment attribute of the specified network interface.

**Command:**

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute attachment
```

**Output:**

```json
{
   "NetworkInterfaceId": "eni-686ea200",
   "Attachment": {
      "Status": "attached",
      "DeviceIndex": 0,
      "AttachTime": "2015-05-21T20:02:20.000Z",
   }
}
```
To describe the description attribute of a network interface

This example command describes the description attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute description
```

Output:

```json
{
  "NetworkInterfaceId": "eni-686ea200",
  "Description": {
    "Value": "My description"
  }
}
```

To describe the groupSet attribute of a network interface

This example command describes the groupSet attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute groupSet
```

Output:

```json
{
  "NetworkInterfaceId": "eni-686ea200",
  "Groups": [
    {
      "GroupName": "my-security-group",
      ...
    }
  ]
}
```
To describe the sourceDestCheck attribute of a network interface

This example command describes the sourceDestCheck attribute of the specified network interface.

Command:

```bash
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute sourceDestCheck
```

Output:

```json
{
   "NetworkInterfaceId": "eni-686ea200",
   "SourceDestCheck": {
      "Value": true
   }
}
```

- For API details, see [DescribeNetworkInterfaceAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-interface-attribute.html) in [AWS CLI Command Reference](https).

---

describe-network-interface-permissions

The following code example shows how to use describe-network-interface-permissions.

**AWS CLI**

**To describe your network interface permissions**

This example describes all of your network interface permissions.

Command:

```bash
aws ec2 describe-network-interface-permissions
```

Output:
{
    "NetworkInterfacePermissions": [
    {
        "PermissionState": {
            "State": "GRANTED"
        },
        "NetworkInterfacePermissionId": "eni-perm-06fd1902ede149ea",
        "NetworkInterfaceId": "eni-b909511a",
        "Permission": "INSTANCE-ATTACH",
        "AwsAccountId": "123456789012"
    }
    ]
}

- For API details, see [DescribeNetworkInterfacePermissions](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/describe-network-interface-permissions.html) in *AWS CLI Command Reference*.

describe-network-interfaces

The following code example shows how to use `describe-network-interfaces`.

**AWS CLI**

To describe your network interfaces

This example describes all your network interfaces.

Command:

```bash
aws ec2 describe-network-interfaces
```

Output:

```json
{
    "NetworkInterfaces": [
    {
        "Status": "in-use",
        "MacAddress": "02:2f:8f:0:b0:cf:75",
        "SourceDestCheck": true,
        "VpcId": "vpc-a01106c2",
        "Description": "my network interface",
        "Association": {
            "PublicIp": "203.0.113.12",
```
"AssociationId": "eipassoc-0fbb766a",
"PublicDnsName": "ec2-203-0-113-12.compute-1.amazonaws.com",
"IpOwnerId": "123456789012"
},
"NetworkInterfaceId": "eni-e5aa89a3",
"PrivateIpAddresses": [
  {
    "PrivateDnsName": "ip-10-0-1-17.ec2.internal",
    "Association": {
      "PublicIp": "203.0.113.12",
      "AssociationId": "eipassoc-0fbb766a",
      "PublicDnsName": "ec2-203-0-113-12.compute-1.amazonaws.com",
      "IpOwnerId": "123456789012"
    },
    "Primary": true,
    "PrivateIpAddress": "10.0.1.17"
  }
],
"RequesterManaged": false,
"Ipv6Addresses": [],
"PrivateDnsName": "ip-10-0-1-17.ec2.internal",
"AvailabilityZone": "us-east-1d",
"Attachment": {
  "Status": "attached",
  "DeviceIndex": 1,
  "AttachTime": "2013-11-30T23:36:42.000Z",
  "InstanceId": "i-1234567890abcdef0",
  "DeleteOnTermination": false,
  "AttachmentId": "eni-attach-66c4350a",
  "InstanceOwnerId": "123456789012"
},
"Groups": [
  {
    "GroupName": "default",
    "GroupId": "sg-8637d3e3"
  }
],
"SubnetId": "subnet-b61f49f0",
"OwnerId": "123456789012",
"TagSet": [],
"PrivateIpAddress": "10.0.1.17"
},
{
  "Status": "in-use",
  "Actions and scenarios"
}
This example describes network interfaces that have a tag with the key **Purpose** and the value **Prod**.

**Command:**

```bash
aws ec2 describe-network-interfaces --filters Name=tag:Purpose,Values=Prod
```

**Output:**

```json
{
   "NetworkInterfaces": [
   {
      "Status": "available",
      "MacAddress": "12:2c:bd:f9:bf:17",
      "SourceDestCheck": true,
      "VpcId": "vpc-8941ebec",
      "Description": "ProdENI",
      "NetworkInterfaceId": "eni-b9a5ac93",
      "PrivateIpAddresses": [
         {
            "PrivateDnsName": "ip-10-0-1-55.ec2.internal",
            "Primary": true,
            "PrivateIpAddress": "10.0.1.55"
         },
         {
            "PrivateDnsName": "ip-10-0-1-117.ec2.internal",
            "Primary": false,
            "PrivateIpAddress": "10.0.1.117"
         }
      ],
      "RequesterManaged": false,
      "PrivateDnsName": "ip-10-0-1-55.ec2.internal",
      "AvailabilityZone": "us-east-1d",
      "Ipv6Addresses": [],
      "Groups": [
      {
         "GroupName": "MySG",
         "GroupId": "sg-905002f5"
      }
      ]
   }
}
```
"SubnetId": "subnet-31d6c219",
"OwnerId": "123456789012",
"TagSet": [
    {
        "Value": "Prod",
        "Key": "Purpose"
    }
],
"PrivateIpAddress": "10.0.1.55"
]
}

- For API details, see DescribeNetworkInterfaces in AWS CLI Command Reference.

describe-placement-groups

The following code example shows how to use describe-placement-groups.

**AWS CLI**

**To describe your placement groups**

This example command describes all of your placement groups.

Command:

```
aws ec2 describe-placement-groups
```

Output:

```json
{
    "PlacementGroups": [
        {
            "GroupName": "my-cluster",
            "State": "available",
            "Strategy": "cluster"
        },
        ...
    ]
}
```
describe-prefix-lists

The following code example shows how to use describe-prefix-lists.

AWS CLI

To describe prefix lists

This example lists all available prefix lists for the region.

Command:

```
aws ec2 describe-prefix-lists
```

Output:

```
{
    "PrefixLists": [
        {
            "PrefixListName": "com.amazonaws.us-east-1.s3",
            "Cidrs": [
                "54.231.0.0/17"
            ],
            "PrefixListId": "pl-63a5400a"
        }
    ]
}
```

For API details, see DescribePrefixLists in AWS CLI Command Reference.

describe-principal-id-format

The following code example shows how to use describe-principal-id-format.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following describe-principal-id-format example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.
aws ec2 describe-principal-id-format \
   --resource instance

Output:

```json
{
   "Principals": [
      {
         "Arn": "arn:aws:iam::123456789012:root",
         "Statuses": [
            {
               "Deadline": "2016-12-15T00:00:00.000Z",
               "Resource": "reservation",
               "UseLongIds": true
            },
            {
               "Deadline": "2016-12-15T00:00:00.000Z",
               "Resource": "instance",
               "UseLongIds": true
            },
            {
               "Deadline": "2016-12-15T00:00:00.000Z",
               "Resource": "volume",
               "UseLongIds": true
            }
         ]
      },
      ...
   ]
}
```

- For API details, see [DescribePrincipalIdFormat](https://awscli.amazonaws.com/clidocs/latest/reference/ec2/describe-principal-id-format.html) in *AWS CLI Command Reference*.

describe-public-ipv4-pools

The following code example shows how to use `describe-public-ipv4-pools`.

**AWS CLI**

To describe your public IPv4 address pools
The following `describe-public-ipv4-pools` example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```bash
aws ec2 describe-public-ipv4-pools
```

Output:

```json
{
   "PublicIpv4Pools": [
      {
         "PoolId": "ipv4pool-ec2-1234567890abcdef0",
         "PoolAddressRanges": [
            {
               "FirstAddress": "203.0.113.0",
               "LastAddress": "203.0.113.255",
               "AddressCount": 256,
               "AvailableAddressCount": 256
            }
         ],
         "TotalAddressCount": 256,
         "TotalAvailableAddressCount": 256
      }
   ]
}
```

• For API details, see [DescribePublicIpv4Pools](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-public-ipv4-pools.html) in [AWS CLI Command Reference](https).

### describe-regions

The following code example shows how to use `describe-regions`.

**AWS CLI**

**Example 1: To describe all of your enabled Regions**

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```bash
aws ec2 describe-regions
```
Output:

```json
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-1.amazonaws.com",
            "RegionName": "eu-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
            "RegionName": "ap-northeast-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
            "RegionName": "ap-northeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
            "RegionName": "ap-northeast-1",
            "OptInStatus": "opt-in-not-required"
        }
    ]
}
```
{  
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
  "RegionName": "ap-southeast-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
  "RegionName": "ap-southeast-2",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.eu-central-1.amazonaws.com",
  "RegionName": "eu-central-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.us-east-1.amazonaws.com",
  "RegionName": "us-east-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.us-east-2.amazonaws.com",
  "RegionName": "us-east-2",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.us-west-1.amazonaws.com",
  "RegionName": "us-west-1",
  "OptInStatus": "opt-in-not-required"
},
{  
  "Endpoint": "ec2.us-west-2.amazonaws.com",
  "RegionName": "us-west-2",
  "OptInStatus": "opt-in-not-required"
}
For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following describe-regions example describes all Regions that you have enabled that have the string "us" in the endpoint.

```bash
aws ec2 describe-regions \
   --filters "Name=endpoint,Values=*us*"
```

Output:

```
{
   "Regions": [
       {
           "Endpoint": "ec2.us-east-1.amazonaws.com",
           "RegionName": "us-east-1"
       },
       {
           "Endpoint": "ec2.us-east-2.amazonaws.com",
           "RegionName": "us-east-2"
       },
       {
           "Endpoint": "ec2.us-west-1.amazonaws.com",
           "RegionName": "us-west-1"
       },
       {
           "Endpoint": "ec2.us-west-2.amazonaws.com",
           "RegionName": "us-west-2"
       }
   ]
}
```

For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 3: To describe all Regions
The following `describe-regions` example describes all available Regions, including Regions that are disabled.

```bash
aws ec2 describe-regions \
   --all-regions
```

Output:

```json
{
   "Regions": [
   {
      "Endpoint": "ec2.eu-north-1.amazonaws.com",
      "RegionName": "eu-north-1",
      "OptInStatus": "opt-in-not-required"
   },
   {
      "Endpoint": "ec2.ap-south-1.amazonaws.com",
      "RegionName": "ap-south-1",
      "OptInStatus": "opt-in-not-required"
   },
   {
      "Endpoint": "ec2.eu-west-3.amazonaws.com",
      "RegionName": "eu-west-3",
      "OptInStatus": "opt-in-not-required"
   },
   {
      "Endpoint": "ec2.eu-west-2.amazonaws.com",
      "RegionName": "eu-west-2",
      "OptInStatus": "opt-in-not-required"
   },
   {
      "Endpoint": "ec2.eu-west-1.amazonaws.com",
      "RegionName": "eu-west-1",
      "OptInStatus": "opt-in-not-required"
   },
   {
      "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
      "RegionName": "ap-northeast-3",
      "OptInStatus": "opt-in-not-required"
   },
   {n
      "Endpoint": "ec2.me-south-1.amazonaws.com",
      "RegionName": "me-south-1",
```
"OptInStatus": "not-opted-in",
},
{
  "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
  "RegionName": "ap-northeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
  "RegionName": "ap-northeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-east-1.amazonaws.com",
  "RegionName": "ap-east-1",
  "OptInStatus": "not-opted-in"
},
{
  "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
  "RegionName": "ap-southeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
  "RegionName": "ap-southeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.eu-central-1.amazonaws.com",
  "RegionName": "eu-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-east-1.amazonaws.com",
  "RegionName": "us-east-1",
  "OptInStatus": "opt-in-not-required"}
"RegionName": "us-east-1",
   "OptInStatus": "opt-in-not-required"
 ],
 [ {
   "Endpoint": "ec2.us-east-2.amazonaws.com",
   "RegionName": "us-east-2",
   "OptInStatus": "opt-in-not-required"
 },
 [ {
   "Endpoint": "ec2.us-west-1.amazonaws.com",
   "RegionName": "us-west-1",
   "OptInStatus": "opt-in-not-required"
 },
 [ {
   "Endpoint": "ec2.us-west-2.amazonaws.com",
   "RegionName": "us-west-2",
   "OptInStatus": "opt-in-not-required"
 } ]
 ]

For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 4: To list the Region names only

The following describe-regions example uses the --query parameter to filter the output and return only the names of the Regions as text.

```bash
aws ec2 describe-regions \
   --all-regions \
   --query "Regions[].{Name:RegionName}" \
   --output text
```

Output:

eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
For more information, see Regions and Zones in the Amazon EC2 User Guide.

- For API details, see DescribeRegions in AWS CLI Command Reference.

**describe-replace-root-volume-tasks**

The following code example shows how to use describe-replace-root-volume-tasks.

**AWS CLI**

**Example 1: To view information about a specific root volume replacement task**

The following describe-replace-root-volume-tasks example describes root volume replacement task replacevol-011122223333ab.</p>

```bash
aws ec2 describe-replace-root-volume-tasks \
   --replace-root-volume-task-ids replacevol-011122223333ab
```

Output:

```json
{
   "ReplaceRootVolumeTasks": [
      {
         "ReplaceRootVolumeTaskId": "replacevol-011122223333ab",
         "Tags": [],
         "InstanceId": "i-0123456789abcdefa",
         "TaskState": "succeeded",
         "StartTime": "2022-03-14T15:16:28Z",
         "CompleteTime": "2022-03-14T15:16:52Z"
      }
   ]
}
```
Example 2: To view information about all root volume replacement tasks for a specific instance

The following describe-replace-root-volume-tasks example describes all of the root volume replacement tasks for instance i-0123456789abcdefa.

```bash
aws ec2 describe-replace-root-volume-tasks \
--filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```json
{
    "ReplaceRootVolumeTasks": [
    {
        "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
        "Tags": [],
        "InstanceId": "i-0123456789abcdefa",
        "TaskState": "succeeded",
        "StartTime": "2022-03-14T15:06:38Z",
        "CompleteTime": "2022-03-14T15:07:03Z"
    },
    {
        "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
        "Tags": [],
        "InstanceId": "i-0123456789abcdefa",
        "TaskState": "succeeded",
        "StartTime": "2022-03-14T15:16:28Z",
        "CompleteTime": "2022-03-14T15:16:52Z"
    }
    ]
}
```

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

For API details, see DescribeReplaceRootVolumeTasks in AWS CLI Command Reference.

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeReplaceRootVolumeTasks in AWS CLI Command Reference.
describe-reserved-instances-listings

The following code example shows how to use describe-reserved-instances-listings.

AWS CLI

To describe a Reserved Instance listing

The following describe-reserved-instances-listings example retrieves information about the specified Reserved Instance listing.

```bash
aws ec2 describe-reserved-instances-listings
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see DescribeReservedInstancesListings in AWS CLI Command Reference.

describe-reserved-instances-modifications

The following code example shows how to use describe-reserved-instances-modifications.

AWS CLI

To describe Reserved Instances modifications

This example command describes all the Reserved Instances modification requests that have been submitted for your account.

Command:

```bash
aws ec2 describe-reserved-instances-modifications
```

Output:

```json
{
    "ReservedInstancesModifications": [
        {
            "Status": "fulfilled",
            "ModificationResults": [
                {
                    "ReservedInstancesId": "93bbca2-62f1-4d9d-b225-16bada29e6c7",
```
For API details, see [DescribeReservedInstancesModifications](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-reserved-instances-offerings) in *AWS CLI Command Reference.*

**describe-reserved-instances-offerings**

The following code example shows how to use `describe-reserved-instances-offerings`.

**AWS CLI**

**To describe Reserved Instances offerings**

This example command describes all Reserved Instances available for purchase in the region.

**Command:**
aws ec2 describe-reserved-instances-offerings

Output:

```json
{
  "ReservedInstancesOfferings": [
    {
      "OfferingType": "Partial Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Red Hat Enterprise Linux",
      "UsagePrice": 0.0,
      "RecurringCharges": [
        {
          "Amount": 0.088,
          "Frequency": "Hourly"
        }
      ],
      "Marketplace": false,
      "CurrencyCode": "USD",
      "FixedPrice": 631.0,
      "Duration": 94608000,
      "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
      "InstanceType": "c1.medium"
    },
    {
      "OfferingType": "Partial Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Linux/UNIX",
      "UsagePrice": 0.0,
      "RecurringCharges": [
        {
          "Amount": 0.028,
          "Frequency": "Hourly"
        }
      ],
      "Marketplace": false,
      "CurrencyCode": "USD",
      "FixedPrice": 631.0,
      "Duration": 94608000,
      "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
      "InstanceType": "c1.medium"
    }
  ]
}
```
To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```bash
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```json
{
"ReservedInstancesOfferings": [
{
"OfferingType": "No Upfront",
"AvailabilityZone": "us-east-1b",
"InstanceTenancy": "default",
"PricingDetails": [],
"ProductDescription": "Windows",
"UsagePrice": 0.0,
"RecurringCharges": [
{
"Amount": 0.015,
"Frequency": "Hourly"
}
],
"Marketplace": false,
"CurrencyCode": "USD",
"FixedPrice": 0.0,
"Duration": 31536000,
"ReservedInstancesOfferingId": "c48ab04c-fe69-4f94-8e39-a23842292823",
"InstanceType": "t1.micro"
}
]
...
For API details, see [DescribeReservedInstancesOfferings](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-reserved-instances) in *AWS CLI Command Reference*.

describe-reserved-instances

The following code example shows how to use describe-reserved-instances.

**AWS CLI**

**To describe your Reserved Instances**

This example command describes the Reserved Instances that you own.

**Command:**

```bash
aws ec2 describe-reserved-instances
```

**Output:**

```json
{
  "ReservedInstances": [
  
  ]
}
```
To describe your Reserved Instances using filters

This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```bash
aws ec2 describe-reserved-instances --filters Name=duration,Values=94608000 Name=instance-type,Values=t2.micro Name=product-description,Values=Linux/UNIX Name=availability-zone,Values=us-east-1e
```

Output:

```json
{
    "ReservedInstances": [
        {
            "ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
            "OfferingType": "No Upfront",
            "AvailabilityZone": "us-west-1c",
            "End": "2016-08-14T21:34:34.000Z",
            "ProductDescription": "Linux/UNIX",
            "UsagePrice": 0.00,
            "RecurringCharges": [
                {
                    "Amount": 0.104,
                    "Frequency": "Hourly"
                }
            ],
            "Start": "2015-08-15T21:34:35.086Z",
            "State": "active",
            "FixedPrice": 0.0,
            "CurrencyCode": "USD",
            "Duration": 31536000,
            "InstanceTenancy": "default",
            "InstanceType": "m3.medium",
            "InstanceCount": 2
        }
    ]
}
```
For more information, see Using Amazon EC2 Instances in the AWS Command Line Interface User Guide.

- For API details, see DescribeReservedInstances in AWS CLI Command Reference.

**describe-route-tables**

The following code example shows how to use describe-route-tables.

**AWS CLI**

**To describe your route tables**

The following describe-route-tables example retrieves the details about your route tables

```
aws ec2 describe-route-tables
```

**Output:**

```json
{
    "RouteTables": [
        {
            "Associations": [
                {
                    "Main": true,
                    "AssociationID": "association-id-1"
                }
            ]
        }
    ]
}
```
"RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
"RouteTableId": "rtb-09ba434c1bEXAMPLE"
],

}]

For more information, see Working with Route Tables in the AWS VPC User Guide.

- For API details, see DescribeRouteTables in AWS CLI Command Reference.
describe-scheduled-instance-availability

The following code example shows how to use describe-scheduled-instance-availability.

AWS CLI

To describe an available schedule

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Command:

```
aws ec2 describe-scheduled-instance-availability --recurrence
  Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-range
  EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

Output:

```
{
  "ScheduledInstanceAvailabilitySet": [
    {
      "AvailabilityZone": "us-west-2b",
      "TotalScheduledInstanceHours": 1219,
      "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
      "MinTermDurationInDays": 366,
      "AvailableInstanceCount": 20,
      "Recurrence": {
        "OccurrenceDaySet": [1],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false
      },
      "Platform": "Linux/UNIX",
      "FirstSlotStartTime": "2016-01-31T00:00:00Z",
      "MaxTermDurationInDays": 366,
      "SlotDurationInHours": 23,
      "NetworkPlatform": "EC2-VPC",
      "InstanceType": "c4.large",
      "HourlyPrice": "0.095"
    }
  ]
}
```
To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

```
--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large
```

- For API details, see `DescribeScheduledInstanceAvailability` in *AWS CLI Command Reference*.

**describe-scheduled-instances**

The following code example shows how to use `describe-scheduled-instances`.

**AWS CLI**

**To describe your Scheduled Instances**

This example describes the specified Scheduled Instance.

Command:

```
aws ec2 describe-scheduled-instances --scheduled-instance-ids sci-1234-1234-1234-1234-123456789012
```

Output:

```json
{
    "ScheduledInstanceSet": [
        {
            "AvailabilityZone": "us-west-2b",
            "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
            "HourlyPrice": "0.095",
            "CreateDate": "2016-01-25T21:43:38.612Z",
            "Recurrence": {
                "OccurrenceDaySet": [1],
            },
```
This example describes all your Scheduled Instances.

Command:

```bash
aws ec2 describe-scheduled-instances
```

- For API details, see [DescribeScheduledInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-scheduled-instances.html) in *AWS CLI Command Reference*.

### describe-security-group-references

The following code example shows how to use `describe-security-group-references`.

**AWS CLI**

**To describe security group references**

This example describes the security group references for sg-bbbbb2222. The response indicates that security group sg-bbbbb2222 is being referenced by a security group in VPC vpc-aaaaaaa.

Command:

```bash
aws ec2 describe-security-group-references --group-id sg-bbbbb2222
```
Output:

```json
{
    "SecurityGroupsReferenceSet": [
        {
            "ReferencingVpcId": "vpc-aaaaaaaa",
            "GroupId": "sg-bbbbb22222",
            "VpcPeeringConnectionId": "pcx-b04deed9"
        }
    ]
}
```

- For API details, see [DescribeSecurityGroupReferences](#) in *AWS CLI Command Reference*.

**describe-security-group-rules**

The following code example shows how to use `describe-security-group-rules`.

**AWS CLI**

**Example 1: To describe the security group rules for a security group**

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.

```bash
aws ec2 describe-security-group-rules \
    --filters Name="group-id",Values="sg-1234567890abcdef0"
```

Output:

```json
{
    "SecurityGroupRules": [
        {
            "SecurityGroupId": "sg-1234567890abcdef0",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "111122223333",
            "IsEgress": false,
            "IpProtocol": ":",  
            "FromPort": -1,
            "ToPort": -1,
            "ReferencedGroupId": {  
```
Example 2: To describe a security group rule

The following `describe-security-group-rules` example describes the specified security group rule.

```
aws ec2 describe-security-group-rules \  
    --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```
{
    "SecurityGroupRules": [
        {
```

For more information, see Security group rules in the Amazon VPC User Guide.

- For API details, see DescribeSecurityGroupRules in AWS CLI Command Reference.

**describe-security-groups**

The following code example shows how to use describe-security-groups.

**AWS CLI**

**Example 1: To describe a security group**

The following describe-security-groups example describes the specified security group.

```bash
aws ec2 describe-security-groups \
   --group-ids sg-903004f8
```

**Output:**

```json
{
   "SecurityGroups": [
      {
         "IpPermissionsEgress": [
            {
               "IpProtocol": "-1",
               "IpRanges": [
                  {
                     "CidrIp": "0.0.0.0/0"
                  }
               ]
            }
         ]
      }
   ]
}
```
"UserIdGroupPairs": [],
  "PrefixListIds": []
],
"Description": "My security group",
"Tags": [
  {
    "Value": "SG1",
    "Key": "Name"
  }
],
"IpPermissions": [
  {
    "IpProtocol": "-1",
    "IpRanges": [],
    "UserIdGroupPairs": [
      {
        "UserId": "123456789012",
        "GroupId": "sg-903004f8"
      }
    ],
    "PrefixListIds": []
  },
  {
    "PrefixListIds": [],
    "FromPort": 22,
    "IpRanges": [
      {
        "Description": "Access from NY office",
        "CidrIp": "203.0.113.0/24"
      }
    ],
    "ToPort": 22,
    "IpProtocol": "tcp",
    "UserIdGroupPairs": []
  }
],
"GroupName": "MySecurityGroup",
"VpcId": "vpc-1a2b3c4d",
"OwnerId": "123456789012",
"GroupId": "sg-903004f8"}
Example 2: To describe security groups that have specific rules

The following describe-security-groups example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (0.0.0.0/0). The example uses the --query parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```bash
aws ec2 describe-security-groups \
  --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
  --query "SecurityGroups[*].[GroupName]" \
  --output text
```

Output:

```
default
my-security-group
web-servers
launch-wizard-1
```

Example 3: To describe security groups based on tags

The following describe-security-groups example uses filters to scope the results to security groups that include test in the security group name, and that have the tag Test=To-delete. The example uses the --query parameter to display only the names and IDs of the security groups.

```bash
aws ec2 describe-security-groups \
  --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
  --query "SecurityGroups[*].{Name:GroupName, ID:GroupId}"
```

Output:

```
[
  {
```
For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSecurityGroups in AWS CLI Command Reference.

describe-snapshot-attribute

The following code example shows how to use describe-snapshot-attribute.

**AWS CLI**

To describe the snapshot attributes for a snapshot

The following describe-snapshot-attribute example lists the accounts with which a snapshot is shared.

```bash
aws ec2 describe-snapshot-attribute \
    --snapshot-id snap-01234567890abcedf \
    --attribute createVolumePermission
```

Output:

```json
{
    "SnapshotId": "snap-01234567890abcedf",
    "CreateVolumePermissions": [
        {
            "UserId": "123456789012"
        }
    ]
}
```

For more information, see Share an Amazon EBS snapshot in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotAttribute in AWS CLI Command Reference.
describe-snapshot-tier-status

The following code example shows how to use describe-snapshot-tier-status.

AWS CLI

To view archival information about an archived snapshot

The following describe-snapshot-tier-status example provides archival information about an archived snapshot.

```bash
aws ec2 describe-snapshot-tier-status \\   --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```
{
   "SnapshotTierStatuses": [
      {
         "Status": "completed",
         "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
         "LastTieringProgress": 100,
         "Tags": [],
         "VolumeId": "vol-01234567890abcedf",
         "LastTieringOperationState": "archival-completed",
         "StorageTier": "archive",
         "OwnerId": "123456789012",
         "SnapshotId": "snap-01234567890abcedf",
         "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
      }
   ]
}
```

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotTierStatus in AWS CLI Command Reference.

describe-snapshots

The following code example shows how to use describe-snapshots.
AWS CLI

Example 1: To describe a snapshot

The following describe-snapshots example describes the specified snapshot.

```bash
aws ec2 describe-snapshots \
   --snapshot-ids snap-1234567890abcdef0
```

Output:

```json
{
   "Snapshots": [
      {
         "Description": "This is my snapshot",
         "Encrypted": false,
         "VolumeId": "vol-049df61146c4d7901",
         "State": "completed",
         "VolumeSize": 8,
         "StartTime": "2019-02-28T21:28:32.000Z",
         "Progress": "100%",
         "OwnerId": "012345678910",
         "SnapshotId": "snap-01234567890abcdef",
         "Tags": [
            {
               "Key": "Stack",
               "Value": "test"
            }
         ]
      }
   ]
}
```

For more information, see [Amazon EBS snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBS_snapshots.html) in the *Amazon EC2 User Guide*.

Example 2: To describe snapshots based on filters

The following describe-snapshots example uses filters to scope the results to snapshots owned by your AWS account that are in the pending state. The example uses the `--query` parameter to display only the snapshot IDs and the time the snapshot was started.

```bash
aws ec2 describe-snapshots \
   --query 'Snapshots[?State == "pending"][].SnapshotId,StartTime'
```
The following `describe-snapshots` example uses filters to scope the results to snapshots created from the specified volume. The example uses the `--query` parameter to display only the snapshot IDs.

```bash
aws ec2 describe-snapshots \
    --filters Name=volume-id,Values=049df61146c4d7901 \
    --query "Snapshots[*].[SnapshotId]" \
    --output text
```

Output:

```
snap-1234567890abcdef0
snap-08637175a712c3fb9
...
```

For additional examples using filters, see [Listing and filtering your resources](#) in the Amazon EC2 User Guide.

**Example 3: To describe snapshots based on tags**

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag `Stack=Prod`. 
aws ec2 describe-snapshots \
   --filters Name=tag:Stack,Values=prod

For an example of the output for describe-snapshots, see Example 1.

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

**Example 4: To describe snapshots based on age**

The following describe-snapshots example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
   --owner-ids 012345678910 \
   --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

**Example 5: To view only archived snapshots**

The following describe-snapshots example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
   --filters "Name=storage-tier,Values=archive"
```

Output:

```
{
   "Snapshots": [
   {
     "Description": "Snap A",
     "Encrypted": false,
     "VolumeId": "vol-01234567890aaaaaa",
     "State": "completed",
     "VolumeSize": 8,
     "StartTime": "2021-09-07T21:00:00.000Z",
     "Progress": "100%",
     "OwnerId": "123456789012",
```

Actions and scenarios

2332
For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshots in AWS CLI Command Reference.

**describe-spot-datafeed-subscription**

The following code example shows how to use describe-spot-datafeed-subscription.

**AWS CLI**

To describe Spot Instance datafeed subscription for an account

This example command describes the data feed for the account.

**Command:**

```bash
aws ec2 describe-spot-datafeed-subscription
```

**Output:**

```json
{
   "SpotDatafeedSubscription": {
      "OwnerId": "123456789012",
      "Prefix": "spotdata",
      "Bucket": "my-s3-bucket",
      "State": "Active"
   }
}
```

- For API details, see DescribeSpotDatafeedSubscription in AWS CLI Command Reference.

**describe-spot-fleet-instances**

The following code example shows how to use describe-spot-fleet-instances.

"SnapshotId": "snap-01234567890aaaaaa",
"StorageTier": "archive",
"Tags": []
]}

```json
{
   "SpotDatafeedSubscription": {
      "OwnerId": "123456789012",
      "Prefix": "spotdata",
      "Bucket": "my-s3-bucket",
      "State": "Active"
   }
}
```
AWS CLI

To describe the Spot Instances associated with a Spot fleet

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```
aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
   "ActiveInstances": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "InstanceType": "m3.medium",
         "SpotInstanceRequestId": "sir-08b93456"
      },
      ...
   ],
   "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

• For API details, see [DescribeSpotFleetInstances](#) in [AWS CLI Command Reference](#).

describe-spot-fleet-request-history

The following code example shows how to use describe-spot-fleet-request-history.

AWS CLI

To describe Spot fleet history

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```
The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```json
{
    "HistoryRecords": [
    {
        "EventInformation": {
            "EventSubType": "submitted"
        },
        "EventType": "fleetRequestChange"
    },
    {
        "EventInformation": {
            "EventSubType": "active"
        },
        "EventType": "fleetRequestChange"
    },
    {
        "EventInformation": {
            "InstanceId": "i-1234567890abcdef0",
            "EventSubType": "launched"
        },
        "EventType": "instanceChange"
    },
    {
        "EventInformation": {
            "InstanceId": "i-1234567890abcdef1",
            "EventSubType": "launched"
        },
        "EventType": "instanceChange"
    }
],
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
    "NextToken": "CpHNsscimcV5oH7bSbib03CI2QmsS+ypNpNm+53MN1R0YcXAk0xF1fKf91yVx5Exmbtma3awYxMFzNA663ZskT0AHtJ6TCh2ZbQC2EnZgyELbymtWPfpZ1ZbauVg+P+TfGlwxWw/VR5dk5d4LfdgA/DRAHUrYgxzrEXAMPLE=",
    "StartTime": "2015-05-26T00:00:00Z"
}
```
describe-spot-fleet-requests

The following code example shows how to use describe-spot-fleet-requests.

AWS CLI

To describe your Spot fleet requests

This example describes all of your Spot fleet requests.

Command:

```
aws ec2 describe-spot-fleet-requests
```

Output:

```json
{
    "SpotFleetRequestConfigs": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "SpotFleetRequestConfig": {
                "TargetCapacity": 20,
                "LaunchSpecifications": [
                    {
                        "EbsOptimized": false,
                        "NetworkInterfaces": [
                            {
                                "SubnetId": "subnet-a61dafcf",
                                "DeviceIndex": 0,
                                "DeleteOnTermination": false,
                                "AssociatePublicIpAddress": true,
                                "SecondaryPrivateIpAddressCount": 0
                            }
                        ],
                        "InstanceType": "cc2.8xlarge",
                        "ImageId": "ami-1a2b3c4d"
                    },
                    {
                        "EbsOptimized": false,
                        "LaunchSpecifications": [

      }
    ],
    "SpotPrice": "0.05",
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role"
  },
  "SpotFleetRequestState": "active"
}];
To describe a Spot fleet request

This example describes the specified Spot fleet request.

Command:

    aws ec2 describe-spot-fleet-requests --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE

Output:

```json
{
    "SpotFleetRequestConfigs": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "SpotFleetRequestConfig": {

                        ]
                    }
                ]
            }
        }
    ]
}
```
describe-spot-instance-requests

The following code example shows how to use describe-spot-instance-requests.

AWS CLI

Example 1: To describe a Spot Instance request

The following describe-spot-instance-requests example describes the specified Spot Instance request.

```
aws ec2 describe-spot-instance-requests \
--spot-instance-request-ids sir-08b93456
```

Output:

```
{
   "SpotInstanceRequests": [ 
       {
           "CreateTime": "2018-04-30T18:14:55.000Z",
           "InstanceId": "i-1234567890abcdef1",
           "LaunchSpecification": {
               "InstanceType": "t2.micro",
               "ImageId": "ami-003634241a8fcdec0",
               "KeyName": "my-key-pair",
               "SecurityGroups": 
        
       },
           "SpotFleetRequestState": "active"
       }
   ]
}
```

For API details, see [DescribeSpotFleetRequests](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-spot-fleet-requests.html) in *AWS CLI Command Reference*.

Example 2: To describe Spot Instance requests based on filters

The following describe-spot-instance-requests example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the --query parameter to display only the instance IDs.

```bash
aws ec2 describe-spot-instance-requests \
   --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-east-2a \
   --query "SpotInstanceRequests[*].[InstanceId]" \
   --output text
```

Output:

```
i-057750d42936e468a
i-001efd250faba6ffa
i-027552a73f021f3bd
...
```

For additional examples using filters, see Listing and filtering your resources in the Amazon Elastic Compute Cloud User Guide.

Example 3: To describe Spot Instance requests based on tags

The following describe-spot-instance-requests example uses tag filters to scope the results to Spot Instance requests that have the tag cost-center=cc123.

```bash
aws ec2 describe-spot-instance-requests \
   --filters Name=tag:cost-center,Values=cc123
```

For an example of the output for describe-spot-instance-requests, see Example 1.

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSpotInstanceRequests in AWS CLI Command Reference.
describe-spot-price-history

The following code example shows how to use describe-spot-price-history.

AWS CLI

To describe Spot price history

This example command returns the Spot Price history for m1.xlarge instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{
   "SpotPriceHistory": [
   {
      "Timestamp": "2014-01-06T07:10:55.000Z",
      "ProductDescription": "SUSE Linux",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.087000",
      "AvailabilityZone": "us-west-1b"
   },
   {
      "Timestamp": "2014-01-06T07:10:55.000Z",
      "ProductDescription": "SUSE Linux",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.087000",
      "AvailabilityZone": "us-west-1c"
   },
   {
      "Timestamp": "2014-01-06T05:42:36.000Z",
      "ProductDescription": "SUSE Linux (Amazon VPC)",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.087000",
      "AvailabilityZone": "us-west-1a"
   },
   ...
   ]
}```
To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```bash
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```json
{
   "SpotPriceHistory": [
      {
         "Timestamp": "2014-01-06T04:32:53.000Z",
         "ProductDescription": "Linux/UNIX (Amazon VPC)",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.080000",
         "AvailabilityZone": "us-west-1a"
      },
      {
         "Timestamp": "2014-01-05T11:28:26.000Z",
         "ProductDescription": "Linux/UNIX (Amazon VPC)",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.080000",
         "AvailabilityZone": "us-west-1c"
      }
   ]
}
```

- For API details, see [DescribeSpotPriceHistory](#) in AWS CLI Command Reference.

**describe-stale-security-groups**

The following code example shows how to use describe-stale-security-groups.

**AWS CLI**

To describe stale security groups
This example describes stale security group rules for `vpc-11223344`. The response shows that `sg-5fa68d3a` in your account has a stale ingress SSH rule that references `sg-279ab042` in the peer VPC, and that `sg-fe6fba9a` in your account has a stale egress SSH rule that references `sg-ef6fba8b` in the peer VPC.

Command:

```bash
aws ec2 describe-stale-security-groups --vpc-id vpc-11223344
```

Output:

```json
{
  "StaleSecurityGroupSet": [
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-ef6fba8b",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ]
        }
      ],
      "IpProtocol": "tcp",
      "GroupName": "MySG1",
      "StaleIpPermissions": [],
      "GroupId": "sg-fe6fba9a",
      "Description": "MySG1"
    },
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [],
      "GroupName": "MySG2",
      "StaleIpPermissions": [
        {
          "ToPort": 22,
          "FromPort": 22,
```
"UserIdGroupPairs": [
  {
    "VpcId": "vpc-7a20e51f",
    "GroupId": "sg-279ab042",
    "Description": "Access from pcx-b04deed9",
    "VpcPeeringConnectionId": "pcx-b04deed9",
    "PeeringStatus": "active"
  }
],
"IpProtocol": "tcp"
]},
"GroupId": "sg-5fa68d3a",
"Description": "MySG2"
}
]
}

- For API details, see [DescribeStaleSecurityGroups](#) in [AWS CLI Command Reference](#).

describe-store-image-tasks

The following code example shows how to use `describe-store-image-tasks`.

**AWS CLI**

**To describe the progress of an AMI store task**

The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```
aws ec2 describe-store-image-tasks
```

**Output:**

```
{
  "AmiId": "ami-1234567890abcdef0",
  "Bucket": "my-ami-bucket",
  "ProgressPercentage": 17,
  "S3ObjectKey": "ami-1234567890abcdef0.bin",
  "StoreTaskState": "InProgress",
  "StoreTaskFailureReason": null,
}

- For API details, see DescribeStoreImageTasks in AWS CLI Command Reference.

**describe-subnets**

The following code example shows how to use describe-subnets.

**AWS CLI**

**Example 1: To describe all your subnets**

The following describe-subnets example displays the details of your subnets.

```bash
aws ec2 describe-subnets
```

Output:

```json
{
   "Subnets": [
      {
         "AvailabilityZone": "us-east-1d",
         "AvailabilityZoneId": "use1-az2",
         "AvailableIpAddressCount": 4089,
         "CidrBlock": "172.31.80.0/20",
         "DefaultForAz": true,
         "MapPublicIpOnLaunch": false,
         "MapCustomerOwnedIpOnLaunch": true,
         "State": "available",
         "SubnetId": "subnet-0bb1c79de3EXAMPLE",
         "VpcId": "vpc-0ee975135dEXAMPLE",
         "OwnerId": "111122223333",
         "AssignIpv6AddressOnCreation": false,
         "Ipv6CidrBlockAssociationSet": [],
         "CustomerOwnedIpv4Pool": "pool-2EXAMPLE",
         "SubnetArn": "arn:aws:ec2:us-east-2:111122223333:subnet/subnet-0bb1c79de3EXAMPLE"
      }
   ]
}
```
"EnableDns64": false,
"Ipv6Native": false,
"PrivateDnsNameOptionsOnLaunch": {
    "HostnameType": "ip-name",
    "EnableResourceNameDnsARecord": false,
    "EnableResourceNameDnsAAAARecord": false
}
},
{
"AvailabilityZone": "us-east-1d",
"AvailabilityZoneId": "use1-az2",
"AvailableIpAddressCount": 4089,
"CidrBlock": "172.31.80.0/20",
"DefaultForAz": true,
"MapPublicIpOnLaunch": true,
"MapCustomerOwnedIpOnLaunch": false,
"State": "available",
"SubnetId": "subnet-8EXAMPLE",
"VpcId": "vpc-3EXAMPLE",
"OwnerId": "111122223333",
"AssignIpv6AddressOnCreation": false,
"Ipv6CidrBlockAssociationSet": [],
"Tags": [
    {
        "Key": "Name",
        "Value": "MySubnet"
    }
],
"EnableDns64": false,
"Ipv6Native": false,
"PrivateDnsNameOptionsOnLaunch": {
    "HostnameType": "ip-name",
    "EnableResourceNameDnsARecord": false,
    "EnableResourceNameDnsAAAARecord": false
}
}
}

For more information, see Working with VPCs and Subnets in the AWS VPC User Guide.

**Example 2: To describe the subnets of a specific VPC**
The following `describe-subnets` example uses a filter to retrieve details for the subnets of the specified VPC.

```
aws ec2 describe-subnets \
   --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

Output:

```json
{
    "Subnets": [
        {
            "AvailabilityZone": "us-east-1d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": true,
            "MapCustomerOwnedIpOnLaunch": false,
            "State": "available",
            "SubnetId": "subnet-8EXAMPLE",
            "VpcId": "vpc-3EXAMPLE",
            "OwnerId": "1111222233333",
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "MySubnet"
                }
            ],
            "EnableDns64": false,
            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        }
    ]
}
```
Example 3: To describe the subnets with a specific tag

The following describe-subnets example uses a filter to retrieve the details of those subnets with the tag CostCenter=123 and the --query parameter to display the subnet IDs of the subnets with this tag.

```bash
aws ec2 describe-subnets \
   --filters "Name=tag:CostCenter,Values=123" \ 
   --query "Subnets[*].SubnetId" \ 
   --output text
```

Output:

```
subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73
```

For more information, see Working with VPCs and Subnets in the Amazon VPC User Guide.

- For API details, see DescribeSubnets in AWS CLI Command Reference.

**describe-tags**

The following code example shows how to use describe-tags.

**AWS CLI**

Example 1: To describe all tags for a single resource

The following describe-tags example describes the tags for the specified instance.

```bash
aws ec2 describe-tags \
   --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{
   "Tags": [
   {
      "ResourceType": "instance",
```
"ResourceId": "i-1234567890abcdef8",
"Value": "Test",
"Key": "Stack"
},
{
"ResourceType": "instance",
"ResourceId": "i-1234567890abcdef8",
"Value": "Beta Server",
"Key": "Name"
}
]
}

Example 2: To describe all tags for a resource type

The following describe-tags example describes the tags for your volumes.

```bash
aws ec2 describe-tags \
  --filters "Name=resource-type,Values=volume"
```

Output:

```json
{
  "Tags": [
  {
    "ResourceType": "volume",
    "ResourceId": "vol-1234567890abcdef0",
    "Value": "Project1",
    "Key": "Purpose"
  },
  {
    "ResourceType": "volume",
    "ResourceId": "vol-049df61146c4d7901",
    "Value": "Logs",
    "Key": "Purpose"
  }
  ]
}
```

Example 3: To describe all your tags

The following describe-tags example describes the tags for all your resources.
Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```
aws ec2 describe-tags \
   --filters Name=key,Values=Stack
```

Output:

```
{
   "Tags": [
   {
       "ResourceType": "volume",
       "ResourceId": "vol-027552a73f021f3b",
       "Value": "Production",
       "Key": "Stack"
   },
   {
       "ResourceType": "instance",
       "ResourceId": "i-1234567890abcdef8",
       "Value": "Test",
       "Key": "Stack"
   }
   ]
}
```

Example 5: To describe the tags for your resources based on a tag key and tag value

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```
aws ec2 describe-tags \
   --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
   "Tags": [
```
The following `describe-tags` example uses alternate syntax to describe resources with the tag `Stack=Test`.

```
aws ec2 describe-tags \
  --filters "Name=tag:Stack,Values=Test"
```

The following `describe-tags` example describes the tags for all your instances that have a tag with the key `Purpose` and no value.

```
aws ec2 describe-tags \
  --filters "Name=resource-type,Values=instance" "Name=key,Values=Purpose" "Name=value,Values="
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef5",
      "Value": null,
      "Key": "Purpose"
    }
  ]
}
```

describe-traffic-mirror-filters

The following code example shows how to use describe-traffic-mirror-filters.

AWS CLI

To view your traffic mirror filters

The following describe-traffic-mirror-filters example displays details for all of your traffic mirror filters.

```bash
aws ec2 describe-traffic-mirror-filters
```

Output:

```
{
    "TrafficMirrorFilters": [
    {
      "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
      "IngressFilterRules": [
        {
          "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
          "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
          "TrafficDirection": "ingress",
          "RuleNumber": 100,
          "RuleAction": "accept",
          "Protocol": 6,
          "DestinationCidrBlock": "10.0.0.0/24",
          "SourceCidrBlock": "10.0.0.0/24",
          "Description": "TCP Rule"
        }
      ],
      "EgressFilterRules": [],
      "NetworkServices": [],
      "Description": "Example filter",
      "Tags": []
    }
    ]
}
```

For more information, see View your traffic mirror filters in the Traffic Mirroring Guide. For API details, see DescribeTrafficMirrorFilters in AWS CLI Command Reference.
**describe-traffic-mirror-sessions**

The following code example shows how to use `describe-traffic-mirror-sessions`.

**AWS CLI**

**To describe a Traffic Mirror Session**

The following `describe-traffic-mirror-sessions` example displays details of your Traffic Mirror sessions.

```bash
aws ec2 describe-traffic-mirror-sessions
```

**Output:**

```json
{
  "TrafficMirrorSessions": [
    {
      "Tags": [],
      "VirtualNetworkId": 42,
      "OwnerId": "111122223333",
      "Description": "TCP Session",
      "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",

    }
  ]
}
```
For more information, see View Traffic Mirror Session Details in the AWS Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorSessions in AWS CLI Command Reference.

**describe-traffic-mirror-targets**

The following code example shows how to use describe-traffic-mirror-targets.

**AWS CLI**

**To describe a traffic mirror target**

The following `describe-traffic-mirror-targets` example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \
    --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```
{
    "TrafficMirrorTargets": [
        {
            "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
            "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",
            "Type": "network-load-balancer",
            "Description": "Example Network Load Balancer target",
            "OwnerId": "111122223333",
            "Tags": []
        }
    ]
}
```

For more information, see Traffic mirror targets in the Amazon VPC Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorTargets in AWS CLI Command Reference.
**describe-transit-gateway-attachments**

The following code example shows how to use `describe-transit-gateway-attachments`.

**AWS CLI**

**To view your transit gateway attachments**

The following `describe-transit-gateway-attachments` example displays details for your transit gateway attachments.

```
aws ec2 describe-transit-gateway-attachments
```

**Output:**

```json
{
    "TransitGatewayAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
            "TransitGatewayOwnerId": "123456789012",
            "ResourceOwnerId": "123456789012",

            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Example"
                }
            ]
        }
    ]
}
```
For more information, see [Work with transit gateways](https://docs.aws.amazon.com/updated) in the *Transit Gateways Guide*. 
For API details, see DescribeTransitGatewayAttachments in AWS CLI Command Reference.

describe-transit-gateway-connect-peers

The following code example shows how to use describe-transit-gateway-connect-peers.

AWS CLI

To describe a Transit Gateway Connect peer

The following describe-transit-gateway-connect-peers example describes the specified Connect peer.

```bash
aws ec2 describe-transit-gateway-connect-peers \
   --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```json
{
   "TransitGatewayConnectPeers": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
         "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
         "State": "available",
         "CreationTime": "2021-10-13T03:35:17.000Z",
         "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
               "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
               {
                  "TransitGatewayAsn": 64512,
                  "PeerAsn": 64512,
                  "TransitGatewayAddress": "169.254.6.2",
                  "PeerAddress": "169.254.6.1",
                  "BgpStatus": "down"
               },
               {
                  "TransitGatewayAsn": 64512,
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnectPeers in AWS CLI Command Reference.

describe-transit-gateway-connects

The following code example shows how to use describe-transit-gateway-connects.

AWS CLI

To describe a transit gateway Connect attachment

The following describe-transit-gateway-connects example describes the specified Connect attachment.

```bash
aws ec2 describe-transit-gateway-connects \
   --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE
```

Output:

```json
{
   "TransitGatewayConnects": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
         "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
         "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
         "State": "available",
         "CreationTime": "2021-03-09T19:59:17+00:00",
         "Options": {
```
The following code example shows how to use `describe-transit-gateway-multicast-domains`.

**AWS CLI**

To describe your transit gateway multicast domains

The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```bash
aws ec2 describe-transit-gateway-multicast-domains
```

Output:

```json
{
    "TransitGatewayMulticastDomains": [
        {
            "TransitGatewayId": "tgw-0bf0bffe6aEXAMPLE",
            "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
            "OwnerId": "123456789012",
            "Options": {
                "Igmpv2Support": "disable",
                "StaticSourcesSupport": "enable",
                "AutoAcceptSharedAssociations": "disable"
            }
        }
    ]
}
```
For more information, see [Managing multicast domains](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/API_DescribeTransitGatewayMulticastDomains.html) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayMulticastDomains](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-multicast-domains.html) in *AWS CLI Command Reference*.

**describe-transit-gateway-peering-attachments**

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

**AWS CLI**

**To describe your transit gateway peering attachments**

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```
aws ec2 describe-transit-gateway-peering-attachments
```

**Output:**

```
{
  "TransitGatewayPeeringAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
      "RequesterTgwInfo": {
        "TransitGatewayId": "tgw-123abc05e04123abc",
        "OwnerId": "123456789012",
        "Region": "us-west-2"
      }
    }
  ]
}
```

```
"AccepterTgwInfo": {
    "TransitGatewayId": "tgw-11223344aabbcc112",
    "OwnerId": "123456789012",
    "Region": "us-east-2"
},
"State": "pendingAcceptance",
"CreationTime": "2019-12-09T11:38:05.000Z",
"Tags": [
]
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayPeeringAttachments](#) in *AWS CLI Command Reference*.

**describe-transit-gateway-policy-tables**

The following code example shows how to use `describe-transit-gateway-policy-tables`.

**AWS CLI**

**To describe a transit gateway policy table**

The following `describe-transit-gateway-policy-tables` example describes the specified transit gateway policy table.

```
aws ec2 describe-transit-gateway-policy-tables \
    --transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "available",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```
For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DescribeTransitGatewayPolicyTables in AWS CLI Command Reference.

describe-transit-gateway-route-tables

The following code example shows how to use describe-transit-gateway-route-tables.

AWS CLI

To describe your transit gateway route tables

The following describe-transit-gateway-route-tables example displays details for your transit gateway route tables.

```bash
aws ec2 describe-transit-gateway-route-tables
```

Output:

```json
{
    "TransitGatewayRouteTables": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
            "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:49.000Z",
            "Tags": []
        },
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:49.000Z",
            "Tags": []
        }
    ]
}
```
For more information, see View transit gateway route tables in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayRouteTables in AWS CLI Command Reference.

describe-transit-gateway-vpc-attachments

The following code example shows how to use describe-transit-gateway-vpc-attachments.

**AWS CLI**

**To describe your transit gateway VPC attachments**

The following describe-transit-gateway-vpc-attachments example displays details for your transit gateway VPC attachments.

```bash
aws ec2 describe-transit-gateway-vpc-attachments
```

Output:

```
{
   "TransitGatewayVpcAttachments": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
         "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
         "VpcId": "vpc-0f501f7ee8EXAMPLE",

         "State": "available",
         "SubnetIds": [
            "subnet-045d586432EXAMPLE",
            "subnet-0a0ad478a6EXAMPLE"
         ],
         "CreationTime": "2019-02-13T11:04:02.000Z",
         "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
         },
         "Tags": [
            
```
For more information, see View your VPC attachments in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayVpcAttachments in AWS CLI Command Reference.

describe-transit-gateways

The following code example shows how to use describe-transit-gateways.

AWS CLI

To describe your transit gateways

The following describe-transit-gateways example retrieves details about your transit gateways.

```bash
aws ec2 describe-transit-gateways
```

Output:

```json
{
   "TransitGateways": [
      {
         "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
         "State": "available",
         "OwnerId": "111122223333",
         "Description": "MyTGW",
         "CreationTime": "2019-07-10T14:02:12.000Z",
         "Options": {
            "AmazonSideAsn": 64516,
            "AutoAcceptSharedAttachments": "enable",

{
"Key": "Name",
"Value": "TGW1"
}
]
}

• For API details, see DescribeTransitGateways in AWS CLI Command Reference.

describe-verified-access-endpoints

The following code example shows how to use describe-verified-access-endpoints.

AWS CLI

To describe a Verified Access endpoint
The following `delete-verified-access-endpoints` example describes the specified Verified Access endpoint.

```bash
aws ec2 describe-verified-access-endpoints \
   --verified-access-endpoint-ids vae-066fac616d4d546f2
```

Output:

```json
{
   "VerifiedAccessEndpoints": [
      {
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
         "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
         "ApplicationDomain": "example.com",
         "EndpointType": "network-interface",
         "AttachmentType": "vpc",
         "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
         "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
         "SecurityGroupIds": [
            "sg-04915970c4c8f13a"
         ],
         "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aee70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
         },
         "Status": {
            "Code": "active"
         },
         "Description": "",
         "CreationTime": "2023-08-25T20:54:43",

         "Tags": [
            {
               "Key": "Name",
               "Value": "my-va-endpoint"
            }
         ]
      }
   ]
}
```
For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verifiedaccess/latest/userguide/) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessEndpoints](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-verified-access-access-groups.html) in *AWS CLI Command Reference*.

### describe-verified-access-groups

The following code example shows how to use `describe-verified-access-groups`.

**AWS CLI**

**To describe a Verified Access group**

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```bash/aws ec2 describe-verified-access-groups \
   --verified-access-group-ids vagr-0dbe967baf14b7235
```

**Output:**

```json
{
   "VerifiedAccessGroups": [
   {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T22:17:25",
      "Tags": [
      {
         "Key": "Name",
         "Value": "my-va-group"
      }
      ]
   }
   ]
}
```
For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/dg/guides/access-groups.html) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessGroups](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-verified-access-instance-logging-configurations.html) in *AWS CLI Command Reference*.

**describe-verified-access-instance-logging-configurations**

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

**AWS CLI**

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
    "LoggingConfigurations": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "AccessLogs": {
                "S3": {
                    "Enabled": false
                },
                "CloudWatchLogs": {
                    "Enabled": true,
                    "DeliveryStatus": {
                        "Code": "success"
                    },
                    "LogGroup": "my-log-group"
                },
                "KinesisDataFirehose": {
                    "Enabled": false
                },
                "LogVersion": "ocsf-1.0.0-rc.2",
            }
        }
    ]
}
```
For more information, see [Verified Access logs](#) in the [AWS Verified Access User Guide](#).

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in [AWS CLI Command Reference](#).

**describe-verified-access-instances**

The following code example shows how to use `describe-verified-access-instances`.

**AWS CLI**

**To describe a Verified Access instance**

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```bash
aws ec2 describe-verified-access-instances \
   --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```json
{
   "VerifiedAccessInstances": [ 
      {
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "Description": "Testing Verified Access",
         "VerifiedAccessTrustProviders": [ 
            {
               "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
               "TrustProviderType": "user",
               "UserTrustProviderType": "iam-identity-center"
            }
         ],
         "CreationTime": "2023-08-25T18:27:56",
         "LastUpdatedTime": "2023-08-25T19:03:32",
         "Tags": [ 
            {
```
For more information, see Verified Access instances in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessInstances in AWS CLI Command Reference.

describe-verified-access-trust-providers

The following code example shows how to use describe-verified-access-trust-providers.

AWS CLI

To describe a Verified Access trust provider

The following describe-verified-access-trust-providers example describes the specified Verified Access trust provider.

```
aws ec2 describe-verified-access-trust-providers \
    --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProviders": [
    {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:03:32",
        "Tags": [
            {
                "Key": "Name",
            }
        ]
    }
]}
```
For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessTrustProviders in AWS CLI Command Reference.

**describe-volume-attribute**

The following code example shows how to use describe-volume-attribute.

**AWS CLI**

**To describe a volume attribute**

This example command describes the autoEnableIo attribute of the volume with the ID `vol-049df61146c4d7901`.

**Command:**

```
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --attribute autoEnableIo
```

**Output:**

```
{
    "AutoEnableIo": {
        "Value": false
    },
    "VolumeId": "vol-049df61146c4d7901"
}
```

- For API details, see DescribeVolumeAttribute in AWS CLI Command Reference.

**describe-volume-status**

The following code example shows how to use describe-volume-status.
AWS CLI

To describe the status of a single volume

This example command describes the status for the volume vol-1234567890abcdef0.

Command:

```
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```
{
  "VolumeStatuses": [
    {
      "VolumeStatus": {
        "Status": "ok",
        "Details": [
          {
            "Status": "passed",
            "Name": "io-enabled"
          },
          {
            "Status": "not-applicable",
            "Name": "io-performance"
          }
        ]
      },
      "AvailabilityZone": "us-east-1a",
      "VolumeId": "vol-1234567890abcdef0",
      "Actions": [],
      "Events": []
    }
  ]
}
```

To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:
The following code example shows how to use `describe-volumes-modifications`.

**AWS CLI**

**To describe the modification status for a volume**

The following `describe-volumes-modifications` example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
  --volume-ids vol-1234567890abcdef0
```

Output:

```
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "optimizing",
      "VolumeId": " vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 70,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```
For API details, see `DescribeVolumesModifications` in *AWS CLI Command Reference*.

### describe-volumes

The following code example shows how to use `describe-volumes`.

#### AWS CLI

**Example 1: To describe a volume**

The following `describe-volumes` example describes the specified volumes in the current Region.

```bash
aws ec2 describe-volumes \\
   --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

**Output:**

```json
{
   "Volumes": [
      {
         "AvailabilityZone": "us-east-1a",
         "Attachments": [
            {
               "AttachTime": "2013-12-18T22:35:00.000Z",
               "InstanceId": "i-1234567890abcdef0",
               "VolumeId": "vol-049df61146c4d7901",
               "State": "attached",
               "DeleteOnTermination": true,
               "Device": "/dev/sda1"
            }
         ],
         "Encrypted": true,
         "KmsKeyId": "arn:aws:kms:us-east-2a:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE",
         "VolumeType": "gp2",
         "VolumeId": "vol-049df61146c4d7901",
         "State": "in-use",
         "Iops": 100,
```
Example 2: To describe volumes that are attached to a specific instance

The following describe-volumes example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```bash
aws ec2 describe-volumes \
    --region us-east-1 \
    --filters Name=attachment.instance-id,Values=i-1234567890abcdef0 \n    Name=attachment.delete-on-termination,Values=true
```

For an example of the output for describe-volumes, see Example 1.

Example 3: To describe available volumes in a specific Availability Zone

The following describe-volumes example describes all volumes that have a status of available and are in the specified Availability Zone.

```bash
aws ec2 describe-volumes \
    --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a
```

For an example of the output for describe-volumes, see Example 1.

Example 4: To describe volumes based on tags
The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```
aws ec2 describe-volumes \
   --filters Name=tag:Name,Values=Test* \
   --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```
[
  {
    "Tag": [
      {
        "Value": "Test2",
        "Key": "Name"
      }
    ],
    "ID": "vol-1234567890abcdef0"
  },
  {
    "Tag": [
      {
        "Value": "Test1",
        "Key": "Name"
      }
    ],
    "ID": "vol-049df61146c4d7901"
  }
]
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeVolumes in AWS CLI Command Reference.

**describe-vpc-attribute**

The following code example shows how to use `describe-vpc-attribute`.

**AWS CLI**

To describe the enableDnsSupport attribute
This example describes the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

**Command:**

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

**Output:**

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsSupport": {
        "Value": true
    }
}
```

**To describe the `enableDnsHostnames` attribute**

This example describes the `enableDnsHostnames` attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

**Command:**

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames
```

**Output:**

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsHostnames": {
        "Value": true
    }
}
```

- For API details, see [DescribeVpcAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-attribute.html) in *AWS CLI Command Reference*.

**describe-vpc-classic-link-dns-support**

The following code example shows how to use `describe-vpc-classic-link-dns-support`.
The following code example shows how to use describe-vpc-classic-link.

### AWS CLI

**To describe the ClassicLink status of your VPCs**

This example lists the ClassicLink status of vpc-88888888.

**Command:**

```bash
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

**Output:**

```
{
    "Vpcs": [
        {
            "VpcId": "vpc-88888888",
            "ClassicLinkDnsSupported": true
        },
        {
            "VpcId": "vpc-1a2b3c4d",
            "ClassicLinkDnsSupported": false
        }
    ]
}
```

- For API details, see [DescribeVpcClassicLinkDnsSupport](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-classic-link-dns-support.html) in *AWS CLI Command Reference*.

### describe-vpc-classic-link

The following code example shows how to use describe-vpc-classic-link.

**AWS CLI**

**To describe ClassicLink DNS support for your VPCs**

This example describes the ClassicLink DNS support status of all of your VPCs.

**Command:**

```bash
aws ec2 describe-vpc-classic-link-dns-support
```

**Output:**

```
{
    "Vpcs": [
        {
            "VpcId": "vpc-88888888",
            "ClassicLinkDnsSupported": true
        },
        {
            "VpcId": "vpc-1a2b3c4d",
            "ClassicLinkDnsSupported": false
        }
    ]
}
```
{  
  "Vpcs": [  
    {  
      "ClassicLinkEnabled": true,  
      "VpcId": "vpc-88888888",  
      "Tags": [  
        {  
          "Value": "classiclinkvpc",  
          "Key": "Name"  
        }  
      ]  
    }  
  ]  
}

This example lists only VPCs that are enabled for ClassicLink (the filter value of is-classic-link-enabled is set to true).

Command:

```bash
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-enabled,Values=true"
```

- For API details, see [DescribeVpcClassicLink](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-classic-link.html) in *AWS CLI Command Reference*.

**describe-vpc-endpoint-connection-notifications**

The following code example shows how to use describe-vpc-endpoint-connection-notifications.

**AWS CLI**

**To describe endpoint connection notifications**

The following describe-vpc-endpoint-connection-notifications example describes all of your endpoint connection notifications.

```bash
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:
For API details, see DescribeVpcEndpointConnectionNotifications in AWS CLI Command Reference.

describe-vpc-endpoint-connections

The following code example shows how to use describe-vpc-endpoint-connections.

AWS CLI

To describe VPC endpoint connections

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are PendingAcceptance.

Command:

```
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

Output:

```
{
    "VpcEndpointConnections": [ 
```

For API details, see DescribeVpcEndpointConnections in AWS CLI Command Reference.

describe-vpc-endpoint-service-configurations

The following code example shows how to use describe-vpc-endpoint-service-configurations.

AWS CLI

To describe endpoint service configurations

The following describe-vpc-endpoint-service-configurations example describes your endpoint service configurations.

```
aws ec2 describe-vpc-endpoint-service-configurations
```

Output:

```
{
  "ServiceConfigurations": [
    {
      "ServiceType": [
        {
          "ServiceType": "GatewayLoadBalancer"
        }
      ],
      "ServiceId": "vpce-svc-012d33a1c4321cabc",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-012d33a1c4321cabc",
      "ServiceState": "Available",
      "AvailabilityZones": ["us-east-1d"
    }
  ]
}
```
For more information, see VPC endpoint services in the Amazon VPC User Guide.
describe-vpc-endpoint-service-permissions

The following code example shows how to use describe-vpc-endpoint-service-permissions.

**AWS CLI**

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
   "AllowedPrincipals": [
      {
         "PrincipalType": "Account",
         "Principal": "arn:aws:iam::123456789012:root"
      }
   ]
}
```

• For API details, see DescribeVpcEndpointServicePermissions in AWS CLI Command Reference.

describe-vpc-endpoint-services

The following code example shows how to use describe-vpc-endpoint-services.

**AWS CLI**

Example 1: To describe all VPC endpoint services

The following "describe-vpc-endpoint-services" example lists all VPC endpoint services for an AWS Region.
aws ec2 describe-vpc-endpoint-services

Output:

```json
{
   "ServiceDetails": [
      {
         "ServiceType": [],
         "AcceptanceRequired": false,
         "ServiceName": "com.amazonaws.us-east-1.dynamodb",
         "VpcEndpointPolicySupported": true,
         "Owner": "amazon",
         "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d",
            "us-east-1e",
            "us-east-1f"
         ],
         "BaseEndpointDnsNames": [
            "dynamodb.us-east-1.amazonaws.com"
         ]
      },
      {
         "ServiceType": [],
         "PrivateDnsName": "ec2.us-east-1.amazonaws.com",
         "ServiceName": "com.amazonaws.us-east-1.ec2",
         "VpcEndpointPolicySupported": false,
         "Owner": "amazon",
         "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d"
         ]
      }
   ]
}
```
"us-east-1e",
"us-east-1f"
],
"AcceptanceRequired": false,
"BaseEndpointDnsNames": [
    "ec2.us-east-1.vpce.amazonaws.com"
]
},
{
    "ServiceType": [
        {
            "ServiceType": "Interface"
        }
    ],
    "PrivateDnsName": "ssm.us-east-1.amazonaws.com",
    "ServiceName": "com.amazonaws.us-east-1.ssm",
    "VpcEndpointPolicySupported": true,
    "Owner": "amazon",
    "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1c",
        "us-east-1d",
        "us-east-1e"
    ],
    "AcceptanceRequired": false,
    "BaseEndpointDnsNames": [
        "ssm.us-east-1.vpce.amazonaws.com"
    ]
}]
]
"ServiceNames": [
    "com.amazonaws.us-east-1.dynamodb",
    "com.amazonaws.us-east-1.ec2",
    "com.amazonaws.us-east-1.ec2messages",
    "com.amazonaws.us-east-1.elasticloadbalancing",
    "com.amazonaws.us-east-1.kinesis-streams",
    "com.amazonaws.us-east-1.s3",
    "com.amazonaws.us-east-1.ssm"
]}
}
Example 2: To describe the details about an endpoint service

The following "describe-vpc-endpoint-services" example lists the details of the Amazon S3 interface endpoint service:

```bash
aws ec2 describe-vpc-endpoint-services \
   --filter "Name=service-type,Values=Interface" Name=service-name,Values=com.amazonaws.us-east-1.s3
```

Output:

```json
{
   "ServiceDetails": [
    {
        "ServiceName": "com.amazonaws.us-east-1.s3",
        "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
        "ServiceType": [
            {
                "ServiceType": "Interface"
            }
        ],
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c",
            "us-east-1d",
            "us-east-1e",
            "us-east-1f"
        ],
        "Owner": "amazon",
        "BaseEndpointDnsNames": [
            "s3.us-east-1.vpce.amazonaws.com"
        ],
        "VpcEndpointPolicySupported": true,
        "AcceptanceRequired": false,
        "ManagesVpcEndpoints": false,
        "Tags": []
    }
   ],
   "ServiceNames": [
```
For more information, see View available AWS service names in the User Guide for AWS PrivateLink.

- For API details, see DescribeVpcEndpointServices in AWS CLI Command Reference.

describe-vpc-endpoints

The following code example shows how to use describe-vpc-endpoints.

**AWS CLI**

**To describe your VPC endpoints**

The following describe-vpc-endpoints example displays details for all of your VPC endpoints.

```
aws ec2 describe-vpc-endpoints
```

Output:

```
{
    "VpcEndpoints": [
        {
            "VpcId": "vpc-aabb1122",
            "NetworkInterfaceIds": [],
            "SubnetIds": [],
            "PrivateDnsEnabled": true,
            "State": "available",
            "ServiceName": "com.amazonaws.us-east-1.dynamodb",
            "RouteTableIds": [
                "rtb-3d560345"
            ],

  }
]
For more information, see VPC endpoints in the Amazon VPC User Guide.

- For API details, see DescribeVpcEndpoints in AWS CLI Command Reference.

describe-vpc-peering-connections

The following code example shows how to use describe-vpc-peering-connections.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

aws ec2 describe-vpc-peering-connections

Output:
{
    "VpcPeeringConnections": [
    {
        "Status": {
            "Message": "Active",
            "Code": "active"
        },
        "Tags": [
            {
                "Value": "Peering-1",
                "Key": "Name"
            }
        ],
        "AccepterVpcInfo": {
            "OwnerId": "111122223333",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.1.0/28"
        },
        "VpcPeeringConnectionId": "pcx-11122233",
        "RequesterVpcInfo": {
            "PeeringOptions": {
                "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                "AllowEgressFromLocalClassicLinkToRemoteVpc": false
            },
            "OwnerId": "444455556666",
            "VpcId": "vpc-123abc45",
            "CidrBlock": "192.168.0.0/16"
        }
    },
    {
        "Status": {
            "Message": "Pending Acceptance by 444455556666",
            "Code": "pending-acceptance"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "PeeringOptions": {
                "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                "AllowEgressFromLocalClassicLinkToRemoteVpc": false
            },
            "OwnerId": "444455556666",
            "VpcId": "vpc-11aa22bb",
            "CidrBlock": "10.0.0.0/28"
        }
    }
]
To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```

This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see [DescribeVpcPeeringConnections](#) in *AWS CLI Command Reference*.

describe-vpcs

The following code example shows how to use describe-vpcs.
AWS CLI

Example 1: To describe all of your VPCs

The following describe-vpcs example retrieves details about your VPCs.

aws ec2 describe-vpcs

Output:

```json
{
    "Vpcs": [
        {
            "CidrBlock": "30.1.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-0e9801d129EXAMPLE",
            "OwnerId": "111122223333",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
                    "CidrBlock": "30.1.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Not Shared"
                }
            ]
        },
        {
            "CidrBlock": "10.0.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-06e4ab6c6cEXAMPLE",
            "OwnerId": "222222222222",
            "InstanceTenancy": "default"
        }
    ]
}
```
"CidrBlockAssociationSet": [
  {
    "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
    "CidrBlock": "10.0.0.0/16",
    "CidrBlockState": {
      "State": "associated"
    }
  }
],
"IsDefault": false,
"Tags": [
  {
    "Key": "Name",
    "Value": "Shared VPC"
  }
]
]

Example 2: To describe a specified VPC

The following describe-vpcs example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
  --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```json
{
  "Vpcs": [
    {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-06e4ab6c6cEXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
          "CidrBlock": "10.0.0.0/16",
          "CidrBlockState": {
          }
        }
      ]
    }
  ]
}
```
describe-vpn-connections

The following code example shows how to use describe-vpn-connections.

**AWS CLI**

**Example 1: To describe your VPN connections**

The following describe-vpn-connections example describes all of your Site-to-Site VPN connections.

```
aws ec2 describe-vpn-connections
```

Output:

```
{
  "VpnConnections": [
    {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-01234567abcde1234",
      "Category": "VPN",
      "State": "available",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-1122334455aabbccd",
      "TransitGatewayId": "tgw-00112233445566aab",
    }
  ]
}
```

• For API details, see [DescribeVpcs](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpcs.html) in *AWS CLI Command Reference*.

**Example 2: To describe your available VPN connections**

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of available.

```
aws ec2 describe-vpn-connections \
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/siteto-site/latest/userguide/) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [DescribeVpnConnections](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpn-connections.html) in *AWS CLI Command Reference*.

### describe-vpn-gateways

The following code example shows how to use `describe-vpn-gateways`.

#### AWS CLI

**To describe your virtual private gateways**

This example describes your virtual private gateways.

**Command:**

```bash
aws ec2 describe-vpn-gateways
```

**Output:**

```json
{
  "VpnGateways": [
    {
      "State": "available",
      "Type": "ipsec.1",
      "VpnGatewayId": "vgw-f211f09b",
      "VpcAttachments": [
        {
          "State": "attached",
          "VpcId": "vpc-98eb5ef5"
        }
      ]
    },
    {
      "State": "available",
      "Type": "ipsec.1",
      "VpnGatewayId": "vgw-9a4cacf3",
      "VpcAttachments": [
        {
        }
      ]
    }
  ]
}
```
For API details, see DescribeVpnGateways in AWS CLI Command Reference.

**detach-classic-link-vpc**

The following code example shows how to use detach-classic-link-vpc.

**AWS CLI**

To unlink (detach) an EC2-Classic instance from a VPC

This example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

Command:

```
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-id vpc-88888888
```

Output:

```
{
   "Return": true
}
```

For API details, see DetachClassicLinkVpc in AWS CLI Command Reference.

**detach-internet-gateway**

The following code example shows how to use detach-internet-gateway.

**AWS CLI**

To detach an internet gateway from your VPC
The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```
aws ec2 detach-internet-gateway \
  --internet-gateway-id igw-0d0fb496b3EXAMPLE \
  --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.
- For API details, see DetachInternetGateway in AWS CLI Command Reference.

**detach-network-interface**

The following code example shows how to use `detach-network-interface`.

**AWS CLI**

To detach a network interface from your instance

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

- For API details, see DetachNetworkInterface in AWS CLI Command Reference.

**detach-verified-access-trust-provider**

The following code example shows how to use `detach-verified-access-trust-provider`.

**AWS CLI**

To detach a trust provider from an instance

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```
aws ec2 detach-verified-access-trust-provider \
```
--verified-access-instance-id vai-0ce000c0b7643abea \
--verified-access-trust-provider-id vatp-0bb32de759a3e19e7

Output:

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T19:00:38",
      "LastUpdatedTime": "2023-08-25T19:00:38"
   },
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T18:27:56"
   }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-accessinstances.html) in the *AWS Verified Access User Guide*.

- For API details, see [DetachVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-volume.html) in *AWS CLI Command Reference*.

**detach-volume**

The following code example shows how to use `detach-volume`.

**AWS CLI**

**To detach a volume from an instance**

This example command detaches the volume (vol-049df61146c4d7901) from the instance it is attached to.

**Command:**

```
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```
Output:

```
{
   "AttachTime": "2014-02-27T19:23:06.000Z",
   "InstanceId": "i-1234567890abcdef0",
   "VolumeId": "vol-049df61146c4d7901",
   "State": "detaching",
   "Device": "/dev/sdb"
}
```

- For API details, see [DetachVolume](#) in *AWS CLI Command Reference*.

**detach-vpn-gateway**

The following code example shows how to use `detach-vpn-gateway`.

**AWS CLI**

**To detach a virtual private gateway from your VPC**

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

**Command:**

```
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

- For API details, see [DetachVpnGateway](#) in *AWS CLI Command Reference*.

**disable-address-transfer**

The following code example shows how to use `disable-address-transfer`.

**AWS CLI**

**To disable an Elastic IP address transfer**

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \
```
Output:

```json
{
   "AddressTransfer": {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "AddressTransferStatus": "disabled"
   }
}
```

For more information, see [Transfer Elastic IP addresses](https://docs.aws.amazon.com/sgdoc梵语VPC/latest/UserGuide/) in the Amazon VPC User Guide.

- For API details, see [DisableAddressTransfer](https://docs.aws.amazon.com/sgdoc梵语CLI/latest/UserGuide/) in AWS CLI Command Reference.

**disable-aws-network-performance-metric-subscription**

The following code example shows how to use **disable-aws-network-performance-metric-subscription**.

**AWS CLI**

**To disable a metric subscription**

The following **disable-aws-network-performance-metric-subscription** example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```bash
aws ec2 disable-aws-network-performance-metric-subscription \
   --source us-east-1 \
   --destination eu-west-1 \
   --metric aggregate-latency \
   --statistic p50
```

Output:

```json
{
   "Output": true
}
```
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DisableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

disable-ebs-encryption-by-default

The following code example shows how to use disable-ebs-encryption-by-default.

**AWS CLI**

*To disable EBS encryption by default*

The following disable-ebs-encryption-by-default example disables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 disable-ebs-encryption-by-default
```

Output:

```
{
   "EbsEncryptionByDefault": false
}
```

- For API details, see DisableEbsEncryptionByDefault in AWS CLI Command Reference.

disable-fast-launch

The following code example shows how to use disable-fast-launch.

**AWS CLI**

*To discontinue fast launching for an image*

The following disable-fast-launch example discontinues fast launching on the specified AMI, and cleans up existing pre-provisioned snapshots.

```
aws ec2 disable-fast-launch \
   --image-id ami-01234567890abcedf
```

Output:
For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

• For API details, see DisableFastLaunch in AWS CLI Command Reference.

disable-fast-snapshot-restores

The following code example shows how to use disable-fast-snapshot-restores.

AWS CLI

To disable fast snapshot restore

The following disable-fast-snapshot-restores example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```bash
aws ec2 disable-fast-snapshot-restores \
   --availability-zones us-east-2a \
   --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```json
{
   "Successful": [
```
For API details, see DisableFastSnapshotRestores in AWS CLI Command Reference.

disable-image-block-public-access

The following code example shows how to use disable-image-block-public-access.

AWS CLI

To disable block public access for AMIs in the specified Region

The following disable-image-block-public-access example disables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 disable-image-block-public-access \
   --region us-east-1
```

Output:

```
{
   "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see Block public access to your AMIs in the Amazon EC2 User Guide.

For API details, see DisableImageBlockPublicAccess in AWS CLI Command Reference.

disable-image-deprecation

The following code example shows how to use disable-image-deprecation.
To cancel the deprecation of an AMI

The following `disable-image-deprecation` example cancels the deprecation of an AMI, which removes the `DeprecationTime` field from the `describe-images` output. You must be the AMI owner to perform this procedure.

```
aws ec2 disable-image-deprecation \
  --image-id ami-1234567890abcdef0
```

Output:

```
{
  "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
  "Return": "true"
}
```

For more information, see Deprecate an AMI (<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami>) in the Amazon EC2 User Guide.

- For API details, see `DisableImageDeprecation` in AWS CLI Command Reference.

disable-image

The following code example shows how to use `disable-image`.

AWS CLI

To disable an AMI

The following `disable-image` example disables the specified AMI.

```
aws ec2 disable-image \
  --image-id ami-1234567890abcdef0
```

Output:

```
{
```

Actions and scenarios 2406
For more information, see Disable an AMI in the Amazon EC2 User Guide.

- For API details, see DisableImage in AWS CLI Command Reference.

**disable-ipam-organization-admin-account**

The following code example shows how to use disable-ipam-organization-admin-account.

**AWS CLI**

To disable the delegated IPAM admin

In certain scenarios, you'll integrate IPAM with AWS Organizations. When you do that, the AWS Organizations management account delegates an AWS Organizations member account as the IPAM admin.

In this example, you are the AWS Organizations management account that delegated the IPAM admin account and you want to disable that account from being the IPAM admin.

You can use any AWS Region for --region when making this request. You don't have to use the Region where you originally delegated the admin, where the IPAM was created, or an IPAM operating Region. If you disable the delegated admin account, you can re-enable it at any time or delegate a new account as IPAM admin.

The following disable-ipam-organization-admin-account example disables the delegated IPAM admin in your AWS account.

```
aws ec2 disable-ipam-organization-admin-account  
  --delegated-admin-account-id 320805250157  
  --region ap-south-1
```

Output:

```json
{
  "Success": true
}
```
For more information, see Integrate IPAM with accounts in an AWS Organization in the Amazon VPC IPAM User Guide.

- For API details, see DisableIpamOrganizationAdminAccount in AWS CLI Command Reference.

disable-serial-console-access

The following code example shows how to use disable-serial-console-access.

**AWS CLI**

**To disable access to the EC2 serial console for your account**

The following disable-serial-console-access example disables account access to the serial console.

```
aws ec2 disable-serial-console-access
```

Output:

```
{
   "SerialConsoleAccessEnabled": false
}
```

For more information, see EC2 Serial Console in the Amazon EC2 User Guide.
- For API details, see DisableSerialConsoleAccess in AWS CLI Command Reference.

disable-snapshot-block-public-access

The following code example shows how to use disable-snapshot-block-public-access.

**AWS CLI**

**To disable block public access for snapshots**

The following disable-snapshot-block-public-access example disables block public access for snapshots to allow public sharing of your snapshots.

```
aws ec2 disable-snapshot-block-public-access
```
Output:

```json
{
  "State": "unblocked"
}
```

For more information, see [Block public access for snapshots](https://docs.aws.amazon.com/AmazonEBS/latest/UserGuide/block-public-access.html) in the [Amazon EBS User Guide](https).

- For API details, see [DisableSnapshotBlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-snapshot-block-public-access.html) in [AWS CLI Command Reference](https).

**disable-transit-gateway-route-table-propagation**

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

**AWS CLI**

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \
  --transit-gateway-route-table-id tgw-rtb-0a823edbbeEXAMPLE \ 
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```json
{
  "Propagation": {
    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
    "ResourceId": "vpc-4d7de228",
    "ResourceType": "vpc",
    "TransitGatewayRouteTableId": "tgw-rtb-0a823edbbeEXAMPLE",
    "State": "disabled"
  }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/TransitGateway/latest/userguide/what-is-transit-gateway.html) in the [Transit Gateways Guide](https).
• For API details, see DisableTransitGatewayRouteTablePropagation in AWS CLI Command Reference.

disable-vgw-route-propagation

The following code example shows how to use disable-vgw-route-propagation.

AWS CLI

To disable route propagation

This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

• For API details, see DisableVgwRoutePropagation in AWS CLI Command Reference.

disable-vpc-classic-link-dns-support

The following code example shows how to use disable-vpc-classic-link-dns-support.

AWS CLI

To disable ClassicLink DNS support for a VPC

This example disables ClassicLink DNS support for vpc-88888888.

Command:

```bash
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```
- For API details, see [DisableVpcClassicLinkDnsSupport](#) in *AWS CLI Command Reference*.

**disable-vpc-classic-link**

The following code example shows how to use `disable-vpc-classic-link`.

**AWS CLI**

**To disable ClassicLink for a VPC**

This example disables ClassicLink for vpc-8888888.

Command:

```bash
aws ec2 disable-vpc-classic-link --vpc-id vpc-8888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [DisableVpcClassicLink](#) in *AWS CLI Command Reference*.

**disassociate-address**

The following code example shows how to use `disassociate-address`.

**AWS CLI**

**To disassociate an Elastic IP addresses in EC2-Classic**

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-address --public-ip 198.51.100.0
```

**To disassociate an Elastic IP address in EC2-VPC**
This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

- For API details, see DisassociateAddress in AWS CLI Command Reference.

### disassociate-client-vpn-target-network

The following code example shows how to use disassociate-client-vpn-target-network.

**AWS CLI**

**To disassociate a network from a Client VPN endpoint**

The following disassociate-client-vpn-target-network example disassociates the target network that's associated with the cvpn-assoc-12312312312312312 association ID for the specified Client VPN endpoint.

```bash
aws ec2 disassociate-client-vpn-target-network
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
  --association-id cvpn-assoc-12312312312312312
```

Output:

```json
{
"AssociationId": "cvpn-assoc-12312312312312312",
"Status": {
  "Code": "disassociating"
}
}
```

For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see DisassociateClientVpnTargetNetwork in AWS CLI Command Reference.

### disassociate-iam-instance-profile

The following code example shows how to use disassociate-iam-instance-profile.
AWS CLI

To disassociate an IAM instance profile

This example disassociates an IAM instance profile with the association ID iip-assoc-05020b59952902f5f.

Command:

```bash
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-05020b59952902f5f
```

Output:

```
{
   "IamInstanceProfileAssociation": {
      "InstanceId": "i-123456789abcde123",
      "State": "disassociating",
      "AssociationId": "iip-assoc-05020b59952902f5f",
      "IamInstanceProfile": {
         "Id": "AIPAI5IVIHMFFYY2DKV5Y",
         "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
   }
}
```

- For API details, see DisassociateIamInstanceProfile in AWS CLI Command Reference.

disassociate-instance-event-window

The following code example shows how to use disassociate-instance-event-window.

AWS CLI

Example 1: To disassociate one or more instances from an event window

The following disassociate-instance-event-window example disassociates one or more instances from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instances, specify the association-target parameter, and for the parameter values, specify one or more instance IDs.
aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To disassociate instance tags from an event window**

The following disassociate-instance-event-window example disassociates instance tags from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instance tags, specify the association-target parameter, and for the parameter values, specify one or more tags.

aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags= [{Key=k2,Value=v2},{Key=k1,Value=v1}]"

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```
For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

### Example 3: To disassociate a Dedicated Host from an event window

The following `disassociate-instance-event-window` example disassociates a Dedicated Host from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window
  --region us-east-1
  --instance-event-window-id iew-0abcdef1234567890
  --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```
For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see [DisassociateInstanceEventWindow](#) in AWS CLI Command Reference.

disassociate-ipam-resource-discovery

The following code example shows how to use disassociate-ipam-resource-discovery.

**AWS CLI**

To disassociate a resource discovery from an IPAM

In this example, you are an IPAM delegated admin account and you want to disassociate an IPAM resource discovery from your IPAM. You ran the describe command and noticed that the "ResourceDiscoveryStatus": "not-found" and you want to disassociate it from your IPAM to make room for other associations.

The following disassociate-ipam-resource-discovery example disassociates an IPAM resource discovery in your AWS account.

```
aws ec2 disassociate-ipam-resource-discovery
  --ipam-resource-discovery-association-id ipam-res-disco-assoc-04382a6346357cf82
  --region us-east-1
```

Output:

```
{
  "IpamResourceDiscoveryAssociation": {
    "OwnerId": "320805250157",
    "IpamResourceDiscoveryAssociationId": "ipam-res-disco-assoc-04382a6346357cf82",
    "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
    "IpamId": "ipam-005f921c17ebd5107",
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
    "IpamRegion": "us-east-1",
    "IsDefault": false,
```

```
```
For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see DisassociateIpamResourceDiscovery in AWS CLI Command Reference.

disassociate-nat-gateway-address

The following code example shows how to use disassociate-nat-gateway-address.

AWS CLI

To disassociate an Elastic IP address from a public NAT gateway

The following disassociate-nat-gateway-address example disassociates the specified Elastic IP address from the specified public NAT gateway.

```bash
aws ec2 disassociate-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \
   --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```json
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
      {
         "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
         "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
         "PrivateIp": "10.0.0.74",
         "PublicIp": "3.211.231.218",
         "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
         "IsPrimary": false,
         "Status": "disassociating"
      }
   ]
}
```
For more information, see NAT gateways in the Amazon VPC User Guide.

- For API details, see DisassociateNatGatewayAddress in AWS CLI Command Reference.

**disassociate-route-table**

The following code example shows how to use disassociate-route-table.

**AWS CLI**

**To disassociate a route table**

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see DisassociateRouteTable in AWS CLI Command Reference.

**disassociate-subnet-cidr-block**

The following code example shows how to use disassociate-subnet-cidr-block.

**AWS CLI**

**To disassociate an IPv6 CIDR block from a subnet**

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```bash
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```json
{
}
```
For API details, see [DisassociateSubnetCidrBlock](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-subnet-cidr-block.html) in *AWS CLI Command Reference*.

**disassociate-transit-gateway-multicast-domain**

The following code example shows how to use `disassociate-transit-gateway-multicast-domain`.

### AWS CLI

**To disassociate subnets from a multicast domain**

The following `disassociate-transit-gateway-multicast-domain` example disassociates a subnet from the specified multicast domain.

```bash
aws ec2 disassociate-transit-gateway-multicast-domain \
  --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \
  --subnet-id subnet-000de86e3bEXAMPLE \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

**Output:**

```json
{
  "Associations": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnets": [
      {
        "SubnetId": "subnet-000de86e3bEXAMPLE",
        "State": "disassociating"
      }
    ]
  }
}
```
For more information, see [Working with multicast](#) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

### disassociate-transit-gateway-route-table

The following code example shows how to use `disassociate-transit-gateway-route-table`.

**AWS CLI**

To disassociate a transit gateway route table from a resource attachment

The following `disassociate-transit-gateway-route-table` example disassociates the specified attachment from the transit gateway route table.

```bash
aws ec2 disassociate-transit-gateway-route-table
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
  --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```json
{
  "Association": {
    "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
    "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
    "ResourceType": "direct-connect-gateway",
    "State": "disassociating"
  }
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayRouteTable](#) in *AWS CLI Command Reference*. 
disassociate-vpc-cidr-block

The following code example shows how to use disassociate-vpc-cidr-block.

AWS CLI

To disassociate an IPv6 CIDR block from a VPC

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

Output:

```
{
   "Ipv6CidrBlockAssociation": {
      "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",
      "AssociationId": "vpc-cidr-assoc-eca54085",
      "Ipv6CidrBlockState": {
         "State": "disassociating"
      }
   },
   "VpcId": "vpc-a034d6c4"
}
```

To disassociate an IPv4 CIDR block from a VPC

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```
{
   "CidrBlockAssociation": {
```

Actions and scenarios
"AssociationId": "vpc-cidr-assoc-0287ac6b",
"CidrBlock": "172.18.0.0/16",
"CidrBlockState": {
    "State": "disassociating"
},
"VpcId": "vpc-27621243"
}

For API details, see DisassociateVpcCidrBlock in AWS CLI Command Reference.

**enable-address-transfer**

The following code example shows how to use enable-address-transfer.

**AWS CLI**

To enable an Elastic IP address transfer

The following enable-address-transfer example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

```bash
aws ec2 enable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf \
    --transfer-account-id 123456789012
```

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

For API details, see EnableAddressTransfer in AWS CLI Command Reference.
enable-aws-network-performance-metric-subscription

The following code example shows how to use enable-aws-network-performance-metric-subscription.

AWS CLI

To enable a metric subscription

The following enable-aws-network-performance-metric-subscription example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```bash
aws ec2 enable-aws-network-performance-metric-subscription 
--source us-east-1 
--destination eu-west-1 
--metric aggregate-latency 
--statistic p50
```

Output:

```json
{
   "Output": true
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide. For API details, see EnableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

enable-ebs-encryption-by-default

The following code example shows how to use enable-ebs-encryption-by-default.

AWS CLI

To enable EBS encryption by default

The following enable-ebs-encryption-by-default example enables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 enable-ebs-encryption-by-default
```
Output:

```json
{
    "EbsEncryptionByDefault": true
}
```

- For API details, see [EnableEbsEncryptionByDefault](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-fast-launch.html) in *AWS CLI Command Reference*.

**enable-fast-launch**

The following code example shows how to use `enable-fast-launch`.

**AWS CLI**

To start fast launching for an image

The following `enable-fast-launch` example starts fast launching on the specified AMI and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to snapshot, which is also the default value.

```
aws ec2 enable-fast-launch \
    --image-id ami-01234567890abcedf \
    --max-parallel-launches 6 \
    --resource-type snapshot
```

Output:

```json
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {
        "TargetResourceCount": 10
    },
    "LaunchTemplate": {},
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "enabling",
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```
For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

- For API details, see EnableFastLaunch in AWS CLI Command Reference.

**enable-fast-snapshot-restores**

The following code example shows how to use enable-fast-snapshot-restores.

**AWS CLI**

**To enable fast snapshot restore**

The following enable-fast-snapshot-restores example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```
aws ec2 enable-fast-snapshot-restores \
    --availability-zones us-east-2a us-east-2b \
    --source-snapshot-ids snap-1234567890abcdef0
```

**Output:**

```json
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2a",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        },
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2b",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z"
        }
    ],
    "Unsuccessful": []
}
```
enable-image-block-public-access

The following code example shows how to use enable-image-block-public-access.

**AWS CLI**

**To enable block public access for AMIs in the specified Region**

The following enable-image-block-public-access example enables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 enable-image-block-public-access
   --region us-east-1
   --image-block-public-access-state block-new-sharing
```

Output:

```json
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/block-public-access.html) in the *Amazon EC2 User Guide*.

For API details, see [EnableImageBlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-image-block-public-access.html) in *AWS CLI Command Reference*.

enable-image-deprecation

The following code example shows how to use enable-image-deprecation.

**AWS CLI**

**Example 1: To deprecate an AMI**

The following enable-image-deprecation example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```bash
aws ec2 enable-image-deprecation
```

For API details, see [EnableImageDeprecation](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-image-deprecation.html) in *AWS CLI Command Reference*.
The following code example shows how to use `enable-image`.

### AWS CLI

**To enable an AMI**

The following `enable-image` example enables the specified AMI.

```bash
aws ec2 enable-image \
  --image-id ami-1234567890abcdef0
```

Output:

```json
{
  "Return": "true"
}
```

For more information, see [Disable an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImage](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_EnableImage.html) in *AWS CLI Command Reference*.

---

### enable-ipam-organization-admin-account

The following code example shows how to use `enable-ipam-organization-admin-account`.

**Actions and scenarios**

2427
To integrate with AWS Organizations and delegate a member account as the IPAM account

The following enable-ipam-organization-admin-account example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```
aws ec2 enable-ipam-organization-admin-account \
   --delegated-admin-account-id 320805250157
```

Output:

```
{
   "Success": true
}
```

For more information, see Integrate IPAM with AWS Organizations in the Amazon VPC IPAM User Guide.
- For API details, see EnableIpamOrganizationAdminAccount in AWS CLI Command Reference.

enable-reachability-analyzer-organization-sharing

The following code example shows how to use enable-reachability-analyzer-organization-sharing.

AWS CLI

To enable trusted access for Reachability Analyzer

The following enable-reachability-analyzer-organization-sharing example enables trusted access for Reachability Analyzer.

```
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see Cross-account analyses in the Reachability Analyzer User Guide.
- For API details, see EnableReachabilityAnalyzerOrganizationSharing in AWS CLI Command Reference.
enable-serial-console-access

The following code example shows how to use enable-serial-console-access.

AWS CLI

To enable access to the serial console for your account

The following enable-serial-console-access example enables account access to the serial console.

```
aws ec2 enable-serial-console-access
```

Output:

```
{
  "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the Amazon EC2 User Guide.
- For API details, see EnableSerialConsoleAccess in AWS CLI Command Reference.

enable-snapshot-block-public-access

The following code example shows how to use enable-snapshot-block-public-access.

AWS CLI

To enable block public access for snapshots

The following enable-snapshot-block-public-access example blocks all public sharing of your snapshots.

```
aws ec2 enable-snapshot-block-public-access \
  --state block-all-sharing
```

Output:

```
{
  "State": "block-all-sharing"
}
```
For more information, see Block public access for snapshots in the Amazon EBS User Guide.

- For API details, see EnableSnapshotBlockPublicAccess in AWS CLI Command Reference.

enable-transit-gateway-route-table-propagation

The following code example shows how to use enable-transit-gateway-route-table-propagation.

**AWS CLI**

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following enable-transit-gateway-route-table-propagation example enables the specified attachment to propagate routes to the specified propagation route table.

```bash
aws ec2 enable-transit-gateway-route-table-propagation 
   --transit-gateway-route-table-id tgw-rtb-0a823edbddeEXAMPLE 
   --transit-gateway-attachment-id tgw-attach-09b52ccdbb5EXAMPLE
```

Output:

```json
{
   "Propagation": {
      "TransitGatewayAttachmentId": "tgw-attach-09b52ccdbb5EXAMPLE",
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "TransitGatewayRouteTableId": "tgw-rtb-0a823edbddeEXAMPLE",
      "State": "disabled"
   }
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see EnableTransitGatewayRouteTablePropagation in AWS CLI Command Reference.

enable-vgw-route-propagation

The following code example shows how to use enable-vgw-route-propagation.
AWS CLI

To enable route propagation

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see EnableVgwRoutePropagation in AWS CLI Command Reference.

enable-volume-io

The following code example shows how to use enable-volume-io.

AWS CLI

To enable I/O for a volume

This example enables I/O on volume vol-1234567890abcdef0.

Command:

```
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "Return": true
}
```

- For API details, see EnableVolumeIo in AWS CLI Command Reference.

enable-vpc-classic-link-dns-support

The following code example shows how to use enable-vpc-classic-link-dns-support.
AWS CLI

To enable ClassicLink DNS support for a VPC

This example enables ClassicLink DNS support for vpc-88888888.

Command:

```bash
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see `EnableVpcClassicLinkDnsSupport` in AWS CLI Command Reference.

enable-vpc-classic-link

The following code example shows how to use `enable-vpc-classic-link`.

AWS CLI

To enable a VPC for ClassicLink

This example enables vpc-8888888 for ClassicLink.

Command:

```bash
aws ec2 enable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see `EnableVpcClassicLink` in AWS CLI Command Reference.
**export-client-vpn-client-certificate-revocation-list**

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

**AWS CLI**

**To export a client certificate revocation list**

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-certificate-revocation-list \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

Output:

```

export-client-vpn-client-configuration

The following code example shows how to use export-client-vpn-client-configuration.

AWS CLI

To export the client configuration

The following export-client-vpn-client-configuration example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --output text
```

Output:

For more information, see [Client VPN Endpoints](https://docs.aws.amazon.com/vpc/latest/userguide/clientvpn-endpoints.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ExportClientVpnClientConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ec2/export-image.html) in *AWS CLI Command Reference*.

**export-image**

The following code example shows how to use `export-image`.

### AWS CLI

**To export a VM from an AMI**

The following `export-image` example exports the specified AMI to the specified bucket in the specified format.

```bash
aws ec2 export-image \
    --image-id ami-1234567890abcdef0 \
    --disk-image-format VMDK \
    --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

**Output:**

```json
{
    "DiskImageFormat": "vmdk",
    "ExportImageTaskId": "export-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "RoleName": "vmimport",
    "Progress": "0",
    "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/"
    },
    "Status": "active",
    "StatusMessage": "validating"
}
```
• For API details, see ExportImage in AWS CLI Command Reference.

get-associated-ipv6-pool-cidrs

The following code example shows how to use get-associated-ipv6-pool-cidrs.

AWS CLI

To get the associations for an IPv6 address pool

The following get-associated-ipv6-pool-cidrs example gets the associations for the specified IPv6 address pool.

```
aws ec2 get-associated-ipv6-pool-cidrs \
  --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
  "Ipv6CidrAssociations": [
    {
      "Ipv6Cidr": "2001:db8:1234:1a00::/56",
      "AssociatedResource": "vpc-1111122222333ab"
    }
  ]
}
```

• For API details, see GetAssociatedIpv6PoolCidrs in AWS CLI Command Reference.

get-aws-network-performance-data

The following code example shows how to use get-aws-network-performance-data.

AWS CLI

To get network performance data

The following get-aws-network-performance-data example retrieves data about the network performance between the specified Regions in the specified time period.
aws ec2 get-aws-network-performance-data \
--start-time 2022-10-26T12:00:00.000Z \
--end-time 2022-10-26T12:30:00.000Z \
--data-queries Id=my-query,Source=us-east-1,Destination=eu-west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes

Output:

```json
{
  "DataResponses": [
    {
      "Id": "my-query",
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes",
      "MetricPoints": [
        {
          "StartDate": "2022-10-26T12:00:00+00:00",
          "EndDate": "2022-10-26T12:05:00+00:00",
          "Value": 62.44349,
          "Status": "OK"
        },
        {
          "StartDate": "2022-10-26T12:05:00+00:00",
          "EndDate": "2022-10-26T12:10:00+00:00",
          "Value": 62.483498,
          "Status": "OK"
        },
        {
          "StartDate": "2022-10-26T12:10:00+00:00",
          "EndDate": "2022-10-26T12:15:00+00:00",
          "Value": 62.51248,
          "Status": "OK"
        },
        {
          "StartDate": "2022-10-26T12:15:00+00:00",
          "EndDate": "2022-10-26T12:20:00+00:00",
          "Value": 62.635475,
          "Status": "OK"
        }
      ]
    }
  ]
}
```
get-capacity-reservation-usage

The following code example shows how to use get-capacity-reservation-usage.

AWS CLI

To view capacity reservation usage across AWS accounts

The following get-capacity-reservation-usage example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:
For more information, see Viewing Shared Capacity Reservation Usage in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetCapacityReservationUsage in AWS CLI Command Reference.

get-coip-pool-usage

The following code example shows how to use get-coip-pool-usage.

AWS CLI

To get customer-owned IP address pool usage

The following get-coip-pool-usage example gets the usage details for the specified customer-owned IP address pool.

    aws ec2 get-coip-pool-usage \
    --pool-id ipv4pool-coip-123a45678bEXAMPLE

Output:

```json
{
    "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
    "CoipAddressUsages": [
        {
            "CoIp": "0.0.0.0"
        }
    ]
}
```
{
    "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
    "AwsAccountId": "123456789012",
    "CoIp": "0.0.0.0"
},
{
    "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
    "AwsAccountId": "123456789111",
    "CoIp": "0.0.0.0"
}
],
"LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
}

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see GetCoipPoolUsage in AWS CLI Command Reference.

get-console-output

The following code example shows how to use get-console-output.

AWS CLI

Example 1: To get the console output

The following get-console-output example gets the console output for the specified Linux instance.

```
aws ec2 get-console-output \
   --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Output": "..."
}
```

For more information, see Instance console output in the Amazon EC2 User Guide.
Example 2: To get the latest console output

The following get-console-output example gets the latest console output for the specified Linux instance.

```
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0 \n    --latest \n    --output text
```

Output:

```
i-1234567890abcdef0 [    0.000000] Command line: root=LABEL=/ console=ttys000 selinux=0 nvme_core.io_timeout=4294967295

[    0.000000] x86/fpu: Supporting XSAVE feature 0x002: 'SSE registers'
[    0.000000] x86/fpu: Supporting XSAVE feature 0x004: 'AVX registers'
...
Cloud-init v. 0.7.6 finished at Wed, 09 May 2018 19:01:13 +0000. Datasource DataSourceEc2. Up 21.50 seconds
Amazon Linux AMI release 2018.03
Kernel 4.14.26-46.32.amzn1.x
```

For more information, see Instance console output in the Amazon EC2 User Guide.

- For API details, see GetConsoleOutput in AWS CLI Command Reference.

get-console-screenshot

The following code example shows how to use get-console-screenshot.

AWS CLI

To retrieve a screenshot of a running instance

The following get-console-screenshot example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```
aws ec2 get-console-screenshot \
    --instance-id i-1234567890abcdef0
```
get-default-credit-specification

The following code example shows how to use get-default-credit-specification.

AWS CLI

To describe the default credit option

The following get-default-credit-specification example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
    --instance-family t2
```

Output:

```
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "standard"
    }
}
```

For API details, see `GetDefaultCreditSpecification` in AWS CLI Command Reference.

get-ebs-default-kms-key-id

The following code example shows how to use get-ebs-default-kms-key-id.

AWS CLI

To describe your default CMK for EBS encryption
The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```
aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```
{
   "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [GetEbsDefaultKmsKeyId](http://awscli.amazonaws.com/clireference/#GetEbsDefaultKmsKeyId) in [AWS CLI Command Reference](http://awscli.amazonaws.com/)

**get-ebs-encryption-by-default**

The following code example shows how to use `get-ebs-encryption-by-default`.

**AWS CLI**

**To describe whether EBS encryption by default is enabled**

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```
aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```
{
   "EbsEncryptionByDefault": false
}
```
The following output indicates that EBS encryption by default is enabled.

```json
{
    "EbsEncryptionByDefault": true
}
```

- For API details, see `GetEbsEncryptionByDefault` in *AWS CLI Command Reference*.

**get-flow-logs-integration-template**

The following code example shows how to use `get-flow-logs-integration-template`.

**AWS CLI**

*To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena*

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

**Linux:**

```bash
aws ec2 get-flow-logs-integration-template \
  --flow-log-id fl-1234567890abcdef0 \
  --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET \
  --integrate-services

  AthenaIntegrations='[
    {IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET, PartitionLoadFrequency=none, PartitionStartDate=2021-07-21T00:40:00, PartitionEndDate=2021-07-21T00:42:00},
    {IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET, PartitionLoadFrequency=none, PartitionStartDate=2021-07-21T00:40:00, PartitionEndDate=2021-07-21T00:42:00}
  ]'
```

**Windows:**

```bash
aws ec2 get-flow-logs-integration-template ^
  --flow-log-id fl-1234567890abcdef0 ^
  --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET ^
  --integrate-services

  AthenaIntegrations='[
    {IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET, PartitionLoadFrequency=none, PartitionStartDate=2021-07-21T00:40:00, PartitionEndDate=2021-07-21T00:42:00},
    {IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET, PartitionLoadFrequency=none, PartitionStartDate=2021-07-21T00:40:00, PartitionEndDate=2021-07-21T00:42:00}
  ]'
```
Output:

```json
{
   "Result": "https://DOC-EXAMPLE-BUCKET.s3.us-east-2.amazonaws.com/VPCFlowLogsIntegrationTemplate_fl-1234567890abcdef0_Wed%20Jul%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see [Working with AWS CloudFormation templates](#) in the *AWS CloudFormation User Guide*.

For information on using Amazon Athena and flow logs, see [Query flow logs using Amazon Athena](#) in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [GetFlowLogsIntegrationTemplate](#) in *AWS CLI Command Reference*.

---

**get-groups-for-capacity-reservation**

The following code example shows how to use `get-groups-for-capacity-reservation`.

**AWS CLI**

**To list the resource groups with a Capacity Reservation**

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```bash
aws ec2 get-groups-for-capacity-reservation \  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```json
{
   "CapacityReservationsGroup": [
      {
         "OwnerId": "123456789012"
      }
   ]
}
```
For more information, see Working with Capacity Reservations in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetGroupsForCapacityReservation in AWS CLI Command Reference.

get-host-reservation-purchase-preview

The following code example shows how to use get-host-reservation-purchase-preview.

**AWS CLI**

**To get a purchase preview for a Dedicated Host Reservation**

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

**Command:**

```
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

**Output:**

```
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
    {
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ],
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see GetHostReservationPurchasePreview in AWS CLI Command Reference.
get-image-block-public-access-state

The following code example shows how to use get-image-block-public-access-state.

AWS CLI

To get the block public access state for AMIs in the specified Region

The following get-image-block-public-access-state example gets the block public access state for AMIs at the account level in the specified Region.

```bash
aws ec2 get-image-block-public-access-state \
   --region us-east-1
```

Output:

```json
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see Block public access to your AMIs in the Amazon EC2 User Guide.

- For API details, see GetImageBlockPublicAccessState in AWS CLI Command Reference.

get-instance-types-from-instance-requirements

The following code example shows how to use get-instance-types-from-instance-requirements.

AWS CLI

To preview the instance types that match specified attributes

The following get-instance-types-from-instance-requirements example first generates a list of all of the possible attributes that can be specified using the --generate-cli-skeleton parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.
aws ec2 get-instance-types-from-instance-requirements \
   --region us-east-1 \
   --generate-cli-skeleton input > attributes.json

Output:

```
{
   "DryRun": true,
   "ArchitectureTypes": ["x86_64_mac"],
   "VirtualizationTypes": ["paravirtual"],
   "InstanceRequirements": {
      "VcpuCount": {"Min": 0,"Max": 0},
      "MemoryMiB": {"Min": 0,"Max": 0},
      "CpuManufacturers": [<"intel">],
      "MemoryGiBPerVcpu": {"Min": 0.0,"Max": 0.0},
      "ExcludedInstanceTypes": [],
      "InstanceGenerations": ["current"],
      "SpotMaxPricePercentageOverLowestPrice": 0,
      "OnDemandMaxPricePercentageOverLowestPrice": 0,
      "BareMetal": "included",
      "BurstablePerformance": "excluded",
      "RequireHibernateSupport": true,
      "NetworkInterfaceCount": {"Min": 0,
```
Configure the JSON file. You must provide values for ArchitectureTypes, VirtualizationTypes, VcpuCount, and MemoryMiB. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.
Preview the instance types that have the attributes specified in attributes.json. Specify the name and path to your JSON file by using the --cli-input-json parameter. In the following request, the output is formatted as a table.

```shell
aws ec2 get-instance-types-from-instance-requirements \
   --cli-input-json file://attributes.json \n   --output table
```

Contents of attributes.json file:

```json
{
   "ArchitectureTypes": [
      "x86_64"
   ],
   "VirtualizationTypes": [
      "hvm"
   ],
   "InstanceRequirements": {
      "VcpuCount": {
         "Min": 4,
         "Max": 6
      },
      "MemoryMiB": {
         "Min": 2048
      },
      "InstanceGenerations": [
         "current"
      ]
   }
}
```

Output:

```
------------------------------------------
|GetInstanceTypesFromInstanceRequirements|
+----------------------------------------+
|| InstanceTypes                          ||
|+---------------------------------------++
|| InstanceType                          ||
|+---------------------------------------++
|| c4.xlarge                              ||
```
For more information about attribute-based instance type selection, see \textit{How attribute-based instance type selection works} in the \textit{Amazon EC2 User Guide}.

- For API details, see \texttt{GetInstanceTypesFromInstanceRequirements} in \textit{AWS CLI Command Reference}.

\textbf{get-instance-uefi-data}

The following code example shows how to use \texttt{get-instance-uefi-data}.

\textbf{AWS CLI}

\textbf{To retrieve UEFI data from an instance}

The following \texttt{get-instance-uefi-data} example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

\begin{verbatim}
aws ec2 get-instance-uefi-data \\
     --instance-id i-0123456789example
\end{verbatim}

Output:

\begin{verbatim}
{

For more information, see \textit{UEFI Secure Boot} in the \textit{Amazon EC2 User Guide}.

- For API details, see \texttt{GetInstanceUefiData} in \textit{AWS CLI Command Reference}.
get-ipam-address-history

The following code example shows how to use get-ipam-address-history.

AWS CLI

To get the history of a CIDR

The following get-ipam-address-history example gets the history of a CIDR.

(Linux):

```bash
aws ec2 get-ipam-address-history \
    --cidr 10.0.0.0/16 \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --start-time 2021-12-08T01:00:00.000Z \
    --end-time 2021-12-10T01:00:00.000Z
```

(Windows):

```bash
aws ec2 get-ipam-address-history ^
    --cidr 10.0.0.0/16 ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --start-time 2021-12-08T01:00:00.000Z ^
    --end-time 2021-12-10T01:00:00.000Z
```

Output:

```json
{
    "HistoryRecords": [
        {
            "ResourceOwnerId": "123456789012",
            "ResourceRegion": "us-west-1",
            "ResourceType": "vpc",
            "ResourceId": "vpc-06cbefa9ee907e1c0",
            "ResourceCidr": "10.0.0.0/16",
            "ResourceName": "Demo",
            "ResourceComplianceStatus": "unmanaged",
            "ResourceOverlapStatus": "overlapping",
            "VpcId": "vpc-06cbefa9ee907e1c0",
            "SampledStartTime": "2021-12-08T19:54:57.675000+00:00"
        },
        {
```

Actions and scenarios 2452
For more information, see View the history of IP addresses in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamAddressHistory in AWS CLI Command Reference.

get-ipam-discovered-accounts

The following code example shows how to use get-ipam-discovered-accounts.

AWS CLI

To view the accounts discovered by an IPAM

In this scenario, you're a IPAM delegated admin who wants to view the AWS accounts that own resources that the IPAM is discovering.

The --discovery-region is the IPAM operating Region you want to view the monitored account statuses in. For example, if you have three IPAM operating Regions, you may want to
make this request three times to view the timestamps specific to discovery in each of those particular Regions.

The following `get-ipam-discovered-accounts` example lists the AWS accounts that own resources that the IPAM is discovering.

```
aws ec2 get-ipam-discovered-accounts \
   --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
   --discovery-region us-east-1
```

Output:

```
{
   "IpamDiscoveredAccounts": [
   {
      "AccountId": "149977607591",
      "DiscoveryRegion": "us-east-1",
      "LastAttemptedDiscoveryTime": "2024-02-09T19:04:31.379000+00:00",
      "LastSuccessfulDiscoveryTime": "2024-02-09T19:04:31.379000+00:00"
   }
   ]
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the Amazon VPC IPAM User Guide.

- For API details, see `GetIpamDiscoveredAccounts` in AWS CLI Command Reference.

`get-ipam-discovered-public-addresses`

The following code example shows how to use `get-ipam-discovered-public-addresses`.

**AWS CLI**

**To view discovered public IP addresses**

In this example, you are an IPAM delegated admin and you want to view the IP addresses of resources discovered by IPAM. You can get the resource discovery ID with `describe-ipam-resource-discoveries`.

The following `get-ipam-discovered-public-addresses` example shows the discovered public IP addresses for a resource discovery.
aws ec2 get-ipam-discovered-public-addresses \
--ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
--address-region us-east-1 \
--region us-east-1

Output:

```json
{
  "IpamDiscoveredPublicAddresses": [
    {
      "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
      "AddressRegion": "us-east-1",
      "Address": "54.208.155.7",
      "AddressOwnerId": "320805250157",
      "AssociationStatus": "associated",
      "AddressType": "ec2-public-ip",
      "VpcId": "vpc-073b294916198ce49",
      "SubnetId": "subnet-0b6c8a8839e9a4f15",
      "NetworkInterfaceId": "eni-081c446b5284a5e06",
      "NetworkInterfaceDescription": "",
      "InstanceId": "i-07459a6fca5b35823",
      "Tags": {},
      "NetworkBorderGroup": "us-east-1c",
      "SecurityGroups": [
        {
          "GroupName": "launch-wizard-2",
          "GroupId": "sg-0a489dd6a65c244ce"
        }
      ],
      "SampleTime": "2024-04-05T15:13:59.228000+00:00"
    },
    {
      "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
      "AddressRegion": "us-east-1",
      "Address": "44.201.251.218",
      "AddressOwnerId": "470889052923",
      "AssociationStatus": "associated",
      "AddressType": "ec2-public-ip",
      "VpcId": "vpc-6c31a611",
      "SubnetId": "subnet-062f476008b99834b1",
      "NetworkInterfaceId": "eni-024845359c2c3ae9b",
      "NetworkInterfaceDescription": "",
      "InstanceId": "i-04ef786d9c4e03f41",
      "Tags": {},
      "NetworkBorderGroup": "us-east-1c",
      "SecurityGroups": [
        {
          "GroupName": "launch-wizard-2",
          "GroupId": "sg-0a489dd6a65c244ce"
        }
      ],
      "SampleTime": "2024-04-05T15:13:59.228000+00:00"
    }
  ]
}
```
For more information, see View public IP insights in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamDiscoveredPublicAddresses in AWS CLI Command Reference.

**get-ipam-discovered-resource-cidrs**

The following code example shows how to use get-ipam-discovered-resource-cidrs.

**AWS CLI**

**To view the IP address CIDRs discovered by an IPAM**

In this example, you're an IPAM delegated admin who wants to view details related to the IP address CIDRs for resources that the IPAM is discovering.

To complete this request:

The resource discovery you choose must be associated with the IPAM. The --resource-region is the AWS Region where resource was created.

The following get-ipam-discovered-resource-cidrs example lists the IP addresses for resources that the IPAM is discovering.

```bash
aws ec2 get-ipam-discovered-resource-cidrs \
   --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \n   --resource-region us-east-1
```

Output:

```json
{
}
```
For more information, see Monitor CIDR usage by resource in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamDiscoveredResourceCidrs in AWS CLI Command Reference.
get-ipam-pool-allocations

The following code example shows how to use get-ipam-pool-allocations.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following get-ipam-pool-allocations example gets the CIDRs allocated from an IPAM pool.

(Linux):

```bash
aws ec2 get-ipam-pool-allocations \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220
```

(Windows):

```bash
aws ec2 get-ipam-pool-allocations ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220
```

Output:

```json
{
   "IpamPoolAllocations": [
      {
         "Cidr": "10.0.0.0/16",
         "IpamPoolAllocationId": "ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220",
         "ResourceType": "custom",
         "ResourceOwner": "123456789012"
      }
   ]
}
```

- For API details, see GetIpamPoolAllocations in AWS CLI Command Reference.
get-ipam-pool-cidrs

The following code example shows how to use get-ipam-pool-cidrs.

AWS CLI

To get the CIDRs provisioned to an IPAM pool

The following get-ipam-pool-cidrs example gets the CIDRs provisioned to an IPAM pool.

(Linux):

```bash
aws ec2 get-ipam-pool-cidrs \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --filters 'Name=cidr,Values=10.*'
```

(Windows):

```bash
aws ec2 get-ipam-pool-cidrs ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --filters Name=cidr,Values=10.*
```

Output:

```json
{
   "IpamPoolCidr": {
      "Cidr": "10.0.0.0/24",
      "State": "provisioned"
   }
}
```

- For API details, see GetIpamPoolCidrs in AWS CLI Command Reference.

get-ipam-resource-cidrs

The following code example shows how to use get-ipam-resource-cidrs.

AWS CLI

To get the CIDRs allocated to a resource

The following get-ipam-resource-cidrs example gets the CIDRs allocated to a resource.
(Linux):

```bash
aws ec2 get-ipam-resource-cidrs \
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --filters Name=management-state,Values=unmanaged
```

(Windows):

```bash
aws ec2 get-ipam-resource-cidrs ^
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --filters Name=management-state,Values=unmanaged
```

Output:

```json
{
  "IpamResourceCidrs": [
    {
      "IpamId": "ipam-08440e7a3acde3908",
      "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
      "ResourceRegion": "us-east-2",
      "ResourceOwnerId": "123456789012",
      "ResourceId": "vpc-621b8709",
      "ResourceName": "Default AWS VPC",
      "ResourceCidr": "172.33.0.0/16",
      "ResourceType": "vpc",
      "ResourceTags": [
        {
          "Key": "Environment",
          "Value": "Test"
        },
        {
          "Key": "Name",
          "Value": "Default AWS VPC"
        }
      ],
      "IpUsage": 0.0039,
      "ComplianceStatus": "unmanaged",
      "ManagementState": "unmanaged",
      "OverlapStatus": "nonoverlapping",
      "VpcId": "vpc-621b8709"
    }
  ]
}
```
For more information, see Monitor CIDR usage by resource in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamResourceCidrs in AWS CLI Command Reference.

get-launch-template-data

The following code example shows how to use get-launch-template-data.

**AWS CLI**

**To get instance data for a launch template**

This example gets data about the specified instance and uses the --query option to return the contents in LaunchTemplateData. You can use the output as a base to create a new launch template or launch template version.

Command:

```
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query 'LaunchTemplateData'
```

Output:

```
{
    "Monitoring": {},
    "ImageId": "ami-8c1be5f6",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/xvda",
            "Ebs": {
                "DeleteOnTermination": true
            }
        }
    ],
    "EbsOptimized": false,
    "Placement": {
        "Tenancy": "default",
        "GroupName": "",
        "AvailabilityZone": "us-east-1a"
    }
}
```
"InstanceType": "t2.micro",
"NetworkInterfaces": [
  {
    "Description": "",
    "NetworkInterfaceId": "eni-35306abc",
    "PrivateIpAddress": "10.0.0.72"
  }
],
"SubnetId": "subnet-7b16de0c",
"Groups": [
  "sg-7c227019"
],
"Ipv6Addresses": [
  {
    "Ipv6Address": "2001:db8:1234:1a00::123"
  }
],
"PrivateIpAddress": "10.0.0.72"
]
}

get-managed-prefix-list-associations

The following code example shows how to use get-managed-prefix-list-associations.

AWS CLI

**To get prefix list associations**

The following get-managed-prefix-list-associations example gets the resources that are associated with the specified prefix list.

```bash
aws ec2 get-managed-prefix-list-associations \   --prefix-list-id pl-0123456abcabcabc1
```

Output:
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see GetManagedPrefixListAssociations in AWS CLI Command Reference.

get-managed-prefix-list-entries

The following code example shows how to use get-managed-prefix-list-entries.

AWS CLI

To get the entries for a prefix list

The following get-managed-prefix-list-entries gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
   --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
   "Entries": [
      {
         "Cidr": "10.0.0.0/16",
         "Description": "vpc-a"
      },
      {
         "Cidr": "10.2.0.0/16",
         "Description": "vpc-b"
      }
   ]
}
```
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see GetManagedPrefixListEntries in AWS CLI Command Reference.

def-network-insights-access-scope-analysis-findings

The following code example shows how to use get-network-insights-access-scope-analysis-findings.

**AWS CLI**

**To get the findings of Network Insights access scope analysis**

The following get-network-insights-access-scope-analysis-findings example gets the selected scope analysis findings in your AWS account.

```bash
aws ec2 get-network-insights-access-scope-analysis-findings \
  --region us-east-1 \
  --network-insights-access-scope-analysis-id nis \
  --nis-123456789111
```

**Output:**

```json
{
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
  "AnalysisFindings": [
    {
      "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "FindingComponents": [
        {
          "SequenceNumber": 1,
          "Component": {
            "Id": "eni-02e3d42d5cceca67d",
            "Arn": "arn:aws:ec2:us-east-1:936459623503:network-interface/eni-02e3d32d9cceca17d"
          },
          "OutboundHeader": {
            "DestinationAddresses": [
              "0.0.0.0/5",
              "11.0.0.0/8",
              "12.0.0.0/6",
              "128.0.0.0/3"
            ]
          }
        }
      ]
    }
  ]
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see GetNetworkInsightsAccessScopeAnalysisFindings in AWS CLI Command Reference.

**get-network-insights-access-scope-content**

The following code example shows how to use get-network-insights-access-scope-content.

**AWS CLI**

To get Network Insights access scope content
The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```bash
aws ec2 get-network-insights-access-scope-content \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789222
```

Output:

```json
{
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::NetworkInterface"
                        ]
                    }
                },
                "Destination": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/waf/latest/可参考的资源) in the [Network Access Analyzer Guide](https://docs.aws.amazon.com/waf/latest/可参考的资源).

**get-password-data**

The following code example shows how to use `get-password-data`.

```
AWS CLI

To get the encrypted password

This example gets the encrypted password.

Command:

```bash
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0",
   "Timestamp": "2013-08-07T22:18:38.000Z",
   "PasswordData": "gSlJFq+VpcZXqy+i4ktxMF6NyXQ4qCrT4+gaOuNOenX1MmgXPTj7XEXAMPLEUQ+YeFfb+L1U4C4AKv652Ux1iRB3CPTYP7wU3TUinhSuBd+p6LVk7T21KUml60Xbk6WPW1VYYm/TRPB1e1DQ7PY4an/DgZT4mwcpRFigzhniQgDDeO1InvSDcwoUtWNs0Y1S8ouri2W4n5GNliM3Q0AnNVelVz/53TkDtxbNoU606M1gK9zUWSxqEgwvbV2j8c5rP0WCUaMWSF14ziDu4bd7q+4RSyi8NUsVWnKZ4aEZffuDPGzKrF5yL1f3etP2L4ZR6CvG7K1hx7VQNV32Dajw="
}
```

To get the decrypted password

This example gets the decrypted password.

Command:

```bash
aws ec2 get-password-data --instance-id i-1234567890abcdef0 --priv-launch-key C:\Keys\MyKeyPair.pem
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0",
   "Timestamp": "2013-08-30T23:18:05.000Z",
   "PasswordData": "&ViJ652e*u"
}
```

- For API details, see [GetPasswordData](#) in [AWS CLI Command Reference](#).
get-reserved-instances-exchange-quote

The following code example shows how to use `get-reserved-instances-exchange-quote`.

**AWS CLI**

**To get a quote for exchanging a Convertible Reserved Instance**

This example gets the exchange information for the specified Convertible Reserved Instances.

**Command:**

```bash
aws ec2 get-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample
```

**Output:**

```json
{
   "CurrencyCode": "USD",
   "ReservedInstanceValueSet": [
      {
         "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",
         "ReservationValue": {
            "RemainingUpfrontValue": "0.000000",
            "HourlyPrice": "0.027800",
            "RemainingTotalValue": "730.556200"
         }
      }
   ],
   "PaymentDue": "424.983828",
   "TargetConfigurationValueSet": [
      {
         "TargetConfiguration": {
            "InstanceCount": 5,
            "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
         },
         "ReservationValue": {
            "RemainingUpfrontValue": "424.983828",
            "HourlyPrice": "0.016000",
            "RemainingTotalValue": "845.447828"
         }
      }
   ]
}
```
For API details, see [GetReservedInstancesExchangeQuote](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-reserved-instances-exchange-quote) in *AWS CLI Command Reference*.

### get-security-groups-for-vpc

The following code example shows how to use `get-security-groups-for-vpc`.

**AWS CLI**

To view security groups that can be associated with network interfaces in a specified VPC.

The following `get-security-groups-for-vpc` example shows the security groups that can be associated with network interfaces in the VPC.

```bash
aws ec2 get-security-groups-for-vpc \
   --vpc-id vpc-6c31a611 \
   --region us-east-1
```

**Output:**

```json
{
    "SecurityGroupForVpcs": [
        {
            "Description": "launch-wizard-36 created 2022-08-29T15:59:35.338Z",
            "GroupName": "launch-wizard-36",
            "OwnerId": "470889052923",
            "GroupId": "sg-007e0c3027ee885f5",
            "Tags": []
        }
    ]
}
```
• For API details, see [GetSecurityGroupsForVpc](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-security-groups-for-vpc.html) in *AWS CLI Command Reference*.

**get-serial-console-access-status**

The following code example shows how to use `get-serial-console-access-status`.

**AWS CLI**

To view the status of account access to the serial console

The following `get-serial-console-access-status` example determines whether serial console access is enabled for your account.

```
aws ec2 get-serial-console-access-status
```

Output:

```
{
   "SerialConsoleAccessEnabled": true
}
```

For more information, see [EC2 Serial Console](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-make-serial-console-access.html) in the *Amazon EC2 User Guide*.

• For API details, see [GetSerialConsoleAccessStatus](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-serial-console-access-status.html) in *AWS CLI Command Reference*.

**get-snapshot-block-public-access-state**

The following code example shows how to use `get-snapshot-block-public-access-state`.

```
aws ec2 get-snapshot-block-public-access-state
```

For more information, see [Block Public Access to Your Snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/block-public-access.html) in the *Amazon EC2 User Guide*.

• For API details, see [BlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/block-public-access.html) in *AWS CLI Command Reference*. 
AWS CLI

To get the current state of block public access for snapshots

The following get-snapshot-block-public-access-state example gets the current state of block public access for snapshots.

```shell
aws ec2 get-snapshot-block-public-access-state
```

Output:

```json
{
   "State": "block-all-sharing"
}
```

For more information, see [Block public access for snapshots](https://docs.aws.amazon.com/ebs/userguide/) in the Amazon EBS User Guide.

get-spot-placement-scores

The following code example shows how to use get-spot-placement-scores.

AWS CLI

To calculate the Spot placement score for specified requirements

The following get-spot-placement-scores example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.

To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```shell
aws ec2 get-spot-placement-scores \
   --region us-east-1 \
   --generate-cli-skeleton input > attributes.json
```

Output:

```json
{
```
"InstanceTypes": [
  "",
],
"TargetCapacity": 0,
"TargetCapacityUnitType": "vcpu",
"SingleAvailabilityZone": true,
"RegionNames": [
  ""
],
"InstanceRequirementsWithMetadata": {
  "ArchitectureTypes": [
    "x86_64_mac"
  ],
  "VirtualizationTypes": [
    "hvm"
  ],
  "InstanceRequirements": {
    "VCpuCount": {
      "Min": 0,
      "Max": 0
    },
    "MemoryMiB": {
      "Min": 0,
      "Max": 0
    },
    "CpuManufacturers": [
      "amd"
    ],
    "MemoryGiBPerVCpu": {
      "Min": 0.0,
      "Max": 0.0
    },
    "ExcludedInstanceTypes": [
      ""
    ],
    "InstanceGenerations": [
      "previous"
    ],
    "SpotMaxPricePercentageOver LowestPrice": 0,
    "OnDemandMaxPricePercentageOver LowestPrice": 0,
    "BareMetal": "excluded",
    "BurstablePerformance": "excluded",
    "RequireHibernateSupport": true,
    "NetworkInterfaceCount": {
      "Actions and scenarios" : 2472
    }
  }
}
Configure the JSON file. You must provide a value for TargetCapacity. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.
Calculate the Spot placement score for the requirements specified in attributes.json. Specify the name and path to your JSON file by using the --cli-input-json parameter.

```bash
aws ec2 get-spot-placement-scores \
--region us-east-1 \
--cli-input-json file://attributes.json
```

Output if SingleAvailabilityZone is set to false or omitted (if omitted, it defaults to false). A scored list of Regions is returned.

```
"Recommendation": [
  {
    "Region": "us-east-1",
    "Score": 7
  },
  {
    "Region": "us-west-1",
    "Score": 5
  },
  ...
```

Output if SingleAvailabilityZone is set to true. A scored list of SingleAvailability Zones is returned.

```
"Recommendation": [
  {
    "Region": "us-east-1",
    "AvailabilityZoneId": "use1-az1",
    "Score": 8
  },
  {
    "Region": "us-east-1",
    "AvailabilityZoneId": "usw2-az3",
    "Score": 6
  },
  ...
```

For more information about calculating a Spot placement score, and for example configurations, see [Calculate a Spot placement score](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/calculate-spot-placement-score.html) in the *Amazon EC2 User Guide*.

- For API details, see [GetSpotPlacementScores](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-spot-placement-scores.html) in *AWS CLI Command Reference*. 

**Actions and scenarios**
get-subnet-cidr-reservations

The following code example shows how to use get-subnet-cidr-reservations.

AWS CLI

To get information about a subnet CIDR reservation

The following get-subnet-cidr-reservations example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \
   --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{
   "SubnetIpv4CidrReservations": [
      {
         "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
         "SubnetId": "subnet-03c51e2e6cEXAMPLE",
         "Cidr": "10.1.0.16/28",
         "ReservationType": "prefix",
         "OwnerId": "123456789012"
      }
   ],
   "SubnetIpv6CidrReservations": []
}
```

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see GetSubnetCidrReservations in AWS CLI Command Reference.

get-transit-gateway-attachment-propagations

The following code example shows how to use get-transit-gateway-attachment-propagations.

AWS CLI

To list the route tables to which the specified resource attachment propagates routes
The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```
aws ec2 get-transit-gateway-attachment-propagations \
  --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
```

Output:

```
{
  "TransitGatewayAttachmentPropagations": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
      "State": "enabled"
    }
  ]
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

**get-transit-gateway-multicast-domain-associations**

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

**AWS CLI**

**To view the information about the transit gateway multicast domain associations**

The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
  "MulticastDomainAssociations": [
    {
```
"TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
"ResourceId": "vpc-01128d2c24EXAMPLE",
"ResourceType": "vpc",
"Subnet": {
    "SubnetId": "subnet-000de86e3bEXAMPLE",
    "State": "associated"
}
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-4EXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-5EXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-aEXAMPLE",
        "State": "associated"
    }
},
{
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnet": {
        "SubnetId": "subnet-fEXAMPLE",
        "State": "associated"
    }
}
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see `GetTransitGatewayMulticastDomainAssociations` in AWS CLI Command Reference.

get-transit-gateway-prefix-list-references

The following code example shows how to use get-transit-gateway-prefix-list-references.

AWS CLI

To get prefix list references in a transit gateway route table

The following get-transit-gateway-prefix-list-references example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```bash
aws ec2 get-transit-gateway-prefix-list-references \
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \ 
   --filters Name=prefix-list-id,Values=pl-1111122222222333
```

Output:

```json
{
   "TransitGatewayPrefixListReferences": [
      {
         "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
         "PrefixListId": "pl-1111122222222333",
         "PrefixListOwnerId": "123456789012",
         "State": "available",
         "Blackhole": false,
         "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbcaab",
            "ResourceType": "vpc",
            "ResourceId": "vpc-1122334455566aabb"
         }
      }
   ]
}
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see GetTransitGatewayPrefixListReferences in AWS CLI Command Reference.

get-transit-gateway-route-table-associations

The following code example shows how to use get-transit-gateway-route-table-associations.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following get-transit-gateway-route-table-associations example displays information about the associations for the specified transit gateway route table.

```bash
aws ec2 get-transit-gateway-route-table-associations \
   --transit-gateway-route-table-id tgw-rtb-0a823eddeEXAMPLE
```

Output:

```json
{
   "Associations": [
   {
      "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "State": "associating"
   }
   ]
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see GetTransitGatewayRouteTableAssociations in AWS CLI Command Reference.
get-transit-gateway-route-table-propagations

The following code example shows how to use get-transit-gateway-route-table-propagations.

AWS CLI

To display information about the route table propagations for the specified transit gateway route table

The following get-transit-gateway-route-table-propagations example returns the route table propagations for the specified route table.

```
aws ec2 get-transit-gateway-route-table-propagations \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```
{
   "TransitGatewayRouteTablePropagations": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
         "ResourceId": "vpc-3EXAMPLE",
         "ResourceType": "vpc",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
         "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
         "ResourceType": "direct-connect-gateway",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
         "ResourceId": "8384da05-13ce-4a91-aada-5a1baEXAMPLE",
         "ResourceType": "direct-connect-gateway",
         "State": "enabled"
      }
   ]
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.
get-verified-access-endpoint-policy

The following code example shows how to use get-verified-access-endpoint-policy.

AWS CLI

To get the Verified Access policy of an endpoint

The following get-verified-access-endpoint-policy example gets the Verified Access policy of the specified endpoint.

```bash
aws ec2 get-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```json
{
  "PolicyEnabled": true,
  "PolicyDocument": "permit(principal,action,resource)\nwhen
  context.identity.groups.contains("finance") &&
  context.identity.email_verified == true
};"
}
```

For more information, see Verified Access policies in the AWS Verified Access User Guide.

get-verified-access-group-policy

The following code example shows how to use get-verified-access-group-policy.

AWS CLI

To get the Verified Access policy of a group

The following get-verified-access-group-policy example gets the Verified Access policy of the specified group.

```bash
aws ec2 get-verified-access-group-policy \
```

For API details, see GetTransitGatewayRouteTablePropagations in AWS CLI Command Reference.

get-verified-access-endpoint-policy

For API details, see GetVerifiedAccessEndpointPolicy in AWS CLI Command Reference.
Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen

    context.identity.groups.contains("finance") &&

    context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/awscli/get-verified-access-group-policy.html) in *AWS CLI Command Reference*.

### get-vpn-connection-device-sample-configuration

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

**AWS CLI**

**To download a sample configuration file**

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```
aws ec2 get-vpn-connection-device-sample-configuration \
    --vpn-connection-id vpn-123456789abc01234 \
    --vpn-connection-device-type-id 5fb390ba
```

Output:

```
{
    "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-file"
}
```

For more information, see [Download the configuration file](https://docs.aws.amazon.com/vpns/latest/adminguide/download-sample-configuration.html) in the *AWS Site-to-Site VPN User Guide*. 

---

**Actions and scenarios**

---

2482
• For API details, see GetVpnConnectionDeviceSampleConfiguration in AWS CLI Command Reference.

get-vpn-connection-device-types

The following code example shows how to use get-vpn-connection-device-types.

AWS CLI

To list gateway devices with a sample configuration file

The following get-vpn-connection-device-types example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```bash
aws ec2 get-vpn-connection-device-types \
   --query "VpnConnectionDeviceTypes[?Vendor=='Palo Alto Networks']"
```

Output:

```
[
    {
        "VpnConnectionDeviceTypeId": "754a6372",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+"
    },
    {
        "VpnConnectionDeviceTypeId": "9612cbed",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+ (GUI)"
    },
    {
        "VpnConnectionDeviceTypeId": "5fb390ba",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 7.0+"
    }
]
```

For more information, see Download the configuration file in the AWS Site-to-Site VPN user Guide.
import-client-vpn-client-certificate-revocation-list

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

**AWS CLI**

**To import a client certificate revocation list**

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```bash
aws ec2 import-client-vpn-client-certificate-revocation-list \
  --certificate-revocation-list file:///path/to/crl.pem \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "Return": true
}
```

For more information, see [Client Certificate Revocation Lists](https://docs.aws.amazon.com/clientvpn/latest/adminguide/crl.html) in the *AWS Client VPN Administrator Guide*.

import-image

The following code example shows how to use `import-image`.

**AWS CLI**

**To import a VM image file as an AMI**

The following `import-image` example imports the specified OVA.
aws ec2 import-image \
   --disk-containers Format=ova,UserBucket="\{S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.ova\}"

Output:

```json
{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "Progress": "2",
   "SnapshotDetails": [
      {
         "DiskImageSize": 0.0,
         "Format": "ova",
         "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
         }
      }
   ],
   "Status": "active",
   "StatusMessage": "pending"
}
```

- For API details, see [ImportImage](#) in AWS CLI Command Reference.

**import-key-pair**

The following code example shows how to use import-key-pair.

**AWS CLI**

**To import a public key**

First, generate a key pair with the tool of your choice. For example, use this ssh-keygen command:

Command:

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

Output:
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...

This example command imports the specified public key.

Command:

```
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```json
{
  "KeyName": "my-key",
}
```

- For API details, see [ImportKeyPair](https://docs.aws.amazon.com/cli/latest/reference/ec2/import-key-pair.html) in *AWS CLI Command Reference*.

**import-snapshot**

The following code example shows how to use `import-snapshot`.

AWS CLI

**To import a snapshot**

The following `import-snapshot` example imports the specified disk as a snapshot.

```
aws ec2 import-snapshot 
  --description "My server VMDK" 
  --disk-container Format=VMDK,UserBucket={S3Bucket=my-import.bucket,S3Key=vms/my-server-vm.vmdk}
```

Output:

```json
{
}
```
"Description": "My server VMDK",
"ImportTaskId": "import-snap-1234567890abcdef0",
"SnapshotTaskDetail": {
  "Description": "My server VMDK",
  "DiskImageSize": "0.0",
  "Format": "VMDK",
  "Progress": "3",
  "Status": "active",
  "StatusMessage": "pending"
  "UserBucket": {
    "S3Bucket": "my-import-bucket",
    "S3Key": "vms/my-server-vm.vmdk"
  }
}
}

• For API details, see ImportSnapshot in AWS CLI Command Reference.

list-images-in-recycle-bin

The following code example shows how to use list-images-in-recycle-bin.

AWS CLI

To list the images in the Recycle Bin

The following list-images-in-recycle-bin example lists all of the images that are currently retained in the Recycle Bin.

aws ec2 list-images-in-recycle-bin

Output:

{
  "Images": [
    {
      "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
      "Description": "Monthly AMI One",
      "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
      "Name": "AMI_01",
      "ImageId": "ami-01112233444abcd"
    }
  ]
}
For more information, see [Recover AMIs from the Recycle Bin](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/recover-amis-from-recycle-bin.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [ListImagesInRecycleBin](https://docs.aws.amazon.com/cli/latest/reference/ec2/list-images-in-recycle-bin.html) in *AWS CLI Command Reference*.

### list-snapshots-in-recycle-bin

The following code example shows how to use `list-snapshots-in-recycle-bin`.

**AWS CLI**

**To view snapshots in the Recycle Bin**

The following `list-snapshots-in-recycle-bin` example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```bash
aws ec2 list-snapshots-in-recycle-bin 
   --snapshot-id snap-01234567890abcdef
```

**Output:**

```json
{
   "SnapshotRecycleBinInfo": [
      {
         "Description": "Monthly data backup snapshot",
         "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
         "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
         "VolumeId": "vol-abcdef09876543210",
         "SnapshotId": "snap-01234567890abcdef"
      }
   ]
}
```

For more information about Recycle Bin for Amazon EBS, see [Recover snapshots from the Recycle Bin](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/recover-snapshots-from-recycle-bin.html) in the *Amazon EC2 User Guide*. 
lock-snapshot

The following code example shows how to use lock-snapshot.

AWS CLI

**Example 1: To lock a snapshot in governance mode**

The following `lock-snapshot` example locks the specified snapshot in governance mode.

```bash
aws ec2 lock-snapshot \
   --snapshot-id snap-0b5e733b4a8df6e0d \
   --lock-mode governance \
   --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "governance",
    "LockDuration": 365,
    "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
    "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00",
    "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00"
}
```

For more information, see [Snapshot lock](https://docs.aws.amazon.com/ebs/userguide/EBS-Snapshot-Lock.html) in the Amazon EBS User Guide.

**Example 2: To lock a snapshot in compliance mode**

The following `lock-snapshot` example lock the specified snapshot in compliance mode.

```bash
aws ec2 lock-snapshot \
   --snapshot-id snap-0163a8524c5b9901f \
   --lock-mode compliance \
   --cool-off-period 24 \
   --lock-duration 365
```

Output:

```
For more information, see [Snapshot lock](https://docs.aws.amazon.com/AmazonEBS/latest/UserGuide/snapshot-lock.html) in the *Amazon EBS User Guide*.

- For API details, see [LockSnapshot](https://docs.aws.amazon.com/AWSCommandReference/ec2-lock-snapshot.html) in *AWS CLI Command Reference*.

**modify-address-attribute**

The following code example shows how to use `modify-address-attribute`.

**AWS CLI**

To modify the domain name attribute associated with an elastic IP address

The following `modify-address-attribute` examples modify the domain name attribute of an elastic IP address.

**Linux:**

```
aws ec2 modify-address-attribute \\
   --allocation-id eipalloc-abcdef01234567890 \\
   --domain-name example.com
```

**Windows:**

```
aws ec2 modify-address-attribute ^
   --allocation-id eipalloc-abcdef01234567890 ^
   --domain-name example.com
```

**Output:**

```
{
   "Actions and scenarios": 2490
```
"Addresses": [  
  [  
    "PublicIp": "192.0.2.0",  
    "AllocationId": "eipalloc-abcdef01234567890",  
    "PtrRecord": "example.net.",  
    "PtrRecordUpdate": {  
      "Value": "example.com.",  
      "Status": "PENDING"  
    }  
  ]  
]

To monitor the pending change and to view the modified attributes of an elastic IP address, see `describe-addresses-attribute` in the AWS CLI Command Reference.

- For API details, see `ModifyAddressAttribute` in AWS CLI Command Reference.

modify-availability-zone-group

The following code example shows how to use `modify-availability-zone-group`.

**AWS CLI**

To enable a zone group

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group 
  --group-name us-west-2-lax-1 
  --opt-in-status opted-in
```

Output:

```
{
  "Return": true
}
```

For more information, see `Regions and Zones` in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `ModifyAvailabilityZoneGroup` in AWS CLI Command Reference.
modify-capacity-reservation-fleet

The following code example shows how to use modify-capacity-reservation-fleet.

**AWS CLI**

**Example 1: To modify the total target capacity of a Capacity Reservation Fleet**

The following `modify-capacity-reservation-fleet` example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```bash
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --total-target-capacity 160
```

Output:

```json
{
    "Return": true
}
```

**Example 2: To modify the end date of a Capacity Reservation Fleet**

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```bash
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --end-date 2022-07-04T23:59:59.000Z
```

Output:

```json
{
    "Return": true
}
```
modify-capacity-reservation

The following code example shows how to use modify-capacity-reservation.

AWS CLI

Example 1: To change the number of instances reserved by an existing capacity reservation

The following modify-capacity-reservation example changes the number of instances for which the capacity reservation reserves capacity.

```shell
aws ec2 modify-capacity-reservation
   --capacity-reservation-id cr-1234abcd56EXAMPLE
   --instance-count 5
```

Output:

```json
{
   "Return": true
}
```

Example 2: To change the end date and time for an existing capacity reservation

The following modify-capacity-reservation example modifies an existing capacity reservation to end at the specified date and time.

```shell
aws ec2 modify-capacity-reservation
   --capacity-reservation-id cr-1234abcd56EXAMPLE
   --end-date-type limited
   --end-date 2019-08-31T23:59:59Z
```

For more information, see Modifying a Capacity Reservation in the Amazon Elastic Compute Cloud User Guide for Linux Instances.
modify-client-vpn-endpoint

The following code example shows how to use modify-client-vpn-endpoint.

**AWS CLI**

To modify a Client VPN endpoint

The following modify-client-vpn-endpoint example enables client connection logging for the specified Client VPN endpoint.

```bash
aws ec2 modify-client-vpn-endpoint \\
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \\
    --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{
   "Return": true
}
```

For more information, see [Client VPN Endpoints](https://docs.aws.amazon.com/vpc/latest/clientvpn-admin/client-vpn-endpoints.html) in the *AWS Client VPN Administrator Guide*.

• For API details, see [ModifyClientVpnEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-client-vpn-endpoint.html) in *AWS CLI Command Reference*.

modify-default-credit-specification

The following code example shows how to use modify-default-credit-specification.

**AWS CLI**

To modify the default credit option

The following modify-default-credit-specification example modifies the default credit option for T2 instances.

```bash
aws ec2 modify-default-credit-specification \\
    --instance-family t2 \\
    --cpu-credits unlimited
```
modify-ebs-default-kms-key-id

The following code example shows how to use modify-ebs-default-kms-key-id.

AWS CLI

To set your default CMK for EBS encryption

The following modify-ebs-default-kms-key-id example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```bash
aws ec2 modify-ebs-default-kms-key-id
   --kms-key-id alias/my-cmk
```

Output:

```json
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

• For API details, see ModifyEbsDefaultKmsKeyId in AWS CLI Command Reference.

modify-fleet

The following code example shows how to use modify-fleet.

AWS CLI

To scale an EC2 Fleet
The following `modify-fleet` example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is `terminate`, the EC2 fleet terminates any instances that exceed the new target capacity.

```bash
aws ec2 modify-fleet 
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE 
    --target-capacity-specification TotalTargetCapacity=5
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Managing an EC2 Fleet](https://aws.amazon.com/documentation/ec2 gestión del escuadrón de EC2) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyFleet](https://aws.amazon.com/documentation/ec2/modify-fleet) in *AWS CLI Command Reference*.

### modify-fpga-image-attribute

The following code example shows how to use `modify-fpga-image-attribute`.

**AWS CLI**

**To modify the attributes of an Amazon FPGA image**

This example adds load permissions for account ID 123456789012 for the specified AFI.

**Command:**

```bash
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id afi-0d123e123bfc85abc --load-permission Add=[[UserId=123456789012]]
```

**Output:**

```json
{
    "FpgaImageAttribute": {
        "FpgaImageId": "afi-0d123e123bfc85abc",
```

*Actions and scenarios*
For API details, see [ModifyFpgaImageAttribute](#) in *AWS CLI Command Reference*.

**modify-hosts**

The following code example shows how to use `modify-hosts`.

**AWS CLI**

**Example 1: To enable auto-placement for a Dedicated Host**

The following `modify-hosts` example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```bash
aws ec2 modify-hosts \
  --host-id h-06c2f189b4EXAMPLE \
  --auto-placement on
```

**Output:**

```
{
  "Successful": [
    "h-06c2f189b4EXAMPLE"
  ],
  "Unsuccessful": []
}
```

**Example 2: To enable host recovery for a Dedicated Host**

The following `modify-hosts` example enables host recovery for the specified Dedicated Host.

```bash
aws ec2 modify-hosts \
  --host-id h-06c2f189b4EXAMPLE \
  --host-recovery on
```
modify-id-format

The following code example shows how to use modify-id-format.

**AWS CLI**

To enable the longer ID format for a resource

The following modify-id-format example enables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \ 
   --resource instance \ 
   --use-long-ids
```

To disable the longer ID format for a resource

The following modify-id-format example disables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \ 
   --resource instance \ 
   --no-use-long-ids
```

The following modify-id-format example enables the longer ID format for all supported resource types that are within their opt-in period.
The following code example shows how to use `modify-identity-id-format`.

**AWS CLI**

**To enable an IAM role to use longer IDs for a resource**

The following `modify-identity-id-format` example enables the IAM role `EC2Role` in your AWS account to use long ID format for the instance resource type.

```bash
aws ec2 modify-identity-id-format \
  --principal-arn arn:aws:iam::123456789012:role/EC2Role \
  --resource instance \
  --use-long-ids
```

**To enable an IAM user to use longer IDs for a resource**

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for the volume resource type.

```bash
aws ec2 modify-identity-id-format \
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \
  --resource volume \
  --use-long-ids
```

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

```bash
aws ec2 modify-identity-id-format \
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \
  --resource all-current \
```

For API details, see [ModifyIdFormat](#) in *AWS CLI Command Reference*.
modify-image-attribute

The following code example shows how to use modify-image-attribute.

AWS CLI

Example 1: To make an AMI public

The following modify-instance-attribute example makes the specified AMI public.

```bash
aws ec2 modify-image-attribute \
   --image-id ami-5731123e \
   --launch-permission "Add=[[Group=all]]"
```

This command produces no output.

Example 2: To make an AMI private

The following modify-instance-attribute example makes the specified AMI private.

```bash
aws ec2 modify-image-attribute \
   --image-id ami-5731123e \
   --launch-permission "Remove=[[Group=all]]"
```

This command produces no output.

Example 3: To grant launch permission to an AWS account

The following modify-instance-attribute example grants launch permissions to the specified AWS account.

```bash
aws ec2 modify-image-attribute \
   --image-id ami-5731123e \
   --launch-permission "Add=[[UserId=123456789012]]"
```

This command produces no output.
Example 4: To remove launch permission from an AWS account

The following modify-instance-attribute example removes launch permissions from the specified AWS account.

```bash
aws ec2 modify-image-attribute \
  --image-id ami-5731123e \
  --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see ModifyImageAttribute in AWS CLI Command Reference.

modify-instance-attribute

The following code example shows how to use modify-instance-attribute.

AWS CLI

Example 1: To modify the instance type

The following modify-instance-attribute example modifies the instance type of the specified instance. The instance must be in the stopped state.

```bash
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --instance-type "{"Value": "m1.small"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following modify-instance-attribute example enables enhanced networking for the specified instance. The instance must be in the stopped state.

```bash
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute
The following modify-instance-attribute example sets the sourceDestCheck attribute of the specified instance to true. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check "{"Value": true}"
```

This command produces no output.

**Example 4: To modify the deleteOnTermination attribute of the root volume**

The following modify-instance-attribute example sets the deleteOnTermination attribute for the root volume of the specified Amazon EBS-backed instance to false. By default, this attribute is true for the root volume.

Command:

```
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --block-device-mappings "["DeviceName": "/dev/sda1","Ebs": \
    {"DeleteOnTermination":false}]"
```

This command produces no output.

**Example 5: To modify the user data attached to an instance**

The following modify-instance-attribute example adds the contents of the file UserData.txt as the UserData for the specified instance.

Contents of original file UserData.txt:

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

**Linux/macOS version of the command:**

```
base64 UserData.txt > UserData.base64.txt
```
This command produces no output.

Windows version of the command:

```
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 > UserData.base64.txt
```

Output:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Now you can reference that file in the CLI command that follows:

```
aws ec2 modify-instance-attribute \
   --instance-id=i-09b5a14dbca622e76 \
   --attribute userData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the EC2 User Guide.

- For API details, see ModifyInstanceAttribute in AWS CLI Command Reference.

modify-instance-capacity-reservation-attributes

The following code example shows how to use modify-instance-capacity-reservation-attributes.

**AWS CLI**

**Example 1: To modify an instance's capacity reservation targeting settings**

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance to target a specific capacity reservation.

```
aws ec2 modify-instance-capacity-reservation-attributes \
   --instance-id i-EXAMPLE8765abcd4e \
   --capacity-reservation-specification
   'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```
Example 2: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```
aws ec2 modify-instance-capacity-reservation-attributes
   --instance-id i-EXAMPLE8765abcd4e
   --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:
```
{
   "Return": true
}
```

- For API details, see [ModifyInstanceCapacityReservationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-capacity-reservation-attributes.html) in *AWS CLI Command Reference*.

modify-instance-credit-specification

The following code example shows how to use `modify-instance-credit-specification`.

**AWS CLI**

To modify the credit option for CPU usage of an instance

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

Command:
aws ec2 modify-instance-credit-specification --instance-credit-specification "InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"

Output:

```
{
   "SuccessfulInstanceCreditSpecifications": [
      {
         "InstanceId": "i-1234567890abcdef0"
      }
   ],
   "UnsuccessfulInstanceCreditSpecifications": []
}
```

- For API details, see [ModifyInstanceCreditSpecification](https://aws.amazon.com/cli/) in *AWS CLI Command Reference*.

modify-instance-event-start-time

The following code example shows how to use `modify-instance-event-start-time`.

**AWS CLI**

**To modify the event start time for an instance**

The following `modify-instance-event-start-time` command shows how to modify the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0 --instance-event-id instance-event-0abcdef1234567890 --not-before 2019-03-25T10:00:00.000
```

Output:

```
"Event": {
   "InstanceEventId": "instance-event-0abcdef1234567890",
   "Code": "system-reboot",
   "Description": "scheduled reboot",
   "NotAfter": "2019-03-25T12:00:00.000Z",
   "NotBefore": "2019-03-25T10:00:00.000Z",
```

Actions and scenarios 2505
modify-instance-event-window

The following code example shows how to use `modify-instance-event-window`.

**AWS CLI**

**Example 1: To modify the time range of an event window**

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

**Output:**

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
        "EndWeekDay": "wednesday",
        "EndHour": 8
      }
    ],
    "Name": "myEventWindowName",
    "AssociationTarget": {
      "InstanceIds": [
      
    
```
For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To modify a set of time ranges for an event window**

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range '[["StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8}, 
    {["StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", 
    "EndHour": 8}]'
```

**Output:**

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
```
For event window constraints, see [Considerations](Scheduled%20Events%20section%20of%20the%20Amazon%20EC2%20User%20Guide) in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 3: To modify the cron expression of an event window**

The following `modify-instance-event-window` example modifies the cron expression of an event window. Specify the `cron-expression` parameter to modify the cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 modify-instance-event-window \\
  --region us-east-1 \\
  --instance-event-window-id iew-0abcdef1234567890 \\
  --cron-expression "* 21-23 * * 2,3"
```
Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [
            "i-0abcdef1234567890",
            "i-0be35f9acb8ba01f0"
         ],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating",
      "Tags": [
         {
            "Key": "K1",
            "Value": "V1"
         }
      ]
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

- For API details, see [ModifyInstanceEventWindow](#) in [AWS CLI Command Reference](#).

modify-instance-maintenance-options

The following code example shows how to use modify-instance-maintenance-options.

**AWS CLI**

**Example 1: To disable the recovery behavior of an instance**

The following modify-instance-maintenance-options example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
   --instance-id i-0abcdef1234567890 \
```
--auto-recovery disabled

Output:

```json
{
   "InstanceId": "i-0abcdef1234567890",
   "AutoRecovery": "disabled"
}
```

For more information, see [Recover your instance](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/recover-instance.html) in the *Amazon EC2 User Guide for Linux Instances*.

**Example 2: To set the recovery behavior of an instance to default**

The following `modify-instance-maintenance-options` example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```bash
aws ec2 modify-instance-maintenance-options \
   --instance-id i-0abcdef1234567890 \
   --auto-recovery default
```

Output:

```json
{
   "InstanceId": "i-0abcdef1234567890",
   "AutoRecovery": "default"
}
```

For more information, see [Recover your instance](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/recover-instance.html) in the *Amazon EC2 User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMaintenanceOptions](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-maintenance-options.html) in *AWS CLI Command Reference*.

### modify-instance-metadata-options

The following code example shows how to use `modify-instance-metadata-options`.

**AWS CLI**

**Example 1: To enable IMDSv2**
The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```
aws ec2 modify-instance-metadata-options \
   --instance-id i-1234567898abcdef0 \
   --http-tokens required \
   --http-endpoint enabled
```

Output:

```
{
   "InstanceId": "i-1234567898abcdef0",
   "InstanceMetadataOptions": {
      "State": "pending",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 1,
      "HttpEndpoint": "enabled"
   }
}
```

For more information, see [Instance metadata and user data](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-metadata.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To disable instance metadata**

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```
aws ec2 modify-instance-metadata-options \
   --instance-id i-1234567898abcdef0 \
   --http-endpoint disabled
```

Output:

```
{
   "InstanceId": "i-1234567898abcdef0",
   "InstanceMetadataOptions": {
      "State": "pending",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 1,
      "HttpEndpoint": "disabled"
   }
}
```
Example 3: To enable instance metadata IPv6 endpoint for your instance

The following modify-instance-metadata-options example shows you how to turn on the IPv6 endpoint for the instance metadata service.

```bash
aws ec2 modify-instance-metadata-options \
   --instance-id i-1234567898abcdef0 \
   --http-protocol-ipv6 enabled \
   --http-endpoint enabled
```

Output:

```json
{
   "InstanceId": "i-1234567898abcdef0",
   "InstanceMetadataOptions": {
      "State": "pending",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 1,
      "HttpEndpoint": "enabled",
      "HttpProtocolIpv6": "enabled"
   }
}
```

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System. For more information, see Instance metadata and user data in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyInstanceMetadataOptions in AWS CLI Command Reference.

modify-instance-placement

The following code example shows how to use modify-instance-placement.

AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host
The following `modify-instance-placement` example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```bash
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
    --affinity default
```

Output:

```json
{
    "Return": true
}
```

**Example 2: To establish affinity between an instance and the specified Dedicated Host**

The following `modify-instance-placement` example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```bash
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
    --affinity host \
    --host-id i-0e6ddf6187EXAMPLE
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Modifying Instance Tenancy and Affinity](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/modifying_instance_tenancy.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 3: To move an instance to a placement group**

The following `modify-instance-placement` example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```bash
aws ec2 stop-instances \
```
For more information, see Changing the Placement Group for an Instance in the Amazon Elastic Compute Cloud Users Guide.

Example 4: To remove an instance from a placement group

The following modify-instance-placement example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string ("") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

```
aws ec2 stop-instances \\
--instance-ids i-0123a456700123456
```

Modify the placement (Windows Command Prompt, Linux, and macOS):

```
aws ec2 modify-instance-placement \\
--instance-id i-0123a456700123456 \\
--group-name ""
```

Modify the placement (Windows PowerShell):

```
aws ec2 modify-instance-placement ` \\
--instance-id i-0123a456700123456 ` \\
--group-name """
```

Restart the instance:

```
aws ec2 start-instances \\
--instance-ids i-0123a456700123456
```
Output:

{
   "Return": true
}

For more information, see Modifying Instance Tenancy and Affinity in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyInstancePlacement in AWS CLI Command Reference.

modify-ipam-pool

The following code example shows how to use modify-ipam-pool.

AWS CLI

To modify an IPAM pool

The following modify-ipam-pool example modifies an IPAM pool.

(Linux):

```
aws ec2 modify-ipam-pool \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --add-allocation-resource-tags "Key=Owner,Value=Build Team" \
   --clear-allocation-default-netmask-length \
   --allocation-min-netmask-length 14
```

(Windows):

```
aws ec2 modify-ipam-pool ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
   --clear-allocation-default-netmask-length ^
   --allocation-min-netmask-length 14
```

Output:

```
{
   "IpamPool": {
```
modify-ipam-resource-cidr

The following code example shows how to use `modify-ipam-resource-cidr`.

AWS CLI

To modify the CIDR allocated to a resource

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.

(Linux):
aws ec2 modify-ipam-resource-cidr
--current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38
--destination-ipam-scope-id ipam-scope-0da34c61fd189a141
--resource-id vpc-010e1791024eb0af9
--resource-cidr 10.0.1.0/24
--resource-region us-east-1
--monitored

(Windows):

aws ec2 modify-ipam-resource-cidr ^
--current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
--destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
--resource-id vpc-010e1791024eb0af9 ^
--resource-cidr 10.0.1.0/24 ^
--resource-region us-east-1 ^
--monitored

Output:

{
  "IpamResourceCidr": {
    "IpamId": "ipam-08440e7a3acde3908",
    "IpamScopeId": "ipam-scope-0da34c61fd189a141",
    "IpamPoolId": "ipam-pool-0533048da7d823723",
    "ResourceRegion": "us-east-1",
    "ResourceOwnerId": "123456789012",
    "ResourceId": "vpc-010e1791024eb0af9",
    "ResourceCidr": "10.0.1.0/24",
    "ResourceType": "vpc",
    "ResourceTags": [
      {
        "Key": "Environment",
        "Value": "Preprod"
      },
      {
        "Key": "Owner",
        "Value": "Build Team"
      }
    ],
    "IpUsage": 0.0,
    "ComplianceStatus": "noncompliant",
  }
}
For more information on moving resources, see [Move resource CIDRs between scopes](#) in the *Amazon VPC IPAM User Guide*.

For more information on changing monitoring states, see [Change the monitoring state of resource CIDRs](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ModifyIpamResourceCidr](#) in [AWS CLI Command Reference](#).

modify-ipam-resource-discovery

The following code example shows how to use `modify-ipam-resource-discovery`.

**AWS CLI**

**To modify the operating regions of a resource discovery**

In this example, you're an IPAM delegated admin who wants to modify the operating regions of a resource discovery.

To complete this request:

You cannot modify a default resource discovery and you must be the owner of the resource discovery. You need the resource discovery ID, which you can get with `describe-ipam-resource-discoveries`.

The following `modify-ipam-resource-discovery` example modifies a non-default resource discovery in your AWS account.

```
aws ec2 modify-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
    --add-operating-regions RegionName='us-west-1' \
    --remove-operating-regions RegionName='us-east-2' \
    --region us-east-1
```

Output:
modify-ipam-scope

The following code example shows how to use modify-ipam-scope.

AWS CLI

To modify the description of a scope

In this scenario, you're an IPAM delegated admin who wants to modify the description of an IPAM scope.

To complete this request, you'll need the scope ID, which you can get with describe-ipam-scopes.

The following modify-ipam-scope example updates the description of the scope.

```
aws ec2 modify-ipam-scope \
--ipam-scope-id ipam-scope-0d3539a30b57dcdd1 \
```
--description example 
--region us-east-1

Output:

```
{
   "IpamScope": {
      "OwnerId": "320805250157",
      "IpamScopeId": "ipam-scope-0d3539a30b57dcdd1",
      "IpamScopeArn": "arn:aws:ec2::320805250157:ipam-scope/ipam-scope-0d3539a30b57dcdd1",
      "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
      "IpamRegion": "us-east-1",
      "IpamScopeType": "public",
      "IsDefault": true,
      "Description": "example",
      "PoolCount": 1,
      "State": "modify-in-progress"
   }
}
```

For more information about scopes, see [How IPAM works](#) in the Amazon VPC IPAM User Guide.

- For API details, see [ModifyIpamScope](#) in AWS CLI Command Reference.

modify-ipam

The following code example shows how to use modify-ipam.

**AWS CLI**

**To modify an IPAM**

The following `modify-ipam` example modifies an IPAM by adding an Operating Region.

(Linux):

```
aws ec2 modify-ipam \
   --ipam-id ipam-08440e7a3acde3908 \
   --add-operating-regions RegionName=us-west-2
```

(Windows):
aws ec2 modify-ipam ^
   --ipam-id ipam-08440e7a3acde3908 ^
   --add-operating-regions RegionName=us-west-2

Output:

```
{
   "Ipam": {
      "OwnerId": "123456789012",
      "IpamId": "ipam-08440e7a3acde3908",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
      "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
      "ScopeCount": 3,
      "OperatingRegions": [
         {
            "RegionName": "us-east-1"
         },
         {
            "RegionName": "us-east-2"
         },
         {
            "RegionName": "us-west-1"
         },
         {
            "RegionName": "us-west-2"
         }
      ],
      "State": "modify-in-progress"
   }
}
```

- For API details, see [ModifyIpam](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-ipam.html) in *AWS CLI Command Reference*.

**modify-launch-template**

The following code example shows how to use `modify-launch-template`.

**AWS CLI**

To change the default launch template version
This example specifies version 2 of the specified launch template as the default version.

Command:

```bash
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-version 2
```

Output:

```json
{
   "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "DefaultVersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "CreateTime": "2017-12-01T13:35:46.000Z"
   }
}
```

- For API details, see [ModifyLaunchTemplate](aws) in [AWS CLI Command Reference](aws).

modify-managed-prefix-list

The following code example shows how to use modify-managed-prefix-list.

**AWS CLI**

**To modify a prefix list**

The following modify-managed-prefix-list example adds an entry to the specified prefix list.

```bash
aws ec2 modify-managed-prefix-list \
   --prefix-list-id pl-0123456abcabcabc1 \
   --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
   --current-version 1
```

Output:

```json
{
}
```
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see ModifyManagedPrefixList in AWS CLI Command Reference.

modify-network-interface-attribute

The following code example shows how to use modify-network-interface-attribute.

AWS CLI

**To modify the attachment attribute of a network interface**

This example command modifies the attachment attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

**To modify the description attribute of a network interface**

This example command modifies the description attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --description "My description"
```
To modify the groupSet attribute of a network interface

This example command modifies the groupSet attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --groups sg-903004f8 sg-1a2b3c4d
```

To modify the sourceDestCheck attribute of a network interface

This example command modifies the sourceDestCheck attribute of the specified network interface.

Command:

```bash
```

- For API details, see [ModifyNetworkInterfaceAttribute](#) in *AWS CLI Command Reference*.

modify-private-dns-name-options

The following code example shows how to use modify-private-dns-name-options.

**AWS CLI**

To modify the options for instance hostnames

The following modify-private-dns-name-options example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```bash
aws ec2 modify-private-dns-name-options \
    --instance-id i-1234567890abcdef0 \
    --no-enable-resource-name-dns-a-record
```

Output:

```json
{
    "Return": true
}
```
modify-reserved-instances

The following code example shows how to use modify-reserved-instances.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=10
```

Output:

```
{
   "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

To modify the network platform of Reserved Instances

This example command converts EC2-Classic Reserved Instances to EC2-VPC.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-VPC,InstanceCount=5
```

Output:

```
{
   "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
}
```
For more information, see Modifying Your Reserved Instances in the *Amazon EC2 User Guide*.

**To modify the instance size of Reserved Instances**

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```bash
aws ec2 modify-reserved-instances --reserved-instances-ids 1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```json
{
   "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modifying the Instance Size of Your Reservations in the *Amazon EC2 User Guide*.

- For API details, see [ModifyReservedInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-reserved-instances.html) in *AWS CLI Command Reference*.

**modify-security-group-rules**

The following code example shows how to use `modify-security-group-rules`.

**AWS CLI**

**To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range**

The following `modify-security-group-rules` example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the `security-group-rules` parameter to enter the updates for the specified security group rules. `-1` specifies all protocols.
aws ec2 modify-security-group-rules \
--group-id sg-1234567890abcdef0 \
--security-group-rules SecurityGroupRuleId=sgr-abcdef01234567890,SecurityGroupRule='{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'

Output:

```json
{
   "Return": true
}
```

- For API details, see [ModifySecurityGroupRules](https://docs.aws.amazon.com/AWSCommandLineReference/index.html) in *AWS CLI Command Reference*.

modify-snapshot-attribute

The following code example shows how to use `modify-snapshot-attribute`.

**AWS CLI**

**Example 1: To modify a snapshot attribute**

The following `modify-snapshot-attribute` example updates the `createVolumePermission` attribute for the specified snapshot, removing volume permissions for the specified user.

```bash
aws ec2 modify-snapshot-attribute \
--snapshot-id snap-1234567890abcdef0 \
--attribute createVolumePermission \
--operation-type remove \
--user-ids 123456789012
```

**Example 2: To make a snapshot public**

The following `modify-snapshot-attribute` example makes the specified snapshot public.

```bash
aws ec2 modify-snapshot-attribute \
--snapshot-id snap-1234567890abcdef0 \
--attribute createVolumePermission \
```
modify-snapshot-tier

The following code example shows how to use modify-snapshot-tier.

AWS CLI

Example 1: To archive a snapshot

The following modify-snapshot-tier example archives the specified snapshot.

```bash
aws ec2 modify-snapshot-tier \
  --snapshot-id snap-01234567890abcedf \
  --storage-tier archive
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

The TieringStartTime response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the Amazon EC2 User Guide.

• For API details, see ModifySnapshotTier in AWS CLI Command Reference.

modify-spot-fleet-request

The following code example shows how to use modify-spot-fleet-request.

AWS CLI

To modify a Spot fleet request
This example command updates the target capacity of the specified Spot fleet request.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
   "Return": true
}
```

This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
   "Return": true
}
```

- For API details, see [ModifySpotFleetRequest](#) in AWS CLI Command Reference.

**modify-subnet-attribute**

The following code example shows how to use modify-subnet-attribute.

**AWS CLI**

**To change a subnet's public IPv4 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.
Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

**To change a subnet's IPv6 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the *AWS Virtual Private Cloud User Guide*.

- For API details, see [ModifySubnetAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-subnet-attribute.html) in *AWS CLI Command Reference*.

**modify-traffic-mirror-filter-network-services**

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

**AWS CLI**

**To add network services to a Traffic Mirror filter**

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```
aws ec2 modify-traffic-mirror-filter-network-services \
   --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
   --add-network-service amazon-dns
```

Output:

```
{
  "TrafficMirrorFilter": {
    "Tags": [
 ```
{  
  "Key": "Name",
  "Value": "Production"
},
"EgressFilterRules": [],
"NetworkServices": [  
  "amazon-dns"
],
"TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
"IngressFilterRules": [  
  {    
    "SourceCidrBlock": "0.0.0.0/0",
    "RuleNumber": 1,
    "DestinationCidrBlock": "0.0.0.0/0",
    "Description": "TCP Rule",
    "Protocol": 6,
    "TrafficDirection": "ingress",
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "RuleAction": "accept",
    "TrafficMirrorFilterRuleId": "tmf-04812ff784EXAMPLE"
  }
}
}

For more information, see Modify Traffic Mirror Filter Network Services in the AWS Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorFilterNetworkServices in AWS CLI Command Reference.

modify-traffic-mirror-filter-rule

The following code example shows how to use modify-traffic-mirror-filter-rule.

AWS CLI

To modify a traffic mirror filter rule

The following modify-traffic-mirror-filter-rule example modifies the description of the specified traffic mirror filter rule.

aws ec2 modify-traffic-mirror-filter-rule
The following code example shows how to use `modify-traffic-mirror-session`.

AWS CLI

To modify a traffic mirror session

The following `modify-traffic-mirror-session` example changes the traffic mirror session description and the number of packets to mirror.

```bash
aws ec2 modify-traffic-mirror-session \
   --description "Change packet length" \
   --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
   --remove-fields "packet-length"
```

Output:
For more information, see Modify your traffic mirror session in the Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorSession in AWS CLI Command Reference.

modify-transit-gateway-prefix-list-reference

The following code example shows how to use modify-transit-gateway-prefix-list-reference.

AWS CLI

To modify a reference to a prefix list

The following modify-transit-gateway-prefix-list-reference example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```bash
aws ec2 modify-transit-gateway-prefix-list-reference
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123
   --prefix-list-id pl-11111122222222333
   --transit-gateway-attachment-id tgw-attach-aabbccdaabbcbaab
```

Output:

```json
{
   "TransitGatewayPrefixListReference": {
      "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
   }
}
```
"PrefixListId": "pl-1111122222222333",
"PrefixListOwnerId": "123456789012",
"State": "modifying",
"Blackhole": false,
"TransitGatewayAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-aabbccdaabbccaab",
    "ResourceType": "vpc",
    "ResourceId": "vpc-112233445566aabb"
}
}
}

For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see ModifyTransitGatewayPrefixListReference in AWS CLI Command Reference.

modify-transit-gateway-vpc-attachment

The following code example shows how to use modify-transit-gateway-vpc-attachment.

AWS CLI

To modify a transit gateway VPC attachment

The following modify-transit-gateway-vpc-attachment example adds a subnet to the specified transit gateway VPC attachment.

```
aws ec2 modify-transit-gateway-vpc-attachment
   --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
   --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
        "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
        "VpcId": "vpc-5eccc927",
        "VpcOwnerId": "111122223333",
        "State": "modifying",
        "SubnetIds": [
            "subnet-0e51f45802EXAMPLE",
```
modify-transit-gateway

The following code example shows how to use `modify-transit-gateway`.

**AWS CLI**

**To modify a transit gateway**

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \
  --transit-gateway-id tgw-111111222222aaaaa \
  --options VpnEcmpSupport=enable
```

**Output:**

```json
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-111111222222aaaaa",
        "TransitGatewayArn": "64512",
        "State": "modifying",
        "OwnerId": "123456789012",
        "CreationTime": "2020-04-30T08:41:37.000Z",
        "Options": {
            "AmazonSideAsn": 64512,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see [Transit gateway attachments to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [ModifyTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.
modify-verified-access-endpoint-policy

The following code example shows how to use modify-verified-access-endpoint-policy.

AWS CLI

To configure the Verified Access policy for an endpoint

The following modify-verified-access-endpoint-policy example adds the specified Verified Access policy to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --policy-enabled \
  --policy-document file://policy.txt
```

Contents of policy.txt:

```
permit(principal, action, resource)
when {
  context.identity.groups.contains("finance") &&
  context.identity.email.verified == true
};
```

Output:

```
{
  "PolicyEnabled": true,
}
"PolicyDocument": "permit(principal,action,resource)\nwhen
{\n    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n};"
}

For more information, see Verified Access policies in the AWS Verified Access User Guide.

- For API details, see ModifyVerifiedAccessEndpointPolicy in AWS CLI Command Reference.

modify-verified-access-endpoint

The following code example shows how to use modify-verified-access-endpoint.

AWS CLI

**To modify the configuration of a Verified Access endpoint**

The following modify-verified-access-endpoint example adds the specified description to the specified Verified Access endpoint.

```bash
aws ec2 modify-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2 \
    --description "Testing Verified Access"
```

Output:

```json
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndPointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
```
"NetworkInterfaceOptions": {
    "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
    "Protocol": "https",
    "Port": 443
},
"Status": {
    "Code": "updating"
},
"Description": "Testing Verified Access",
"CreationTime": "2023-08-25T20:54:43",
"LastUpdatedTime": "2023-08-25T22:46:32"
}}

For more information, see [Verified Access endpoints](#) in the AWS Verified Access User Guide.

- For API details, see [ModifyVerifiedAccessEndpoint](#) in AWS CLI Command Reference.

modify-verified-access-group-policy

The following code example shows how to use modify-verified-access-group-policy.

**AWS CLI**

**To configure a Verified Access policy for a group**

The following modify-verified-access-group-policy example adds the specified Verified Access policy to the specified Verified Access group.

```bash
aws ec2 modify-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --policy-enabled \
    --policy-document file://policy.txt
```

**Contents of policy.txt:**

```plaintext
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email.verified == true
};
```
Output:

```json
{
   "PolicyEnabled": true,
   "PolicyDocument": "permit(principal,action,resource)\nwhen
\n    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n;"
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the AWS Verified Access User Guide.

**modify-verified-access-group**

The following code example shows how to use `modify-verified-access-group`.

**AWS CLI**

To modify the configuration of a Verified Access group

The following `modify-verified-access-group` example adds the specified description to the specified Verified Access group.

```bash
aws ec2 modify-verified-access-group \
   --verified-access-group-id vagr-0dbe967baf14b7235 \
   --description "Testing Verified Access"
```

Output:

```json
{
   "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T22:17:25"
   }
}
```
For more information, see [Verified Access groups](https://docs.aws.amazon.com/verifiedaccess/latest/userguide/what-is-verifed-access.html) in the *AWS Verified Access User Guide*.

### modify-verified-access-instance-logging-configuration

The following code example shows how to use `modify-verified-access-instance-logging-configuration`.

#### AWS CLI

**To enable logging for a Verified Access instance**

The following `modify-verified-access-instance-logging-configuration` example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```bash
aws ec2 modify-verified-access-instance-logging-configuration \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

**Output:**

```json
{
  "LoggingConfiguration": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "AccessLogs": {
      "S3": {
        "Enabled": false
      },
      "CloudWatchLogs": {
        "Enabled": true,
        "DeliveryStatus": {
          "Code": "success"
        },
        "LogGroup": "my-log-group"
      },
      "KinesisDataFirehose": {
        "Enabled": false
      },
      "LogVersion": "ocsf-1.0.0-rc.2",
      "IncludeTrustContext": false
  }
}
```
modify-verified-access-instance

The following code example shows how to use modify-verified-access-instance.

**AWS CLI**

To modify the configuration of a Verified Access instance

The following modify-verified-access-instance example adds the specified description to the specified Verified Access instance.

```bash
aws ec2 modify-verified-access-instance \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --description "Testing Verified Access"
```

Output:

```json
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [
            {
                "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                "TrustProviderType": "user",
                "UserTrustProviderType": "iam-identity-center"
            }
        ],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T22:41:04"
    }
}
```
modify-verified-access-trust-provider

The following code example shows how to use modify-verified-access-trust-provider.

AWS CLI

**To modify the configuration of a Verified Access trust provider**

The following modify-verified-access-trust-provider example adds the specified description to the specified Verified Access trust provider.

```bash
aws ec2 modify-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
    --description "Testing Verified Access"
```

Output:

```json
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:18:21"
    }
}
```

For more information, see **Trust providers for Verified Access** in the *AWS Verified Access User Guide*.

- For API details, see **ModifyVerifiedAccessTrustProvider** in *AWS CLI Command Reference*.

modify-volume-attribute

The following code example shows how to use modify-volume-attribute.
AWS CLI

To modify a volume attribute

This example sets the autoEnableIo attribute of the volume with the ID vol-1234567890abcdef0 to true. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io
```

- For API details, see ModifyVolumeAttribute in AWS CLI Command Reference.

modify-volume

The following code example shows how to use modify-volume.

AWS CLI

**Example 1: To modify a volume by changing its size**

The following modify-volume example changes the size of the specified volume to 150GB.

Command:

```
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "modifying",
      "VolumeId": "vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 0,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```
Example 2: To modify a volume by changing its type, size, and IOPS value

The following modify-volume example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```bash
aws ec2 modify-volume
  --volume-type io1
  --iops 10000
  --size 350
  --volume-id vol-1234567890abcdef0
```

Output:

```json
{
  "VolumeModification": {
    "TargetSize": 350,
    "TargetVolumeType": "io1",
    "ModificationState": "modifying",
    "VolumeId": "vol-0721c1a9d08c93bf6",
    "TargetIops": 10000,
    "StartTime": "2019-05-17T11:38:57.000Z",
    "Progress": 0,
    "OriginalVolumeType": "gp2",
    "OriginalIops": 150,
    "OriginalSize": 50
  }
}
```

For API details, see ModifyVolume in AWS CLI Command Reference.

modify-vpc-attribute

The following code example shows how to use modify-vpc-attribute.

AWS CLI

To modify the enableDnsSupport attribute

This example modifies the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is true, the Amazon DNS server resolves DNS
hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{"Value ":false}"
```

To modify the enableDnsHostnames attribute

This example modifies the enableDnsHostnames attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{"Value ":false}"
```

- For API details, see ModifyVpcAttribute in AWS CLI Command Reference.

**modify-vpc-endpoint-connection-notification**

The following code example shows how to use modify-vpc-endpoint-connection-connection-notification.

**AWS CLI**

To modify an endpoint connection notification

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```
```

Output:
modify-vpc-endpoint-service-configuration

The following code example shows how to use modify-vpc-endpoint-service-configuration.

AWS CLI

To modify an endpoint service configuration

This example changes the acceptance requirement for the specified endpoint service.

Command:

```bash
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-svc-09222513e6e77dc86 --no-acceptance-required
```

Output:

```json
{
   "ReturnValue": true
}
```

For API details, see ModifyVpcEndpointServiceConfiguration in AWS CLI Command Reference.

modify-vpc-endpoint-service-payer-responsibility

The following code example shows how to use modify-vpc-endpoint-service-payer-responsibility.

AWS CLI

To modify the payer responsibility

For API details, see ModifyVpcEndpointServiceConfiguration in AWS CLI Command Reference.
The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
    --service-id vpce-svc-071afff70666e61e0 \
    --payer-responsibility ServiceOwner
```

This command produces no output.

- For API details, see [ModifyVpcEndpointServicePayerResponsibility](#) in *AWS CLI Command Reference*.

### modify-vpc-endpoint-service-permissions

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

**AWS CLI**

**To modify endpoint service permissions**

This example adds permission for an AWS account to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '"arn:aws:iam::123456789012:root"'
```

Output:

```
{
    "ReturnValue": true
}
```

This example adds permission for a specific IAM user (`admin`) to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '"arn:aws:iam::123456789012:user/admin"'
```
modify-vpc-endpoint

The following code example shows how to use modify-vpc-endpoint.

**AWS CLI**

To modify a gateway endpoint

This example modifies gateway endpoint vpce-1a2b3c4d by associating route table rtb-aaa222bb with the endpoint, and resetting the policy document.

Command:

```bash
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids rtb-aaa222bb --reset-policy
```

Output:

```json
{
   "Return": true
}
```

To modify an interface endpoint

This example modifies interface endpoint vpce-0fe5b17a0707d6fa5 by adding subnet subnet-d6fcaa8d to the endpoint.

Command:

```bash
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id subnet-d6fcaa8d
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [ModifyVpcEndpointServicePermissions](#) in AWS CLI Command Reference.
modify-vpc-peering-connection-options

The following code example shows how to use modify-vpc-peering-connection-options.

AWS CLI

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection pcx-aaaabbb, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```json
{
   "RequesterPeeringConnectionOptions": {
      "AllowEgressFromLocalClassicLinkToRemoteVpc": true
   }
}
```

To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --accepter-peering-connection-options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:
To enable DNS resolution support for the VPC peering connection

In this example, the owner of the requester VPC modifies the VPC peering connection options for pcx-aaaabbbb to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Command:

```
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
       "AllowDnsResolutionFromRemoteVpc": true
   }
}
```

For API details, see [ModifyVpcPeeringConnectionOptions](aws-cli-command-reference) in *AWS CLI Command Reference*.

modify-vpc-tenancy

The following code example shows how to use `modify-vpc-tenancy`.

**AWS CLI**

To modify the tenancy of a VPC

This example modifies the tenancy of VPC vpc-1a2b3c4d to default.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```
Output:

```json
{
    "Return": true
}
```

- For API details, see [ModifyVpcTenancy](#) in *AWS CLI Command Reference*.

**modify-vpn-connection-options**

The following code example shows how to use `modify-vpn-connection-options`.

**AWS CLI**

*To modify your VPN connection options*

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```bash
aws ec2 modify-vpn-connection-options \
    --vpn-connection-id vpn-1122334455aabbccd \
    --local-ipv4-network-cidr 10.0.0.0/16
```

Output:

```json
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "modifying",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "10.0.0.0/16",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            }
        }
    ]
}
```
For more information, see Modifying Site-to-Site VPN connection options in the AWS Site-to-Site VPN User Guide.

- For API details, see ModifyVpnConnectionOptions in AWS CLI Command Reference.

modify-vpn-connection

The following code example shows how to use modify-vpn-connection.

AWS CLI

To modify a VPN connection

The following modify-vpn-connection example changes the target gateway for VPN connection vpn-12345678901234567 to virtual private gateway vgw-11223344556677889:
aws ec2 modify-vpn-connection \
   --vpn-connection-id vpn-12345678901234567 \
   --vpn-gateway-id vgw-11223344556677889

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-aabbccdde1122334",
      "Category": "VPN",
      "State": "modifying",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-12345678901234567",
      "VpnGatewayId": "vgw-11223344556677889",
      "Options": {
         "StaticRoutesOnly": false
      },
      "VgwTelemetry": [
         {
            "AcceptedRouteCount": 0,
            "LastStatusChange": "2019-07-17T07:34:00.000Z",
            "OutsideIpAddress": "18.210.3.222",
            "Status": "DOWN",
            "StatusMessage": "IPSEC IS DOWN"
         },
         {
            "AcceptedRouteCount": 0,
            "LastStatusChange": "2019-07-20T21:20:16.000Z",
            "OutsideIpAddress": "34.193.129.33",
            "Status": "DOWN",
            "StatusMessage": "IPSEC IS DOWN"
         }
      ]
   }
}
```

- For API details, see [ModifyVpnConnection] in AWS CLI Command Reference.

modify-vpn-tunnel-certificate

The following code example shows how to use modify-vpn-tunnel-certificate.
AWS CLI

To rotate a VPN tunnel certificate

The following modify-vpn-tunnel-certificate example rotates the certificate for the specified tunnel for a VPN connection

```bash/aws ec2 modify-vpn-tunnel-certificate \
   --vpn-tunnel-outside-ip-address 203.0.113.17 \
   --vpn-connection-id vpn-12345678901234567
```

Output:

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": ...configuration information...
    },
    "VgwTelemetry": [
        {
            "AcceptedRouteCount": 0,
            "LastStatusChange": "2019-09-11T17:27:14.000Z",

}
```
modify-vpn-tunnel-options

The following code example shows how to use modify-vpn-tunnel-options.

AWS CLI

To modify the tunnel options for a VPN connection

The following modify-vpn-tunnel-options example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```bash
aws ec2 modify-vpn-tunnel-options \
  --vpn-connection-id vpn-12345678901234567 \
  --vpn-tunnel-outside-ip-address 203.0.113.17 \
  --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}]
```

Output:

```json
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "...configuration information...",
    "CustomerGatewayId": "cgw-aabbccddeee1122334",

    Actions and scenarios
monitor-instances

The following code example shows how to use monitor-instances.

AWS CLI

To enable detailed monitoring for an instance

This example command enables detailed monitoring for the specified instance.

Command:

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceMonitorings": [
   {
      "InstanceId": "i-1234567890abcdef0",
      "Monitoring": {
         "State": "pending"
      }
   }
   ]
}
```

For API details, see ModifyVpnTunnelOptions in AWS CLI Command Reference.
move-address-to-vpc

The following code example shows how to use move-address-to-vpc.

AWS CLI

**To move an address to EC2-VPC**

This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

Command:

```bash
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

Output:

```json
{
    "Status": "MoveInProgress"
}
```

• For API details, see MoveAddressToVpc in AWS CLI Command Reference.

move-byoip-cidr-to-ipam

The following code example shows how to use move-byoip-cidr-to-ipam.

AWS CLI

**To transfer a BYOIP CIDR to IPAM**

The following move-byoip-cidr-to-ipam example transfers a BYOIP CIDR to IPAM.

(Windows):

```bash
aws ec2 move-byoip-cidr-to-ipam \
    --region us-west-2 \
```

(Linux):

```bash
aws ec2 move-byoip-cidr-to-ipam \
    --region us-west-2 \
```

For API details, see move-byoip-cidr-to-ipam in AWS CLI Command Reference.
(Windows):

```bash
aws ec2 move-byoip-cidr-to-ipam ^
    --region us-west-2 ^
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^
    --ipam-pool-owner 111111111111 ^
    --cidr 130.137.249.0/24
```

Output:

```json
{
    "ByoipCidr": {
        "Cidr": "130.137.249.0/24",
        "State": "pending-transfer"
    }
}
```

For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the Amazon VPC IPAM User Guide.

- For API details, see MoveByoipCidrToIpam in AWS CLI Command Reference.

**network-insights-access-scope**

The following code example shows how to use network-insights-access-scope.

**AWS CLI**

**To create Network Insights access scopes**

The following create-network-insights-access-scope example creates a network insights access scope in your AWS account.

```bash
aws ec2 create-network-insights-access-scope \
    --cli-input-json file://access-scope-file.json
```

Contents of access-scope-file.json:
{
    "MatchPaths": [
        { "Source": { "ResourceStatement": { "Resources": [ "vpc-abcd12e3" ] } } }
    ],
    "ExcludePaths": [
        { "Source": { "ResourceStatement": { "ResourceTypes": [ "AWS::EC2::InternetGateway" ] } } }
    ]
}

Output:

{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111"
}
{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-04c0fbca737c404",
        "MatchPaths": [
            { }  
        ]
    }
}
For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the Network Access Analyzer Guide.

- For API details, see [NetworkInsightsAccessScope](#) in [AWS CLI Command Reference](#).

### provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

#### AWS CLI

**To provision an address range**

The following `provision-byoip-cidr` example provisions a public IP address range for use with AWS.

```
aws ec2 provision-byoip-cidr \
   --cidr 203.0.113.25/24 \
   --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```
Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "State": "pending-provision"
   }
}
```

For more information about creating the messages strings for the authorization context, see Bring Your Own IP Addresses in the Amazon EC2 User Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

**provision-ipam-pool-cidr**

The following code example shows how to use provision-ipam-pool-cidr.

**AWS CLI**

To provision a CIDR to an IPAM pool

The following provision-ipam-pool-cidr example provisions a CIDR to an IPAM pool.

(Linux):

```
aws ec2 provision-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --cidr 10.0.0.0/24
```

(Windows):

```
aws ec2 provision-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --cidr 10.0.0.0/24
```

Output:

```
{
   "IpamPoolCidr": {
```

Actions and scenarios 2562
For more information, see Provision CIDRs to a pool in the Amazon VPC IPAM User Guide.

- For API details, see ProvisionIpamPoolCidr in AWS CLI Command Reference.

purchase-host-reservation

The following code example shows how to use purchase-host-reservation.

**AWS CLI**

**To purchase a Dedicated Host Reservation**

This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
    "TotalHourlyPrice": "1.499",
    "Purchase": [
        {
            "HourlyPrice": "1.499",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "HostIdSet": [
                "h-013abcd2a00cbd123"
            ],
            "HostReservationId": "hr-0d418a3a4ffcc669ae",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ]
}
```
"TotalUpfrontPrice": "0.000"
}

- For API details, see PurchaseHostReservation in AWS CLI Command Reference.

**purchase-reserved-instances-offering**

The following code example shows how to use `purchase-reserved-instances-offering`.

**AWS CLI**

**To purchase a Reserved Instance offering**

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

**Command:**

```
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-id ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3
```

**Output:**

```
{
   "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
}
```

- For API details, see PurchaseReservedInstancesOffering in AWS CLI Command Reference.

**purchase-scheduled-instances**

The following code example shows how to use `purchase-scheduled-instances`.

**AWS CLI**

**To purchase a Scheduled Instance**

This example purchases a Scheduled Instance.

**Command:**
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-request.json

Purchase-request.json:

```json
[
  {
    "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
    "InstanceCount": 1
  }
]
```

Output:

```json
{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [1],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false,
        "OccurrenceUnit": ""
      },
      "Platform": "Linux/UNIX",
      "TermEndDate": "2017-01-31T09:00:00Z",
      "InstanceCount": 1,
      "SlotDurationInHours": 32,
      "TermStartDate": "2016-01-31T09:00:00Z",
      "NetworkPlatform": "EC2-VPC",
      "TotalScheduledInstanceHours": 1696,
      "NextSlotStartTime": "2016-01-31T09:00:00Z",
      "InstanceType": "c4.large"
    }
  ]
}```
• For API details, see PurchaseScheduledInstances in AWS CLI Command Reference.

reboot-instances

The following code example shows how to use reboot-instances.

AWS CLI

To reboot an Amazon EC2 instance

This example reboots the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```

For more information, see Reboot Your Instance in the Amazon Elastic Compute Cloud User Guide.

• For API details, see RebootInstances in AWS CLI Command Reference.

register-image

The following code example shows how to use register-image.

AWS CLI

Example 1: To register an AMI using a manifest file

The following register-image example registers an AMI using the specified manifest file in Amazon S3.

```
aws ec2 register-image \
  --name my-image \
  --image-location my-s3-bucket/myimage/image.manifest.xml
```

Output:

```
{
  "ImageId": "ami-1234567890EXAMPLE"
}
```
For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

Example 2: To register an AMI using a snapshot of a root device

The following register-image example registers an AMI using the specified snapshot of an EBS root volume as device /dev/xvda. The block device mapping also includes an empty 100 GiB EBS volume as device /dev/xvdf.

```
aws ec2 register-image \
  --name my-image \
  --root-device-name /dev/xvda \
  --block-device-mappings DeviceName=/dev/
xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/
xvdf,Ebs={VolumeSize=100}
```

Output:
```
{
    "ImageId": "ami-1a2b3c4d5eEXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

- For API details, see RegisterImage in AWS CLI Command Reference.

register-instance-event-notification-attributes

The following code example shows how to use register-instance-event-notification-attributes.

AWS CLI

Example 1: To include all tags in event notifications

The following register-instance-event-notification-attributes example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \n  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:
Example 2: To include specific tags in event notifications

The following `register-instance-event-notification-attributes` example includes the specified tags in event notifications. You cannot specify tags if `IncludeAllTagsOfInstance` is true.

```
aws ec2 register-instance-event-notification-attributes
   --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [
         "tag-key1",
         "tag-key2"
      ],
      "IncludeAllTagsOfInstance": false
   }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [RegisterInstanceEventNotificationAttributes](#) in *AWS CLI Command Reference*.

**register-transit-gateway-multicase-group-sources**

The following code example shows how to use `register-transit-gateway-multicase-group-sources`.

```bash
register-transit-gateway-multicase-group-sources
```
**AWS CLI**

**To register a source with a transit gateway multicast group.**

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
  "RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see [Register Sources with a Multicast Group](https://docs.aws.amazon.com/AmazonVPC/latest/userguide/aws-cli-register-transit-gateway-multicast-group-sources.html) in the *AWS Transit Gateways User Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupSources](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_RegisterTransitGatewayMulticastGroupSources.html) in *AWS CLI Command Reference*.

**register-transit-gateway-multicast-group-members**

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

**AWS CLI**

**To view the information about the transit gateway multicast domain associations**

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.
aws ec2 register-transit-gateway-multicast-group-members \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \ 
   --group-ip-address 224.0.1.0 \ 
   --network-interface-ids eni-0e246d32695012e81

Output:

```
{
   "RegisteredMulticastGroupMembers": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "RegisteredNetworkInterfaceIds": [
         "eni-0e246d32695012e81"
      ],
      "GroupIpAddress": "224.0.1.0"
   }
}
```

For more information, see Managing multicast domains in the Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.

**register-transit-gateway-multicast-group-sources**

The following code example shows how to use register-transit-gateway-multicast-group-sources.

**AWS CLI**

**To register a source with a transit gateway multicast group.**

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \ 
   --group-ip-address 224.0.1.0 \ 
   --network-interface-ids eni-07f290fc3c090c0ae
```

Output:
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see RegisterTransitGatewayMulticastGroupSources in AWS CLI Command Reference.

reject-transit-gateway-peering-attachment

The following code example shows how to use reject-transit-gateway-peering-attachment.

AWS CLI

To reject a transit gateway peering attachment

The following reject-transit-gateway-peering-attachment example rejects the specified transit gateway peering attachment request. The --region parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd \
    --region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        }
    }
}
```

- For API details, see [RejectTransitGatewayPeeringAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/reject-transit-gateway-peering-attachment.html) in *AWS CLI Command Reference*.

### reject-transit-gateway-vpc-attachment

The following code example shows how to use `reject-transit-gateway-vpc-attachment`.

**AWS CLI**

**To reject a transit gateway VPC attachment**

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```bash
aws ec2 reject-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8fffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
    }
}
```
For more information, see [Transit gateway attachments to a VPC](https://docs.aws.amazon.com/TransitGateways/latest/communityguide/transit-gateway-attachments.html) in the *Transit Gateways Guide*.

- For API details, see [RejectTransitGatewayVpcAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/reject-transit-gateway-vpc-attachment.html) in *AWS CLI Command Reference*.

**reject-transit-gateway-vpc-attachments**

The following code example shows how to use `reject-transit-gateway-vpc-attachments`.

**AWS CLI**

**To reject a transit gateway VPC attachment**

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8fffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}
```
For more information, see `Transit gateway attachments to a VPC` in the `Transit Gateways Guide`. For API details, see `RejectTransitGatewayVpcAttachments` in `AWS CLI Command Reference`.

`reject-vpc-endpoint-connections`

The following code example shows how to use `reject-vpc-endpoint-connections`.

**AWS CLI**

**To reject an interface endpoint connection request**

This example rejects the specified endpoint connection request for the specified endpoint service.

**Command:**

```bash
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

**Output:**

```json
{
  "Unsuccessful": []
}
```

For API details, see `RejectVpcEndpointConnections` in `AWS CLI Command Reference`.

`reject-vpc-peering-connection`

The following code example shows how to use `reject-vpc-peering-connection`.

**AWS CLI**

**To reject a VPC peering connection**

This example rejects the specified VPC peering connection request.

**Command:**

```bash

```
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d

Output:

```
{
   "Return": true
}
```

- For API details, see [RejectVpcPeeringConnection](#) in *AWS CLI Command Reference*.

### release-address

The following code example shows how to use `release-address`.

**AWS CLI**

**To release an Elastic IP addresses for EC2-Classic**

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

**Command:**

```
aws ec2 release-address --public-ip 198.51.100.0
```

**To release an Elastic IP address for EC2-VPC**

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

**Command:**

```
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

- For API details, see [ReleaseAddress](#) in *AWS CLI Command Reference*.

### release-hosts

The following code example shows how to use `release-hosts`.
**AWS CLI**

**To release a Dedicated host from your account**

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

**Command:**

```
aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

**Output:**

```
{
    "Successful": [
        "h-0029d6e3cacf1b3da"
    ],
    "Unsuccessful": []
}
```

- For API details, see [ReleaseHosts](https://docs.aws.amazon.com/cli/latest/reference/ec2/release-hosts.html) in *AWS CLI Command Reference*.

**release-ipam-pool-allocation**

The following code example shows how to use `release-ipam-pool-allocation`.

**AWS CLI**

**To release an IPAM pool allocation**

In this example, you're an IPAM delegated admin who tried to delete an IPAM pool but received an error that you cannot delete the pool while the pool has allocations. You are using this command to release a pool allocation.

**Note the following:**

You can only use this command for custom allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using `modify-ipam-resource-cidr`. To complete this request, you'll need the IPAM pool ID, which you can get with `describe-ipam-pools`. You'll also need the allocation ID, which you can get with `get-ipam-pool-`
allocations. If you do not want to remove allocations one by one, you can use the --cascade option when you delete an IPAM pool to automatically release any allocations in the pool before deleting it. There are a number of prerequisites before running this command. For more information, see Release an allocation in the Amazon VPC IPAM User Guide. The --region in which you run this command must be the locale of the IPAM pool where the allocation is.

The following release-ipam-pool-allocation example releases an IPAM pool allocation.

```
aws ec2 release-ipam-pool-allocation \
   --ipam-pool-id ipam-pool-07bdd12d7c94e4693 \
   --cidr 10.0.0.0/23 \
   --ipam-pool-allocation-id ipam-pool-alloc-0e66a1f730da54791b99465b79e7d1e89 \
   --region us-west-1
```

Output:

```
{
   "Success": true
}
```

Once you release an allocation, you may want to run delete-ipam-pool.

- For API details, see ReleaseIpamPoolAllocation in AWS CLI Command Reference.

replace-iam-instance-profile-association

The following code example shows how to use replace-iam-instance-profile-association.

AWS CLI

To replace an IAM instance profile for an instance

This example replaces the IAM instance profile represented by the association iip-assoc-060bae234aac2e7fa with the IAM instance profile named AdminRole.

```
aws ec2 replace-iam-instance-profile-association \
   --iam-instance-profile Name=AdminRole \
   --association-id iip-assoc-060bae234aac2e7fa
```

Output:
For API details, see `ReplaceIamInstanceProfileAssociation` in *AWS CLI Command Reference*.

**replace-network-acl-association**

The following code example shows how to use `replace-network-acl-association`.

**AWS CLI**

To replace the network ACL associated with a subnet

This example associates the specified network ACL with the subnet for the specified network ACL association.

Command:

```bash
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --network-acl-id acl-5fb85d36
```

Output:

```json
{
   "NewAssociationId": "aclassoc-3999875b"
}
```

For API details, see `ReplaceNetworkAclAssociation` in *AWS CLI Command Reference*.

**replace-network-acl-entry**

The following code example shows how to use `replace-network-acl-entry`.
**AWS CLI**

**To replace a network ACL entry**

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```bash
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see [ReplaceNetworkAclEntry](https://docs.aws.amazon.com/cli/latest/reference/ec2/replace-network-acl-entry.html) in *AWS CLI Command Reference*.

**replace-route-table-association**

The following code example shows how to use `replace-route-table-association`.

**AWS CLI**

**To replace the route table associated with a subnet**

This example associates the specified route table with the subnet for the specified route table association.

Command:

```bash
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```json
{
   "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see [ReplaceRouteTableAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/replace-route-table-association.html) in *AWS CLI Command Reference*.

**replace-route**

The following code example shows how to use `replace-route`.
AWS CLI

To replace a route

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-block 10.0.0.0/16 --gateway-id vgw-9a4cacf3
```

- For API details, see ReplaceRoute in AWS CLI Command Reference.

replace-transit-gateway-route

The following code example shows how to use replace-transit-gateway-route.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following replace-transit-gateway-route example replaces the route in the specified transit gateway route table.

```bash
aws ec2 replace-transit-gateway-route \
  --destination-cidr-block 10.0.2.0/24 \
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
  --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAME
```

Output:

```json
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                "ResourceType": "vpc"
            }
        ]
    }
}
```
For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [ReplaceTransitGatewayRoute](#) in *AWS CLI Command Reference*.

### report-instance-status

The following code example shows how to use `report-instance-status`.

**AWS CLI**

**To report status feedback for an instance**

This example command reports status feedback for the specified instance.

**Command:**

```bash
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --reason-codes unresponsive
```

- For API details, see [ReportInstanceStatus](#) in *AWS CLI Command Reference*.

### request-spot-fleet

The following code example shows how to use `request-spot-fleet`.

**AWS CLI**

**To request a Spot fleet in the subnet with the lowest price**

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.
Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

Command:

```bash
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Output:

```json
{
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

To request a Spot fleet in the Availability Zone with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot
instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
   "SpotPrice": "0.04",
   "TargetCapacity": 2,
   "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
   "LaunchSpecifications": [
      {
         "ImageId": "ami-1a2b3c4d",
         "KeyName": "my-key-pair",
         "SecurityGroups": [
            {
               "GroupId": "sg-1a2b3c4d"
            }
         ],
         "InstanceType": "m3.medium",
         "Placement": {
            "AvailabilityZone": "us-west-2a, us-west-2b"
         },
         "IamInstanceProfile": {
            "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
         }
      }
   ]
}
```

To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```
**To request a Spot fleet using the diversified allocation strategy**

This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

**Command:**

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

**Config.json:**

```json
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
}
```
"AllocationStrategy": "diversified",
"IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
"LaunchSpecifications": [
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "c4.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  },
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "m3.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  },
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "r3.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  }
]
}

For more information, see Spot Fleet Requests in the Amazon Elastic Compute Cloud User Guide.

- For API details, see RequestSpotFleet in AWS CLI Command Reference.

**request-spot-instances**

The following code example shows how to use request-spot-instances.

**AWS CLI**

**To request Spot Instances**

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

**Command:**

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```
### Specification.json:

```
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "SecurityGroupIds": [ "sg-1a2b3c4d" ],
    "InstanceType": "m3.medium",
    "Placement": {
        "AvailabilityZone": "us-west-2a"
    },
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

### Output:

```
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T20:54:21.000Z",
                "Code": "pending-evaluation",
                "Message": "Your Spot request has been submitted for review, and is pending evaluation."
            },
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-df6f405d",
            "State": "open",
            "LaunchSpecification": {
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                },
                "ImageId": "ami-1a2b3c4d",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "my-security-group",
                        "GroupId": "sg-1a2b3c4d"
                    }
                ],
                "Monitoring": {
                    "Enabled": false
                }
            }
        }
    ]
}
```
This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```bash
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```json
{
  "ImageId": "ami-1a2b3c4d",
  "SecurityGroupIds": ["sg-1a2b3c4d"],
  "InstanceType": "m3.medium",
  "SubnetId": "subnet-1a2b3c4d",
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

Output:

```json
{
  "SpotInstanceRequests": [
    {
      "Status": {
        "UpdateTime": "2014-03-25T22:58:00Z",
```

Actions and scenarios 2587
"Code": "pending-evaluation",
"Message": "Your Spot request has been submitted for review, and is pending evaluation."
},
"ProductDescription": "Linux/UNIX",
"SpotInstanceRequestId": "sir-df6f405d",
"State": "open",
"LaunchSpecification": {
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  }
  "ImageId": "ami-1a2b3c4d"
  "SecurityGroups": [
    {
      "GroupName": "my-security-group",
      "GroupID": "sg-1a2b3c4d"
    }
  ]
  "SubnetId": "subnet-1a2b3c4d",
  "Monitoring": {
    "Enabled": false
  },
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  },
  "InstanceType": "m3.medium",
  "Type": "one-time",
  "SpotPrice": "0.050000"
},
...}

This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

aws ec2 request-spot-instances --spot-price "0.050" --instance-count 1 --type "one-time" --launch-specification file://specification.json
Specification.json:

```json
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "InstanceType": "m3.medium",
    "NetworkInterfaces": [
        {
            "DeviceIndex": 0,
            "SubnetId": "subnet-1a2b3c4d",
            "Groups": [ "sg-1a2b3c4d" ],
            "AssociatePublicIpAddress": true
        }
    ],
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

- For API details, see [RequestSpotInstances](http://aws.amazon.com/cli) in *AWS CLI Command Reference*.

### reset-address-attribute

The following code example shows how to use `reset-address-attribute`.

**AWS CLI**

**To reset the domain name attribute associated with an elastic IP address**

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

**Linux:**

```
aws ec2 reset-address-attribute \
    --allocation-id eipalloc-abcdef0123456789012 \
    --attribute domain-name
```

**Windows:**

```
aws ec2 reset-address-attribute ^
    --allocation-id eipalloc-abcdef0123456789012 ^
```
Output:

```json
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-abcd1e01234567890",
      "PtrRecord": "example.com."
      "PtrRecordUpdate": {
          "Value": "example.net.",
          "Status": "PENDING"
      }
    }
  ]
}
```

To monitor the pending change, see [describe-addresses-attribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-addresses-attribute.html) in the *AWS CLI Command Reference*.

- For API details, see [ResetAddressAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-addresses-attribute.html) in *AWS CLI Command Reference*.

**reset-ebs-default-kms-key-id**

The following code example shows how to use `reset-ebs-default-kms-key-id`.

**AWS CLI**

**To reset your default CMK for EBS encryption**

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```bash
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```json
{
  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE"
}
```
• For API details, see `ResetEbsDefaultKmsKeyId` in *AWS CLI Command Reference*.

**reset-fpga-image-attribute**

The following code example shows how to use `reset-fpga-image-attribute`.

**AWS CLI**

To reset the attributes of an Amazon FPGA image

This example resets the load permissions for the specified AFI.

Command:

```bash
aws ec2 reset-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

Output:

```json
{
   "Return": true
}
```

• For API details, see `ResetFpgaImageAttribute` in *AWS CLI Command Reference*.

**reset-image-attribute**

The following code example shows how to use `reset-image-attribute`.

**AWS CLI**

To reset the launchPermission attribute

This example resets the launchPermission attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

• For API details, see `ResetImageAttribute` in *AWS CLI Command Reference*. 

---

Actions and scenarios 2591
**reset-instance-attribute**

The following code example shows how to use `reset-instance-attribute`.

**AWS CLI**

**To reset the sourceDestCheck attribute**

This example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute sourceDestCheck
```

**To reset the kernel attribute**

This example resets the `kernel` attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute kernel
```

**To reset the ramdisk attribute**

This example resets the `ramdisk` attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute ramdisk
```

- For API details, see [ResetInstanceAttribute](#) in *AWS CLI Command Reference*.

**reset-network-interface-attribute**

The following code example shows how to use `reset-network-interface-attribute`.
To reset a network interface attribute

The following `reset-network-interface-attribute` example resets the value of the source/destination checking attribute to `true`.

```bash
aws ec2 reset-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --source-dest-check
```

This command produces no output.

- For API details, see `ResetNetworkInterfaceAttribute` in *AWS CLI Command Reference*.

reset-snapshot-attribute

The following code example shows how to use `reset-snapshot-attribute`.

AWS CLI

To reset a snapshot attribute

This example resets the create volume permissions for snapshot `snap-1234567890abcdef0`. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --attribute createVolumePermission
```

- For API details, see `ResetSnapshotAttribute` in *AWS CLI Command Reference*.

restore-address-to-classic

The following code example shows how to use `restore-address-to-classic`.

AWS CLI

To restore an address to EC2-Classic
This example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

Command:

```
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```
{
   "Status": "MoveInProgress",
   "PublicIp": "198.51.100.0"
}
```

- For API details, see [RestoreAddressToClassic](#) in *AWS CLI Command Reference*.

---

### restore-image-from-recycle-bin

The following code example shows how to use `restore-image-from-recycle-bin`.

**AWS CLI**

**To restore an image from the Recycle Bin**

The following `restore-image-from-recycle-bin` example restores AMI ami-0111222333444abcd from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin \
    --image-id ami-0111222333444abcd
```

Output:

```
{
   "Return": true
}
```

For more information, see [Recover AMIs from the Recycle Bin](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RestoreImageFromRecycleBin](#) in *AWS CLI Command Reference*. 

---
restore-managed-prefix-list-version

The following code example shows how to use restore-managed-prefix-list-version.

AWS CLI

us-west-2**To restore a prefix list version**

The following restore-managed-prefix-list-version restores the entries from version 1 of the specified prefix list.

```bash
aws ec2 restore-managed-prefix-list-version \
    --prefix-list-id pl-0123456abcabcabc1 \
    --current-version 2 \ 
    --previous-version 1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "restore-in-progress",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 2,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see RestoreManagedPrefixListVersion in AWS CLI Command Reference.

restore-snapshot-from-recycle-bin

The following code example shows how to use restore-snapshot-from-recycle-bin.

AWS CLI

To restore snapshots from the Recycle Bin
The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```bash
aws ec2 restore-snapshot-from-recycle-bin \
   --snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.

- For API details, see `RestoreSnapshotFromRecycleBin` in AWS CLI Command Reference.

### restore-snapshot-tier

The following code example shows how to use `restore-snapshot-tier`.

#### AWS CLI

**Example 1: To permanently restore an archived snapshot**

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```bash
aws ec2 restore-snapshot-tier \
   --snapshot-id snap-01234567890abcedf \
   --permanent-restore
```

**Output:**

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.
Example 2: To temporarily restore an archived snapshot

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```
aws ec2 restore-snapshot-tier \
  --snapshot-id snap-01234567890abcedf \
  --temporary-restore-days 5
```

Output:

```
{
  "SnapshotId": "snap-01234567890abcedf",
  "RestoreDuration": 5,
  "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier \
  --snapshot-id snap-01234567890abcedf \
  --temporary-restore-days 10
```

Output:

```
{
  "SnapshotId": "snap-01234567890abcedf",
  "RestoreDuration": 10,
  "IsPermanentRestore": false
}
```
For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**Example 4: To modify the restore type**

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```bash
aws ec2 restore-snapshot-tier 
   --snapshot-id snap-01234567890abcedf 
   --permanent-restore
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**revoke-client-vpn-ingress**

The following code example shows how to use `revoke-client-vpn-ingress`.

**AWS CLI**

**To revoke an authorization rule for a Client VPN endpoint**

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (0.0.0.0/0) for all groups.

```bash
aws ec2 revoke-client-vpn-ingress 
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde 
   --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

Output:

```
```
For more information, see Authorization Rules in the Amazon EC2 User Guide.

- For API details, see RevokeClientVpnIngress in AWS CLI Command Reference.

**revoke-security-group-egress**

The following code example shows how to use revoke-security-group-egress.

**AWS CLI**

**Example 1: To remove the rule that allows outbound traffic to a specific address range**

The following revoke-security-group-egress example command removes the rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 revoke-security-group-egress \
   --group-id sg-026c12253ce15eff7 \
   --ip-permissions \
   [{IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]}
```

This command produces no output.

For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove the rule that allows outbound traffic to a specific security group**

The following revoke-security-group-egress example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress \
   --group-id sg-026c12253ce15eff7 \
   --ip-permissions '[["IpProtocol": "tcp", "FromPort": 443, "ToPort": 443,"UserIdGroupPairs": [["GroupId": "sg-06df23a01ff2df86d"]]]
```

This command produces no output.
For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupEgress in AWS CLI Command Reference.

**revoke-security-group-ingress**

The following code example shows how to use `revoke-security-group-ingress`.

**AWS CLI**

**Example 1: To remove a rule from a security group**

The following `revoke-security-group-ingress` example removes TCP port 22 access for the 203.0.113.0/24 address range from the specified security group for a default VPC.

```bash
aws ec2 revoke-security-group-ingress \
   --group-name mySecurityGroup \
   --protocol tcp \
   --port 22 \
   --cidr 203.0.113.0/24
```

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove a rule using the IP permissions set**

The following `revoke-security-group-ingress` example uses the `ip-permissions` parameter to remove an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4).

```bash
aws ec2 revoke-security-group-ingress \
   --group-id sg-026c12253ce15eff7 \
   --ip-permissions
IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[[CidrIp=0.0.0.0/0]]
```

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupIngress in AWS CLI Command Reference.
The following code example shows how to use `run-instances`.

**AWS CLI**

**Example 1: To launch an instance into a default subnet**

The following `run-instances` example launches a single instance of type `t2.micro` into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --key-name MyKeyPair
```

**Output:**

```
{
   "Instances": [
      {
         "AmiLaunchIndex": 0,
         "ImageId": "ami-0abcdef1234567890",

}

Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```
aws ec2 run-instances \
```
For an example of the output for `run-instances`, see Example 1.

### Example 3: To launch an instance with additional volumes

The following `run-instances` example uses a block device mapping, specified in `mapping.json`, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```bash
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --subnet-id subnet-08fc749671b2d077c \
   --security-group-ids sg-0b0384b66d7d692f9 \
   --key-name MyKeyPair \
   --block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```json
[
    {
        "DeviceName": "/dev/sdh",
        "Ebs": {
            "VolumeSize": 100
        }
    }
]
```

Contents of `mapping.json`. This example adds `ephemeral1` as an instance store volume.

```json
[
    {
        "DeviceName": "/dev/sdc",
        "VirtualName": "ephemeral1"
    }
]
```
For an example of the output for `run-instances`, see Example 1.

For more information about block device mappings, see [Block device mapping](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/block-device-mapping-concepts.html) in the Amazon EC2 User Guide.

**Example 4: To launch an instance and add tags on creation**

The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```bash
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --count 1 \
   --subnet-id subnet-08fc749671b2d077c \
   --key-name MyKeyPair \
   --security-group-ids sg-0b0384b66d7d692f9 \
   --tag-specifications
      'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
      'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

For an example of the output for `run-instances`, see Example 1.

**Example 5: To launch an instance with user data**

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```bash
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --count 1 \
   --subnet-id subnet-08fc749671b2d077c \
   --key-name MyKeyPair \
   --security-group-ids sg-0b0384b66d7d692f9 \
   --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.
For more information about instance user data, see Working with instance user data in the Amazon EC2 User Guide.

**Example 6: To launch a burstable performance instance**

The following `run-instances` example launches a t2.micro instance with the unlimited credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the standard credit option. When you launch a T3 instance, the default is the unlimited credit option.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --credit-specification CpuCredits=unlimited
```

For an example of the output for `run-instances`, see Example 1.

For more information about burstable performance instances, see Burstable performance instances in the Amazon EC2 User Guide.

- For API details, see `RunInstances` in AWS CLI Command Reference.

**run-scheduled-instances**

The following code example shows how to use `run-scheduled-instances`.

**AWS CLI**

**To launch a Scheduled Instance**

This example launches the specified Scheduled Instance in a VPC.

**Command:**

```
```
Launch-specification.json:

```json
{
   "ImageId": "ami-12345678",
   "KeyName": "my-key-pair",
   "InstanceType": "c4.large",
   "NetworkInterfaces": [
      {
         "DeviceIndex": 0,
         "SubnetId": "subnet-12345678",
         "AssociatePublicIpAddress": true,
         "Groups": ["sg-12345678"]
      }
   ],
   "IamInstanceProfile": {
      "Name": "my-iam-role"
   }
}
```

Output:

```json
{
   "InstanceIdSet": [
      "i-1234567890abcdef0"
   ]
}
```

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```bash
aws ec2 run-scheduled-instances --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification file:///launch-specification.json
```

Launch-specification.json:

```json
{
   "ImageId": "ami-12345678",
   "KeyName": "my-key-pair",
   "SecurityGroupIds": ["sg-12345678"]
}
```
"InstanceType": "c4.large",
"Placement": {
   "AvailabilityZone": "us-west-2b"
}
"IamInstanceProfile": {
   "Name": "my-iam-role"
}
}

Output:

{
   "InstanceIdSet": [
      "i-1234567890abcdef0"
   ]
}

- For API details, see RunScheduledInstances in AWS CLI Command Reference.

search-local-gateway-routes

The following code example shows how to use search-local-gateway-routes.

AWS CLI

To search for routes in a local gateway route table

The following search-local-gateway-routes example searches for static routes in the specified local gateway route table.

```bash
aws ec2 search-local-gateway-routes \
   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
   --filters "Name=type,Values=static"
```

Output:

```json
{
   "Route": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
      "Type": "static",
   }
}
```
For API details, see [SearchLocalGatewayRoutes](#) in *AWS CLI Command Reference*.

**search-transit-gateway-multicast-groups**

The following code example shows how to use `search-transit-gateway-multicast-groups`.

**AWS CLI**

To search one or more transit gateway multicast groups and return the group membership information

The following `search-transit-gateway-multicast-groups` example returns the group membership of the specified multicast group.

```bash
aws ec2 search-transit-gateway-multicast-groups \\
--transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```json
{
    "MulticastGroups": [
        {
            "GroupIpAddress": "224.0.1.0",
            "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
            "SubnetId": "subnet-0187aff814EXAMPLE",
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "ResourceType": "vpc",
            "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
            "GroupMember": false,
            "GroupSource": true,
            "SourceType": "static"
        }
    ]
}
```

For more information, see [Managing multicast groups](#) in the *Transit Gateways Guide*. 

---

**Actions and scenarios**

2609
• For API details, see SearchTransitGatewayMulticastGroups in AWS CLI Command Reference.

**search-transit-gateway-routes**

The following code example shows how to use search-transit-gateway-routes.

**AWS CLI**

**To search for routes in the specified transit gateway route table**

The following search-transit-gateway-routes example returns all the routes that are of type static in the specified route table.

```bash
aws ec2 search-transit-gateway-routes \
   --transit-gateway-route-table-id tgw-rtb-0a823edbdexmple \
   --filters "Name=type,Values=static"
```

**Output:**

```json
{
   "Routes": [
   {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
      {
         "ResourceId": "vpc-4example",
         "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5example",
         "ResourceType": "vpc"
      }
      ],
      "Type": "static",
      "State": "active"
   },
   {
      "DestinationCidrBlock": "10.1.0.0/24",
      "TransitGatewayAttachments": [
      {
         "ResourceId": "vpc-4example",
         "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5example",
         "ResourceType": "vpc"
      }
      ],
   }
}
```
For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/TRANSIT_GATEWAYS/latest/userguide/transit-gateway-concepts.html) in the *Transit Gateways Guide*.

- For API details, see [SearchTransitGatewayRoutes](https://docs.aws.amazon.com/cli/latest/reference/ec2/search-transit-gateway-routes.html) in *AWS CLI Command Reference*.

### send-diagnostic-interrupt

The following code example shows how to use `send-diagnostic-interrupt`.

**AWS CLI**

**To send a diagnostic interrupt**

The following `send-diagnostic-interrupt` example sends a diagnostic interrupt to the specified instance.

```
aws ec2 send-diagnostic-interrupt --instance-id i-1234567890abcdef0
```

This command produces no output.

- For API details, see [SendDiagnosticInterrupt](https://docs.aws.amazon.com/cli/latest/reference/ec2/send-diagnostic-interrupt.html) in *AWS CLI Command Reference*.

### start-instances

The following code example shows how to use `start-instances`.

**AWS CLI**

**To start an Amazon EC2 instance**

This example starts the specified Amazon EBS-backed instance.

Command:

```
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```
Output:

```json
{
   "StartingInstances": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "CurrentState": {
            "Code": 0,
            "Name": "pending"
         },
         "PreviousState": {
            "Code": 80,
            "Name": "stopped"
         }
      }
   ]
}
```

For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [StartInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-instances.html) in *AWS CLI Command Reference*.

### start-network-insights-access-scope-analysis

The following code example shows how to use `start-network-insights-access-scope-analysis`.

**AWS CLI**

**To start a Network Insights access scope analysis**

The following `start-network-insights-access-scope-analysis` example starts the scope analysis in your AWS account.

```bash
aws ec2 start-network-insights-access-scope-analysis \
   --region us-east-1 \
   --network-insights-access-scope-id nis-123456789111
```

Output:

```json
{
}
```
"NetworkInsightsAccessScopeAnalysis": {
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
    "NetworkInsightsAccessScopeId": "nis-123456789111",
    "Status": "running",
    "StartDate": "2022-01-26T00:47:06.814000+00:00"
}
}

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see StartNetworkInsightsAccessScopeAnalysis in AWS CLI Command Reference.

start-network-insights-analysis

The following code example shows how to use start-network-insights-analysis.

AWS CLI

To analyze a path

The following start-network-insights-analysis example analyzes the path between the source and destination. To view the results of the path analysis, use the describe-network-insights-analyses command.

aws ec2 start-network-insights-analysis \
    --network-insights-path-id nip-0b26f224f1d131fa8

Output:

{
    "NetworkInsightsAnalysis": {
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "Status": "running",
        "StartDate": "2021-01-20T22:58:37.495Z"
    }
}
For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/getting-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [StartNetworkInsightsAnalysis](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-network-insights-analysis.html) in *AWS CLI Command Reference*.

**start-vpc-endpoint-service-private-dns-verification**

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

**AWS CLI**

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```bash
aws ec2 start-vpc-endpoint-service-private-dns-verification \
    --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see [Manage DNS names](https://docs.aws.amazon.com私有链路/latest/userguide/private-link-manage-dns-names.html) in the *AWS PrivateLink User Guide*.

- For API details, see [StartVpcEndpointServicePrivateDnsVerification](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-vpc-endpoint-service-private-dns-verification.html) in *AWS CLI Command Reference*.

**stop-instances**

The following code example shows how to use `stop-instances`.

**AWS CLI**

**Example 1: To stop an Amazon EC2 instance**

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```bash
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0
```
Example 2: To hibernate an Amazon EC2 instance

The following stop-instances example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```
aws ec2 stop-instances \
  --instance-ids i-1234567890abcdef0 \
  --hibernate
```

Output:

```
{
    "StoppingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```
For more information, see [Hibernate your On-Demand Linux instance](https://docs.aws.amazon.com/AmazonElasticCloudCompute/latest/UserGuide/index.html) in the *Amazon Elastic Cloud Compute User Guide*.

- For API details, see [StopInstances](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_StopInstances.html) in *AWS CLI Command Reference*.

### terminate-client-vpn-connections

The following code example shows how to use `terminate-client-vpn-connections`.

#### AWS CLI

**To terminate a connection to a Client VPN endpoint**

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```
aws ec2 terminate-client-vpn-connections \
  --client-vpn-endpoint-id vpn-endpoint-123456789123abcde \
  --connection-id cvpn-connection-04edd76f5201e0cb8
```

**Output:**

```
{
    "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
    "ConnectionStatuses": [
        {
            "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
            "PreviousStatus": {
                "Code": "active"
            },
            "CurrentStatus": {
                "Code": "terminating"
            }
        }
    ]
}
```
For more information, see [Client Connections](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [TerminateClientVpnConnections](#) in *AWS CLI Command Reference*.

### terminate-instances

The following code example shows how to use `terminate-instances`.

**AWS CLI**

**To terminate an Amazon EC2 instance**

This example terminates the specified instance.

**Command:**

```bash
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

**Output:**

```json
{
  "TerminatingInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
        "Code": 32,
        "Name": "shutting-down"
      },
      "PreviousState": {
        "Code": 16,
        "Name": "running"
      }
    }
  ]
}
```

For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see [TerminatInstances](#) in *AWS CLI Command Reference*. 
unassign-ipv6-addresses

The following code example shows how to use unassign-ipv6-addresses.

AWS CLI

To unassign an IPv6 address from a network interface

This example unassigns the specified IPv6 address from the specified network interface.

Command:

```
aws ec2 unassign-ipv6-addresses --ipv6-addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

Output:

```
{
   "NetworkInterfaceId": "eni-23c49b68",
   "UnassignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071"
   ]
}
```

- For API details, see UnassignIpv6Addresses in AWS CLI Command Reference.

unassign-private-ip-addresses

The following code example shows how to use unassign-private-ip-addresses.

AWS CLI

To unassign a secondary private IP address from a network interface

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```
• For API details, see `UnassignPrivateIpAddresses` in *AWS CLI Command Reference*.

**unassign-private-nat-gateway-address**

The following code example shows how to use `unassign-private-nat-gateway-address`.

**AWS CLI**

**To unassign a private IP address from your private NAT gateway**

The following `unassign-private-nat-gateway-address` example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \\
  --nat-gateway-id nat-1234567890abcdef0 \\
  --private-ip-addresses 10.0.20.197
```

Output:

```
{
  "NatGatewayId": "nat-0ee3edd182361f662",
  "NatGatewayAddresses": [
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "PrivateIp": "10.0.20.197",
      "IsPrimary": false,
      "Status": "unassigning"
    }
  ]
}
```

For more information, see [NAT gateways](https://aws.amazon.com/vpc/userguide) in the *Amazon VPC User Guide*.

• For API details, see `UnassignPrivateNatGatewayAddress` in *AWS CLI Command Reference*.

**unlock-snapshot**

The following code example shows how to use `unlock-snapshot`.

**AWS CLI**

**To unlock a snapshot**
The following unlock-snapshot example unlocks the specified snapshot.

```
aws ec2 unlock-snapshot \
   --snapshot-id snap-0b5e733b4a8df6e0d
```

Output:

```
{
   "SnapshotId": "snap-0b5e733b4a8df6e0d"
}
```

For more information, see Snapshot lock in the Amazon EBS User Guide.
- For API details, see UnlockSnapshot in AWS CLI Command Reference.

unmonitor-instances

The following code example shows how to use unmonitor-instances.

AWS CLI

**To disable detailed monitoring for an instance**

This example command disables detailed monitoring for the specified instance.

Command:

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceMonitorings": [ 
   
   {
   "InstanceId": "i-1234567890abcdef0",
   "Monitoring": {
   "State": "disabling"
   }
   
   ]
   }
```
For API details, see UnmonitorInstances in AWS CLI Command Reference.

**update-security-group-rule-descriptions-egress**

The following code example shows how to use update-security-group-rule-descriptions-egress.

**AWS CLI**

**To update the description of an outbound security group rule**

The following update-security-group-rule-descriptions-egress example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-egress 
   --group-id sg-02f0d35a850ba727f 
   --ip-permissions
   IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[[CidrIp=203.0.113.0/24,Description="Outbound HTTP access to server 2"]]
```

Output:

```
{
   "Return": true
}
```

For more information, see Security group rules in the Amazon EC2 User Guide.

For API details, see UpdateSecurityGroupRuleDescriptionsEgress in AWS CLI Command Reference.

**update-security-group-rule-descriptions-ingress**

The following code example shows how to use update-security-group-rule-descriptions-ingress.

**AWS CLI**

**Example 1: To update the description of an inbound security group rule with a CIDR source**
The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
   --group-id sg-02f0d35a850ba727f \
   --ip-permissions
   IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{CidrIp=203.0.113.0/16,Description="SSH access from corpnet"}]'
```

Output:

```
{
   "Return": true
}
```

**Example 2: To update the description of an inbound security group rule with a prefix list source**

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
   --group-id sg-02f0d35a850ba727f \
   --ip-permissions
   IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{PrefixListId=pl-12345678,Description="SSH access from corpnet"}]'
```

Output:

```
{
   "Return": true
}
```

**withdraw-byoip-cidr**

The following code example shows how to use withdraw-byoip-cidr.

**AWS CLI**

**To stop advertising an address range**

The following withdraw-byoip-cidr example stops advertising the specified address range.

```
aws ec2 withdraw-byoip-cidr
   --cidr 203.0.113.25/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "advertised"
   }
}
```

- For API details, see [WithdrawByoipCidr](https://awscli.amazonaws.com/v2/documentation/api/current/reference/services/ec2.html#WithdrawByoipCidr) in *AWS CLI Command Reference*.

**Amazon EC2 Instance Connect examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
• Actions

Actions

send-ssh-public-key

The following code example shows how to use send-ssh-public-key.

AWS CLI

To send an SSH public key to an instance

The following send-ssh-public-key example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```
aws ec2-instance-connect send-ssh-public-key \
    --instance-id i-1234567890abcdef0 \
    --instance-os-user ec2-user \
    --availability-zone us-east-2b \
    --ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

• For API details, see SendSshPublicKey in AWS CLI Command Reference.

Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**batch-check-layer-availability**

The following code example shows how to use `batch-check-layer-availability`.

**AWS CLI**

**To check the availability of a layer**

The following `batch-check-layer-availability` example checks the availability of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```bash
aws ecr batch-check-layer-availability \
   --repository-name cluster-autoscaler \
   --layer-digests sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```json
{
   "layers": [
      {
         "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
         "layerAvailability": "AVAILABLE",
         "layerSize": 2777,
         "mediaType": "application/vnd.docker.container.image.v1+json"
      }
   ],
   "failures": []
}
```

- For API details, see **BatchCheckLayerAvailability** in *AWS CLI Command Reference*.

**batch-delete-image**

The following code example shows how to use `batch-delete-image`.
Example 1: To delete an image

The following `batch-delete-image` example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
   --repository-name ubuntu \
   --image-ids imageTag=precise
```

Output:

```
{
   "failures": [],
   "imageIds": [
      {
         "imageTag": "precise",
         "imageDigest": "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
      }
   ]
}
```

Example 2: To delete multiple images

The following `batch-delete-image` example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
   --repository-name MyRepository \
   --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
   "imageIds": [
      {
         "imageDigest": "sha256:123456789012",
         "imageTag": "prod"
      },
      {
```
For more information, see Deleting an Image in the Amazon ECR User Guide.

- For API details, see BatchDeleteImage in AWS CLI Command Reference.

**batch-get-image**

The following code example shows how to use batch-get-image.

**AWS CLI**

**Example 1: To get an image**

The following batch-get-image example gets an image with the tag v1.13.6 in a repository called cluster-autoscaler in the default registry for an account.

```
aws ecr batch-get-image \\
   --repository-name cluster-autoscaler \\
   --image-ids imageTag=v1.13.6
```

**Output:**

```
{
   "images": [
   {
      "registryId": "012345678910",
      "repositoryName": "cluster-autoscaler",
      "imageId": {
         "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
         "imageTag": "v1.13.6"
      },
      "imageManifest": "\n   
   "MediaType": "application/vnd.docker.distribution.manifest.v2+json",
   "config": {"\n   
   "MediaType": "application/vnd.docker.container.image.v1+json",
   "size": 2777,\n   "digest": "sha256:567890121234",
   "imageTag": "team1"
   ],
   "failures": []
}
Example 2: To get multiple images

The following *batch-get-image* example displays details of all images tagged with *prod* and *team1* in the specified repository.

```sh
aws ecr batch-get-image 
  --repository-name MyRepository 
  --image-ids imageTag=prod imageTag=team1
```

Output:

```json
{
  "images": [
    {
      "registryId": "123456789012",
      "repositoryName": "MyRepository",
      "imageId": {
        "imageDigest": "sha256:123456789012",
        "imageTag": "prod"
      },
      "imageManifest": "manifestExample1"
    }
  ],
  "failures": []
}
```

For more information, see `Images` in the *Amazon ECR User Guide*.

- For API details, see `BatchGetImage` in *AWS CLI Command Reference*.

### complete-layer-upload

The following code example shows how to use `complete-layer-upload`.

**AWS CLI**

**To complete an image layer upload**

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```bash
aws ecr complete-layer-upload \
--repository-name layer-test \
--upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
--layer-digests 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

**Output:**

```json
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "layerDigest": "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",
    "repositoryName": "layer-test",
    "registryId": "130757420319"
}
```
create-repository

The following code example shows how to use create-repository.

AWS CLI

**Example 1: To create a repository**

The following create-repository example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/nginx-web-app"
    }
}
```

For more information, see [Creating a Repository](#) in the [Amazon ECR User Guide](#).

**Example 2: To create a repository configured with image tag immutability**

The following create-repository example creates a repository configured for tag immutability in the default registry for an account.

```
aws ecr create-repository \
    --repository-name sample-repo \
    --image-tag-mutability IMMUTABLE
```

Output:
For more information, see [Image Tag Mutability](#) in the Amazon ECR User Guide.

**Example 3: To create a repository configured with a scanning configuration**

The following `create-repository` example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```bash
aws ecr create-repository 
  --repository-name sample-repo 
  --image-scanning-configuration scanOnPush=true
```

**Output:**

```json
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
    "imageScanningConfiguration": {
      "scanOnPush": true
    }
  }
}
```

For more information, see [Image Scanning](#) in the Amazon ECR User Guide.

- For API details, see CreateRepository in AWS CLI Command Reference.

### delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.
AWS CLI

To delete the lifecycle policy for a repository

The following delete-lifecycle-policy example deletes the lifecycle policy for the hello-world repository.

```
aws ecr delete-lifecycle-policy \
  --repository-name hello-world
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "hello-world",
  "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Remove untagged images.\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":10},\"action\":{\"type \":\"expire\"}}]}",
  "lastEvaluatedAt": 0.0
}
```

- For API details, see [DeleteLifecyclePolicy](https://docs.aws.amazon.com/cli/latest/reference/ecr/delete-lifecycle-policy.html) in AWS CLI Command Reference.

deleterepository-policy

The following code example shows how to use delete-repository-policy.

AWS CLI

To delete the repository policy for a repository

The following delete-repository-policy example deletes the repository policy for the cluster-autoscaler repository.

```
aws ecr delete-repository-policy \
  --repository-name cluster-autoscaler
```

Output:

```
{
  "registryId": "012345678910",
```
"repositoryName": "cluster-autoscaler",
"policyText": "{
  "Version": "2008-10-17",
  "Statement": [
    {
      "Sid": "allow public pull",
      "Effect": "Allow",
      "Principal": "*",
      "Action": [
        "ecr:BatchCheckLayerAvailability",
        "ecr:BatchGetImage",
        "ecr:GetDownloadUrlForLayer"
      ]
    }
  ]
}"
}

- For API details, see [DeleteRepositoryPolicy](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ecr/delete-repository.html) in the *AWS CLI Command Reference*.

### delete-repository

The following code example shows how to use `delete-repository`.

**AWS CLI**

**To delete a repository**

The following `delete-repository` example command force deletes the specified repository in the default registry for an account. The `--force` flag is required if the repository contains images.

```bash
aws ecr delete-repository \
  --repository-name ubuntu \
  --force
```

**Output:**

```json
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "ubuntu",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
  }
}
```

For more information, see [Deleting a Repository](https://docs.aws.amazon.com/AmazonECR/latest/userguide/understanding-repositories.html) in the *Amazon ECR User Guide*.

- For API details, see [DeleteRepository](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ecr/delete-repository.html) in the *AWS CLI Command Reference*.

### describe-image-scan-findings

The following code example shows how to use `describe-image-scan-findings`.

For more information, see [Describe Image Scans](https://docs.aws.amazon.com/AmazonECR/latest/userguide/monitor-images.html) in the *Amazon ECR User Guide*. 

- For API details, see [DescribeImageScans](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ecr/describe-image-scans.html) in the *AWS CLI Command Reference*.
AWS CLI

To describe the scan findings for an image

The following `describe-image-scan-findings` example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```bash
aws ecr describe-image-scan-findings \
  --repository-name sample-repo \
  --image-id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
  "imageScanFindings": {
    "findings": [
      {
        "name": "CVE-2019-5188",
        "description": "A code execution vulnerability exists in the directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4 directory can cause an out-of-bounds write on the stack, resulting in code execution. An attacker can corrupt a partition to trigger this vulnerability.",
        "severity": "MEDIUM",
        "attributes": [
          {
            "key": "package_version",
            "value": "1.44.1-1ubuntu1.1"
          },
          {
            "key": "package_name",
            "value": "e2fsprogs"
          },
          {
            "key": "CVSS2_VECTOR",
            "value": "AV:L/AC:L/Au:N/C:P/I:P/A:P"
          },
          {
            "key": "CVSS2_SCORE",
            "value": "4.6"
          }
        ]
      }
    ]
  }
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see DescribeImageScanFindings in AWS CLI Command Reference.

describe-images

The following code example shows how to use describe-images.

AWS CLI

To describe an image in a repository

The following describe-images example displays details about an image in the cluster-autoscaler repository with the tag v1.13.6.

```
aws ecr describe-images \
  --repository-name cluster-autoscaler \
  --image-ids imageTag=v1.13.6
```

Output:

```json
{
  
}
```
"imageDetails": [
  {
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
    "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eedd8451110c299e3368d2210066487d97e5",
    "imageTags": [
      "v1.13.6"
    ],
    "imageSizeInBytes": 48318255,
    "imagePushedAt": 1565128275.0
  }
]

- For API details, see [DescribeImages](AWS CLI Command Reference) in AWS CLI Command Reference.

**describe-repositories**

The following code example shows how to use describe-repositories.

**AWS CLI**

**To describe the repositories in a registry**

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
  "repositories": [
    {
      "registryId": "012345678910",
      "repositoryName": "ubuntu",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
    },
    {
      "registryId": "012345678910",
      "repositoryName": "test",
```

For API details, see [DescribeRepositories](https://docs.aws.amazon.com/cli/latest/reference/ecr/describeRepositories.html) in *AWS CLI Command Reference*.

**get-authorization-token**

The following code example shows how to use `get-authorization-token`.

**AWS CLI**

To get an authorization token for your default registry

The following `get-authorization-token` example command gets an authorization token for your default registry.

```bash
aws ecr get-authorization-token
```

Output:

```json
{
    "authorizationData": [
        {
            "authorizationToken": "QVdTOkN...",
            "expiresAt": 1448875853.241,
            "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
        }
    ]
}
```

**get-download-url-for-layer**

The following code example shows how to use `get-download-url-for-layer`.

**AWS CLI**

To get the download URL of a layer
The following `get-download-url-for-layer` example displays the download URL of a layer with the digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed in the `cluster-autoscaler` repository.

```bash
aws ecr get-download-url-for-layer \
  --repository-name cluster-autoscaler \ 
  --layer-digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```json
{
  "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

- For API details, see [GetDownloadUrlForLayer](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-download-url-for-layer.html) in *AWS CLI Command Reference*.

---

**get-lifecycle-policy-preview**

The following code example shows how to use `get-lifecycle-policy-preview`.

**AWS CLI**

To retrieve details for a lifecycle policy preview

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```bash
aws ecr get-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample"
```
Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\n    "rules": [
        {
            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }
    ],
    "status": "COMPLETE",
    "previewResults": [],
    "summary": {
      "expiringImageTotalCount": 0
    }
  }
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicyPreview in AWS CLI Command Reference.

get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To retrieve a lifecycle policy

The following get-lifecycle-policy example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```
aws ecr get-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
  "registryId": "123456789012",
  "repositoryName": "project-a/amazon-ecs-sample",
```
"lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":{\"type\":\"expire\"}}]}",
  "lastEvaluatedAt": 1504295007.0
}

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-login-password

The following code example shows how to use get-login-password.

AWS CLI

To retrieve a password to authenticate to a registry

The following get-login-password displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```
aws ecr get-login-password
```

Output:

```
<password>
```

To use with the Docker CLI, pipe the output of the get-login-password command to the docker login command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```
aws ecr get-login-password \
   --region <region> \
| docker login \
   --username AWS \
   --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

For more information, see Registry Authentication in the Amazon ECR User Guide.

- For API details, see GetLoginPassword in AWS CLI Command Reference.
get-login

The following code example shows how to use get-login.

AWS CLI

To retrieve a Docker login command to your default registry

This example prints a command that you can use to log in to your default Amazon ECR registry.

Command:

```
aws ecr get-login
```

Output:

```
docker login -u AWS -p <password> -e none https://<aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

Command:

```
aws ecr get-login --registry-ids 012345678910 023456789012
```

Output:

```
docker login -u <username> -p <token-1> -e none <endpoint-1>
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

- For API details, see [GetLogin](#) in AWS CLI Command Reference.

get-repository-policy

The following code example shows how to use get-repository-policy.

AWS CLI

To retrieve the repository policy for a repository
The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```bash
aws ecr get-repository-policy 
  --repository-name cluster-autoscaler
```

Output:

```json
{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
  "policyText": "{\n    "Version" : "2008-10-17",
    "Statement" : [ {\n      "Sid" : "allow public pull",
      "Effect" : "Allow",
      "Principal" : "*",
      "Action" : [ "ecr:BatchCheckLayerAvailability", "ecr:BatchGetImage",
                   "ecr:GetDownloadUrlForLayer" ]\n    } ]\n  }"
}
```

- For API details, see [GetRepositoryPolicy](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-repository-policy.html) in *AWS CLI Command Reference*.

**initiate-layer-upload**

The following code example shows how to use `initiate-layer-upload`.

**AWS CLI**

To initiate an image layer upload

The following `initiate-layer-upload` example initiates an image layer upload to the `layer-test` repository.

```bash
aws ecr initiate-layer-upload 
  --repository-name layer-test
```

Output:

```json
{
  "partSize": 10485760,
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9"
}
```

- For API details, see [InitiateLayerUpload](https://docs.aws.amazon.com/cli/latest/reference/ecr/initiate-layer-upload.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
list-images

The following code example shows how to use list-images.

AWS CLI

To list the images in a repository

The following list-images example displays a list of the images in the cluster-autoscaler repository.

```bash
aws ecr list-images \
  --repository-name cluster-autoscaler
```

Output:

```
{
   "imageIds": [
   {
      "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
      "imageTag": "v1.13.8"
   },
   {
      "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
      "imageTag": "v1.13.7"
   },
   {
      "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7e2dd8451110c299e3368d2210066487d97e5",
      "imageTag": "v1.13.6"
   }
   ]
}
```

- For API details, see ListImages in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.
AWS CLI

To list the tags for repository

The following `list-tags-for-resource` example displays a list of the tags associated with the `hello-world` repository.

```bash
aws ecr list-tags-for-resource \
```

Output:

```json
{
   "tags": [
      {
         "Key": "Stage",
         "Value": "Integ"
      }
   ]
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-image-scanning-configuration

The following code example shows how to use `put-image-scanning-configuration`.

AWS CLI

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```bash
aws ecr put-image-scanning-configuration \
   --repository-name sample-repo \
   --image-scanning-configuration scanOnPush=true
```

Output:

```json
{
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

• For API details, see PutImageScanningConfiguration in AWS CLI Command Reference.

put-image-tag-mutability

The following code example shows how to use put-image-tag-mutability.

AWS CLI

To update the image tag mutability setting for a repository

The following put-image-tag-mutability example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```bash
aws ecr put-image-tag-mutability \
  --repository-name hello-repository \
  --image-tag-mutability IMMUTABLE
```

Output:

```json
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

• For API details, see PutImageTagMutability in AWS CLI Command Reference.

put-image

The following code example shows how to use put-image.
AWS CLI

To retag an image with its manifest

The following `put-image` example creates a new tag in the `hello-world` repository with an existing image manifest.

```
aws ecr put-image \
    --repository-name hello-world \
    --image-tag 2019.08 \
    --image-manifest file://hello-world.manifest.json
```

Contents of `hello-world.manifest.json`:

```
{
    "schemaVersion": 2,
    "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
    "config": {
        "mediaType": "application/vnd.docker.container.image.v1+json",

  }
}
put-lifecycle-policy

The following code example shows how to use put-lifecycle-policy.

AWS CLI

To create a lifecycle policy

The following put-lifecycle-policy example creates a lifecycle policy for the specified repository in the default registry for an account.

```bash
aws ecr put-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of policy.json:

```json
{
  "rules": [
    {
      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged"
      }
    }
  ]
}
```
"countType": "sinceImagePushed",
"countUnit": "days",
"countNumber": 14
},
"action": {
"type": "expire"
}
]}
}

Output:

{
  "registryId": "<aws_account_id>",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{"rules": [{"rulePriority": 1, "description": "Expire images older than 14 days", "selection": {"tagStatus": "untagged", "countType": "sinceImagePushed", "countUnit": "days", "countNumber": 14}, "action": {"type": "expire"}]}}"
}

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

**set-repository-policy**

The following code example shows how to use set-repository-policy.

**AWS CLI**

**To set the repository policy for a repository**

The following set-repository-policy example attaches a repository policy contained in a file to the cluster-autoscaler repository.

```
aws ecr set-repository-policy \
  --repository-name cluster-autoscaler \
  --policy-text file://my-policy.json
```

Contents of my-policy.json:

Output:

{  "registryId": "012345678910",  "repositoryName": "cluster-autoscaler",  "policyText": "{\n  "Version": "2008-10-17",  "Statement": [{\n    "Sid": "allow public pull",  "Effect": "Allow",  "Principal": "*",  "Action": [    "ecr:BatchCheckLayerAvailability",    "ecr:BatchGetImage",    "ecr:GetDownloadUrlForLayer"  ]\n}]}  }

• For API details, see SetRepositoryPolicy in AWS CLI Command Reference.

start-image-scan

The following code example shows how to use start-image-scan.

AWS CLI

To start an image vulnerability scan

The following start-image-scan example starts an image scan for and specified by the image digest in the specified repository.

aws ecr start-image-scan \
The following code example shows how to use `start-lifecycle-policy-preview`.

**AWS CLI**

To create a lifecycle policy preview

The following `start-lifecycle-policy-preview` example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```
aws ecr start-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```json
{
  "rules": [
  
  
```
Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n        "rules": [{\n            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }]
    },
    "status": "IN_PROGRESS"
}
```

- For API details, see [StartLifecyclePolicyPreview](https://docs.aws.amazon.com/cli/latest/reference/ecs/start-lifecycle-policy-preview.html) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a repository**

The following `tag-resource` example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.
aws ecr tag-resource \
   --tags Key=Stage,Value=Integ

This command produces no output.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To untag a repository

The following untag-resource example removes the tag with the key Stage from the hello-world repository.

aws ecr untag-resource \
   --tag-keys Stage

This command produces no output.

- For API details, see UntagResource in AWS CLI Command Reference.

upload-layer-part

The following code example shows how to use upload-layer-part.

AWS CLI

To upload a layer part

This following upload-layer-part uploads an image layer part to the layer-test repository.

aws ecr upload-layer-part \
   --repository-name layer-test \
   --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9
Output:

```json
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "registryId": "012345678910",
    "lastByteReceived": 8323314,
    "repositoryName": "layer-test"
}
```

- For API details, see [UploadLayerPart](#) in *AWS CLI Command Reference*.

### Amazon ECS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*create-capacity-provider*

The following code example shows how to use *create-capacity-provider*. 
AWS CLI

To create a capacity provider

The following create-capacity-provider example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```
aws ecs create-capacity-provider \
  --name "MyCapacityProvider" \
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/MyCapacityProvider",
        "name": "MyCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 1000,
                "instanceWarmupPeriod": 300
            },
            "managedTerminationProtection": "ENABLED"
        },
        "tags": []
    }
}
```

For more information, see Amazon ECS cluster auto scaling in the Amazon ECS Developer Guide.

- For API details, see CreateCapacityProvider in AWS CLI Command Reference.
**create-cluster**

The following code example shows how to use create-cluster.

**AWS CLI**

**Example 1: To create a new cluster**

The following create-cluster example creates a cluster.

```bash
aws ecs create-cluster \
   --cluster-name MyCluster
```

Output:

```json
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": []
   }
}
```

For more information, see [Creating a Cluster](#) in the *Amazon ECS Developer Guide*.

**Example 2: To create a new cluster using capacity providers**

The following create-cluster example creates a cluster and associates two existing capacity providers with it. The create-capacity-provider command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named MyCluster and associate the MyCapacityProvider1 and MyCapacityProvider2 capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```bash
aws ecs create-cluster --cluster-name MyCluster --capacity-providers MyCapacityProvider1 MyCapacityProvider2 --default-capacity-
```
provider-strategy capacityProvider=MyCapacityProvider1,weight=1
capacityProvider=MyCapacityProvider2,weight=1

Output:

```json
{
    "cluster": {
        "clusterName": "MyCluster",
        "status": "PROVISIONING",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1",
            "MyCapacityProvider2"
        ],
        "defaultCapacityProviderStrategy": [
            {
                "capacityProvider": "MyCapacityProvider1",
                "weight": 1,
                "base": 0
            },
            {
                "capacityProvider": "MyCapacityProvider2",
                "weight": 1,
                "base": 0
            }
        ],
        "attachments": [
            {
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "asp",
                "status": "PRECREATED",
                "details": [
                    {

```
Example 3: To create a new cluster with multiple tags

The following create-cluster example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see Using Shorthand Syntax with the AWS Command Line Interface in the AWS CLI User Guide.

```bash
aws ecs create-cluster \
  --cluster-name MyCluster \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```
Output:

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [
      {
        "key": "key1",
        "value": "value1"
      },
      {
        "key": "key2",
        "value": "value2"
      },
      {
        "key": "key3",
        "value": "value3"
      }
    ]
  }
}
```

For more information, see [Creating a Cluster](https://docs.aws.amazon.com/AmazonECS/latest/developerguide) in the [Amazon ECS Developer Guide](https://docs.aws.amazon.com/AmazonECS/latest/developerguide).

- For API details, see [CreateCluster](https://docs.aws.amazon.com/cli/latest/reference/ecs/create-cluster.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ecs.html).

**create-service**

The following code example shows how to use create-service.

**AWS CLI**

**Example 1: To create a service with a Fargate task**

The following `create-service` example shows how to create a service using a Fargate task.
aws ecs create-service \
   --cluster MyCluster \
   --service-name MyService \
   --task-definition sample-fargate:1 \
   --desired-count 2 \
   --launch-type FARGATE \
   --platform-version LATEST \
   --network-configuration \
   "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp=ENABLED}" \
   --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3

Output:

{
   "service": {
      "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
      "serviceName": "MyService",
      "loadBalancers": [],
      "serviceRegistries": [],
      "status": "ACTIVE",
      "desiredCount": 2,
      "runningCount": 0,
      "pendingCount": 0,
      "launchType": "FARGATE",
      "platformVersion": "LATEST",
      "deploymentConfiguration": {
         "maximumPercent": 200,
         "minimumHealthyPercent": 100
      },
      "deployments": [
         {
            "id": "ecs-svc/1234567890123456789",
            "status": "PRIMARY",
            "desiredCount": 2,
            "pendingCount": 0,
            "runningCount": 0,
         }
      ]
   }
}
"launchType": "FARGATE",
"platformVersion": "1.3.0",
"networkConfiguration": {
  "awsVpcConfiguration": {
    "subnets": [
      "subnet-12344321"
    ],
    "securityGroups": [
      "sg-12344321"
    ],
    "assignPublicIp": "ENABLED"
  }
},

"placementStrategy": [],
"networkConfiguration": {
  "awsVpcConfiguration": {
    "subnets": [
      "subnet-12344321"
    ],
    "securityGroups": [
      "sg-12344321"
    ],
    "assignPublicIp": "ENABLED"
  }
},
"schedulingStrategy": "REPLICA",
"tags": [
  {
    "key": "key1",
    "value": "value1"
  },
  {
    "key": "key2",
    "value": "value2"
  }
]
Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```
aws ecs create-service \
   --cluster MyCluster \
   --service-name ecs-simple-service \
   --task-definition sleep360:2 \
   --desired-count 1
```

Output:

```
{}
```

```
"service": {
   "serviceName": "ecs-simple-service",
   "loadBalancers": [],
   "serviceRegistries": [],
   "status": "ACTIVE",
   "desiredCount": 1,
   "runningCount": 0,
   "pendingCount": 0,
   "launchType": "EC2",
   "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
   "deploymentConfiguration": {
      "maximumPercent": 200,
      "minimumHealthyPercent": 100
   }
}
```
Example 3: To create a service that uses an external deployment controller

The following create-service example creates a service that uses an external deployment controller.

```bash
aws ecs create-service \
    --cluster MyCluster \n    --service-name MyService \n    --deployment-controller type=EXTERNAL \n    --desired-count 1
```

Output:

```json
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
        "serviceName": "MyService",
```
Example 4: To create a new service behind a load balancer

The following create-service example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the --cli-input-json option and a JSON input file called ecs-simple-service-elb.json with the following content:

```json
{
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
            "containerPort": 8080
        }
    ]
}
```
"containerPort": 80
}
,"desiredCount": 10,
"role": "ecsServiceRole"
}

Command:

```
aws ecs create-service \\
--cluster MyCluster \\
--service-name ecs-simple-service-elb \\
--cli-input-json file://ecs-simple-service-elb.json
```

Output:

```
{
  "service": {
    "status": "ACTIVE",
    "pendingCount": 0,
    "loadBalancers": [
      {
        "containerName": "ecs-demo",
        "containerPort": 80,
        "loadBalancerName": "EC2Contai-EcsElast-123456789012"
      }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
    "desiredCount": 10,
    "serviceName": "ecs-simple-service-elb",
    "deployments": [
      {
        "status": "PRIMARY",
        "pendingCount": 0,
        "createdAt": 1428100239.123,
        "desiredCount": 10,
```
For more information, see Creating a Service in the Amazon ECS Developer Guide.

- For API details, see CreateService in AWS CLI Command Reference.

create-task-set

The following code example shows how to use create-task-set.

AWS CLI

To create a task set

The following create-task-set example creates a task set in a service that uses an external deployment controller.

```bash
aws ecs create-task-set \
   --cluster MyCluster \
   --service MyService \
   --task-definition MyTaskDefinition:2 \
   --network-configuration \
   "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```json
{
   "taskSet": {
      "id": "ecs-svc/1234567890123456789",
      "runningCount": 0
   }
}
```
"computedDesiredCount": 0,
"pendingCount": 0,
"runningCount": 0,
"createdAt": 1557128360.711,
"updatedAt": 1557128360.711,
"launchType": "EC2",
"networkConfiguration": {
   "awsvpcConfiguration": {
      "subnets": [
         "subnet-12344321"
      ],
      "securityGroups": [
         "sg-12344321"
      ],
      "assignPublicIp": "DISABLED"
   }
},
"loadBalancers": [],
"serviceRegistries": [],
"scale": {
   "value": 0.0,
   "unit": "PERCENT"
},
"stabilityStatus": "STABILIZING",
"stabilityStatusAt": 1557128360.711
}

- For API details, see [CreateTaskSet](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ecs/create-task-set.html) in *AWS CLI Command Reference*.

**delete-account-setting**

The following code example shows how to use `delete-account-setting`.

**AWS CLI**

**To delete the account settings for a specific IAM user or IAM role**

The following example `delete-account-setting` deletes the account settings for the specific IAM user or IAM role.

```
aws ecs delete-account-setting \
   --name serviceLongArnFormat \
```
--principal-arn arn:aws:iam::123456789012:user/MyUser

Output:

```
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.

• For API details, see DeleteAccountSetting in AWS CLI Command Reference.

default-attributes

The following code example shows how to use delete-attributes.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following delete-attributes deletes an attribute with the name stack from a container instance.

```
aws ecs delete-attributes \\
   --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
  "attributes": [
    {
      "name": "stack",
      "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
      "value": "production"
    }
  ]
}
```
For API details, see `DeleteAttributes` in *AWS CLI Command Reference*.

### delete-capacity-provider

The following code example shows how to use `delete-capacity-provider`.

**AWS CLI**

**Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)**

The following `delete-capacity-provider` example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```bash
aws ecs delete-capacity-provider \
```

**Output:**

```json
{
    "capacityProvider": {
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
          "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000
          },
          "managedTerminationProtection": "DISABLED"
    }
}
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster_capacity_providers.html) in the *Amazon ECS Developer Guide*.

**Example 2: To delete a capacity provider using the name**

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```bash
aws ecs delete-capacity-provider \
  --capacity-provider ExampleCapacityProvider
```

Output:

```
{
  "capacityProvider": {
    "name": "ExampleCapacityProvider",
    "status": "ACTIVE",
    "autoScalingGroupProvider": {
      "managedScaling": {
        "status": "ENABLED",
        "targetCapacity": 100,
        "minimumScalingStepSize": 1,
        "maximumScalingStepSize": 10000
      },
      "managedTerminationProtection": "DISABLED"
    },
    "updateStatus": "DELETE_IN_PROGRESS",
    "tags": []
  }
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

- For API details, see DeleteCapacityProvider in AWS CLI Command Reference.

**delete-cluster**

The following code example shows how to use delete-cluster.

**AWS CLI**

**To delete an empty cluster**

The following delete-cluster example deletes the specified empty cluster.

```sh
aws ecs delete-cluster --cluster MyCluster
```

Output:

```
{
  "cluster": {
    "status": "INACTIVE",
    "clusterName": "MyCluster",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0
  }
}
```

For more information, see Deleting a Cluster in the Amazon ECS Developer Guide.

- For API details, see DeleteCluster in AWS CLI Command Reference.

**delete-service**

The following code example shows how to use delete-service.

**AWS CLI**

**To delete a service**
The following `ecs delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```bash
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see [Deleting a Service](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteService](#) in *AWS CLI Command Reference*.

### delete-task-definitions

The following code example shows how to use `delete-task-definitions`.

**AWS CLI**

**To delete a task definition**

The following `delete-task-definitions` example deletes an INACTIVE task definition.

```bash
aws ecs delete-task-definitions \
  --task-definition curltest:1
```

Output:

```json
{
  "taskDefinitions": [
    {
      "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/curltest:1",
      "containerDefinitions": [
        {
          "name": "ctest",
          "image": "mreferre/eksutils",
          "cpu": 0,
          "portMappings": [],
          "essential": true,
          "entryPoint": [
            "sh",
            "-c"
          ]
        }
      ]
    }
  ]
}
```
"command": [  
  "curl ${ECS_CONTAINER_METADATA_URI_V4}/task"
],

- For API details, see DeleteTaskDefinitions in AWS CLI Command Reference.
delete-task-set

The following code example shows how to use delete-task-set.

AWS CLI

To delete a task set

The following delete-task-set example shows how to delete a task set. You can include the --force parameter to delete a task set even if it has not been scaled to zero.

```bash
aws ecs delete-task-set \
  --cluster MyCluster \ 
  --service MyService \ 
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \ 
  --force
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "DRAINING",
    "computedDesiredCount": 0,
    "pendingCount": 0,
    "runningCount": 0,
    "createdAt": 1557130260.276,
    "updatedAt": 1557130290.707,
    "launchType": "EC2",
    "networkConfiguration": {
      "awsvpcConfiguration": {
        "subnets": ["subnet-12345678"],
        "securityGroups": ["sg-12345678"],
        "assignPublicIp": "DISABLED"
      }
    }
  }
}```
For API details, see [DeleteTaskSet](awscli:DeleteTaskSet) in *AWS CLI Command Reference*.

deregister-container-instance

The following code example shows how to use `deregister-container-instance`.

**AWS CLI**

To deregister a container instance from a cluster

The following `deregister-container-instance` example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the `--force` option.

```bash
aws ecs deregister-container-instance
   --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
   --force
```

Output:

```json
{
   "containerInstance": {
      "remainingResources": [
         {
            "integerValue": 1024,
            "doubleValue": 0.0,
            "type": "INTEGER",
```

For more information, see [Deregister a Container Instance](#) in the *ECS Developer Guide*.

- For API details, see [DeregisterContainerInstance](#) in [AWS CLI Command Reference](#).

**deregister-task-definition**

The following code example shows how to use `deregister-task-definition`.

**AWS CLI**

**To deregister a task definition**

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region.

```bash
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows INACTIVE:
```json
{
    "taskDefinition": {
        "status": "INACTIVE",
        "family": "curler",
        "volumes": [],
        "containerDefinitions": [
            {
                "environment": [],
                "name": "curler",
                "mountPoints": [],
                "image": "curl:latest",

                    "curl -v http://example.com/"
                ],
                "essential": true,
                "volumesFrom": []
            }
        ],
        "revision": 1
    }
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DeregisterTaskDefinition in AWS CLI Command Reference.

describe-capacity-providers

The following code example shows how to use describe-capacity-providers.

AWS CLI

**Example 1: To describe all capacity providers**

The following describe-capacity-providers example retrieves details about all capacity providers.
aws ecs describe-capacity-providers

Output:

```json
{
   "capacityProviders": [
      {
         "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
         "name": "MyCapacityProvider",
         "status": "ACTIVE",
         "autoScalingGroupProvider": {
            "managedScaling": {
               "status": "ENABLED",
               "targetCapacity": 100,
               "minimumScalingStepSize": 1,
               "maximumScalingStepSize": 1000
            },
            "managedTerminationProtection": "ENABLED"
         },
         "tags": []
      },
      {
         "name": "FARGATE",
         "status": "ACTIVE",
         "tags": []
      },
      {
         "name": "FARGATE_SPOT",
         "status": "ACTIVE",
         "tags": []
      }
   ]
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

### Example 2: To describe a specific capacity providers

The following describe-capacity-providers example retrieves details about a specific capacity provider. Using the --include TAGS parameter will add the tags associated with the capacity provider to the output.

```bash
aws ecs describe-capacity-providers \
   --capacity-providers MyCapacityProvider \
   --include TAGS
```

Output:

```json
{
   "capacityProviders": [
      {
         "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
         "name": "MyCapacityProvider",
         "status": "ACTIVE",
         "autoScalingGroupProvider": {
            "managedScaling": {
               "status": "ENABLED",
               "targetCapacity": 100,
               "minimumScalingStepSize": 1,
               "maximumScalingStepSize": 1000
            },
            "managedTerminationProtection": "ENABLED"
         },
         "tags": [
            {
               "key": "environment",
               "value": "production"
            }
         ]
      }
   ]
}
```
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

- For API details, see DescribeCapacityProviders in AWS CLI Command Reference.

describe-clusters

The following code example shows how to use describe-clusters.

AWS CLI

Example 1: To describe a cluster

The following describe-clusters example retrieves details about the specified cluster.

```bash
aws ecs describe-clusters \
   --cluster default
```

Output:

```json
{
   "clusters": [
      {
         "status": "ACTIVE",
         "clusterName": "default",
         "registeredContainerInstancesCount": 0,
         "pendingTasksCount": 0,
         "runningTasksCount": 0,
         "activeServicesCount": 1,
         "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
      }
   ],
   "failures": []
}
```

For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

Example 2: To describe a cluster with the attachment option

The following describe-clusters example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.
aws ecs describe-clusters \
--include ATTACHMENTS \
--clusters sampleCluster

Output:

```json
{
   "clusters": [
      {
         "clusterName": "sampleCluster",
         "status": "ACTIVE",
         "registeredContainerInstancesCount": 0,
         "runningTasksCount": 0,
         "pendingTasksCount": 0,
         "activeServicesCount": 0,
         "statistics": [],
         "tags": [],
         "settings": [],
         "capacityProviders": [
            "sampleCapacityProvider"
         ],
         "defaultCapacityProviderStrategy": [],
         "attachments": [
            {
               "id": "a1b2c3d4-5678-901b-cdef-EXAMPLE22222",
               "type": "as_policy",
               "status": "CREATED",
               "details": [
                  {
                     "name": "capacityProviderName",
                     "value": "sampleCapacityProvider"
                  },
                  {
                     "name": "scalingPolicyName",
                     "value": "ECSManagedAutoScalingPolicy-3048e262-fe39-4eaf-826d-6f975d303188"
                  }
               ]
            }
         ],
         "attachmentsStatus": "UPDATE_COMPLETE"
      }
   ]
}```
describe-container-instances

The following code example shows how to use describe-container-instances.

AWS CLI

To describe container instance

The following describe-container-instances example retrieves details for a container instance in the update cluster, using the container instance UUID as an identifier.

```
aws ecs describe-container-instances \
  --cluster update \
  --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
  "failures": [],
  "containerInstances": [
    {
      "status": "ACTIVE",
      "registeredResources": [
      {
        "integerValue": 2048,

      "22",
      "2376",

For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.

- For API details, see DescribeContainerInstances in AWS CLI Command Reference.

describe-services

The following code example shows how to use describe-services.

AWS CLI

To describe a service

The following describe-services example retrieves details for the my-http-service service in the default cluster.

```
aws ecs describe-services --services my-http-service
```

Output:

```
{
   "services": [
   {
      "status": "ACTIVE",
```
"pendingCount": 0,
"loadBalancers": [],

    }
],
"runningCount": 10
"failures": []
]

For more information, see Services in the Amazon ECS Developer Guide.

- For API details, see DescribeServices in AWS CLI Command Reference.

describe-task-definition

The following code example shows how to use describe-task-definition.
AWS CLI

To describe a task definition

The following describe-task-definition example retrieves the details of a task definition.

```bash
aws ecs describe-task-definition \
    --task-definition hello_world:8
```

Output:

```json
{
    "tasks": [
        {
            "attachments": [
                {
                    "id": "17f3dff6-a9e9-4d83-99a9-7eb5193c2634",

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DescribeTaskDefinition in AWS CLI Command Reference.
**describe-task-sets**

The following code example shows how to use `describe-task-sets`.

**AWS CLI**

**To describe a task set**

The following `describe-task-sets` example describes a task set in a service that uses an external deployer.

```bash
aws ecs describe-task-sets \
  --cluster MyCluster \
  --service MyService \
```

**Output:**

```json
{
  "taskSets": [
    {
      "id": "ecs-svc/1234567890123456789",
      "status": "ACTIVE",
      "computedDesiredCount": 0,
      "pendingCount": 0,
      "runningCount": 0,
      "createdAt": 1557207715.195,
      "updatedAt": 1557207740.014,
      "launchType": "EC2",
      "networkConfiguration": {
        "awsvpcConfiguration": {
          "subnets": [
            "subnet-12344321"
          ],
          "securityGroups": [
            "sg-1234431"
          ],
          "assignPublicIp": "DISABLED"
        }
      }
    }
  ]
}
```
For API details, see [DescribeTaskSets](awscli://#cmd=DescribeTaskSets) in *AWS CLI Command Reference*.

**describe-tasks**

The following code example shows how to use `describe-tasks`.

**AWS CLI**

**Example 1: To describe a single task**

The following `describe-tasks` example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```bash
aws ecs describe-tasks \
  --cluster MyCluster \
  --tasks arn:aws:ecs:us-east-1:123456789012:task/MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```json
{
  "tasks": [
    {
      "attachments": [],
      "attributes": [
      
```
"name": "ecs.cpu-architecture",
"value": "x86_64"
}
],
"availabilityZone": "us-east-1b",

For more information, see [Amazon ECS Task Definitions](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/taskdecorators.html) in the *Amazon ECS Developer Guide*.

**Example 2: To describe multiple tasks**

The following `describe-tasks` example retrieves the details of multiple tasks in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full IDs of the tasks.

```
aws ecs describe-tasks \
  --cluster MyCluster \
  --tasks "74de0355a10a4f979ac495c14EXAMPLE" "d789e9434314c25b9f6bd59eEXAMPLE"
```

Output:

  "startedBy": "ecs-svc/988401040018EXAMPLE"
The following code example shows how to use `execute-command`.

**AWS CLI**

To run an interactive `/bin/sh` command

The following `execute-command` example runs an interactive `/bin/sh` command against a container named MyContainer for a task with an id of `arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \
  --cluster MyCluster \
  --task arn:aws:ecs:us-east-1:123456789012:task/MyCluster/
  d789e94343414c25b9f6bd59eEXAMPLE \
  --container MyContainer \
  --interactive \
  --command "/bin/sh"
```

This command produces no output.

For more information, see [Using Amazon ECS Exec for debugging](https://docs.aws.amazon.com/ecs/latest/developerguide/using-exec.html) in the *Amazon ECS Developer Guide*. 
list-account-settings

The following code example shows how to use list-account-settings.

**AWS CLI**

**Example 1: To view the account settings for an account**

The following list-account-settings example displays the effective account settings for an account.

```shell
aws ecs list-account-settings --effective-settings
```

Output:

```
{
    "settings": [
        {
            "name": "containerInstanceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "taskLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        }
    ]
}
```

**Example 2: To view the account settings for a specific IAM user or IAM role**

The following list-account-settings example displays the account settings for the specified IAM user or IAM role.

- For API details, see [ExecuteCommand](#) in *AWS CLI Command Reference*. 
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser

Output:

```json
{
   "settings": [
      {
         "name": "serviceLongArnFormat",
         "value": "enabled",
         "principalArn": "arn:aws:iam::123456789012:user/MyUser"
      }
   ]
}
```

For more information, see [Amazon Resource Names (ARNs) and IDs](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/arns.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAccountSettings](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-account-settings.html) in *AWS CLI Command Reference*.

---

**list-attributes**

The following code example shows how to use `list-attributes`.

**AWS CLI**

**To list the container instances that contain a specific attribute**

The following example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.

```
aws ecs list-attributes \
   --target-type container-instance \
   --attribute-name stack \
   --attribute-value production \
   --cluster default
```

Output:

```json
{
   "attributes": [
      {
```
For more information, see Amazon ECS Container Agent Configuration in the Amazon ECS Developer Guide.

- For API details, see ListAttributes in AWS CLI Command Reference.

list-clusters

The following code example shows how to use list-clusters.

AWS CLI

To list your available clusters

The following list-clusters example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
   "clusterArns": [
      "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
   ]
}
```

For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

- For API details, see ListClusters in AWS CLI Command Reference.

list-container-instances

The following code example shows how to use list-container-instances.
AWS CLI

**To list the container instances in a cluster**

The following `list-container-instances` example lists all of the available container instances in a cluster.

```bash
aws ecs list-container-instances --cluster MyCluster
```

Output:

```json
{
  "containerInstanceArns": [
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
  ]
}
```

For more information, see [Amazon ECS Container Instances](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/ecs-container-instances.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListContainerInstances](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-container-instances.html) in *AWS CLI Command Reference*.

**list-services-by-namespace**

The following code example shows how to use `list-services-by-namespace`.

**AWS CLI**

**To list the services in a namespace**

The following `list-services-by-namespace` example lists all of the services configured for the specified namespace in your default Region.

```bash
aws ecs list-services-by-namespace \\
--namespace service-connect
```

Output:

```json
{
  "serviceArns": [
```

```
For more information, see Service Connect in the Amazon ECS Developer Guide.
- For API details, see ListServicesByNamespace in AWS CLI Command Reference.

**list-services**

The following code example shows how to use list-services.

**AWS CLI**

To list the services in a cluster

The following list-services example shows how to list the services running in a cluster.

```bash
aws ecs list-services --cluster MyCluster
```

Output:

```json
{
    "serviceArns": [
        "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
    ]
}
```

For more information, see Services in the Amazon ECS Developer Guide.
- For API details, see ListServices in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list the tags for a resource

The following list-tags-for-resource example lists the tags for a specific cluster.
aws ecs list-tags-for-resource \

Output:

```json
{
   "tags": [
   {
   "key": "key1",
   "value": "value1"
   },
   {
   "key": "key2",
   "value": "value2"
   },
   {
   "key": "key3",
   "value": "value3"
   }
   
   ]
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-tags-for-resource.html) in AWS CLI Command Reference.

### list-task-definition-families

The following code example shows how to use `list-task-definition-families`.

**AWS CLI**

**Example 1: To list the registered task definition families**

The following `list-task-definition-families` example lists all of the registered task definition families.

```bash
aws ecs list-task-definition-families
```

Output:

```json
{
```
Example 2: To filter the registered task definition families

The following list-task-definition-families example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```

Output:

```
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Task Definition Parameters in the Amazon ECS Developer Guide. For API details, see ListTaskDefinitionFamilies in AWS CLI Command Reference.

### list-task-definitions

The following code example shows how to use list-task-definitions.

#### AWS CLI

**Example 1: To list the registered task definitions**

```
aws ecs list-task-definitions
```

Output:
Example 2: To list the registered task definitions in a family

The following list-task-definitions example lists the task definition revisions of a specified family.

```bash
aws ecs list-task-definitions --family-prefix wordpress
```

Output:

```
{
  "taskDefinitionArns": [
  ]
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see ListTaskDefinitions in AWS CLI Command Reference.

list-tasks

The following code example shows how to use list-tasks.

AWS CLI

Example 1: To list the tasks in a cluster

The following list-tasks example lists all of the tasks in a cluster.
aws ecs list-tasks --cluster default

Output:

```
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
   ]
}
```

Example 2: To list the tasks on a particular container instance

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
   ]
}
```

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see ListTasks in AWS CLI Command Reference.

put-account-setting-default

The following code example shows how to use put-account-setting-default.

AWS CLI

To modify the default account settings
The following `put-account-setting-default` example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```bash
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```json
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:root"
  }
}
```

For more information, see [Amazon Resource Names (ARNs) and IDs](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/arns.html) in the *Amazon ECS Developer Guide*.

- For API details, see [PutAccountSettingDefault](https://docs.aws.amazon.com/cli/latest/reference/ecs/put-account-setting-default.html) in *AWS CLI Command Reference*.

### put-account-setting

The following code example shows how to use `put-account-setting`.

**AWS CLI**

**To modify the account setting for your IAM user account**

The following `put-account-setting` example enables the `serviceLongArnFormat` account setting for your IAM user account.

```bash
aws ecs put-account-setting --name serviceLongArnFormat --value enabled
```

Output:

```json
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::130757420319:user/your_username"
  }
}
```
For more information, see Modifying Account Settings in the Amazon ECS Developer Guide.

- For API details, see PutAccountSetting in AWS CLI Command Reference.

**put-account-settings**

The following code example shows how to use put-account-settings.

**AWS CLI**

**To modify the account settings for an IAM user or IAM role**

The following put-account-setting example modifies the account settings for the specified IAM user or IAM role.

```
aws ecs put-account-setting \
  --name serviceLongArnFormat \
  --value enabled \
  --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}
```

- For API details, see PutAccountSetting in AWS CLI Command Reference.

**put-attributes**

The following code example shows how to use put-attributes.

**AWS CLI**

**To create an attribute and associate it with an Amazon ECS resource**
The following `put-attributes` applies an attribute with the name `stack` and the value `production` to a container instance.

```
aws ecs put-attributes \
    --attributes name=stack,value=production,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
            "value": "production"
        }
    ]
}
```

- For API details, see [PutAttributes](#) in AWS CLI Command Reference.

**put-cluster-capacity-providers**

The following code example shows how to use `put-cluster-capacity-providers`.

**AWS CLI**

**Example 1: To add an existing capacity provider to a cluster**

The following `put-cluster-capacity-providers` example adds an existing capacity provider to a cluster. The `create-capacity-provider` command is used to create a capacity provider. The `describe-clusters` command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the `MyCluster` cluster has the `MyCapacityProvider1` capacity provider associated with it and you want to add the `MyCapacityProvider2` capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.
aws ecs put-cluster-capacity-providers \
   --cluster MyCluster \
   --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
   --default-capacity-provider-strategy 
capacityProvider=MyCapacityProvider1,weight=1 
capacityProvider=MyCapacityProvider2,weight=1

Output:

```
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "runningTasksCount": 0,
      "pendingTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ],
      "capacityProviders": [
         "MyCapacityProvider1",
         "MyCapacityProvider2"
      ],
      "defaultCapacityProviderStrategy": [
         {
            "capacityProvider": "MyCapacityProvider1",
            "weight": 1,
            "base": 0
         },
         {
            "capacityProvider": "MyCapacityProvider2",
            "weight": 1,
            "base": 0
         }
      ],
      "attachments": [  
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capability-overview.html) in the [Amazon ECS Developer Guide](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capability-overview.html).

**Example 2: To remove a capacity provider from a cluster**

The following `put-cluster-capacity-providers` example removes a capacity provider from a cluster. The `describe-clusters` command is used to describe the current capacity...
providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the MyCapacityProvider1 and MyCapacityProvider2 capacity providers associated with it and you want to remove the MyCapacityProvider2 capacity provider, so you specify only MyCapacityProvider1 in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers \
  --cluster MyCluster \
  --capacity-providers MyCapacityProvider1 \
  --default-capacity-provider-strategy capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ],
    "capacityProviders": [
      "MyCapacityProvider1"
    ],
    "defaultCapacityProviderStrategy": [
      "capacityProvider": "MyCapacityProvider1",
      "weight": 1,
      "base": 0
    ],
    "attachments": [
```

Actions and scenarios
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

**Example 3: To remove all capacity providers from a cluster**

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers [] \
    --default-capacity-provider-strategy []

Output:

```json
{
    "cluster": {
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [],
        "defaultCapacityProviderStrategy": [],
        "attachments": [
            {
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
                    }
                ]
            }
        ]
    }
}
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/ecs/latest/userguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [PutClusterCapacityProviders](https://docs.aws.amazon.com/AmazonECS/latest/APIReference/API_PutClusterCapacityProviders.html) in *AWS CLI Command Reference*.

### register-task-definition

The following code example shows how to use `register-task-definition`.

**AWS CLI**

**Example 1: To register a task definition with a JSON file**

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```bash
aws ecs register-task-definition \
--cli-input-json file://<path_to_json_file>/sleep360.json
```

**Contents of sleep360.json:**

```json
{
}
```
"containerDefinitions": [ 
{
    "name": "sleep",
    "image": "busybox",
    "cpu": 10,
    "command": [
        "sleep",
        "360"
    ],
    "memory": 10,
    "essential": true
}
],
"family": "sleep360"
}

Output:

{
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
            "EXTERNAL",
            "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/sleep360:1",
        "containerDefinitions": [ 
            { 
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": [
                    "sleep",
                    "360"
                ],
                "memory": 10,
            }
        ]
    }
}
For more information, see Example task definitions in the Amazon ECS Developer Guide.

Example 2: To register a task definition with a JSON string parameter

The following register-task-definition example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```bash
aws ecs register-task-definition
--family sleep360
--container-definitions "[{"name":"sleep","image":"busybox","cpu":10,"command":["sleep","360"],"memory":10,"essential":true}]"
```

The output is identical to the previous example.

For more information, see Creating a Task Definition in the Amazon ECS Developer Guide.

- For API details, see RegisterTaskDefinition in AWS CLI Command Reference.

run-task

The following code example shows how to use run-task.

AWS CLI

To run a task on your default cluster

The following run-task example runs a task on the default cluster and uses a client token.

```bash
aws ecs run-task
--cluster default
--task-definition sleep360:1
--client-token 550e8400-e29b-41d4-a716-446655440000
```

Output:
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-east-1b",
            "capacityProviderName": "example-capacity-provider",
            "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/default",
            "containerInstanceArn": "arn:aws:ecs:us-east-1:123456789012:container-instance/default/bc4d2ec011d04bb77bb97e83ceEXAMPLE",
            "containers": [
                {
                    "containerArn": "arn:aws:ecs:us-east-1:123456789012:container/default/d6f51cc5bcc94a47969c92035e9f66f8/75853d2d-711e-458a-8362-0f0aEXAMPLE",
                    "taskArn": "arn:aws:ecs:us-east-1:123456789012:task/default/d6f51cc5bcc94a47969c9203EXAMPLE",
                    "name": "sleep",
                    "image": "busybox",
                    "lastStatus": "PENDING",
                    "networkInterfaces": [],
                    "cpu": "10",
                    "memory": "10"
                }
            ],
            "cpu": "10",
            "createdAt": "2023-11-21T16:59:34.403000-05:00",
            "desiredStatus": "RUNNING",
            "enableExecuteCommand": false,
            "group": "family:sleep360",
            "lastStatus": "PENDING",
            "launchType": "EC2",
            "memory": "10",
            "overrides": {
                "containerOverrides": [
                    {
                        "name": "sleep"
                    }
                ]
            }
        }
    ]
}
For more information, see Running Tasks in the Amazon ECS Developer Guide.

- For API details, see RunTask in AWS CLI Command Reference.

**start-task**

The following code example shows how to use start-task.

**AWS CLI**

To start a new task

The following `start-task` starts a task using the latest revision of the sleep360 task definition on the specified container instance in the default cluster.

```bash
aws ecs start-task \
   --task-definition sleep360 \
   --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```json
{
   "tasks": [
      {
         "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e22d4b6894dd422f4eeee8f8",
         "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
```
The following code example shows how to use `stop-task`.

```json
"containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",
  "overrides": [
    "containerOverrides": [
      { "name": "sleep" }
    ],
  },
  "lastStatus": "PENDING",
  "desiredStatus": "RUNNING",
  "cpu": "128",
  "memory": "128",
  "containers": [
    { "containerArn": "arn:aws:ecs:us-west-2:130757420319:container/75f11ed4-8a3d-4f26-a33b-ad1db9e02d41",
      "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4e3ee8f8",
      "name": "sleep",
      "lastStatus": "PENDING",
      "networkInterfaces": [],
      "cpu": "10",
      "memory": "10"
    }
  ],
  "version": 1,
  "createdAt": 1563421494.186,
  "group": "family:sleep360",
  "launchType": "EC2",
  "attachments": [],
  "tags": []
},
"failures": []
}
```

- For API details, see [StartTask](#) in [AWS CLI Command Reference](#).

### stop-task

The following code example shows how to use `stop-task`.
AWS CLI

To stop a task

The following `stop-task` stops the specified task from running in the default cluster.

```
aws ecs stop-task
  --task 666fdccc2e2d4b6894dd422f4eeeee8f8
```

Output:

```json
{
  "task": {
    "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4eeeee8f8",
    "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
    "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbd46b5991a4bd70c2a43d4",
    "overrides": [
      "containerOverrides": []
    ],
    "lastStatus": "STOPPED",
    "desiredStatus": "STOPPED",
    "cpu": "128",
    "memory": "128",
    "containers": [],
    "version": 2,
    "stoppedReason": "Taskfailedtostart",
    "stopCode": "TaskFailedToStart",
    "connectivity": "CONNECTED",
    "connectivityAt": 1563421494.186,
    "pullStartedAt": 1563421494.252,
    "pullStoppedAt": 1563421496.252,
    "executionStoppedAt": 1563421497,
    "createdAt": 1563421494.186,
    "stoppingAt": 1563421497.252,
    "stoppedAt": 1563421497.252,
    "group": "family:sleep360",
    "launchType": "EC2",
    "attachments": [],
    "tags": []
  }
}
```
tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example adds a single tag to the specified resource.

```bash
aws ecs tag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tags key=key1,value=value1
```

This command produces no output.

**To add multiple tags to a resource**

The following tag-resource example adds multiple tags to the specified resource.

```bash
aws ecs tag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove a tag from a resource**
The following `untag-resource` example removes the listed tags from the specified resource.

```bash
aws ecs untag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tag-keys key1,key2
```

This command produces no output.

- For API details, see [UntagResource](#) in [AWS CLI Command Reference](#).

### update-cluster-settings

The following code example shows how to use `update-cluster-settings`.

**AWS CLI**

**To modify the settings for your cluster**

The following `update-cluster-settings` example enables CloudWatch Container Insights for the default cluster.

```bash
aws ecs update-cluster-settings \
  --cluster default \
  --settings name=containerInsights,value=enabled
```

**Output:**

```
{
  "cluster": {
    "clusterName": "default",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }

  }
}
```
update-container-agent

The following code example shows how to use update-container-agent.

AWS CLI

To update the container agent on an Amazon ECS container instance

The following update-container-agent example updates the container agent on the specified container instance in the default cluster.

```bash
aws ecs update-container-agent --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
    "containerInstance": {
        "status": "ACTIVE",
        ...
        "agentUpdateStatus": "PENDING",
        "versionInfo": {
            "agentVersion": "1.0.0",
            "agentHash": "4023248",
            "dockerVersion": "DockerVersion: 1.5.0"
        }
    }
}
```

For more information, see Updating the Amazon ECS Container Agent in the Amazon ECS Developer Guide.

- For API details, see UpdateContainerAgent in AWS CLI Command Reference.
update-container-instances-state

The following code example shows how to use update-container-instances-state.

AWS CLI

To update the state of a container instance

The following update-container-instances-state updates the state of the specified container instance to DRAINING which will remove it from the cluster it is registered to.

```
aws ecs update-container-instances-state \\
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4 \\
    --status DRAINING
```

Output:

```
{
    "containerInstances": [
        {
            "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",

**update-service-primary-task-set**

The following code example shows how to use `update-service-primary-task-set`.

**AWS CLI**

**To update the primary task set for a service**

The following `update-service-primary-task-set` example updates the primary task set for the specified service.

```
aws ecs update-service-primary-task-set \
  --cluster MyCluster \
  --service MyService \
```

Output:

```
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
```
"status": "PRIMARY",
"computedDesiredCount": 1,

}

- For API details, see UpdateServicePrimaryTaskSet in AWS CLI Command Reference.

update-service

The following code example shows how to use update-service.

AWS CLI

Example 1: To change the task definition used in a service
The following update-service example updates the my-http-service service to use the amazon-ecs-sample task definition.

```bash
aws ecs update-service --service my-http-service --task-definition amazon-ecs-sample
```

**Example 2: To change the number of tasks in a service**

The following update-service example updates the desired task count of the service my-http-service to 3.

```bash
aws ecs update-service --service my-http-service --desired-count 3
```

For more information, see [Updating a Service](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateService](#) in *AWS CLI Command Reference*.

**update-task-set**

The following code example shows how to use update-task-set.

**AWS CLI**

**To update a task set**

The following update-task-set example updates a task set to adjust the scale.

```bash
aws ecs update-task-set \   
   --cluster MyCluster \   
   --service MyService \   
   --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \   
   --scale value=50,unit=PERCENT
```

Output:

```json
{
   "taskSet": {
      "id": "ecs-svc/1234567890123456789",
```

Actions

create-file-system

The following code example shows how to use create-file-system.

**AWS CLI**

To create an encrypted file system

The following create-file-system example creates an encrypted file system using the default CMK. It also adds the tag Name=my-file-system.

```
aws efs create-file-system \
  --performance-mode generalPurpose \
  --throughput-mode bursting \
  --encrypted \
  --tags Key=Name,Value=my-file-system
```

Output:

```
{
  "OwnerId": "123456789012",
  "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
  "FileSystemId": "fs-c7a0456e",
  "CreationTime": 1595286880.0,
  "LifeCycleState": "creating",
  "Name": "my-file-system",
  "NumberOfMountTargets": 0,
  "SizeInBytes": {
```
The following code example shows how to use `create-mount-target`.

**AWS CLI**

To create a mount target

The following `create-mount-target` example creates a mount target for the specified file system.

```bash
aws efs create-mount-target \
   --file-system-id fs-c7a0456e \
   --subnet-id subnet-02bf4c428bexample \
   --security-groups sg-068f739363example
```

**Output:**

```json
{
   "OwnerId": "123456789012",
   "Value": 0,
   "ValueInIA": 0,
   "ValueInStandard": 0
}
```

For more information, see [Creating Amazon EFS file systems](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*.

- For API details, see [CreateFileSystem](https://docs.aws.amazon.com/cli/latest/reference/efs/create-mount-target.html) in AWS CLI Command Reference.
"MountTargetId": "fsmt-f9a14450",
"FileSystemId": "fs-c7a0456e",

}

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see CreateMountTarget in AWS CLI Command Reference.

delete-file-system

The following code example shows how to use delete-file-system.

AWS CLI

To delete a file system

The following delete-file-system example deletes the specified file system.

```
aws efs delete-file-system \
   --file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the Amazon Elastic File System User Guide.

- For API details, see DeleteFileSystem in AWS CLI Command Reference.

delete-mount-target

The following code example shows how to use delete-mount-target.

AWS CLI

To delete a mount target
The following delete-mount-target example deletes the specified mount target.

```bash
aws efs delete-mount-target \
   --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see [Creating mount targets](#) in the Amazon Elastic File System User Guide.

- For API details, see [DeleteMountTarget](#) in AWS CLI Command Reference.

describe-file-systems

The following code example shows how to use describe-file-systems.

**AWS CLI**

**To describe a file system**

The following describe-file-systems example describes the specified file system.

```bash
aws efs describe-file-systems \
   --file-system-id fs-c7a0456e
```

**Output:**

```json
{
   "FileSystems": [
      {
         "OwnerId": "123456789012",
         "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
         "FileSystemId": "fs-c7a0456e",

         "SizeInBytes": {
            "Value": 6144,
            "Timestamp": 1600991437.0,
         }
      }
   ]
}
```
For more information, see Managing Amazon EFS file systems in the Amazon Elastic File System User Guide.

- For API details, see DescribeFileSystems in AWS CLI Command Reference.

**describe-mount-targets**

The following code example shows how to use describe-mount-targets.

**AWS CLI**

**To describe a mount target**

The following describe-mount-targets example describes the specified mount target.

```bash
aws efs describe-mount-targets \
  --mount-target-id fsmt-f9a14450
```

Output:

```json
{
  "MountTargets": [
    {
      "OwnerId": "123456789012",
      "ValueInIA": 0,
      "ValueInStandard": 6144
    },
    {
      "PerformanceMode": "generalPurpose",
      "Encrypted": true,
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-adcf-30d92example",
      "ThroughputMode": "bursting",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-file-system"
        }
      ]
    }
  ]
}
```
"MountTargetId": "fsmt-f9a14450",
"FileSystemId": "fs-c7a0456e",
"SubnetId": "subnet-02bf4c428bexample",
"LifeCycleState": "creating",
"IpAddress": "10.0.1.24",
"NetworkInterfaceId": "eni-02d542216aexample",
"AvailabilityZoneId": "use2-az2",
"AvailabilityZoneName": "us-east-2b",
"VpcId": "vpc-0123456789abcdef0"
] ]
}]

For more information, see Creating mount targets in the Amazon Elastic File System User Guide. For API details, see DescribeMountTargets in AWS CLI Command Reference.

describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags for a file system

The following describe-tags example describes the tags for the specified file system.

aws efs describe-tags \ 
   --file-system-id fs-c7a0456e

Output:

```json
{
   "Tags": [
   {
      "Key": "Name",
      "Value": "my-file-system"
   },
   {
      "Key": "Department",
      "Value": "Business Intelligence"
   }
```
For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see DescribeTags in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To retrieve the tags for a resource**

The following list-tags-for-resource example retrieves the tags associated with the specified file system.

```bash
aws efs list-tags-for-resource 
  --resource-id fs-c7a0456e
```

Output:

```json
{
  "Tags": [
    {
      "Key": "Name",
      "Value": "my-file-system"
    },
    {
      "Key": "Department",
      "Value": "Business Intelligence"
    }
  ]
}
```

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

To tag a resource

The following `tag-resource` example adds the tag `Department=Business Intelligence` to the specified file system.

```
aws efs tag-resource \
   --resource-id fs-c7a0456e \
   --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see [Managing file system tags](#) in the Amazon Elastic File System User Guide.

- For API details, see [TagResource](#) in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove a tag from a resource

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```
aws efs untag-resource \
   --resource-id fs-c7a0456e \
   --tag-keys Department
```

This command produces no output.

For more information, see [Managing file system tags](#) in the Amazon Elastic File System User Guide.

- For API details, see [UntagResource](#) in AWS CLI Command Reference.
### Amazon EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Actions

**associate-encryption-config**

The following code example shows how to use associate-encryption-config.

#### AWS CLI

To associates an encryption configuration to an existing cluster

The following associate-encryption-config example enable's encryption on an existing EKS clusters that do not already have encryption enabled.

```
aws eks associate-encryption-config \
  --cluster-name my-eks-cluster \
  --encryption-config '[["resources":["secrets"],"provider":\n{"keyArn":"arn:aws:kms:region-code:account:key/key"}]]'
```

**Output:**

```
{
  "update": {
    "id": "3141b835-8103-423a-8e68-12c2521ffa4d",
    "status": "InProgress",
  }
}
```
For more information, see [Enabling secret encryption on an existing cluster](#) in the Amazon EKS User Guide.

- For API details, see [AssociateEncryptionConfig](#) in AWS CLI Command Reference.

associate-identity-provider-config

The following code example shows how to use associate-identity-provider-config.

**AWS CLI**

**Associate identity provider to your Amazon EKS Cluster**

The following associate-identity-provider-config example associates an identity provider to your Amazon EKS Cluster.

```
aws eks associate-identity-provider-config \
  --cluster-name my-eks-cluster \
  --oidc 'identityProviderConfigName=my-identity-provider,issuerUrl=https://oidc.eks.us-east-2.amazonaws.com/id/38D6A4619A0A69E342B113ED7F1A7652,clientId=kubernetes,usernameClaim=email,usernamePrefix=my-,username-prefix,groupsClaim=my-claim,groupsPrefix=my-groups-prefix,requiredClaims={Claim1=value1,Claim2=value2}' \
  --tags env=dev
```

Output:

```
{
  "update": {
    "id": "8c6c1bef-61fe-42ac-a242-89412387b8e7",
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Associate an OIDC identity provider in the Amazon EKS User Guide.

- For API details, see AssociateIdentityProviderConfig in AWS CLI Command Reference.

create-addon

The following code example shows how to use create-addon.

AWS CLI

Example 1: To create an Amazon EKS add-on with default compatible version for the respective EKS cluster version

The following create-addon example command creates an Amazon EKS add-on with default compatible version for the respective EKS cluster version.

```bash
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role ROLENAME
```

Output:

```json
{
    "addon": {
```
"addonName": "my-eks-addon",
"clusterName": "my-eks-cluster",
"status": "CREATING",
"addonVersion": "v1.15.1-eksbuild.1",
"health": {
    "issues": [],
},
"addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/1ec71ee1-b9c2-8915-4e17-e8be0a55a149",
"createdAt": "2024-03-14T12:20:03.264000-04:00",
"modifiedAt": "2024-03-14T12:20:03.283000-04:00",
"serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
"tags": {}\}
\}

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

Example 2: To create an Amazon EKS add-on with specific add-on version

The following `create-addon` example command creates an Amazon EKS add-on with specific add-on version.

```bash
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
    --addon-version v1.16.4-eksbuild.2
```

Output:

```json
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
```

Example 3: To create an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolves conflicts details.

```bash
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values '{"resources":{"limits":{"cpu":"100m"}}}' \
  --resolve-conflicts OVERWRITE
```

Output:

```json
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/a6c71ee9-0304-9237-1be8-25af1b0f1ff3",
    "createdAt": "2024-03-14T12:35:58.313000-04:00",
    "modifiedAt": "2024-03-14T12:35:58.327000-04:00",
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "tags": {},
    "configurationValues": "{"resources":{"limits":{"cpu":"100m"}}}"
  }
}
```
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

**Example 4: To create an Amazon EKS add-on with custom JSON configuration values file**

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```bash
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iams::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values 'file://configuration-values.json' \
  --resolve-conflicts OVERWRITE \
  --tags '{"eks-addon-key-1": "value-1", "eks-addon-key-2": "value-2"}"
```

**Contents of configuration-values.json:**

```json
{
  "resources": {
    "limits": {
      "cpu": "150m"
    }
  },
  "env": {
    "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
  }
}
```

**Output:**

```json
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    }
  }
}
```
For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

Example 5: To create an Amazon EKS add-on with custom YAML configuration values file

The following create-addon example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```bash
aws eks create-addon 
  --cluster-name my-eks-cluster 
  --addon-name my-eks-addon 
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name 
  --addon-version v1.16.4-eksbuild.2 
  --configuration-values 'file://configuration-values.yaml' 
  --resolve-conflicts OVERWRITE 
  --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of configuration-values.yaml:

```yaml
resources:
  limits:
    cpu: '100m'
env:
  AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:
The following code example shows how to use `create-cluster`.

```
aws eks create-cluster --name prod 
--role-arn arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI 
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the Amazon EKS User Guide.

- For API details, see CreateAddon in AWS CLI Command Reference.

**create-cluster**

The following code example shows how to use `create-cluster`.

### AWS CLI

#### To create a new cluster

This example command creates a cluster named `prod` in your default region.

**Command:**

```
aws eks create-cluster --name prod 
--role-arn arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI 
```
--resources-vpc-config subnetIds=subnet-6782e71e,subnet-e7e761ac,securityGroupIds=sg-6979fe18

Output:

```json
{
   "cluster": {
      "name": "prod",
      "createdAt": 1527808069.147,
      "version": "1.10",
      "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
      "resourcesVpcConfig": {
         "subnetIds": [
            "subnet-6782e71e",
            "subnet-e7e761ac"
         ],
         "securityGroupIds": [
            "sg-6979fe18"
         ],
         "vpcId": "vpc-950809ec"
      },
      "status": "CREATING",
      "certificateAuthority": {}
   }
}
```

**To create a new cluster with private endpoint access and logging enabled**

This example command creates a cluster named `example` in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

**Command:**

```
aws eks create-cluster --name example --kubernetes-version 1.12 --role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q --resources-vpc-config subnetIds=subnet-0a188dcd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,subnet-051f77c5cfe5a9bc,subnet-01a1b1f5c6946a9fe,subnet-08f00f0f0f0f0f0f0,securityGroupIds=sg-0c5b580845a031c10,endpointPublicAccess=false,endpointPrivateAccess=true
```
--logging '{"clusterLogging":[{"types"[:
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'}

Output:

```
{
  "cluster": {
    "name": "example",
    "createdAt": 1565804921.901,
    "version": "1.12",
    "roleArn": "arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q",
    "resourcesVpcConfig": {
      "subnetIds": [
        "subnet-0a188dccd2f9a632f",
        "subnet-09290d93da4278664",
        "subnet-0f21dd86e0e91134a",
        "subnet-0173dead68481a583",
        "subnet-051f70a57ed6fcb6",
        "subnet-01322339c5c7de9b4"
      ],
      "securityGroupIds": [
        "sg-0c5b580845a031c10"
      ],
      "vpcId": "vpc-0f622c01f68d4afec",
      "endpointPublicAccess": false,
      "endpointPrivateAccess": true
    },
    "logging": {
      "clusterLogging": [
        {"types": [
          "api",
          "audit",
          "authenticator",
          "controllerManager",
          "scheduler"
        ],
        "enabled": true
      }
    }
  }
}
```
For API details, see CreateCluster in AWS CLI Command Reference.

**create-fargate-profile**

The following code example shows how to use create-fargate-profile.

**AWS CLI**

**Example 1: Create EKS Fargate Profile for a selector with a namespace**

The following create-fargate-profile example creates an EKS Fargate Profile for a selector with a namespace.

```bash
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[["namespace": "default"]]'
```

Output:

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:38:47.368000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      {
        "namespace": "default"
      }
    ]
  }
}
```
For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the Amazon EKS User Guide.

**Example 2: Create EKS Fargate Profile for a selector with a namespace and labels**

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace and labels.

```bash
aws eks create-fargate-profile \
   --cluster-name my-eks-cluster \
   --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
   --fargate-profile-name my-fargate-profile \
   --selectors '[["namespace": "default", "labels": {"labelname1": "labelvalue1"}]]'
```

**Output:**

```json
{
   "fargateProfile": {
      "fargateProfileName": "my-fargate-profile",
      "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/my-fargate-profile/88c72bc7-e8a4-fa34-44e4-2f1397224bb3",
      "clusterName": "my-eks-cluster",
      "createdAt": "2024-03-19T12:33:48.125000-04:00",
      "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
      "subnets": [
         "subnet-09d912bb63ef21b9a",
         "subnet-04ad87f71c6e5ab4d",
         "subnet-0e2907431c9988b72"
      ],
      "selectors": [
         {
            "namespace": "default",
            "labels": {
               "labelname1": "labelvalue1"
            }
         }
      ]
   }
}
```
For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the Amazon EKS User Guide.

**Example 3: Create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.**

The following `create-fargate-profile` example create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

```bash
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[["namespace": "default", "labels": {"labelname1": "labelvalue1"}]]' \
  --subnets ['subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d", "subnet-0e2907431c9988b72"]'
```

**Output:**

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:35:58.640000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
```
The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```bash
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[{"namespace": "default1", "labels": {"labelname1": "labelvalue1", "labelname2": "labelvalue2"}],{"namespace": "default2", "labels": {"labelname1": "labelvalue1", "labelname2": "labelvalue2"}}\n  --subnets "["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d", "subnet-0e2907431c9988b72"]\n  --tags "{"eks-fargate-profile-key-1": "value-1", "eks-fargate-profile-key-2": "value-2"}"
```

Output:

```json
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:15:55.271000-04:00",
  }
}
```
"podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
"subnets": [
   "subnet-09d912bb63ef21b9a",
   "subnet-04ad87f71c6e5ab4d",
   "subnet-0e2907431c9988b72"
],
"selectors": [
   {
      "namespace": "default1",
      "labels": {
         "labelname2": "labelvalue2",
         "labelname1": "labelvalue1"
      }
   },
   {
      "namespace": "default2",
      "labels": {
         "labelname2": "labelvalue2",
         "labelname1": "labelvalue1"
      }
   }
],
"status": "CREATING",
"tags": {
   "eks-fargate-profile-key-2": "value-2",
   "eks-fargate-profile-key-1": "value-1"
}
}

For more information, see AWS Fargate profile - Creating a Fargate profile in the Amazon EKS User Guide.

**Example 5: Create EKS Fargate Profile with a wildcard selector for namespaces and labels, along with IDs of subnets to launch a Pod into**

The following create-fargate-profile example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```bash
aws eks create-fargate-profile \
   --cluster-name my-eks-cluster \
   --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
   --fargate-profile-name my-fargate-profile \
```
Output:

```json
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/my-fargate-profile/e8c72bd6-5966-0bfe-b77b-1802893e5a6f",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T13:05:20.550000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "prod*",
                "labels": {
                    "labelname*?": "*value1"
                }
            },
            {
                "namespace": "*dev*",
                "labels": {
                    "labelname*?": "*value*"
                }
            }
        ],
        "status": "CREATING",
        "tags": {
            "eks-fargate-profile-key-2": "value-2",
            "eks-fargate-profile-key-1": "value-1"
        }
    }
}
```
For more information, see [AWS Fargate profile - Creating a Fargate profile](https://docs.aws.amazon.com/eks/latest/userguide/aws-fargate-profile.html) in the *Amazon EKS User Guide*.

### create-nodegroup

The following code example shows how to use `create-nodegroup`.

**AWS CLI**

**Example 1: Creates a managed node group for an Amazon EKS cluster**

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster.

```
aws eks create-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --node-role arn:aws:iam::111122223333:role/role-name \
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a" \
  --scaling-config minSize=1,maxSize=3,desiredSize=1 \
  --region us-east-2
```

**Output:**

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "clusterName": "my-eks-cluster",
    "version": "1.26",
    "releaseVersion": "1.26.12-20240329",
    "createdAt": "2024-04-04T13:19:32.260000-04:00",
    "modifiedAt": "2024-04-04T13:19:32.260000-04:00",
    "status": "CREATING",
    "capacityType": "ON_DEMAND",
    "scalingConfig": {
      "minSize": 1,
      "maxSize": 3,
      "desiredSize": 1
    }
  }
```

```
For more information, see [Creating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide/create-nodegroup.html) in the *Amazon EKS User Guide*.

**Example 2: Creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size**

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size.

```bash
aws eks create-nodegroup
  --cluster-name my-eks-cluster
  --nodegroup-name my-eks-nodegroup
  --node-role arn:aws:iam::111122223333:role/role-name
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
  --scaling-config minSize=1,maxSize=3,desiredSize=1
  --capacity-type ON_DEMAND
  --instance-types 'm5.large'
  --disk-size 50
  --region us-east-2
```

Output:
Example 3: Creates a managed node group for an Amazon EKS cluster with custom instance-
types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.
The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

```bash
aws eks create-nodegroup  
  --cluster-name my-eks-cluster 
  --nodegroup-name my-eks-nodegroup 
  --node-role arn:aws:iam::111122223333:role/role-name

### delete-addon

The following code example shows how to use `delete-addon`.

```json
"t3.large",
"subnets": ["subnet-0e2907431c9988b72", "subnet-04ad87f71c6e5ab4d", "subnet-09d912bb63ef21b9a"],
"amiType": "AL2_x86_64",
"nodeRole": "arn:aws:iam::111122223333:role/role-name",
"labels": {
    "my-eks-nodegroup-label-2": "value-2",
    "my-eks-nodegroup-label-1": "value-1"
},
"taints": [
    {
        "key": "taint-key-1",
        "value": "taint-value-1",
        "effect": "NO_EXECUTE"
    }
],
"diskSize": 50,
"health": {
    "issues": []
},
"updateConfig": {
    "maxUnavailable": 2
},
"tags": {
    "my-eks-nodegroup-key-1": "value-1",
    "my-eks-nodegroup-key-2": "value-2"
}
}`
**AWS CLI**

**Example 1. To deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster**

The following `delete-addon` example command deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster.

```bash
aws eks delete-addon \
   --cluster-name my-eks-cluster \
   --addon-name my-eks-addon \
   --preserve
```

**Output:**

```
{
   "addon": {
      "addonName": "my-eks-addon",
      "clusterName": "my-eks-cluster",
      "status": "DELETING",
      "addonVersion": "v1.9.3-eksbuild.7",
      "health": {
         "issues": []
      },
      "createdAt": "2024-03-14T11:49:09.009000-04:00",
      "modifiedAt": "2024-03-14T12:03:49.776000-04:00",
      "tags": {}
   }
}
```

For more information, see [Managing Amazon EKS add-ons - Deleting an add-on](#) in the Amazon EKS.

**Example 2. To deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster**

The following `delete-addon` example command deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster.

```bash
aws eks delete-addon \
```

Actions and scenarios

2770
--cluster-name my-eks-cluster \
--addon-name my-eks-addon

Output:

```json
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
        "createdAt": "2024-03-14T11:45:31.983000-04:00",

                        "controllerManager",
                        "scheduler"
                    ]
                }
            ]
        }
    }
}

Actions and scenarios

2772
For more information, see Deleting an Amazon EKS cluster in the Amazon EKS User Guide.

- For API details, see DeleteCluster in AWS CLI Command Reference.
delete-fargate-profile

The following code example shows how to use delete-fargate-profile.

AWS CLI

Example 1: Create EKS Fargate Profile for a selector with a namespace

The following delete-fargate-profile example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks delete-fargate-profile \\
  --cluster-name my-eks-cluster \\
  --fargate-profile-name my-fargate-profile
```

Output:

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T11:48:39.975000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      {
        "namespace": "default",
        "labels": {
          "foo": "bar"
        }
      }
    ],
    "status": "DELETING",
    "tags": {}
  }
}
```
For more information, see AWS Fargate profile - Deleting a Fargate in the Amazon EKS User Guide.

- For API details, see DeleteFargateProfile in AWS CLI Command Reference.

delete-nodegroup

The following code example shows how to use delete-nodegroup.

AWS CLI

Example 1: Delete a managed node group for an Amazon EKS cluster

The following delete-nodegroup example deletes a managed node group for an Amazon EKS cluster.

```
aws eks delete-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup
```

Output:

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-nodegroup/1ec75f5f-0e21-dcc0-b46e-f9c442685cd8",
    "clusterName": "my-eks-cluster",
    "version": "1.26",
    "releaseVersion": "1.26.12-20240329",
    "createdAt": "2024-04-08T13:25:15.033000-04:00",
    "modifiedAt": "2024-04-08T13:25:31.252000-04:00",
    "status": "DELETING",
    "capacityType": "SPOT",
    "scalingConfig": {
      "minSize": 1,
      "maxSize": 5,
      "desiredSize": 4
    },
    "instanceTypes": [
      "t3.large"
    ],
    "subnets": [
```
For API details, see [DeleteNodegroup](awscli/reference/eks/delete-nodegroup) in *AWS CLI Command Reference*.

**deregister-cluster**

The following code example shows how to use `deregister-cluster`.

**AWS CLI**

To deregisters a connected cluster to remove it from the Amazon EKS control plane

The following `deregister-cluster` example deregisters a connected cluster to remove it from the Amazon EKS control plane.
aws eks deregister-cluster \
   --name my-eks-anywhere-cluster

Output:
{
   "cluster": {
      "name": "my-eks-anywhere-cluster",
      "createdAt": "2024-04-12T12:38:37.561000-04:00",
      "status": "DELETING",
      "tags": {},
      "connectorConfig": {
         "activationId": "dfb5ad28-13c3-4e26-8a19-5b2457638c74",
         "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
         "provider": "EKS_ANYWHERE",
         "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
      }
   }
}

For more information, see [Deregistering a cluster](https://docs.aws.amazon.com/eks/userguide) in the *Amazon EKS User Guide*.

- For API details, see [DeregisterCluster](https://docs.aws.amazon.com/cli/latest/reference/eks/deregister-cluster.html) in *AWS CLI Command Reference*.

describe-addon-configuration

The following code example shows how to use describe-addon-configuration.

**AWS CLI**

**Example 1: Configuration options available when creating or updating Amazon vpc-cni AddOns**

The following describe-addon-configuration example returns the all the available configuration schema you use when an add-on is created or updated for vpc-cni add-on with respective version.

```bash
aws eks describe-addon-configuration \
   --addon-name vpc-cni \
   --addon-version v1.15.1-eksbuild.1
```
Output:

```json
{
    "addonName": "vpc-cni",
    "addonVersion": "v1.15.1-eksbuild.1",
    "configurationSchema": "{ "$ref": "#/definitions/VpcCni" }
}
```
Example 2: Configuration options available when creating or updating Amazon coredns AddOns

The following describe-addon-configuration example returns all the available configuration schema you use when an add-on is created or updated for coredns add-on with respective version.

```
aws eks describe-addon-configuration 
   --addon-name coredns 
   --addon-version v1.8.7-eksbuild.4
```

Output:

```json
{
  "vpc-cni": {
    "description": "vpc-cni",
    "actions_and_scenarios": 2779
  }
}
```
For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the Amazon EKS.

- For API details, see DescribeAddonConfiguration in AWS CLI Command Reference.

**describe-addon-versions**

The following code example shows how to use describe-addon-versions.

**AWS CLI**

**Example 1: List all the available addons for EKS Cluster**

The following describe-addon-versions example list all the available AWS addons.

```bash
aws eks describe-addon-versions  
   --query 'sort_by(addons &owner)[].{publisher: publisher, owner: owner, 
addonName: addonName, type: type}' 
   --output table
```

Output:

```
| DescribeAddonVersions |
|-----------------------|--------------------------|
| +-----------------------+--------------------------|
| +-----------------------+--------------------------|
| +-----------------------+--------------------------|
```

- For API details, see DescribeAddonVersions in AWS CLI Command Reference.

**describe-addon**

The following code example shows how to use describe-addon.
AWS CLI

Describe actively running EKS addon in your Amazon EKS cluster

The following describe-addon example actively running EKS addon in your Amazon EKS cluster.

```bash
aws eks describe-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni
```

Output:

```
{
  "addon": {
    "addonName": "vpc-cni",
    "clusterName": "my-eks-cluster",
    "status": "ACTIVE",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
    "issues": [],
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f",
    "createdAt": "2024-03-14T13:18:45.417000-04:00",

    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm",
    "tags": {
      "eks-addon-key-3": "value-3",
      "eks-addon-key-4": "value-4"
    },
    "configurationValues": "resources:
      limits:
        cpu: '100m'
      dependencies:
        AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
    }
  }
}
```

- For API details, see DescribeAddon in AWS CLI Command Reference.

describe-cluster

The following code example shows how to use describe-cluster.
Describe actively running EKS addon in your Amazon EKS cluster

The following describe-cluster example actively running EKS addon in your Amazon EKS cluster.

```bash
aws eks describe-cluster \\
  --cluster-name my-eks-cluster
```

Output:

```json
{
  "cluster": {
    "name": "my-eks-cluster",
    "createdAt": "2024-03-14T11:31:44.348000-04:00",
    "version": "1.26",

}
For API details, see `DescribeCluster` in *AWS CLI Command Reference*.

**describe-fargate-profile**

The following code example shows how to use describe-fargate-profile.

**AWS CLI**

**Describe a Fargate profile**

The following `describe-fargate-profile` example describes a Fargate profile.

```bash
aws eks describe-fargate-profile
--cluster-name my-eks-cluster
--fargate-profile-name my-fargate-profile
```

Output:

```json
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-04-11T10:42:52.486000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-farga-FargatePodExecutionRole-1htfAaJdJUEO",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      
    ]
  }
}
```
For API details, see `DescribeFargateProfile` in *AWS CLI Command Reference*.

describe-identity-provider-config

The following code example shows how to use `describe-identity-provider-config`.

**AWS CLI**

**Describe an identity provider configuration associated to your Amazon EKS Cluster**

The following `describe-identity-provider-config` example describes an identity provider configuration associated to your Amazon EKS Cluster.

```bash
aws eks describe-identity-provider-config \
--cluster-name my-eks-cluster \
--identity-provider-config type=oidc,name=my-identity-provider
```

Output:

```json
{
    "identityProviderConfig": {
        "oidc": {
            "namespace": "*dev*",
            "labels": {
                "labelname*??": "*value*"
            }
        }
    }
}
```
For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the Amazon EKS User Guide.

- For API details, see DescribeIdentityProviderConfig in AWS CLI Command Reference.

**describe-nodegroup**

The following code example shows how to use describe-nodegroup.

**AWS CLI**

**Describe a managed node group for an Amazon EKS cluster**

The following describe-nodegroup example describes a managed node group for an Amazon EKS cluster.

```bash
aws eks describe-nodegroup \
  --cluster-name my-eks-cluster \n  --nodegroup-name my-eks-nodegroup
```
Output:

```json
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-nodegroup/a8c75f2f-df78-a72f-4063-4b69af3de5b1",
        "clusterName": "my-eks-cluster",
        "version": "1.26",
        "releaseVersion": "1.26.12-20240329",
        "createdAt": "2024-04-08T11:42:10.555000-04:00",
        "modifiedAt": "2024-04-08T11:44:12.402000-04:00",
        "status": "ACTIVE",
        "capacityType": "ON_DEMAND",
        "scalingConfig": {
            "minSize": 1,
            "maxSize": 3,
            "desiredSize": 1
        },

            "t3.medium"
        ],
        "subnets": [
            "subnet-0e2907431c9988b72",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-09d912bb63ef21b9a"
        ],
        "amiType": "AL2_x86_64",
        "nodeRole": "arn:aws:iam::111122223333:role/role-name",
        "labels": {},
        "resources": {
            "autoScalingGroups": [
                {
                    "name": "eks-my-eks-nodegroup-a8c75f2f-df78-a72f-4063-4b69af3de5b1"
                }
            ]
        },
        "diskSize": 20,
        "health": {
            "issues": []
        },
        "updateConfig": {
            "maxUnavailable": 1
        }
    }
}
```
describe-update

The following code example shows how to use describe-update.

AWS CLI

Example 1: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```shell
aws eks describe-update \
  --name my-eks-cluster \
  --update-id 10bddd13-a71b-425a-b0a6-71cd03e59161
```

Output:

```json
{
  "update": {
    "id": "10bddd13-a71b-425a-b0a6-71cd03e59161",
    "status": "Successful",
    "type": "EndpointAccessUpdate",
    "params": [
      {
        "type": "EndpointPublicAccess",
        "value": "false"
      },
      {
        "type": "EndpointPrivateAccess",
        "value": "true"
      }
    ],
    "createdAt": "2024-03-14T10:10:26.297000-04:00",
    "errors": []
  }
}
```
For more information, see Updating an Amazon EKS cluster Kubernetes version in the Amazon EKS User Guide.

Example 2: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```
aws eks describe-update \
  --name my-eks-cluster \
  --update-id e4994991-4c0f-475a-a040-427e6da52966
```

Output:

```
{
  "update": {
    "id": "e4994991-4c0f-475a-a040-427e6da52966",
    "status": "Successful",
    "type": "AssociateEncryptionConfig",
    "params": [
      {
        "type": "EncryptionConfig",
        "value": "["resources":["secrets"],"provider":{"keyArn": "arn:aws:kms:region-code:account:key/key"}]
      }
    ],
    "createdAt": "2024-03-14T11:01:26.297000-04:00",
    "errors": []
  }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the Amazon EKS User Guide.

Example 3: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```
aws eks describe-update \
  --name my-eks-cluster \
  --update-id b5f0ba18-9a87-4450-b5a0-825e6e84496f
```

Output:
For more information, see [Updating an Amazon EKS cluster Kubernetes version](https://docs.aws.amazon.com/eks/userguide/cluster-update-kubernetes-version.html) in the *Amazon EKS User Guide*.

- For API details, see [DescribeUpdate](https://docs.aws.amazon.com/cli/latest/reference/eks/describe-update.html) in *AWS CLI Command Reference*.

### disassociate-identity-provider-config

The following code example shows how to use `disassociate-identity-provider-config`.

**AWS CLI**

**Disassociate identity provider to your Amazon EKS Cluster**

The following `disassociate-identity-provider-config` example disassociates an identity provider to your Amazon EKS Cluster.

```bash
aws eks disassociate-identity-provider-config \   --cluster-name my-eks-cluster \   --identity-provider-config 'type=oidc,name=my-identity-provider'
```

**Output:**

```bash
```
For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Disassociate an OIDC identity provider from your cluster in the Amazon EKS User Guide.

- For API details, see DisassociateIdentityProviderConfig in AWS CLI Command Reference.

get-token

The following code example shows how to use get-token.

AWS CLI

Example 1: Get an authentication token for an Amazon EKS Cluster named `my-eks-cluster`

The following get-token example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster.

```bash
aws eks get-token 
   --cluster-name my-eks-cluster
```

Output:

```json
{
   "kind": "ExecCredential",
   "apiVersion": "client.authentication.k8s.io/v1beta1",
   "spec": {}
}
```
Example 2: Gets an authentication token for an Amazon EKS Cluster named `my-eks-cluster` by assuming this roleARN for credentials when signing the token

The following get-token example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster by assuming this roleARN for credentials when signing the token.

```bash
aws eks get-token \
--cluster-name my-eks-cluster \
--role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```json
{
    "kind": "ExecCredential",
    "apiVersion": "client.authentication.k8s.io/v1beta1",
    "spec": {},
    "status": {
        "expirationTimestamp": "2024-04-11T21:05:26Z",
        "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
    }
}
```

- For API details, see [GetToken](https://docs.aws.amazon.com/cli/latest/reference/eks/get-token.html) in AWS CLI Command Reference.

**list-addons**

The following code example shows how to use list-addons.

**AWS CLI**

List all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following list-addons example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.
aws eks list-addons \\ 
--cluster-name my-eks-cluster

Output:

{
   "addons": [
   "kube-proxy",
   "vpc-cni"
   ]
}

• For API details, see ListAddons in AWS CLI Command Reference.

list-clusters

The following code example shows how to use list-clusters.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following list-clusters example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

aws eks list-clusters

Output:

{
   "clusters": [
   "prod",
   "qa",
   "stage",
   "my-eks-cluster"
   ]
}

• For API details, see ListClusters in AWS CLI Command Reference.
list-fargate-profiles

The following code example shows how to use list-fargate-profiles.

AWS CLI

To list all the fargate profiles in your Amazon EKS cluster named `my-eks-cluster`

The following list-fargate-profiles example lists all the fargate profiles in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-fargate-profiles \
  --cluster-name my-eks-cluster
```

Output:

```
{
  "fargateProfileNames": [
    "my-fargate-profile"
  ]
}
```

- For API details, see ListFargateProfiles in AWS CLI Command Reference.

list-identity-provider-configs

The following code example shows how to use list-identity-provider-configs.

AWS CLI

List identity providers associated to an Amazon EKS Cluster

The following list-identity-provider-configs example lists identity provider associated to an Amazon EKS Cluster.

```
aws eks list-identity-provider-configs \
  --cluster-name my-eks-cluster
```

Output:

```
{
```

Actions and scenarios
"identityProviderConfigs": [
    {
        "type": "oidc",
        "name": "my-identity-provider"
    }
]
}

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the Amazon EKS User Guide.

- For API details, see ListIdentityProviderConfigs in AWS CLI Command Reference.

list-nodegroups

The following code example shows how to use list-nodegroups.

AWS CLI

List all the node groups in an Amazon EKS cluster

The following list-nodegroups example list all the node groups in an Amazon EKS cluster.

```
aws eks list-nodegroups \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "nodegroups": [
        "my-eks-managed-node-group",
        "my-eks-nodegroup"
    ]
}
```

- For API details, see ListNodegroups in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.
Example 1: To list all the tags for an Amazon EKS Cluster ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Cluster ARN.

```bash
aws eks list-tags-for-resource \\
```

Output:

```json
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "karpenter.sh/discovery": "my-eks-cluster",
        "auto-delete": "no",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/cluster-oidc-enabled": "true",
        "aws:cloudformation:logical-id": "ControlPlane",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev+a7ee89342.2024-03-01T03:40:57Z",
        "Name": "eksctl-my-eks-cluster-cluster/ControlPlane"
    }
}
```

Example 2: To list all the tags for an Amazon EKS Node group ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Node group ARN.

```bash
aws eks list-tags-for-resource \\
```

Output:

```json
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "karpenter.sh/discovery": "my-eks-cluster",
        "auto-delete": "no",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/cluster-oidc-enabled": "true",
        "aws:cloudformation:logical-id": "ControlPlane",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev+a7ee89342.2024-03-01T03:40:57Z",
        "Name": "eksctl-my-eks-cluster-cluster/ControlPlane"
    }
}
```
Example 3: To list all the tags on an Amazon EKS Fargate profile ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Fargate profile ARN.

```
aws eks list-tags-for-resource \
```

Output:

```
{
   "tags": {
      "eks-fargate-profile-key-2": "value-2",
      "eks-fargate-profile-key-1": "value-1"
   }
}
```
Example 4: To list all the tags for an Amazon EKS Add-on ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```bash
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f
```

Output:

```json
{
    "tags": {
        "eks-addon-key-2": "value-2",
        "eks-addon-key-1": "value-1"
    }
}
```

Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```bash
aws eks list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "my-identity-provider": "test"
    }
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/eks/list-tags-for-resource.html) in AWS CLI Command Reference.

**list-update**

The following code example shows how to use `list-update`.

---

**Example 4: To list all the tags for an Amazon EKS Add-on ARN**

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```bash
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f
```

Output:

```json
{
    "tags": {
        "eks-addon-key-2": "value-2",
        "eks-addon-key-1": "value-1"
    }
}
```

**Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN**

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```bash
aws eks list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "my-identity-provider": "test"
    }
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/eks/list-tags-for-resource.html) in AWS CLI Command Reference.

**list-update**

The following code example shows how to use `list-update`. 
AWS CLI

Example 1: To lists the updates associated with an Amazon EKS Cluster name

The following `list-updates` example lists all the update IDs for an Amazon EKS Cluster name.

```
aws eks list-updates \\n  --name my-eks-cluster
```

Output:

```
{
    "updateIds": [
        "5f78d14e-c57b-4857-a3e4-cf664ae20949",
        "760e5a3f-adad-48c7-88d3-7ac283c09c26",
        "cd4ec863-bc55-47d5-a377-3971502f529b",
        "f12657ce-e869-4f17-b158-a82ab8b7d937"
    ]
}
```

Example 2: To list all the update IDs for an Amazon EKS Node group

The following `list-updates` example lists all the update IDs for an Amazon EKS Node group.

```
aws eks list-updates \\n  --name my-eks-cluster \\n  --nodegroup-name my-eks-managed-node-group
```

Output:

```
{
    "updateIds": [
        "8c6c1bef-61fe-42ac-a242-89412387b8e7"
    ]
}
```

Example 3: To list all the update IDs on an Amazon EKS Add-one

The following `list-updates` example lists all the update IDs for an Amazon EKS Add-on.

```
aws eks list-updates \
```
--name my-eks-cluster \ 
--addon-name vpc-cni

Output:

{
  "updateIds": [
    "9cdba8d4-79fb-3c83-afe8-00b508d33268"
  ]
}

• For API details, see ListUpdate in AWS CLI Command Reference.

list-updates

The following code example shows how to use list-updates.

AWS CLI

To list the updates for a cluster

This example command lists the current updates for a cluster named example in your default region.

Command:

aws eks list-updates --name example

Output:

{
  "updateIds": [
    "10bddb13-a71b-425a-b0a6-71cd03e59161"
  ]
}

• For API details, see ListUpdates in AWS CLI Command Reference.

register-cluster

The following code example shows how to use register-cluster.
Example 1: Register an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
  --name my-eks-anywhere-cluster \
  --connector-config 'roleArn=arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole,provider=EKS_ANYWHERE'
```

Output:

```
{
  "cluster": {
    "name": "my-eks-anywhere-cluster",
    "createdAt": "2024-04-12T12:38:37.561000-04:00",
    "status": "PENDING",
    "tags": {},
    "connectorConfig": {
      "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
      "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
      "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
      "provider": "EKS_ANYWHERE",
      "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
    }
  }
}
```

For more information, see [Connecting an external cluster](https://docs.aws.amazon.com/eks/userguide) in the *Amazon EKS User Guide*.

Example 2: Register any external Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
  --name my-eks-anywhere-cluster \
  --connector-config 'roleArn=arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole,provider=EKS_ANYWHERE'
```

Output:

```json
{
  "cluster": {
    "name": "my-onprem-k8s-cluster",
    "createdAt": "2024-04-12T12:42:10.861000-04:00",
    "status": "PENDING",
    "tags": {},
    "connectorConfig": {
      "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
      "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
      "activationExpiry": "2024-04-15T12:42:10.339000-04:00",
      "provider": "OTHER",
      "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
    }
  }
}
```

For more information, see [Connecting an external cluster](#) in the [Amazon EKS User Guide](#).

- For API details, see [RegisterCluster](#) in [AWS CLI Command Reference](#).

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**Example 1: To add the specified tags to an Amazon EKS Cluster**

The following `tag-resource` example adds the specified tags to an Amazon EKS Cluster.

```
aws eks tag-resource \
  --tag 'my-eks-cluster-test-1=test-value-1,my-eks-cluster-dev-1=dev-value-2'
```

This command produces no output.

**Example 2: To add the specified tags to an Amazon EKS Node group**

The following `tag-resource` example adds the specified tags to an Amazon EKS Node group.
```
aws eks tag-resource \
   --tag 'my-eks-nodegroup-test-1=test-value-1,my-eks-nodegroup-dev-1=dev-value-2'
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use *untag-resource*.

**AWS CLI**

**Example 1: To deletes the specified tags from an Amazon EKS Cluster**

The following *untag-resource* example deletes the specified tags from an Amazon EKS Cluster.

```
aws eks untag-resource \
   --tag-keys "my-eks-cluster-test-1" "my-eks-cluster-dev-1"
```

This command produces no output.

**Example 2: To deletes the specified tags from an Amazon EKS Node group**

The following *untag-resource* example deletes the specified tags from an Amazon EKS Node group.

```
aws eks untag-resource \
   --tag-keys "my-eks-nodegroup-test-1" "my-eks-nodegroup-dev-1"
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**  2808
update-addon

The following code example shows how to use update-addon.

AWS CLI

Example 1. To update an Amazon EKS add-on with service account role ARN

The following update-addon example command updates an Amazon EKS add-on with service account role ARN.

```
aws eks update-addon
  --cluster-name my-eks-cluster
  --addon-name vpc-cni
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm
```

Output:

```
{
  "update": {
    "id": "c00d2de2-c2e4-3d30-929e-46b8edec2ce4",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
      }
    ],
    "updatedAt": "2024-04-12T16:04:55.614000-04:00",
    "errors": []
  }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

Example 2. To update an Amazon EKS add-on with specific add-on version

The following update-addon example command updates an Amazon EKS add-on with specific add-on version.
aws eks update-addon \
   --cluster-name my-eks-cluster \
   --addon-name vpc-cni \
   --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-\n   addon-vpc-cni-Role1-YfakrqOC1UTm \
   --addon-version v1.16.4-eksbuild.2

Output:

```
{
    "update": {
        "id": "f58dc0b0-2b18-34bd-bc6a-e4abc0011f36",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-\n                addon-vpc-cni-Role1-YfakrqOC1UTm"
            }
        ],
        "createdAt": "2024-04-12T16:07:16.550000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

**Example 3. To update an Amazon EKS add-on with custom configuration values and resolve conflicts details**

The following update-addon example command updates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

aws eks update-addon \
   --cluster-name my-eks-cluster \
   --addon-name vpc-cni \

--service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
--addon-version v1.16.4-eksbuild.2 \
--configuration-values '{"resources": {"limits":{"cpu":"100m"}, "requests": {"cpu":"50m"}}}' \
--resolve-conflicts PRESERVE

Output:

```json
{
    "update": {
        "id": "cd9f2173-a8d8-3004-a90f-032f14326520",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
                "value": "{"resources": {"limits": {"cpu": "100m"}, "requests": {"cpu": "50m"}}}"
            }
        ],
        "createdAt": "2024-04-12T16:16:27.363000-04:00",
        "errors": []
    }
}
```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](https://docs.aws.amazon.com/eks/latest/userguide/cluster-addons.html) in the *Amazon EKS User Guide*.

**Example 4. To update an Amazon EKS add-on with custom JSON configuration values file**
The following `update-addon` example command updates an Amazon EKS add-on with custom JSON configuration values and resolve conflicts details.

```
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-\n  addon-vpc-cni-Role1-YfakrqOC1UTm \
  --addon-version v1.17.1-eksbuild.1 \
  --configuration-values 'file://configuration-values.json' \
  --resolve-conflicts PRESERVE
```

Contents of `configuration-values.json`:

```
{
  "resources": {
    "limits": {
      "cpu": "100m"
    },
    "requests": {
      "cpu": "50m"
    }
  },
  "env": {
    "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
  }
}
```

Output:

```
{
  "update": {
    "id": "6881a437-174f-346b-9a63-6e91763507cc",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.17.1-eksbuild.1"
      },
      {
        "type": "ServiceAccountRoleArn",
```
For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

Example 5. To update an Amazon EKS add-on with custom YAML configuration values file

The following update-addon example command updates an Amazon EKS add-on with custom YAML configuration values and resolve conflicts details.

```
aws eks update-addon \
   --cluster-name my-eks-cluster \
   --addon-name vpc-cni \
   --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
   --addon-version v1.18.0-eksbuild.1 \
   --configuration-values 'file://configuration-values.yaml' \
   --resolve-conflicts PRESERVE
```

Contents of configuration-values.yaml:

```
resources: 
  limits: 
    cpu: '100m'
```
requests:
  cpu: '50m'
env:
  AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'

Output:

```json
{
  "update": {
    "id": "a067a4c9-69d0-3769-ace9-d235c5b16701",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.18.0-eksbuild.1"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
      },
      {
        "type": "ResolveConflicts",
        "value": "PRESERVE"
      },
      {
        "type": "ConfigurationValues",
        "value": "resources:
            limits:
              cpu: '100m'
            requests:
              cpu: '50m'
env:
            AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
        }
    ],
    "createdAt": "2024-04-12T16:25:07.212000-04:00",
    "errors": []
  }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the Amazon EKS User Guide.

- For API details, see UpdateAddon in AWS CLI Command Reference.
**update-cluster-config**

The following code example shows how to use `update-cluster-config`.

**AWS CLI**

**To update cluster endpoint access**

This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:

```bash
aws eks update-cluster-config --name example \
--resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```json
{
   "update": {
      "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
      "status": "InProgress",
      "type": "EndpointAccessUpdate",
      "params": [
         {
            "type": "EndpointPublicAccess",
            "value": "false"
         },
         {
            "type": "EndpointPrivateAccess",
            "value": "true"
         }
      ],
      "createdAt": 1565806986.506,
      "errors": []
   }
}
```

**To enable logging for a cluster**

This example command enables all cluster control plane logging types for a cluster named `example`. 
Command:

```bash
aws eks update-cluster-config --name example \
--logging '{"clusterLogging":[{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```json
{
   "update": {
      "id": "7551c64b-1d27-4b1e-9f8e-c45f056eb6fd",
      "status": "InProgress",
      "type": "LoggingUpdate",
      "params": [
         {
            "type": "ClusterLogging",
            "value": "{"clusterLogging": [{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}"
         }
      ],
      "createdAt": 1565807210.37,
      "errors": []
   }
}
```

- For API details, see [UpdateClusterConfig](https://docs.aws.amazon.com/cli/latest/reference/eks/update-cluster-config.html) in *AWS CLI Command Reference*.

**update-cluster-version**

The following code example shows how to use `update-cluster-version`.

**AWS CLI**

To update an Amazon EKS cluster named `my-eks-cluster` to the specified Kubernetes version

The following `update-cluster-version` example updates an Amazon EKS cluster to the specified Kubernetes version.

```bash
aws eks update-cluster-version \
   --name my-eks-cluster \
```
Output:

```json
{
  "update": {
    "id": "e4091a28-ea14-48fd-a8c7-975aeb469e8a",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.27"
      },
      {
        "type": "PlatformVersion",
        "value": "eks.16"
      }
    ],
    "createdAt": "2024-04-12T16:56:01.082000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](https://docs.aws.amazon.com/eks/latest/userguide/cluster-update.html) in the *Amazon EKS User Guide*.

**update-kubeconfig**

The following code example shows how to use `update-kubeconfig`.

**AWS CLI**

Example 1: Configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
```
--name my-eks-cluster

Output:

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](https://docs.aws.amazon.com/eks/latest/userguide/kubeconfig.html) in the *Amazon EKS User Guide*.

Example 2: Configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```bash
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](https://docs.aws.amazon.com/eks/latest/userguide/kubeconfig.html) in the *Amazon EKS User Guide*.

Example 3: Configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

The following update-kubeconfig example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.
Example 4: Print kubeconfig file entries for review and configures your kubectl so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

The following `aws eks update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```bash
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM \
    --alias stage-eks-cluster \
    --user-alias john
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
```

```
Entries:

cell: cluster

context:
  user: john
  name: stage-eks-cluster
```
The following code example shows how to use `update-nodegroup-config`.

**AWS CLI**

**Example 1: Update a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster**

The following `update-nodegroup-config` example updates a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster.

```bash
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster
```
aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \

Example 2: Update a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster

The following update-nodegroup-config example updates a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster.

Output:

```json
{
  "update": {
    "id": "e66d21d3-bd8b-3ad1-a5aa-b196dc08c7c1",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToAdd",
        "value": "{{"my-eks-nodegroup-label-2":"value-2","my-eks-nodegroup-label-1":"value-1"}}"
      },
      {
        "type": "TaintsToAdd",
        "value": "{{"effect":"NO_EXECUTE","value":"taint-value-1","key":"taint-key-1"}}"
      }
    ],
    "createdAt": "2024-04-08T12:05:19.161000-04:00",
    "errors": []
  }
}
```

For more information, see Updating a managed node group in the Amazon EKS User Guide.
---taints 'removeTaints=[{key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE}]'

Output:

```
{
  "update": {
    "id": "67a08692-9e59-3ace-a916-13929f44cec3",
    "status": "InProgress",

  }
}
```

For more information, see [Updating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide) in the *Amazon EKS User Guide*.

**Example 3: Update a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster**

The following `aws eks update-nodegroup-config` example updates a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config
  --cluster-name my-eks-cluster
  --nodegroup-name my-eks-nodegroup
```
For more information, see [Updating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide) in the *Amazon EKS User Guide*.

**Example 4: Update a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster**
The following `update-nodegroup-config` example updates a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config 
  --cluster-name my-eks-cluster 
  --nodegroup-name my-eks-nodegroup 
  --scaling-config minSize=1,maxSize=5,desiredSize=2 
  --update-config maxUnavailable=2
```

Output:

```json
{
  "update": {
    "id": "a977160f-59bf-3023-805d-c9826e460aea",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "MinSize",
        "value": "1"
      },
      {
        "type": "MaxSize",
        "value": "5"
      },
      {
        "type": "DesiredSize",
        "value": "2"
      },
      {
        "type": "MaxUnavailable",
        "value": "2"
      }
    ],
    "createdAt": "2024-04-08T12:35:17.036000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating a managed node group](amazon-eks-user-guide) in the *Amazon EKS User Guide*.

- For API details, see [UpdateNodegroupConfig](aws-cli-command-reference) in *AWS CLI Command Reference*.
update-nodegroup-version

The following code example shows how to use update-nodegroup-version.

AWS CLI

Example 1: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following update-nodegroup-version example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version for your Kubernetes cluster.

```bash
aws eks update-nodegroup-version \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --no-force
```

Output:

```json
{
  "update": {
    "id": "a94ebfc3-6bf8-307a-89e6-7dbaa36421f7",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.26"
      },
      {
        "type": "ReleaseVersion",
        "value": "1.26.12-20240329"
      }
    ],
    "createdAt": "2024-04-08T13:16:00.724000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide) in the *Amazon EKS User Guide*. 
Example 2: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the specified AMI release version.

```
aws eks update-nodegroup-version \
   --cluster-name my-eks-cluster \
   --nodegroup-name my-eks-nodegroup \
   --kubernetes-version '1.26' \
   --release-version '1.26.12-20240307' \
   --no-force
```

Output:

```
{
   "update": {
      "id": "4db06fe1-088d-336b-bdcd-3fdb94995fb7",
      "status": "InProgress",
      "type": "VersionUpdate",
      "params": [
         {
            "type": "Version",
            "value": "1.26"
         },
         {
            "type": "ReleaseVersion",
            "value": "1.26.12-20240307"
         }
      ],
      "createdAt": "2024-04-08T13:13:58.595000-04:00",
      "errors": []
   }
}
```

For more information, see Updating a managed node group - <https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html>` in the Amazon EKS User Guide.

- For API details, see `UpdateNodegroupVersion` in AWS CLI Command Reference.
Elastic Beanstalk examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**abort-environment-update**

The following code example shows how to use `abort-environment-update`.

**AWS CLI**

**To abort a deployment**

The following command aborts a running application version deployment for an environment named `my-env`:

```
aws elasticbeanstalk abort-environment-update --environment-name my-env
```

- For API details, see [AbortEnvironmentUpdate](#) in *AWS CLI Command Reference*.

**check-dns-availability**

The following code example shows how to use `check-dns-availability`. 
AWS CLI

To check the availability of a CNAME

The following command checks the availability of the subdomain my-cname.elasticbeanstalk.com:

```
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname
```

Output:

```
{
    "Available": true,
    "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

- For API details, see CheckDnsAvailability in AWS CLI Command Reference.

create-application-version

The following code example shows how to use create-application-version.

AWS CLI

To create a new application version

The following command creates a new version, "v1" of an application named "MyApp":

```
aws elasticbeanstalk create-application-version --application-name MyApp
    --version-label v1 --description MyAppv1 --source-bundle S3Bucket="my-bucket",S3Key="sample.war" --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "my-bucket" that contains the Apache Tomcat sample application.

Output:

```
{
    "ApplicationVersion": {
        "ApplicationName": "MyApp",
```
For API details, see CreateApplicationVersion in AWS CLI Command Reference.

create-application

The following code example shows how to use create-application.

AWS CLI

**To create a new application**

The following command creates a new application named "MyApp":

```
aws elasticbeanstalk create-application --application-name MyApp --description "my application"
```

The create-application command only configures the application's name and description. To upload source code for the application, create an initial version of the application using create-application-version. create-application-version also has an auto-create-application option that lets you create the application and the application version in one step.

Output:

```
{
   "Application": {
      "ApplicationName": "MyApp",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-02-12T18:32:21.181Z",
      "Description": "my application",
      "DateCreated": "2015-02-12T18:32:21.181Z"
   }
}
```
create-configuration-template

The following code example shows how to use create-configuration-template.

AWS CLI

To create a configuration template

The following command creates a configuration template named my-app-v1 from the settings applied to an environment with the id e-rpqsewtp2j:

```bash
aws elasticbeanstalk create-configuration-template --application-name my-app --template-name my-app-v1 --environment-id e-rpqsewtp2j
```

Output:

```json
{
   "ApplicationName": "my-app",
   "TemplateName": "my-app-v1",
   "DateCreated": "2015-08-12T18:40:39Z",
   "DateUpdated": "2015-08-12T18:40:39Z",
   "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

create-environment

The following code example shows how to use create-environment.

AWS CLI

To create a new environment for an application

The following command creates a new environment for version "v1" of a java application named "my-app":
aws elasticbeanstalk create-environment --application-name my-app --environment-name my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "v1",
    "Status": "Launching",
    "EnvironmentId": "e-izqpassy4h",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
    "CNAME": "my-app.elasticbeanstalk.com",
    "Health": "Grey",
    "Tier": {
        "Type": "Standard",
        "Name": "WebServer",
        "Version": ""
    },
    "DateUpdated": "2015-02-03T23:04:54.479Z",
    "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

v1 is the label of an application version previously uploaded with create-application-version.

**To specify a JSON file to define environment configuration options**

The following `create-environment` command specifies that a JSON file with the name `myoptions.json` should be used to override values obtained from the solution stack or the configuration template:

```
aws elasticbeanstalk create-environment --environment-name sample-env --application-name sampleapp --option-settings file://myoptions.json
```

`myoptions.json` is a JSON object defining several settings:

```
[
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Interval",
        "OptionValue": "5"
    }
]
```
For more information, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [CreateEnvironment](#) in *AWS CLI Command Reference*.

### create-storage-location

The following code example shows how to use `create-storage-location`.

**AWS CLI**

**To create a storage location**

The following command creates a storage location in Amazon S3:

```bash
aws elasticbeanstalk create-storage-location
```

**Output:**

```json
{
   "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

- For API details, see [CreateStorageLocation](#) in *AWS CLI Command Reference*. 

---

### Option Values

```
"Value": "15"
",
{   
"Namespace": "aws:elb:healthcheck",
"OptionName": "Timeout",
"Value": "8"
},
{   
"Namespace": "aws:elb:healthcheck",
"OptionName": "HealthyThreshold",
"Value": "2"
},
{   
"Namespace": "aws:elb:healthcheck",
"OptionName": "UnhealthyThreshold",
"Value": "3"
}
]```
delete-application-version

The following code example shows how to use delete-application-version.

AWS CLI

To delete an application version

The following command deletes an application version named 22a0-stage-150819_182129 for an application named my-app:

```bash
aws elasticbeanstalk delete-application-version --version-label 22a0-stage-150819_182129 --application-name my-app
```

- For API details, see `DeleteApplicationVersion` in *AWS CLI Command Reference*.

delete-application

The following code example shows how to use delete-application.

AWS CLI

To delete an application

The following command deletes an application named my-app:

```bash
aws elasticbeanstalk delete-application --application-name my-app
```

- For API details, see `DeleteApplication` in *AWS CLI Command Reference*.

delete-configuration-template

The following code example shows how to use delete-configuration-template.

AWS CLI

To delete a configuration template

The following command deletes a configuration template named my-template for an application named my-app:
aws elasticbeanstalk delete-configuration-template --template-name my-template --application-name my-app

- For API details, see [DeleteConfigurationTemplate](#) in *AWS CLI Command Reference*.

delete-environment-configuration

The following code example shows how to use delete-environment-configuration.

**AWS CLI**

**To delete a draft configuration**

The following command deletes a draft configuration for an environment named `my-env`:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --application-name my-app
```

- For API details, see [DeleteEnvironmentConfiguration](#) in *AWS CLI Command Reference*.

describe-application-versions

The following code example shows how to use describe-application-versions.

**AWS CLI**

**To view information about an application version**

The following command retrieves information about an application version labeled `v2`:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --version-label "v2"
```

Output:

```
{
   "ApplicationVersions": [
    {
      "ApplicationName": "my-app",
      "ApplicationVersion": "v2",
      "EnvironmentName": "my-env",
      "State": "DEPLOYING",
      "DeploymentId": "0123456789abcdef0123456789abcdef",
      "Description": "Draft configuration created at 2020-01-01 12:00:00"
    }
   ]
}
```
• For API details, see DescribeApplicationVersions in AWS CLI Command Reference.

describe-applications

The following code example shows how to use describe-applications.

AWS CLI

To view a list of applications

The following command retrieves information about applications in the current region:

```bash
aws elasticbeanstalk describe-applications
```

Output:

```json
{
   "Applications": [
      
```
### describe-configuration-options

The following code example shows how to use describe-configuration-options.

**AWS CLI**

**To view configuration options for an environment**

The following command retrieves descriptions of all available configuration options for an environment named my-env:

```
```

- For API details, see [DescribeApplications](#) in AWS CLI Command Reference.
aws elasticbeanstalk describe-configuration-options --environment-name my-env --application-name my-app

Output (abbreviated):

```json
{
   "Options": [
      {
         "Name": "JVMOptions",
         "UserDefined": false,
         "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
         "ChangeSeverity": "RestartApplicationServer",
         "Namespace": "aws:cloudformation:template:parameter",
         "ValueType": "KeyValueList"
      },
      {
         "Name": "Interval",
         "UserDefined": false,
         "DefaultValue": "30",
         "ChangeSeverity": "NoInterruption",
         "Namespace": "aws:elb:healthcheck",
         "MaxValue": 300,
         "MinValue": 5,
         "ValueType": "Scalar"
      },
      ...
      {
         "Name": "LowerThreshold",
         "UserDefined": false,
         "DefaultValue": "2000000",
         "ChangeSeverity": "NoInterruption",
         "Namespace": "aws:autoscaling:trigger",
         "MinValue": 0,
         "ValueType": "Scalar"
      },
      {
         "Name": "ListenerEnabled",
         "UserDefined": false,
         "DefaultValue": "true",
         "ChangeSeverity": "Unknown",
         "Namespace": "aws:elb:listener",
         "ValueType": "Boolean"
      }
   ]
}```
Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationOptions in AWS CLI Command Reference.

describe-configuration-settings

The following code example shows how to use describe-configuration-settings.

AWS CLI

**To view configurations settings for an environment**

The following command retrieves configuration settings for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --application-name my-app
```

Output (abbreviated):

```
{
  "ConfigurationSettings": [ 
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Description": "Environment created from the EB CLI using \"eb create \"
      "DeploymentStatus": "deployed",
      "DateCreated": "2015-08-13T19:16:25Z",
      "OptionSettings": [ 
        {
          "OptionName": "Availability Zones",
          "ResourceName": "AWSEBAutoScalingGroup",
          "Namespace": "aws:autoscaling:asg",
          "Value": "Any"
        },
        {
          "OptionName": "Cooldown",
          "ResourceName": "AWSEBAutoScalingGroup",
```
"Namespace": "aws:autoscaling:asg",
"Value": "360"
},
...
{
 "OptionName": "ConnectionDrainingTimeout",
 "ResourceName": "AWSEBLoadBalancer",
 "Namespace": "aws:elb:policies",
 "Value": "20"
},
{
 "OptionName": "ConnectionSettingIdleTimeout",
 "ResourceName": "AWSEBLoadBalancer",
 "Namespace": "aws:elb:policies",
 "Value": "60"
}
],
"DateUpdated": "2015-08-13T23:30:07Z",
"SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8
Java 8"
}
]
}

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationSettings in AWS CLI Command Reference.

describe-environment-health

The following code example shows how to use describe-environment-health.

AWS CLI

To view environment health

The following command retrieves overall health information for an environment named my-env:

aws elasticbeanstalk describe-environment-health --environment-name my-env --attribute-names All
Output:

```json
{
    "Status": "Ready",
    "EnvironmentName": "my-env",
    "Color": "Green",
    "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
            "P99": 0.004,
            "P75": 0.002,
            "P90": 0.003,
            "P95": 0.004,
            "P85": 0.003,
            "P10": 0.001,
            "P999": 0.004,
            "P50": 0.001
        },
        "RequestCount": 45,
        "StatusCodes": {
            "Status3xx": 0,
            "Status2xx": 45,
            "Status5xx": 0,
            "Status4xx": 0
        }
    },
    "RefreshedAt": "2015-08-20T21:09:18Z",
    "HealthStatus": "Ok",
    "InstancesHealth": {
        "Info": 0,
        "Ok": 1,
        "Unknown": 0,
        "Severe": 0,
        "Warning": 0,
        "Degraded": 0,
        "NoData": 0,
        "Pending": 0
    },
    "Causes": []
}
```
Health information is only available for environments with enhanced health reporting enabled.
For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic
Beanstalk Developer Guide.

- For API details, see `DescribeEnvironmentHealth` in AWS CLI Command Reference.

**describe-environment-resources**

The following code example shows how to use `describe-environment-resources`.

**AWS CLI**

To view information about the AWS resources in your environment

The following command retrieves information about resources in an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

**Output:**

```json
{
    "EnvironmentResources": {
        "EnvironmentName": "my-env",
        "AutoScalingGroups": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-QSB2Z088SXZT"
            }
        ],
        "Triggers": [],
        "LoadBalancers": [
            {
                "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
            }
        ],
        "Queues": [],
        "Instances": [
            {
                "Id": "i-0c91c786"
            }
        ],
        "LaunchConfigurations": [
```
For API details, see DescribeEnvironmentResources in AWS CLI Command Reference.

**describe-environments**

The following code example shows how to use `describe-environments`.

**AWS CLI**

**To view information about an environment**

The following command retrieves information about an environment named `my-env`:

```bash
aws elasticbeanstalk describe-environments --environment-names my-env
```

**Output:**

```json
{
   "Environments": [
     {
       "ApplicationName": "my-app",
       "EnvironmentName": "my-env",
       "VersionLabel": "7f58-stage-150812_025409",
       "Status": "Ready",
       "EnvironmentId": "e-rpqsewtp2j",
       "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-west-2.elb.amazonaws.com",
       "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
       "CNAME": "my-env.elasticbeanstalk.com",
       "Health": "Green",
       "AbortableOperationInProgress": false,
       "Tier": {
         "Version": "",
         "Type": "Standard",
         "Name": "WebServer"
       }
     }
   ]
}
```
For API details, see [DescribeEnvironments](#) in *AWS CLI Command Reference*.

**describe-events**

The following code example shows how to use `describe-events`.

**AWS CLI**

**To view events for an environment**

The following command retrieves events for an environment named `my-env`:

```
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```json
{
  "Events": [
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Message": "Environment health has transitioned from Info to Ok.",
      "EventDate": "2015-08-20T07:06:53.535Z",
      "Severity": "INFO"
    },
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Message": "Environment update completed successfully.",
      "EventDate": "2015-08-20T07:06:02.049Z"
    },
    ...
  ]
}
```
For API details, see `DescribeEvents` in *AWS CLI Command Reference*.

**describe-instances-health**

The following code example shows how to use `describe-instances-health`.

**AWS CLI**

**To view environment health**

The following command retrieves health information for instances in an environment named `my-env`:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --attribute-names All
```

Output:

```json
{
   "InstanceHealthList": [
   {
      "InstanceId": "i-08691cc7",
      "ApplicationMetrics": {
         "Duration": 10,
      }
   }
   ]
}
```
"Latency": {

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeInstancesHealth](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/describe-instances-health.html) in *AWS CLI Command Reference*.

**list-available-solution-stacks**

The following code example shows how to use `list-available-solution-stacks`.

**AWS CLI**

**To view solution stacks**

The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

```
aws elasticbeanstalk list-available-solution-stacks
```

Output (abbreviated):

```
{
    "SolutionStacks": [
        "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 1.9.3",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 6",
        "64bit Windows Server Core 2012 R2 running IIS 8.5",
        "64bit Windows Server 2012 R2 running IIS 8.5",
    ]
}
```
"64bit Windows Server 2012 running IIS 8",
"64bit Windows Server 2008 R2 running IIS 7.5",
"64bit Amazon Linux 2015.03 v2.0.0 running Docker 1.6.2",
"64bit Amazon Linux 2015.03 v2.0.0 running Multi-container Docker 1.6.2 (Generic)",
"64bit Debian jessie v2.0.0 running GlassFish 4.1 Java 8 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running GlassFish 4.0 Java 7 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running Go 1.4 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running Go 1.3 (Preconfigured - Docker)",
"64bit Debian jessie v2.0.0 running Python 3.4 (Preconfigured - Docker)",
],
"SolutionStackDetails": [
{
"PermittedFileTypes": ["zip"
],
"SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Node.js"
},
...
]
}

- For API details, see ListAvailableSolutionStacks in AWS CLI Command Reference.

**rebuild-environment**

The following code example shows how to use rebuild-environment.

**AWS CLI**

**To rebuild an environment**

The following command terminates and recreates the resources in an environment named my-env:

```
aws elasticbeanstalk rebuild-environment --environment-name my-env
```

- For API details, see RebuildEnvironment in AWS CLI Command Reference.
**request-environment-info**

The following code example shows how to use `request-environment-info`.

**AWS CLI**

**To request tailed logs**

The following command requests logs from an environment named `my-env`:

```
aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail
```

After requesting logs, retrieve their location with `retrieve-environment-info`.
- For API details, see `RequestEnvironmentInfo` in *AWS CLI Command Reference*.

**restart-app-server**

The following code example shows how to use `restart-app-server`.

**AWS CLI**

**To restart application servers**

The following command restarts application servers on all instances in an environment named `my-env`:

```
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see `RestartAppServer` in *AWS CLI Command Reference*.

**retrieve-environment-info**

The following code example shows how to use `retrieve-environment-info`.

**AWS CLI**

**To retrieve tailed logs**

The following command retrieves a link to logs from an environment named `my-env`:
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail

Output:

```json
{
  "EnvironmentInfo": [
    {
      "SampleTimestamp": "2015-08-20T22:23:17.703Z",
      "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqju3yjs/i-09c1c867/TailLogs-1440109397703.out?AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n%2BEalOV6A2HI0x4Rcfb7LT16bBM%3D",
      "InfoType": "tail",
      "Ec2InstanceId": "i-09c1c867"
    }
  ]
}
```

View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

- For API details, see RetrieveEnvironmentInfo in AWS CLI Command Reference.

**swap-environment-cnames**

The following code example shows how to use swap-environment-cnames.

**AWS CLI**

**To swap environment CNAMES**

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue --destination-environment-name my-env-green
```

- For API details, see SwapEnvironmentCnames in AWS CLI Command Reference.
**terminate-environment**

The following code example shows how to use `terminate-environment`.

**AWS CLI**

**To terminate an environment**

The following command terminates an Elastic Beanstalk environment named `my-env`:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:

```json
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "Status": "Terminating",
   "EnvironmentId": "e-fh2eravpns",
   "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-west-2.elb.amazonaws.com",
   "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
   "CNAME": "my-env.elasticbeanstalk.com",
   "Health": "Grey",
   "AbortableOperationInProgress": false,
   "Tier": {
      "Version": "",
      "Type": "Standard",
      "Name": "WebServer"
   },
   "DateUpdated": "2015-08-12T19:05:54.744Z",
   "DateCreated": "2015-08-12T18:52:53.622Z"
}
```

- For API details, see [TerminateEnvironment](#) in AWS CLI Command Reference.

**update-application-version**

The following code example shows how to use `update-application-version`.
AWS CLI

To change an application version's description

The following command updates the description of an application version named 22a0-stage-150819_185942:

```
aws elasticbeanstalk update-application-version --version-label 22a0-stage-150819_185942 --application-name my-app --description "new description"
```

Output:

```
{
   "ApplicationVersion": {
      "ApplicationName": "my-app",
      "VersionLabel": "22a0-stage-150819_185942",
      "Description": "new description",
      "DateCreated": "2015-08-19T18:59:17.646Z",
      "DateUpdated": "2015-08-20T22:53:28.871Z",
      "SourceBundle": {
         "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012",
         "S3Key": "my-app/22a0-stage-150819_185942.war"
      }
   }
}
```

- For API details, see [UpdateApplicationVersion](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/update-application-version.html) in *AWS CLI Command Reference*.

update-application

The following code example shows how to use update-application.

AWS CLI

To change an application's description

The following command updates the description of an application named my-app:

```
aws elasticbeanstalk update-application --application-name my-app --description "my Elastic Beanstalk application"
```

Output:
For API details, see UpdateApplication in AWS CLI Command Reference.

update-configuration-template

The following code example shows how to use update-configuration-template.

AWS CLI

To update a configuration template

The following command removes the configured CloudWatch custom health metrics configuration ConfigDocument from a saved configuration template named my-template:

```bash
cmd
aws elasticbeanstalk update-configuration-template --template-name my-template --application-name my-app --options-to-remove
  Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```json
{
  "ApplicationName": "my-app",
  "TemplateName": "my-template",
  "DateCreated": "2015-08-20T22:39:31Z",
  "DateUpdated": "2015-08-20T22:43:11Z",
}
```
For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see UpdateConfigurationTemplate in AWS CLI Command Reference.

update-environment

The following code example shows how to use update-environment.

AWS CLI

To update an environment to a new version

The following command updates an environment named "my-env" to version "v2" of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "VersionLabel": "v2",
   "Status": "Updating",
   "EnvironmentId": "e-szqipays4h",
   "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUA0-0123456789.us-west-2.elb.amazonaws.com",
   "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
   "CNAME": "my-env.elasticbeanstalk.com",
   "Health": "Grey",
   "Tier": {
      "Version": "",
      "Type": "Standard",
      "Name": "WebServer"
   }
}
```
To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
   Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=ParamValue
```

The option-settings parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

To configure option settings from a file

The following command configures several options in the `aws:elb:loadbalancer` namespace from a file:

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
   file://options.json
```

`options.json` is a JSON object defining several settings:

```
[
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Interval",
        "Value": "15"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Timeout",
        "Value": "8"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "HealthyThreshold",
        "Value": "2"
    }
]
```
Output:

```json
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "7f58-stage-150812_025409",
    "Status": "Updating",
    "EnvironmentId": "e-wtp2rpqsej",
    "EndpointURL": "awseb-e-w-AWSEBLoa-14XBB83101Q4L-104QXY80921.sa-east-1.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": true,
    "Tier": {
        "Version": "",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-08-12T18:15:23.804Z",
    "DateCreated": "2015-08-07T20:48:49.599Z"
}
```

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see UpdateEnvironment in AWS CLI Command Reference.

**validate-configuration-settings**

The following code example shows how to use validate-configuration-settings.

**AWS CLI**

To validate configuration settings
The following command validates a CloudWatch custom metrics config document:

```bash
aws elasticbeanstalk validate-configuration-settings --application-name my-app --environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON document that includes one or more configuration settings to validate:

```json
[
  {
    "Namespace": "aws:elasticbeanstalk:healthreporting:system",
    "OptionName": "ConfigDocument",
    "Value": "{"CloudWatchMetrics": {"Environment": {
      "ApplicationLatencyP99.9": null, "InstancesSevere": 60,
      "ApplicationLatencyP90": 60, "ApplicationLatencyP99": null,
      "ApplicationLatencyP95": 60, "InstancesUnknown": 60, "ApplicationLatencyP85":
      60, "InstancesInfo": null, "ApplicationRequests2xx": null, "InstancesDegraded"
    : null, "InstancesWarning": 60, "ApplicationLatencyP50": 60,
    "ApplicationRequestsTotal": null, "InstancesNoData": null, "InstancesPending"
    : 60, "ApplicationLatencyP10": null, "ApplicationRequests5xx": null,
    "ApplicationLatencyP75": null, "InstancesOk": 60, "ApplicationRequests3xx":
    null, "ApplicationRequests4xx": null}, "Instance": {
      "ApplicationLatencyP99.9": null, "ApplicationLatencyP90": null,
      "ApplicationLatencyP99": null, "ApplicationLatencyP95": null,
      "ApplicationLatencyP85": null, "CPUUser": 60, "ApplicationRequests2xx": null,
      "CPUIdle": null, "ApplicationLatencyP50": null, "ApplicationRequests3xx":
      null, "CPURequests4xx": null, "InstanceHealth": null, "CPUUtil": null,
      "LoadAverage1min": null, "CPUIrrq": null, "CPUNice": 60, "CPUIowait": 60,
      "ApplicationLatencyP10": null, "LoadAverage5min": null, "ApplicationRequests5xx"
    : null, "ApplicationLatencyP75": 60, "CPUSystem": 60, "ApplicationRequests3xx":
    60, "ApplicationRequests4xx": null, "InstanceHealth": null, "CPUSoftirq": 60},
    "Version": 1}"
  }
]
```

If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty `Messages` array:

```json
{
  "Messages": []
}
```

If validation fails, the response will include information about the error:
Elastic Load Balancing - Version 1 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 1.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions
add-tags

The following code example shows how to use add-tags.
**AWS CLI**

**To add a tag to a load balancer**

This example adds tags to the specified load balancer.

Command:

```bash
aws elb add-tags --load-balancer-name my-load-balancer --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](https://docs.aws.amazon.com/cli/latest/userguide/aws-cli-add-tags.html) in *AWS CLI Command Reference*.

**apply-security-groups-to-load-balancer**

The following code example shows how to use `apply-security-groups-to-load-balancer`.

**AWS CLI**

**To associate a security group with a load balancer in a VPC**

This example associates a security group with the specified load balancer in a VPC.

Command:

```bash
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer --security-groups sg-fc448899
```

Output:

```json
{
    "SecurityGroups": ["sg-fc448899"
]
}
```

- For API details, see [ApplySecurityGroupsToLoadBalancer](https://docs.aws.amazon.com/cli/latest/userguide/aws-cli-apply-security-groups-to-load-balancer.html) in *AWS CLI Command Reference*.

**attach-load-balancer-to-subnets**

The following code example shows how to use `attach-load-balancer-to-subnets`.
AWS CLI

To attach subnets to a load balancer

This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```bash
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:

```json
{
    "Subnets": [
        "subnet-15aaab61",
        "subnet-0ecac448"
    ]
}
```

- For API details, see `AttachLoadBalancerToSubnets` in *AWS CLI Command Reference*.

configure-health-check

The following code example shows how to use `configure-health-check`.

AWS CLI

To specify the health check settings for your backend EC2 instances

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```bash
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```json
{
}
```
"HealthCheck": {
    "HealthyThreshold": 2,
    "Interval": 30,
    "Target": "HTTP:80/png",
    "Timeout": 3,
    "UnhealthyThreshold": 2
  }
}

- For API details, see [ConfigureHealthCheck](#) in *AWS CLI Command Reference*.

### create-app-cookie-stickiness-policy

The following code example shows how to use `create-app-cookie-stickiness-policy`.

**AWS CLI**

**To generate a stickiness policy for your HTTPS load balancer**

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

**Command:**

```bash
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-app-cookie-policy --cookie-name my-app-cookie
```

- For API details, see [CreateAppCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

### create-lb-cookie-stickiness-policy

The following code example shows how to use `create-lb-cookie-stickiness-policy`.

**AWS CLI**

**To generate a duration-based stickiness policy for your HTTPS load balancer**

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

**Command:**
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy --cookie-expiration-period 60

- For API details, see [CreateLbCookieStickinessPolicy](#) in AWS CLI Command Reference.

**create-load-balancer-listeners**

The following code example shows how to use create-load-balancer-listeners.

**AWS CLI**

**To create HTTP listeners for a load balancer**

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

**To create HTTPS listeners for a load balancer**

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

- For API details, see [CreateLoadBalancerListeners](#) in AWS CLI Command Reference.

**create-load-balancer-policy**

The following code example shows how to use create-load-balancer-policy.

**AWS CLI**

**To create a policy that enables Proxy Protocol on a load balancer**

This example creates a policy that enables Proxy Protocol on the specified load balancer.
Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-attributes AttributeName=ProxyProtocol,AttributeValue=true
```

**To create an SSL negotiation policy using the recommended security policy**

This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

**To create an SSL negotiation policy using a custom security policy**

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-TLSv1.1,AttributeValue=true AttributeName=Server-Defined-Cipher-Order,AttributeValue=true
```

**To create a public key policy**

This example creates a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-attributes AttributeName=PublicKey,AttributeValue=MIIBIJANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAwAYUjnfyEyXr1pxjhFWBpMlggUcqoi3kl+dS74kj//c6x7R0tusUaeQCTgIUkayttRDWchuo1pHClu+n5xxXnBBe2ejbbb2WrsK1Q5rXEeixsjFpSojS/PKkzVhG16m3VZBDVKSmSwnL8dofLhzv11povBPThE+o4haAWvDBALJU0pkSI1FecPHcs2hwxf14zHoXy1e2k36A64nXW43wtfx5qcVIxtCEOjnYRg7RPvybaGfQ
```
To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-authentication-policy --policy-type-name BackendServerAuthenticationPolicyType --policy-attributes 
  AttributeName=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

create-load-balancer

The following code example shows how to use `create-load-balancer`.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```bash
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```json
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.

Command:
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --availability-zones us-west-2a us-west-2b

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

To create an HTTPS load balancer

This example creates a load balancer with an HTTPS listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```
**To create an internal load balancer**

This example creates an internal load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --scheme
  internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

- For API details, see [CreateLoadBalancer](#) in AWS CLI Command Reference.

**delete-load-balancer-listeners**

The following code example shows how to use delete-load-balancer-listeners.

AWS CLI

**To delete a listener from your load balancer**

This example deletes the listener for the specified port from the specified load balancer.

Command:

```
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-balancer-ports 80
```

- For API details, see [DeleteLoadBalancerListeners](#) in AWS CLI Command Reference.

**delete-load-balancer-policy**

The following code example shows how to use delete-load-balancer-policy.

AWS CLI

**To delete a policy from your load balancer**
This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```bash
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```

### delete-load-balancer

The following code example shows how to use delete-load-balancer.

**AWS CLI**

**To delete a load balancer**

This example deletes the specified load balancer.

Command:

```bash
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```

### deregister-instances-from-load-balancer

The following code example shows how to use deregister-instances-from-load-balancer.

**AWS CLI**

**To deregister instances from a load balancer**

This example deregisters the specified instance from the specified load balancer.

Command:

```bash
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```

Output:
For API details, see [DeregisterInstancesFromLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elb/deregister-instances-from-load-balancer) in *AWS CLI Command Reference*.

### describe-account-limits

The following code example shows how to use `describe-account-limits`.

**AWS CLI**

To **describe your Classic Load Balancer limits**

The following `describe-account-limits` example displays details about the Classic Load Balancer limits for your AWS account.

```bash
aws elb describe-account-limits
```

**Output:**

```json
{
   "Limits": [
      {
         "Name": "classic-load-balancers",
         "Max": "20"
      },
      {
         "Name": "classic-listeners",
         "Max": "100"
      },
      {
         "Name": "classic-registered-instances",
         "Max": "1000"
      }
   ]
}
```
For API details, see `DescribeAccountLimits` in *AWS CLI Command Reference*.

**describe-instance-health**

The following code example shows how to use `describe-instance-health`.

**AWS CLI**

*To describe the health of the instances for a load balancer*

This example describes the health of the instances for the specified load balancer.

**Command:**

```bash
aws elb describe-instance-health --load-balancer-name my-load-balancer
```

**Output:**

```json
{
    "InstanceStates": [
        {
            "InstanceId": "i-207d9717",
            "ReasonCode": "N/A",
            "State": "InService",
            "Description": "N/A"
        },
        {
            "InstanceId": "i-afefb49b",
            "ReasonCode": "N/A",
            "State": "InService",
            "Description": "N/A"
        }
    ]
}
```

*To describe the health of an instance for a load balancer*

This example describes the health of the specified instance for the specified load balancer.
Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer --instances i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "ELB",
            "State": "OutOfService",
            "Description": "Instance registration is still in progress."
        }
    ]
}
```

The following is an example response for an unhealthy instance.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "Instance",
            "State": "OutOfService",
            "Description": "Instance has failed at least the UnhealthyThreshold number of health checks consecutively."
        }
    ]
}
```

- For API details, see [DescribeInstanceHealth](#) in [AWS CLI Command Reference](#).

**describe-load-balancer-attributes**

The following code example shows how to use `describe-load-balancer-attributes`. 
AWS CLI

To describe the attributes of a load balancer

This example describes the attributes of the specified load balancer.

Command:

```
aws elb describe-load-balancer-attributes --load-balancer-name my-load-balancer
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": false,
         "Timeout": 300
      },
      "CrossZoneLoadBalancing": {
         "Enabled": true
      },
      "ConnectionSettings": {
         "IdleTimeout": 30
      },
      "AccessLog": {
         "Enabled": false
      }
   }
}
```

- For API details, see [DescribeLoadBalancerAttributes](https://docs.aws.amazon.com/cli/latest/reference/elb/describe-load-balancer-attributes.html) in *AWS CLI Command Reference*.

**describe-load-balancer-policies**

The following code example shows how to use `describe-load-balancer-policies`.

AWS CLI

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.
Command:

aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer

Output:

```
{
  "PolicyDescriptions": [
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "ProxyProtocol",
          "AttributeValue": "true"
        }
      ],
      "PolicyName": "my-ProxyProtocol-policy",
      "PolicyTypeName": "ProxyProtocolPolicyType"
    },
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "CookieName",
          "AttributeValue": "my-app-cookie"
        }
      ],
      "PolicyName": "my-app-cookie-policy",
      "PolicyTypeName": "AppCookieStickinessPolicyType"
    },
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "CookieExpirationPeriod",
          "AttributeValue": "60"
        }
      ],
      "PolicyName": "my-duration-cookie-policy",
      "PolicyTypeName": "LBCookieStickinessPolicyType"
    },
    ...
    ...
  ]
}
```
To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --
policy-name my-authentication-policy
```

Output:

```
{
   "PolicyDescriptions": [
       {
           "PolicyAttributeDescriptions": [
               {
                   "AttributeName": "PublicKeyPolicyName",
                   "AttributeValue": "my-PublicKey-policy"
               }
           ],
           "PolicyName": "my-authentication-policy",
           "PolicyTypeName": "BackendServerAuthenticationPolicyType"
       }
   ]
}
```

- For API details, see [DescribeLoadBalancerPolicies](#) in [AWS CLI Command Reference](#).

describe-load-balancer-policy-types

The following code example shows how to use describe-load-balancer-policy-types.

AWS CLI

To describe the load balancer policy types defined by Elastic Load Balancing

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```
Output:

```json
{
  "PolicyTypeDescriptions": [
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "ProxyProtocol",
          "AttributeType": "Boolean"
        }
      ],
      "PolicyTypeName": "ProxyProtocolPolicyType",
      "Description": "Policy that controls whether to include the IP address and port of the originating request for TCP messages. This policy operates on TCP/SSL listeners only"
    },
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "PublicKey",
          "AttributeType": "String"
        }
      ],
      "PolicyTypeName": "PublicKeyPolicyType",
      "Description": "Policy containing a list of public keys to accept when authenticating the back-end server(s). This policy cannot be applied directly to back-end servers or listeners but must be part of a BackendServerAuthenticationPolicyType."
    },
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "CookieName",
          "AttributeType": "String"
        }
      ],
      "PolicyTypeName": "AppCookieStickinessPolicyType",
      "Description": "Stickiness policy with session lifetimes controlled by the lifetime of the application-generated cookie. This policy can be associated only with HTTP/HTTPS listeners."
    }
  ]
}
```
For API details, see [DescribeLoadBalancerPolicyTypes](https://docs.aws.amazon.com/cli/latest/reference/elbv2/describe-load-balancer-policy-types.html) in AWS CLI Command Reference.
**describe-load-balancers**

The following code example shows how to use `describe-load-balancers`.

**AWS CLI**

**To describe your load balancers**

This example describes all of your load balancers.

Command:

```
aws elb describe-load-balancers
```

**To describe one of your load balancers**

This example describes the specified load balancer.

Command:

```
aws elb describe-load-balancers --load-balancer-name my-load-balancer
```

The following example response is for an HTTPS load balancer in a VPC.

Output:

```
{
   "LoadBalancerDescriptions": [
   {
      "Subnets": ["subnet-15aaab61"],
      "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
      "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",
      "ListenerDescriptions": [
         {
            "Listener": {
               "InstancePort": 80,
               "LoadBalancerPort": 80,
               "Protocol": "HTTP",
               "InstanceProtocol": "HTTP"
            },
            "PolicyNames": []
         }
      ]
   }
]}
```
"Listener": {
    "InstancePort": 443,
    "SSLCertificateId": "arn:aws:iam::123456789012:server-certificate/my-server-cert",
    "LoadBalancerPort": 443,
    "Protocol": "HTTPS",
    "InstanceProtocol": "HTTPS"
},
"PolicyNames": [
    "ELBSecurityPolicy-2015-03"
]
},
"HealthCheck": {
    "HealthyThreshold": 2,
    "Interval": 30,
    "Target": "HTTP:80/png",

    "OwnerAlias": "123456789012",
    "GroupName": "my-elb-sg"
}
]
}

- For API details, see DescribeLoadBalancers in AWS CLI Command Reference.

describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:
aws elb describe-tags --load-balancer-name my-load-balancer

Output:

```json
{
   "TagDescriptions": [
      {
         "Tags": [
            {
               "Value": "lima",
               "Key": "project"
            },
            {
               "Value": "digital-media",
               "Key": "department"
            }
         ],
         "LoadBalancerName": "my-load-balancer"
      }
   ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

**detach-load-balancer-from-subnets**

The following code example shows how to use `detach-load-balancer-from-subnets`.

**AWS CLI**

*To detach load balancers from subnets*

This example detaches the specified load balancer from the specified subnet.

**Command:**

```bash
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

**Output:**
For API details, see `DetachLoadBalancerFromSubnets` in *AWS CLI Command Reference*.

disable-availability-zones-for-load-balancer

The following code example shows how to use `disable-availability-zones-for-load-balancer`.

**AWS CLI**

**To disable Availability Zones for a load balancer**

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```
{
   "AvailabilityZones": [
      "us-west-2b"
   ]
}
```

For API details, see `DisableAvailabilityZonesForLoadBalancer` in *AWS CLI Command Reference*.

enable-availability-zones-for-load-balancer

The following code example shows how to use `enable-availability-zones-for-load-balancer`.

Actions and scenarios
**AWS CLI**

**To enable Availability Zones for a load balancer**

This example adds the specified Availability Zone to the specified load balancer.

**Command:**

```
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

**Output:**

```
{
   "AvailabilityZones": [
   "us-west-2a",
   "us-west-2b"
   ]
}
```

- For API details, see [EnableAvailabilityZonesForLoadBalancer](#) in *AWS CLI Command Reference*.

**modify-load-balancer-attributes**

The following code example shows how to use `modify-load-balancer-attributes`.

**AWS CLI**

**To modify the attributes of a load balancer**

This example modifies the CrossZoneLoadBalancing attribute of the specified load balancer.

**Command:**

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{"CrossZoneLoadBalancing":{"Enabled":true}}"
```

**Output:**

```
{
   "LoadBalancerAttributes": {
   "CrossZoneLoadBalancing": {
```
This example modifies the `ConnectionDraining` attribute of the specified load balancer.

Command:

```bash
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{"ConnectionDraining":{"Enabled":true,"Timeout":300}}"
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": true,
         "Timeout": 300
      }
   },
   "LoadBalancerName": "my-load-balancer"
}
```

**register-instances-with-load-balancer**

The following code example shows how to use `register-instances-with-load-balancer`.

**AWS CLI**

**To register instances with a load balancer**

This example registers the specified instance with the specified load balancer.

Command:

```bash
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```
Output:

```json
{
   "Instances": [
      {
         "InstanceId": "i-d6f6fae3"
      },
      {
         "InstanceId": "i-207d9717"
      },
      {
         "InstanceId": "i-afefb49b"
      }
   ]
}
```

- For API details, see `RegisterInstancesWithLoadBalancer` in *AWS CLI Command Reference*.

**remove-tags**

The following code example shows how to use `remove-tags`.

**AWS CLI**

**To remove tags from a load balancer**

This example removes a tag from the specified load balancer.

**Command:**

```
aws elb remove-tags --load-balancer-name my-load-balancer --tags project
```

- For API details, see `RemoveTags` in *AWS CLI Command Reference*.

**set-load-balancer-listener-ssl-certificate**

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

**AWS CLI**

**To update the SSL certificate for an HTTPS load balancer**
This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```
```

- For API details, see `SetLoadBalancerListenerSslCertificate` in *AWS CLI Command Reference*.

**set-load-balancer-policies-for-backend-server**

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

**AWS CLI**

**To replace the policies associated with a port for a backend instance**

This example replaces the policies that are currently associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```

**To remove all policies that are currently associated with a port on your backend instance**

This example removes all policies associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the describe-load-balancer-policies command.

- For API details, see `SetLoadBalancerPoliciesForBackendServer` in *AWS CLI Command Reference*.
**set-load-balancer-policies-of-listener**

The following code example shows how to use `set-load-balancer-policies-of-listener`.

**AWS CLI**

**To replace the policies associated with a listener**

This example replaces the policies that are currently associated with the specified listener.

Command:

```bash
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

**To remove all policies associated with your listener**

This example removes all policies that are currently associated with the specified listener.

Command:

```bash
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.

**Elastic Load Balancing - Version 2 examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

• **Actions**

Actions

**add-listener-certificates**

The following code example shows how to use `add-listener-certificates`.

**AWS CLI**

To add a certificate to a secure listener

This example adds the specified certificate to the specified secure listener.

Command:

```
```

Output:

```
{
   "Certificates": [
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
         "IsDefault": false
      }
   ]
}
```

• For API details, see [AddListenerCertificates](#) in **AWS CLI Command Reference**.

**add-tags**

The following code example shows how to use `add-tags`.

Actions and scenarios 2885
AWS CLI

To add tags to a load balancer

The following add-tags example adds the project and department tags to the specified load balancer.

```sh
aws elbv2 add-tags
  --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
  --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see AddTags in AWS CLI Command Reference.

create-listener

The following code example shows how to use create-listener.

AWS CLI

Example 1: To create an HTTP listener

The following create-listener example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```sh
aws elbv2 create-listener
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
  --protocol HTTP
  --port 80
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

Example 2: To create an HTTPS listener

The following create-listener example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools,
get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```bash
aws elbv2 create-listener
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol HTTPS \
    --port 443 \
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
    --ssl-policy ELBSecurityPolicy-2016-08 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [Add an HTTPS listener](#) in the *User Guide for Application Load Balancers*.

**Example 3: To create a TCP listener**

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ce11e \
    --protocol TCP \
    --port 80 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](#) in the *User Guide for Network Load Balancers*.

**Example 4: To create a TLS listener**

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```bash
aws elbv2 create-listener
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
```
For more information, see [TLS listeners for your Network Load Balancer](#) in the *User Guide for Network Load Balancers*.

**Example 5: To create a UDP listener**

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ce11e \
  --protocol UDP \
  --port 53 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](#) in the *User Guide for Network Load Balancers*.

**Example 6: To create a listener for the specified gateway and forwarding**

The following `create-listener` example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```
{
```
"Listeners": [  
  
  "ListenerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/afc127db15f925de",
  "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
  "DefaultActions": [  
    
    "Type": "forward",
    "ForwardConfig": {  
      "TargetGroups": [  
        {  
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"  
        }  
      ]  
    }  
  ]  
]

- For API details, see [CreateListener](https://docs.aws.amazon.com/cli/latest/reference/elbv2/create-listener.html) in AWS CLI Command Reference.

### create-load-balancer

The following code example shows how to use `create-load-balancer`.

#### AWS CLI

**Example 1: To create an Internet-facing load balancer**

The following `create-load-balancer` example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```sh
aws elbv2 create-load-balancer \\
```
--name my-load-balancer \  
--subnets subnet-b7d581c0 subnet-8360a9e7

Output:

```
{
  "LoadBalancers": [
  {
    "Type": "application",
    "Scheme": "internet-facing",
    "IpAddressType": "ipv4",
    "VpcId": "vpc-3ac0fb5f",
    "AvailabilityZones": [
      {
        "ZoneName": "us-west-2a",
        "SubnetId": "subnet-8360a9e7"
      },
      {
        "ZoneName": "us-west-2b",
        "SubnetId": "subnet-b7d581c0"
      }
    ],
    "CreatedTime": "2017-08-25T21:26:12.920Z",
    "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
    "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
    "SecurityGroups": [
      "sg-5943793c"
    ],
    "LoadBalancerName": "my-load-balancer",
    "State": {
      "Code": "provisioning"
    },
    "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
  }
  ]
```

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

Example 2: To create an internal load balancer
The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```bash
aws elbv2 create-load-balancer
    --name my-internal-load-balancer
    --scheme internal
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internal",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "internal-my-internal-load-balancer-1529930873.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-internal-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"
        }
    ]
}
```
Example 3: To create a Network Load Balancer

The following `create-load-balancer` example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```
aws elbv2 create-load-balancer \
  --name my-network-load-balancer \
  --type network \
  --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```
{
  "LoadBalancers": [
    {
      "Type": "network",
      "Scheme": "internet-facing",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
        {
          "LoadBalancerAddresses": [
            {
              "IpAddress": "35.161.207.171",
              "AllocationId": "eipalloc-64d5890a"
            }
          ],
          "ZoneName": "us-west-2b",
          "SubnetId": "subnet-5264e837"
        }
      ],
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
      "DNSName": "my-network-load-balancer-5d1b75f4f1ceee1e.elb.us-west-2.amazonaws.com"
    }
  ]
}
```
"LoadBalancerName": "my-network-load-balancer",
"State": {
   "Code": "provisioning"
},
"LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ce61e"
]}
]

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

**Example 4: To create a Gateway Load Balancer**

The following `create-load-balancer` example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```bash
aws elbv2 create-load-balancer \  
   --name my-gateway-load-balancer \  
   --type gateway \  
   --subnets subnet-dc83f691 subnet-a62583f9
```

Output:

```json
{
   "LoadBalancers": [
      {
         "Type": "gateway",
         "VpcId": "vpc-838475fe",
         "AvailabilityZones": [
            {
               "ZoneName": "us-east-1b",
               "SubnetId": "subnet-a62583f9"
            },
            {
               "ZoneName": "us-east-1a",
               "SubnetId": "subnet-dc83f691"
            }
         ],
         "CreatedTime": "2021-07-14T19:33:43.324000+00:00",
         "LoadBalancerName": "my-gateway-load-balancer",
         "State": {
```
For more information, see [Getting started with Gateway Load Balancers using the AWS CLI](http://example.com) in the *User Guide for Gateway Load Balancers*.

- For API details, see [CreateLoadBalancer](http://example.com) in *AWS CLI Command Reference*.

**create-rule**

The following code example shows how to use create-rule.

**AWS CLI**

**Example 1: To create a rule using a path condition and a forward action**

The following create-rule example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```bash
aws elbv2 create-rule \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
   --priority 5 \
   --conditions file://conditions-pattern.json \
   --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

**Contents of conditions-pattern.json:**

```json
[
  {
    "Field": "path-pattern",
    "PathPatternConfig": {
      "Values": ["/images/*"]
    }
  }
]
```
Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```bash
aws elbv2 create-rule \
--listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
--priority 10 \
--conditions file://conditions-host.json \
--actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```json
[
  {
    "Field": "host-header",
    "HostHeaderConfig": {
      "Values": ["*.example.com"]
    }
  }
]
```

Contents of `actions-fixed-response.json`

```json
[
  {
    "Type": "fixed-response",
    "FixedResponseConfig": {
      "MessageBody": "Hello world",
      "StatusCode": "200",
      "ContentType": "text/plain"
    }
  }
]
```

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.
```
aws elbv2 create-rule 
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 
   --priority 20 
   --conditions file://conditions-source-ip.json 
   --actions file://actions-authenticate.json
```

### Contents of `conditions-source-ip.json`

```
[
  {
    "Field": "source-ip",
    "SourceIpConfig": {
      "Values": ["192.0.2.0/24", "198.51.100.10/32"]
    }
  }
]
```

### Contents of `actions-authenticate.json`

```
[
  {
    "Type": "authenticate-oidc",
    "AuthenticateOidcConfig": {
      "Issuer": "https://idp-issuer.com",
      "TokenEndpoint": "https://token-endpoint.com",
      "UserInfoEndpoint": "https://user-info-endpoint.com",
      "ClientId": "abcdefghijklmnopqrstuvwxyz123456789",
      "ClientSecret": "123456789012345678901234567890",
      "SessionCookieName": "my-cookie",
      "SessionTimeout": 3600,
      "Scope": "email",
      "AuthenticationRequestExtraParams": {
        "display": "page",
        "prompt": "login"
      },
      "OnUnauthenticatedRequest": "deny"
    },
    "Order": 1
  },
  {
```

Actions and scenarios 2896
• For API details, see CreateRule in AWS CLI Command Reference.

**create-target-group**

The following code example shows how to use create-target-group.

**AWS CLI**

**Example 1: To create a target group for an Application Load Balancer**

The following create-target-group example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is instance). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```bash
aws elbv2 create-target-group \
    --name my-targets \
    --protocol HTTP \
    --port 80 \
    --target-type instance \
    --vpc-id vpc-3ac0fb5f
```

**Output:**

```json
{
   "TargetGroups": [
   {
       "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
       "TargetGroupName": "my-targets",
       "Protocol": "HTTP",
       "Port": 80,
       "VpcId": "vpc-3ac0fb5f",
       "HealthCheckProtocol": "HTTP",
       "HealthCheckPort": "traffic-port",
   }
   ]
}
```
"HealthCheckEnabled": true,
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 5,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
    "HttpCode": "200"
},
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
]
]

For more information, see Create a target group in the User Guide for Application Load Balancers.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following create-target-group example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is lambda). Health checks are disabled for this target group by default.

```
aws elbv2 create-target-group \
    --name my-lambda-target \ 
    --target-type lambda
```

Output:

```json
{
    "TargetGroups": [
    {
        "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
        "TargetGroupName": "my-lambda-target",
        "HealthCheckEnabled": false,
        "HealthCheckIntervalSeconds": 35,
        "HealthCheckTimeoutSeconds": 30,
        "HealthyThresholdCount": 5,
    }
    ]
}
```
"UnhealthyThresholdCount": 2,
  "HealthCheckPath": "/",
  "Matcher": {
    "HttpCode": "200"
  },
  "TargetType": "lambda",
  "IpAddressType": "ipv4"
}
]

For more information, see Lambda functions as targets in the User Guide for Application Load Balancers.

Example 3: To create a target group for a Network Load Balancer

The following create-target-group example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is ip). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```bash
aws elbv2 create-target-group \
  --name my-ip-targets \
  --protocol TCP \
  --port 80 \
  --target-type ip \
  --vpc-id vpc-3ac0fb5f
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
      "TargetGroupName": "my-ip-targets",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckEnabled": true,
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckIntervalSeconds": 30,
    }
  ]
}
```
"HealthCheckTimeoutSeconds": 10,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"TargetType": "ip",
"IpAddressType": "ipv4"
}]
}

For more information, see Create a target group in the User Guide for Network Load Balancers.

**Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer**

The following `create-target-group` example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is `alb`).

```bash
aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
      "TargetGroupName": "my-alb-target",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 6,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
      "Matcher": {
        "HttpCode": "200-399"
      },
      "TargetType": "alb",
```
For more information, see [Create a target group with an Application Load Balancer as the target](#) in the *User Guide for Network Load Balancers*.

**Example 5: To create a target group for a Gateway Load Balancer**

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```
aws elbv2 create-target-group \
    --name my-glb-targetgroup \
    --protocol GENEVE \
    --port 6081 \
    --target-type instance \
    --vpc-id vpc-838475fe
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57ead6f40b6f",
            "TargetGroupName": "my-glb-targetgroup",
            "Protocol": "GENEVE",
            "Port": 6081,
            "VpcId": "vpc-838475fe",
            "HealthCheckProtocol": "TCP",
            "HealthCheckPort": "80",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 10,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "TargetType": "instance"
        }
    ]
}
```
For more information, see Create a target group <https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html> in the Gateway Load Balancer User Guide.

- For API details, see CreateTargetGroup in AWS CLI Command Reference.

**delete-listener**

The following code example shows how to use delete-listener.

**AWS CLI**

**To delete a listener**

The following delete-listener example deletes the specified listener.

```bash
aws elbv2 delete-listener \
   --listener-arn arn:aws:elasticloadbalancing:ua-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see DeleteListener in AWS CLI Command Reference.

**delete-load-balancer**

The following code example shows how to use delete-load-balancer.

**AWS CLI**

**To delete a load balancer**

The following delete-load-balancer example deletes the specified load balancer.

```bash
aws elbv2 delete-load-balancer \
   --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

- For API details, see DeleteLoadBalancer in AWS CLI Command Reference.

**delete-rule**

The following code example shows how to use delete-rule.
AWS CLI

**To delete a rule**

The following delete-rule example deletes the specified rule.

```bash
aws elbv2 delete-rule \
   --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

- For API details, see [DeleteRule](#) in AWS CLI Command Reference.

**delete-target-group**

The following code example shows how to use delete-target-group.

AWS CLI

**To delete a target group**

The following delete-target-group example deletes the specified target group.

```bash
aws elbv2 delete-target-group \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see [Delete a load balancer](#) in the Application Load Balancer Guide.

- For API details, see [DeleteTargetGroup](#) in AWS CLI Command Reference.

**deregister-targets**

The following code example shows how to use deregister-targets.

AWS CLI

**Example 1: To deregister a target from a target group**

The following deregister-targets example removes the specified instance from the specified target group.
Example 2: To deregister a target registered using port overrides

The following deregister-targets example removes an instance from a target group that was registered using port overrides.

```bash
aws elbv2 deregister-targets
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9
   --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

- For API details, see `DeregisterTargets` in AWS CLI Command Reference.

describe-account-limits

The following code example shows how to use describe-account-limits.

AWS CLI

To describe your Elastic Load Balancing limits

The following describe-account-limits example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```bash
aws elbv2 describe-account-limits
```

Output:

```json
{
   "Limits": [
   {
      "Name": "target-groups",
      "Max": "3000"
   },
   {
      "Name": "targets-per-application-load-balancer",
      "Max": "1000"
   }
}

    "Max": "300"
  }
]
```
For more information, see Quotas in the AWS General Reference.

- For API details, see DescribeAccountLimits in AWS CLI Command Reference.

**describe-listener-certificates**

The following code example shows how to use describe-listener-certificates.

**AWS CLI**

**To describe the certificates for a secure listener**

This example describes the certificates for the specified secure listener.

Command:

```
aws elbv2 describe-listener-certificates --listener-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
   "Certificates": [
   {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba7f705",
      "IsDefault": false
   },
   {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557",
      "IsDefault": false
   },
   {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/fe59da96-6f58-4a22-8eed-6d0d50477e1d",
      "IsDefault": true
   }
   ]
}
```

- For API details, see DescribeListenerCertificates in AWS CLI Command Reference.
**describe-listeners**

The following code example shows how to use `describe-listeners`.

**AWS CLI**

**To describe a listener**

This example describes the specified listener.

**Command:**

```bash
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

**Output:**

```json
{
   "Listeners": [
      {
         "Port": 80,
         "Protocol": "HTTP",
         "DefaultActions": [
            {
               "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
               "Type": "forward"
            }
         ],
         "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
         "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
      }
   ]
}
```

**To describe the listeners for a load balancer**

This example describe the listeners for the specified load balancer.

**Command:**

```bash
aws elbv2 describe-listeners --load-balancer-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```
aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188

Output:

```json
{
  "Listeners": [
    {
      "Port": 443,
      "Protocol": "HTTPS",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ],
      "SslPolicy": "ELBSecurityPolicy-2015-05",
      "Certificates": [
        {
          "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-server-cert"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    },
    {
      "Port": 80,
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
    }
  ]
}
```
- For API details, see [DescribeListeners](#) in *AWS CLI Command Reference*.

### describe-load-balancer-attributes

The following code example shows how to use `describe-load-balancer-attributes`.

**AWS CLI**

**To describe load balancer attributes**

The following `describe-load-balancer-attributes` example displays the attributes of the specified load balancer.

```bash
aws elbv2 describe-load-balancer-attributes \
   --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

The following example output show the attributes for an Application Load Balancer.

```
{
   "Attributes": [
   {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.bucket"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.prefix"
   },
   {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
   }
}
```
The following example output includes the attributes for a Network Load Balancer.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "true",
            "Key": "routing.http2.enabled"
        }
    ]
}
```

- For API details, see [DescribeLoadBalancerAttributes](#) in AWS CLI Command Reference.

**describe-load-balancers**

The following code example shows how to use `describe-load-balancers`. 
**AWS CLI**

**To describe a load balancer**

This example describes the specified load balancer.

Command:

```bash
aws elbv2 describe-load-balancers --load-balancer-arns
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
   "LoadBalancers": [
      {
         "Type": "application",
         "Scheme": "internet-facing",
         "IpAddressType": "ipv4",
         "VpcId": "vpc-3ac0fb5f",
         "AvailabilityZones": [
            {
               "ZoneName": "us-west-2a",
               "SubnetId": "subnet-8360a9e7"
            },
            {
               "ZoneName": "us-west-2b",
               "SubnetId": "subnet-b7d581c0"
            }
         ],
         "CreatedTime": "2016-03-25T21:26:12.920Z",
         "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
         "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
         "SecurityGroups": [
            "sg-5943793c"
         ],
         "LoadBalancerName": "my-load-balancer",
         "State": {
            "Code": "active"
         },
         "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
      }
   ]
}
```
To describe all load balancers

This example describes all of your load balancers.

Command:

```bash
aws elbv2 describe-load-balancers
```

- For API details, see `DescribeLoadBalancers` in AWS CLI Command Reference.

**describe-rules**

The following code example shows how to use `describe-rules`.

**AWS CLI**

**Example 1: To describe a rule**

The following `describe-rules` example displays details for the specified rule.

```bash
aws elbv2 describe-rules \
    --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

**Example 2: To describe the rules for a listener**

The following `describe-rules` example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```bash
aws elbv2 describe-rules \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see `DescribeRules` in AWS CLI Command Reference.

**describe-ssl-policies**

The following code example shows how to use `describe-ssl-policies`.
AWS CLI

Example 1: To list the policies used for SSL negotiation by load balancer type

The following `describe-ssl-policies` example displays the names of the policies that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query SslPolicies[*].Name
```

Output:

```
[
    "ELBSecurityPolicy-2016-08",
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06",
    "ELBSecurityPolicy-TLS-1-2-2017-01",
    "ELBSecurityPolicy-TLS-1-1-2017-01",
    "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "ELBSecurityPolicy-FS-2018-06",
    "ELBSecurityPolicy-FS-2015-05",
    "ELBSecurityPolicy-TLS-1-0-2015-04",
    "ELBSecurityPolicy-FS-1-1-2019-08",
    "ELBSecurityPolicy-FS-1-2-2019-08",
    "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```

Example 2: To list the policies that support a specific protocol

The following `describe-ssl-policies` example displays the names of the policies that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \\n```

Actions and scenarios
Example 3: To display the ciphers for a policy

The following describe-ssl-policies example displays the names of the ciphers for the specified policy. The example uses the --query parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```
aws elbv2 describe-ssl-policies \
  --names ELBSecurityPolicy-TLS13-1-2-2021-06 \
  --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
[ 
  "TLS_AES_128_GCM_SHA256",
  "TLS_AES_256_GCM_SHA384",
  "TLS_CHACHA20_POLY1305_SHA256",
  "ECDHE-ECDSA-AES128-GCM-SHA256",
  "ECDHE-RSA-AES128-GCM-SHA256",
  "ECDHE-ECDSA-AES128-SHA256",
  "ECDHE-RSA-AES128-SHA256",
  "ECDHE-ECDSA-AES256-GCM-SHA384",
  "ECDHE-RSA-AES256-GCM-SHA384",
  "ECDHE-ECDSA-AES256-SHA384",
  "ECDHE-RSA-AES256-SHA384"
]
```

For more information, see Security policies in the User Guide for Application Load Balancers.
describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elbv2 describe-tags --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```json
{
   "TagDescriptions": [
      {
         "ResourceArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
         "Tags": [
            {
               "Value": "lima",
               "Key": "project"
            },
            {
               "Value": "digital-media",
               "Key": "department"
            }
         ]
      }
   ]
}
```

• For API details, see DescribeSslPolicies in AWS CLI Command Reference.

• For API details, see DescribeTags in AWS CLI Command Reference.
describe-target-group-attributes

The following code example shows how to use describe-target-group-attributes.

AWS CLI

To describe target group attributes

The following describe-target-group-attributes example displays the attributes of the specified target group.

```bash
aws elbv2 describe-target-group-attributes \
--target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is instance or ip.

```json
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "stickiness.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
        },
        {
            "Value": "lb_cookie",
            "Key": "stickiness.type"
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        },
        {
            "Value": "0",
            "Key": "slow_start.duration_seconds"
        }
    ]
}
```
The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is lambda.

```json
{
   "Attributes": [
   {
      "Value": "false",
      "Key": "lambda.multi_value_headers.enabled"
   }
   ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```json
{
   "Attributes": [
   {
      "Value": "false",
      "Key": "proxy_protocol_v2.enabled"
   },
   {
      "Value": "300",
      "Key": "deregistration_delay.timeout_seconds"
   }
   ]
}
```

- For API details, see [DescribeTargetGroupAttributes](https://docs.aws.amazon.com/cli/latest/reference/elbv2/describe-target-groups.html) in *AWS CLI Command Reference*.

### describe-target-groups

The following code example shows how to use `describe-target-groups`.

**AWS CLI**

**Example 1: To describe a target group**

The following `describe-target-groups` example displays details for the specified target group.

```
aws elbv2 describe-target-groups \
```
Output:

```
{
   "TargetGroups": [
      {
         "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
         "TargetGroupName": "my-targets",
         "Protocol": "HTTP",
         "Port": 80,
         "VpcId": "vpc-3ac0fb5f",
         "HealthCheckProtocol": "HTTP",
         "HealthCheckPort": "traffic-port",
         "HealthCheckEnabled": true,
         "HealthCheckIntervalSeconds": 30,
         "HealthCheckTimeoutSeconds": 5,
         "HealthyThresholdCount": 5,
         "UnhealthyThresholdCount": 2,
         "HealthCheckPath": "/",
         "Matcher": {
            "HttpCode": "200"
         },
         "LoadBalancerArns": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
         ],
         "TargetType": "instance",
         "ProtocolVersion": "HTTP1",
         "IpAddressType": "ipv4"
      }
   ]
}
```

Example 2: To describe all target groups for a load balancer

The following describe-target-groups example displays details for all target groups for the specified load balancer. The example uses the --query parameter to display only the target group names.

```
aws elbv2 describe-target-groups \
```
--load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \ --query TargetGroups[*].TargetGroupName

Output:

```
[
    "my-instance-targets",
    "my-ip-targets",
    "my-lambda-target"
]
```

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see DescribeTargetGroups in AWS CLI Command Reference.

**describe-target-health**

The following code example shows how to use describe-target-health.

**AWS CLI**

**Example 1: To describe the health of the targets for a target group**

The following describe-target-health example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health \ --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-ceddcd4d",
                "Port": 80
            },
            "TargetHealth": {
```
Example 2: To describe the health of a target

The following `describe-target-health` example displays health details for the specified target. This target is healthy.

```
aws elbv2 describe-target-health \
  --targets Id=i-0f76fade,Port=80 \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```json
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    }
  ]
}
```
The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```json
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "unused",
                "Reason": "Target.NotInUse",
                "Description": "Target group is not configured to receive traffic from the load balancer"
            }
        }
    ]
}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```json
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "initial",
                "Reason": "Elb.RegistrationInProgress",
                "Description": "Target registration is in progress"
            }
        }
    ]
}
```

The following example output is for an unhealthy target.
The following example output is for a target that is a Lambda function and health checks are disabled.

```json
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "unhealthy",
                "Reason": "Target.Timeout",
                "Description": "Connection to target timed out"
            }
        }
    ]
}
```

For API details, see [DescribeTargetHealth](https://awscli.amazonaws.com/manual/awscli-command-reference.html#describe-target-health) in *AWS CLI Command Reference*.

**modify-listener**

The following code example shows how to use `modify-listener`.

```
Example 1: To change the default action to a forward action

The following modify-listener example changes the default action (to a forward action) for the specified listener.

```bash
aws elbv2 modify-listener \
--listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
--default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```json
{
   "Listeners": [
   {
      "Protocol": "HTTP",
      "DefaultActions": [
      {
         "Type": "forward"
      }
   ],
   "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
   "Port": 80,
   "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
   }
  ]
}
```

Example 2: To change the default action to a redirect action

The following modify-listener example changes the default action to a redirect action for the specified listener.

```bash
aws elbv2 modify-listener \
--listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
```

Output:

```
{
    "Listeners": [
        {
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "Type": "redirect"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Port": 80,
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

**Example 3: To change the server certificate**

This example changes the server certificate for the specified HTTPS listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \
```

Output:

```
{
    "Listeners": [
        {
            "Protocol": "HTTPS",
            "DefaultActions": [
                {
                }
            ]
        }
    ]
}
```
"TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
  "Type": "forward"
  
]},
"SslPolicy": "ELBSecurityPolicy-2015-05",
"Certificates": [
  
  "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-new-server-cert"
  
],
"LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
  "Port": 443,
  "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
  
]

• For API details, see ModifyListener in AWS CLI Command Reference.

**modify-load-balancer-attributes**

The following code example shows how to use modify-load-balancer-attributes.

**AWS CLI**

To enable deletion protection

This example enables deletion protection for the specified load balancer.

Command:

```bash
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=deletion_protection.enabled,Value=true
```

Output:

```json
{
  "Attributes": [
```
To change the idle timeout

This example changes the idle timeout value for the specified load balancer.

Command:

```bash
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=idle_timeout.timeout_seconds,Value=30
```

Output:

```json
{
  "Attributes": [
    {
      "Value": "30",
      "Key": "idle_timeout.timeout_seconds"
    },
    {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
    }
  ]
}
```
To enable access logs

This example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

Command:

```bash
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
    arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes
    Key=access_logs.s3.enabled,Value=true
    Key=access_logs.s3.bucket,Value=my-loadbalancer-logs
    Key=access_logs.s3.prefix,Value=myapp
```

Output:

```json
{
    "Attributes": [
        {
            "Value": "true",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "my-load-balancer-logs",
            "Key": "access_logs.s3.bucket"
        }
    ]
}
```
For API details, see ModifyLoadBalancerAttributes in AWS CLI Command Reference.

modify-rule

The following code example shows how to use modify-rule.

AWS CLI

To modify a rule

The following modify-rule example updates the actions and conditions for the specified rule.

```bash
aws elbv2 modify-rule \
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --conditions Field=path-pattern,Values='/images/*' \
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```json
{
  "Rules": [
    {
      "Priority": "10",
      "Conditions": [
        {
          "Field": "path-pattern",
          "Values": ["/images/*"]
        }
      ]
    }
  ]
}
```
The following code example shows how to use modify-target-group-attributes.

**AWS CLI**

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```bash
data elbv2 modify-target-group-attributes --target-group-arn
    arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 --attributes
    Key=deregistration_delay.timeout_seconds,Value=600
```

Output:

```json
{
    "Values": [
        "/images/*"
    ],
    "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee",
    "IsDefault": false,
    "Actions": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "Type": "forward"
        }
    ]
}
```
For API details, see [ModifyTargetGroupAttributes](#) in *AWS CLI Command Reference*.

**modify-target-group**

The following code example shows how to use `modify-target-group`.

**AWS CLI**

To modify the health check configuration for a target group

The following `modify-target-group` example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the `--matcher` option with single quotes instead of double quotes.

```
aws elbv2 modify-target-group \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \
  --health-check-protocol HTTPS \
  --health-check-port 443 \
  --matcher HttpCode='200,299'
```
For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see ModifyTargetGroup in AWS CLI Command Reference.

register-targets

The following code example shows how to use register-targets.

AWS CLI

Example 1: To register targets with a target group by instance ID
The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

**Example 2: To register targets with a target group using port overrides**

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
  --targets Id=i-0598c7d356eba4&d7,Port=80 Id=i-0598c7d356eba4&d7,Port=766
```

**Example 3: To register targets with a target group by IP address**

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
  --targets Id=10.0.1.15 Id=10.0.1.23
```

**Example 4: To register a Lambda function as a target**

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
  --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see [RegisterTargets](#) in *AWS CLI Command Reference*. 
**remove-listener-certificates**

The following code example shows how to use `remove-listener-certificates`.

**AWS CLI**

**To remove a certificate from a secure listener**

This example removes the specified certificate from the specified secure listener.

Command:

```bash
aws elbv2 remove-listener-certificates --listener-arn
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --certificates
CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-
f4a3-4072-80be-05b9ba72f705
```

- For API details, see [RemoveListenerCertificates](#) in *AWS CLI Command Reference*.

**remove-tags**

The following code example shows how to use `remove-tags`.

**AWS CLI**

**To remove tags from a load balancer**

The following `remove-tags` example removes the project and department tags from the specified load balancer.

Command:

```bash
aws elbv2 remove-tags \
   --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \ 
   --tag-keys project department
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

**set-ip-address-type**

The following code example shows how to use `set-ip-address-type`.
AWS CLI

To set the address type of a load balancer

This example sets the address type of the specified load balancer to dualstack. The load balancer subnets must have associated IPv6 CIDR blocks.

Command:

```
aws elbv2 set-ip-address-type --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --ip-address-type dualstack
```

Output:

```
{
   "IpAddressType": "dualstack"
}
```

- For API details, see [SetIpAddressType](#) in *AWS CLI Command Reference*.

**set-rule-priorities**

The following code example shows how to use set-rule-priorities.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```
aws elbv2 set-rule-priorities --rule-priorities
   RuleArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3,PRIORITY=5
```

Output:

```
{
   "Rules": [ 
   
```

Actions and scenarios
For API details, see [SetRulePriorities](https://docs.aws.amazon.com/cli/latest/reference/elbv2/set-rule-priorities.html) in *AWS CLI Command Reference*.

**set-security-groups**

The following code example shows how to use `set-security-groups`.

**AWS CLI**

**To associate a security group with a load balancer**

This example associates the specified security group with the specified load balancer.

**Command:**

```
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-groups sg-5943793c
```

**Output:**
set-subnets

The following code example shows how to use set-subnets.

AWS CLI

To enable Availability Zones for a load balancer

This example enables the Availability Zone for the specified subnet for the specified load balancer.

Command:

```bash
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```json
{
   "AvailabilityZones": [
   {
      "SubnetId": "subnet-8360a9e7",
      "ZoneName": "us-west-2a"
   },
   {
      "SubnetId": "subnet-b7d581c0",
      "ZoneName": "us-west-2b"
   }
   ]
}
```

• For API details, see SetSecurityGroups in AWS CLI Command Reference.

• For API details, see SetSubnets in AWS CLI Command Reference.
Elastic Transcoder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Transcoder.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- [Actions](#)

**Actions**

**cancel-job**

The following code example shows how to use `cancel-job`.

**AWS CLI**

*To cancel a job for ElasticTranscoder*

This cancels the specified job for ElasticTranscoder.

Command:

```bash
aws elastictranscoder cancel-job --id 3333333333333-abcde3
```

- For API details, see [CancelJob](#) in *AWS CLI Command Reference*.

**create-job**

The following code example shows how to use `create-job`. 
AWS CLI

**To create a job for ElasticTranscoder**

The following `create-job` example creates a job for ElasticTranscoder.

```bash
aws elastictranscoder create-job \
    --pipeline-id 1111111111111-abcde1 \
    --inputs file://inputs.json \
    --outputs file://outputs.json \
    --output-key-prefix "recipes/" \
    --user-metadata file://user-metadata.json
```

Contents of `inputs.json`:

```json
[
    {
        "Key":"ETS_example_file.mp4",
        "FrameRate":"auto",
        "Resolution":"auto",
        "AspectRatio":"auto",
        "Interlaced":"auto",

- For API details, see CreateJob in AWS CLI Command Reference.

create-pipeline

The following code example shows how to use create-pipeline.

AWS CLI

To create a pipeline for ElasticTranscoder

The following create-pipeline example creates a pipeline for ElasticTranscoder.

```bash
aws elastictranscoder create-pipeline \
--name Default \
--input-bucket salesoffice.example.com-source \
--role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
--notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-
est-1:111222333444:ETS_Errors \
--content-config file://content-config.json \
--thumbnail-config file://thumbnail-config.json
```

Contents of content-config.json:

```json
{
  "Bucket":"salesoffice.example.com-public-promos",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
    }
  ]
}
```
"Access": [  "FullControl" ]
],  "StorageClass": "Standard"
}

Contents of thumbnail-config.json:

{
    "Bucket": "salesoffice.example.com-public-promos-thumbnails",
    "Permissions": [{
        "GranteeType": "Email",
        "Grantee": "marketing-promos@example.com",
        "Access": [  "FullControl"
        ]
    }],  "StorageClass": "ReducedRedundancy"
}

Output:

{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "salesoffice.example.com-public-promos",
            "StorageClass": "Standard",
            "Permissions": [{
                "Access": [  "FullControl"
                ],
                "Grantee": "marketing-promos@example.com",
                "GranteeType": "Email"
            }]
        },  "Name": "Default",
    }
}
"ThumbnailConfig": {
  "Bucket": "salesoffice.example.com-public-promos-thumbnails",

**create-preset**

The following code example shows how to use create-preset.
**AWS CLI**

**To create a preset for ElasticTranscoder**

The following `create-preset` example creates a preset for ElasticTranscoder.

```bash
aws elastictranscoder create-preset \
  --name DefaultPreset \
  --description "Use for published videos" \
  --container mp4 \
  --video file://video.json \
  --audio file://audio.json \
  --thumbnails file://thumbnails.json
```

Contents of `video.json`:

```json
{
  "Codec":"H.264",
  "CodecOptions":{
    "Profile":"main",
    "Level":"2.2",
    "MaxReferenceFrames":"3",
    "MaxBitRate":"",
    "BufferSize":"",
    "InterlacedMode":"Progressive",
    "ColorSpaceConversionMode":"None"
  },
  "KeyframesMaxDist":"240",
  "FixedGOP":"false",
  "BitRate":"1600",
  "FrameRate":"auto",
  "MaxFrameRate":"30",
  "MaxWidth":"auto",
  "MaxHeight":"auto",
  "SizingPolicy":"Fit",
  "PaddingPolicy":"Pad",
  "DisplayAspectRatio":"auto",
  "Watermarks":[
    {
      "Id":"company logo",
      "MaxWidth":"20%",
      "MaxHeight":"20%",
      "SizingPolicy":"ShrinkToFit",
    }
  ]
}
```
Contents of audio.json:

{  
   "Codec":"AAC",
   "CodecOptions":{
      "Profile":"AAC-LC"
   },
   "SampleRate":"44100",
   "BitRate":"96",
   "Channels":"2"
}

Contents of thumbnails.json:

{  
   "Format":"png",
   "Interval":"120",
   "MaxWidth":"auto",
   "MaxHeight":"auto",
   "SizingPolicy":"Fit",
   "PaddingPolicy":"Pad"
}

Output:

{  
   "Preset": {  
      "Thumbnails": {  
         "SizingPolicy": "Fit",
         "MaxWidth": "auto",
         "Format": "png",
         "PaddingPolicy": "Pad",
         "MinWidth": "auto",
         "MaxHeight": "auto",
         "MinHeight": "auto",
         "MaxSize": "auto",
         "SizingPolicy": "Fit",
         "PaddingPolicy": "Pad"
      }
   }
}
"Interval": "120",
"MaxHeight": "auto"
},

            "VerticalAlign": "Bottom",
            "Target": "Content",
            "MaxWidth": "20%",
            "MaxHeight": "20%",
            "HorizontalAlign": "Right",
            "HorizontalOffset": "10px",
            "Opacity": "55.5",
            "Id": "company logo"
        }
    ],
    "CodecOptions": {
        "Profile": "main",
        "MaxBitRate": "32",
        "InterlacedMode": "Progressive",
        "Level": "2.2",
        "ColorSpaceConversionMode": "None",
        "MaxReferenceFrames": "3",
        "BufferSize": "5"
    },
    "BitRate": "1600",
    "DisplayAspectRatio": "auto"
},
"Audio": {
    "Channels": "2",
    "CodecOptions": {

For API details, see CreatePreset in AWS CLI Command Reference.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete the specified ElasticTranscoder pipeline

This deletes the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder delete-pipeline --id 1111111111-abcde1
```

Output:

```
{
   "Success":"true"
}
```

For API details, see DeletePipeline in AWS CLI Command Reference.

delete-preset

The following code example shows how to use delete-preset.
AWS CLI

**To delete the specified ElasticTranscoder preset**

This deletes the specified ElasticTranscoder preset.

Command:

```
aws elastictranscoder delete-preset --id 5555555555555-abcde5
```

• For API details, see [DeletePreset](https://docs.aws.amazon.com/cli/latest/reference/elastictranscoder/delete-preset.html) in *AWS CLI Command Reference*.

**list-jobs-by-pipeline**

The following code example shows how to use list-jobs-by-pipeline.

AWS CLI

**To retrieve a list of ElasticTranscoder jobs in the specified pipeline**

This example retrieves a list of ElasticTranscoder jobs in the specified pipeline.

Command:

```
aws elastictranscoder list-jobs-by-pipeline --pipeline-id 1111111111111-abcde1
```

Output:

```json
{
    "Jobs": []
}
```

• For API details, see [ListJobsByPipeline](https://docs.aws.amazon.com/cli/latest/reference/elastictranscoder/list-jobs-by-pipeline.html) in *AWS CLI Command Reference*.

**list-jobs-by-status**

The following code example shows how to use list-jobs-by-status.

AWS CLI

**To retrieve a list of ElasticTranscoder jobs with a status of Complete**
This example retrieves a list of ElasticTranscoder jobs with a status of Complete.

Command:

```bash
aws elastictranscoder list-jobs-by-status --status Complete
```

Output:

```json
{
   "Jobs": []
}
```

- For API details, see `ListJobsByStatus` in `AWS CLI Command Reference`.

**list-pipelines**

The following code example shows how to use `list-pipelines`.

**AWS CLI**

**To retrieve a list of ElasticTranscoder pipelines**

This example retrieves a list of ElasticTranscoder pipelines.

Command:

```bash
aws elastictranscoder list-pipelines
```

Output:

```json
{
   "Pipelines": [
      {
         "Status": "Active",
         "ContentConfig": {
            "Bucket": "ets-example",
            "Permissions": []
         },
         "Name": "example-pipeline",
         "ThumbnailConfig": {
            "Bucket": "ets-example",
            "Permissions": []
         }
      }
   ]
}
```
},
  "Notifications": {
    "Warning": "",

},
{
  "Status": "Active",
  "ContentConfig": {
    "Bucket": "ets-west-output",
    "Permissions": []
  }
}
For API details, see ListPipelines in AWS CLI Command Reference.

**list-presets**

The following code example shows how to use list-presets.

**AWS CLI**

To retrieve a list of ElasticTranscoder presets

This example retrieves a list of ElasticTranscoder presets.

Command:

```bash
aws elastictranscoder list-presets --max-items 2
```

Output:

```json
{
    "Presets": [
        {
            "Container": "mp4",
```
"Name": "KindleFireHD-preset",
"Video": {
    "Resolution": "1280x720",
    "FrameRate": "30",
    "KeyframesMaxDist": "90",
    "FixedGOP": "false",
    "Codec": "H.264",
    "Watermarks": [],
    "CodecOptions": {
        "Profile": "main",
        "MaxReferenceFrames": "3",
        "ColorSpaceConversionMode": "None",
        "InterlacedMode": "Progressive",
        "Level": "4"
    },
    "AspectRatio": "16:9",
    "BitRate": "2200"
},
"Audio": {
    "Channels": "2",
    "CodecOptions": {
        "Profile": "AAC-LC"
    },
    "SampleRate": "48000",
    "Codec": "AAC",
    "BitRate": "160"
},
"Type": "Custom",
"Id": "3333333333333-abcde2",
" Thumbnails": {
    "AspectRatio": "16:9",
    "Interval": "60",
    "Resolution": "192x108",
    "Format": "png"
}
},
{
    " Thumbnails": {
        "AspectRatio": "16:9",
        "Interval": "60",
        "Resolution": "192x108",
        "Format": "png"
• For API details, see ListPresets in AWS CLI Command Reference.
**read-job**

The following code example shows how to use `read-job`.

**AWS CLI**

**To retrieve an ElasticTranscoder job**

This example retrieves the specified ElasticTranscoder job.

**Command:**

```bash
aws elastictranscoder read-job --id 1533838012294-example
```

**Output:**

```json
{
   "Job": {
      "Status": "Progressing",
      "Inputs": [
         {
            "Container": "mp4",
            "FrameRate": "auto",
            "Key": "ETS_example_file.mp4",
            "AspectRatio": "auto",
            "Resolution": "auto",
            "Interlaced": "auto"
         }
      ],
      "Playlists": [],
      "Outputs": [
         {
            "Status": "Progressing",

            "Id": "1"
         }
      ],
      "PipelineId": "3333333333333-abcde3",
      "OutputKeyPrefix": "recipes/",
      "UserMetadata": {
         "Cook book": "recipe notebook",
```
For API details, see ReadJob in AWS CLI Command Reference.

**read-pipeline**

The following code example shows how to use read-pipeline.

**AWS CLI**

**To retrieve an ElasticTranscoder pipeline**

This example retrieves the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder read-pipeline --id 3333333333333-abcde3
```
Output:

```json
{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
                {
                    "Access": ["FullControl"],
                    "Grantee": "marketing-promos@example.com",
                    "GranteeType": "Email"
                }
            ]
        },
        "Name": "Default",
        "ThumbnailConfig": {
            "Bucket": "ets-example",
            "StorageClass": "ReducedRedundancy",

                    "GranteeType": "Email"
                }
            ]
        },
        "Notifications": {
            "Completed": "",
            "Warning": "",
            "Progressing": "",
            "Error": "arn:aws:sns:us-east-1:123456789012:ETS_Errors"
        },
        "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
        "InputBucket": "ets-example",
        "Id": "3333333333333-abcde3",
    }
}
```
"Warnings": [
  {
    "Message": "The SNS notification topic for Error events and the pipeline are in different regions, which increases processing time for jobs in the pipeline and can incur additional charges. To decrease processing time and prevent cross-regional charges, use the same region for the SNS notification topic and the pipeline.",
    "Code": "6006"
  }
]

- For API details, see ReadPipeline in AWS CLI Command Reference.

**read-preset**

The following code example shows how to use read-preset.

**AWS CLI**

**To retrieve an ElasticTranscoder preset**

This example retrieves the specified ElasticTranscoder preset.

Command:

```
aws elastictranscoder read-preset --id 1351620000001-500020
```

Output:

```
{
  "Preset": {
    "Thumbnails": {
      "SizingPolicy": "ShrinkToFit",
      "MaxWidth": "192",
      "Format": "png",
      "PaddingPolicy": "NoPad",
      "Interval": "300",
      "MaxHeight": "108"
    },
    "Container": "fmp4",
    "Description": "System preset: MPEG-Dash Video - 4.8M",
    "Video": {
```
"SizingPolicy": "ShrinkToFit",
"MaxWidth": "1280",
"PaddingPolicy": "NoPad",
"FrameRate": "30",
"MaxHeight": "720",
"KeyframesMaxDist": "60",
"FixedGOP": "true",
"Codec": "H.264",
"Watermarks": [
{
  "SizingPolicy": "ShrinkToFit",
  "VerticalOffset": "10%",
  "VerticalAlign": "Top",
  "Target": "Content",
  "MaxWidth": "10%",
  "MaxHeight": "10%",
  "HorizontalAlign": "Left",
  "HorizontalOffset": "10%",
  "Opacity": "100",
  "Id": "TopLeft"
},
{
  "SizingPolicy": "ShrinkToFit",
  "VerticalOffset": "10%",
  "VerticalAlign": "Top",
  "Target": "Content",
  "MaxWidth": "10%",
  "MaxHeight": "10%",
  "HorizontalAlign": "Right",
  "HorizontalOffset": "10%",
  "Opacity": "100",
  "Id": "TopRight"
},
{
  "SizingPolicy": "ShrinkToFit",
  "VerticalOffset": "10%",
  "VerticalAlign": "Bottom",
  "Target": "Content",
  "MaxWidth": "10%",
  "MaxHeight": "10%",
  "HorizontalAlign": "Left",
  "HorizontalOffset": "10%",
  "Opacity": "100",
  "Id": "BottomLeft"
• For API details, see ReadPreset in AWS CLI Command Reference.

update-pipeline-notifications

The following code example shows how to use update-pipeline-notifications.

AWS CLI

To update the notifications of an ElasticTranscoder pipeline
This example updates the notifications of the specified ElasticTranscoder pipeline.

Command:

```
```

Output:

```
{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
                {
                    "Access": [
                        "FullControl"
                    ],
                    "Grantee": "marketing-promos@example.com",
                    "GranteeType": "Email"
                }
            ],
            "Name": "Default",
            "ThumbnailConfig": {
                "Bucket": "ets-example",
                "StorageClass": "ReducedRedundancy",
                "Permissions": [
                    {
                        "Access": [
                            "FullControl"
                        ],
                        "Grantee": "marketing-promos@example.com",
                        "GranteeType": "Email"
                    }
                ]
            }
        },
        "Name": "Default",
        "Notifications": {
            "Error": "arn:aws:sns:us-east-1:111222333444:ETS_Errors"
        }
    }
}
```
For API details, see `UpdatePipelineNotifications` in AWS CLI Command Reference.

**update-pipeline-status**

The following code example shows how to use `update-pipeline-status`.

**AWS CLI**

To update the status of an ElasticTranscoder pipeline

This example updates the status of the specified ElasticTranscoder pipeline.

Command:

```bash
aws elastictranscoder update-pipeline-status --id 1111111111111-abcde1 --status Paused
```

Output:

```json
{
    "Pipeline": {
        "Status": "Paused",
        "ContentConfig": {
            "Bucket": "ets-example",
            "StorageClass": "Standard",
            "Permissions": [
            {
                "Access": ["FullControl"
            }
```
For API details, see UpdatePipelineStatus in AWS CLI Command Reference.

update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update an ElasticTranscoder pipeline
The following update-pipeline example updates the specified ElasticTranscoder pipeline.

```bash
aws elastictranscoder update-pipeline \
   --id 1111111111111-abcde1 \
   --name DefaultExample \
   --input-bucket salesoffice.example.com-source \
   --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
   --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
   --content-config file://content-config.json \
   --thumbnail-config file://thumbnail-config.json
```

Contents of `content-config.json`:

```json
{
   "Bucket":"salesoffice.example.com-public-promos",
   "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
   ],
   "StorageClass":"Standard"
}
```

Contents of `thumbnail-config.json`:

```json
{
   "Bucket":"salesoffice.example.com-public-promos-thumbnails",
   "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
   ],
   "StorageClass":"ReducedRedundancy"
}
```
Output:

```json
{
   "Pipeline": {
      "Status": "Active",
      "ContentConfig": {
         "Bucket": "ets-example",
         "StorageClass": "Standard",
         "Permissions": [
            {
               "Access": [
                  "FullControl"
               ],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      },
      "Name": "DefaultExample",
      "ThumbnailConfig": {
         "Bucket": "ets-example",

      },
      "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
      "InputBucket": "ets-example",
      "Id": "333333333333-abcde3"
   }
}
```
},
"Warnings": [
{
"Message": "The SNS notification topic for Error events and the pipeline are in different regions, which increases processing time for jobs in the pipeline and can incur additional charges. To decrease processing time and prevent cross-regional charges, use the same region for the SNS notification topic and the pipeline."
,
"Code": "6006"
}
]

- For API details, see [UpdatePipeline](#) in *AWS CLI Command Reference*.

### ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics
- **Actions**

#### Actions

**add-tags-to-resource**

The following code example shows how to use `add-tags-to-resource`.
AWS CLI

To add tags to a resource

The following add-tags-to-resource example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```bash
aws elasticache add-tags-to-resource \
--resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-cluster" \
--tags '{"20150202":15, "ElastiCache":"Service"}'
```

Output:

```json
{
  "TagList": [
    {
      "Value": "20150202",
      "Key": "APIVersion"
    },
    {
      "Value": "ElastiCache",
      "Key": "Service"
    }
  ]
}
```

For more information, see Monitoring Costs with Cost Allocation Tags in the Elasticache User Guide.

- For API details, see AddTagsToResource in AWS CLI Command Reference.

authorize-cache-security-group-ingress

The following code example shows how to use authorize-cache-security-group-ingress.

AWS CLI

To authorize cache security group for ingress

The following authorize-cache-security-group-ingress example allows network ingress to a cache security group.
aws elasticache authorize-cache-security-group-ingress \
  --cache-security-group-name "my-sec-grp" \
  --ec2-security-group-name "my-ec2-sec-grp" \
  --ec2-security-group-owner-id "1234567890"

The command produces no output.

For more information, see Self-Service Updates in Amazon ElastiCache in the Elasticache User Guide.

- For API details, see AuthorizeCacheSecurityGroupIngress in AWS CLI Command Reference.

batch-apply-update-action

The following code example shows how to use batch-apply-update-action.

AWS CLI

To apply a service update

The following batch-apply-update-action example applies a service update to a Redis cluster.

aws elasticache batch-apply-update-action \
  --service-update-name elc-xxxxx406-xxx \
  --replication-group-ids test-cluster

Output:

{
  "ProcessedUpdateActions": [
    {
      "ReplicationGroupId": "pat-cluster",
      "ServiceUpdateName": "elc-xxxxx406-xxx",
      "UpdateActionStatus": "waiting-to-start"
    }
  ],
  "UnprocessedUpdateActions": []
}

For more information, see Self-Service Updates in Amazon ElastiCache in the Elasticache User Guide.
For API details, see [BatchApplyUpdateAction](https://docs.aws.amazon.com/cli/latest/reference/elasticache/batch-apply-update-action.html) in *AWS CLI Command Reference*.

### batch-stop-update-action

The following code example shows how to use `batch-stop-update-action`.

**AWS CLI**

**To stop a service update**

The following `batch-stop-update-action` example applies a service update to a Redis cluster.

```bash
aws elasticache batch-stop-update-action \
  --service-update-name elc-xxxxx406-xxx \
  --replication-group-ids test-cluster
```

**Output:**

```json
{
  "ProcessedUpdateActions": [
    {
      "ReplicationGroupId": "pat-cluster",
      "ServiceUpdateName": "elc-xxxxx406-xxx",
      "UpdateActionStatus": "stopping"
    }
  ],
  "UnprocessedUpdateActions": []
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/mgmt/index.html) in the *Elasticache User Guide*.

For API details, see [BatchStopUpdateAction](https://docs.aws.amazon.com/cli/latest/reference/elasticache/batch-stop-update-action.html) in *AWS CLI Command Reference*.

### copy-snapshot

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**To copy a snapshot**
The following copy-snapshot example makes a copy of an existing snapshot.

```bash
aws elasticache copy-snapshot \
    --source-snapshot-name "my-snapshot" \
    --target-snapshot-name "my-snapshot-copy"
```

Output:

```
{
    "Snapshot": {
        "Engine": "redis",
        "CacheParameterGroupName": "default.redis3.2",
        "VpcId": "vpc-3820329f3",
        "CacheClusterId": "my-redis4",
        "SnapshotRetentionLimit": 7,
        "NumCacheNodes": 1,
        "SnapshotName": "my-snapshot-copy",
        "CacheClusterCreateTime": "2016-12-21T22:24:04.955Z",
        "AutoMinorVersionUpgrade": true,
        "PreferredAvailabilityZone": "us-east-1c",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "SnapshotWindow": "07:00-08:00",
        "EngineVersion": "3.2.4",
        "NodeSnapshots": [
            {
                "CacheSize": "3 MB",
                "SnapshotCreateTime": "2016-12-28T07:00:52Z",
                "CacheNodeId": "0001",
                "CacheNodeCreateTime": "2016-12-21T22:24:04.955Z"
            }
        ],
        "CacheSubnetGroupName": "default",
        "Port": 6379,
        "PreferredMaintenanceWindow": "tue:09:30-tue:10:30",
        "CacheNodeType": "cache.m3.large"
    }
}
```

For more information, see [Exporting a Backup](https://docs.aws.amazon.com/elasticache/latest/ug/monitor-backups.html) in the *Elasticache User Guide*.

- For API details, see [CopySnapshot](https://docs.aws.amazon.com/cli/latest/reference/elasticache/copy-snapshot.html) in *AWS CLI Command Reference*. 
create-cache-cluster

The following code example shows how to use create-cache-cluster.

AWS CLI

To create a cache cluster

The following create-cache-cluster example creates a cache cluster using the Redis engine.

```
aws elasticache create-cache-cluster \
   --cache-cluster-id "cluster-test" \
   --engine redis \
   --cache-node-type cache.m5.large \
   --num-cache-nodes 1
```

Output:

```
{
   "CacheCluster": {
      "CacheClusterId": "cluster-test",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.m5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "creating",
      "NumCacheNodes": 1,
      "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
      "PendingModifiedValues": {},
      "CacheSecurityGroups": []
    },
    "CacheParameterGroup": {
      "CacheParameterGroupName": "default.redis5.0",
      "ParameterApplyStatus": "in-sync",
      "CacheNodeIdsToReboot": []
    },
    "CacheSubnetGroupName": "default",
    "AutoMinorVersionUpgrade": true,
    "SnapshotRetentionLimit": 0,
    "SnapshotWindow": "06:30-07:30",
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
}
```
For more information, see Creating a Cluster in the Elasticache User Guide.

- For API details, see CreateCacheCluster in AWS CLI Command Reference.

create-cache-parameter-group

The following code example shows how to use create-cache-parameter-group.

AWS CLI

To create a cache parameter group

The following create-cache-parameter-group example creates a new Amazon ElastiCache cache parameter group.

```
aws elasticache create-cache-parameter-group \\
  --cache-parameter-group-family "redis5.0" \\
  --cache-parameter-group-name "mygroup" \\
  --description "mygroup"
```

Output:

```json
{
  "CacheParameterGroup": {
    "CacheParameterGroupName": "mygroup",
    "CacheParameterGroupFamily": "redis5.0",
    "Description": "my group"
  }
}
```

For more information, see Creating a Parameter Group in the Elasticache User Guide.

- For API details, see CreateCacheParameterGroup in AWS CLI Command Reference.

create-cache-subnet-group

The following code example shows how to use create-cache-subnet-group.
AWS CLI

To create a cache subnet group

The following create-cache-subnet-group example creates a new cache subnet group.

```
aws elasticache create-cache-subnet-group \
   --cache-subnet-group-name "mygroup" \ 
   --cache-subnet-group-description "my subnet group" \ 
   --subnet-ids "subnet-xxxxec4f"
```

Output:

```
{
   "CacheSubnetGroup": {
       "CacheSubnetGroupName": "mygroup",
       "CacheSubnetGroupDescription": "my subnet group",
       "VpcId": "vpc-a3e97cdb",
       "Subnets": [
           {
               "SubnetIdentifier": "subnet-xxxxec4f",
               "SubnetAvailabilityZone": {
                   "Name": "us-west-2d"
               }
           }
       ]
   }
}
```

For more information, see Creating a Cache Subnet Group in the Elasticache User Guide.

- For API details, see CreateCacheSubnetGroup in AWS CLI Command Reference.

create-global-replication-group

The following code example shows how to use create-global-replication-group.

AWS CLI

To create a global replication group

The following create-global-replication-group example creates a new global replication group.
aws elasticache create-global-replication-group \
   --global-replication-group-id-suffix my-global-replication-group \
   --primary-replication-group-id my-primary-cluster

Output:

```json
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgau1-my-global-replication-group",
      "GlobalReplicationGroupDescription": "",
      "Status": "creating",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "Members": [
         {
            "ReplicationGroupId": "my-primary-cluster",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associating"
         }
      ],
      "ClusterEnabled": true,
      "GlobalNodeGroups": [
         {
            "GlobalNodeGroupId": "sgau1-my-global-replication-group-0001",
            "Slots": "0-16383"
         }
      ],
      "AuthTokenEnabled": false,
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/migration/replication-across-regions.html) in the Elasticache User Guide.

- For API details, see [CreateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-global-replication-group.html) in AWS CLI Command Reference.
**create-replication-group**

The following code example shows how to use `create-replication-group`.

**AWS CLI**

**To create a replication group**

The following `create-replication-group` example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```
aws elasticache create-replication-group \
    --replication-group-id "mygroup" \
    --replication-group-description "my group" \
    --engine "redis" \
    --cache-node-type "cache.m5.large"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "Status": "creating",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mygroup-001"
        ],
        "AutomaticFailover": "disabled",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:00-07:00",
        "ClusterEnabled": false,
        "CacheNodeType": "cache.m5.large",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Creating a Redis Replication Group](#) in the *Elasticache User Guide*.

- For API details, see [CreateReplicationGroup](#) in *AWS CLI Command Reference*.  

Actions and scenarios
create-snapshot

The following code example shows how to use create-snapshot.

AWS CLI

To create a snapshot

The following create-snapshot example creates a snapshot using the Redis engine.

```bash
aws elasticache create-snapshot \\
   --snapshot-name mysnapshot \\
   --cache-cluster-id cluster-test
```

Output:

```json
{
   "Snapshot": {
      "SnapshotName": "mysnapshot",
      "CacheClusterId": "cluster-test",
      "SnapshotStatus": "creating",
      "SnapshotSource": "manual",
      "CacheNodeType": "cache.m5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "NumCacheNodes": 1,
      "PreferredAvailabilityZone": "us-west-2b",
      "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
      "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
      "Port": 6379,
      "CacheParameterGroupName": "default.redis5.0",
      "CacheSubnetGroupName": "default",
      "VpcId": "vpc-a3e97cdb",
      "AutoMinorVersionUpgrade": true,
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:30-07:30",
      "NodeSnapshots": [
         {
            "CacheNodeId": "0001",
            "CacheSize": "",
            "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
         }
      ]
   }
}
```
For more information, see Backup and Restore for ElastiCache for Redis in the Elasticache User Guide.

- For API details, see CreateSnapshot in AWS CLI Command Reference.

create-user-group

The following code example shows how to use create-user-group.

AWS CLI

To create a user group

The following create-user-group example creates a new user group.

```
aws elasticache create-user-group \
    --user-group-id myusergroup \
    --engine redis \
    --user-ids default
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "creating",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "ReplicationGroups": [],
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see CreateUserGroup in AWS CLI Command Reference.
create-user

The following code example shows how to use create-user.

AWS CLI

To create a user

The following create-user example creates a new user.

```bash
aws elasticache create-user \
  --user-id user1 \ 
  --user-name myUser \ 
  --passwords mYnuUzrpAxXw2rdzx \ 
  --engine redis \ 
  --access-string "on ~app:::* -@all +@read"
```

Output:

```json
{
  "UserId": "user2",
  "UserName": "myUser",
  "Status": "active",
  "Engine": "redis",
  "AccessString": "on ~app:::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
  "UserGroupIds": [],
  "Authentication": { 
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see CreateUser in AWS CLI Command Reference.
**decrease-node-groups-in-global-replication-group**

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

**AWS CLI**

**To decrease the number of node groups in a global replication group**

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```bash
aws elasticache decrease-node-groups-in-global-replication-group \
--global-replication-group-id sgaui-test \
--node-group-count 1 \
--apply-immediately \
--global-node-groups-to-retain sgaui-test-0003
```

**Output:**

```
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "sgaui-test",
    "GlobalReplicationGroupDescription": "test",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
      {
        "ReplicationGroupId": "test-2",
        "ReplicationGroupRegion": "us-east-1",
        "Role": "SECONDARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      },
      {
        "ReplicationGroupId": "test-1",
        "ReplicationGroupRegion": "us-west-2",
        "Role": "PRIMARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      }
    ]
  }
}
```
For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the [Elasticache User Guide](#).

- For API details, see [DecreaseNodeGroupsInGlobalReplicationGroup](#) in [AWS CLI Command Reference](#).

### decrease-replica-count

The following code example shows how to use `decrease-replica-count`.

**AWS CLI**

**To decrease replica count**

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes.
in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count \
   --replication-group-id my-cluster \
   --apply-immediately \ 
   --new-replica-count 2
```

**Output:**

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": "",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "myrepliace",
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "modifying",
                "PrimaryEndpoint": {
                    "Address": "my-cluster.xxxxx.ng.0001.usw2.cache.amazonaws.com",

    "CurrentRole": "replica"

}
],
"AutomaticFailover": "disabled",
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "07:30-08:30",
"ClusterEnabled": false,
For more information, see Changing the Number of Replicas in the Elasticache User Guide.

- For API details, see DecreaseReplicaCount in AWS CLI Command Reference.

**delete-cache-cluster**

The following code example shows how to use delete-cache-cluster.

**AWS CLI**

**To delete a cache cluster**

The following delete-cache-cluster example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints, and the cluster itself. When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clusters
A cluster that is the last read replica of a replication group
A node group (shard) that has Multi-AZ mode enabled
A cluster from a Redis (cluster mode enabled) replication group
A cluster that is not in the available state

```
aws elasticache delete-cache-cluster \
    --cache-cluster-id "my-cluster-002"
```

**Output:**

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster-002",
home#client-download:",
        "CacheNodeType": "cache.r5.xlarge",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
    }
}
```
For more information, see Deleting a Cluster in the Elasticache User Guide.

- For API details, see DeleteCacheCluster in AWS CLI Command Reference.

**delete-cache-parameter-group**

The following code example shows how to use delete-cache-parameter-group.
AWS CLI

**To delete a cache parameter group**

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```bash
aws elasticache delete-cache-parameter-group 
   --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see [Deleting a Parameter Group](Elasticache_User_Guide) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheParameterGroup](AWS_CLI_Command_Reference) in *AWS CLI Command Reference*.

**delete-cache-subnet-group**

The following code example shows how to use `delete-cache-subnet-group`.

AWS CLI

**To delete a cache subnet group**

The following `delete-cache-subnet-group` example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```bash
aws elasticache delete-cache-subnet-group 
   --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see [Deleting a Subnet Group](Elasticache_User_Guide) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheSubnetGroup](AWS_CLI_Command_Reference) in *AWS CLI Command Reference*.

**delete-global-replication-group**

The following code example shows how to use `delete-global-replication-group`.
To delete a global replication group

The following delete-global-replication-group example deletes a new global replication group.

```bash
aws elasticache delete-global-replication-group \
    --global-replication-group-id my-global-replication-group \
    --retain-primary-replication-group
```

Output:

```json
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-my-grg",
        "GlobalReplicationGroupDescription": "my-grg",
        "Status": "deleting",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-cluster-grg",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": false,
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/mdb/global-datastore.html) in the [Elasticache User Guide](https://docs.aws.amazon.com/elasticache/latest/mdb/).  

delete-replication-group

The following code example shows how to use delete-replication-group.

AWS CLI

To delete a replication group

The following delete-replication-group example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true.

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \\
   --replication-group-id "mygroup"
```

Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "mygroup",
      "Description": "my group",
      "Status": "deleting",
      "PendingModifiedValues": {},
      "AutomaticFailover": "disabled",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:00-07:00",
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

• For API details, see [DeleteReplicationGroup](#) in [AWS CLI Command Reference](#).

delete-snapshot

The following code example shows how to use delete-snapshot.

Actions and scenarios
AWS CLI

To delete a snapshot

The following delete-snapshot example deleted a snapshot using the Redis engine.

```bash
aws elasticache delete-snapshot
  --snapshot-name mysnapshot
```

Output:

```json
{
  "Snapshot": {
    "SnapshotName": "my-cluster-snapshot",
    "ReplicationGroupId": "mycluster",
    "ReplicationGroupDescription": "mycluster",
    "SnapshotStatus": "deleting",
    "SnapshotSource": "manual",
    "CacheNodeType": "cache.r5.xlarge",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
    "PreferredMaintenanceWindow": "thu:12:00-thu:13:00",
    "Port": 6379,
    "CacheParameterGroupName": "default.redis5.0.cluster.on",
    "CacheSubnetGroupName": "default",
    "VpcId": "vpc-a3e97cdb",
    "AutoMinorVersionUpgrade": true,
    "SnapshotRetentionLimit": 1,
    "SnapshotWindow": "13:00-14:00",
    "NumNodeGroups": 4,
    "AutomaticFailover": "enabled",
    "NodeSnapshots": [
      {
        "CacheClusterId": "mycluster-0002-003",
        "NodeGroupId": "0002",
        "CacheNodeId": "0001",
        "CacheSize": "6 MB",
        "CacheNodeCreateTime": "2020-06-18T00:05:44.719000+00:00",
        "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
      },
      {
        "CacheClusterId": "mycluster-0003-003",
```
For more information, see Backup and Restore for ElastiCache for Redis in the Elasticache User Guide.

- For API details, see DeleteSnapshot in AWS CLI Command Reference.

**delete-user-group**

The following code example shows how to use delete-user-group.

**AWS CLI**

**To delete a user group**

The following delete-user-group example deletes a user group.

```
aws elasticache delete-user-group \
  --user-group-id myusergroup
```
Output:

```
{
   "UserGroupId": "myusergroup",
   "Status": "deleting",
   "Engine": "redis",
   "UserIds": [
      "default"
   ],
   "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/userguide/using-rbac.html) in the Elasticache User Guide.

- For API details, see [DeleteUserGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-user-group.html) in AWS CLI Command Reference.

### delete-user

The following code example shows how to use `delete-user`.

**AWS CLI**

#### To delete a user

The following `delete-user` example deletes a user.

```
aws elasticache delete-user \\
   --user-id user2
```

Output:

```
{
   "UserId": "user1",
   "UserName": "myUser",
   "Status": "deleting",
   "Engine": "redis",
   "AccessString": "on ~* +@all",
   "UserGroupIds": [
      "myusergroup"
   ],
   "Authentication": {
```
For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see DeleteUser in AWS CLI Command Reference.

describe-cache-clusters

The following code example shows how to use describe-cache-clusters.

AWS CLI

To describe a cache cluster

The following describe-cache-clusters example describes a cache cluster.

```bash
aws elasticache describe-cache-clusters
```

Output:

```
{
    "CacheClusters": [
    {
        "CacheClusterId": "my-cluster-003",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "available",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2a",
        "CacheClusterCreateTime": "2019-11-26T01:22:52.396Z",
        "PendingModifiedValues": {},
        "NotificationConfiguration": {
            "TopicStatus": "active"
        }
    }
    ]
}
```
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeCacheClusters in AWS CLI Command Reference.
**describe-cache-engine-versions**

The following code example shows how to use `describe-cache-engine-versions`.

**AWS CLI**

To describe a cache engine version

The following `describe-cache-engine-versions` example returns a list of the available cache engines and their versions.

```bash
aws elasticache describe-cache-engine-versions \
    --engine "Redis"
```

Output:

```json
{
    "CacheEngineVersions": [
        {
            "Engine": "redis",
            "EngineVersion": "2.6.13",
            "CacheParameterGroupFamily": "redis2.6",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.6.13"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.19",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.19"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.21",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.21"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.22",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.22"
        }
    ]
}
```
"Engine": "redis",
"EngineVersion": "2.8.22",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.22"
},
{
"Engine": "redis",
"EngineVersion": "2.8.23",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.23"
},
{
"Engine": "redis",
"EngineVersion": "2.8.24",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.24"
},
{
"Engine": "redis",
"EngineVersion": "2.8.6",
"CacheParameterGroupFamily": "redis2.8",

"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 3.2.10"
},
{
"Engine": "redis",
"EngineVersion": "3.2.4",
"CacheParameterGroupFamily": "redis3.2",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 3.2.4"
},
{
"Engine": "redis",
"EngineVersion": "3.2.6",
"CacheParameterGroupFamily": "redis3.2",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 3.2.6"
• For API details, see DescribeCacheEngineVersions in AWS CLI Command Reference.
describe-cache-parameter-groups

The following code example shows how to use describe-cache-parameter-groups.

AWS CLI

To describe a cache parameter group

The following describe-cache-parameter-groups example returns a list of cache parameter group descriptions.

aws elasticache describe-cache-parameter-groups \
    --cache-parameter-group-name "mygroup"

Output:

```
{
   "CacheParameterGroups": [
       {
          "CacheParameterGroupName": "mygroup",
          "CacheParameterGroupFamily": "redis5.0",
          "Description": ""
       }
   ]
}
```

For more information, see [Configuring Engine Parameters Using Parameter Groups](#) in the Elasticache User Guide.

- For API details, see [DescribeCacheParameterGroups](#) in AWS CLI Command Reference.

describe-cache-parameters

The following code example shows how to use describe-cache-parameters.

AWS CLI

To describe cache parameters

The following "describe-cache-parameters" example returns the detailed parameter list for the specified cache parameter group.
aws elasticache describe-cache-parameters \
   --cache-parameter-group-name "myparamgroup"

Output:

```json
{
   "Parameters": [ 
   {
      "ParameterName": "activedefrag",
      "ParameterValue": "yes",

describe-cache-subnet-groups

The following code example shows how to use describe-cache-subnet-groups.

AWS CLI

To describe cache subnet groups

The following describe-cache-subnet-groups example returns a list of subnet groups.

    aws elasticache describe-cache-subnet-groups

Output:

```json
{
    "CacheSubnetGroups": [
        {
            "CacheSubnetGroupName": "default",
            "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
            "VpcId": "vpc-a3e97c9d",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-8d4bacf5",
                
```
"SubnetAvailabilityZone": {
    "Name": "us-west-2b"
},
{

            }
        }
    ]
}
For more information, see Subnets and Subnet Groups in the Elasticache User Guide or Subnets and Subnet Groups in the ElastiCache for Memcached User Guide.

- For API details, see DescribeCacheSubnetGroups in AWS CLI Command Reference.

describe-engine-default-parameters

The following code example shows how to use describe-engine-default-parameters.

**AWS CLI**

To describe engine default parameters

The following describe-engine-default-parameters example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
  --cache-parameter-group-family "redis5.0"
```

Output:

```
{
  "EngineDefaults": {
    "Parameters": [
      {

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events of a replication group

The following describe-events example returns a list of events for a replication group.

```bash
aws elasticache describe-events \
   --source-identifier test-cluster \
   --source-type replication-group
```

Output:

```json
{
   "Events": [
      {
         "SourceIdentifier": "test-cluster",
         "SourceType": "replication-group",
         "Message": "Automatic failover has been turned on for replication group test-cluster",
         "Date": "2020-03-18T23:51:34.457Z"
      },
      {
         "SourceIdentifier": "test-cluster",
         "SourceType": "replication-group",
         "Message": "Replication group test-cluster created",
         "Date": "2020-03-18T23:50:31.378Z"
      }
   ]
}
```

For more information, see Monitoring Events in the Elasticache User Guide.
For API details, see DescribeEvents in AWS CLI Command Reference.

describe-global-replication-groups

The following code example shows how to use describe-global-replication-groups.

AWS CLI

To describe global replication groups

The following describe-global-replication-groups example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \
--global-replication-group-id my-grg
```

Output:

```
{
    "GlobalReplicationGroups": [
        {
            "GlobalReplicationGroupId": "my-grg",
            "GlobalReplicationGroupDescription": "my-grg",
            "Status": "creating",
            "CacheNodeType": "cache.r5.large",
            "Engine": "redis",
            "EngineVersion": "5.0.6",
            "ClusterEnabled": false,
            "AuthTokenEnabled": false,
            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false
        }
    ]
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

• For API details, see DescribeGlobalReplicationGroups in AWS CLI Command Reference.
describe-replication-groups

The following code example shows how to use describe-replication-groups.

AWS CLI

To return a list of replication group details

The following describe-replication-groups example returns the replication groups.

aws elasticache describe-replication-groups

Output:

```json
{
   "ReplicationGroups": [
      {
         "ReplicationGroupId": "my-cluster",
         "Description": "mycluster",

}
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeReplicationGroups in AWS CLI Command Reference.

describe-reserved-cache-nodes-offerings

The following code example shows how to use describe-reserved-cache-nodes-offerings.

AWS CLI

To describe reserved-cache-nodes-offerings

The following describe-reserved-cache-nodes-offerings example returns details of a reserved-cache-node options.
```
aws elasticache describe-reserved-cache-nodes-offerings

Output:

{
    "ReservedCacheNodesOfferings": [
        {
            "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbcde8e5",
            "CacheNodeType": "cache.t3.small",

                }
            ]
        },
        ...
    ]
}

- For API details, see DescribeReservedCacheNodesOfferings in AWS CLI Command Reference.

describe-reserved-cache-nodes

The following code example shows how to use describe-reserved-cache-nodes.

**AWS CLI**

**To describe reserved cache nodes**

The following describe-reserved-cache-nodes example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```json
{
    "ReservedCacheNodes": [
        {
            "ReservedCacheNodeId": "mynode",
            "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxxx71",

                }
            ],
        }
    ]
}
```
For more information, see Managing Costs with Reserved Nodes in the Elasticache User Guide.

• For API details, see DescribeReservedCacheNodes in AWS CLI Command Reference.

describe-service-updates

The following code example shows how to use describe-service-updates.

AWS CLI

To describe service updates

The following describe-service-updates example returns details about service updates.

 aws elasticache describe-service-updates

Output:

```json
{
   "ServiceUpdates": [
      {
         "ServiceUpdateName": "elc-xxxxxxxxx7-001",
         "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
         "ServiceUpdateEndDate": "2020-02-09T15:59:59Z",
         "ServiceUpdateSeverity": "important",
         "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
         "ServiceUpdateStatus": "available",
         "ServiceUpdateDescription": "Upgrades to improve the security, reliability, and operational performance of your ElastiCache nodes",
         "ServiceUpdateType": "security-update",
         "Engine": "redis, memcached",
         "EngineVersion": "redis 2.6.13 and onwards, memcached 1.4.5 and onwards",
         "AutoUpdateAfterRecommendedApplyByDate": false,
         "EstimatedUpdateTime": "30 minutes per node"
      },
      {
         "ServiceUpdateName": "elc-xxxxxxxxx4-001",
         "ServiceUpdateReleaseDate": "2019-06-11T15:00:00Z",
```
• For API details, see DescribeServiceUpdates in AWS CLI Command Reference.

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

To describe snapshots

The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

aws elasticache describe-snapshots

Output:

```json
{
   "Snapshots": [ 
   {
      "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",

    {
      "CacheNodeId": "0001",

For more information, see Backup and Restore for ElastiCache for Redis in the Elasticache User Guide.

- For API details, see DescribeSnapshots in AWS CLI Command Reference.
describe-update-actions

The following code example shows how to use describe-update-actions.

AWS CLI

To describe update actions

The following describe-update-actions example returns details of update actions.

aws elasticache describe-update-actions

Output:

```json
{
    "UpdateActions": [
        {
            "ReplicationGroupId": "mycluster",
            "ServiceUpdateName": "elc-20191007-001",
            "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
            "ServiceUpdateSeverity": "important",
            "ServiceUpdateStatus": "available",
            "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
            "ServiceUpdateType": "security-update",

            "SlaMet": "n/a",
            "Engine": "redis"
        },
        {
            "CacheClusterId": "my-memcached-cluster",
            "ServiceUpdateName": "elc-20191007-001",
            "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
            "ServiceUpdateSeverity": "important",
            "ServiceUpdateStatus": "available",
            "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
            "ServiceUpdateType": "security-update",
            "UpdateActionAvailableDate": "2019-12-04T18:26:05.349Z",
            "UpdateActionStatus": "complete",
            "NodesUpdated": "1/1",
            "UpdateActionStatusModifiedDate": "2019-12-04T18:26:05.352Z",
            "SlaMet": "n/a"
        }
    ]
}
```
For more information, see [Self-Service Updates in Amazon ElastiCache](#) in the Elasticache User Guide.

- For API details, see [DescribeUpdateActions](#) in AWS CLI Command Reference.

**describe-user-groups**

The following code example shows how to use `describe-user-groups`.
AWS Command Line Interface

AWS CLI

To describe user-groups

The following `describe-user-groups` example returns a list of user groups.

```bash
aws elasticache describe-user-groups
```

Output:

```json
{
    "UserGroups": [
        {
            "UserGroupId": "myusergroup",
            "Status": "active",
            "Engine": "redis",
            "UserIds": [
                "default"
            ],
            "ReplicationGroups": [],
        }
    ]
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](Elasticache User Guide) in the Elasticache User Guide.

- For API details, see [DescribeUserGroups](AWS CLI Command Reference) in AWS CLI Command Reference.

describe-users

The following code example shows how to use `describe-users`.

AWS CLI

To describe users

The following `describe-users` example returns a list of users.

```bash
aws elasticache describe-users
```
Output:

```json
{
  "Users": [
    {
      "UserId": "default",
      "UserName": "default",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [
        "myusergroup"
      ],
      "Authentication": {
        "Type": "no-password"
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
    },
    {
      "UserId": "user1",
      "UserName": "myUser",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [],
      "Authentication": {
        "Type": "password",
        "PasswordCount": 1
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
    },
    {
      "UserId": "user2",
      "UserName": "myUser",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
      "UserGroupIds": [],
      "Authentication": {
        "Type": "password",
        "PasswordCount": 1
      }
    }
  ]
}```
For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/mgmt/user-guide/rbac.html) in the Elasticache User Guide.

- For API details, see DescribeUsers in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-users.html).

### disassociate-global-replication-group

The following code example shows how to use disassociate-global-replication-group.

**AWS CLI**

**To diassociate a secondary cluster from a global replication group**

The following `disassociate-global-replication-group` example removes a secondary cluster from a Global datastore

```
aws elasticache disassociate-global-replication-group \
  --global-replication-group-id my-grg \
  --replication-group-id my-cluster-grg-secondary \
  --replication-group-region us-east-1
```

**Output:**

```
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "my-grg",
    "GlobalReplicationGroupDescription": "my-grg",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
      {
        "ReplicationGroupId": "my-cluster-grg-secondary",
        "ReplicationGroupRegion": "us-east-1",
        "Role": "SECONDARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      }
    ]
  }
}
```
For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/guide.html) in the *Elasticache User Guide*.

- For API details, see [DisassociateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/disassociate-global-replication-group.html) in *AWS CLI Command Reference*.

### increase-node-groups-in-global-replication-group

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

#### AWS CLI

**To increase the number of node groups in a global replication group**

The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```bash
aws elasticache increase-node-groups-in-global-replication-group \
  --global-replication-group-id sgau-1jtv-test-4 \
  --node-group-count 6 \
  --apply-immediately
```

**Output:**

```json
{
  "GlobalReplicationGroup": {
```
For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

- For API details, see IncreaseNodeGroupsInGlobalReplicationGroup in AWS CLI Command Reference.

increase-replica-count

The following code example shows how to use increase-replica-count.

AWS CLI

To increase replica count

The following increase-replica-count example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache increase-replica-count \
   --replication-group-id "my-cluster" \ 
   --apply-immediately \ 
   --new-replica-count 3
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": "",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "my-cluster-001",
```
"my-cluster-002",
"my-cluster-003",
"my-cluster-004"
],
"NodeGroups": [
{
  "NodeGroupId": "0001",
  "Status": "modifying",
  "PrimaryEndpoint": {
    "Address": "my-cluster.xxxxxih.ng.0001.usw2.cache.amazonaws.com",
    "Port": 6379
  },
  "ReaderEndpoint": {
    "Address": "my-cluster-ro.xxxxxxih.ng.0001.usw2.cache.amazonaws.com",
    "Port": 6379
  },
  "NodeGroupMembers": [
    {
      "CacheClusterId": "my-cluster-001",
      "CacheNodeId": "0001",
      "ReadEndpoint": {
        "Address": "my-cluster-001.xxxxxih.0001.usw2.cache.amazonaws.com",
        "Port": 6379
      },
      "PreferredAvailabilityZone": "us-west-2a",
      "CurrentRole": "primary"
    },
    {
      "CacheClusterId": "my-cluster-003",
      "CacheNodeId": "0001",
      "ReadEndpoint": {
        "Address": "my-cluster-003.xxxxxih.0001.usw2.cache.amazonaws.com",
        "Port": 6379
      },
      "PreferredAvailabilityZone": "us-west-2a",
      "CurrentRole": "replica"
    }
  ]
}]}
For more information, see [Increasing the Number of Replicas in a Shard](#) in the [Elasticache User Guide](#).

- For API details, see [IncreaseReplicaCount](#) in [AWS CLI Command Reference](#).

### list-allowed-node-type-modifications

The following code example shows how to use `list-allowed-node-type-modifications`.

**AWS CLI**

To list the allowed node modifications

The following `list-allowed-node-type-modifications` example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```
aws elasticache list-allowed-node-type-modifications \
  --replication-group-id "my-replication-group"
```

**Output:**

```json
{
   "ScaleUpModifications": [
      "cache.m5.12xlarge",
      "cache.m5.24xlarge",
      "cache.m5.4xlarge",
      "cache.r5.12xlarge",
      "cache.r5.24xlarge",
      "cache.r5.2xlarge",
      "cache.r5.4xlarge"
   ],
   "ScaleDownModifications": [
```
"cache.m3.large",
"cache.m3.medium",
"cache.m3.xlarge",
"cache.m4.large",
"cache.m4.xlarge",
"cache.m5.2xlarge",
"cache.m5.large",
"cache.m5.xlarge",
"cache.r3.large",
"cache.r4.large",
"cache.r4.xlarge",
"cache.r5.large",
"cache.t2.medium",
"cache.t2.micro",
"cache.t2.small",
"cache.t3.medium",
"cache.t3.micro",
"cache.t3.small"
]
}

For more information, see Scaling ElastiCache for Redis Clusters in the Elasticache User Guide.

- For API details, see ListAllowedNodeTypeModifications in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a resource**

The following list-tags-for-resource example lists tags for a resource.

```bash
aws elasticache list-tags-for-resource \
   --resource-name "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

**Output:**

```json
{
   "TagList": [
   {
```

For more information, see [Listing Tags Using the AWS CLI](https://docs.aws.amazon.com/elasticache/latest/mdb/using-tags.html) in the *Elasticache User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/elasticache/list-tags-for-resource.html) in *AWS CLI Command Reference*.

modify-cache-cluster

The following code example shows how to use `modify-cache-cluster`.

**AWS CLI**

**To modify cache clusters**

The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
  --cache-cluster-id "my-cluster" \
  --num-cache-nodes 1
```

**Output:**

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "available",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2c",
        "CacheClusterCreateTime": "2019-12-04T18:24:56.652Z",
        "PreferredMaintenanceWindow": "sat:10:00-sat:11:00",
    }
}
```
"PendingModifiedValues": {},
"CacheSecurityGroups": [],
"CacheParameterGroup": {
   "CacheParameterGroupName": "default.redis5.0",
   "ParameterApplyStatus": "in-sync",
   "CacheNodeIdsToReboot": []
},
"CacheSubnetGroupName": "default",
"AutoMinorVersionUpgrade": true,
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "07:00-08:00",
"TransitEncryptionEnabled": false,
"AtRestEncryptionEnabled": false
}
}

For more information, see Modifying an ElastiCache Cluster in the Elasticache User Guide.

- For API details, see ModifyCacheCluster in AWS CLI Command Reference.

modify-cache-parameter-group

The following code example shows how to use modify-cache-parameter-group.

AWS CLI

To modify a cache parameter group

The following modify-cache-parameter-group example modifies the parameters of the specified cache parameter group.

```
aws elasticache modify-cache-parameter-group \
   --cache-parameter-group-name "mygroup" \
   --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
   "CacheParameterGroupName": "mygroup"
}
```

For more information, see Modifying a Parameter Group in the Elasticache User Guide.
modify-cache-subnet-group

The following code example shows how to use modify-cache-subnet-group.

**AWS CLI**

**To modify a cache subnet group**

The following modify-cache-subnet-group example modifies the specified cache subnet group.

```bash
aws elasticache modify-cache-subnet-group \
   --cache-subnet-group-name kxxk \ 
   --cache-subnet-group-description "mygroup"
```

Output:

```json
{
   "CacheSubnetGroup": {
      "CacheSubnetGroupName": "kxxk",
      "CacheSubnetGroupDescription": "mygroup",
      "VpcId": "vpc-xxxxcdb",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-xxxxbff",
            "SubnetAvailabilityZone": {
               "Name": "us-west-2a"
            }
         }
      ]
   }
}
```

For more information, see [Modifying a Subnet Group](https://docs.aws.amazon.com/elasticache/latest/userguide/modify-cache-subnet-group.html) in the Elasticache User Guide.

**modify-global-replication-group**

The following code example shows how to use modify-global-replication-group.

**Actions and scenarios**
AWS CLI

To modify a global replication group

The following `modify-global-replication-group` modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```
aws elasticache modify-global-replication-group \
   --global-replication-group-id sgaui-pat-group \
   --apply-immediately \
   --no-automatic-failover-enabled
```

Output

```
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgaui-test-group",
      "GlobalReplicationGroupDescription": "",
      "Status": "modifying",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "ClusterEnabled": false,
      "AuthTokenEnabled": false,
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

For more information, see Replication Across AWS Regions Using Global Datstore in the Elasticache User Guide.

- For API details, see ModifyGlobalReplicationGroup in AWS CLI Command Reference.

modify-replication-group-shard-configuration

The following code example shows how to use `modify-replication-group-shard-configuration`.

AWS CLI

To modify a replication group shard configuration
The following modify-replication-group-shard-configuration decreases the node group count using the Redis engine.

```
aws elasticache modify-replication-group-shard-configuration \
  --replication-group-id mycluster \
  --node-group-count 3 \
  --apply-immediately \
  --node-groups-to-remove 0002
```

Output

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "mycluster",
    "Description": "mycluster",
    "GlobalReplicationGroupInfo": {},
    "Status": "modifying",
    "PendingModifiedValues": {},
    "MemberClusters": [
      "mycluster-0002-001",
      "mycluster-0002-002",
      "mycluster-0002-003",
      "mycluster-0003-001",
      "mycluster-0003-002",
      "mycluster-0003-003",
      "mycluster-0003-004",
      "mycluster-0004-001",
      "mycluster-0004-002",
      "mycluster-0004-003",
      "mycluster-0005-001",
      "mycluster-0005-002",
      "mycluster-0005-003",
    ],
    "NodeGroups": [
      {
        "NodeGroupId": "0002",
        "Status": "modifying",
        "Slots": "894-1767,3134-4443,5149-5461,6827-7332,12570-13662",
        "NodeGroupMembers": [
          {
            "CacheClusterId": "mycluster-0002-001",
            "CacheNodeId": "0001",
            "PreferredAvailabilityZone": "us-west-2c"
          }
        ]
      }
    ]
  }

modify-replication-group

The following code example shows how to use modify-replication-group.

**AWS CLI**

To modify a replication group

The following modify-replication-group disables Multi-AZ using the Redis engine.

```
aws elasticache modify-replication-group \
    --replication-group-id test-cluster \
    --no-multi-az-enabled \ 
    --apply-immediately
```

**Output**

```
{
    "ReplicationGroup": {
        "ReplicationGroupIds": "test-cluster",
        "Description": "test-cluster",
        "GlobalReplicationGroupInfo": {
            "GlobalReplicationGroupId": "sgauipat-group",
            "GlobalReplicationGroupMemberRole": "PRIMARY"
        }
    }
}
```
"Status": "available",
"PendingModifiedValues": {},
"MemberClusters": [
    "test-cluster-001",
    "test-cluster-002",
    "test-cluster-003"
],
"NodeGroups": [
    {
        "NodeGroupId": "0001",
        "Status": "available",
        "PrimaryEndpoint": {

                },
                "PreferredAvailabilityZone": "us-west-2b",
                "CurrentRole": "replica"
            }
        ]
    }
]
For more information, see [Modifying a Replication Group](https://docs.aws.amazon.com/elasticache/latest/userguide/replication-group-modify.html) in the *Elasticache User Guide*.

- For API details, see [ModifyReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/modify-replication-group.html) in *AWS CLI Command Reference*.

**modify-user-group**

The following code example shows how to use `modify-user-group`.

**AWS CLI**

**To modify a user group**

The following `modify-user-group` example adds a user to the user group.

```bash
aws elasticache modify-user-group \
  --user-group-id myusergroup \
  --user-ids-to-add user1
```
Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "modifying",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "PendingChanges": {
        "UserIdsToAdd": [
            "user1"
        ]
    },
    "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/mdb/user-guide/auth-rbac.html) in the Elasticache User Guide.

**modify-user**

The following code example shows how to use `modify-user`.

**AWS CLI**

**To modify a user**

The following `modify-user` example modifies a user's access string.

```
aws elasticache modify-user \
    --user-id user2 \
    --append-access-string "on ~* +@all"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "UserGroupId": "myusergroup",
    "Status": "modifying",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "PendingChanges": {
        "UserIdsToAdd": [
            "user1"
        ]
    },
    "ReplicationGroups": [],
}
```
For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/userguide/using-rbac.html) in the Elasticache User Guide.

### purchase-reserved-cache-nodes-offering

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

#### AWS CLI

**To purchase a reserved-cache-node-offering**

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```bash
aws elasticache purchase-reserved-cache-nodes-offering \
  --reserved-cache-nodes-offering-id xxxxxxx-4da5-4b90-b92d-929fbd7abed2
```

**Output**

```
{
    "ReservedCacheNode": {
        "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
        "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
        "CacheNodeType": "cache.m3.2xlarge",
        "StartTime": "2020-06-30T17:59:40.474000+00:00",
        "Duration": 31536000,
        "FixedPrice": 1772.0,
        "UsagePrice": 0.0,
        "CacheNodeCount": 1,
    }
}
```

- For API details, see PurchaseReservedCacheNodesOffering in AWS CLI Command Reference.

reboot-cache-cluster

The following code example shows how to use reboot-cache-cluster.

AWS CLI

To reboot a cache cluster

The following reboot-cache-cluster example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to REBOOTING.

```
aws elasticache reboot-cache-cluster \
  --cache-cluster-id "my-cluster-001" \
  --cache-node-ids-to-reboot "0001"
```

Output:

```json
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster-001",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:"
  }
}
```
"CacheNodeType": "cache.r5.xlarge",
"Engine": "redis",
"EngineVersion": "5.0.5",
"CacheClusterStatus": "rebooting cache cluster nodes",
"NumCacheNodes": 1,
"PreferredAvailabilityZone": "us-west-2a",
"CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",

      "SecurityGroupId": "sg-xxxxxxxxxxxxxx7b",
      "Status": "active"
   }
],
"ReplicationGroupId": "my-cluster",
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "07:30-08:30",
"TransitEncryptionEnabled": false,
"AtRestEncryptionEnabled": false
}

- For API details, see RebootCacheCluster in AWS CLI Command Reference.
**reset-cache-parameter-group**

The following code example shows how to use `reset-cache-parameter-group`.

**AWS CLI**

**To reset a cache parameter group**

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```
aws elasticache reset-cache-parameter-group \\
  --cache-parameter-group-name "mygroup" \\
  --reset-all-parameters
```

Output:

```
{
  "CacheParameterGroupName": "mygroup"
}
```

- For API details, see [ResetCacheParameterGroup](#) in *AWS CLI Command Reference*.

**start-migration**

The following code example shows how to use `start-migration`.

**AWS CLI**

**To start a migration**

The following `start-migration` migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration \\
  --replication-group-id test \\
  --customer-node-endpoint-list \\
  "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```
```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test",
        "Description": "test",

                },
                "ReaderEndpoint": {
                    "Address": "test-ro.g2xbih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "NodeGroupMembers": [
                    {
                        "CacheClusterId": "test-001",
                        "CacheNodeId": "0001",
                        "ReadEndpoint": {
                            "Address": "test-001.g2xbih.0001.usw2.cache.amazonaws.com",
                            "Port": 6379
                        },
                        "PreferredAvailabilityZone": "us-west-2a",
                        "CurrentRole": "primary"
                    },
                    {
                        "CacheClusterId": "test-002",
                        "CacheNodeId": "0001",
                        "ReadEndpoint": {
                            "Address": "test-002.g2xbih.0001.usw2.cache.amazonaws.com",
                            "Port": 6379
                        }
                    }
                ]
            }
        ]
    }
}
```
For more information, see Online Migration to ElastiCache in the Elasticache User Guide.

- For API details, see StartMigration in AWS CLI Command Reference.

**test-failover**

The following code example shows how to use test-failover.

**AWS CLI**

To test failover of a node group
The following `test-failover` example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```
aws elasticache test-failover /
  --replication-group-id "mycluster" /
  --node-group-id "0001"
```

Output:

```json
{
  "ReplicationGroup": {
    "ReplicationGroupId": "mycluster",
    "Description": "My Cluster",
    "Status": "available",
    "PendingModifiedValues": {},

For API details, see TestFailover in AWS CLI Command Reference.

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions
Actions

create-container

The following code example shows how to use create-container.

AWS CLI

To create a container

The following create-container example creates a new, empty container.

```
aws mediastore create-container --container-name ExampleContainer
```

Output:

```
{
    "Container": {
        "AccessLoggingEnabled": false,
        "CreationTime": 1563557265,
        "Name": "ExampleContainer",
        "Status": "CREATING",
    }
}
```

For more information, see Creating a Container in the AWS Elemental MediaStore User Guide.

- For API details, see CreateContainer in AWS CLI Command Reference.

delete-container-policy

The following code example shows how to use delete-container-policy.

AWS CLI

To delete a container policy

The following delete-container-policy example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.
aws mediastore delete-container-policy \
   --container-name LiveEvents

This command produces no output.

For more information, see `DeleteContainerPolicy` in the *AWS Elemental MediaStore API reference*.

- For API details, see `DeleteContainerPolicy` in *AWS CLI Command Reference*.

**delete-container**

The following code example shows how to use delete-container.

**AWS CLI**

To delete a container

The following `delete-container` example deletes the specified container. You can delete a container only if it has no objects.

```bash
aws mediastore delete-container \
   --container-name=ExampleLiveDemo
```

This command produces no output.

For more information, see `Deleting a Container` in the *AWS Elemental MediaStore User Guide*.

- For API details, see `DeleteContainer` in *AWS CLI Command Reference*.

**delete-cors-policy**

The following code example shows how to use delete-cors-policy.

**AWS CLI**

To delete a CORS policy

The following `delete-cors-policy` example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```bash
aws mediastore delete-cors-policy \
```
This command produces no output.

For more information, see Deleting a CORS Policy in the AWS Elemental MediaStore User Guide.

• For API details, see DeleteCorsPolicy in AWS CLI Command Reference.

delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete an object lifecycle policy

The following delete-lifecycle-policy example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

    aws mediastore delete-lifecycle-policy \\
        --container-name LiveEvents

This command produces no output.

For more information, see Deleting an Object Lifecycle Policy in the AWS Elemental MediaStore User Guide.

• For API details, see DeleteLifecyclePolicy in AWS CLI Command Reference.

describe-container

The following code example shows how to use describe-container.

AWS CLI

To view the details of a container

The following describe-container example displays the details of the specified container.

    aws mediastore describe-container \\
        --container-name ExampleContainer
Output:

```json
{
   "Container": {
      "CreationTime": 1563558086,
      "AccessLoggingEnabled": false,
      "Status": "ACTIVE",
      "Name": "ExampleContainer",
      "Endpoint": "https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com"
   }
}
```

For more information, see [Viewing the Details for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeContainer](#) in *AWS CLI Command Reference*.

### describe-object

The following code example shows how to use `describe-object`.

**AWS CLI**

**To view a list of objects and folders in a specific container**

The following `describe-object` example displays items (objects and folders) stored in a specific container.

```
aws mediastore-data describe-object \
   --endpoint https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com \ 
   --path /folder_name/file1234.jpg
```

Output:

```json
{
   "ContentType": "image/jpeg",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ContentLength": "2307346",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555da6d3"
}
```
For more information, see Viewing the Details of an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DescribeObject in AWS CLI Command Reference.

get-container-policy

The following code example shows how to use get-container-policy.

AWS CLI

To view a container policy

The following get-container-policy example displays the resource-based policy of the specified container.

```
aws mediastore get-container-policy \
  --container-name ExampleLiveDemo
```

Output:

```
{
  "Policy": {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Sid": "PublicReadOverHttps",
        "Effect": "Allow",
        "Principal": {
          "AWS": "arn:aws:iamp:111122223333:root"
        },
        "Action": [
          "mediastore:GetObject",
          "mediastore:DescribeObject"
        ],
        "Condition": {
          "Bool": {
            "aws:SecureTransport": "true"
          }
        }
      }
    ]
  }
}
```
For more information, see Viewing a Container Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetContainerPolicy in AWS CLI Command Reference.

get-cors-policy

The following code example shows how to use get-cors-policy.

AWS CLI

To view a CORS policy

The following get-cors-policy example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```bash
aws mediastore get-cors-policy \
   --container-name ExampleContainer \
   --region us-west-2
```

Output:

```json
{
   "CorsPolicy": [
      {
         "AllowedMethods": [
            "GET",
            "HEAD"
         ],
         "MaxAgeSeconds": 3000,
         "AllowedOrigins": [
            ""
         ],
         "AllowedHeaders": [
            ""
         ]
      }
   ]
}
```
For more information, see [Viewing a CORS Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetCorsPolicy](#) in *AWS CLI Command Reference*.

### get-lifecycle-policy

The following code example shows how to use `get-lifecycle-policy`.

**AWS CLI**

To view an object lifecycle policy

The following `get-lifecycle-policy` example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \\
    --container-name LiveEvents
```

Output:

```json
{
   "LifecyclePolicy": {
      "rules": [
        {
          "definition": {
            "path": [
              {
                "prefix": "Football/"
              },
              {
                "prefix": "Baseball/
              }
            ],
            "days_since_create": [
              {
                "numeric": [
                  ">",
                  28
                ]
              }
            ]
          }
        }
      ]
   }
}
```
For more information, see Viewing an Object Lifecycle Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-object

The following code example shows how to use get-object.

AWS CLI

To download an object

The following get-object example download an object to the specified endpoint.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md README.md
```

Output:

```
{
   "ContentLength": "2307346",
   "ContentType": "image/jpeg",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f55555555555da6d3",
   "StatusCode": 200
}
```

To download part of an object

The following get-object example downloads a portion an object to the specified endpoint.

```
aws mediastore-data get-object \
```
--endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \ 
--path /folder_name/README.md \ 
--range="bytes=0-100" README2.md

Output:

```
{
    "StatusCode": 206,
    "ContentRange": "bytes 0-100/2307346",
    "ContentLength": "101",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ContentType": "image/jpeg",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f5555555555555da6d3"
}
```

For more information, see [Downloading an Object](https://docs.aws.amazon.com/mediastore/latest/userguide) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetObject](https://docs.aws.amazon.com/cli/latest/reference/mediastore/get-object.html) in *AWS CLI Command Reference*.

**list-containers**

The following code example shows how to use `list-containers`.

**AWS CLI**

**To view a list of containers**

The following `list-containers` example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```

Output:

```
{
    "Containers": [
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "Status": "ACTIVE"
        }
    ]
}
```
The following code example shows how to use `list-items`.

**AWS CLI**

**Example 1: To view a list of objects and folders in a specific container**

The following `list-items` example displays items (objects and folders) stored in the specified container.

```bash
aws mediastore-data list-items \
   --endpoint https://aaabbcccddee.data.mediastore.us-west-2.amazonaws.com
```

**Output:**

```json
{
   "Items": [
      {
         "Name": "ExampleContainer",
         "Status": "ACTIVE",
         "AccessLoggingEnabled": false,
         "CreationTime": 1506528818,
         "Endpoint": "https://fffggghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
      },
      {
         "Name": "ExampleLiveDemo",
         "Status": "ACTIVE",
         "AccessLoggingEnabled": false,
         "CreationTime": 1506528818,
         "Endpoint": "https://fffggghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
      }
   ]
}
```

For more information, see [Viewing a List of Containers](https://aws.amazon.com/documentation/mediaconnect/) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListContainers](https://docs.aws.amazon.com/cli/latest/reference/mediastore-data/list-containers.html) in *AWS CLI Command Reference*.
Example 2: To view a list of objects and folders in a specific folder

The following list-items example displays items (objects and folders) stored in a specific folder.

```bash
cmd
aws mediastore-data list-items \\
  --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```json
{
  "Items": [
    {
      "ContentType": "image/jpeg",
      "LastModified": 1563571859.379,
      "Name": "filename.jpg",
      "Type": "OBJECT",
      "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
      "ContentLength": 3784
    },
    {
      "Type": "FOLDER",
      "Name": "ExampleLiveDemo"
    }
  ]
}
```
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a container

The following list-tags-for-resource example displays the tag keys and values assigned to the specified container.

```bash
aws mediastore list-tags-for-resource \
```

Output:

```json
{
   "Tags": [
      {
         "Value": "Test",
         "Key": "Environment"
      },
      {
         "Value": "West",
         "Key": "Region"
      }
   ]
}
```

For more information, see ListTagsForResource in the AWS Elemental MediaStore API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-container-policy

The following code example shows how to use put-container-policy.

For more information, see Viewing a List of Objects in the AWS Elemental MediaStore User Guide.

- For API details, see ListItems in AWS CLI Command Reference.
To edit a container policy

The following `put-container-policy` example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named `LiveEventsContainerPolicy.json`.

```
aws mediastore put-container-policy \\
  --container-name LiveEvents \\
  --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see [Editing a Container Policy](https://aws.amazon.com/documentation/mediastore/) in the *AWS Elemental MediaStore User Guide*.

put-cors-policy

The following code example shows how to use `put-cors-policy`.

**AWS CLI**

**Example 1: To add a CORS policy**

The following `put-cors-policy` example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named `corsPolicy.json`.

```
aws mediastore put-cors-policy \\
  --container-name ExampleContainer \\
  --cors-policy file://corsPolicy.json
```

This command produces no output.

For more information, see [Adding a CORS Policy to a Container](https://aws.amazon.com/documentation/mediastore/) in the *AWS Elemental MediaStore User Guide*.

**Example 2: To edit a CORS policy**
The following put-cors-policy example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named corsPolicy2.json.

For more information, see Editing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutCorsPolicy in AWS CLI Command Reference.

put-lifecycle-policy

The following code example shows how to use put-lifecycle-policy.

AWS CLI

To create an object lifecycle policy

The following put-lifecycle-policy example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named LiveEventsLifecyclePolicy.json.

```bash
aws mediastore put-lifecycle-policy \
  --container-name ExampleContainer \
  --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see Adding an Object Lifecycle Policy to a Container in the AWS Elemental MediaStore User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

put-object

The following code example shows how to use put-object.

AWS CLI

To upload an object
The following `put-object` example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```bash
aws mediastore-data put-object \
   --endpoint https://aaabbbccccddddee.data.mediastore.us-west-2.amazonaws.com \
   --body README.md \
   --path /folder_name/README.md \
   --cache-control "max-age=6, public" \
   --content-type binary/octet-stream
```

Output:

```
{
   "ContentSHA256": "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",
   "StorageClass": "TEMPORAL",
   "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"
}
```

For more information, see [Uploading an Object](https://aws.amazon.com/documentation/mediastore/) in the [AWS Elemental MediaStore User Guide](https://aws.amazon.com/documentation/mediastore/).

- For API details, see [PutObject](https://aws.amazon.com/documentation/mediastore/) in [AWS CLI Command Reference](https://aws.amazon.com/documentation/mediastore/).

### start-access-logging

The following code example shows how to use `start-access-logging`.

**AWS CLI**

**To enable access logging on a container**

The following `start-access-logging` example enable access logging on the specified container.

```bash
aws mediastore start-access-logging \
   --container-name LiveEvents
```

This command produces no output.
For more information, see Enabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.

- For API details, see StartAccessLogging in AWS CLI Command Reference.

**stop-access-logging**

The following code example shows how to use stop-access-logging.

**AWS CLI**

To disable access logging on a container

The following stop-access-logging example disables access logging on the specified container.

```
aws mediastore stop-access-logging \
   --container-name LiveEvents
```

This command produces no output.

For more information, see Disabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.

- For API details, see StopAccessLogging in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To add tags to a container

The following tag-resource example adds tag keys and values to the specified container.

```
aws mediastore tag-resource \
   --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
   --tags '[["Key": "Region", "Value": "West"],{"Key": "Environment", "Value": "Test"}]'
```
This command produces no output.

For more information, see TagResource in the AWS Elemental MediaStore API Reference.
• For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a container

The following untag-resource example removes the specified tag key and its associated value from a container.

```bash
aws mediastore untag-resource \
   --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
   --tag-keys Region
```

This command produces no output.

For more information, see UntagResource in the AWS Elemental MediaStore API Reference.
• For API details, see UntagResource in AWS CLI Command Reference.

Amazon EMR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
### Actions

#### add-instance-fleet

The following code example shows how to use `add-instance-fleet`.

**AWS CLI**

**To add a task instance fleet to a cluster**

This example adds a new task instance fleet to the cluster specified.

**Command:**

```bash
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
  InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='TimeoutDurationMinutes=20,TimeoutAction=TERMINATE_CLUSTER'},InstanceTypeConfigs=['{InstanceType=m3.xlarge,BidPrice=0.5}']
```

**Output:**

```json
{
  "ClusterId": "j-12ABCDEFGHI34JK",
  "InstanceFleetId": "if-23ABCDEFGHI45JJ"
}
```

- For API details, see [AddInstanceFleet](https://docs.aws.amazon.com/cli/latest/reference/emr/add-instance-fleet) in *AWS CLI Command Reference*.

#### add-steps

The following code example shows how to use `add-steps`.

**AWS CLI**

**1. To add Custom JAR steps to a cluster**

**Command:**

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps
  Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,Args=arg1, arg2, arg3
```
Type=CUSTOM_JAR, Name=CustomJAR, ActionOnFailure=CONTINUE, Jar=s3://mybucket/mytest.jar, MainClass=mymainclass, Args=arg1, arg2, arg3

Required parameters:

- Jar

Optional parameters:

- Type, Name, ActionOnFailure, Args

Output:

{  
   "StepIds": [  
      "s-XXXXXXXX",  
      "s-YYYYYYYY"  
   ]
}

2. To add Streaming steps to a cluster

Command:

aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING, Name='Streaming Program', ActionOnFailure=CONTINUE, Args=[-files, s3://elasticmapreduce/samples/wordcount/wordSplitter.py, -mapper, wordSplitter.py, -reducer, aggregate, -input, s3://elasticmapreduce/samples/wordcount/input, -output, s3://mybucket/wordcount/output]

Required parameters:

- Type, Args

Optional parameters:

- Name, ActionOnFailure

JSON equivalent (contents of step.json):

[ ]
NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./step.json
```

Output:

```json
{
    "StepIds": [
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```json
[{
    "Name": "JSON Streaming Step",
    "Type": "STREAMING",
    "ActionOnFailure": "CONTINUE",
    "Args": [
        "-files", "s3://mybucket/mapper.py,s3://mybucket/reducer.py",
        "-mapper",
        "mapper.py",
        "-reducer",
        "reducer.py",
        "-input",
        "s3://mybucket/input",
```
4. To add Hive steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/myhivescript.q,-d,INPUT=s3://mybucket/myhiveinput,-d,OUTPUT=s3://mybucket/myhiveoutput,arg1,arg2]
```

Required parameters:

Type, Args

Actions and scenarios
Optional parameters:

Name, ActionOnFailure

Output:

```
{
    "StepIds": [
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

5. To add Pig steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/mypigscript.pig,-p,INPUT=s3://mybucket/mypiginput,-p,OUTPUT=s3://mybucket/mypigoutput,arg1,arg2]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
    "StepIds": [
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```
6. To add Impala steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXX --steps Type=IMPALA,Name='Impala program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--console-output-path,s3://myimpala/output
```

Required parameters:

- `Type`, `Args`

Optional parameters:

- `Name`, `ActionOnFailure`

Output:

```json
{
   "StepIds": [
      "s-XXXXXXXX",
      "s-YYYYYYYY"
   ]
}
```

- For API details, see [AddSteps](#) in *AWS CLI Command Reference*.

**add-tags**

The following code example shows how to use `add-tags`.

**AWS CLI**

1. To add tags to a cluster

Command:

```bash
aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male address="123 East NW Seattle"
```

Output:
2. To list tags of a cluster

--Command:

```bash
aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
```

Output:

```json
[
  {
    "Value": "male",
    "Key": "sex"
  },
  {
    "Value": "123 East NW Seattle",
    "Key": "address"
  },
  {
    "Value": "John Doe",
    "Key": "name"
  },
  {
    "Value": "29",
    "Key": "age"
  }
]
```

- For API details, see [AddTags](#) in AWS CLI Command Reference.

**create-cluster-examples**

The following code example shows how to use create-cluster-examples.

**AWS CLI**

Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the --use-default-roles parameter when creating your cluster. For more
information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the Amazon EMR Management Guide.

Example 1: To create a cluster

The following create-cluster example creates a simple EMR cluster.

```bash
aws emr create-cluster \
  --release-label emr-5.14.0 \
  --instance-type m4.large \
  --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-groups configuration.

```bash
aws emr create-cluster \
  --release-label emr-5.14.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-fleets configuration, specifying two instance types for each fleet and two EC2 Subnets.

```bash
aws emr create-cluster \
  --release-label emr-5.14.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetIds,['subnet-ab12345c','subnet-de67890f'] \
  --instance-fleets InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=['{InstanceType=m4.large,BidPrice=0.5,WeightedCapacity=3}'] InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=['{InstanceType=m4.large,BidPrice=0.5,WeightedCapacity=5}']
```
Example 4: To create a cluster with default roles

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --use-default-roles \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 5: To create a cluster and specify the applications to install

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \
  --applications Name=Hadoop Name=Hive Name=Pig \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 6: To create a cluster that includes Spark

The following example installs Spark.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --applications Name=Spark \
  --ec2-attributes KeyName=myKey \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID ami-a518e6df.

```
aws emr create-cluster \
```
Example 8: To customize application configurations

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see Configuring Applications in the Amazon EMR Release Guide.

Contents of `configurations.json`:

```json
[
  {
    "Classification": "mapred-site",
    "Properties": {
      "mapred.tasktracker.map.tasks.maximum": 2
    }
  },
  {
    "Classification": "hadoop-env",
    "Properties": {},
    "Configurations": [
      {
        "Classification": "export",
        "Properties": {
          "HADOOP_DATANODE_HEAPSIZE": 2048,
          "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"
        }
      }
    ]
  }
]
```

The following example references `configurations.json` as a local file.

```bash
aws emr create-cluster \
  --configurations file://configurations.json \
  --release-label emr-5.9.0 \
```
---instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
--auto-terminate

The following example references configurations.json as a file in Amazon S3.

aws emr create-cluster \
  --configurations https://s3.amazonaws.com/myBucket/configurations.json \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate

**Example 9: To create a cluster with master, core, and task instance groups**

The following create-cluster example uses --instance-groups to specify the type and number of EC2 instances to use for master, core, and task instance groups.

aws emr create-cluster \
  --release-label emr-5.9.0 \
  --instance-groups
Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1
Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2
Name=Task,InstanceGroupType=TASK,InstanceType=m4.large,InstanceCount=2

**Example 10: To specify that a cluster should terminate after completing all steps**

The following create-cluster example uses --auto-terminate to specify that the cluster should shut down automatically after completing all steps.

aws emr create-cluster \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate

**Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups**

The following create-cluster example creates a cluster with the Amazon EC2 key pair named myKey and a customized instance profile named myProfile. Key pairs are used to
authorize SSH connections to cluster nodes, most often the master node. For more information, see Use an Amazon EC2 Key Pair for SSH Credentials in the Amazon EMR Management Guide.

```bash
aws emr create-cluster \
   --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```bash
aws emr create-cluster \
   --ec2-attributes SubnetId=subnet-xxxxx \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

The following example creates a cluster in the us-east-1b availability zone.

```bash
aws emr create-cluster \
   --ec2-attributes AvailabilityZone=us-east-1b \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-master1,EmrManagedSlaveSecurityGroup=sg-slave1 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.
The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```
aws emr create-cluster
   --release-label emr-5.9.0 \
   --service-role myServiceRole \ 
   --ec2-attributes file://ec2_attributes.json \ 
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large

Contents of ec2_attributes.json:

```json
[
  {
    "SubnetId": "subnet-xxxxx",
    "KeyName": "myKey",
    "InstanceProfile": "myRole",
    "EmrManagedMasterSecurityGroup": "sg-master1",
    "EmrManagedSlaveSecurityGroup": "sg-slave1",
    "ServiceAccessSecurityGroup": "sg-service-access",
    "AdditionalMasterSecurityGroups": ["sg-addMaster1","sg-addMaster2","sg-
                                      addMaster3","sg-addMaster4"],
    "AdditionalSlaveSecurityGroups": ["sg-addSlave1","sg-addSlave2","sg-
                                       addSlave3","sg-addSlave4"]
  }
]
```

Example 12: To enable debugging and specify a log URI

The following create-cluster example uses the --enable-debugging parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The --log-uri parameter is required with --enable-debugging.

```bash
aws emr create-cluster \
   --enable-debugging \
   --log-uri s3://myBucket/myLog \ 
   --release-label emr-5.9.0 \ 
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \ 
   --auto-terminate
```

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following create-cluster example uses the --tags parameter to create three tags for a cluster, one with the
key name name and the value Shirley Rodriguez, a second with the key name age and the value 29, and a third tag with the key name department and the value Analytics.

```bash
aws emr create-cluster \
   --tags name="Shirley Rodriguez" age=29 department="Analytics" \
   --release-label emr-5.32.0 \
   --instance-type m5.xlarge \
   --instance-count 3 \
   --use-default-roles
```

The following example lists the tags applied to a cluster.

```bash
aws emr describe-cluster \
   --cluster-id j-XXXXXXYY \
   --query Cluster.Tags
```

**Example 14: To use a security configuration that enables encryption and other security features**

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```bash
aws emr create-cluster \
   --instance-type m4.large \
   --release-label emr-5.9.0 \
   --security-configuration mySecurityConfiguration
```

**Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups**

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --use-default-roles \
```
The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --use-default-roles \
   --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1, 
   InstanceType=d2.xlarge, 
   EbsConfiguration={EbsOptimized=true, 
   EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100, 
   Iops=100}, VolumesPerInstance=4}], 
   {VolumeSpecification={VolumeType=standard, SizeInGB=50}, VolumesPerInstance=3}]}' \
   --auto-terminate
```

**Example 16: To create a cluster with an automatic scaling policy**

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the Amazon EMR Management Guide.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the CORE instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \
```
The following example uses a JSON file, instancegroupconfig.json, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```bash
aws emr create-cluster \
--release-label emr-5.9.0 \n--service-role EMR_DefaultRole \n--ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \n--instance-groups file://myfolder/instancegroupconfig.json \n--auto-scaling-role EMR_AutoScaling_DefaultRole
```

Contents of instancegroupconfig.json:

```json
[
  {
    "InstanceCount": 1,
    "Name": "MyMasterIG",
    "InstanceGroupType": "MASTER",
    "InstanceType": "m4.large"
  },
  {
    "InstanceCount": 2,
    "Name": "MyCoreIG",
    "InstanceGroupType": "CORE",
    "InstanceType": "m4.large",
    "AutoScalingPolicy": {
      "Constraints": {
        "MinCapacity": 2,
        "MaxCapacity": 10
      },
      "Rules": [
        {
          "Name": "Default-scale-out",
          "Description": "Replicates the default scale-out rule in the console for YARN memory."
        }
      ]
    }
  }
]
```
Example 17: Add custom JAR steps when creating a cluster

The following create-cluster example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using Type=CUSTOM_JAR.

Custom JAR steps require the Jar= parameter, which specifies the path and file name of the JAR. Optional parameters are Type, Name, ActionOnFailure, Args, and MainClass. If main class is not specified, the JAR file should specify Main-Class in its manifest file.

```
aws emr create-cluster \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,Args=arg1,arg2,arg3
```
Example 18: To add streaming steps when creating a cluster

The following create-cluster examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters Type and Args. Streaming steps optional parameters are Name and ActionOnFailure.

The following example specifies the step inline.

```bash
aws emr create-cluster \
  --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output] \
  --release-label emr-5.3.1 \n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n  --auto-terminate
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```bash
aws emr create-cluster \
  --steps file://./multiplefiles.json \n  --release-label emr-5.9.0 \n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n  --auto-terminate
```

Contents of `multiplefiles.json`:

```json
[
  {
```
Example 19: To add Hive steps when creating a cluster

The following example add Hive steps when creating a cluster. Hive steps require parameters Type and Args. Hive steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
  --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs] \
  --applications Name=Hive \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are Type and Args. Pig steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
  --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output]
```
Example 21: To add bootstrap actions

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```bash
aws emr create-cluster
  --bootstrap-actions Path=s3://mybucket/
  myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/
  myscript2,Name=BootstrapAction2,Args=[arg1,arg2]
  --release-label emr-5.3.1
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
  --auto-terminate
```

Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```bash
aws emr create-cluster
  --instance-type m4.large
  --release-label emr-5.9.0
  --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```bash
aws emr create-cluster
  --instance-type m4.large
  --release-label emr-5.9.0
  --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```json
{
```
Example 23: To create a cluster with Kerberos configured

The following create-cluster examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using --kerberos-attributes.

The following command specifies Kerberos attributes for the cluster inline.

```bash
aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --security-configuration mySecurityConfiguration \
  --kerberos-attributes
Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123
```

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```bash
aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --security-configuration mySecurityConfiguration \
  --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```json
{
  "Realm": "EC2.INTERNAL",
  "KdcAdminPassword": "123",
  "CrossRealmTrustPrincipalPassword": "123",
}
```
The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```bash
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n  --managed-scaling-policy ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--log-encryption-kms-key-id` to define KMS key ID utilized for Log encryption.

```bash
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --log-uri s3://myBucket/myLog \
  --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/dd559181-283e-45d7-99d1-66da348c4d33 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--placement-group-configs` configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```bash
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \n  --placement-group-configs InstanceRole=MASTER
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--auto-termination-policy` configuration to place an automatic idle termination threshold for the cluster.

```bash
aws emr create-cluster \
```
The following `create-cluster` example creates an Amazon EMR cluster that uses the `--os-release-label` to define an Amazon Linux release for cluster launch.

```
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \n   --custom-ami-id ami-a518e6df \n   --ebs-root-volume-size 20 \n   --ebs-root-volume-iops 3000 \n   --ebs-root-volume-throughput 125 \n   --release-label emr-6.15.0 \n   --use-default-roles \n   --instance-count 2 \n   --instance-type m4.large
```

Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \n   --custom-ami-id ami-a518e6df \n   --ebs-root-volume-size 20 \n   --ebs-root-volume-iops 3000 \n   --ebs-root-volume-throughput 125 \
   --release-label emr-6.15.0 \
   --use-default-roles \
   --instance-count 2 \
   --instance-type m4.large
```

- For API details, see [CreateClusterExamples](#) in AWS CLI Command Reference.

---

**create-default-roles**

The following code example shows how to use `create-default-roles`.

```
aws emr create-default-roles \
   --release-label emr-5.34.0 \n   --service-role EMR_DefaultRole \n   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \n   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
   InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \n   --auto-termination-policy IdleTimeout=100
```
1. To create the default IAM role for EC2

Command:

```
aws emr create-default-roles
```

Output:

If the role already exists then the command returns nothing.

If the role does not exist then the output will be:

```

create-security-configuration

The following code example shows how to use create-security-configuration.

AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```bash
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption" : true,
        "EnableAtRestEncryption" : true,
        "InTransitEncryptionConfiguration" : {
            "TLSCertificateConfiguration" : {
                "CertificateProviderType" : "PEM",
                "S3Object" : "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration" : {
            "S3EncryptionConfiguration" : {
                "EncryptionMode" : "SSE-S3"
            }
        }
    }
}'
```
"LocalDiskEncryptionConfiguration": {
    "EncryptionKeyProviderType": "AwsKms",
    "AwsKmsKey": ".12345678-1234-1234-1234-123456789012"
}

Output:

{
    "CreationDateTime": 1474070889.129,
    "Name": "MySecurityConfig"
}

JSON equivalent (contents of security_configuration.json):

{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "InTransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            }
        },
        "LocalDiskEncryptionConfiguration": {
            "EncryptionKeyProviderType": "AwsKms",
            "AwsKmsKey": ".12345678-1234-1234-1234-123456789012"
        }
    }
}

Command (using security_configuration.json):
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json

Output:

{
   "CreationDateTime": 1474070889.129,
   "Name": "MySecurityConfig"
}

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

Command:

aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
   "AuthenticationConfiguration": {
      "KerberosConfiguration": {
         "Provider": "ClusterDedicatedKdc",
         "ClusterDedicatedKdcConfiguration": {
            "TicketLifetimeInHours": 24,
            "CrossRealmTrustConfiguration": {
               "Realm": "AD.DOMAIN.COM",
               "Domain": "ad.domain.com",
               "AdminServer": "ad.domain.com",
               "KdcServer": "ad.domain.com"
            }
         }
      }
   }
}'

Output:

{
   "CreationDateTime": 1490225558.982,
   "Name": "MySecurityConfig"
}

JSON equivalent (contents of security_configuration.json):

Actions and scenarios
{  
  "AuthenticationConfiguration": {  
    "KerberosConfiguration": {  
      "Provider": "ClusterDedicatedKdc",
      "ClusterDedicatedKdcConfiguration": {  
        "TicketLifetimeInHours": 24,
        "CrossRealmTrustConfiguration": {  
          "Realm": "AD.DOMAIN.COM",
          "Domain": "ad.domain.com",
          "AdminServer": "ad.domain.com",
          "KdcServer": "ad.domain.com"
        }
      }
    }
  }
}

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json
```

Output:

```
{
  "CreationDateTime": 1490225558.982,
  "Name": "MySecurityConfig"
}
```

- For API details, see [CreateSecurityConfiguration](https://docs.aws.amazon.com/cli/latest/reference/emr/create-security-configuration.html) in [AWS CLI Command Reference](https).

---

**delete-security-configuration**

The following code example shows how to use `delete-security-configuration`.

**AWS CLI**

**To delete a security configuration in the current region**

Command:
aws emr delete-security-configuration --name MySecurityConfig

Output:

None

- For API details, see [DeleteSecurityConfiguration](#) in [AWS CLI Command Reference](#).

describe-cluster

The following code example shows how to use describe-cluster.

**AWS CLI**

**Command:**

```bash
aws emr describe-cluster --cluster-id j-XXXXXXXX
```

**Output:**

For release-label based uniform instance groups cluster:

```json
{
   "Cluster": {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1436475075.199,

The following code example shows how to use `describe-step`.

**AWS CLI**

The following command describes a step with the step ID `s-3LZ0QUT43AM` in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZ0QUT43AM
```

**Output:**

```
{
   "Step": {
      "Status": {
         "Timeline": {
            "EndDateDateTime": 1433200470.481,
            "CreationDateTime": 1433199926.597,
            "StartDateTime": 1433200404.959
         },
         "State": "COMPLETED",
         "StateChangeReason": {}
      },
      "Config": {
         "Args": [
         
```
```json
{
    "Steps": [{
        "Actions": [
            "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
            "--base-path",
            "s3://us-west-2.elasticmapreduce/libs/hive/",
            "--install-hive",
            "--hive-versions",
            "0.13.1"
        ],
        "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-runner.jar",
        "Properties": {}
    }]
}
```

- For API details, see [DescribeStep](https://aws.amazon.com/cli) in [AWS CLI Command Reference](https).

**get**

The following code example shows how to use `get`.

**AWS CLI**

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /home/hadoop-examples.jar --dest ~
```

- For API details, see [Get](https://aws.amazon.com/cli) in [AWS CLI Command Reference](https).

**list-clusters**

The following code example shows how to use `list-clusters`.

**AWS CLI**

The following command lists all active EMR clusters in the current region:
aws emr list-clusters --active

Output:

```
{
   "Clusters": [
   {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1433200405.353,
            "CreationDateTime": 1433199926.596
         },
         "State": "WAITING",
         "StateChangeReason": {
            "Message": "Waiting after step completed"
         }
      },
      "NormalizedInstanceHours": 6,
      "Id": "j-3SD91U2E1L2QX",
      "Name": "my-cluster"
   }
   ]
}
```

- For API details, see [ListClusters](#) in AWS CLI Command Reference.

**list-instance-fleets**

The following code example shows how to use `list-instance-fleets`.

**AWS CLI**

**To get configuration details of instance fleets in a cluster**

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

Output:
"ProvisionedSpotCapacity": 0,
"Name": "MASTER",
"InstanceFleetType": "MASTER",
"ProvisionedOnDemandCapacity": 1,
"InstanceTypeSpecifications": [
{
   "BidPriceAsPercentageOfOnDemandPrice": 100.0,
   "InstanceType": "m3.xlarge",
   "WeightedCapacity": 1
}
],
"Id": "if-2ABC4DEFGHIJ4"
}
]
}

- For API details, see ListInstanceFleets in AWS CLI Command Reference.

**list-instances**

The following code example shows how to use list-instances.

**AWS CLI**

The following command lists all of the instances in a cluster with the cluster ID j-3C6XNQ39VR9WL:

```bash
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

**Output:**

For a uniform instance group based cluster

```json
{
   "Instances": [
   {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1433200400.03,
            "CreationDateTime": 1433199960.152
         },
         "State": "RUNNING",
         "StateChangeReason": {}
      }
   }
]
```
For a fleet based cluster:
{
  "Instances": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1487810810.878,
          "CreationDateTime": 1487810588.367,
          "EndDateTime": 1488022990.924
        },
        "State": "TERMINATED",
        "StateChangeReason": {
          "Message": "Instance was terminated."
        }
      },
      "Ec2InstanceId": "i-xxxxx",
      "InstanceFleetId": "if-xxxxx",
      "EbsVolumes": [],
      "PublicDnsName": "ec2-xx-xxx-xxx-xxx.compute-1.amazonaws.com",
      "InstanceType": "m3.xlarge",
      "PrivateDnsName": "ip-xx-xx-xxx-xx.ec2.internal",
      "Market": "SPOT",
      "PublicIpAddress": "xx.xx.xxx.xxx",
      "Id": "ci-xxxxx",
      "PrivateIpAddress": "10.47.191.80"
    }
  ]
}

• For API details, see ListInstances in AWS CLI Command Reference.

list-security-configurations

The following code example shows how to use list-security-configurations.

AWS CLI

To list security configurations in the current region

Command:

aws emr list-security-configurations
Output:

```json
{
    "SecurityConfigurations": [
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-1"
        },
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-2"
        }
    ]
}
```

- For API details, see `ListSecurityConfigurations` in *AWS CLI Command Reference*.

### list-steps

The following code example shows how to use `list-steps`.

**AWS CLI**

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see `ListSteps` in *AWS CLI Command Reference*.

### modify-cluster-attributes

The following code example shows how to use `modify-cluster-attributes`.

**AWS CLI**

The following command sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users:

```bash
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-users
```
modify-instance-fleet

The following code example shows how to use modify-instance-fleet.

**AWS CLI**

To change the target capacities of an instance fleet

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

• For API details, see ModifyInstanceFleet in AWS CLI Command Reference.

put

The following code example shows how to use put.

**AWS CLI**

The following command uploads a file named healthcheck.sh to the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

• For API details, see Put in AWS CLI Command Reference.

remove-tags

The following code example shows how to use remove-tags.
The following command removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see [RemoveTags](https://docs.aws.amazon.com/cli/latest/reference/emr/remove-tags.html) in *AWS CLI Command Reference*.

### schedule-hbase-backup

The following code example shows how to use `schedule-hbase-backup`.

#### AWS CLI

**Note: This command can only be used with HBase on AMI version 2.x and 3.x**

1. **To schedule a full HBase backup**

   **Command:**

   ```bash
   aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir s3://myBucket/backup --interval 10 --unit hours --start-time 2014-04-21T05:26:10Z --consistent
   ```

   **Output:**

   None

2. **To schedule an incremental HBase backup**

   **Command:**

   ```bash
   aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental --dir s3://myBucket/backup --interval 30 --unit minutes --start-time 2014-04-21T05:26:10Z --consistent
   ```

   **Output:**

   None
• For API details, see ScheduleHbaseBackup in AWS CLI Command Reference.

**socks**

The following code example shows how to use socks.

**AWS CLI**

The following command opens a socks connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

• For API details, see Socks in AWS CLI Command Reference.

**ssh**

The following code example shows how to use ssh.

**AWS CLI**

The following command opens an ssh connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

**Output:**

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

```

```
Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in \texttt{/home/hadoop}. Log files are in \texttt{/mnt/var/log/hadoop}. Check \texttt{/mnt/var/log/hadoop/steps} for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

\begin{itemize}
\item \texttt{ResourceManager} \hspace{1cm} \texttt{lynx \url{http://ip-172-21-11-216:9026/}}
\item \texttt{NameNode} \hspace{1cm} \texttt{lynx \url{http://ip-172-21-11-216:9101/}}
\end{itemize}

For API details, see \texttt{Ssh} in \textit{AWS CLI Command Reference}.

\section*{Amazon EMR on EKS examples using AWS CLI}

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

\textit{Actions} are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

\textit{Scenarios} are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

update-role-trust-policy

The following code example shows how to use update-role-trust-policy.

**AWS CLI**

**To update the trust policy of an IAM Role to be used with Amazon EMR on EKS**

This example command updates the trust policy of a role named `example_iam_role` such that it can be used with Amazon EMR on EKS with `example_namespace` namespace from an EKS cluster named `example_cluster`.

Command:

```
aws emr-containers update-role-trust-policy \
    --cluster example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

Output:

If the trust policy has already been updated, then the output will be:

```
Trust policy statement already exists for role example_iam_role. No changes were made!
```

If the trust policy has not been updated yet, then the output will be:

```
Successfully updated trust policy of role example_iam_role.
```

- For API details, see [UpdateRoleTrustPolicy](https://docs.aws.amazon.com/cli/latest/reference/emr-containers/update-role-trust-policy.html) in AWS CLI Command Reference.

**EventBridge examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

Actions

delete-rule

The following code example shows how to use delete-rule.

AWS CLI

To delete a CloudWatch Events rule

This example deletes the rule named EC2InstanceStateChanges:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see [DeleteRule](#) in [AWS CLI Command Reference](#).

describe-rule

The following code example shows how to use describe-rule.

AWS CLI

To display information about a CloudWatch Events rule

This example displays information about the rule named DailyLambdaFunction:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see [DescribeRule](#) in [AWS CLI Command Reference](#).
disable-rule

The following code example shows how to use disable-rule.

AWS CLI

To disable a CloudWatch Events rule

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

• For API details, see DisableRule in AWS CLI Command Reference.

enable-rule

The following code example shows how to use enable-rule.

AWS CLI

To enable a CloudWatch Events rule

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```
aws events enable-rule --name "DailyLambdaFunction"
```

• For API details, see EnableRule in AWS CLI Command Reference.

list-rule-names-by-target

The following code example shows how to use list-rule-names-by-target.

AWS CLI

To display all the rules that have a specified target

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```
list-rules

The following code example shows how to use list-rules.

AWS CLI

**To display a list of all CloudWatch Events rules**

This example displays all CloudWatch Events rules in the region:

```bash
aws events list-rules
```

**To display a list of CloudWatch Events rules beginning with a certain string.**

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```bash
aws events list-rules --name-prefix "Daily"
```

- For API details, see [ListRules](https://docs.aws.amazon.com/cli/latest/reference/events/list-rules.html) in AWS CLI Command Reference.

list-targets-by-rule

The following code example shows how to use list-targets-by-rule.

AWS CLI

**To display all the targets for a CloudWatch Events rule**

This example displays all the targets of the rule named DailyLambdaFunction:

```bash
aws events list-targets-by-rule --rule "DailyLambdaFunction"
```

- For API details, see [ListTargetsByRule](https://docs.aws.amazon.com/cli/latest/reference/events/list-targets-by-rule.html) in AWS CLI Command Reference.

put-events

The following code example shows how to use put-events.
AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the putevents.json file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the putevents.json file:

```json
[
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ "key1": "value1", "key2": "value2" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  },
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ "key1": "value3", "key2": "value4" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  }
]
```

- For API details, see [PutEvents](#) in *AWS CLI Command Reference*.

**put-rule**

The following code example shows how to use put-rule.

AWS CLI

To create CloudWatch Events rules
This example creates a rule that triggers every day at 9:00am (UTC). If you use `put-targets` to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```bash
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 * * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```bash
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"], "detail": {}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```bash
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"], "detail":{"state": ["stopped", "terminated"]}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

- For API details, see [PutRule](#) in *AWS CLI Command Reference*.

**put-targets**

The following code example shows how to use `put-targets`.

**AWS CLI**

**To add targets for CloudWatch Events rules**

This example adds a Lambda function as the target of a rule:

```bash
aws events put-targets --rule DailyLambdaFunction --targets
  "Id"="1","Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:
This example sets two Amazon Kinesis streams as targets for one rule:

```
aws events put-targets --rule EC2InstanceStateChanges --targets
    "Id"="1","Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

• For API details, see PutTargets in AWS CLI Command Reference.

**remove-targets**

The following code example shows how to use remove-targets.

**AWS CLI**

**To remove a target for an event**

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

• For API details, see RemoveTargets in AWS CLI Command Reference.

**test-event-pattern**

The following code example shows how to use test-event-pattern.

**AWS CLI**

**To check whether an event pattern matches a specified event**

This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```
Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**associate-admin-account**

The following code example shows how to use `associate-admin-account`.

**AWS CLI**

**To set the Firewall Manager administrator account**

The following `associate-admin-account` example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account
    --admin-account 123456789012
```
This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see AssociateAdminAccount in AWS CLI Command Reference.

delete-notification-channel

The following code example shows how to use delete-notification-channel.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following delete-notification-channel example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteNotificationChannel in AWS CLI Command Reference.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a Firewall Manager policy

The following delete-policy example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --delete-all-policy-resources
```

This command produces no output.
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeletePolicy in AWS CLI Command Reference.

**disassociate-admin-account**

The following code example shows how to use disassociate-admin-account.

**AWS CLI**

**To remove the Firewall Manager administrator account**

The following disassociate-admin-account example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DisassociateAdminAccount in AWS CLI Command Reference.

**get-admin-account**

The following code example shows how to use get-admin-account.

**AWS CLI**

**To retrieve the Firewall Manager administrator account**

The following get-admin-account example retrieves the administrator account.

```
aws fms get-admin-account
```

Output:

```
{
   "AdminAccount": "123456789012",
   "RoleStatus": "READY"
}
```
get-compliance-detail

The following code example shows how to use `get-compliance-detail`.

**AWS CLI**

To retrieve the compliance information for an account

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --member-account 123456789012
```

Output:

```
{
  "PolicyComplianceDetail": {
    "EvaluationLimitExceeded": false,
    "IssueInfoMap": {},
    "MemberAccount": "123456789012",
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyOwner": "123456789012",
    "Violators": []
  }
}
```

For more information, see Viewing Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetComplianceDetail in AWS CLI Command Reference.

get-notification-channel

The following code example shows how to use `get-notification-channel`.

For more information, see AWS Firewall Manager Prerequisites in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetAdminAccount in AWS CLI Command Reference.
AWS CLI

To retrieve the SNS topic information for Firewall Manager logs

The following get-notification-channel example retrieves the SNS topic information.

```bash
aws fms get-notification-channel
```

Output:

```
{
    "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetNotificationChannel in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve a Firewall Manager policy

The following get-policy example retrieves the policy with the specified ID.

```bash
aws fms get-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
```
"Type": "SECURITY_GROUPS_COMMON",
  "ManagedServiceData": "{"type":"SECURITY_GROUPS_COMMON",
},
  "ResourceType": "AWS::EC2::Instance",
  "ResourceTags": [],
  "ExcludeResourceTags": false,
  "RemediationEnabled": false
},
  "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-b2e0-7c620422ddc2"
}

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

list-compliance-status

The following code example shows how to use list-compliance-status.

AWS CLI

To retrieve the policy compliance information for member accounts

The following list-compliance-status example retrieves member account compliance information for the specified policy.

aws fms list-compliance-status \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

{
  "PolicyComplianceStatusList": [
    {
      "PolicyOwner": "123456789012",
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "MemberAccount": "123456789012",

```
"EvaluationResults": [
  {
    "ComplianceStatus": "COMPLIANT",
    "ViolatorCount": 0,
    "EvaluationLimitExceeded": false
  },
  {
    "ComplianceStatus": "NON_COMPLIANT",
    "ViolatorCount": 2,
    "EvaluationLimitExceeded": false
  }
],
"LastUpdated": 1576283774.0,
"IssueInfoMap": {}
}

For more information, see View Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListComplianceStatus in AWS CLI Command Reference.

**list-member-accounts**

The following code example shows how to use `list-member-accounts`.

**AWS CLI**

**To retrieve the member accounts in the organization**

The following `list-member-accounts` example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```bash
aws fms list-member-accounts
```

Output:

```json
{
  "MemberAccounts": [
    "222222222222",
    "333333333333",
    "444444444444",
    "555555555555",
    "666666666666",...
  ]
}
```

- For API details, see [ListMemberAccounts](https://docs.aws.amazon.com/cli/latest/reference/fms/list-member-accounts.html) in *AWS CLI Command Reference*.

### list-policies

The following code example shows how to use `list-policies`.

**AWS CLI**

**To retrieve all Firewall Manager policies**

The following `list-policies` example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a `NextToken` that can be used as the value for the `--starting-token` parameter in the next `list-policies` call to get the next set of results for the list.

```
aws fms list-policies \
  --max-items 2
```

Output:

```json
{
  "PolicyList": [
    {
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "ResourceType": "AWS::EC2::Instance",
      "SecurityServiceType": "SECURITY_GROUPS_COMMON",
      "RemediationEnabled": false
    },
    {
      "PolicyId": "457c9b21-fc94-406c-ae63-21217395ba72",
```

Actions and scenarios
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

put-notification-channel

The following code example shows how to use put-notification-channel.

AWS CLI

To set the SNS topic information for Firewall Manager logs

The following put-notification-channel example sets the SNS topic information.

```
aws fms put-notification-channel
   --sns-role-name arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutNotificationChannel in AWS CLI Command Reference.

put-policy

The following code example shows how to use put-policy.

AWS CLI

To create a Firewall Manager policy
The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \
   --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
   "Policy": {
      "PolicyName": "test",
      "SecurityServicePolicyData": {
         "Type": "SECURITY_GROUPS_USAGE_AUDIT",
         "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT", "deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true}"
      },
      "ResourceType": "AWS::EC2::SecurityGroup",
      "ResourceTags": [],
      "ExcludeResourceTags": false,
      "RemediationEnabled": false
   },
   "TagList": [
      {
         "Key": "foo",
         "Value": "foo"
      }
   ]
}
```

Output:

```
{
   "Policy": {
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "PolicyUpdateToken": "1:X9QGexP7HASD1sFp+G31Iw==",
      "SecurityServicePolicyData": {
         "Type": "SECURITY_GROUPS_USAGE_AUDIT",
         "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT", "deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true, "optionalDelayForUnusedInMinutes":null}"
      },
      "ResourceType": "AWS::EC2::SecurityGroup",
```

Actions and scenarios
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutPolicy in AWS CLI Command Reference.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

create-experiment-template

The following code example shows how to use create-experiment-template.

AWS CLI

To create an experiment template
The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
   --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```json
{
   "description": "experimentTemplate",
   "stopConditions": [
      {
         "source": "aws:cloudwatch:alarm",
         "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
      }
   ],
   "targets": {
      "Instances-Target-1": {
         "resourceType": "aws:ec2:instance",
         "resourceArns": [
            "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
         ],
         "selectionMode": "ALL"
      }
   },
   "actions": {
      "reboot": {
         "actionId": "aws:ec2:reboot-instances",
         "description": "reboot",
         "parameters": {},
         "targets": {
            "Instances": "Instances-Target-1"
         }
      }
   },
   "roleArn": "arn:aws:iam::123456789012:role/myRole"
}
```

Output:

```json
{
   "experimentTemplate": {
```
"id": "ABCDE1fgHIjKlmnop",
"description": "experimentTemplate",
"targets": {
   "Instances-Target-1": {
      "resourceType": "aws:ec2:instance",
      "resourceArns": [
         "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c5d78e9012"
      ],
      "selectionMode": "ALL"
   }
},
"actions": {
   "reboot": {
      "actionId": "aws:ec2:reboot-instances",
      "description": "reboot",
      "parameters": {},
      "targets": {
         "Instances": "Instances-Target-1"
      }
   }
},
"stopConditions": [
   {
      "source": "aws:cloudwatch:alarm",

}

For more information, see Create an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see CreateExperimentTemplate in AWS CLI Command Reference.

delete-experiment-template

The following code example shows how to use delete-experiment-template.
AWS CLI

**To delete an experiment template**

The following delete-experiment-template example deletes the specified experiment template.

```bash
aws fis delete-experiment-template \
--id ABCDE1fgHIJkLmNop
```

Output:

```json
{
  "experimentTemplate": {
    "id": "ABCDE1fgHIJkLmNop",
    "description": "myExperimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "testaction": {
        "actionId": "aws:ec2:stop-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616017191.124,
    "lastUpdateTime": 1616017859.607,
    "roleArn": "arn:aws:iam::123456789012:role/FISRole"
  }
}
```
For more information, see [Delete an experiment template](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [DeleteExperimentTemplate](#) in *AWS CLI Command Reference*.

---

### get-action

The following code example shows how to use `get-action`.

**AWS CLI**

**To get action details**

The following `get-action` example gets the details of the specified action.

```bash
aws fis get-action \
  --id aws:ec2:stop-instances
```

**Output:**

```
{
  "action": {
    "id": "aws:ec2:stop-instances",
    "description": "Stop the specified EC2 instances.",
    "parameters": {
      "startInstancesAfterDuration": {
        "description": "The time to wait before restarting the instances (ISO 8601 duration).",
        "required": false
      }
    },
    "targets": {
      "Instances": {
        "resourceType": "aws:ec2:instance"
      }
    },
    "tags": {}
  }
}
```
For more information, see Actions in the AWS Fault Injection Simulator User Guide.

- For API details, see GetAction in AWS CLI Command Reference.

get-experiment-template

The following code example shows how to use get-experiment-template.

**AWS CLI**

**To get experiment template details**

The following get-experiment-template example gets the details of the specified experiment template.

```bash
aws fis get-experiment-template \
--id ABCDE1fgHIJkLnMnop
```

**Output:**

```json
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIJkLnMnop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "testaction": {
            "actionId": "aws:ec2:stop-instances",
            "parameters": {},
            "targets": {
               "Instances": "Instances-Target-1"
            }
         }
      }
   }
}
```
For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.

- For API details, see GetExperimentTemplate in AWS CLI Command Reference.

get-experiment

The following code example shows how to use get-experiment.

AWS CLI

To get experiment details

The following get-experiment example gets the details of the specified experiment.

```
aws fis get-experiment \
--id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
  "experiment": {
    "id": "ABC12DeFGhI3jKLMNOP",
    "experimentTemplateId": "ABCDE1fgHIJkLmNop",
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "state": {
      "status": "completed",
      "reason": "Experiment completed."
    }
  }
}
```
The following code example shows how to use list-actions.

For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see GetExperiment in AWS CLI Command Reference.
AWS CLI

To list actions

The following list-actions example lists the available actions.

```
aws fis list-actions
```

Output:

```json
{
   "actions": [
      {
         "id": "aws:ec2:reboot-instances",
         "description": "Reboot the specified EC2 instances.",
         "targets": {
            "Instances": {
               "resourceType": "aws:ec2:instance"
            }
         },
         "tags": {}                                    
      },
      {
         "id": "aws:ec2:stop-instances",
         "description": "Stop the specified EC2 instances.",
         "targets": {
            "Instances": {
               "resourceType": "aws:ec2:instance"
            }
         },
         "tags": {}                                    
      },
      {
         "id": "aws:ec2:terminate-instances",
         "description": "Terminate the specified EC2 instances.",
         "targets": {
            "Instances": {
               "resourceType": "aws:ec2:instance"
            }
         },
         "tags": {}                                    
      }
   ]
}
```
"id": "aws:ecs:drain-container-instances",
"description": "Drain percentage of underlying EC2 instances on an ECS cluster.",

    "DBInstances": {
        "resourceType": "aws:rds:db"
    }
},
"tags": {}},

{"id": "aws:ssm:send-command",
"description": "Run the specified SSM document.",
"targets": {
    "Instances": {
        "resourceType": "aws:ec2:instance"
    }
},
For more information, see [Actions](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListActions](#) in *AWS CLI Command Reference*.

### list-experiment-templates

The following code example shows how to use `list-experiment-templates`.

#### AWS CLI

**To list experiment templates**

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```bash
aws fis list-experiment-templates
```

**Output:**

```json
{
   "experimentTemplates": [
      {
         "id": "ABCDEfgHIJKlmnop",
         "description": "myExperimentTemplate",
         "creationTime": 1616017191.124,
         "lastUpdateTime": 1616017191.124,
         "tags": {
            "key": "value"
         }
      }
   ]
}
```

For more information, see [Experiment templates](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListExperimentTemplates](#) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
list-experiments

The following code example shows how to use list-experiments.

AWS CLI

To list experiments

The following list-experiments example lists the experiments in your AWS account.

```bash
aws fis list-experiments
```

Output:

```json
{
  "experiments": [
    {
      "id": "ABCdeF1GHiJkLM23NO",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "state": {
        "status": "running",
        "reason": "Experiment is running."
      },
      "creationTime": 1616017341.197,
      "tags": {
        "key": "value"
      }
    }
  ]
}
```

For more information, see Experiments in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperiments in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a resource
The following `list-tags-for-resource` example lists the tags for the specified resource.

```
aws fis list-tags-for-resource \
```

Output:

```
{
    "tags": {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**start-experiment**

The following code example shows how to use `start-experiment`.

**AWS CLI**

**To start an experiment**

The following `start-experiment` example starts the specified experiment.

```
aws fis start-experiment \
    --experiment-template-id ABCDE1fgHIjkmNop
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIjkmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "initiating",
            "reason": "Experiment is initiating."
        }
    }
}
```
stop-experiment

The following code example shows how to use stop-experiment.

For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see StartExperiment in AWS CLI Command Reference.
AWS CLI

To stop an experiment

The following stop-experiment example stops the specified experiment from running.

```
aws fis stop-experiment 
    --id ABC12DeFghI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFghI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "stopping",
            "reason": "Stopping Experiment."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "startAfter": [
                    "wait"
                ],
                "state": {
                    "status": "pending",
                    "reason": "Initial state."
                }
            }
        }
    }
}
```
For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see StopExperiment in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example tags the specified resource.

```bash
aws fis tag-resource
     --tags key1=value1,key2=value2
```
This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

• For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To untag a resource

The following untag-resource example removes the tags from the specified resource.

```
aws fis untag-resource \ 
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

• For API details, see UntagResource in AWS CLI Command Reference.

update-experiment-template

The following code example shows how to use update-experiment-template.

AWS CLI

To update an experiment template

The following update-experiment-template example updates the description of the specified experiment template.

```
aws fis update-experiment-template \ 
   --id ABCDE1fgHIjKlmNop \ 
```
---description myExperimentTemplate

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIkJLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
        "tags": {
            "key": "value"
        }
    }
}
```

For more information, see [Update an experiment template](#) in the [AWS Fault Injection Simulator User Guide](#).
Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-build**

The following code example shows how to use `create-build`.

**AWS CLI**

**Example 1: To create a game build from files in an S3 bucket**

The following `create-build` example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```bash
aws gamelift create-build
   --storage-location file://storage-loc.json
   --name MegaFrogRaceServer.NA
   --build-version 12345.678
```
Contents of storage-loc.json:

```json
{
    "Bucket":"MegaFrogRaceServer_NA_build_files",
    "Key":"MegaFrogRaceServer_build_123.zip",
    "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```json
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "WINDOWS_2012",
        "SizeOnDisk": 479303,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "MegaFrogRaceServer_NA_build_files",
        "Key": "MegaFrogRaceServer_build_123.zip"
    }
}
```

**Example2: To create a game build resource for manually uploading files to GameLift**

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```bash
aws gamelift create-build \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678 \
    --operating-system AMAZON_LINUX
```

Output:
For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/gamelift-upload-custom.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [CreateBuild](https://docs.aws.amazon.com/cli/latest/reference/gamelift/create-build.html) in *AWS CLI Command Reference*.

**create-fleet**

The following code example shows how to use `create-fleet`.

**AWS CLI**

**Example 1: To create a basic Linux fleet**

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
  --name MegaFrogRaceServer.NA.v2 \
```
Example 2: To create a basic Windows fleet

The following create-fleet example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using update-fleet.

```
aws gamelift create-fleet \
   --name MegaFrogRace.NA.v2 \
   --description 'Hosts for v2 North America' \
   --build-id build-2222aaaa-33bb-44cc-55dd-6666eee77ff \
   --certificate-configuration 'CertificateType=GENERATED'
```
Output:

```json
{
  "FleetAttributes": {
    "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eee77ff",
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    },
    "CreationTime": 1496365885.44,
    "Description": "Hosts for v2 North America",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetType": "SPOT",
    "InstanceType": "c4.large",
    "MetricGroups": ["default"],
    "Name": "MegaFrogRace.NA.v2",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
    "Status": "NEW"
  }
}
```

Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
  --name MegaFrogRace.NA.v2 \
  --description 'Hosts for v2 North America' \
  --build-id build-2222aaaa-33bb-44cc-55dd-6666eee77ff \
  --certificate-configuration 'CertificateType=GENERATED' \
  --ec2-instance-type c4.large \
  --ec2-inbound-permissions \
    'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP'
```
--fleet-type SPOT \
--new-game-session-protection-policy FullProtection \
--runtime-configuration file://runtime-config.json \
--metric-groups default \
--instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'

Contents of runtime-config.json:

```
GameSessionActivationTimeoutSeconds=300,
MaxConcurrentGameSessionActivations=2,
ServerProcesses=[
    {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-debug,ConcurrentExecutions=1},
    {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{
    "FleetAttributes": {
        "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
        "Status": "NEW",
        "InstanceType": "c4.large",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Description": "Hosts for v2 North America",
        "FleetType": "SPOT",
        "OperatingSystem": "WINDOWS_2012",
        "Name": "MegaFrogRace.NA.v2",
        "CreationTime": 1569309011.11,
        "MetricGroups": [
            "default"
        ],
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "ServerLaunchParameters": "abc",
        "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\\MegaFrogRace_Server.exe",
        "NewGameSessionProtectionPolicy": "FullProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        }
    }
}
```
Example 4: To create a Realtime Servers fleet

The following create-fleet example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the Init() function located in the script file called MainScript.js. As shown, this file is identified as the launch script in the runtime configuration.

```bash
aws gamelift create-fleet \
   --name MegaFrogRace.NA.realtime \n   --description 'Mega Frog Race Realtime fleet' \n   --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \n   --ec2-instance-type c4.large \n   --fleet-type SPOT \n   --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/MainScript.js,Parameters=+map Winter444,ConcurrentExecutions=5}]
```

Output:

```json
{
   "FleetAttributes": {
      "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "Status": "NEW",
      "CreationTime": 1569310745.212,
      "InstanceType": "c4.large",
      "NewGameSessionProtectionPolicy": "NoProtection",
      "CertificateConfiguration": {
         "CertificateType": "GENERATED"
      },
      "Name": "MegaFrogRace.NA.realtime",
      "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
      "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "FleetType": "SPOT",
      "MetricGroups": [
         "default"
      ],
      "Description": "Mega Frog Race Realtime fleet",
      "CertificateConfigId": "cert-12345678901234567890123456789012",
      "FleetArn": "arn:aws:gamelift:us-west-2:123456789012:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa"
   }
}
```
create-game-session-queue

The following code example shows how to use create-game-session-queue.

AWS CLI

Example1: To set up an ordered game session queue

The following create-game-session-queue example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```bash
aws gamelift create-game-session-queue \
   --name MegaFrogRaceServer-NA \
   --destinations file://destinations.json \
   --timeout-in-seconds 600
```

Contents of destinations.json:

```json
{
   "Destinations": [
      {
         "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      },
      {
         "DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
   ]
}
```

Output:

```json
{
   "GameSessionQueues": [
      {
         "Name": "MegaFrogRaceServer-NA",
```
Example2: To set up a game session queue with player latency policies

The following create-game-session-queue example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```bash
aws gamelift create-game-session-queue \
   --name MegaFrogRaceServer-NA \
   --destinations file://destinations.json \
   --player-latency-policies file://latency-policies.json \
   --timeout-in-seconds 180
```

Contents of destinations.json:

```json
{
   "Destinations": [
      {
         "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      },
      {
         "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
   ]
}
```

Contents of latency-policies.json:

```json
{
   "PlayerLatencyPolicies": [
```

---

Actions and scenarios 3181
Output:

```
{
    "GameSessionQueue": {
        "Name": "MegaFrogRaceServer-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 100,
                "PolicyDurationSeconds": 60
            },
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200
            }
        ],
        "Destinations": [
            {
                "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
            {
                "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            }
        ],
    }
}
```

For more information, see [Create a Queue](https://docs.aws.amazon.com/gamelift/latest/developerguide/queue-create.html) in the *Amazon GameLift Developer Guide*.  

- For API details, see [CreateGameSessionQueue](https://docs.aws.amazon.com/cli/latest/reference/gamelift/create-gamesessionqueue.html) in *AWS CLI Command Reference*.  

**delete-build**  
The following code example shows how to use delete-build.  

**AWS CLI**  
To delete a custom game build
The following delete-build example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see [DeleteBuild](http://awscli.amazonaws.com/clireference/latest/gamelift/DeleteBuild.html) in *AWS CLI Command Reference*.

### delete-fleet

The following code example shows how to use delete-fleet.

**AWS CLI**

**To delete a fleet that is no longer in use**

The following delete-fleet example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Manage GameLift Fleets](http://docs.aws.amazon.com/gamelift/latest/developerguide/manage-fleets.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [DeleteFleet](http://awscli.amazonaws.com/clireference/latest/gamelift/DeleteFleet.html) in *AWS CLI Command Reference*.

### delete-game-session-queue

The following code example shows how to use delete-game-session-queue.

**AWS CLI**

**To delete a game session queue**

The following delete-game-session-queue example deletes a specified game session queue.
aws gamelift delete-game-session-queue \
   --name MegaFrogRace-NA

This command produces no output.

- For API details, see DeleteGameSessionQueue in AWS CLI Command Reference.

describe-build

The following code example shows how to use describe-build.

AWS CLI

To get information on a custom game build

The following describe-build example retrieves properties for a game server build resource.

aws gamelift describe-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

```
{
   "Build": {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "CreationTime": 1496708916.18,
      "Name": "My_Game_Server_Build_One",
      "OperatingSystem": "AMAZON_LINUX",
      "SizeOnDisk": 1304924,
      "Status": "READY",
      "Version": "12345.678"
   }
}
```

For more information, see Upload a Custom Server Build to GameLift in the Amazon GameLift Developer Guide.

- For API details, see DescribeBuild in AWS CLI Command Reference.
describe-ec2-instance-limits

The following code example shows how to use describe-ec2-instance-limits.

AWS CLI

To retrieve service limits for an EC2 instance type

The following describe-ec2-instance-limits example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```bash
aws gamelift describe-ec2-instance-limits \
  --ec2-instance-type m5.large
```

Output:

```
{
    "EC2InstanceLimits": [
        {
            "EC2InstanceType": "m5.large",
            "CurrentInstances": 5,
            "InstanceLimit": 20
        }
    ]
}
```

For more information, see [Choose Computing Resources](https://docs.aws.amazon.com/gamelift/latest/developerguide/choose-computing-resources.html) in the Amazon GameLift Developer Guide.

- For API details, see [DescribeEc2InstanceLimits](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-ec2-instance-limits.html) in AWS CLI Command Reference.

describe-fleet-attributes

The following code example shows how to use describe-fleet-attributes.

AWS CLI

Example1: To view attributes for a list of fleets
The following `describe-fleet-attributes` example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```bash
aws gamelift describe-fleet-attributes \\
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```json
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Fleet Arn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetType": "ON_DEMAND",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-od",
            "CreationTime": 1568836191.995,
            "Status": "ACTIVE",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\game\MegaFrogRace_Server.exe",
            "ServerLaunchParameters": "+gamelift_start_server",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "DISABLED"
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
```
Example 2: To request attributes for all fleets

The following `describe-fleet-attributes` returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
    --limit 1
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

The output includes a NextToken value that you can use when you call the command a second time. Pass the value to the --next-token parameter to specify where to pick up the output.

The following command returns the second result in the output.

```bash
aws gamelift describe-fleet-attributes \
  --limit 1 \
  --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiIjdp7InMiOiIjdWlsZC01NWYxZTZmMSI
```

Repeat until the response doesn't include a NextToken value.

For more information, see Setting Up GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetAttributes in AWS CLI Command Reference.

**describe-fleet-capacity**

The following code example shows how to use describe-fleet-capacity.

**AWS CLI**

To view capacity status for a list of fleets

The following describe-fleet-capacity example retrieves current capacity for two specified fleets.
aws gamelift describe-fleet-capacity \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE222222

Output:

```json
{
   "FleetCapacity": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
         "InstanceType": "c5.large",
         "InstanceCounts": {
            "DESIRED": 10,
            "MINIMUM": 1,
            "MAXIMUM": 20,
            "PENDING": 0,
            "ACTIVE": 10,
            "IDLE": 3,
            "TERMINATING": 0
         }
      },
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE222222",
         "InstanceType": "c5.large",
         "InstanceCounts": {
            "DESIRED": 13,
            "MINIMUM": 1,
            "MAXIMUM": 20,
            "PENDING": 0,
            "ACTIVE": 15,
            "IDLE": 2,
            "TERMINATING": 2
         }
      }
   ]
}
```

For more information, see [GameLift Metrics for Fleets](https://docs.aws.amazon.com/gamelift/latest/developerguide/metrics-fleets.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetCapacity](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-fleet-capacity.html) in *AWS CLI Command Reference*. 

Actions and scenarios 3189
describe-fleet-events

The following code example shows how to use describe-fleet-events.

AWS CLI

To request events for a specified time span

The following describe-fleet-events example displays details of all fleet-related events that occurred during the specified time span.

```bash
aws gamelift describe-fleet-events \
   --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --start-time 1579647600 \
   --end-time 1579649400 \
   --limit 5
```

Output:

```json
{
   "Events": [
      {
         "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",

For more information, see Debug GameLift Fleet Issues in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetEvents in AWS CLI Command Reference.

**describe-fleet-port-settings**

The following code example shows how to use describe-fleet-port-settings.

**AWS CLI**

To view inbound connection permissions for a fleet

The following describe-fleet-port-settings example retrieves connection settings for a specified fleet.

```bash
aws gamelift describe-fleet-port-settings \
   --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```

Output:

```
{
   "InboundPermissions": [
       {
           "FromPort": 33400,
           "ToPort": 33500,
           "IpRange": "0.0.0.0/0",
           "Protocol": "UDP"
       },
       {
           "FromPort": 1900,
           "ToPort": 2000,
           "IpRange": "0.0.0.0/0",
           "Protocol": "TCP"
       }
   ]
}
```
For more information, see [Setting Up GameLift Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetPortSettings](#) in *AWS CLI Command Reference*.

**describe-fleet-utilization**

The following code example shows how to use `describe-fleet-utilization`.

**AWS CLI**

**Example 1: To view usage data for a list of fleets**

The following `describe-fleet-utilization` example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
   "FleetUtilization": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 62,
         "CurrentPlayerSessionCount": 329,
         "MaximumPlayerSessionCount": 1000
      }
   ]
}
```

**Example 2: To request usage data for all fleets**

The following `describe-fleet-utilization` returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```
aws gamelift describe-fleet-utilization \
   --limit 2
```

Output:

```json
```
Call the command a second time, passing the NextToken value as the argument to the \(--next-token\) parameter to see the next two results.

```
aws gamelift describe-fleet-utilization
   --limit 2 \n   --next-token
   eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMSJ9
```

Repeat until the response no longer includes a NextToken value in the output.

For more information, see GameLift Metrics for Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetUtilization in AWS CLI Command Reference.

**describe-game-session-queues**

The following code example shows how to use describe-game-session-queues.

**AWS CLI**

To view game session queues
The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
  --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```
{
  "GameSessionQueues": [{
    "Destinations": [{
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    {
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
  ],
  "Name": "MegaFrogRace-NA",
  "TimeoutInSeconds": 600,
  "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/MegaFrogRace-NA",
  "PlayerLatencyPolicies": [{
    "MaximumIndividualPlayerLatencyMilliseconds": 200
  },
  {
    "MaximumIndividualPlayerLatencyMilliseconds": 100,
    "PolicyDurationSeconds": 60
  }
  ],
  "FilterConfiguration": {
    "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
  },
  "PriorityConfiguration": {
    "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
    "LocationOrder": ["us-west-2", "ap-south-1", "us-east-1"]
  }
},
{
  "Destinations": [{
    "DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
  }
  ],
  "Name": "MegaFrogRace-EU",
  "TimeoutInSeconds": 600,
  "GameSessionQueueArn": "arn:aws:gamelift:eu-west-3::gamesessionqueue/MegaFrogRace-EU",
  "PlayerLatencyPolicies": [{
    "MaximumIndividualPlayerLatencyMilliseconds": 200
  },
  {
    "MaximumIndividualPlayerLatencyMilliseconds": 100,
    "PolicyDurationSeconds": 60
  }
  ],
  "FilterConfiguration": {
    "AllowedLocations": ["eu-west-3", "ap-south-1", "us-east-1"]
  },
  "PriorityConfiguration": {
    "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
    "LocationOrder": ["eu-west-3", "ap-south-1", "us-east-1"]
  }
},
```
For more information, see Using Multi-Region Queues in the Amazon GameLift Developer Guide.

- For API details, see DescribeGameSessionQueues in AWS CLI Command Reference.

**describe-runtime-configuration**

The following code example shows how to use describe-runtime-configuration.

**AWS CLI**

**To request the runtime configuration for a fleet**

The following describe-runtime-configuration example retrieves details about the current runtime configuration for a specified fleet.

```bash
aws gamelift describe-runtime-configuration \\
--fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Output:**

```json
{
   "RuntimeConfiguration": {
      "ServerProcesses": [
         {
            "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
            "Parameters": "+gamelift_start_server",
            "ConcurrentExecutions": 3
         },
         {
            "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
            "Parameters": "+gamelift_start_server +debug",
```
For more information, see Run Multiple Processes on a Fleet in the Amazon GameLift Developer Guide.

- For API details, see DescribeRuntimeConfiguration in AWS CLI Command Reference.

list-builds

The following code example shows how to use list-builds.

AWS CLI

Example1: To get a list of custom game builds

The following list-builds example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, Limit and NextToken, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a NextToken to indicate that more results are available.

```bash
aws gamelift list-builds \
  --limit 2
```

Output:

```json
{
  "Builds": [
    {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "CreationTime": 1495664528.723,
      "Name": "My_Game_Server_Build_One",
      "OperatingSystem": "WINDOWS_2012",
    }
  ]
}
```
You can then call the command again with the \--next-token parameter as follows to see the next two builds.

```bash
aws gamelift list-builds \
    --limit 2 \
    --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM51
```

Repeat until the response doesn't include a NextToken value.

**Example2: To get a list of custom game builds in failure status**

The following list-builds example retrieves properties for all game server builds in the current region that currently have status FAILED.

```bash
aws gamelift list-builds \
    --status FAILED
```

Output:

```json
{
```
For API details, see ListBuilds in AWS CLI Command Reference.

**list-fleets**

The following code example shows how to use list-fleets.

**AWS CLI**

**Example1: To get a list of all fleets in a Region**

The following list-fleets example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a next-token attribute, which indicates that there are more results to retrieve.

```bash
aws gamelift list-fleets \
   --limit 2
```

**Output:**

```json
{
   "FleetIds": [
      "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
   ],
   "NextToken": "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS1jY2FlLTQ3YTctOWI5ZS1iYjFkYTQwMjJEXAMPLE="
}
```
You can pass the NextToken value from the previous response in the next command, as shown here to get the next two results.

```bash
aws gamelift list-fleets \
--limit 2 \
--next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJCJidWlsZEElkIjp7InMiOiIJidWlsZC00NDRlZjQxZSI=
```

**Example2: To get a list of all fleets in a Region with a specific build or script**

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```bash
aws gamelift list-fleets \
--build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
    "FleetIds": [ 
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

- For API details, see [ListFleets](https://docs.aws.amazon.com/cli/latest/reference/gamelift/list-fleets.html) in *AWS CLI Command Reference*.

**request-upload-credentials**

The following code example shows how to use `request-upload-credentials`.

**AWS CLI**

To refresh access credentials for uploading a build
The following `create-build` example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original `CreateBuild` request.

```
aws gamelift request-upload-credentials \
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "StorageLocation": {
    "Bucket": "gamelift-builds-us-west-2",
    "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  },
  "UploadCredentials": {
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "SecretAccessKey": "wJalrXUtнFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
    "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
  }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/upload-custom-build.html) in the Amazon *GameLift* Developer Guide.

- For API details, see RequestUploadCredentials in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/gamelift/request-upload-credentials.html).

### start-fleet-actions

The following code example shows how to use `start-fleet-actions`.

**AWS CLI**

#### To restart fleet automatic scaling activity

The following `start-fleet-actions` example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling `"stop-fleet-actions"`. After starting, the scaling policies immediately begin tracking their respective metrics.

```
aws gamelift start-fleet-actions \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --actions AUTO_SCALING
```
This command produces no output.

• For API details, see StartFleetActions in AWS CLI Command Reference.

**stop-fleet-actions**

The following code example shows how to use stop-fleet-actions.

**AWS CLI**

To stop a fleet's automatic scaling activity

The following stop-fleet-actions example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

```
aws gamelift start-fleet-actions \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --actions AUTO_SCALING
```

This command produces no output.

• For API details, see StopFleetActions in AWS CLI Command Reference.

**update-build**

The following code example shows how to use update-build.

**AWS CLI**

To update a custom game build

The following update-build example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

```
aws gamelift update-build \
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --name MegaFrogRaceServer.NA.east \
  --build-version 12345.east
```

Output:
For more information, see [Update Your Build Files](#) in the [Amazon GameLift Developer Guide](#).

- For API details, see [UpdateBuild](#) in [AWS CLI Command Reference](#).

**update-game-session-queue**

The following code example shows how to use `update-game-session-queue`.

**AWS CLI**

**To update a game session queue configuration**

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
  --name MegaFrogRace-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```json
{
  "Destinations": [
    {
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
    {
      "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
  ]
}
```
Contents of `latency-policies.json`:

```json
{
    "PlayerLatencyPolicies": [
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 200
        },
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 150,
            "PolicyDurationSeconds": 120
        },
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 100,
            "PolicyDurationSeconds": 120
        }
    ]
}
```

Output:

```json
{
    "GameSessionQueue": {
        "Destinations": [
            {
                "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d",
                "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b",
                "DestinationArn": "arn:aws:gamelift:us-east-1::alias/alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
            },
        "Name": "MegaFrogRace-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200,
                "MaximumIndividualPlayerLatencyMilliseconds": 150,
                "PolicyDurationSeconds": 120,
                "PolicyDurationSeconds": 120
            }
        ]
    }
}
```
For more information, see Using Multi-Region Queues in the Amazon GameLift Developer Guide.

- For API details, see UpdateGameSessionQueue in AWS CLI Command Reference.

upload-build

The following code example shows how to use upload-build.

AWS CLI

Example1: To upload a Linux game server build

The following upload-build example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```bash
aws gamelift upload-build \
   --name MegaFrogRaceServer.NA \
   --build-version 2.0.1 \
   --build-root ~/MegaFrogRace_Server/release-na \
   --operating-system AMAZON_LINUX_2 \
   --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Example2: To upload a Windows game server build

The following upload-build example uploads Windows game server build files from a directory to the GameLift service and creates a build record.

```bash
aws gamelift upload-build \
   --name MegaFrogRaceServer.NA \
   --build-version 2.0.1 \
   --build-root C:\MegaFrogRace_Server\release-na \
   --operating-system WINDOWS_2012
```
Output:

Uploading C:\MegaFrogRace_Server\release-na: 16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na: 32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na: 48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na: 64.0 KiB / 74.6 KiB (85.79%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE1111

For more information, see [Upload a Custom Server Build to GameLift](#) in the [Amazon GameLift Developer Guide](#).

- For API details, see [UploadBuild](#) in [AWS CLI Command Reference](#).

### Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**add-custom-routing-endpoints**

The following code example shows how to use add-custom-routing-endpoints.
AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following add-custom-routing-endpoints example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \
  --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
  "EndpointDescriptions": [
    {
      "EndpointId": "subnet-1234567890abcdef0"
    }
  ],
  "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AddCustomRoutingEndpoints in AWS CLI Command Reference.

advertise-byoip-cidr

The following code example shows how to use advertise-byoip-cidr.

AWS CLI

To advertise an address range

The following advertise-byoip-cidr example requests AWS to advertise an address range that you’ve provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
```
--cidr 198.51.100.0/24

Output:

```
{
   "ByoipCidr": {
      "Cidr": "198.51.100.0/24",
      "State": "PENDING_ADVERTISING"
   }
}
```

For more information, see Bring Your Own IP Address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AdvertiseByoipCidr in AWS CLI Command Reference.

allow-custom-routing-traffic

The following code example shows how to use allow-custom-routing-traffic.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following allow-custom-routing-traffic example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
   --endpoint-group-arn \
   arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
   --endpoint-id subnet-abcd123example \
   --destination-addresses "172.31.200.6" "172.31.200.7" \
   --destination-ports 80 81
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.
• For API details, see `AllowCustomRoutingTraffic` in *AWS CLI Command Reference*.

**create-accelerator**

The following code example shows how to use `create-accelerator`.

**AWS CLI**

**To create an accelerator**

The following `create-accelerator` example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
   --name ExampleAccelerator \
   --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
   --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleAccelerator",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ],
      "DnsName": "a12345678901234abcd.awsglobalaccelerator.com",
      "CreatedTime": 1542394847.0,
      "LastModifiedTime": 1542394847.0
   }
}
```
create-custom-routing-accelerator

The following code example shows how to use `create-custom-routing-accelerator`.

AWS CLI

To create a custom routing accelerator

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags Name and Project.

```bash
aws globalaccelerator create-custom-routing-accelerator
    --name ExampleCustomRoutingAccelerator
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```json
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleCustomRoutingAccelerator",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ]
   }
}
```
create-custom-routing-endpoint-group

The following code example shows how to use create-custom-routing-endpoint-group.

AWS CLI

To create an endpoint group for a custom routing accelerator

The following create-custom-routing-endpoint-group example creates an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator create-custom-routing-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-2 \
  --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 80,
                "ToPort": 81,
            }
        ]
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingAccelerator in AWS CLI Command Reference.
For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/ga-gл/latest/devguide/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateCustomRoutingEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/create-custom-routing-endpoint-group.html) in *AWS CLI Command Reference*.

### create-custom-routing-listener

The following code example shows how to use `create-custom-routing-listener`.

**AWS CLI**

To create a listener for a custom routing accelerator

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```bash
aws globalaccelerator create-custom-routing-listener \   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \   --port-ranges FromPort=5000,ToPort=10000
```

**Output:**

```json
{
   "Listener": {
      "PortRange": [
         "FromPort": 5000,
         "ToPort": 10000
      ],
      "ListenerArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234abcdefh/listener/0123vxyz"
   }
}
```
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingListener in AWS CLI Command Reference.

create-endpoint-group

The following code example shows how to use create-endpoint-group.

AWS CLI

To create an endpoint group

The following create-endpoint-group example creates an endpoint group with one endpoint.

```bash
aws globalaccelerator create-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-1 \
  --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100.0,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "i-1234567890abcdef0"
      }
    ],
    "EndpointGroupRegion": "us-east-1"
  }
}```
For more information, see [Endpoint groups in AWS Global Accelerator](#) in the **AWS Global Accelerator Developer Guide**.

- For API details, see [CreateEndpointGroup](#) in **AWS CLI Command Reference**.

### create-listener

The following code example shows how to use `create-listener`.

**AWS CLI**

**To create a listener**

The following `create-listener` example creates a listener with two ports.

```bash
aws globalaccelerator create-listener \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
  --protocol TCP
```

**Output:**

```json
{
  "Listener": {
    "PortRanges": [
      {
        "ToPort": 80,
        "FromPort": 80
      },
      {
        "ToPort": 81,
        "FromPort": 81
      }
    ],
    "ClientAffinity": "NONE",
    "Protocol": "TCP",
    "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234abcdefg/listener/0123vxyz"
}
```
deny-custom-routing-traffic

The following code example shows how to use `deny-custom-routing-traffic`.

**AWS CLI**

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following `deny-custom-routing-traffic` example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful `deny-custom-routing-traffic` call.

```bash
aws globalaccelerator deny-custom-routing-traffic \
  --endpoint-group-arn "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefg/listener/0123vxyz/endpoint-group/ab88888example" \
  --endpoint-id "subnet-abcd123example" \
  --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see [VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globa.../Developer_Guide) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DenyCustomRoutingTraffic](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/deny-custom-routing-traffic.html) in *AWS CLI Command Reference*.

deprovision-byoip-cidr

The following code example shows how to use `deprovision-byoip-cidr`.

**AWS CLI**

To deprovision an address range
The following `deprovision-byoip-cidr` example releases the specified address range that you provisioned to use with your AWS resources.

```bash
aws globalaccelerator deprovision-byoip-cidr \
   --cidr "198.51.100.0/24"
```

Output:

```json
{
   "ByoipCidr": {
       "Cidr": "198.51.100.0/24",
       "State": "PENDING_DEPROVISIONING"
   }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/ga3/latest/userguide/bring-your-own-ip-address.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DeprovisionByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/deprovision-byoip-cidr.html) in *AWS CLI Command Reference*.

### describe-accelerator-attributes

The following code example shows how to use `describe-accelerator-attributes`.

**AWS CLI**

To describe an accelerator's attributes

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```bash
aws globalaccelerator describe-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "AcceleratorAttributes": {
       "FlowLogsEnabled": true
   }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeAcceleratorAttributes in AWS CLI Command Reference.

**describe-accelerator**

The following code example shows how to use describe-accelerator.

**AWS CLI**

**To describe an accelerator**

The following describe-accelerator example retrieves the details about the specified accelerator.

```bash
aws globalaccelerator describe-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
    "Accelerator": {
        "AcceleratorArn":
            "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ]
            }
        ]
    }
}
```
For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/devguide/) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAccelerator](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-accelerators.html) in *AWS CLI Command Reference*.

### describe-custom-routing-accelerator-attributes

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

**AWS CLI**

**To describe a custom routing accelerator's attributes**

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator-attributes 
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "AcceleratorAttributes": {
       "FlowLogsEnabled": false
   }
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/devguide/) in the *AWS Global Accelerator Developer Guide*. 
• For API details, see DescribeCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

describe-custom-routing-accelerator

The following code example shows how to use describe-custom-routing-accelerator.

AWS CLI

To describe a custom routing accelerator

The following describe-custom-routing-accelerator example retrieves the details about the specified custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleCustomRoutingAccelerator",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ],
      "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
      "CreatedTime": 1542394847,
      "LastModifiedTime": 1542395013
   }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingAccelerator in AWS CLI Command Reference.

**describe-custom-routing-endpoint-group**

The following code example shows how to use `describe-custom-routing-endpoint-group`.

**AWS CLI**

To describe an endpoint group for a custom routing accelerator

The following `describe-custom-routing-endpoint-group` example describes an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-endpoint-group \
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

**Output:**

```
{
    "EndpointGroup": {
        "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 5000,
                "ToPort": 10000,
                "Protocols": [
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": [
            {}
        ]
    }
}
```
For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).

### describe-custom-routing-listener

The following code example shows how to use `describe-custom-routing-listener`.

**AWS CLI**

**To describe a listener for a custom routing accelerator**

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-listener \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

**Output:**

```
{
   "Listener": {
       "PortRanges": [
           "FromPort": 5000,
           "ToPort": 10000
       ],
       "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234"
   }
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).
• For API details, see DescribeCustomRoutingListener in AWS CLI Command Reference.

**describe-endpoint-group**

The following code example shows how to use describe-endpoint-group.

### AWS CLI

**To describe an endpoint group**

The following describe-endpoint-group example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```bash
aws globalaccelerator describe-endpoint-group \
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example
```

**Output:**

```json
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100.0,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "i-1234567890abcdef0"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
      }
    ],
    "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abc..."
  }
}
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/gaamelbar/latest/userguide/endpoint_groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/global-accelerator/describe-endpoint-group.html) in *AWS CLI Command Reference*.

**describe-listener**

The following code example shows how to use `describe-listener`.

**AWS CLI**

To describe a listener

The following `describe-listener` example describes a listener.

```bash
code
aws globalaccelerator describe-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
code
{
  "Listener": {
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
    "PortRanges": [
      {
        "FromPort": 80,
        "ToPort": 80
      }
    ],
    "Protocol": "TCP",
    "ClientAffinity": "NONE"
  }
}
```
For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/listeners.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeListener](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-listeners.html) in *AWS CLI Command Reference*.

### list-accelerators

The following code example shows how to use list-accelerators.

#### AWS CLI

**To list your accelerators**

The following `list-accelerators` example lists the accelerators in your AWS account. This account has two accelerators.

```
aws globalaccelerator list-accelerators
```

**Output:**

```json
{
    "Accelerators": [
    {
        "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-abcd-5555EXAMPLE1",
        "Name": "TestAccelerator",
        "IpAddressType": "IPV4",
        "Enabled": true,
        "IpSets": [
            {
                "IpFamily": "IPv4",
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ]
            }
        ],
        "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
        "Status": "DEPLOYED",
        "CreatedTime": 1552424416.0,
        "LastModifiedTime": 1569375641.0
    }
    ]
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListAccelerators in AWS CLI Command Reference.

list-byoip-cidr

The following code example shows how to use list-byoip-cidr.

AWS CLI

To list your address ranges

The following list-byoip-cidr example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

aws globalaccelerator list-byoip-cidrs
Output:

```json
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        },
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

- For API details, see [ListByoipCidr](https://docs.aws.amazon.com/cli/reference/glob加快器/list-byoip-cidr.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/reference/glob加快器/list-byoip-cidr.html).

### list-custom-routing-accelerators

The following code example shows how to use `list-custom-routing-accelerators`.

#### AWS CLI

**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```json
{
    "Accelerators": [
        {
            "AcceleratorArn":
            "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-abcd-5555EXAMPLE1",
            "Name": "TestCustomRoutingAccelerator",
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingAccelerators in AWS CLI Command Reference.
list-custom-routing-endpoint-groups

The following code example shows how to use list-custom-routing-endpoint-groups.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following list-custom-routing-endpoint-groups example lists the endpoint groups for a listener in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-endpoint-groups \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
   "EndpointGroups": [
   {
      "EndpointGroupArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
      "EndpointGroupRegion": "eu-central-1",
      "DestinationDescriptions": [
      {
         "FromPort": 80,
         "ToPort": 80,
         "Protocols": [
            "TCP",
            "UDP"
         ]
      }
   ]
   }]
}
```

**list-custom-routing-listeners**

The following code example shows how to use `list-custom-routing-listeners`.

**AWS CLI**

**To list listeners for custom routing accelerators**

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-listeners \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```json
{
    "Listeners": [
        {
            "ListenerArn":
                "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

list-custom-routing-port-mappings-by-destination

The following code example shows how to use list-custom-routing-port-mappings-by-destination.

AWS CLI

To list the port mappings for a specific custom routing accelerator destination

The following list-custom-routing-port-mappings-by-destination example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \\
   --endpoint-id subnet-abcd123example \\
   --destination-address 198.51.100.52
```

Output:

```
{
   "DestinationPortMappings": [
       {
           "AcceleratorArn": "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-d750-4489-8919-3095f3c4b0a7",
           "AcceleratorSocketAddresses": [
               {
                   "IpAddress": "192.0.2.250",
                   "Port": 65514
               },
               {
                   "IpAddress": "192.10.100.99",
                   "Port": 65514
               }
           ],
           "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefg/listener/0123vxyz/endpoint-group/ab88888example",
           "EndpointId": "subnet-abcd123example",
           "EndpointGroupRegion": "us-west-2",
           "DestinationSocketAddress": {
               "IpAddress": "198.51.100.52",
               "Port": 0
           }
       }
   ]
}
```
For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/cra.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingPortMappingsByDestination](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-custom-routing-port-mappings-by-destination.html) in *AWS CLI Command Reference*.

### list-custom-routing-port-mappings

The following code example shows how to use `list-custom-routing-port-mappings`.

**AWS CLI**

**To list the port mappings in a custom routing accelerator**

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-port-mappings \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```json
{
    "PortMappings": [
        {
            "AcceleratorPort": 40480,
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
                "IpAddress": "192.0.2.250",
                "Port": 80
            }
        }
    ]
}
```
"Protocols": ["TCP", "UDP"],
"DestinationTrafficState": "ALLOW"
}
{
  "AcceleratorPort": 40481,
  "EndpointGroupArn":
  "EndpointId": "subnet-1234567890abcdef0",
  "DestinationSocketAddress": {
    "IpAddress": "192.0.2.251",
    "Port": 80
  },
  "Protocols": ["TCP", "UDP"],
  "DestinationTrafficState": "ALLOW"
}
]

For more information, see How custom routing accelerators work in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingPortMappings in AWS CLI Command Reference.

list-endpoint-groups

The following code example shows how to use list-endpoint-groups.

AWS CLI

To list endpoint groups

The following list-endpoint-groups example lists the endpoint groups for a listener. This listener has two endpoint groups.

aws globalaccelerator --region us-west-2 list-endpoint-groups \
--listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234

Output:

```json
{
    "EndpointGroups": [
        {
            "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 100.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        },
        {
            "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",
            "EndpointGroupRegion": "us-east-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 50.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
    ]
}
```

For more information, see [Endpoint Groups in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/)

- For API details, see [ListEndpointGroups](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-endpoint-groups.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/)

### list-listeners

The following code example shows how to use `list-listeners`. 
AWS CLI

To list listeners

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
   "Listeners": [
       {
           "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
           "PortRanges": [
               {
                   "FromPort": 80,
                   "ToPort": 80
               }
           ],
           "Protocol": "TCP",
           "ClientAffinity": "NONE"
       }
   ]
}
```

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an accelerator
The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```
aws globalaccelerator list-tags-for-resource \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
  "Tags": [
    {
      "Key": "Project",
      "Value": "A123456"
    }
  ]
}
```

For more information, see [Tagging in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/tagging.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-tags-for-resource.html) in *AWS CLI Command Reference*.

---

**provision-byoip-cidr**

The following code example shows how to use `provision-byoip-cidr`.

**AWS CLI**

**To provision an address range**

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```
aws globalaccelerator provision-byoip-cidr \
  --cidr 192.0.2.250/24 \
  --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
}
```
"ByoipCidr": {
  "Cidr": "192.0.2.250/24",
  "State": "PENDING_PROVISIONING"
}
}

For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag an accelerator

The following tag-resource example adds tags Name and Project to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234abcd-1234abcdefgh \
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from an accelerator
The following untag-resource example removes the tags Name and Project from an accelerator.

```
aws globalaccelerator untag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.
- For API details, see UntagResource in AWS CLI Command Reference.

update-accelerator-attributes

The following code example shows how to use update-accelerator-attributes.

AWS CLI

To update an accelerator's attributes

The following update-accelerator-attributes example updates an accelerator to enable flow logs. You must specify the US-West-2 (Oregon) Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```json
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateAcceleratorAttributes](#) in *AWS CLI Command Reference*.

### update-accelerator

The following code example shows how to use `update-accelerator`.

**AWS CLI**

**To update an accelerator**

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the US-West-2 (Oregon) Region to create or update accelerators.

```bash
aws globalaccelerator update-accelerator \
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh \
   --name ExampleAcceleratorNew
```

**Output:**

```json
{
   "Accelerator": {
      "IpAddressType": "IPV4",
      "Name": "ExampleAcceleratorNew",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ]
   }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateAccelerator in AWS CLI Command Reference.

**update-custom-routing-accelerator-attributes**

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

**AWS CLI**

**To update a custom routing accelerator's attributes**

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```bash
aws globalaccelerator update-custom-routing-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
   --flow-logs-enabled \
   --flow-logs-s3-bucket flowlogs-abc \
   --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```json
{
   "AcceleratorAttributes": {
      "FlowLogsEnabled": true
      "FlowLogsS3Bucket": flowlogs-abc
      "FlowLogsS3Prefix": bucketprefix-abc
   }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

**update-custom-routing-accelerator**

The following code example shows how to use update-custom-routing-accelerator.

**AWS CLI**

**To update a custom routing accelerator**

The following update-custom-routing-accelerator example modifies a custom routing accelerator to change the accelerator name.

```bash
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \\
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh \\
   --name ExampleCustomRoutingAcceleratorNew
```

Output:

```json
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleCustomRoutingAcceleratorNew",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ],
      "DnsName": "a1234567890abcdef.awsglobalaccelerator.com"
   }
}
```
For more information, see [Custom routing accelerators in AWS Global Accelerator](#) in the AWS Global Accelerator Developer Guide.

- For API details, see [UpdateCustomRoutingAccelerator](#) in AWS CLI Command Reference.

**update-custom-routing-listener**

The following code example shows how to use `update-custom-routing-listener`.

**AWS CLI**

**To update a listener for a custom routing accelerator**

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=10000,ToPort=20000
```

**Output:**

```
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz",
        "PortRanges": [
            {
                "FromPort": 10000,
                "ToPort": 20000
            }
        ],
        "Protocol": "TCP"
    }
}
```
For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/listeners.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).  

### update-endpoint-group

The following code example shows how to use `update-endpoint-group`.

**AWS CLI**

**To update an endpoint group**

The following `update-endpoint-group` example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```bash
aws globalaccelerator update-endpoint-group
    --endpoint-group-arn
    ab88888example
    --endpoint-configurations
        EndpointId=eipalloc-eip01234567890abc,Weight=128
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz,Weight=128
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs,Weight=128
```

**Output:**

```json
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890qrs"
            }
        ]
    }
}
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/globa...Accelerator Developer Guide).

- For API details, see [UpdateEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/update-end...CLI Command Reference).

**update-listener**

The following code example shows how to use `update-listener`.

**AWS CLI**

**To update a listener**

The following `update-listener` example updates a listener to change the port to 100.

```
aws globalaccelerator update-listener \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
   --port-ranges FromPort=100,ToPort=100
```

**Output:**

```
{
   "Listener": {
      "ListenerArn": \
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz"
   }
}```
withdraw-byoip-cidr

The following code example shows how to use withdraw-byoip-cidr.

**AWS CLI**

**To withdraw an address range**

The following withdraw-byoip-cidr example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```bash
aws globalaccelerator withdraw-byoip-cidr \
   --cidr 192.0.2.250/24
```

**Output:**

```json
{
   "ByoipCidr": {
      "Cidr": "192.0.2.250/24",
      "State": "PENDING_WITHDRAWING"
   }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/bring-your-own-ip-address.html) in the **AWS Global Accelerator Developer Guide**.

- For API details, see [WithdrawByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/withdraw-byoip-cidr.html) in **AWS CLI Command Reference**.

---

**Actions and scenarios**

3244
AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-stop-job-run**

The following code example shows how to use `batch-stop-job-run`.

**AWS CLI**

**To stop job runs**

The following `batch-stop-job-run` example stops a job runs.

```
aws glue batch-stop-job-run \
   --job-name "my-testing-job" \
   --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

**Output:**

```
{
   "SuccessfulSubmissions": [
      {
         "JobName": "my-testing-job",
         "JobRunId": "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
      }
   ]
}
```
For more information, see [Job Runs](https://docs.aws.amazon.com/glue/latest/dg/) in the AWS Glue Developer Guide.

- For API details, see [BatchStopJobRun](https://docs.aws.amazon.com/cli/latest/reference/batch_StopJobRun.html) in AWS CLI Command Reference.

### create-connection

The following code example shows how to use `create-connection`.

#### AWS CLI

**To create a connection for AWS Glue data stores**

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```bash
aws glue create-connection \
  --connection-input '{ \n    "Name":"conn-kafka-custom", \n    "Description":"kafka connection with ssl to custom kafka", \n    "ConnectionType":"KAFKA", \n    "ConnectionProperties":{ \n      "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \n      "KAFKA_SSL_ENABLED":"true", \n      "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \n    }, \n    "PhysicalConnectionRequirements":{ \n```
create-database

The following code example shows how to use create-database.

AWS CLI

To create a database

The following create-database example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \\
    --database-input "{"Name":"tempdb"}" \\
    --profile my_profile \\
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateDatabase in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.

AWS CLI

To create a job to transform data
The following `create-job` example creates a streaming job that runs a script stored in S3.

```bash
aws glue create-job \
   --name my-testing-job \
   --role AWSGlueServiceRoleDefault \
   --command '{ \
      "Name": "gluestreaming", \
      "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/" \
   }' \
   --region us-east-1 \
   --output json \
   --default-arguments '{ \
      "--job-language":"scala", \
      "--class":"GlueApp" \
   }' \
   --profile my-profile \
   --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```scala
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx = "datasource0"]
    // @return: datasource0
  }
}
```
// @inputs: []
val datasource0 = glueContext.getCatalogSource(database = "tempdb",
tableName = "s3-source", redshiftTmpDir = ",", transformationContext =
"datasource0").getDynamicFrame()
  // @type: ApplyMapping
  // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
  ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
  "status", "string")], transformation_ctx = "applymapping1"]
  // @return: applymapping1
  // @inputs: [frame = datasource0]
val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
  "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
  "int"), ("status", "string", "status", "string")), caseSensitive = false,
transformationContext = "applymapping1")
  // @type: SelectFields
  // @args: [paths = ["sensorid", "currenttemperature", "status"],
transformation_ctx = "selectfields2"]
  // @return: selectfields2
  // @inputs: [frame = applymapping1]
val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
  "currenttemperature", "status"), transformationContext = "selectfields2")
  // @type: ResolveChoice
  // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-
s3-sink", transformation_ctx = "resolvechoice3"]
  // @return: resolvechoice3
  // @inputs: [frame = selectfields2]
val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
Some("my-s3-sink"), transformationContext = "resolvechoice3")
  // @type: DataSink
  // @args: [database = "tempdb", table_name = "my-s3-sink",
transformation_ctx = "datasink4"]
  // @return: datasink4
  // @inputs: [frame = resolvechoice3]
val datasink4 = glueContext.getCatalogSink(database = "tempdb",
tableName = "my-s3-sink", redshiftTmpDir = ",", transformationContext =
"datasink4").writeDynamicFrame(resolvechoice3)
  Job.commit()
For more information, see Authoring Jobs in AWS Glue in the AWS Glue Developer Guide.

- For API details, see CreateJob in AWS CLI Command Reference.

create-table

The following code example shows how to use create-table.

AWS CLI

Example 1: To create a table for a Kinesis data stream

The following create-table example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```sh
aws glue create-table \
--database-name tempdb \
--table-input '{"Name":"test-kinesis-input", "StorageDescriptor":{ \n  "Columns":[ \n    {"Name":"sensorid", "Type":"int"}, \n    {"Name":"currenttemperature", "Type":"int"}, \n    {"Name":"status", "Type":"string"}, \n  ], \n  "Location":"my-testing-stream", \n  "Parameters":{ \n    "typeOfData":"kinesis","streamName":"my-testing-stream", \n    "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" \n  }, \n  "SerdeInfo":{ \n    "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe" \n  }, \n  "Parameters":{ \n    "classification":"json" \n  }, \
--profile my-profile \
--endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.
Example 2: To create a table for a Kafka data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```bash
aws glue create-table \
    --database-name tempdb \
    --table-input '{"Name":"test-kafka-input", "StorageDescriptor":{ \
    "Columns":[ \
        {"Name":"sensorid", "Type":"int"}, \
        {"Name":"currenttemperature", "Type":"int"}, \
        {"Name":"status", "Type":"string"} \
    ], \
    "Location":"glue-topic", \
    "Parameters":{ \
        "typeOfData":"kafka","topicName":"glue-topic", \
        "connectionName":"my-kafka-connection" \
    }, \
    "SerdeInfo":{ \n        "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"\n    }, \
    "Parameters":{ \n        "separatorChar":","} \n}', \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

Example 3: To create a table for an AWS S3 data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes an AWS Simple Storage Service (AWS S3) data store.

```bash
aws glue create-table \
    --database-name tempdb \
    --table-input '{"Name":"test-s3-input", "StorageDescriptor":{ \
    "Columns":[ \
        {"Name":"sensorid", "Type":"int"}, \
        {"Name":"currenttemperature", "Type":"int"}, \
        {"Name":"status", "Type":"string"} \
    ], \
    "Location":"s3://my-bucket", \
    "Parameters":{ \
        "typeOfData":"s3","bucketName":"my-bucket", \
        "connectionName":"my-s3-connection" \
    }, \
    "SerdeInfo":{ \n        "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"\n    }, \
    "Parameters":{ \n        "separatorChar":","} \n}', \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```
This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

• For API details, see CreateTable in AWS CLI Command Reference.

delete-job

The following code example shows how to use delete-job.

AWS CLI

To delete a job

The following delete-job example deletes a job that is no longer needed.

```
aws glue delete-job
  --job-name my-testing-job
```

Output:

```
{
  "JobName": "my-testing-job"
}
```
get-databases

The following code example shows how to use get-databases.

AWS CLI

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following get-databases example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```
{
    "DatabaseList": [
        {
            "Name": "default",
            "Description": "Default Hive database",
            "LocationUri": "file:/spark-warehouse",
            "CreateTime": 1602084052.0,
            "CreateTableDefaultPermissions": [
                {
                    "Principal": {

      ]
    }
  ],
  "CatalogId": "111122223333"
}
For more information, see [Defining a Database in Your Data Catalog](https://docs.aws.amazon.com/glue/latest/dg/defining-database.html) in the *AWS Glue Developer Guide*.

- For API details, see [GetDatabases](https://docs.aws.amazon.com/cli/latest/reference/glue/get-databases.html) in *AWS CLI Command Reference*.

### get-job-run

The following code example shows how to use `get-job-run`.

**AWS CLI**

**To get information about a job run**

The following `get-job-run` example retrieves information about a job run.

```
aws glue get-job-run \
  --job-name "Combine legislators data" \
  --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

Output:

```
{
  "JobRun": {
    "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
    "Attempt": 0,
    "JobName": "Combine legislators data",
    "StartedOn": 1602873931.255,
    "LastModifiedOn": 1602874075.985,
    "CompletedOn": 1602874075.985,
    "JobRunState": "SUCCEEDED",
    "Arguments": {
      "--enable-continuous-cloudwatch-log": "true",
      "--enable-metrics": "",
      "--enable-spark-ui": "true",
      "--job-bookmark-option": "job-bookmark-enable",
      "--spark-event-logs-path": "s3://aws-glue-assets-111122223333-us-east-1/sparkHistoryLogs/"
    },
    "PredecessorRuns": [],
    "AllocatedCapacity": 10,
    "ExecutionTime": 117,
    "Timeout": 2880,
    "MaxCapacity": 10.0,
  }
}
```
"WorkerType": "G.1X",
"NumberOfWorkers": 10,
"LogGroupName": "/aws-glue/jobs",
"GlueVersion": "2.0"
}
}

For more information, see Job Runs in the AWS Glue Developer Guide.

- For API details, see GetJobRun in AWS CLI Command Reference.

**get-job-runs**

The following code example shows how to use get-job-runs.

**AWS CLI**

**To get information about all job runs for a job**

The following get-job-runs example retrieves information about job runs for a job.

```
aws glue get-job-runs \
  --job-name "my-testing-job"
```

**Output:**

```
{
  "JobRuns": [
    {
      "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
      "Attempt": 0,

**get-job**

The following code example shows how to use `get-job`.

### AWS CLI

**To retrieve information about a job**

The following `get-job` example retrieves information about a job.

```
aws glue get-job \
```
Output:

```json
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,
        "LastModifiedOn": 1602805698.167,
        "ExecutionProperty": {
            "MaxConcurrentRuns": 1
        },
        "Command": {
            "Name": "gluestreaming",
            "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
            "PythonVersion": "2"
        },
        "DefaultArguments": {
            "--class": "GlueApp",
            "--job-language": "scala"
        },
        "MaxRetries": 0,
        "AllocatedCapacity": 10,
        "MaxCapacity": 10.0,
        "GlueVersion": "1.0"
    }
}
```

For more information, see Jobs in the AWS Glue Developer Guide.

- For API details, see GetJob in AWS CLI Command Reference.

get-plan

The following code example shows how to use get-plan.

AWS CLI

To get the generated code for mapping data from source tables to target tables

The following get-plan retrieves the generated code for mapping columns from the data source to the data target.
aws glue get-plan --mapping '[[
    {
        "SourcePath":"sensorid",
        "SourceTable":"anything",
        "SourceType":"int",
        "TargetPath":"sensorid",
        "TargetTable":"anything",
        "TargetType":"int"
    },
    {
        "SourcePath":"currenttemperature",
        "SourceTable":"anything",
        "SourceType":"int",
        "TargetPath":"currenttemperature",
        "TargetTable":"anything",
        "TargetType":"int"
    },
    {
        "SourcePath":"status",
        "SourceTable":"anything",
        "SourceType":"string",
        "TargetPath":"status",
        "TargetTable":"anything",
        "TargetType":"string"
    }]]'
--source '{
    "DatabaseName":"tempdb",
    "TableName":"s3-source"
}'
--sinks '{[
    {
        "DatabaseName":"tempdb",
        "TableName":"my-s3-sink"
    }]
} --language "scala"
--endpoint https://glue.us-east-1.amazonaws.com
--output "text"

Output:

import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite

    // @return: applymapping1
    // @inputs: [frame = datasource0]
    val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid", "int", "sensorid", "int"),
      ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
      "status", "string")], transformationContext = "applymapping1")
    // @type: SelectFields
    // @args: [paths = ["sensorid", "currenttemperature", "status"],
    transformation_ctx = "selectfields2"]
    // @return: selectfields2
    // @inputs: [frame = applymapping1]
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
      "currenttemperature", "status"), transformationContext = "selectfields2")
    // @type: ResolveChoice
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
  }
}
For more information, see [Editing Scripts in AWS Glue](https://docs.aws.amazon.com/glue/latest/dg/editing-scripts.html) in the [AWS Glue Developer Guide](https://docs.aws.amazon.com/glue/latest/dg/index.html).

### get-tables

The following code example shows how to use `get-tables`.

#### AWS CLI

**To list the definitions of some or all of the tables in the specified database**

The following `get-tables` example returns information about the tables in the specified database.

```bash
aws glue get-tables --database-name 'tempdb'
```

**Output:**

```json
{
  "TableList": [
    {
      "Name": "my-s3-sink",
      "DatabaseName": "tempdb",
      "CreateTime": 1602730539.0,
      "UpdateTime": 1602730539.0,
      "Retention": 0,
    }
  ]
}
```

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see GetTables in AWS CLI Command Reference.

**start-crawler**

The following code example shows how to use start-crawler.

**AWS CLI**

**To start a crawler**

The following start-crawler example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

None
For more information, see Defining Crawlers in the AWS Glue Developer Guide.

- For API details, see StartCrawler in AWS CLI Command Reference.

**start-job-run**

The following code example shows how to use start-job-run.

**AWS CLI**

**To start running a job**

The following start-job-run example starts a job.

```bash
aws glue start-job-run \
  --job-name my-job
```

Output:

```
{
    "JobRunId":
    "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Authoring Jobs in the AWS Glue Developer Guide.

- For API details, see StartJobRun in AWS CLI Command Reference.

**GuardDuty examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

- **Actions**

Actions

**accept-invitation**

The following code example shows how to use `accept-invitation`.

**AWS CLI**

To accept an invitation to become a GuardDuty member account in the current region

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation  
   --detector-id 12abc34d567e8fa901bc2d34eexample 
   --master-id 123456789111 
   --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see [Managing GuardDuty Accounts by Invitation](#) in the GuardDuty User Guide.

- For API details, see [AcceptInvitation](#) in *AWS CLI Command Reference*.

**archive-findings**

The following code example shows how to use `archive-findings`.

**AWS CLI**

To archive findings in the current region

This example shows how to archive findings in the current region.

```
aws guardduty archive-findings  
   --detector-id 12abc34d567e8fa901bc2d34eexample 
   --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```
This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ArchiveFindings in AWS CLI Command Reference.

create-detector

The following code example shows how to use create-detector.

AWS CLI

To enable GuardDuty in the current region

This example shows how to create a new detector, which enables GuardDuty, in the current region:

```bash
aws guardduty create-detector --enable
```

Output:

```json
{
   "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the GuardDuty User Guide.

- For API details, see CreateDetector in AWS CLI Command Reference.

create-filter

The following code example shows how to use create-filter.

AWS CLI

To create a new filter for the current region

This example creates a filter that matches all portscan findings for instance created from a specific image:

```bash
aws guardduty create-filter
```
For more information, see Filtering findings in the GuardDuty User Guide.

For API details, see CreateFilter in AWS CLI Command Reference.

create-ip-set

The following code example shows how to use create-ip-set.

AWS CLI

To create a trusted IP set

The following create-ip-set example creates and activates a trusted IP set in the current region.

```bash
aws guardduty create-ip-set \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --name new-ip-set \
   --format TXT \
   --location s3://AWSDOC-EXAMPLE-BUCKET/customtrustlist.csv \
   --activate
```

Output:

```json
{
   "IpSetId": "d4b9fc952d6912b8f3060768example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.
• For API details, see CreateIpSet in AWS CLI Command Reference.

create-members

The following code example shows how to use create-members.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --account-details AccountId=111122223333,Email=first+member@example.com
   AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see Managing multiple accounts in the GuardDuty User Guide.

• For API details, see CreateMembers in AWS CLI Command Reference.

create-publishing-destination

The following code example shows how to use create-publishing-destination.

AWS CLI

To create a publishing destination to export GuardDuty findings in the current region to.

This example shows how to create a publishing destination for GuardDuty findings.

```
aws guardduty create-publishing-destination \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --destination-type S3 \
```
--destination-properties
  DestinationArn=arn:aws:s3:::yourbucket,KmsKeyArn=arn:aws:kms:us-west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-e1de7example

Output:

```
{
  "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see Exporting findings in the GuardDuty User Guide.

- For API details, see CreatePublishingDestination in AWS CLI Command Reference.

create-sample-findings

The following code example shows how to use create-sample-findings.

AWS CLI

**To create sample GuardDuty findings in the current region.**

This example shows how to create a sample finding of the provided types.

```
aws guardduty create-sample-findings \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see Sample findings in the GuardDuty User Guide.

- For API details, see CreateSampleFindings in AWS CLI Command Reference.

create-threat-intel-set

The following code example shows how to use create-threat-intel-set.

AWS CLI

**To create a new threat intel set in the current region.**

This example shows how to upload a threat intel set to GuardDuty and activate it immediately.
aws guardduty create-threat-intel-set \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --name myThreatSet \
   --format TXT \
   --location s3://EXAMPLEBUCKET/threatlist.csv \
   --activate

Output:

```
{
   "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see [Trusted IP and threat lists](https://docs.aws.amazon.com/guardduty/latest/ug/trusted-ip-threat-lists.html) in the GuardDuty User Guide.

---

decline-invitations

The following code example shows how to use `decline-invitations`.

**AWS CLI**

To *decline an invitation to have GuardDuty managed by another account in the current region*.

This example shows how to decline a membership invitation.

```bash
aws guardduty decline-invitations \
   --account-ids 111122223333
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see [Managing GuardDuty accounts by invitation](https://docs.aws.amazon.com/guardduty/latest/ug/managing-guard-duty-accounts.html) in the GuardDuty User Guide.

- For API details, see [DeclineInvitations](https://docs.aws.amazon.com/cli/latest/reference/guardduty/decline-invitations.html) in AWS CLI Command Reference.
delete-detector

The following code example shows how to use delete-detector.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \
  --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the GuardDuty User Guide. For API details, see DeleteDetector in AWS CLI Command Reference.

delete-filter

The following code example shows how to use delete-filter.

AWS CLI

To delete an existing filter in the current region

This example shows how to create delete a filter.

```
aws guardduty delete-filter \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --filter-name byebyeFilter
```

This command produces no output.

For more information, see Filtering findings in the GuardDuty User Guide. For API details, see DeleteFilter in AWS CLI Command Reference.

disable-organization-admin-account

The following code example shows how to use disable-organization-admin-account.
AWS CLI

To remove an account as the delegated administrator for GuardDuty within your organization

This example shows how to remove an account as the delegated administrator for GuardDuty.

```
aws guardduty disable-organization-admin-account \
   --admin-account-id 111122223333
```

This command produces no output.

For more information, see Managing accounts with AWS organizations in the GuardDuty User Guide.

- For API details, see DisableOrganizationAdminAccount in AWS CLI Command Reference.

**disassociate-from-master-account**

The following code example shows how to use disassociate-from-master-account.

AWS CLI

To disassociate from your current master account in the current region

The following disassociate-from-master-account example disassociates your account from the current GuardDuty master account in the current AWS region.

```
aws guardduty disassociate-from-master-account \
   --detector-id d4b040365221be2b54a6264dceexample
```

This command produces no output.

For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see DisassociateFromMasterAccount in AWS CLI Command Reference.

**get-detector**

The following code example shows how to use get-detector.
AWS CLI

To retrieve details of a specific detector

The following `get-detector` example displays the configurations details of the specified detector.

```bash
aws guardduty get-detector \
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
  "Status": "ENABLED",
  "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
  "Tags": {},
  "FindingPublishingFrequency": "SIX_HOURS",
  "UpdatedAt": "2018-11-07T03:24:22.938Z",
  "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see GetDetector in AWS CLI Command Reference.

get-findings

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```bash
aws guardduty get-findings \
  --detector-id 12abc34d567e8fa901bc2d34eexample \
  --finding-id 1ab92989eaf0e742df4a014d5example
```
Output:

```json
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",
                    "PrincipalId": "AIDACKCEVSQ6C2EXAMPLE",
                    "AccessKeyId": "ASIASZ4SI7REEEXAMPLE"
                }
            },
            "Description": "APIs commonly used to discover the users, groups, policies and permissions in an account, was invoked by IAM principal testuser under unusual circumstances. Such activity is not typically seen from this principal."
        },
        {
            "Service": {
                "Count": 5,

}

For more information, see Findings in the GuardDuty User Guide.

- For API details, see GetFindings in AWS CLI Command Reference.

get-ip-set

The following code example shows how to use get-ip-set.

AWS CLI

To list get details on a specified trusted IP set

The following get-ip-set example shows the status and details of the specified trusted IP set.

```
aws guardduty get-ip-set \
  --detector-id 12abc34d567e8fa901bc2d34eexample \
  --ip-set-id d4b94fc952d6912b8f3060768example
```
Output:

```json
{
   "Status": "ACTIVE",
   "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customlist.csv",
   "Tags": {},
   "Format": "TXT",
   "Name": "test-ip-set"
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [GetIpSet](#) in *AWS CLI Command Reference*.

**get-master-account**

The following code example shows how to use `get-master-account`.

**AWS CLI**

**To retrieve details about your master account in the current region**

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```bash
aws guardduty get-master-account
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```json
{
   "Master": {
      "InvitationId": "04b94d9704854a73f94e061e8example",
      "InvitedAt": "2020-06-09T22:23:04.970Z",
      "RelationshipStatus": "Enabled",
      "AccountId": "123456789111"
   }
}
```
For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see `GetMasterAccount` in AWS CLI Command Reference.

**list-detectors**

The following code example shows how to use `list-detectors`.

**AWS CLI**

*To list the available detectors in the current region*  

The following `list-detectors` example lists the available detectors in your current AWS region.

```bash
aws guardduty list-detectors
```

**Output:**

```json
{
   "DetectorIds": [
      "12abc34d567e8fa901bc2d34eexample"
   ]
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see `ListDetectors` in AWS CLI Command Reference.

**list-findings**

The following code example shows how to use `list-findings`.

**AWS CLI**

*Example 1: To list all findings for the current region*

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.
aws guardduty list-findings
   --detector-id 12abc34d567e8fa901bc2d34eexample
   --sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'

Output:

```
{
   "FindingIds": [
      "04b8ab50fd29c64fc771b232dexample",
      "5ab8ab50fd21373735c826d3aexample",
      "90b93de7aba69107f05bbe60bexample",
      ...
   ]
}
```

For more information, see Findings in the GuardDuty User Guide.

**Example 2: To list findings for the current region matching a specific finding criteria**

The following list-findings example displays a list of all findingIds that match a specified finding type.

aws guardduty list-findings
   --detector-id 12abc34d567e8fa901bc2d34eexample
   --finding-criteria  '{"Criterion":{"type": {"Eq": ["UnauthorizedAccess:EC2/SSHBruteForce"]}}}'}

Output:

```
{
   "FindingIds": [
      "90b93de7aba69107f05bbe60bexample",
      "6eb9430d7023d30774d6f05e3example",
      "2eb91a2d060ac9a21963a5848example",
      "44b8ab50fd2b0039a9e48f570example",
      "9eb8ab4cd2b7e5b66ba4f5e96example",
      "e0b8ab3a38e9b0312cc390ceexample"
   ]
}
```

For more information, see Findings in the GuardDuty User Guide.
Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following list-findings example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```
aws guardduty list-findings \\
  --detector-id 12abc34d567e8fa901bc2d34eexample \\
  --finding-criteria  file://myfile.json
```

Contents of `myfile.json`:

```json
{"Criterion": {
    "resource.accessKeyDetails.userName":{
        "Eq":[
            "testuser"
        ],
    },
    "service.archived": {  
        "Eq": [
            "false"
        ]
    }
}
}
```

Output:

```json
{
    "FindingIds": [
        "1ab92989eaf0e742df4a014d5example"
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.
- For API details, see ListFindings in AWS CLI Command Reference.

list-invitations

The following code example shows how to use list-invitations.
AWS CLI

To list details on your invitations to become a member account in the current region

The following list-invitations example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
  "Invitations": [
    {
      "InvitationId": "d6b94fb03a66ff665f7db8764example",
      "InvitedAt": "2020-06-10T17:56:38.221Z",
      "RelationshipStatus": "Invited",
      "AccountId": "123456789111"
    }
  ]
}
```

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ListInvitations in AWS CLI Command Reference.

list-ip-sets

The following code example shows how to use list-ip-sets.

AWS CLI

To list trusted IP sets in the current region

The following list-ip-sets example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:
For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

• For API details, see ListIpSets in AWS CLI Command Reference.

list-members

The following code example shows how to use list-members.

AWS CLI

To list all members in the current region

The following list-members example lists all member accounts and their details for the current region.

aws guardduty list-members \
   --detector-id 12abc34d567e8fa901bc2d34eexample

Output:

```json
{
   "Members": [
      {
         "RelationshipStatus": "Enabled",
         "InvitedAt": "2020-06-09T22:49:00.910Z",
         "MasterId": "123456789111",
         "DetectorId": "7ab8b2f61b256c87f793f6a86example",
         "UpdatedAt": "2020-06-09T23:08:22.512Z",
         "Email": "your+member@example.com",
         "AccountId": "123456789222"
      }
   ]
}
```
For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see ListMembers in AWS CLI Command Reference.

**update-ip-set**

The following code example shows how to use update-ip-set.

**AWS CLI**

**To update a trusted IP set**

The following update-ip-set example shows how to update the details of a trusted IP set.

```
aws guardduty update-ip-set \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --ip-set-id d4b94fc952d6912b8f3060768example \
   --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/ 
   customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see UpdateIpSet in AWS CLI Command Reference.

**AWS Health examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Actions

describe-affected-entities

The following code example shows how to use describe-affected-entities.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following describe-affected-entities example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```bash
aws health describe-affected-entities \
   --filter "eventArns=arn:aws:health:global::event/BILLING/\n   AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-\n   EXAMPLE11145" \
   --region us-east-1
```

Output:

```json
{
    "entities": [
        {
            "entityArn": "arn:aws:health:global:123456789012:entity/\n            EXAMPLEimSMoULmWHpb",
            "eventArn": "arn:aws:health:global::event/BILLING/\n            AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-\n            EXAMPLE11145",
            "entityValue": "AWS_ACCOUNT",
            "awsAccountId": "123456789012",
            "lastUpdatedTime": 1588356454.08
        }
    ]
}
```

For more information, see Event log in the AWS Health User Guide.

- For API details, see DescribeAffectedEntities in AWS CLI Command Reference.
describe-event-details

The following code example shows how to use describe-event-details.

AWS CLI

To list information about an AWS Health event

The following describe-event-details example lists information about the specified AWS Health event.

```
aws health describe-event-details \
   --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
   --region us-east-1
```

Output:

```json
{
   "successfulSet": [
      {
         "event": {
            "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/EC2/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
            "service": "EC2",
            "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
            "eventTypeCategory": "issue",
            "region": "us-east-1",
            "startTime": 1587462325.096,
            "endTime": 1587464204.774,
            "lastUpdatedTime": 1587464204.865,
            "statusCode": "closed"
         },
         "eventDescription": {
            "latestDescription": "[RESOLVED] Increased API Error Rates and Latencies\n\n[02:45 AM PDT] We are investigating increased API error rates and latencies in the US-EAST-1 Region.\n\n[03:16 AM PDT] Between 2:10 AM and 2:59 AM PDT we experienced increased API error rates and latencies in the US-EAST-1 Region. The issue has been resolved and the service is operating normally."
         }
      }
   ],
   "failedSet": []
}```
For more information, see [Event details pane](#) in the *AWS Health User Guide*.

- For API details, see [DescribeEventDetails](#) in *AWS CLI Command Reference*.

**describe-events**

The following code example shows how to use describe-events.

**AWS CLI**

**Example 1: To list AWS Health events**

The following describe-events example lists recent AWS Health events.

```
aws health describe-events \\
    --region us-east-1
```

Output:

```json
{
    "events": [
        {
            "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/AWS_ECS_OPERATIONAL_ISSUE_KWQPY_EXAMPLE111",
            "service": "ECS",

For more information, see [Getting started with the AWS Personal Health Dashboard](https://docs.aws.amazon.com/health/latest/userguide/getting-started-solutions.html) in the AWS Health User Guide.

**Example 2: To list AWS Health events by service and event status code**

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```
aws health describe-events \
  --filter "services=EC2,eventStatusCodes=closed"
```

Output:

```json
{
  "events": [
    {
      "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
      "service": "EC2",
      "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",

**Actions**

**copy-image-set**

The following code example shows how to use `copy-image-set`.

**AWS CLI**

**Example 1: To copy an image set without a destination.**

The following `copy-image-set` code example makes a duplicate copy of an image set without a destination.

```bash
aws medical-imaging copy-image-set
  --datastore-id 12345678901234567890123456789012
  --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e
  --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" }}'
```

**Output:**

```json
{
  "destinationImageSetProperties": {
```
Example 2: To copy an image set with a destination.

The following `copy-image-set` code example makes a duplicate copy of an image set with a destination.

```
aws medical-imaging copy-image-set \
   --datastore-id 12345678901234567890123456789012 \ 
   --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \ 
   --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" }, \  
"destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5", \  
"latestVersionId": "1"} }'
```

Output:

```
{
   "destinationImageSetProperties": {
      "latestVersionId": "2",  
      "imageSetWorkflowStatus": "COPYING",  
      "updatedAt": 1680042505.135,  
      "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",  
      "imageSetState": "LOCKED",  
      "createdAt": 1680042357.432
   },
   "sourceImageSetProperties": {
      "latestVersionId": "1",  
      "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",  
      "updatedAt": 1680042357.432,  
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",

      "createdAt": 1680027126.436
   },
   "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see [Copying an image set](#) in the [*AWS HealthImaging Developer Guide*](#).

- For API details, see [CopyImageSet](#) in [*AWS CLI Command Reference*](#).

### create-datastore

The following code example shows how to use create-datastore.

**AWS CLI**

**To create a data store**

The following `create-datastore` code example creates a data store with the name `my-datastore`.

```bash
aws medical-imaging create-datastore \
  --datastore-name "my-datastore"
```

**Output:**

```
{
  "datastoreId": "12345678901234567890123456789012",
  "datastoreStatus": "CREATING"
}
```

For more information, see [Creating a data store](#) in the [*AWS HealthImaging Developer Guide*](#).

- For API details, see [CreateDatastore](#) in [*AWS CLI Command Reference*](#).

### delete-datastore

The following code example shows how to use delete-datastore.
AWS CLI

To delete a data store

The following delete-datastore code example deletes a data store.

```bash
aws medical-imaging delete-datastore \
   --datastore-id "12345678901234567890123456789012"
```

Output:

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the AWS HealthImaging Developer Guide.

- For API details, see DeleteDatastore in AWS CLI Command Reference.

delete-image-set

The following code example shows how to use delete-image-set.

AWS CLI

To delete an image set

The following delete-image-set code example deletes an image set.

```bash
aws medical-imaging delete-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```json
{
   "imageSetWorkflowStatus": "DELETING",
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see [Deleting an image set](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [DeleteImageSet](#) in *AWS CLI Command Reference*.

### get-datastore

The following code example shows how to use `get-datastore`.

**AWS CLI**

**To get a data store's properties**

The following `get-datastore` code example gets a data store's properties.

```bash
aws medical-imaging get-datastore \
  --datastore-id 12345678901234567890123456789012
```

Output:

```json
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "datastoreArn": "arn:aws:medical-imaging:us-east-1:123456789012:12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

For more information, see [Getting data store properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDatastore](#) in *AWS CLI Command Reference*.

### get-dicom-import-job

The following code example shows how to use `get-dicom-import-job`.

Actions and scenarios
AWS CLI

To get a dicom import job's properties

The following get-dicom-import-job code example gets a dicom import job's properties.

```
aws medical-imaging get-dicom-import-job \
   --datastore-id "12345678901234567890123456789012" \
   --job-id "09876543210987654321098765432109"
```

Output:

```
{
   "jobProperties": {
      "jobId": "09876543210987654321098765432109",
      "jobName": "my-job",
      "jobStatus": "COMPLETED",
      "datastoreId": "12345678901234567890123456789012",
      "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
      "endedAt": "2022-08-12T11:29:42.285000+00:00",
      "submittedAt": "2022-08-12T11:28:11.152000+00:00",
      "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
      "outputS3Uri": "s3://medical-imaging-output/job_output/12345678901234567890123456789012-DicomImport-09876543210987654321098765432109/"
   }
}
```

For more information, see [Getting import job properties](#) in the AWS HealthImaging Developer Guide.

- For API details, see [GetDICOMImportJob](#) in AWS CLI Command Reference.

**get-image-frame**

The following code example shows how to use get-image-frame.

AWS CLI

To get image set pixel data

The following get-image-frame code example gets an image frame.
get-image-frame

The following code example shows how to use get-image-frame.

AWS CLI

Example 1: To get image frame information

The following get-image-frame code example gets information about an image frame.

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the imageframe.jph file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the AWS HealthImaging Developer Guide.

• For API details, see GetImageFrame in AWS CLI Command Reference.

get-image-set-metadata

The following code example shows how to use get-image-set-metadata.

AWS CLI

Example 1: To get image set metadata without version

The following get-image-set-metadata code example gets metadata for an image set without specifying a version.

Note: outfile is a required parameter

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
    "contentType": "application/json",
```
Example 2: To get image set metadata with version

The following get-image-set-metadata code example gets metadata for an image set with a specified version.

Note: outfile is a required parameter

```bash
aws medical-imaging get-image-set-metadata \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   --version-id 1 \
   studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
   "contentEncoding": "gzip"
}
```

For more information, see [Getting image set metadata](https://docs.aws.amazon.com/health-imaging/latest/DeveloperGuide/Getting-image-set-metadata.html) in the *AWS HealthImaging Developer Guide*.

get-image-set

The following code example shows how to use get-image-set.

AWS CLI

**To get image set properties**

The following get-image-set code example gets the properties for an image set.
aws medical-imaging get-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id 18f88ac7870584f58d56256646b4d92b \
   --version-id 1

Output:

{
   "versionId": "1",
   "imageSetWorkflowStatus": "COPIED",
   "updatedAt": 1680027253.471,
   "imageSetId": "18f88ac7870584f58d56256646b4d92b",
   "imageSetState": "ACTIVE",
   "createdAt": 1679592510.753,
   "datastoreId": "12345678901234567890123456789012"
}

For more information, see Getting image set properties in the AWS HealthImaging Developer Guide.

- For API details, see GetImageSet in AWS CLI Command Reference.

**list-datastores**

The following code example shows how to use list-datastores.

**AWS CLI**

**To list data stores**

The following list-datastores code example lists available data stores.

aws medical-imaging list-datastores

Output:

{
   "datastoreSummaries": [
      {
         "datastoreId": "12345678901234567890123456789012",
         "datastoreState": "ACTIVE",
         "datastoreName": "my-datastore",
         "createdAt": 1679592510.753,
         "updatedAt": 1680027253.471
      }
   ]
}
For more information, see Listing data stores in the AWS HealthImaging Developer Guide.

- For API details, see ListDatastores in AWS CLI Command Reference.

**list-dicom-import-jobs**

The following code example shows how to use list-dicom-import-jobs.

**AWS CLI**

**To list dicom import jobs**

The following list-dicom-import-jobs code example lists dicom import jobs.

```bash
aws medical-imaging list-dicom-import-jobs \
   --datastore-id "12345678901234567890123456789012"
```

**Output:**

```json
{
   "jobSummaries": [
       {
           "jobId": "09876543210987654321098765432109",
           "jobName": "my-job",
           "jobStatus": "COMPLETED",
           "datastoreId": "12345678901234567890123456789012",
           "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
           "endedAt": "2022-08-12T11:21:56.504000+00:00",
           "submittedAt": "2022-08-12T11:20:21.734000+00:00"
       }
   ]
}
```
For more information, see Listing import jobs in the AWS HealthImaging Developer Guide.

- For API details, see ListDICOMImportJobs in AWS CLI Command Reference.

**list-image-set-versions**

The following code example shows how to use list-image-set-versions.

**AWS CLI**

**To list image set versions**

The following `list-image-set-versions` code example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \\
    --datastore-id 12345678901234567890123456789012 \\
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

**Output:**

```json
{
    "imageSetPropertiesList": [
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "4",
            "updatedAt": 1680029436.304,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "3",
            "updatedAt": 1680029163.325,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "2",
            "updatedAt": 1680029163.325,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        }
    ]
}
```
For more information, see [Listing image set versions](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListImageSetVersions](#) in [AWS CLI Command Reference](#).

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**Example 1: To list resource tags for a data store**

The following `list-tags-for-resource` code example lists tags for a data store.

```bash
aws medical-imaging list-tags-for-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012"
```

**Output:**

```json
{
    "tags":{
        "Deployment":"Development"
    }
}
```
Example 2: To list resource tags for an image set

The following `list-tags-for-resource` code example lists tags for an image set.

```bash
aws medical-imaging list-tags-for-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```json
{
   "tags":{
      "Deployment":"Development"
   }
}
```

For more information, see [Tagging resources with AWS HealthImaging](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListTagsForResource](#) in [AWS CLI Command Reference](#).

search-image-sets

The following code example shows how to use `search-image-sets`.

AWS CLI

Example 1: To search image sets with an EQUAL operator

The following `search-image-sets` code example uses the EQUAL operator to search image sets based on a specific value.

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`
Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following search-image-sets code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012
```
--search-criteria file://search-criteria.json

Contents of search-criteria.json

```json
{
  "filters": [{
    "values": [{
      "DICOMStudyDateAndTime": {
        "DICOMStudyDate": "19900101",
        "DICOMStudyTime": "000000"
      }
    },
    {
      "DICOMStudyDateAndTime": {
        "DICOMStudyDate": "20230101",
        "DICOMStudyTime": "000000"
      }
    }
  },
  "operator": "BETWEEN"
}
}
```

Output:

```json
{
  "imageSetsMetadataSummaries": [{
    "imageSetId": "09876543210987654321098765432109",
    "createdAt": "2022-12-06T21:40:59.429000+00:00",
    "version": 1,
    "DICOMTags": {
      "DICOMStudyId": "2011201407",
      "DICOMStudyDate": "19991122",
      "DICOMPatientSex": "F",
      "DICOMStudyInstanceUID": "1.2.840.9999999.84710745.943275268089",
      "DICOMPatientBirthDate": "19201120",
      "DICOMStudyDescription": "UNKNOWN",
      "DICOMPatientId": "SUBJECT08701",
      "DICOMPatientName": "Melissa844 Huel628",
      "DICOMNumberOfStudyRelatedInstances": 1,
      "DICOMStudyTime": "140728",
      "DICOMNumberOfStudyRelatedSeries": 1
    },
    "updatedAt": "2022-12-06T21:40:59.429000+00:00"
  }
},
```

Actions and scenarios 3306
Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide createdAt in example format ("1985-04-12T23:20:50.52Z").

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \ 
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
   "filters": [
      {
         "values": [
            {
               "createdAt": "1985-04-12T23:20:50.52Z"
            },
            {
               "createdAt": "2022-04-12T23:20:50.52Z"
            }
         ],
         "operator": "BETWEEN"
      }
   ]
}
```

Output:

```json
{
   "imageSetsMetadataSummaries": [
      {
         "imageSetId": "09876543210987654321098765432109",
         "createdAt": "2022-12-06T21:40:59.429000+00:00",
         "version": 1,
         "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.9999999.84710745.943275268089",
            ...
         }
      }
   ]
}
```
Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field

The following search-image-sets code example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of search-criteria.json

```
{
   "filters": [{
      "values": [{
         "updatedAt": "2024-03-11T15:00:05.074000-07:00"
      }, {
         "updatedAt": "2024-03-11T16:00:05.074000-07:00"
      }],
      "operator": "BETWEEN"
   }, {
      "values": [{
         "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
      }],
      "operator": "EQUAL"
   }],
   "sort": {
      ...
   }
}
"sortField": "updatedAt",
  "sortOrder": "ASC"
}
}

Output:

{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}

For more information, see Searching image sets in the AWS HealthImaging Developer Guide.

- For API details, see SearchImageSets in AWS CLI Command Reference.

**start-dicom-import-job**

The following code example shows how to use `start-dicom-import-job`.

**AWS CLI**

To start a dicom import job

The following `start-dicom-import-job` code example starts a dicom import job.
aws medical-imaging start-dicom-import-job \
  --job-name "my-job" \
  --datastore-id "12345678901234567890123456789012" \
  --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
  --output-s3-uri "s3://medical-imaging-output/job_output/" \
  --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"

Output:

```
{
  "datastoreId": "12345678901234567890123456789012",
  "jobId": "09876543210987654321098765432109",
  "jobStatus": "SUBMITTED",
  "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

For more information, see Starting an import job in the AWS HealthImaging Developer Guide.

- For API details, see StartDICOMImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**Example 1: To tag a data store**

The following tag-resource code examples tags a data store.

```
aws medical-imaging tag-resource \
  --resource-arn "arn:aws:medical-imaging:us-east-1:12345678901234567890123456789012" \
  --tags '{"Deployment":"Development"}'
```

This command produces no output.

**Example 2: To tag an image set**

The following tag-resource code examples tags an image set.
aws medical-imaging tag-resource \ 
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b" \ 
   --tags '{"Deployment" : "Development"}"

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the AWS HealthImaging Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

**Example 1: To untag a data store**

The following untag-resource code example untags a data store.

aws medical-imaging untag-resource \ 
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012" \ 
   --tag-keys '[:"Deployment"]'

This command produces no output.

**Example 2: To untag an image set**

The following untag-resource code example untags an image set.

aws medical-imaging untag-resource \ 
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b" \ 
   --tag-keys '[:"Deployment"]'

This command produces no output.
For more information, see [Tagging resources with AWS HealthImaging](#) in the [AWS HealthImaging Developer Guide](#).

- For API details, see [UntagResource](#) in [AWS CLI Command Reference](#).

**update-image-set-metadata**

The following code example shows how to use `update-image-set-metadata`.

**AWS CLI**

To insert or update an attribute in image set metadata

The following `update-image-set-metadata` code example inserts or updates an attribute in image set metadata.

```bash
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```json
{
    "DICOMUpdates": {
        "updatableAttributes":
            "eyJTY2hlbWFWZXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVudE5hbWUvYW0iLjMs" 
    }
}
```

Note: `updatableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

```json
{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}}
```

Output:

```json
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",

    "DICOMUpdates": {
        "updatableAttributes":
            "eyJTY2hlbWFWZXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVu" 
    }
}
```
To remove an attribute from image set metadata

The following `update-image-set-metadata` code example removes an attribute from image set metadata.

```
aws medical-imaging update-image-set-metadata \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   --latest-version-id 1 \ 
   --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
   "DICOMUpdates": {
      "removableAttributes":
      "e1NjaGVtYVZlcnNpb246MS4xLFN0dWR5OntESUNPTTp7U3R1ZHlEZXNjcmlwdGlvbjpDSEVTVH19fQo=
   }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string. The key and value must match the attribute to be removed.

{"SchemaVersion":1.1,"Study":{"DICOM":{"StudyDescription":"CHEST"}}}

Output:

```
{
   "latestVersionId": "2",
   "imageSetWorkflowStatus": "UPDATING",
   "updatedAt": 1680042257.908,
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "createdAt": 1680027126.436,
```
To remove an instance from image set metadata

The following `update-image-set-metadata` code example removes an instance from image set metadata.

```bash
aws medical-imaging update-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --latest-version-id 1 \
  --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```json
{
  "DICOMUpdates": {
    "removableAttributes": "ezEuMS4xLjEuMS4xLjEyMzQ1LjEyMzQ1Njc4OTAxMi4xMjMuMTIzNDU2Nzg5MDEyMzQuMTp7SW5zdGFuY2VzOnsxLjEuMS4xLjEuMS4xMjM0NS4xMjM0NTY3ODkwMTIuMTIzLjEyMzQ1Njc4OTAxMjM0LjE6e319fX19fQo="
  }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

```json
{"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1":{"Instances": {}}}
```

Output:

```json
{
  "latestVersionId": "2",
  "imageSetWorkflowStatus": "UPDATING",
  "updatedAt": 1680042257.908,

}
```
HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

create-fhir-datastore

The following code example shows how to use create-fhir-datastore.

AWS CLI

To create a FHIR Data Store.

The following create-fhir-datastore example demonstrates how to create a new Data Store in Amazon HealthLake.

```
aws healthlake create-fhir-datastore \
  --region us-east-1 \
  --datastore-type-version R4 \
  --datastore-type-version R4 
```
--datastore-name "FhirTestDatastore"

Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/fhir",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "CREATING",
   "DatastoreId": "(Datastore ID)"
}
```

For more information, see [Creating and monitoring a FHIR Data Store](https://aws.amazon.com/documentation/healthlake/) in the *Amazon HealthLake Developer Guide*.

- For API details, see [CreateFhirDatastore](https://docs.aws.amazon.com/cli/latest/reference/healthlake/create-fhir-datastore.html) in *AWS CLI Command Reference*.

## delete-fhir-datastore

The following code example shows how to use `delete-fhir-datastore`.

### AWS CLI

**To delete a FHIR Data Store**

The following `delete-fhir-datastore` example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```bash
aws healthlake delete-fhir-datastore \
   --datastore-id (Data Store ID) \ 
   --region us-east-1
```

Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/fhir",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "DELETING",
}
```
"DatastoreId": "(Datastore ID)"
}

For more information, see Creating and monitoring a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the Amazon HealthLake Developer Guide.

- For API details, see DeleteFhirDatastore in AWS CLI Command Reference.

describe-fhir-datastore

The following code example shows how to use describe-fhir-datastore.

AWS CLI

To describe a FHIR Data Store

The following describe-fhir-datastore example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
   --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
   --region us-east-1
```

Output:

```
{
   "DatastoreProperties": {
      "PreloadDataConfig": {
         "PreloadDataType": "SYNTHEA"
      },
      "DatastoreName": "FhirTestDatastore",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
      "DatastoreStatus": "CREATING",
      "DatastoreTypeVersion": "R4",
      "DatastoreId": "(Datastore ID)"
   }
}
```
For more information, see Creating and monitoring a FHIR Data Stores in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirDatastore in AWS CLI Command Reference.

**describe-fhir-export-job**

The following code example shows how to use describe-fhir-export-job.

**AWS CLI**

To describe a FHIR export job

The following describe-fhir-export-job example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```
aws healthlake describe-fhir-export-job \
   --datastore-id (Datastore ID) \
   --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```json
{
   "ExportJobProperties": {
      "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
      "JobStatus": "IN_PROGRESS",
      "JobId": "9009813e9d69ba7cf79bcb3468780f16",
      "SubmitTime": 1609175692.715,
      "OutputDataConfig": {
         "S3Uri": "s3://(Bucket Name)/(Prefix Name)/59593b2d0367ce252b5e66bf5fd6b574-FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"
      },
      "DatastoreId": "(Datastore ID)"
   }
}
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirExportJob in AWS CLI Command Reference.
describe-fhir-import-job

The following code example shows how to use describe-fhir-import-job.

AWS CLI

To describe a FHIR import job

The following describe-fhir-import-job example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```bash
aws healthlake describe-fhir-import-job \
   --datastore-id (Datastore ID) \
   --job-id c145fbb27b192af392f8ce6e7838e34f \
   --region us-east-1
```

Output:

```
{
   "ImportJobProperties": {
      "InputDataConfig": {
         "S3Uri": "s3://(Bucket Name)/(Prefix Name)/" 
         { "arrayitem2": 2 }
      },
      "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
      "JobStatus": "COMPLETED",
      "JobId": "c145fbb27b192af392f8ce6e7838e34f",
      "SubmitTime": 1606272542.161,
      "EndTime": 1606272609.497,
      "DatastoreId": "(Datastore ID)"
   }
}
```

For more information, see [Importing files to a FHIR Data Store](https://docs.aws.amazon.com/amazonhealthlake/latest/developerguide/Importing-and-Streaming-data.html) in the Amazon HealthLake Developer Guide.

- For API details, see [DescribeFhirImportJob](https://docs.aws.amazon.com/cli/latest/reference/healthlake/describe-fhir-import-job.html) in AWS CLI Command Reference.

list-fhir-datastores

The following code example shows how to use list-fhir-datastores.
AWS CLI

To list FHIR Data Stores

The following `list-fhir-datastores` example shows how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```bash
aws healthlake list-fhir-datastores \
   --region us-east-1 \
   --filter DatastoreStatus=ACTIVE
```

Output:

```json
{
   "DatastorePropertiesList": [
   {
      "PreloadDataConfig": {
         "PreloadDataType": "SYNTHEA"
      },
      "DatastoreName": "FhirTestDatastore",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/<Datastore ID>",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/<Datastore ID>/r4/",
      "DatastoreStatus": "ACTIVE",
      "DatastoreTypeVersion": "R4",
      "CreatedAt": 1605574003.209,
      "DatastoreId": "<Datastore ID>",
   },
   {
      "DatastoreName": "Demo",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/<Datastore ID>",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/<Datastore ID>/r4/",
      "DatastoreStatus": "ACTIVE",
      "DatastoreTypeVersion": "R4",
      "CreatedAt": 1603761064.881,
      "DatastoreId": "<Datastore ID>",
   }
   ]
}
```
For more information, see [Creating and monitoring a FHIR Data Store](#) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirDatastores](#) in AWS CLI Command Reference.

### list-fhir-export-jobs

The following code example shows how to use `list-fhir-export-jobs`.

#### AWS CLI

To list all FHIR export jobs

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \
  --datastore-id (Datastore ID) \
  --submitted-before (DATE like 2024-10-13T19:00:00Z)\n  --submitted-after (DATE like 2020-10-13T19:00:00Z )\n  --job-name "FHIR-EXPORT" \
  --job-status SUBMITTED \n  --max-results (Integer between 1 and 500)
```

Output:

```
{
  "ExportJobProperties": {
    "OutputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "JobName": "FHIR-EXPORT",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Datastore ID)"
  }
}
```
For more information, see [Exporting files from a FHIR Data Store](https://docs.aws.amazon.com/healthlake/latest/DeveloperGuide/exporting-files-from-fhir-data-store.html) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirExportJobs](https://docs.aws.amazon.com/cli/latest/reference/healthlake/list-fhir-export-jobs.html) in *AWS CLI Command Reference*.

**list-fhir-import-jobs**

The following code example shows how to use `list-fhir-import-jobs`.

**AWS CLI**

**To list all FHIR import jobs**

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```
aws healthlake list-fhir-import-jobs \
  --datastore-id (Datastore ID) \
  --submitted-before (DATE like 2024-10-13T19:00:00Z) \
  --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
  --job-name "FHIR-IMPORT" \
  --job-status SUBMITTED \
  -max-results (Integer between 1 and 500)
```

Output:

```json
{
  "ImportJobProperties": {
    "OutputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
      "S3Configuration": {
        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
        "KmsKeyId" : "(KmsKey Id)"
      },
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
```
For more information, see Importing files to FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirImportJobs in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a Data Store

The following list-tags-for-resource example lists the tags associated with the specified Data Store:

```bash
aws healthlake list-tags-for-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdde" \
    --region us-east-1
```

Output:

```
{
    "tags": {
        "key": "value",
        "key1": "value1"
    }
}
```

For more information, see Tagging resources in Amazon HealthLake in the Amazon HealthLake Developer Guide.
For API details, see ListTagsForResource in AWS CLI Command Reference.

**start-fhir-export-job**

The following code example shows how to use start-fhir-export-job.

**AWS CLI**

**To start a FHIR export job**

The following start-fhir-export-job example shows how to start a FHIR export job using Amazon HealthLake.

```bash
aws healthlake start-fhir-export-job \
    --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
    --datastore-id (Datastore ID) \
    --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```json
{
    "DatastoreId": "(Datastore ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

For API details, see StartFhirExportJob in AWS CLI Command Reference.

**start-fhir-import-job**

The following code example shows how to use start-fhir-import-job.

**AWS CLI**

**To start a FHIR import job**

The following start-fhir-import-job example shows how to start a FHIR import job using Amazon HealthLake.
aws healthlake start-fhir-import-job \
   --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
   --datastore-id (Datastore ID) \
   --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \
   --region us-east-1

Output:

```
{
   "DatastoreId": "(Datastore ID)",
   "JobStatus": "SUBMITTED",
   "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR Data Store 'https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html in the Amazon HealthLake Developer Guide.

- For API details, see `StartFhirImportJob` in `AWS CLI Command Reference`.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to Data Store**

The following `tag-resource` example shows how to add a tag to a Data Store.

```
aws healthlake tag-resource \
   --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
   --tags '[["Key": "key1", "Value": "value1"]]' \
   --region us-east-1
```

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>' in the Amazon HealthLake Developer Guide.

- For API details, see `TagResource` in `AWS CLI Command Reference`. 
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a Data Store.

The following untag-resource example shows how to remove tags from a Data Store.

```bash
aws healthlake untag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/b91723d65c6fdeb1d26543a49d2ed1fa" \
    --tag-keys ['"key1"]' \
    --region us-east-1
```

This command produces no output.

For more information, see Removing tags from a Data Store in the Amazon HealthLake Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions
**Actions**

**abort-multipart-read-set-upload**

The following code example shows how to use `abort-multipart-read-set-upload`.

**AWS CLI**

**To stop a multipart read set upload**

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```bash
aws omics abort-multipart-read-set-upload \
--sequence-store-id 0123456789 \
--upload-id 1122334455
```

This command produces no output.

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [AbortMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

**accept-share**

The following code example shows how to use `accept-share`.

**AWS CLI**

**To accept a share of analytics store data**

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```bash
aws omics accept-share \
----share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```json
{
   "status": "ACTIVATING"
}
```
For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see AcceptShare in AWS CLI Command Reference.

**batch-delete-read-set**

The following code example shows how to use batch-delete-read-set.

**AWS CLI**

*To delete multiple read sets*

The following batch-delete-read-set example deletes two read sets.

```bash
aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```json
{
    "errors": [
        {
            "code": "",
            "id": "0123456789",
            "message": "The specified readset does not exist."
        }
    ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see BatchDeleteReadSet in AWS CLI Command Reference.

**cancel-annotation-import-job**

The following code example shows how to use cancel-annotation-import-job.

**AWS CLI**

*To cancel an annotation import job*
The following `cancel-annotation-import-job` example cancels an annotation import job with ID `04f57618-xmpl-4fd0-9349-e5a85aefb997`.

```bash
aws omics cancel-annotation-import-job \
  --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see [Omics Analytics](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [CancelAnnotationImportJob](#) in [AWS CLI Command Reference](#).

`cancel-run`

The following code example shows how to use `cancel-run`.

**AWS CLI**

**To cancel a run**

The following `cancel-run` example cancels a run with ID `1234567`.

```bash
aws omics cancel-run \
  --id 1234567
```

For more information, see [Omics Workflows](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [CancelRun](#) in [AWS CLI Command Reference](#).

`cancel-variant-import-job`

The following code example shows how to use `cancel-variant-import-job`.

**AWS CLI**

**To cancel a variant import job**

The following `cancel-variant-import-job` example cancels a variant import job with ID `69cb65d6-xmpl-4a4a-9025-4565794b684e`.

```bash
aws omics cancel-variant-import-job \
  --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see [Omics Analytics](#) in the [Amazon Omics Developer Guide](#).
complete-multipart-read-set-upload

The following code example shows how to use complete-multipart-read-set-upload.

AWS CLI

To conclude a multipart upload once you have uploaded all of the components.

The following complete-multipart-read-set-upload example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload
   --sequence-store-id 0123456789
   --upload-id 1122334455
   --parts '[["checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/Vobh5zBDb4W4","partNumber":1,"partSource":"SOURCE1"]]'
```

Output:

```
{
   "readSetId": "0000000001"
   "readSetId": "0000000002"
   "readSetId": "0000000003"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

create-annotation-store-version

The following code example shows how to use create-annotation-store-version.

AWS CLI

To create a new version of an annotation store

The following create-annotation-store-version example creates a new version of an annotation store.
aws omics create-annotation-store-version \
  --name my_annotation_store \
  --version-name my_version

Output:

```
{
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "id": "3b93cdef69d2",
    "name": "my_annotation_store",
    "reference": {
    },
    "status": "CREATING",
    "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see CreateAnnotationStoreVersion in AWS CLI Command Reference.

create-annotation-store

The following code example shows how to use create-annotation-store.

AWS CLI

**Example 1: To create a VCF annotation store**

The following create-annotation-store example creates a VCF format annotation store.

```
aws omics create-annotation-store \
  --name my_ann_store \
  --store-format VCF \
```

Output:

```
{
```
```
Example 2: To create a TSV annotation store

The following create-annotation-store example creates a TSV format annotation store.

```
aws omics create-annotation-store \
   --name tsv_ann_store \
   --store-format TSV \
   --store-options file://tsv-store-options.json
```

`tsv-store-options.json` configures format options for annotations.

```json
{
   "tsvStoreOptions": {
      "annotationType": "CHR_START_END_ZERO_BASE",
      "formatToHeader": {
         "CHR": "chromosome",
         "START": "start",
         "END": "end"
      },
      "schema": [
         {
            "chromosome": "STRING"
         },
         {
            "start": "LONG"
         },
         {
            "end": "LONG"
         }
      ]
   }
}
```
Output:

```json
{
    "creationTime": "2022-11-30T01:28:08.525586Z",
    "id": "861cxml96b0",
    "name": "tsv_ann_store",
    "reference": {
    },
    "status": "CREATING",
    "storeFormat": "TSV",
    "storeOptions": {
        "tsvStoreOptions": {
            "annotationType": "CHR_START_END_ZERO_BASE",
            "formatToHeader": {
                "CHR": "chromosome",
                "END": "end",
                "START": "start"
            },
            "schema": [
                {
                    "chromosome": "STRING"
                },
                {
                    "start": "LONG"
                },
                {
                    "end": "LONG"
                },
                {
                    "name": "STRING"
                }
            ]
        }
    }
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

• For API details, see CreateAnnotationStore in AWS CLI Command Reference.

create-multipart-read-set-upload

The following code example shows how to use create-multipart-read-set-upload.

AWS CLI

To begin a multipart read set upload.

The following create-multipart-read-set-upload example initiates a multipart read set upload.

```bash
aws omics create-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --name HG00146 \
   --source-file-type FASTQ \
   --subject-id mySubject\n   --sample-id mySample\n   --description "FASTQ for HG00146"\n   --generated-from "1000 Genomes"
```

Output:

```json
{
   "description": "FASTQ for HG00146",
   "generatedFrom": "1000 Genomes",
   "name": "HG00146",
   "sampleId": "mySample",
   "sequenceStoreId": "0123456789",
   "sourceFileType": "FASTQ",
   "subjectId": "mySubject",
   "uploadId": "1122334455"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

• For API details, see CreateMultipartReadSetUpload in AWS CLI Command Reference.
create-reference-store

The following code example shows how to use create-reference-store.

AWS CLI

To create a reference store

The following create-reference-store example creates a reference store my-ref-store.

```bash
aws omics create-reference-store \
   --name my-ref-store
```

Output:

```
{
   "id": "1234567890",
   "name": "my-ref-store"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see CreateReferenceStore in AWS CLI Command Reference.

create-run-group

The following code example shows how to use create-run-group.

AWS CLI

To create a run group

The following create-run-group example creates a run group named cram-converter.

```bash
aws omics create-run-group \
   --name cram-converter \
   --max-cpus 20 \
   --max-duration 600
```
Output:

```
{
   "id": "1234567",
   "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateRunGroup in AWS CLI Command Reference.

create-sequence-store

The following code example shows how to use create-sequence-store.

**AWS CLI**

**To create a sequence store**

The following create-sequence-store example creates a sequence store.

```
aws omics create-sequence-store \\
   --name my-seq-store
```

Output:

```
{
   "creationTime": "2022-11-23T01:24:33.629Z",
   "id": "1234567890",
   "name": "my-seq-store"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see CreateSequenceStore in AWS CLI Command Reference.

create-share

The following code example shows how to use create-share.
AWS CLI

To create a share of a HealthOmics analytics store

The following create-share example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```bash
aws omics create-share \
    --principal-subscriber "123456789012" \
    --name "my_Share-123"
```

Output:

```json
{
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
    "name": "my_Share-123",
    "status": "PENDING"
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateShare](#) in *AWS CLI Command Reference*.

create-variant-store

The following code example shows how to use create-variant-store.

AWS CLI

To create a variant store

The following create-variant-store example creates a variant store named `my_var_store`.

```bash
aws omics create-variant-store \
    --name my_var_store \
```

Output:
create-workflow

The following code example shows how to use create-workflow.

AWS CLI

To create a workflow

The following create-workflow example creates a WDL workflow.

```bash
aws omics create-workflow \
  --name cram-converter \
  --engine WDL \
  --definition-zip fileb://workflow-crambam.zip \
  --parameter-template file://workflow-params.json
```

workflow-crambam.zip is a ZIP archive containing a workflow definition. workflow-params.json defines runtime parameters for the workflow.

```json
{
  "ref_fasta" : {
    "description": "Reference genome fasta file",
    "optional": false
  },
  "ref_fasta_index" : {
    "description": "Index of the reference genome fasta file",
  }
}
```
Output:

```
{
    "id": "1234567",
    "status": "CREATING",
    "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateWorkflow in AWS CLI Command Reference.

### delete-annotation-store-versions

The following code example shows how to use delete-annotation-store-versions.

**AWS CLI**

**To delete an annotation store version**

The following delete-annotation-store-versions example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
   --name my_annotation_store \
```
--versions my_version

Output:

{
    "errors": []
}

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see DeleteAnnotationStoreVersions in AWS CLI Command Reference.

delete-annotation-store

The following code example shows how to use delete-annotation-store.

**AWS CLI**

**To delete an annotation store**

The following delete-annotation-store example deletes an annotation store named my_vcf_store.

```
aws omics delete-annotation-store \
   --name my_vcf_store
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteAnnotationStore in AWS CLI Command Reference.

delete-reference-store

The following code example shows how to use delete-reference-store.
AWS CLI

To delete a reference store

The following `delete-reference-store` example deletes a reference store with ID `1234567890`.

```
aws omics delete-reference-store \
    --id 1234567890
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developer-guide/omics-storage.html) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReferenceStore](https://docs.aws.amazon.com/cli/latest/reference/omics/delete-reference-store.html) in *AWS CLI Command Reference*.

delete-reference

The following code example shows how to use `delete-reference`.

AWS CLI

To delete a reference

The following `delete-reference` example deletes a reference.

```
aws omics delete-reference \
    --reference-store-id 1234567890 \
    --id 1234567890
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developer-guide/omics-storage.html) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReference](https://docs.aws.amazon.com/cli/latest/reference/omics/delete-reference.html) in *AWS CLI Command Reference*.

delete-run-group

The following code example shows how to use `delete-run-group`.

AWS CLI

To delete a run group

The following `delete-run-group` example deletes a run group with ID `1234567`.
aws omics delete-run-group \
   --id 1234567

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see DeleteRunGroup in AWS CLI Command Reference.

delete-run

The following code example shows how to use delete-run.

AWS CLI

To delete a workflow run

The following delete-run example deletes a run with ID 1234567.

aws omics delete-run \
   --id 1234567

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
• For API details, see DeleteRun in AWS CLI Command Reference.

delete-sequence-store

The following code example shows how to use delete-sequence-store.

AWS CLI

To delete a sequence store

The following delete-sequence-store example deletes a sequence store with ID 1234567890.

aws omics delete-sequence-store \
   --id 1234567890

For more information, see Omics Storage in the Amazon Omics Developer Guide.
• For API details, see DeleteSequenceStore in AWS CLI Command Reference.
delete-share

The following code example shows how to use delete-share.

AWS CLI

To delete a share of HealthOmics analytics data

The following delete-share example deletes a cross-account share of analytics data.

```bash
aws omics delete-share \
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```json
{
  "status": "DELETING"
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see DeleteShare in AWS CLI Command Reference.

delete-variant-store

The following code example shows how to use delete-variant-store.

AWS CLI

To delete a variant store

The following delete-variant-store example deletes a variant store named my_var_store.

```bash
aws omics delete-variant-store \
  --name my_var_store
```

Output:

```json
{
  "status": "DELETING"
}
```
For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteVariantStore](#) in *AWS CLI Command Reference*.

**delete-workflow**

The following code example shows how to use `delete-workflow`.

### AWS CLI

**To delete a workflow**

The following `delete-workflow` example deletes a workflow with ID 1234567.

```bash
aws omics delete-workflow \
--id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteWorkflow](#) in *AWS CLI Command Reference*.

**get-annotation-import-job**

The following code example shows how to use `get-annotation-import-job`.

### AWS CLI

**To view an annotation import job**

The following `get-annotation-import-job` example gets details about an annotation import job.

```bash
aws omics get-annotation-import-job \
--job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

**Output:**

```json
{
    "creationTime": "2022-11-30T01:40:11.017746Z",
```
"destinationName": "tsv_ann_store",
"id": "984162c7-xmpl-4d23-ab47-286f7950bfbf",
"items": [
  {
    "jobStatus": "COMPLETED",
    "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
  }
],
"roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
"runLeftNormalization": false,
"status": "COMPLETED",
"updateTime": "2022-11-30T01:42:39.134009Z"
}

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetAnnotationImportJob in AWS CLI Command Reference.

get-annotation-store-version

The following code example shows how to use get-annotation-store-version.

AWS CLI

To retrieve the metadata for an annotation store version

The following get-annotation-store-version example retrieves the metadata for the requested annotation store version.

```bash
aws omics get-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version
```

Output:

```json
{
   "storeId": "4934045d1c6d",
   "id": "2a3f4a44aa7b",
   "status": "ACTIVE",
}
```
"name": "my_annotation_store",
"versionName": "my_version",
"creationTime": "2023-07-21T17:15:49.251040+00:00",
"updateTime": "2023-07-21T17:15:56.434223+00:00",
"statusMessage": "",
"versionSizeBytes": 0
}

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see GetAnnotationStoreVersion in AWS CLI Command Reference.

get-annotation-store

The following code example shows how to use get-annotation-store.

AWS CLI

To view an annotation store

The following get-annotation-store example gets details about an annotation store named my_ann_store.

aws omics get-annotation-store \
    --name my_ann_store

Output:

{
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
    },
    "status": "CREATING",
    "storeFormat": "VCF",
    "storeSizeBytes": 0,
    "tags": {}
}
get-read-set-activation-job

The following code example shows how to use get-read-set-activation-job.

AWS CLI

To view a read set activation job

The following get-read-set-activation-job example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
--sequence-store-id 1234567890 \ 
--id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "readSetId": "1234567890",
            "status": "FINISHED",
            "statusMessage": "No activation needed as read set is already in ACTIVATING or ACTIVE state."
        }
    ],
    "status": "COMPLETED",
    "statusMessage": "The job completed successfully."
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetActivationJob in AWS CLI Command Reference.
get-read-set-export-job

The following code example shows how to use `get-read-set-export-job`.

**AWS CLI**

**To view a read set export job**

The following `get-read-set-export-job` example gets details about a read set export job.

```bash
aws omics get-read-set-export-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```json
{
    "completionTime": "2022-12-06T22:39:14.491Z",
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "COMPLETED",
    "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetExportJob in AWS CLI Command Reference.

get-read-set-import-job

The following code example shows how to use `get-read-set-import-job`.

**AWS CLI**

**To view a read set import job**

The following `get-read-set-import-job` example gets details about a read set import job.

```bash
aws omics get-read-set-import-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```
Output:

```json
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "name": "HG00100",
            "sampleId": "bam-sample",
            "sourceFileType": "BAM",
            "sourceFiles": {
                "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam",
                "source2": ""
            },
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress.",
            "subjectId": "bam-subject",
            "tags": {
                "aws:omics:sampleId": "bam-sample",
                "aws:omics:subjectId": "bam-subject"
            }
        },
        {
            "name": "HG00146",
            "sampleId": "fastq-sample",
            "sourceFileType": "FASTQ",
            "sourceFiles": {
                "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/SRR233106_1.filt.fastq.gz",
                "source2": "s3://omics-artifacts-01d6xmpl4e72dd32/SRR233106_2.filt.fastq.gz"
            },
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress.",
            "subjectId": "fastq-subject",
            "tags": {
            }
        }
    ]
}
```
"aws:omics:sampleId": "fastq-sample",
"aws:omics:subjectId": "fastq-subject"
}
},
{

    "aws:omics:subjectId": "cram-subject"
  }
}
],
"status": "IN_PROGRESS",
"statusMessage": "The job is currently in progress."
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetImportJob in AWS CLI Command Reference.

get-read-set-metadata

The following code example shows how to use get-read-set-metadata.

AWS CLI

To view a read set

The following get-read-set-metadata example gets details about a read set's files.

```
aws omics get-read-set-metadata \
--sequence-store-id 1234567890 \
```
Output:

```
{
    "creationTime": "2022-11-23T21:55:00.515Z",
    "fileType": "FASTQ",
    "files": {
        "source1": {
            "contentLength": 310054739,
            "partSize": 104857600,
            "totalParts": 3
        },
        "source2": {
            "contentLength": 307846621,
            "partSize": 104857600,
            "totalParts": 3
        }
    },
    "id": "1234567890",
    "name": "HG00146",
    "sampleId": "fastq-sample",
    "sequenceInformation": {
        "alignment": "UNALIGNED",
        "totalBaseCount": 677717384,
        "totalReadCount": 8917334
    },
    "sequenceStoreId": "1234567890",
    "status": "ACTIVE",
    "subjectId": "fastq-subject"
}
```

For more information, see [Oomics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSetMetadata](#) in *AWS CLI Command Reference*.

**get-read-set**

The following code example shows how to use `get-read-set`.
AWS CLI

To download a read set

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```bash
aws omics get-read-set \
  --sequence-store-id 1234567890 \
  --id 1234567890 \
  --part-number 3 1234567890.3.bam
```

For more information, see [Omens Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSet](#) in *AWS CLI Command Reference*.

get-reference-import-job

The following code example shows how to use `get-reference-import-job`.

AWS CLI

To view a reference import job

The following `get-reference-import-job` example example gets details about a reference import job.

```bash
aws omics get-reference-import-job \
  --reference-store-id 1234567890 \
  --id 1234567890
```

Output:

```json
{
  "creationTime": "2022-11-22T22:25:41.124Z",
  "id": "1234567890",
  "referenceStoreId": "1234567890",
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
  "sources": [
    {
      "name": "assembly-38",
      "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
```
"status": "IN_PROGRESS",
   "statusMessage": "The source job is currently in progress."
}
],
"status": "IN_PROGRESS",
   "statusMessage": "The job is currently in progress."
}

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide) in the *Amazon Omics Developer Guide*.

**get-reference-metadata**

The following code example shows how to use `get-reference-metadata`.

**AWS CLI**

To view a reference

The following `get-reference-metadata` example gets details about a reference.

```
aws omics get-reference-metadata \
   --reference-store-id 1234567890 \
   --id 1234567890
```

Output:

```json
{
   "files": {
      "index": {
         "contentLength": 160928,
         "partSize": 104857600,
         "totalParts": 1
      },
      "source": {
         "contentLength": 3249912778,
         "partSize": 104857600,
         "totalParts": 31
      }
   }
}```
The following code example shows how to use `get-reference-store`.

**AWS CLI**

**To view a reference store**

The following `get-reference-store` example gets details about a reference store.

```bash
aws omics get-reference-store \
   --id 1234567890
```

Output:

```
{
   "creationTime": "2022-09-23T23:27:20.364Z",
   "id": "1234567890",
   "name": "my-rstore-0"
}
```

For more information, see [Oomics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the Amazon Omics Developer Guide.

---

**get-reference**

The following code example shows how to use `get-reference`.

---

Actions and scenarios
AWS CLI

To download a genome reference

The following get-reference example downloads part 1 of a genome as hg38.1.fa.

```bash
aws omics get-reference \
    --reference-store-id 1234567890 \ 
    --id 1234567890 \ 
    --part-number 1 hg38.1.fa
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReference in AWS CLI Command Reference.

get-run-group

The following code example shows how to use get-run-group.

AWS CLI

To view a run group

The following get-run-group example gets details about a run group.

```bash
aws omics get-run-group \
    --id 1234567
```

Output:

```json
{
   "creationTime": "2022-12-01T00:58:42.915219Z",
   "id": "1234567",
   "maxCpus": 20,
   "maxDuration": 600,
   "name": "cram-convert",
   "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
For API details, see GetRunGroup in AWS CLI Command Reference.

get-run-task

The following code example shows how to use get-run-task.

AWS CLI

To view a task

The following get-run-task example gets details about a workflow task.

```
aws omics get-run-task \
  --id 1234567 \
  --task-id 1234567
```

Output:

```
{
  "cpus": 1,
  "creationTime": "2022-11-30T23:13:00.718651Z",
  "memory": 15,
  "name": "CramToBamTask",
  "startTime": "2022-11-30T23:17:47.016Z",
  "status": "COMPLETED",
  "taskId": "1234567"
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

get-run

The following code example shows how to use get-run.

AWS CLI

To view a workflow run
The following get-run example gets details about a workflow run.

```bash
aws omics get-run \
--id 1234567
```

Output:

```json
{
  "creationTime": "2022-11-30T22:58:22.615865Z",
  "digest": "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
  "id": "1234567",
  "name": "cram-to-bam",
  "outputUri": "s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/",
  "parameters": {

  "tags": {},
  "workflowId": "1234567",
  "workflowType": "PRIVATE"
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetRun in AWS CLI Command Reference.

get-sequence-store

The following code example shows how to use get-sequence-store.

**AWS CLI**

To view a sequence store

The following get-sequence-store example gets details about a sequence store with ID 1234567890.

```bash
aws omics get-sequence-store \
   --id 1234567890
```

Output:

```
{
   "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",
   "id": "1234567890",
   "name": "my-seq-store"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetSequenceStore in AWS CLI Command Reference.

get-share

The following code example shows how to use get-share.

**AWS CLI**

To retrieves the metadata about a share of a HealthOmics analytics data

The following get-share example retrieves the metadata for a cross-account share of analytics data.
aws omics get-share
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"

Output:

```json
{
    "share": {
        "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
        "name": "my_Share-123",
        "principalSubscriber": "123456789012",
        "ownerId": "555555555555",
        "status": "PENDING"
    }
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [GetShare](#) in *AWS CLI Command Reference*.

### get-variant-import-job

The following code example shows how to use `get-variant-import-job`.

#### AWS CLI

**To view a variant import job**

The following `get-variant-import-job` example gets details about a variant import job.

```
aws omics get-variant-import-job
    --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```json
{
    "creationTime": "2022-11-23T22:42:50.037812Z",
    "destinationName": "my_var_store",
    "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
    "items": [
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetVariantImportJob in AWS CLI Command Reference.

get-variant-store

The following code example shows how to use get-variant-store.

AWS CLI

To view a variant store

The following get-variant-store example gets details about a variant store.

```
aws omics get-variant-store \\
    --name my_var_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
    },
    "status": "CREATING",
    "storeSizeBytes": 0,
}```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetVariantStore in AWS CLI Command Reference.

**get-workflow**

The following code example shows how to use get-workflow.

**AWS CLI**

**To view a workflow**

The following get-workflow example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
   --id 1234567
```

**Output:**

```
{
   "digest": "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
   "engine": "WDL",
   "id": "1234567",
   "main": "workflow-crambam.wdl",
   "name": "cram-converter",
   "parameterTemplate": {
      "ref_dict": {
         "description": "dictionary file for 'ref_fasta'"
      },
      "ref_fasta_index": {
         "description": "Index of the reference genome fasta file"
      },
      "ref_fasta": {
         "description": "Reference genome fasta file"
      },
      "input_cram": {
```
For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetWorkflow](#) in *AWS CLI Command Reference*.

### list-annotation-import-jobs

The following code example shows how to use `list-annotation-import-jobs`.

**AWS CLI**

**To get a list of annotation import jobs**

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```bash/aws omics list-annotation-import-jobs
```

**Output:**

```json
{
  "annotationImportJobs": [
    {
      "creationTime": "2022-11-30T01:39:41.478294Z",
      "destinationName": "gff_ann_store",
      "id": "18a9e792-xmpl-4869-a105-e5b602900444",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
      serviceRole-W8O1XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
    }
  ]
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.
- For API details, see ListAnnotationImportJobs in AWS CLI Command Reference.

**list-annotation-store-versions**

The following code example shows how to use list-annotation-store-versions.

**AWS CLI**

To list all the versions of an annotation store.

The following list-annotation-store-versions example lists all versions that exist of an annotation store.

```bash
aws omics list-annotation-store-versions \
  --name my_annotation_store
```

Output:

```json
{
  "annotationStoreVersions": [
    {
      "storeId": "4934045d1c6d",
      "id": "2a3f4a44aa7b",
      "status": "CREATING",
    }
  ]
}
```
For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see ListAnnotationStoreVersions in AWS CLI Command Reference.

### list-annotation-stores

The following code example shows how to use list-annotation-stores.

**AWS CLI**

**To get a list of annotation stores**

The following list-annotation-stores example gets a list of annotation stores.

```bash
aws omics list-annotation-stores
```

**Output:**

```json
{
   "annotationStores": [
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListAnnotationStores in AWS CLI Command Reference.

**list-multipart-read-set-uploads**

The following code example shows how to use list-multipart-read-set-uploads.

**AWS CLI**

To list all multipart read set uploads and their statuses.

The following list-multipart-read-set-uploads example lists all multipart read set uploads and their statuses.

```bash
aws omics list-multipart-read-set-uploads \
    --sequence-store-id 0123456789
```

Output:

```json
{
    "uploads": [
        
    ]
}
```
For more information, see [Direct upload to a sequence store](https://aws.amazon.com/healthomics/user-guide/) in the AWS HealthOmics User Guide.

- For API details, see [ListMultipartReadSetUploads](https://aws.amazon.com/healthomics/cli/command-reference/) in AWS CLI Command Reference.
list-read-set-activation-jobs

The following code example shows how to use list-read-set-activation-jobs.

AWS CLI

To get a list of read set activation jobs

The following list-read-set-activation-jobs example gets a list of activation jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-activation-jobs \
   --sequence-store-id 1234567890
```

Output:

```json
{
   "activationJobs": [
      {
         "completionTime": "2022-12-06T22:33:42.828Z",
         "creationTime": "2022-12-06T22:32:45.213Z",
         "id": "1234567890",
         "sequenceStoreId": "1234567890",
         "status": "COMPLETED"
      },
      {
         "creationTime": "2022-12-06T22:35:10.100Z",
         "id": "1234567890",
         "sequenceStoreId": "1234567890",
         "status": "IN_PROGRESS"
      }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSetActivationJobs in AWS CLI Command Reference.

list-read-set-export-jobs

The following code example shows how to use list-read-set-export-jobs.
AWS CLI

To get a list of read set export jobs

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-export-jobs \
  --sequence-store-id 1234567890
```

Output:

```json
{
  "exportJobs": [
    {
      "completionTime": "2022-12-06T22:39:14.491Z",
      "creationTime": "2022-12-06T22:37:18.612Z",
      "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
    },
    {
      "creationTime": "2022-12-06T22:38:04.871Z",
      "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "IN_PROGRESS"
    }
  ]
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSetExportJobs](https://docs.aws.amazon.com/cli/latest/reference/omics/list-read-set-export-jobs.html) in *AWS CLI Command Reference*.

list-read-set-import-jobs

The following code example shows how to use `list-read-set-import-jobs`.

AWS CLI

To get a list of read set import jobs
The following list-read-set-import-jobs example gets a list of import jobs for a sequence store with id 1234567890.

```
aws omics list-read-set-import-jobs \
   --sequence-store-id 1234567890
```

Output:

```
{
   "importJobs": [
      {
         "completionTime": "2022-11-29T18:17:49.244Z",
         "creationTime": "2022-11-29T17:32:47.700Z",
         "id": "1234567890",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
         "sequenceStoreId": "1234567890",
         "status": "COMPLETED"
      },
      {
         "completionTime": "2022-11-23T22:01:34.090Z",
         "creationTime": "2022-11-23T21:52:43.289Z",
         "id": "1234567890",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
         "sequenceStoreId": "1234567890",
         "status": "COMPLETED_WITH_FAILURES"
      }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSetImportJobs in AWS CLI Command Reference.

list-read-set-upload-parts

The following code example shows how to use list-read-set-upload-parts.

AWS CLI

To list all parts in a requested multipart upload for a sequence store.
The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```bash
aws omics list-read-set-upload-parts \
   --sequence-store-id 0123456789 \
   --upload-id 112234455 \
   --part-source SOURCE1
```

Output:

```json
{
   "parts": [
      {
         "partNumber": 1,
         "partSize": 94371840,
         "file": "SOURCE1",
         "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
         "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
      },
      {
         "partNumber": 2,
         "partSize": 10471840,
         "file": "SOURCE1",
         "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
         "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
      }
   ]
}
```

For more information, see [Direct upload to a sequence store](https://docs.aws.amazon.com/healthomics/latest/userguide/direct-upload-to-an-omics-sequencing-store.html) in the *AWS HealthOmics User Guide*.

- For API details, see [ListReadSetUploadParts](https://docs.aws.amazon.com/cli/latest/reference/omics/list-read-set-upload-parts.html) in *AWS CLI Command Reference*.

**list-read-sets**

The following code example shows how to use `list-read-sets`. 
AWS CLI

To get a list of read sets

The following list-read-sets example gets a list of read sets for a sequence store with id 1234567890.

```
aws omics list-read-sets \
  --sequence-store-id 1234567890
```

Output:

```
{
  "readSets": [
    {
      "creationTime": "2022-11-23T21:55:00.515Z",
      "fileType": "FASTQ",
      "id": "1234567890",
      "name": "HG00146",
      "sampleId": "fastq-sample",
      "sequenceStoreId": "1234567890",
      "status": "ACTIVE",
      "subjectId": "fastq-subject"
    }
  ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSets in AWS CLI Command Reference.

list-reference-import-jobs

The following code example shows how to use list-reference-import-jobs.

AWS CLI

To get a list of reference import jobs
The following list-reference-import-jobs example gets a list of reference import jobs for a reference store with id 1234567890.

```bash
aws omics list-reference-import-jobs \
--reference-store-id 1234567890
```

Output:

```
{
   "importJobs": [
   {
      "completionTime": "2022-11-23T19:54:58.204Z",
      "creationTime": "2022-11-23T19:53:20.729Z",
      "id": "1234567890",
      "referenceStoreId": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "status": "COMPLETED"
   },
   {
      "creationTime": "2022-11-23T20:34:03.250Z",
      "id": "1234567890",
      "referenceStoreId": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "status": "IN_PROGRESS"
   }
   ]
}
```

For more information, see [Omics Storage](https://aws.amazon.com) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReferenceImportJobs](https://docs.aws.amazon.com/cli/1.23.0/reference/command/aws-omics/list-reference-import-jobs.html) in *AWS CLI Command Reference*.

**list-reference-stores**

The following code example shows how to use list-reference-stores.

**AWS CLI**

To get a list of reference stores

The following list-reference-stores example gets a list of reference stores.
aws omics list-reference-stores

Output:

{
   "referenceStores": [
   {
   "id": "1234567890",
   "name": "my-ref-store"
   }
   ]
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceStores in AWS CLI Command Reference.

list-references

The following code example shows how to use list-references.

AWS CLI

To get a list of references

The following list-references example gets a list of genome references for a reference store with id 1234567890.

aws omics list-references \
   --reference-store-id 1234567890

Output:

{
   "references": [
   {
   ...
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferences in AWS CLI Command Reference.

### list-run-groups

The following code example shows how to use list-run-groups.

**AWS CLI**

**To get a list of run groups**

The following list-run-groups example gets a list of run groups.

```bash
aws omics list-run-groups
```

**Output:**

```
{
   "items": [
     {
       "creationTime": "2022-12-01T00:58:42.915219Z",
       "id": "1234567",
       "maxCpus": 20,
       "maxDuration": 600,
       "name": "cram-convert"
     }
   ]
}
```
list-run-tasks

The following code example shows how to use list-run-tasks.

AWS CLI

To get a list of tasks

The following list-run-tasks example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \\
   --id 1234567
```

Output:

```
{
   "items": [
   {
       "cpus": 1,
       "creationTime": "2022-11-30T23:13:00.718651Z",
       "memory": 15,
       "name": "CramToBamTask",
       "startTime": "2022-11-30T23:17:47.016Z",
       "status": "COMPLETED",
       "taskId": "1234567"
   },
   {
       "cpus": 1,
       "creationTime": "2022-11-30T23:18:32.315606Z",
       "memory": 4,
       "name": "ValidateSamFile",
       "startTime": "2022-11-30T23:23:40.165Z",
       "status": "COMPLETED",
       "taskId": "1234567"
   }
   ]
```
For more information, see [Omics Workflows](https://aws.amazon.com) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRunTasks](https://docs.aws.amazon.com/cli/latest/reference/omics/list-run-tasks.html) in *AWS CLI Command Reference*.

### list-runs

The following code example shows how to use `list-runs`.

#### AWS CLI

**To get a list of workflow runs**

The following `list-runs` example gets a list of workflow runs.

```bash
aws omics list-runs
```

**Output:**

```json
{
   "items": [
   {
      "creationTime": "2022-12-02T23:20:01.202074Z",
      "id": "1234567",
      "name": "cram-to-bam",
      "priority": 1,
      "startTime": "2022-12-02T23:29:18.115Z",
      "status": "COMPLETED",
      "stopTime": "2022-12-02T23:57:54.428812Z",
      "storageCapacity": 10,
      "workflowId": "1234567"
   },
   {
      "creationTime": "2022-12-03T00:16:57.180066Z",
      "id": "1234567",
      "name": "cram-to-bam",
      "priority": 1,
      "startTime": "2022-12-03T00:26:50.233Z",
      "status": "FAILED",
   }
   ]
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListRuns in AWS CLI Command Reference.

### list-sequence-stores

The following code example shows how to use list-sequence-stores.

**AWS CLI**

**To get a list of sequence stores**

The following list-sequence-stores example gets a list of sequence stores.

```bash
aws omics list-sequence-stores
```

**Output:**

```json
{
    "sequenceStores": [
        {
            "creationTime": "2022-11-23T01:24:33.629Z",
            "id": "1234567890",
            "name": "my-seq-store"
        }
    ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListSequenceStores in AWS CLI Command Reference.

**list-shares**

The following code example shows how to use list-shares.

**AWS CLI**

To list the available shares of a HealthOmics analytics data

The following list-shares example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
  --resource-owner SELF
```

Output:

```
{
  "shares": [
    {
      "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",
      "name": "myShare",
      "principalSubscriber": "123456789012",
      "ownerId": "555555555555",
      "status": "PENDING"
    },
    {
      "shareId": "39b65d0d-4368-4a19-9814-b0e31d73c10a",
      "name": "myShare3456",
      "principalSubscriber": "123456789012",
      "ownerId": "555555555555",
      "status": "ACTIVE"
    }
  ]
}
```
For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

• For API details, see ListShares in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To get a list of tags

The following list-tags-for-resource example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource \
```

Output:

```
{
    "tags": {
        "department": "analytics"
    }
}
```

For more information, see Tagging resources in Amazon Omics in the Amazon Omics Developer Guide.

• For API details, see ListTagsForResource in AWS CLI Command Reference.
list-variant-import-jobs

The following code example shows how to use list-variant-import-jobs.

AWS CLI

To get a list of variant import jobs

The following list-variant-import-jobs example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
   "variantImportJobs": [
      {
         "creationTime": "2022-11-23T22:47:02.514002Z",
         "destinationName": "my_var_store",
         "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
         "runLeftNormalization": false,
         "status": "COMPLETED",
         "updateTime": "2022-11-23T22:49:17.976597Z"
      },
      {
         "creationTime": "2022-11-23T22:42:50.037812Z",
         "destinationName": "my_var_store",
         "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
         "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
         "runLeftNormalization": false,
         "status": "COMPLETED",
         "updateTime": "2022-11-23T22:45:26.009880Z"
      }
   ]
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantImportJobs in AWS CLI Command Reference.
list-variant-stores

The following code example shows how to use list-variant-stores.

AWS CLI

To get a list of variant stores

The following list-variant-stores example gets a list of variant stores.

```bash
aws omics list-variant-stores
```

Output:

```json
{
   "variantStores": [
   {
      "creationTime": "2022-11-23T22:09:07.534999Z",
      "id": "02dexamplecfdd",
      "name": "my_var_store",
      "reference": {
      },
      "status": "CREATING",
      "storeSizeBytes": 0,
      "updateTime": "2022-11-23T22:09:24.931711Z"
   },
   {
      "creationTime": "2022-09-23T23:00:09.140265Z",
      "id": "8777examplea24",
      "name": "myvstore0",
      "status": "ACTIVE",
      "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/myvstore0",
      "storeSizeBytes": 0,
      "updateTime": "2022-09-23T23:03:26.013220Z"
   }
   ]
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantStores in AWS CLI Command Reference.

**list-workflows**

The following code example shows how to use list-workflows.

**AWS CLI**

**To get a list of workflows**

The following list-workflows example gets a list of workflows.

```
aws omics list-workflows
```

**Output:**

```json
{
   "items": [
      {
         "creationTime": "2022-09-23T23:08:22.041227Z",
         "digest": "nSCNo/qMWFxmplXpUdokXJnwgne0axyyuc2Y0xVxrJTE=",
         "id": "1234567",
         "name": "my-wkflow-0",
         "status": "ACTIVE",
         "type": "PRIVATE"
      },
      {
         "digest": "sha256:c54bxmpl742dcc26f7fa1f10e37550dd8f251f418277c0a58e895b801ed28cf",
         "id": "1234567",
         "name": "cram-converter",
         "status": "ACTIVE",
         "type": "PRIVATE"
      }
   ]
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
For API details, see ListWorkflows in AWS CLI Command Reference.

**start-annotation-import-job**

The following code example shows how to use start-annotation-import-job.

**AWS CLI**

**To import annotations**

The following start-annotation-import-job example imports annotations from Amazon S3.

```bash
aws omics start-annotation-import-job \
    --destination-name tsv_ann_store \
    --no-run-left-normalization \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
    --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```json
{
    "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

For API details, see StartAnnotationImportJob in AWS CLI Command Reference.

**start-read-set-activation-job**

The following code example shows how to use start-read-set-activation-job.

**AWS CLI**

**To activate an archived read set**

The following start-read-set-activation-job example activates two read sets.

```bash
aws omics start-read-set-activation-job \
```

Actions and scenarios
start-read-set-export-job

The following code example shows how to use start-read-set-export-job.

AWS CLI

To export a read set

The following start-read-set-export-job example exports two read sets to Amazon S3.

```
aws omics start-read-set-export-job \
    --sequence-store-id 1234567890 \ 
    --sources readSetId=1234567890 readSetId=1234567890 \ 
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \ 
    --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/
```

Output:

```
{
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
}
```
For more information, see [Oomics Storage](https://aws.amazon.com/omics/) in the Amazon Omics Developer Guide.

### start-read-set-import-job

The following code example shows how to use `start-read-set-import-job`.

**AWS CLI**

**To import a read set**

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
    --sequence-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
    --sources file://readset-sources.json
```

`readset-sources.json` is a JSON document with the following content.

```
[
    {
        "sourceFiles":
        {
            "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
        },
        "sourceFileType": "BAM",
        "subjectId": "bam-subject",
        "sampleId": "bam-sample",
        "name": "HG00100"
    }
]
```

**Output:**

"status": "SUBMITTED"
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetImportJob in AWS CLI Command Reference.

**start-reference-import-job**

The following code example shows how to use start-reference-import-job.

**AWS CLI**

**To import a reference genome**

The following start-reference-import-job example imports a reference genome from Amazon S3.

```
aws omics start-reference-import-job \
    --reference-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMP7QZ \
    --sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/\n    Homo_sapiens_assembly38.fasta,name=assembly-38
```

**Output:**

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMP7QZ",
    "status": "SUBMITTED"
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReferenceImportJob in AWS CLI Command Reference.

```start-run```

The following code example shows how to use start-run.

**AWS CLI**

**To run a workflow**

The following start-run example runs a workflow with ID 1234567.

```
aws omics start-run \
   --workflow-id 1234567 \
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMP7QZ \
   --name 'cram-to-bam' \
   --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
   --run-group-id 1234567 \
   --priority 1 \
   --storage-capacity 10 \
   --log-level ALL \
   --parameters file://workflow-inputs.json
```

workflow-inputs.json is a JSON document with the following content.

```json
{
    "sample_name": "NA12878",
    "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```json
{
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

To load source files from Amazon Omics

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```json
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see StartRun in AWS CLI Command Reference.

start-variant-import-job

The following code example shows how to use start-variant-import-job.

AWS CLI

To import a variant file

The following start-variant-import-job example imports a VCF format variant file.

```
aws omics start-variant-import-job \
    --destination-name my_var_store \
    --no-run-left-normalization \
```
The following code example shows how to use `tag-resource`.

**AWS CLI**

To tag a resource

The following `tag-resource` example adds a department tag to a workflow with id 1234567.

```
aws omics tag-resource \
--resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
--tags department=analytics
```

For more information, see [Tagging resources in Amazon Omics](https://docs.aws.amazon.com/omics/latest/userguide/tag-resource.html) in the *Amazon Omics Developer Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/omics/latest/userguide/tag-resource.html) in *AWS CLI Command Reference*.

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove a tag from a resource

```
aws omics untag-resource \
--resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
--key department
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see [StartVariantImportJob](https://docs.aws.amazon.com/omics/latest/userguide/start-variant-import-job.html) in *AWS CLI Command Reference*. 

The following code example shows how to import variants.

```bash
aws omics variant-import-job \
--role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPLE7QZ \
--items source=s3://omics-artifacts-01d6xmpl4e72dd32/ \
Homo_sapiens_assembly38.known_indels.vcf.gz
```

**Output:**

```json
{
    "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see [StartVariantImportJob](https://docs.aws.amazon.com/omics/latest/userguide/start-variant-import-job.html) in *AWS CLI Command Reference*. 

---

**tag-resource**

---

**untag-resource**

---
The following untag-resource example removes the department tag from a workflow.

```
aws omics untag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tag-keys department
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.
- For API details, see UntagResource in AWS CLI Command Reference.

**update-annotation-store**

The following code example shows how to use update-annotation-store.

AWS CLI

To update an annotation store

The following update-annotation-store example updates the description of an annotation store named my_vcf_store.

```
aws omics update-annotation-store \
    --name my_vcf_store \
    --description "VCF annotation store"
```

Output:

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.
• For API details, see UpdateAnnotationStore in AWS CLI Command Reference.

**update-run-group**

The following code example shows how to use `update-run-group`.

**AWS CLI**

To update a run group

The following `update-run-group` example updates the settings of a run group with id `1234567`.

```bash
aws omics update-run-group \
  --id 1234567 \
  --max-cpus 10
```

Output:

```json
{
  "creationTime": "2022-12-01T00:58:42.915219Z",
  "id": "1234567",
  "maxCpus": 10,
  "maxDuration": 600,
  "name": "cram-convert",
  "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

• For API details, see UpdateRunGroup in AWS CLI Command Reference.

**update-variant-store**

The following code example shows how to use `update-variant-store`.

**AWS CLI**

To update a variant store
The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```bash
aws omics update-variant-store \
  --name my_var_store \
  --description "variant store"
```

Output:

```json
{
  "creationTime": "2022-11-23T22:09:07.534499Z",
  "description": "variant store",
  "id": "02dexmplcfdd",
  "name": "my_var_store",
  "reference": {
  },
  "status": "ACTIVE",
  "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateVariantStore](#) in *AWS CLI Command Reference*.

**update-workflow**

The following code example shows how to use `update-workflow`.

**AWS CLI**

**To update a workflow**

The following `update-workflow` example updates the description of a workflow with ID 1234567.

```bash
aws omics update-workflow \
  --id 1234567 \
  --description "copy workflow"
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*. 

---

**Actions and scenarios**
For API details, see UpdateWorkflow in AWS CLI Command Reference.

upload-read-set-part

The following code example shows how to use upload-read-set-part.

**AWS CLI**

To upload a read set part.

The following upload-read-set-part example uploads a specified part of a read set.

```bash
aws omics upload-read-set-part \
  --sequence-store-id 0123456789 \
  --upload-id 1122334455 \
  --part-source SOURCE1 \
  --part-number 1 \
  --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```
{
  "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

For API details, see UploadReadSetPart in AWS CLI Command Reference.

**IAM examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**add-client-id-to-open-id-connect-provider**

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

**AWS CLI**

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```bash
aws iam add-client-id-to-open-id-connect-provider \
  --client-id my-application-ID \ 
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_create_openid.html) in the **AWS IAM User Guide**.

- For API details, see [AddClientIdToOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/api/iam/add-client-id-to-open-id-connect-provider.html) in **AWS CLI Command Reference**.

**add-role-to-instance-profile**

The following code example shows how to use `add-role-to-instance-profile`.

**AWS CLI**

To add a role to an instance profile
The following add-role-to-instance-profile command adds the role named S3Access to the instance profile named Webserver.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the create-instance-profile command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the AWS IAM User Guide.

- For API details, see AddRoleToInstanceProfile in AWS CLI Command Reference.

add-user-to-group

The following code example shows how to use add-user-to-group.

**AWS CLI**

To add a user to an IAM group

The following add-user-to-group command adds an IAM user named Bob to the IAM group named Admins.

```
aws iam add-user-to-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

- For API details, see AddUserToGroup in AWS CLI Command Reference.

attach-group-policy

The following code example shows how to use attach-group-policy.
AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
  --group-name Finance
```

This command produces no output.

For more information, see [Managed policies and inline policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [AttachGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/attach-group-policy.html) in *AWS CLI Command Reference*.

**attach-role-policy**

The following code example shows how to use `attach-role-policy`.

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
  --role-name ReadOnlyRole
```

This command produces no output.

For more information, see [Managed policies and inline policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [AttachRolePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/attach-role-policy.html) in *AWS CLI Command Reference*.

**attach-user-policy**

The following code example shows how to use `attach-user-policy`. 
AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named Alice.

```bash
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachUserPolicy in AWS CLI Command Reference.

change-password

The following code example shows how to use change-password.

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the change-password command with the `--generate-cli-skeleton` parameter, as in the following example.

```bash
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords. For example, the file might look like the following.

```json
{
    "OldPassword": "3s0K_;xh4~8XXI",
```
Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called `change-password.json`.

```bash
aws iam change-password \
   --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see [How an IAM user changes their own password](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_change-password.html) in the *AWS IAM User Guide*.

- For API details, see [ChangePassword](https://docs.aws.amazon.com/cli/latest/reference/iam/change-password.html) in *AWS CLI Command Reference*.

### create-access-key

The following code example shows how to use `create-access-key`.

**AWS CLI**

**To create an access key for an IAM user**

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```bash
aws iam create-access-key \
   --user-name Bob
```

Output:

```json
{
   "AccessKey": {
       "UserName": "Bob",
   }
}
```
Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see CreateAccessKey in AWS CLI Command Reference.

create-account-alias

The following code example shows how to use create-account-alias.

AWS CLI

To create an account alias

The following create-account-alias command creates the alias examplecorp for your AWS account.

```
aws iam create-account-alias \
   --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see CreateAccountAlias in AWS CLI Command Reference.

create-group

The following code example shows how to use create-group.

AWS CLI

To create an IAM group
The following create-group command creates an IAM group named Admins.

```
aws iam create-group \\
   --group-name Admins
```

Output:

```
{
   "Group": {
      "Path": "/",
      "CreateDate": "2015-03-09T20:30:24.940Z",
      "GroupId": "AIDGPMS9R04H3FEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admins",
      "GroupName": "Admins"
   }
}
```

For more information, see Creating IAM user groups in the AWS IAM User Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.

**create-instance-profile**

The following code example shows how to use create-instance-profile.

**AWS CLI**

**To create an instance profile**

The following create-instance-profile command creates an instance profile named Webserver.

```
aws iam create-instance-profile \\
   --instance-profile-name Webserver
```

Output:

```
{
   "InstanceProfile": {
      "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
```

Actions and scenarios
To add a role to an instance profile, use the add-role-to-instance-profile command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_create_forinstance-profile.html) in the *AWS IAM User Guide*.

- For API details, see [CreateInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/create-instance-profile.html) in *AWS CLI Command Reference*.

### create-login-profile

The following code example shows how to use `create-login-profile`.

**AWS CLI**

#### To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
  --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called `create-login-profile.json` that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```json
{
  "UserName": "Bob",
  "Password": "&1-3a6u:RA0djs",
  "PasswordResetRequired": true
}
```
Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called `create-login-profile.json`.

```bash
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Output:

```json
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

- For API details, see [CreateLoginProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/create-login-profile.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/index.html).

**create-open-id-connect-provider**

The following code example shows how to use `create-open-id-connect-provider`.

**AWS CLI**

To create an OpenID Connect (OIDC) provider
To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```bash
class create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called `create-open-id-connect-provider.json` that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```json
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called `create-open-id-connect-provider.json`.

```bash
class create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```json
{
```
"OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/server.example.com"
}

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the AWS IAM User Guide.

• For API details, see CreateOpenIdConnectProvider in AWS CLI Command Reference.

create-policy-version

The following code example shows how to use create-policy-version.

AWS CLI

To create a new version of a managed policy

This example creates a new v2 version of the IAM policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy and makes it the default version.

    aws iam create-policy-version \
      --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
      --policy-document file://NewPolicyVersion.json \
      --set-as-default

Output:

    
    
    
    
    

For more information, see Versioning IAM policies in the AWS IAM User Guide.

• For API details, see CreatePolicyVersion in AWS CLI Command Reference.

Actions and scenarios
create-policy

The following code example shows how to use create-policy.

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named my-policy.

```
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy
```

The file policy is a JSON document in the current folder that grants read only access to the shared folder in an Amazon S3 bucket named my-bucket.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:Get*",
        "s3:List*
      ],
      "Resource": [
        "arn:aws:s3:::my-bucket/shared/**"
      ]
    }
  ]
}
```

Output:

```
{
  "Policy": {
    "PolicyName": "my-policy",
    "CreateDate": "2015-06-01T19:31:18.620Z",
    "AttachmentCount": 0,
    "IsAttachable": true,
  }
}
```
"PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
"DefaultVersionId": "v1",
"Path": "/",
"Arn": "arn:aws:iam::0123456789012:policy/my-policy",
"UpdateDate": "2015-06-01T19:31:18.620Z"
}

For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the AWS CLI User Guide.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named my-policy with an immutable description:

```
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json \
  --description "This policy grants access to all Put, Get, and List actions for my-bucket"
```

The file policy.json is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named my-bucket.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket*",
        "s3:PutBucket*",
        "s3:GetBucket*"
      ],
      "Resource": [
        "arn:aws:s3:::my-bucket"
      ]
    }
  ]
}
```
Output:

```json
{
   "Policy": {
      "PolicyName": "my-policy",
      "PolicyId": "ANPAWGSUGIDPEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:policy/my-policy",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 0,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2023-05-24T22:38:47+00:00",
      "UpdateDate": "2023-05-24T22:38:47+00:00"
   }
}
```

For more information on Identity-based Policies, see [Identity-based policies and resource-based policies](#) in the AWS IAM User Guide.

**Example 3: To Create a customer managed policy with tags**

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: '{}"Key": "Department", "Value": "Accounting"}' '{}"Key": "Location", "Value": "Seattle"}'. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
aws iam create-policy \
   --policy-name my-policy \
   --policy-document file://policy.json \
   --tags '{}"Key": "Department", "Value": "Accounting"}' '{}"Key": "Location", "Value": "Seattle"}'
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {"Effect": "Allow",
```
"Action": [
  "s3:ListBucket**",
  "s3:PutBucket**",
  "s3:GetBucket**"
],
"Resource": [
  "arn:aws:s3:::my-bucket"
]
}

Output:

{
  "Policy": {
    "PolicyName": "my-policy",
    "PolicyId": "ANPAWGSUGIDPEXAMPLE",
    "Arn": "arn:aws:iam::12345678012:policy/my-policy",
    "Path": "/",
    "DefaultVersionId": "v1",
    "AttachmentCount": 0,
    "PermissionsBoundaryUsageCount": 0,
    "IsAttachable": true,
    "CreateDate": "2023-05-24T23:16:39+00:00",
    "UpdateDate": "2023-05-24T23:16:39+00:00",
    "Tags": [
      {
        "Key": "Department",
        "Value": "Accounting"
      },
      {
        "Key": "Location",
        "Value": "Seattle"
      }
    ]
  }
}

For more information on Tagging policies, see [Tagging customer managed policies](#) in the AWS IAM User Guide.

- For API details, see [CreatePolicy](#) in [AWS CLI Command Reference](#).
create-role

The following code example shows how to use create-role.

AWS CLI

Example 1: To create an IAM role

The following `create-role` command creates a role named Test-Role and attaches a trust policy to it.

```bash
aws iam create-role \
  --role-name Test-Role \
  --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```json
{
  "Role": {
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
    "RoleId": "AKIAIOSFODNN7EXAMPLE",
    "CreateDate": "2013-06-07T20:43:32.821Z",
    "RoleName": "Test-Role",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
  }
}
```

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` command creates a role named Test-Role and sets a maximum session duration of 7200 seconds (2 hours).

```bash
aws iam create-role \
```
Output:

```json
{
   "Role": {
       "Path": "/",
       "RoleName": "Test-Role",
       "RoleId": "AKIAIOSFODNN7EXAMPLE",
       "Arn": "arn:aws:iam::12345678012:role/Test-Role",
       "CreateDate": "2023-05-24T23:50:25+00:00",
       "AssumeRolePolicyDocument": {
           "Version": "2012-10-17",
           "Statement": [
               {
                   "Sid": "Statement1",
                   "Effect": "Allow",
                   "Principal": {
                       "AWS": "arn:aws:iam::12345678012:root"
                   },
                   "Action": "sts:AssumeRole"
               }
           ]
       }
   }
}
```

For more information, see [Modifying a role maximum session duration (AWS API)](https://aws.amazon.com) in the *AWS IAM User Guide*.

### Example 3: To create an IAM Role with tags

The following command creates an IAM Role Test-Role with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}' and '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
aws iam create-role \
```

Actions and scenarios  3410
Output:

```json
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see [Tagging IAM roles](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tagging-iam-roles.html) in the *AWS IAM User Guide*.

- For API details, see [CreateRole](https://docs.aws.amazon.com/cli/latest/reference/iam/create-role.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

3411
create-saml-provider

The following code example shows how to use create-saml-provider.

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named MySAMLProvider. It is described by the SAML metadata document found in the file SAMLMetaData.xml.

```bash
aws iam create-saml-provider
   --saml-metadata-document file://SAMLMetaData.xml
   --name MySAMLProvider
```

Output:

```
{
   "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see [Creating IAM SAML identity providers](https://docs.aws.amazon.com/iam/latest/UserGuide/creating-saml-identity-providers.html) in the *AWS IAM User Guide*.

- For API details, see [CreateSAMLProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/create-saml-provider.html) in *AWS CLI Command Reference*.

create-service-linked-role

The following code example shows how to use create-service-linked-role.

AWS CLI

To create a service-linked role

The following create-service-linked-role example creates a service-linked role for the specified AWS service and attaches the specified description.

```bash
aws iam create-service-linked-role
   --aws-service-name lex.amazonaws.com
   --description "My service-linked role to support Lex"
```

Output:
The following code example shows how to use `create-service-specific-credential`.

**AWS CLI**

Create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```bash
aws iam create-service-specific-credential \
```
--user-name sofia \
--service-name codecommit.amazonaws.com

Output:

```
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "k1zPZM6uVxMQ3oxqgoYlNuJPyRTZ1vREs76zTQE3eJk=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](https://docs.aws.amazon.com/codecommit/latest/userguide/create-github-credentials.html) in the *AWS CodeCommit User Guide*.

- For API details, see [CreateServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/create-service-specific-credential.html) in *AWS CLI Command Reference*.

### create-user

The following code example shows how to use `create-user`.

**AWS CLI**

**Example 1: To create an IAM user**

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
   --user-name Bob
```

Output:

```
{
   "User": {
      "UserName": "Bob",
      "Path": "/"
   }
}
```
Example 2: To create an IAM user at a specified path

The following create-user command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
  --user-name Bob \
  --path /division_abc/subdivision_xyz/
```

Output:

```
{
  "User": {
    "Path": "/division_abc/subdivision_xyz/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
    "CreateDate": "2023-05-24T18:20:17+00:00"
  }
}
```

Example 3: To Create an IAM User with tags

The following create-user command creates an IAM user named Bob with tags. This example uses the --tags parameter flag with the following JSON-formatted tags: '

```
aws iam create-user \
  --user-name Bob \
  --tags ""Department": "Accounting", "Location": "Seattle"
```

Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting,Key=Location,Value=Seattle'.

```
aws iam create-user \
  --user-name Bob \
  --tags ""Department": "Accounting", "Location": "Seattle"
```

Output:

```
{
   "User": {
       "Path": "/",
       "UserName": "Bob",
       "UserId": "AIDAIOSFODNN7EXAMPLE",
       "Arn": "arn:aws:iam::12345678012:user/Bob",
       "CreateDate": "2023-05-25T17:14:21+00:00",
       "Tags": [
           {
               "Key": "Department",
               "Value": "Accounting"
           },
           {
               "Key": "Location",
               "Value": "Seattle"
           }
       ]
   }
}
```

For more information, see [Tagging IAM users](#) in the AWS IAM User Guide.

**Example 3: To create an IAM user with a set permissions boundary**

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
   --user-name Bob \
   --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
   "User": {
       "Path": "/",
       "UserName": "Bob",
   }
}
```
For more information, see Permissions boundaries for IAM entities in the AWS IAM User Guide.

- For API details, see CreateUser in AWS CLI Command Reference.

create-virtual-mfa-device

The following code example shows how to use create-virtual-mfa-device.

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called BobsMFADevice. It creates a file that contains bootstrap information called QRCODE.png and places it in the C:/ directory. The bootstrap method used in this example is QRCodePNG.

```bash
aws iam create-virtual-mfa-device \
  --virtual-mfa-device-name BobsMFADevice \n  --outfile C:/QRCODE.png \n  --bootstrap-method QRCodePNG
```

Output:

```
{
  "VirtualMFADevice": {
    "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
  }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see CreateVirtualMfaDevice in AWS CLI Command Reference.
deactivate-mfa-device

The following code example shows how to use `deactivate-mfa-device`.

**AWS CLI**

**To deactivate an MFA device**

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

- For API details, see [DeactivateMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/deactivate-mfa-device.html) in AWS CLI Command Reference.

decode-authorization-message

The following code example shows how to use `decode-authorization-message`.

**AWS CLI**

**To decode a authorization failure message**

The following `decode-authorization-message` example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```
aws sts decode-authorization-message \
  --encoded-message lxzA8VEjEvu-s0TTt3PgYCXik9YakOqsrFJGRZR98xNcyWAwRq14xIvd-\npzbqTeuuufCTbeBAaDAArg9cbTK1rJbg3awM33o-Vy3ebPER2-\nMW9hYVdvX-0zKgVOWF9pWjZaJSMqx8-aLXo-I_8TTvBq88x8IFPbMAzNdpu0IjxDzJf22PF3S0E3xVQ-\n_PEO0aUqHCCcsSrzFtvxm6yQ0inbw6VTIVrfa0Bzy8lsoMo7Sj1Ja2r5vph6SY5vCCw6o2JKe3hIHTa8zrikDbZSFMcKcX\nXx9YAAnYZ6bhcis7C__bZh4d1AAw0HGKgfoJcWGwdzgBu9hWyVvKTPeot5hsb8qANyjJRPCXTKpi6PZfdijIkwb6g
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.
For more information, see How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch? in AWS re:Post.

- For API details, see DecodeAuthorizationMessage in AWS CLI Command Reference.

delete-access-key

The following code example shows how to use delete-access-key.

**AWS CLI**

**To delete an access key for an IAM user**

The following delete-access-key command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key 
  --access-key-id AKIDPMS9R04H3FEXAMPLE 
```
This command produces no output.

To list the access keys defined for an IAM user, use the list-access-keys command.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccessKey in AWS CLI Command Reference.

delete-account-alias

The following code example shows how to use delete-account-alias.

AWS CLI

To delete an account alias

The following delete-account-alias command removes the alias mycompany for the current account.

```bash
aws iam delete-account-alias \
   --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.
- For API details, see DeleteAccountAlias in AWS CLI Command Reference.

delete-account-password-policy

The following code example shows how to use delete-account-password-policy.

AWS CLI

To delete the current account password policy

The following delete-account-password-policy command removes the password policy for the current account.

```bash
aws iam delete-account-password-policy
```
This command produces no output.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccountPasswordPolicy in AWS CLI Command Reference.

**delete-group-policy**

The following code example shows how to use delete-group-policy.

**AWS CLI**

**To delete a policy from an IAM group**

The following delete-group-policy command deletes the policy named ExamplePolicy from the group named Admins.

```bash
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the list-group-policies command.

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see DeleteGroupPolicy in AWS CLI Command Reference.

**delete-group**

The following code example shows how to use delete-group.

**AWS CLI**

**To delete an IAM group**

The following delete-group command deletes an IAM group named MyTestGroup.

```bash
aws iam delete-group \
    --group-name MyTestGroup
```
This command produces no output.

For more information, see Deleting an IAM user group in the AWS IAM User Guide.

- For API details, see DeleteGroup in AWS CLI Command Reference.

delete-instance-profile

The following code example shows how to use delete-instance-profile.

AWS CLI

To delete an instance profile

The following delete-instance-profile command deletes the instance profile named ExampleInstanceProfile.

```
aws iam delete-instance-profile
   --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see DeleteInstanceProfile in AWS CLI Command Reference.

delete-login-profile

The following code example shows how to use delete-login-profile.

AWS CLI

To delete a password for an IAM user

The following delete-login-profile command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile
   --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.
• For API details, see DeleteLoginProfile in AWS CLI Command Reference.

delete-open-id-connect-provider

The following code example shows how to use delete-open-id-connect-provider.

AWS CLI

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider example.oidcprovider.com.

```
aws iam delete-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

• For API details, see DeleteOpenIdConnectProvider in AWS CLI Command Reference.

delete-policy-version

The following code example shows how to use delete-policy-version.

AWS CLI

To delete a version of a managed policy

This example deletes the version identified as v2 from the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```
aws iam delete-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
• For API details, see [DeletePolicyVersion in AWS CLI Command Reference.](#)

**delete-policy**

The following code example shows how to use `delete-policy`.

**AWS CLI**

To delete an IAM policy

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the AWS IAM User Guide.

• For API details, see [DeletePolicy in AWS CLI Command Reference](#).

**delete-role-permissions-boundary**

The following code example shows how to use `delete-role-permissions-boundary`.

**AWS CLI**

To delete a permissions boundary from an IAM role

The following delete-role-permissions-boundary example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
  --role-name lambda-application-role
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the AWS IAM User Guide.

• For API details, see [DeleteRolePermissionsBoundary in AWS CLI Command Reference](#).
delete-role-policy

The following code example shows how to use delete-role-policy.

AWS CLI

To remove a policy from an IAM role

The following delete-role-policy command removes the policy named ExamplePolicy from the role named Test-Role.

```bash
aws iam delete-role-policy \
  --role-name Test-Role \
  --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.
- For API details, see DeleteRolePolicy in AWS CLI Command Reference.

delete-role

The following code example shows how to use delete-role.

AWS CLI

To delete an IAM role

The following delete-role command removes the role named Test-Role.

```bash
aws iam delete-role \
  --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (remove-role-from-instance-profile), detach any managed policies (detach-role-policy) and delete any inline policies that are attached to the role (delete-role-policy).

For more information, see Creating IAM roles and Using instance profiles in the AWS IAM User Guide.
For API details, see DeleteRole in AWS CLI Command Reference.

**delete-saml-provider**

The following code example shows how to use delete-saml-provider.

**AWS CLI**

**To delete a SAML provider**

This example deletes the IAM SAML 2.0 provider whose ARN is arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider.

```
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

For API details, see DeleteSAMLProvider in AWS CLI Command Reference.

**delete-server-certificate**

The following code example shows how to use delete-server-certificate.

**AWS CLI**

**To delete a server certificate from your AWS account**

The following delete-server-certificate command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
--server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the list-server-certificates command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.
For API details, see [DeleteServerCertificate](#) in *AWS CLI Command Reference*.

**delete-service-linked-role**

The following code example shows how to use `delete-service-linked-role`.

**AWS CLI**

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```bash
aws iam delete-service-linked-role \
  --role-name AWSServiceRoleForLexBots
```

Output:

```json
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
              AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"
}
```

For more information, see [Using service-linked roles](#) in the *AWS IAM User Guide*.

For API details, see [DeleteServiceLinkedRole](#) in *AWS CLI Command Reference*.

**delete-service-specific-credential**

The following code example shows how to use `delete-service-specific-credential`.

**AWS CLI**

**Example 1: Delete a service-specific credential for the requesting user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The service-specific-credential-id is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.
aws iam delete-service-specific-credential \ 
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE

This command produces no output.

**Example 2: Delete a service-specific credential for a specified user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

aws iam delete-service-specific-credential \ 
   --user-name sofia \ 
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE

This command produces no output.

- For API details, see [DeleteServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/userguide/aws-cmd-iam-delete-service-specific-credential.html) in *AWS CLI Command Reference*.

delete-signing-certificate

The following code example shows how to use `delete-signing-certificate`.

**AWS CLI**

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

aws iam delete-signing-certificate \ 
   --user-name Bob \ 
   --certificate-id TA75MP42TDN5Z26OBPJE7EXAMPLE

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.
For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see DeleteSigningCertificate in AWS CLI Command Reference.

**delete-ssh-public-key**

The following code example shows how to use delete-ssh-public-key.

**AWS CLI**

To delete an SSH public keys attached to an IAM user

The following delete-ssh-public-key command deletes the specified SSH public key attached to the IAM user sofia.

```
aws iam delete-ssh-public-key \\
   --user-name sofia \\
   --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see DeleteSshPublicKey in AWS CLI Command Reference.

**delete-user-permissions-boundary**

The following code example shows how to use delete-user-permissions-boundary.

**AWS CLI**

To delete a permissions boundary from an IAM user

The following delete-user-permissions-boundary example deletes the permissions boundary attached to the IAM user named intern. To apply a permissions boundary to a user, use the put-user-permissions-boundary command.

```
aws iam delete-user-permissions-boundary \\
   --user-name intern
```

This command produces no output.
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeleteUserPermissionsBoundary in AWS CLI Command Reference.

**delete-user-policy**

The following code example shows how to use `delete-user-policy`.

**AWS CLI**

To remove a policy from an IAM user

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```bash
aws iam delete-user-policy \
  --user-name Bob \
  --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see DeleteUserPolicy in AWS CLI Command Reference.

**delete-user**

The following code example shows how to use `delete-user`.

**AWS CLI**

To delete an IAM user

The following `delete-user` command removes the IAM user named Bob from the current account.

```bash
aws iam delete-user \
  --user-name Bob
```

This command produces no output.
For more information, see Deleting an IAM user in the AWS IAM User Guide.

- For API details, see DeleteUser in AWS CLI Command Reference.

**delete-virtual-mfa-device**

The following code example shows how to use delete-virtual-mfa-device.

**AWS CLI**

**To remove a virtual MFA device**

The following delete-virtual-mfa-device command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \\n--serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the AWS IAM User Guide.

- For API details, see DeleteVirtualMfaDevice in AWS CLI Command Reference.

**detach-group-policy**

The following code example shows how to use detach-group-policy.

**AWS CLI**

**To detach a policy from a group**

This example removes the managed policy with the ARN
arn:aws:iam::123456789012:policy/TesterAccessPolicy from the group called Testers.

```
aws iam detach-group-policy \\n--group-name Testers \\n--policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.
For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see DetachGroupPolicy in AWS CLI Command Reference.

**detach-role-policy**

The following code example shows how to use detach-role-policy.

**AWS CLI**

**To detach a policy from a role**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called FedTesterRole.

```bash
aws iam detach-role-policy \
   --role-name FedTesterRole \ 
   --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see DetachRolePolicy in AWS CLI Command Reference.

**detach-user-policy**

The following code example shows how to use detach-user-policy.

**AWS CLI**

**To detach a policy from a user**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```bash
aws iam detach-user-policy \
   --user-name Bob \ 
   --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.
For more information, see Changing permissions for an IAM user in the AWS IAM User Guide.

- For API details, see DetachUserPolicy in AWS CLI Command Reference.

**enable-mfa-device**

The following code example shows how to use enable-mfa-device.

**AWS CLI**

**To enable an MFA device**

After you use the create-virtual-mfa-device command to create a new virtual MFA device, you can assign the MFA device to a user. The following enable-mfa-device example assigns the MFA device with the serial number arn:aws:iam::210987654321:mfa/BobsMFADevice to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
   --user-name Bob \
   --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
   --authentication-code1 123456 \
   --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see EnableMfaDevice in AWS CLI Command Reference.

**generate-credential-report**

The following code example shows how to use generate-credential-report.

**AWS CLI**

**To generate a credential report**

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```
Output:

```json
{
  "State": "STARTED",
  "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see [Getting credential reports for your AWS account](aws-iam-user-guide) in the *AWS IAM User Guide*.

- For API details, see [GenerateCredentialReport](aws-cli-command-reference) in *AWS CLI Command Reference*.

### generate-organizations-access-report

The following code example shows how to use `generate-organizations-access-report`.

#### AWS CLI

**Example 1: To generate an access report for a root in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb
```

Output:

```json
{
  "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

**Example 2: To generate an access report for an account in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 123456789012 in the organization o-4fxmplt198. You can display the report after it's created by running the `get-organizations-access-report` command.
aws iam generate-organizations-access-report \
   --entity-path o-4fxmplt198/r-c3xb/123456789012

Output:

{
   "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"
}

Example 3: To generate an access report for an account in an organizational unit in an organization

The following generate-organizations-access-report example starts a background job to create an access report for account ID 234567890123 in organizational unit ou-c3xb-lmu7j2yg in the organization o-4fxmplt198. You can display the report after it's created by running the get-organizations-access-report command.

aws iam generate-organizations-access-report \
   --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123

Output:

{
   "JobId": "2eb6c6e6-0xmp-ec04-1425-c937916a6af"
}

To get details about roots and organizational units in your organization, use the organizations list-roots and organizations list-organizational-units-for-parent commands.

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GenerateOrganizationsAccessReport in AWS CLI Command Reference.

generate-service-last-accessed-details

The following code example shows how to use generate-service-last-accessed-details.
Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details
   --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
   "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

Example 2: To generate a service access report for the AWS managed `AdministratorAccess` policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details
   --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
   "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see `GenerateServiceLastAccessedDetails` in AWS CLI Command Reference.
get-access-key-last-used

The following code example shows how to use get-access-key-last-used.

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key ABCDEEXAMPLE was last used.

```
aws iam get-access-key-last-used \
    --access-key-id ABCDEEXAMPLE
```

Output:

```
{
    "UserName": "Bob",
    "AccessKeyLastUsed": {
        "Region": "us-east-1",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see GetAccessKeyLastUsed in AWS CLI Command Reference.

get-account-authorization-details

The following code example shows how to use get-account-authorization-details.

AWS CLI

To list an AWS accounts IAM users, groups, roles, and policies

The following get-account-authorization-details command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```
Output:
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "RoleId": "AROA1234567890EXAMPLE",
            "CreateDate": "2014-07-30T17:09:20Z",
            "InstanceProfileList": [
                {
                    "InstanceProfileId": "AIPA1234567890EXAMPLE",
                    "Roles": [
                        {
                            "AssumeRolePolicyDocument": {
                                "Version": "2012-10-17",
                                "Statement": [
                                    {
                                        "Effect": "Allow",
                                        "Principal": {
                                            "Service": "ec2.amazonaws.com"
                                        },
                                        "Action": "sts:AssumeRole"
                                    }
                                ]
                            },
                            "RoleId": "AROA1234567890EXAMPLE",
                            "CreateDate": "2014-07-30T17:09:20Z",

For more information, see AWS security audit guidelines in the AWS IAM User Guide.

- For API details, see GetAccountAuthorizationDetails in AWS CLI Command Reference.

**get-account-password-policy**

The following code example shows how to use get-account-password-policy.

**AWS CLI**

To see the current account password policy
The following `get-account-password-policy` command displays details about the password policy for the current account.

```bash
aws iam get-account-password-policy
```

Output:

```json
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see `GetAccountPasswordPolicy` in AWS CLI Command Reference.

**get-account-summary**

The following code example shows how to use `get-account-summary`.

**AWS CLI**

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```bash
aws iam get-account-summary
```

Output:

```json
{
    "SummaryMap": {
```
For more information about entity limitations, see IAM and AWS STS quotas in the AWS IAM User Guide.

- For API details, see GetAccountSummary in AWS CLI Command Reference.

get-context-keys-for-custom-policy

The following code example shows how to use get-context-keys-for-custom-policy.

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following get-context-keys-for-custom-policy command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands
simulate-custom-policy and simulate-custom-policy. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the get-context-keys-for-custom-policy command. Parameter values that begin with file:// instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
   --policy-input-list '{"Version":"2012-10-17","Statement":
   {"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}'}
```

Output:

```
{
   "ContextKeyNames": [
      "aws:username",
      "aws:CurrentTime"
   ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following get-context-keys-for-custom-policy command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[ "Policy1",
  "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ".

```
```
This file can then be submitted to the following command.

```bash
aws iam get-context-keys-for-custom-policy \
   --policy-input-list file://policyfile.json
```

Output:

```json
{
   "ContextKeyNames": [
       "aws:username",
       "aws:CurrentTime"
   ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the AWS IAM User Guide.

- For API details, see GetContextKeysForCustomPolicy in AWS CLI Command Reference.

**get-context-keys-for-principal-policy**

The following code example shows how to use get-context-keys-for-principal-policy.

**AWS CLI**

**To list the context keys referenced by all policies associated with an IAM principal**

The following get-context-keys-for-principal-policy command retrieves all policies that are attached to the user saanvi and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the simulate-custom-policy and simulate-principal-policy commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the get-context-keys-for-custom-policy command.

```bash
aws iam get-context-keys-for-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```
Output:

```json
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see [Using the IAM Policy Simulator (AWS CLI and AWS API)](https://aws.amazon.com/documentation/iam/userguide/) in the **AWS IAM User Guide**.

- For API details, see [GetContextKeysForPrincipalPolicy](https://aws.amazon.com/documentation/iam/reference/) in **AWS CLI Command Reference**.

---

### get-credential-report

The following code example shows how to use `get-credential-report`.

**AWS CLI**

**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```bash
aws iam get-credential-report
```

Output:

```json
{
    "GeneratedTime": "2015-06-17T19:11:50Z",
    "ReportFormat": "text/csv"
}
```

For more information, see [Getting credential reports for your AWS account](https://aws.amazon.com/documentation/iam/userguide/) in the **AWS IAM User Guide**.

- For API details, see [GetCredentialReport](https://aws.amazon.com/documentation/iam/reference/) in **AWS CLI Command Reference**.

---

### get-group-policy

The following code example shows how to use `get-group-policy`.

---

**Actions and scenarios**

3449
AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named Test-Group.

```bash
aws iam get-group-policy \
   --group-name Test-Group \
   --policy-name S3-ReadOnly-Policy
```

Output:

```json
{
   "GroupName": "Test-Group",
   "PolicyDocument": {
      "Statement": [
         {
            "Action": ["s3:Get*", "s3:List"]
         },
         "Resource": "*",
         "Effect": "Allow"
      ]
   },
   "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see [Managing IAM policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policies.html) in the AWS IAM User Guide.

get-group

The following code example shows how to use `get-group`.

AWS CLI

To get an IAM group

This example returns details about the IAM group Admins.
aws iam get-group
   --group-name Admins

Output:

```
{
   "Group": {
      "Path": "/",
      "CreateDate": "2015-06-16T19:41:48Z",
      "GroupId": "AIDGPMS9R04H3FEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admins",
      "GroupName": "Admins"
   },
   "Users": []
}
```

For more information, see IAM Identities (users, user groups, and roles) in the AWS IAM User Guide.

- For API details, see GetGroup in AWS CLI Command Reference.

### get-instance-profile

The following code example shows how to use get-instance-profile.

**AWS CLI**

**To get information about an instance profile**

The following get-instance-profile command gets information about the instance profile named ExampleInstanceProfile.

```
aws iam get-instance-profile \
   --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
   "InstanceProfile": {
      "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
      "Roles": []
   }
}
```
For more information, see [Using instance profiles](#) in the AWS IAM User Guide.

- For API details, see [GetInstanceProfile](#) in AWS CLI Command Reference.

### get-login-profile

The following code example shows how to use `get-login-profile`.

**AWS CLI**

**To get password information for an IAM user**

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```bash
aws iam get-login-profile
    --user-name Bob
```

**Output:**

```json
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```
The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a NoSuchEntity error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see [Managing passwords for IAM users](https://docs.aws.amazon.com/iam/latest/userguide/managing-passwords.html) in the *AWS IAM User Guide*.

- For API details, see [GetLoginProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/get-login-profile.html) in *AWS CLI Command Reference*.

---

**get-mfa-device**

The following code example shows how to use `get-mfa-device`.

**AWS CLI**

**To retrieve information about a FIDO security key**

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \
    --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{
    "UserName": "alice",
    "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE",
    "EnableDate": "2023-09-19T01:49:18+00:00",
    "Certifications": {
        "FIDO": "L1"
    }
}
```

For more information, see [Using multi-factor authentication (MFA) in AWS](https://docs.aws.amazon.com/iam/latest/userguide/mfa.html) in the *AWS IAM User Guide*. 
• For API details, see GetMfaDevice in AWS CLI Command Reference.

**get-open-id-connect-provider**

The following code example shows how to use get-open-id-connect-provider.

**AWS CLI**

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is arn:aws:iam::123456789012:oidc-provider/server.example.com.

```bash
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```json
{
    "Url": "server.example.com",
    "CreateDate": "2015-06-16T19:41:48Z",
    "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
    ],
    "ClientIDList": [
        "example-application-ID"
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

• For API details, see GetOpenIdConnectProvider in AWS CLI Command Reference.

**get-organizations-access-report**

The following code example shows how to use get-organizations-access-report.

**AWS CLI**

To retrieve an access report
The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```bash
aws iam get-organizations-access-report \
   --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

Output:

```json
{
   "JobStatus": "COMPLETED",
   "JobCreationDate": "2019-09-30T06:53:36.187Z",
   "JobCompletionDate": "2019-09-30T06:53:37.547Z",
   "NumberOfServicesAccessible": 188,
   "NumberOfServicesNotAccessed": 171,
   "AccessDetails": [  
      {
         "ServiceName": "Alexa for Business",
         "ServiceNamespace": "a4b",
         "TotalAuthenticatedEntities": 0
      },...
   }
}
```

For more information, see [Refining permissions in AWS using last accessed information](aws-iam-user-guide) in the [AWS IAM User Guide](aws-iam-user-guide).

- For API details, see [GetOrganizationsAccessReport](aws-cli-command-reference) in [AWS CLI Command Reference](aws-cli-command-reference).

### get-policy-version

The following code example shows how to use `get-policy-version`.

**AWS CLI**

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```bash
aws iam get-policy-version \
```
```bash
--policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
--version-id v2
```

Output:

```
{
   "PolicyVersion": {
      "Document": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Effect": "Allow",
               "Action": "iam:*",
               "Resource": "*"
            }
         ],
         "VersionId": "v2",
         "IsDefaultVersion": true,
         "CreateDate": "2023-04-11T00:22:54+00:00"
      }
   }
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions-in-iam.html) in the *AWS IAM User Guide*.

### get-policy

The following code example shows how to use `get-policy`.

#### AWS CLI

To retrieve information about the specified managed policy

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam get-policy \
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:
get-role-policy

The following code example shows how to use `get-role-policy`.

**AWS CLI**

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named Test-Role.

```bash
aws iam get-role-policy \
  --role-name Test-Role \
  --policy-name ExamplePolicy
```

Output:

```json
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
    "Statement": [
      {
        "Action": ["s3:ListBucket",
                    "s3:GetObject"
                   ],
        "Effect": "Allow",
        "Resource": "arn:aws:s3:::examplebucket/*"
      }
    ],
    "Version": "1"
  }
}
```
For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see GetRolePolicy in AWS CLI Command Reference.

get-role

The following code example shows how to use get-role.

AWS CLI

To get information about an IAM role

The following get-role command gets information about the role named Test-Role.

```
aws iam get-role \
   --role-name Test-Role
```

Output:

```
{
   "Role": {
      "Description": "Test Role",
      "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
      "MaxSessionDuration": 3600,
      "RoleId": "AROA1234567890EXAMPLE",
      "CreateDate": "2019-11-13T16:45:56Z",
      "RoleName": "Test-Role",
      "Path": "/",
      "RoleLastUsed": {
```
The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see `GetRole` in AWS CLI Command Reference.

**get-saml-provider**

The following code example shows how to use get-saml-provider.

**AWS CLI**

**To retrieve the SAML provider metadocument**

This example retrieves the details about the SAML 2.0 provider whose ARM is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```bash
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

**Output:**

```json
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2017-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        }
    ],
```
"Key": "Department",
"Value": "Accounting"
]
}
}

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see GetSamlProvider in AWS CLI Command Reference.

**get-server-certificate**

The following code example shows how to use get-server-certificate.

**AWS CLI**

**To get details about a server certificate in your AWS account**

The following get-server-certificate command retrieves all of the details about the specified server certificate in your AWS account.

```bash
aws iam get-server-certificate \ 
    --server-certificate-name myUpdatedServerCertificate
```

**Output:**

```json
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----
MIICiTCCAfICCQD6m7oRw0uX0jANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC
VVMxCzAJBgNVBAgTAldBMRAwDgYDVQQHEwdTZWF0dGxlMQ8wDQYDVQQKEwZBbWF6
b24xFDASBgNVBAoTC0lBTSBDb25zb2l0eCAOBoIhMCVVMxCzAJBgNVBAcTAlNQWQgEj
MQswCQYDVQQDDA5OQXV0dGxlM headset4FQjAEF1dMQGQwHwYDVR0fMCMCAWQGCCsGA
"}
```
To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see [Managing server certificates in IAM](#) in the [AWS IAM User Guide](#).

- For API details, see [GetServerCertificate](#) in [AWS CLI Command Reference](#).

**get-service-last-accessed-details-with-entities**

The following code example shows how to use `get-service-last-accessed-details-with-entities`.

**AWS CLI**

To retrieve a service access report with details for a service
The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
   --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
   --service-namespace lambda
```

Output:

```
{
   "JobStatus": "COMPLETED",
   "JobCreationDate": "2019-10-01T03:55:41.756Z",
   "JobCompletionDate": "2019-10-01T03:55:42.533Z",
   "EntityDetailsList": [
      {
         "EntityInfo": {
            "Arn": "arn:aws:iam::123456789012:user/admin",
            "Name": "admin",
            "Type": "USER",
            "Id": "AIDAIO2XMPLENQEXAMPLE",
            "Path": "/"
         },
         "LastAuthenticated": "2019-09-30T23:02:00Z"
      },
      {
         "EntityInfo": {
            "Arn": "arn:aws:iam::123456789012:user/developer",
            "Name": "developer",
            "Type": "USER",
            "Id": "AIDAIBEYXMPL2YEXAMPLE",
            "Path": "/"
         },
         "LastAuthenticated": "2019-09-16T19:34:00Z"
      }
   ]
}
```

For API details, see `GetServiceLastAccessedDetailsWithEntities` in *AWS CLI Command Reference*.

**get-service-last-accessed-details**

The following code example shows how to use `get-service-last-accessed-details`.

**AWS CLI**

**To retrieve a service access report**

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```bash
aws iam get-service-last-accessed-details \
   --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cddf
```

**Output:**

```json
{
   "JobStatus": "COMPLETED",
   "JobCreationDate": "2019-10-01T03:50:35.929Z",
   "ServicesLastAccessed": [
      {
         "ServiceName": "AWS Lambda",
         "LastAuthenticated": "2019-09-30T23:02:00Z",
         "ServiceNamespace": "lambda",
         "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
         "TotalAuthenticatedEntities": 6
      }
   ]
}
```

For more information, see [Refining permissions in AWS using last accessed information](https://docs.aws.amazon.com/IAM/latest/UserGuide/id permissions-refining_permissions-last-accessed-information.html) in the *AWS IAM User Guide*.

For API details, see `GetServiceLastAccessedDetails` in *AWS CLI Command Reference*. 
get-service-linked-role-deletion-status

The following code example shows how to use get-service-linked-role-deletion-status.

**AWS CLI**

**To check the status of a request to delete a service-linked role**

The following get-service-linked-role-deletion-status example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a DeletionTaskId value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
  --deletion-task-id task/aws-service-role/lex.amazonaws.com/\n  AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
  "Status": "SUCCEEDED"
}
```

For more information, see [Using service-linked roles](#) in the AWS IAM User Guide.

- For API details, see GetServiceLinkedRoleDeletionStatus in AWS CLI Command Reference.

get-ssh-public-key

The following code example shows how to use get-ssh-public-key.

**AWS CLI**

**Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form**

The following get-ssh-public-key command retrieves the specified SSH public key from the IAM user sofia. The output is in SSH encoding.

```
aws iam get-ssh-public-key \
  --user-name sofia \n  --ssh-public-key-id APKA123456789EXAMPLE \n```
Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user sofia. The output is in PEM encoding.

```
aws iam get-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE \
   --encoding PEM
```

Output:

```
{
   "SSHPublicKey": {
      "UserName": "sofia",
      "SSHPublicKeyId": "APKA123456789EXAMPLE",
      "SSHPublicKeyBody": "-----BEGIN PUBLIC KEY-----
<<long encoded PEM string>>
-----END PUBLIC KEY-----",
      "Status": "Inactive",
      "UploadDate": "2019-04-18T17:04:49+00:00"
   }
}
```

For more information, see [Use SSH keys and SSH with CodeCommit](https://docs.aws.amazon.com/iam/latest/userguide/ssh-keys.html) in the *AWS IAM User Guide*.

- For API details, see [GetSshPublicKey](https://docs.aws.amazon.com/cli/latest/reference/iam/get-ssh-public-key.html) in *AWS CLI Command Reference*. 
**get-user-policy**

The following code example shows how to use `get-user-policy`.

**AWS CLI**

**To list policy details for an IAM user**

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```bash
aws iam get-user-policy \
  --user-name Bob \
  --policy-name ExamplePolicy
```

**Output:**

```json
{
  "UserName": "Bob",
  "PolicyName": "ExamplePolicy",
  "PolicyDocument": {
    "Version": "2012-10-17",
    "Statement": [
      {
        "Action": "*",
        "Resource": "*",
        "Effect": "Allow"
      }
    ]
  }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/iam/latest/userguide/).  

**get-user**

The following code example shows how to use `get-user`.

**Actions and scenarios**
AWS CLI

To get information about an IAM user

The following `get-user` command gets information about the IAM user named Paulo.

```bash
aws iam get-user \
    --user-name Paulo
```

Output:

```json
{
    "User": {
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the AWS IAM User Guide.

- For API details, see `GetUser` in AWS CLI Command Reference.

list-access-keys

The following code example shows how to use `list-access-keys`.

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```bash
aws iam list-access-keys \
    --user-name Bob
```

Output:

```json
{
```
You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the create-access-keys command.

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/userguide/managing-access-keys.html) in the *AWS IAM User Guide*.

- For API details, see [ListAccessKeys](https://docs.aws.amazon.com/cli/latest/reference/iam/list-access-keys.html) in *AWS CLI Command Reference*.

### list-account-aliases

The following code example shows how to use `list-account-aliases`.

**AWS CLI**

**To list account aliases**

The following `list-account-aliases` command lists the aliases for the current account.

```bash
aws iam list-account-aliases
```

**Output:**

```json
{
   "AccountAliases": [
      "mycompany"
   ]
}
```
For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see ListAccountAliases in AWS CLI Command Reference.

**list-attached-group-policies**

The following code example shows how to use list-attached-group-policies.

**AWS CLI**

**To list all managed policies that are attached to the specified group**

This example returns the names and ARNs of the managed policies that are attached to the IAM group named Admins in the AWS account.

```bash
aws iam list-attached-group-policies \
    --group-name Admins
```

**Output:**

```json
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListAttachedGroupPolicies in AWS CLI Command Reference.

**list-attached-role-policies**

The following code example shows how to use list-attached-role-policies.
AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named SecurityAuditRole in the AWS account.

```
aws iam list-attached-role-policies \
  --role-name SecurityAuditRole
```

Output:

```
{
   "AttachedPolicies": [
      {
         "PolicyName": "SecurityAudit",
         "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
      }
   ],
   "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
- For API details, see ListAttachedRolePolicies in AWS CLI Command Reference.

list-attached-user-policies

The following code example shows how to use list-attached-user-policies.

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
  --user-name Bob
```

Output:
For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListAttachedUserPolicies](#) in *AWS CLI Command Reference*.

**list-entities-for-policy**

The following code example shows how to use `list-entities-for-policy`.

**AWS CLI**

*To list all users, groups, and roles that the specified managed policy is attached to*

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
   --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

**Output:**

```json
{
   "PolicyGroups": [
      {
         "GroupName": "Admins",
         "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
      }
   ],
   "IsTruncated": false
}
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListEntitiesForPolicy in AWS CLI Command Reference.

list-group-policies

The following code example shows how to use list-group-policies.

AWS CLI

To list all inline policies that are attached to the specified group

The following list-group-policies command lists the names of inline policies that are attached to the IAM group named Admins in the current account.

```
aws iam list-group-policies \
  --group-name Admins
```

Output:

```json
{
  "PolicyNames": [
    "AdminRoot",
    "ExamplePolicy"
  ]
}
```
For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see ListGroupPolicies in AWS CLI Command Reference.

list-groups-for-user

The following code example shows how to use list-groups-for-user.

AWS CLI

To list the groups that an IAM user belongs to

The following list-groups-for-user command displays the groups that the IAM user named Bob belongs to.

```bash
aws iam list-groups-for-user \
  --user-name Bob
```

Output:

```json
{
   "Groups": [
   {
      "Path": "/",
      "CreateDate": "2013-05-06T01:18:08Z",
      "GroupId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admin",
      "GroupName": "Admin"
   },
   {
      "Path": "/",
      "CreateDate": "2013-05-06T01:37:28Z",
      "GroupId": "AKIAI44QH8DHBEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/s3-Users",
      "GroupName": "s3-Users"
   }
   ]
}
```

For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see ListGroupsForUser in AWS CLI Command Reference.
**list-groups**

The following code example shows how to use list-groups.

**AWS CLI**

**To list the IAM groups for the current account**

The following list-groups command lists the IAM groups in the current account.

```bash
aws iam list-groups
```

Output:

```
{
   "Groups": [
   {
       "Path": "/",
       "CreateDate": "2013-06-04T20:27:27.972Z",
       "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
       "Arn": "arn:aws:iam::123456789012:group/Admins",
       "GroupName": "Admins"
   },
   {
       "Path": "/",
       "CreateDate": "2013-04-16T20:30:42Z",
       "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
       "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
       "GroupName": "S3-Admins"
   }
   ]
}
```

For more information, see [Managing IAM user groups](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-users-list-groups.html) in the AWS IAM User Guide.

- For API details, see [ListGroups](https://docs.aws.amazon.com/cli/latest/reference/iam/list-groups.html) in AWS CLI Command Reference.

**list-instance-profile-tags**

The following code example shows how to use list-instance-profile-tags.
AWS CLI

To list the tags attached to an instance profile

The following `list-instance-profile-tags` command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
    --instance-profile-name deployment-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/idTags.html) in the AWS IAM User Guide.

- For API details, see [ListInstanceProfileTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-instance-profile-tags.html) in AWS CLI Command Reference.

**list-instance-profiles-for-role**

The following code example shows how to use `list-instance-profiles-for-role`.

**AWS CLI**

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role Test-Role.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```
Output:

```json
{
   "InstanceProfiles": [
   {
      "InstanceProfileId": "AIGPMS9R04H3EXAMPLE",
      "Roles": [
         {
            "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
            "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
            "CreateDate": "2013-06-07T20:15Z",
            "RoleName": "Test-Role",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:role/Test-Role"
         }
      ],
      "CreateDate": "2013-06-07T21:05:24Z",
      "InstanceProfileName": "ExampleInstanceProfile",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/ExampleInstanceProfile"
   }
   ]
}
```

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see ListInstanceProfilesForRole in AWS CLI Command Reference.

**list-instance-profiles**

The following code example shows how to use list-instance-profiles.

**AWS CLI**

**To lists the instance profiles for the account**

The following list-instance-profiles command lists the instance profiles that are associated with the current account.

```bash
aws iam list-instance-profiles
```

**Output:**
{
    "InstanceProfiles": [
        {
            "Path": "/",
            "InstanceProfileName": "example-dev-role",
            "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
            "CreateDate": "2023-09-21T18:17:41+00:00",
            "Roles": [*
                {
                    "Path": "/",
                    "RoleName": "example-dev-role",
                    "RoleId": "AROAJSRTH4H7LEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                    "CreateDate": "2023-09-21T18:17:40+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ],
        },

        {
            "Path": "/",
            "InstanceProfileName": "example-s3-role",
            "InstanceProfileId": "AIPAJVJVNRIQFREXAMPLE",

                    "RoleId": "AROAJSRTH4H7LEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
                    "CreateDate": "2023-09-21T18:18:49+00:00",
                }
            ],
        }]
    }
}
```json
"AssumeRolePolicyDocument": {
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "ec2.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see ListInstanceProfiles in AWS CLI Command Reference.

**list-mfa-device-tags**

The following code example shows how to use list-mfa-device-tags.

**AWS CLI**

**To list the tags attached to an MFA device**

The following list-mfa-device-tags command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
    --serial-number arn:aws:iam::123456789012:mfa/alice
```

**Output:**

```json
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "Finance"
        },
        {
            "Key": "Location",
            "Value": "New York"
        }
    ]
}
```
For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/iam/latest/userguide/tagging-resources.html) in the *AWS IAM User Guide*.

- For API details, see [ListMfaDeviceTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-mfa-device-tags.html) in *AWS CLI Command Reference*.

### list-mfa-devices

The following code example shows how to use `list-mfa-devices`.

**AWS CLI**

**To list all MFA devices for a specified user**

This example returns details about the MFA device assigned to the IAM user Bob.

```bash
aws iam list-mfa-devices \
  --user-name Bob
```

**Output:**

```
{
  "MFADevices": [
    {
      "UserName": "Bob",
      "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
      "EnableDate": "2019-10-28T20:37:09+00:00"
    },
    {
      "UserName": "Bob",
      "SerialNumber": "GAKT12345678",
      "EnableDate": "2023-02-18T21:44:42+00:00"
    },
    {
      "UserName": "Bob",
      "SerialNumber": "ARWZ12345678",
      "EnableDate": "2023-02-18T21:44:42+00:00"
    }
  ]
}
```
For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see ListMfaDevices in AWS CLI Command Reference.

**list-open-id-connect-provider-tags**

The following code example shows how to use list-open-id-connect-provider-tags.

**AWS CLI**

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following list-open-id-connect-provider-tags command retrieves the list of tags associated with the specified OIDC identity provider.

```bash
aws iam list-open-id-connect-provider-tags \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

**Output:**

```json
{
   "Tags": [
   {
     "Key": "DeptID",
     "Value": "123456"
   },
   
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListOpenIdConnectProviderTags in AWS CLI Command Reference.

**list-open-id-connect-providers**

The following code example shows how to use list-open-id-connect-providers.

**AWS CLI**

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNs of all the OpenID Connect providers that are defined in the current AWS account.

```bash
aws iam list-open-id-connect-providers
```

Output:

```json
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com"
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see ListOpenIdConnectProviders in AWS CLI Command Reference.

**list-policies-granting-service-access**

The following code example shows how to use list-policies-granting-service-access.
To list the policies that grant a principal access to the specified service

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user sofia access to AWS CodeCommit service.

```bash
aws iam list-policies-granting-service-access \
   --arn arn:aws:iam::123456789012:user/sofia \
   --service-namespaces codecommit
```

Output:

```
{
   "PoliciesGrantingServiceAccess": [
      {
         "ServiceNamespace": "codecommit",
         "Policies": [
            {
               "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
               "PolicyType": "INLINE",
               "EntityType": "USER",
               "EntityName": "sofia"
            }
         ]
      },
      "IsTruncated": false
   }
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the AWS IAM User Guide.

- For API details, see ListPoliciesGrantingServiceAccess in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use `list-policies`.

**AWS CLI**

To list managed policies that are available to your AWS account
This example returns a collection of the first two managed policies available in the current AWS account.

```bash
aws iam list-policies \
--max-items 3
```

Output:

```json
{
  "Policies": [
    {
      "PolicyName": "AWSCloudTrailAccessPolicy",
      "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 0,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2019-09-04T17:43:42+00:00",
      "UpdateDate": "2019-09-04T17:43:42+00:00"
    },
    {
      "PolicyName": "AdministratorAccess",
      "PolicyId": "ANPAIWMBCKSKIE64ZLYK",
      "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
      "Path": "/",
      "DefaultVersionId": "v1",
      "AttachmentCount": 6,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
      "CreateDate": "2015-02-06T18:39:46+00:00",
      "UpdateDate": "2015-02-06T18:39:46+00:00"
    },
    {
      "PolicyName": "PowerUserAccess",
      "PolicyId": "ANPAJYRXTHIB4F0VS3ZXS",
      "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
      "Path": "/",
      "DefaultVersionId": "v5",
      "AttachmentCount": 1,
      "PermissionsBoundaryUsageCount": 0,
      "IsAttachable": true,
```
list-policy-tags

The following code example shows how to use `list-policy-tags`.

**AWS CLI**

To list the tags attached to a managed policy

The following `list-policy-tags` command retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags \
  --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
      "Key": "Department",
      "Value": "Accounting"
    }
  ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/userguide/tutorials-tag-iam-resources.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest/userguide/tutorials-tag-iam-resources.html).

- For API details, see [ListPolicyTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-tags.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-tags.html).
list-policy-versions

The following code example shows how to use list-policy-versions.

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```bash
aws iam list-policy-versions \
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```json
{
   "IsTruncated": false,
   "Versions": [
      {
         "VersionId": "v2",
         "IsDefaultVersion": true,
         "CreateDate": "2015-06-02T23:19:44Z"
      },
      {
         "VersionId": "v1",
         "IsDefaultVersion": false,
         "CreateDate": "2015-06-02T22:30:47Z"
      }
   ]
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListPolicyVersions in AWS CLI Command Reference.

list-role-policies

The following code example shows how to use list-role-policies.

AWS CLI

To list the policies attached to an IAM role
The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
    "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see [Creating IAM roles](#) in the [AWS IAM User Guide](#).

- For API details, see [ListRolePolicies](#) in [AWS CLI Command Reference](#).

### list-role-tags

The following code example shows how to use `list-role-tags`.

**AWS CLI**

**To list the tags attached to a role**

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
    {
        "Key": "Department",
        "Value": "Accounting"
    }
    ]
}
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListRoleTags in AWS CLI Command Reference.

### list-roles

The following code example shows how to use list-roles.

**AWS CLI**

**To list IAM roles for the current account**

The following list-roles command lists IAM roles for the current account.

```bash
aws iam list-roles
```

Output:

```json
{
  "Roles": [
    {
      "Path": "/",
      "RoleName": "ExampleRole",
      "RoleId": "AROAJ52OTH4H7LEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
      "CreateDate": "2017-09-12T19:23:36+00:00",
      "AssumeRolePolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
              "Service": "ec2.amazonaws.com"
            }
          }
        ]
      }
    }
  ]
}
```
For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see ListRoles in AWS CLI Command Reference.

**list-saml-provider-tags**

The following code example shows how to use list-saml-provider-tags.

**AWS CLI**

To list the tags attached to a SAML provider
The following `list-saml-provider-tags` command retrieves the list of tags associated with the specified SAML provider.

```bash
aws iam list-saml-provider-tags \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```json
{
   "Tags": [
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      {
         "Key": "Department",
         "Value": "Accounting"
      }
   ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/iam/latest/userguide/tagging-iam-resources.html) in the *AWS IAM User Guide*.

- For API details, see [ListSamlProviderTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-saml-provider-tags.html) in *AWS CLI Command Reference*.

### list-saml-providers

The following code example shows how to use `list-saml-providers`.

**AWS CLI**

#### To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```bash
aws iam list-saml-providers
```

Output:

```json
{
   "SAMLProviderList": [
```
The following code example shows how to use `list-server-certificate-tags`.

**AWS CLI**

To list the tags attached to a server certificate

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```bash
aws iam list-server-certificate-tags \
--server-certificate-name ExampleCertificate
```

Output:

```json
{
   "Tags": [
   {
      "Key": "DeptID",
      "Value": "123456"
   },
   {
      "Key": "Department",
      "Value": "Accounting"
   }
   ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tag-resources.html) in the AWS IAM User Guide.
list-server-certificates

The following code example shows how to use list-server-certificates.

AWS CLI

To list the server certificates in your AWS account

The following list-server-certificates command lists all of the server certificates stored and available for use in your AWS account.

aws iam list-server-certificates

Output:

```
{
   "ServerCertificateMetadataList": [
      {
         "Path": "/",
         "ServerCertificateName": "myUpdatedServerCertificate",
         "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
         "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
         "UploadDate": "2019-04-22T21:13:44+00:00",
         "Expiration": "2019-10-15T22:23:16+00:00"
      },
      {
         "Path": "/cloudfront/",
         "ServerCertificateName": "MyTestCert",
         "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
         "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyTestCert",
         "UploadDate": "2015-04-21T18:14:16+00:00",
         "Expiration": "2018-01-14T17:52:36+00:00"
      }
   ]
}
```

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

• For API details, see ListServerCertificateTags in AWS CLI Command Reference.
list-service-specific-credential

The following code example shows how to use `list-service-specific-credential`.

AWS CLI

Example 1: List the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```bash
aws iam list-service-specific-credentials \
  --user-name sofia
```

Output:

```json
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: List the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```bash
aws iam list-service-specific-credentials \
  --service-name codecommit.amazonaws.com
```

Output:

```json
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
```

Actions and scenarios
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredential in AWS CLI Command Reference.

```bash
aws iam list-service-specific-credentials \
  --user-name developer \
  --service-name codecommit.amazonaws.com
```

Output:

```json
{
  "ServiceSpecificCredentials": [
    {
      "UserName": "developer",
      "Status": "Inactive",
      "ServiceUserName": "developer-at-123456789012",
      "CreateDate": "2019-10-01T04:31:41Z",
      "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
      "ServiceName": "codecommit.amazonaws.com"
    },
    {
      "UserName": "developer",
```

```json
```
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredentials in AWS CLI Command Reference.

### list-signing-certificates

The following code example shows how to use list-signing-certificates.

**AWS CLI**

**To list the signing certificates for an IAM user**

The following `list-signing-certificates` command lists the signing certificates for the IAM user named Bob.

```bash
aws iam list-signing-certificates \
   --user-name Bob
```

Output:

```json
{
   "Certificates": [
      {
         "UserName": "Bob",
         "Status": "Inactive",
         "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
         "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
         "UploadDate": "2013-06-06T21:40:08Z"
      }
   ]
}
```
For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see ListSigningCertificates in AWS CLI Command Reference.

**list-ssh-public-keys**

The following code example shows how to use list-ssh-public-keys.

**AWS CLI**

**To list the SSH public keys attached to an IAM user**

The following list-ssh-public-keys example lists the SSH public keys attached to the IAM user sofia.

```
aws iam list-ssh-public-keys \
   --user-name sofia
```

Output:

```json
{
   "SSHPublicKeys": [
      {
         "UserName": "sofia",
         "SSHPublicKeyId": "APKA1234567890EXAMPLE",
         "Status": "Inactive",
         "UploadDate": "2019-04-18T17:04:49+00:00"
      }
   ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.
- For API details, see ListSshPublicKeys in AWS CLI Command Reference.

**list-user-policies**

The following code example shows how to use list-user-policies.

**AWS CLI**

**To list policies for an IAM user**
The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```bash
aws iam list-user-policies \
   --user-name Bob
```

Output:

```json
{
   "PolicyNames": [
      "ExamplePolicy",
      "TestPolicy"
   ]
}
```

For more information, see [Creating an IAM user in your AWS account](https://docs.aws.amazon.com/IAM/latest/UserGuide/creating-an-iam-user-in-your-aws-account.html) in the *AWS IAM User Guide*.

- For API details, see [ListUserPolicies](https://docs.aws.amazon.com/cli/latest/reference/iam/list-user-policies.html) in *AWS CLI Command Reference*.

---

**list-user-tags**

The following code example shows how to use `list-user-tags`.

**AWS CLI**

**To list the tags attached to a user**

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```bash
aws iam list-user-tags \
   --user-name alice
```

Output:

```json
{
   "Tags": [
      {
         "Key": "Department",
         "Value": "Accounting"
      },
      {
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListUserTags in AWS CLI Command Reference.

**list-users**

The following code example shows how to use list-users.

**AWS CLI**

**To list IAM users**

The following `list-users` command lists the IAM users in the current account.

```sh
aws iam list-users
```

**Output:**

```json
{
   "Users": [
   {
      "UserName": "Adele",
      "Path": "/",
      "CreateDate": "2013-03-07T05:14:48Z",
      "UserId": "AKIAI44QH8DHBEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Adele"
   },
   {
      "UserName": "Bob",
      "Path": "/",
      "CreateDate": "2012-09-21T23:03:13Z",
      "UserId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Bob"
   }
   ]
}
```
For more information, see Listing IAM users in the AWS IAM User Guide.

- For API details, see ListUsers in AWS CLI Command Reference.

list-virtual-mfa-devices

The following code example shows how to use `list-virtual-mfa-devices`.

**AWS CLI**

To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
   "VirtualMFADevices": [
      {
         "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
      },
      {
         "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
      }
   ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see ListVirtualMfaDevices in AWS CLI Command Reference.

put-group-policy

The following code example shows how to use `put-group-policy`.

**AWS CLI**

**To add a policy to a group**
The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```bash
aws iam put-group-policy \
  --group-name Admins \
  --policy-document file://AdminPolicy.json \
  --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see PutGroupPolicy in AWS CLI Command Reference.

**put-role-permissions-boundary**

The following code example shows how to use `put-role-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM role**

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
  --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
  --role-name lambda-application-role
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role**

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
  --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess
```
This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see PutRolePermissionsBoundary in AWS CLI Command Reference.

**put-role-policy**

The following code example shows how to use put-role-policy.

**AWS CLI**

**To attach a permissions policy to an IAM role**

The following put-role-policy command adds a permissions policy to the role named Test-Role.

```bash
aws iam put-role-policy \
  --role-name Test-Role \
  --policy-name ExamplePolicy \
  --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the AdminPolicy.json file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the update-assume-role-policy command.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see PutRolePolicy in AWS CLI Command Reference.

**put-user-permissions-boundary**

The following code example shows how to use put-user-permissions-boundary.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM user**
The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```bash
aws iam put-user-permissions-boundary \
  --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
  --user-name intern
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user**

The following `put-user-permissions-boundary` example applies the AWS managed policy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```bash
aws iam put-user-permissions-boundary \
  --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
  --user-name developer
```

This command produces no output.

- For API details, see [PutUserPermissionsBoundary](https://docs.aws.amazon.com/cli/latest/reference/iam/put-user-permissions-boundary.html) in *AWS CLI Command Reference*.

**put-user-policy**

The following code example shows how to use `put-user-policy`.

**AWS CLI**

**To attach a policy to an IAM user**

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```bash
aws iam put-user-policy \
  --user-name Bob \
  --policy-name ExamplePolicy \
  --policy-document file://AdminPolicy.json
```

This command produces no output.
The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

**remove-client-id-from-open-id-connect-provider**

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

**AWS CLI**

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID My-TestApp-3 from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
   --client-id My-TestApp-3 \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.

- For API details, see [RemoveClientIdFromOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iamacl/remove-client-id-from-open-id-connect-provider.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iamacl/).

**remove-role-from-instance-profile**

The following code example shows how to use `remove-role-from-instance-profile`.

**AWS CLI**

To remove a role from an instance profile
The following `remove-role-from-instance-profile` command removes the role named Test-Role from the instance profile named ExampleInstanceProfile.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see [Using instance profiles](https://docs.aws.amazon.com/IAM/latest/UserGuide/users-groups-guests.html) in the AWS IAM User Guide.

- For API details, see [RemoveRoleFromInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/remove-role-from-instance-profile.html) in AWS CLI Command Reference.

### remove-user-from-group

The following code example shows how to use `remove-user-from-group`.

**AWS CLI**

**To remove a user from an IAM group**

The following `remove-user-from-group` command removes the user named Bob from the IAM group named Admins.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see [Adding and removing users in an IAM user group](https://docs.aws.amazon.com/IAM/latest/UserGuide/tutorial-groups-users-as-admin.html) in the AWS IAM User Guide.

- For API details, see [RemoveUserFromGroup](https://docs.aws.amazon.com/cli/latest/reference/iam/remove-user-from-group.html) in AWS CLI Command Reference.

### reset-service-specific-credential

The following code example shows how to use `reset-service-specific-credential`.

**AWS CLI**

**Example 1: Reset the password for a service-specific credential attached to the user making the request**
The following reset-service-specific-credential example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```bash
aws iam reset-service-specific-credential \\
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
  "ServiceSpecificCredential": {
    "CreateDate": "2019-04-18T20:45:36+00:00",
    "ServiceName": "codecommit.amazonaws.com",
    "ServiceUserName": "sofia-at-123456789012",
    "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
    "UserName": "sofia",
    "Status": "Active"
  }
}
```

Example 2: Reset the password for a service-specific credential attached to a specified user

The following reset-service-specific-credential example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```bash
aws iam reset-service-specific-credential \\
  --user-name sofia \\
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
  "ServiceSpecificCredential": {
    "CreateDate": "2019-04-18T20:45:36+00:00",
    "ServiceName": "codecommit.amazonaws.com",
    "ServiceUserName": "sofia-at-123456789012",
    "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
    "UserName": "sofia",
    "Status": "Active"
  }
}
```
For more information, see [Create Git credentials for HTTPS connections to CodeCommit](https://docs.aws.amazon.com/codecommit/latest/userguide/create-code-credentials.html) in the [AWS CodeCommit User Guide](https://docs.aws.amazon.com/codecommit/latest/userguide/). 

### `resync-mfa-device`

The following code example shows how to use `resync-mfa-device`.

**AWS CLI**

**To synchronize an MFA device**

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```bash
aws iam resync-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
  --authentication-code1 123456 \
  --authentication-code2 987654
```

This command produces no output.

### `set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

**AWS CLI**

**To set the specified version of the specified policy as the policy's default version.**

```bash
```
This example sets the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy as the default active version.

```bash
aws iam set-default-policy-version \
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
  --version-id v2
```

For more information, see [Policies and permissions in IAM](https://aws.amazon.com/documentation/iam/) in the [AWS IAM User Guide](https).

**set-security-token-service-preferences**

The following code example shows how to use `set-security-token-service-preferences`.

**AWS CLI**

**To set the global endpoint token version**

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```bash
aws iam set-security-token-service-preferences \
  --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see [Managing AWS STS in an AWS Region](https://aws.amazon.com/documentation/iam/) in the [AWS IAM User Guide](https).

- For API details, see [SetSecurityTokenServicePreferences](https://docs.aws.amazon.com/cli/latest/reference/iam/set-security-token-service-preferences.html) in [AWS CLI Command Reference](https).

**simulate-custom-policy**

The following code example shows how to use `simulate-custom-policy`.

**AWS CLI**

**Example 1: To simulate the effects of all IAM policies associated with an IAM user or role**

The following `simulate-custom-policy` shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation
succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```bash
aws iam simulate-custom-policy \
   --policy-input-list '{"Version":"2012-10-17","Statement":
   {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
   {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
   --action-names dynamodb:CreateBackup \
   --context-entries
"ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```json
{
   "EvaluationResults": [ 
   {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [ 
      {
         "SourcePolicyId": "PolicyInputList.1",
         "StartPosition": {
            "Line": 1,
            "Column": 38
         },
         "EndPosition": {
            "Line": 1,
            "Column": 167
         }
      }],
      "MissingContextValues": []
   }
   ]
}
```

**Example 2: To simulate a command that is prohibited by the policy**

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.
aws iam simulate-custom-policy
   --policy-input-list '{"Version":"2012-10-17","Statement":
   {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
   {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}' \
   --action-names dynamodb:CreateBackup \
   --context-entries
"ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=date"

Output:

{
   "EvaluationResults": [ 
   {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "implicitDeny",
      "MatchedStatements": [],
      "MissingContextValues": []
   }
   ]
}

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.

- For API details, see SimulateCustomPolicy in AWS CLI Command Reference.

simulate-principal-policy

The following code example shows how to use simulate-principal-policy.

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following simulate-principal-policy shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the codecommit:ListRepositories action.

aws iam simulate-principal-policy \

actions and scenarios

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following simulate-principal-policy shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the codecommit:ListRepositories action.

aws iam simulate-principal-policy \

Actions and scenarios

3508
--policy-source-arn arn:aws:iam::123456789012:user/alejandro \
--action-names codecommit:ListRepositories

Output:

```
{
   "EvaluationResults": [
   {
      "EvalActionName": "codecommit:ListRepositories",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [
         {
            "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
            "StartPosition": {
               "Line": 3,
               "Column": 19
            },
            "EndPosition": {
               "Line": 9,
               "Column": 10
            }
         }
      ],
      "MissingContextValues": []
   }
   ]
}
```

Example 2: To simulate the effects of a prohibited command

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
   --action-names dynamodb:CreateBackup \
   --context-entries
   "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKeyType=date"
```
Output:

```
{
   "EvaluationResults": [
      {
         "EvalActionName": "dynamodb:CreateBackup",
         "EvalResourceName": "*",
         "EvalDecision": "implicitDeny",
         "MatchedStatements": [],
         "MissingContextValues": []
      }
   ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.

- For API details, see SimulatePrincipalPolicy in AWS CLI Command Reference.

**tag-instance-profile**

The following code example shows how to use tag-instance-profile.

**AWS CLI**

**To add a tag to an instance profile**

The following tag-instance-profile command adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
   --instance-profile-name deployment-role \ 
   --tags '[["Key": "Department", "Value": "Accounting"]]' 
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagInstanceProfile in AWS CLI Command Reference.

**tag-mfa-device**

The following code example shows how to use tag-mfa-device.
AWS CLI

To add a tag to an MFA device

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \
  --serial-number arn:aws:iam::123456789012:mfa/alice \
  --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tags_activities.html) in the *AWS IAM User Guide*.

- For API details, see [TagMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-mfa-device.html) in *AWS CLI Command Reference*.

**tag-open-id-connect-provider**

The following code example shows how to use `tag-open-id-connect-provider`.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
  --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tags_activities.html) in the *AWS IAM User Guide*.

- For API details, see [TagOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-open-id-connect-provider.html) in *AWS CLI Command Reference*.

**tag-policy**

The following code example shows how to use `tag-policy`. 
AWS CLI

**To add a tag to a customer managed policy**

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```bash
aws iam tag-policy \
  --policy-arn arn:aws:iam::123456789012:policy/billing-access \
  --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [TagPolicy](https://docs.aws.amazon.com/cli/latest/reference/index.html) in *AWS CLI Command Reference*.

**tag-role**

The following code example shows how to use `tag-role`.

AWS CLI

**To add a tag to a role**

The following `tag-role` command adds a tag with a Department name to the specified role.

```bash
aws iam tag-role --role-name my-role \
  --tags '{"Key": "Department", "Value": "Accounting"}'}
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [TagRole](https://docs.aws.amazon.com/cli/latest/reference/index.html) in *AWS CLI Command Reference*.

**tag-saml-provider**

The following code example shows how to use `tag-saml-provider`.

AWS CLI

**To add a tag to a SAML provider**
The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
   --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/idtápgsiam-resources-taggingsaml.html) in the *AWS IAM User Guide*.

- For API details, see [TagSamlProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-saml-provider.html) in *AWS CLI Command Reference*.

### tag-server-certificate

The following code example shows how to use `tag-server-certificate`.

**AWS CLI**

**To add a tag to a server certificate**

The following `tag-saml-provider` command adds a tag with a Department name to the specified server certificate.

```
aws iam tag-server-certificate \
   --server-certificate-name ExampleCertificate \
   --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/idtápgsiam-resources-taggingsaml.html) in the *AWS IAM User Guide*.

- For API details, see [TagServerCertificate](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-server-certificate.html) in *AWS CLI Command Reference*.

### tag-user

The following code example shows how to use `tag-user`.

**AWS CLI**

**To add a tag to a user**
The following `tag-user` command adds a tag with the associated Department to the specified user.

```bash
aws iam tag-user \
--user-name alice \
--tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the [AWS IAM User Guide](#).

- For API details, see [TagUser](#) in [AWS CLI Command Reference](#).

### untag-instance-profile

The following code example shows how to use `untag-instance-profile`.

**AWS CLI**

**To remove a tag from an instance profile**

The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```bash
aws iam untag-instance-profile \
--instance-profile-name deployment-role \
--tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the [AWS IAM User Guide](#).

- For API details, see [UntagInstanceProfile](#) in [AWS CLI Command Reference](#).

### untag-mfa-device

The following code example shows how to use `untag-mfa-device`.

**AWS CLI**

**To remove a tag from an MFA device**
The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```bash
aws iam untag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/idtágsimple.html) in the *AWS IAM User Guide*.

- For API details, see [UntagMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-mfa-device.html) in *AWS CLI Command Reference*.

### `untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

**AWS CLI**

**To remove a tag from an OIDC identity provider**

The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```bash
aws iam untag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
    --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/idtágsimple.html) in the *AWS IAM User Guide*.

- For API details, see [UntagOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-open-id-connect-provider.html) in *AWS CLI Command Reference*.

### `untag-policy`

The following code example shows how to use `untag-policy`.

**AWS CLI**

**To remove a tag from a customer managed policy**
The following untag-policy command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
  --policy-arn arn:aws:iam::452925170507:policy/billing-access \ 
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagPolicy in AWS CLI Command Reference.

untag-role

The following code example shows how to use untag-role.

AWS CLI

**To remove a tag from a role**

The following untag-role command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
  --role-name my-role \ 
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagRole in AWS CLI Command Reference.

untag-saml-provider

The following code example shows how to use untag-saml-provider.

AWS CLI

**To remove a tag from a SAML provider**
The following untag-saml-provider command removes any tag with the key name 'Department' from the specified instance profile.

```bash
aws iam untag-saml-provider \
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
- For API details, see UntagSamlProvider in AWS CLI Command Reference.

untag-server-certificate

The following code example shows how to use untag-server-certificate.

**AWS CLI**

**To remove a tag from a server certificate**

The following untag-server-certificate command removes any tag with the key name 'Department' from the specified server certificate.

```bash
aws iam untag-server-certificate \
  --server-certificate-name ExampleCertificate \
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
- For API details, see UntagServerCertificate in AWS CLI Command Reference.

untag-user

The following code example shows how to use untag-user.

**AWS CLI**

**To remove a tag from a user**
The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \\
   --user-name alice \\
   --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [UntagUser](https://docs.aws.amazon.com/cli/latest/reference/iam/untag-user.html) in *AWS CLI Command Reference*.

### update-access-key

The following code example shows how to use `update-access-key`.

**AWS CLI**

**To activate or deactivate an access key for an IAM user**

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \\
   --access-key-id AKIAIOSFODNN7EXAMPLE \\
   --status Inactive \\
   --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the *AWS IAM User Guide*.

- For API details, see [UpdateAccessKey](https://docs.aws.amazon.com/cli/latest/reference/iam/update-access-key.html) in *AWS CLI Command Reference*.

### update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

**Actions and scenarios**
To set or change the current account password policy

The following update-account-password-policy command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
   --minimum-password-length 8 \
   --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see UpdateAccountPasswordPolicy in AWS CLI Command Reference.

update-assume-role-policy

The following code example shows how to use update-assume-role-policy.

AWS CLI

To update the trust policy for an IAM role

The following update-assume-role-policy command updates the trust policy for the role named Test-Role.

```
aws iam update-assume-role-policy \
   --role-name Test-Role \
   --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the Test-Role-Trust-Policy.json file. (The file name and extension do not have significance.) The trust policy must specify a principal.
To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](https://docs.aws.amazon.com/IAM/latest/userguide/creating-iam-roles.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateAssumeRolePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/update-assume-role-policy.html) in *AWS CLI Command Reference*.

**update-group**

The following code example shows how to use `update-group`.

**AWS CLI**

To rename an IAM group

The following `update-group` command changes the name of the IAM group Test to Test-1.

```bash
code snippet
aws iam update-group \
   --group-name Test \
   --new-group-name Test-1
```

This command produces no output.

For more information, see [Renaming an IAM user group](https://docs.aws.amazon.com/IAM/latest/userguide/rename-iam-group.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateGroup](https://docs.aws.amazon.com/cli/latest/reference/iam/update-group.html) in *AWS CLI Command Reference*.

**update-login-profile**

The following code example shows how to use `update-login-profile`.

**AWS CLI**

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```bash
code snippet
aws iam update-login-profile \
   --user-name Bob \
   --password <password>
```
This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see [Managing passwords for IAM users](https://docs.aws.amazon.com/iam/latest/userguide/managing-passwords.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateLoginProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/update-login-profile.html) in *AWS CLI Command Reference*.

`update-open-id-connect-provider-thumbprint`

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

**AWS CLI**

**To replace the existing list of server certificate thumbprints with a new list**

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com \
  --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/iam/latest/userguide/idp-architecture.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateOpenIdConnectProviderThumbprint](https://docs.aws.amazon.com/cli/latest/reference/iam/update-open-id-connect-provider-thumbprint.html) in *AWS CLI Command Reference*. 
**update-role-description**

The following code example shows how to use `update-role-description`.

**AWS CLI**

**To change an IAM role's description**

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
   --role-name production-role \
   --description 'Main production role'
```

**Output:**

```
{
   "Role": {
      "Path": "/",
      "RoleName": "production-role",
      "RoleId": "AROA1234567890EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/production-role",
      "CreateDate": "2017-12-06T17:16:37+00:00",
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Effect": "Allow",
               "Principal": {
                  "AWS": "arn:aws:iam::123456789012:root"
               },
               "Action": "sts:AssumeRole",
               "Condition": {}
            }
         ]
      },
      "Description": "Main production role"
   }
}
```

For more information, see [Modifying a role](aws-iam-modify-role) in the *AWS IAM User Guide*. 
For API details, see `UpdateRoleDescription` in AWS CLI Command Reference.

**update-role**

The following code example shows how to use `update-role`.

**AWS CLI**

To change an IAM role's description or session duration

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```bash
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_saml-update-saml-provider.html) in the AWS IAM User Guide.

For API details, see `UpdateRole` in AWS CLI Command Reference.

**update-saml-provider**

The following code example shows how to use `update-saml-provider`.

**AWS CLI**

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```bash
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:
```json
{
   "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see [Creating IAM SAML identity providers](#) in the AWS IAM User Guide.

- For API details, see [UpdateSamlProvider](#) in AWS CLI Command Reference.

**update-server-certificate**

The following code example shows how to use `update-server-certificate`.

**AWS CLI**

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
   --server-certificate-name myServerCertificate \
   --new-server-certificate-name myUpdatedServerCertificate \
   --new-path /cloudfront/
```

This command produces no output.

For more information, see [Managing server certificates in IAM](#) in the AWS IAM User Guide.

- For API details, see [UpdateServerCertificate](#) in AWS CLI Command Reference.

**update-service-specific-credential**

The following code example shows how to use `update-service-specific-credential`.

**AWS CLI**

Example 1: To update the status of the requesting user's service-specific credential
The following `update-service-specific-credential` example changes the status for the specified credential for the user making the request to Inactive.

```
aws iam update-service-specific-credential \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \ 
  --status Inactive
```

This command produces no output.

**Example 2: To update the status of a specified user's service-specific credential**

The following `update-service-specific-credential` example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \
  --user-name sofia \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
  --status Inactive
```

This command produces no output.

For more information, see [Create Git Credentials for HTTPS Connections to CodeCommit](https://docs.aws.amazon.com/codecommit/latest/userguide/codecommit-getting-started.html) in the *AWS CodeCommit User Guide*

- For API details, see [UpdateServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/update-service-specific-credential.html) in *AWS CLI Command Reference*.

**update-signing-certificate**

The following code example shows how to use `update-signing-certificate`.

**AWS CLI**

**To activate or deactivate a signing certificate for an IAM user**

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
  --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
  --status Inactive \
  --user-name Bob
```
To get the ID for a signing certificate, use the list-signing-certificates command.

For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see UpdateSigningCertificate in AWS CLI Command Reference.

**update-ssh-public-key**

The following code example shows how to use update-ssh-public-key.

**AWS CLI**

**To change the status of an SSH public key**

The following update-ssh-public-key command changes the status of the specified public key to Inactive.

```bash
aws iam update-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA1234567890EXAMPLE \
   --status Inactive
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.

- For API details, see UpdateSshPublicKey in AWS CLI Command Reference.

**update-user**

The following code example shows how to use update-user.

**AWS CLI**

**To change an IAM user's name**

The following update-user command changes the name of the IAM user Bob to Robert.

```bash
aws iam update-user \
   --user-name Bob \
   --new-user-name Robert
```

This command produces no output.
For more information, see Renaming an IAM user group in the AWS IAM User Guide.

- For API details, see UpdateUser in AWS CLI Command Reference.

**upload-server-certificate**

The following code example shows how to use upload-server-certificate.

**AWS CLI**

To upload a server certificate to your AWS account

The following `upload-server-certificate` command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name `myServerCertificate`. Parameters that begin with `file://` tell the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
   --server-certificate-name myServerCertificate \
   --certificate-body file://public_key_cert_file.pem \
   --private-key file://my_private_key.pem \
   --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
   "ServerCertificateMetadata": {
      "Path": "/",
      "ServerCertificateName": "myServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
      "UploadDate": "2019-04-22T21:13:44+00:00",
      "Expiration": "2019-10-15T22:23:16+00:00"
   }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.
For API details, see [UploadServerCertificate](#) in *AWS CLI Command Reference*.

**upload-signing-certificate**

The following code example shows how to use `upload-signing-certificate`.

**AWS CLI**

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```bash
aws iam upload-signing-certificate \
   --user-name Bob \
   --certificate-body file://certificate.pem
```

Output:

```json
{
   "Certificate": {
      "UserName": "Bob",
      "Status": "Active",
      "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
      "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
      "UploadDate": "2013-06-06T21:40:08.121Z"
   }
}
```

The certificate is in a file named `certificate.pem` in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

For API details, see [UploadSigningCertificate](#) in *AWS CLI Command Reference*.

**upload-ssh-public-key**

The following code example shows how to use `upload-ssh-public-key`.

---

*Actions and scenarios* 3528
AWS CLI

To upload an SSH public key and associate it with a user

The following upload-ssh-public-key command uploads the public key found in the file sshkey.pub and attaches it to the user sofia.

```
aws iam upload-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-body file://sshkey.pub
```

Output:

```json
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA1234567890EXAMPLE",
        "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen command>>",
        "Status": "Active",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information about how to generate keys in a format suitable for this command, see SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the AWS CodeCommit User Guide.

- For API details, see UploadSshPublicKey in AWS CLI Command Reference.

IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**apply-archive-rule**

The following code example shows how to use `apply-archive-rule`.

**AWS CLI**

To apply an archive rule to existing findings that meet the archive rule criteria

The following `apply-archive-rule` example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \
  --rule-name MyArchiveRule
```

This command produces no output.

For more information, see [Archive rules](https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM-access-analyzer.html) in the *AWS IAM User Guide*.

- For API details, see [ApplyArchiveRule](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/apply-archive-rule.html) in *AWS CLI Command Reference*.

**cancel-policy-generation**

The following code example shows how to use `cancel-policy-generation`.

**AWS CLI**

To cancel the requested policy generation
The following cancel-policy-generation example cancels the requested policy generation job id.

```bash
aws accessanalyzer cancel-policy-generation \
  --job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbc6f2
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see `CancelPolicyGeneration` in AWS CLI Command Reference.

### check-access-not-granted

The following code example shows how to use check-access-not-granted.

AWS CLI

**To check whether the specified access isn't allowed by a policy**

The following check-access-not-granted example checks whether the specified access isn't allowed by a policy.

```bash
aws accessanalyzer check-access-not-granted \
  --policy-document file://myfile.json \
  --access actions="s3:DeleteBucket","s3:GetBucketLocation" \
  --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
```
The following code example shows how to use `check-no-new-access`.

**AWS CLI**

To check whether new access is allowed for an updated policy when compared to the existing policy

The following `check-no-new-access` example checks whether new access is allowed for an updated policy when compared to the existing policy.

```
aws accessanalyzer check-no-new-access \
  --existing-policy-document file://existing-policy.json \
  --new-policy-document file://new-policy.json \
  --policy-type IDENTITY_POLICY
```

Contents of `existing-policy.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
  ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide. For API details, see CheckAccessNotGranted in AWS CLI Command Reference.
Contents of new-policy.json:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:GetObjectAcl",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
            ]
        }
    ]
}
```

Output:

```json
{
    "result": "FAIL",
    "message": "The modified permissions grant new access compared to your existing policy.",
    "reasons": [
        {
            "description": "New access in the statement with index: 0."
        }
    ]
}
```
For more information, see [Previewing access with IAM Access Analyzer APIs](https://docs.aws.amazon.com/iam/latest/userguide/iam-access-analyzer-quickstart.html) in the *AWS IAM User Guide*.

- For API details, see [CheckNoNewAccess](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/check-n ovarify-new-access.html) in *AWS CLI Command Reference*.

### create-access-preview

The following code example shows how to use `create-access-preview`.

#### AWS CLI

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following `create-access-preview` example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```bash
aws accessanalyzer create-access-preview \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --configurations file://myfile.json
```

**Contents of `myfile.json`:**

```json
{
  "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
    "s3Bucket": {
      "bucketPublicAccessBlock": {
        "ignorePublicAcls": true,
        "restrictPublicBuckets": true
      },
      "bucketAclGrants": [
```
Actions and scenarios

```
{
    "grantee": {
        "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be",
        "permission": "READ"
    }
}

Output:

```
{
    "id": "3c65eb13-6ef9-4629-8919-a32043619e6b"
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CreateAccessPreview in AWS CLI Command Reference.

**create-analyzer**

The following code example shows how to use create-analyzer.

**AWS CLI**

**To create an analyzer**

The following create-analyzer example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
    --analyzer-name example \
    --type ACCOUNT
```

Output:

```
{
    "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example"
}
```
For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the AWS IAM User Guide.

- For API details, see CreateAnalyzer in AWS CLI Command Reference.

**create-archive-rule**

The following code example shows how to use create-archive-rule.

**AWS CLI**

To create an archive rule for the specified analyzer

The following create-archive-rule example creates an archive rule for the specified analyzer in your AWS account.

```bash
aws accessanalyzer create-archive-rule \
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyRule \
  --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see CreateArchiveRule in AWS CLI Command Reference.

**delete-analyzer**

The following code example shows how to use delete-analyzer.

**AWS CLI**

To delete the specified analyzer

The following delete-analyzer example deletes the specified analyzer in your AWS account.

```bash
aws accessanalyzer delete-analyzer \
  --analyzer-name example
```
This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteAnalyzer in AWS CLI Command Reference.

**delete-archive-rule**

The following code example shows how to use delete-archive-rule.

**AWS CLI**

To delete the specified archive rule

The following delete-archive-rule example deletes the specified archive rule in your AWS account.

```bash
code
aws accessanalyzer delete-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteArchiveRule in AWS CLI Command Reference.

**get-access-preview**

The following code example shows how to use get-access-preview.

**AWS CLI**

To retrieves information about an access preview for the specified analyzer

The following get-access-preview example retrieves information about an access preview for the specified analyzer in your AWS account.

```bash
code
aws accessanalyzer get-access-preview \
   --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```
Output:

```json
{
   "accessPreview": {
      "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
      "configurations": {
         "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
            "s3Bucket": {
               "bucketAclGrants": [{
                  "permission": "READ",
                  "grantee": {
                     "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                  }
               }],
               "bucketPublicAccessBlock": {
                  "ignorePublicAcls": true,
                  "restrictPublicBuckets": true
               }
            }
         }
      }
   },
   "createdAt": "2024-02-17T00:18:44+00:00",
   "status": "COMPLETED"
}
```

**get-analyzed-resource**

The following code example shows how to use `get-analyzed-resource`. 
AWS CLI

To retrieve information about a resource that was analyzed

The following get-analyzed-resource example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \\
    --resource-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET
```

Output:

```
{
    "resource": {
        "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
        "isPublic": false,
        "resourceArn": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
        "resourceOwnerAccount": "111122223333",
        "resourceType": "AWS::S3::Bucket"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see GetAnalyzedResource in AWS CLI Command Reference.

get-analyzer

The following code example shows how to use get-analyzer.

AWS CLI

To retrieve information about the specified analyzer

The following get-analyzer example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \\
    --analyzer-name ConsoleAnalyzer-account
```
Output:

```
{
    "analyzer": {
        "createdAt": "2019-12-03T07:28:17+00:00",
        "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
        "name": "ConsoleAnalyzer-account",
        "status": "ACTIVE",
        "tags": {
            "auto-delete": "no"
        },
        "type": "ACCOUNT"
    }
}
```

### get-archive-rule

The following code example shows how to use get-archive-rule.

**AWS CLI**

**To retrieve information about an archive rule**

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```
aws accessanalyzer get-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyArchiveRule
```

Output:

```
{
}
```
"archiveRule": {
  "createdAt": "2024-02-15T00:49:27+00:00",
  "filter": {
    "resource": {
      "contains": [
        "Cognito"
      ]
    },
    "resourceType": {
      "eq": [
        "AWS::IAM::Role"
      ]
    }
  },
  "ruleName": "MyArchiveRule",
  "updatedAt": "2024-02-15T00:49:27+00:00"
}

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see GetArchiveRule in AWS CLI Command Reference.

**get-finding-v2**

The following code example shows how to use get-finding-v2.

**AWS CLI**

**To retrieve information about the specified finding**

The following get-finding-v2 example etreives information about the specified finding in your AWS account.

```bash
aws accessanalyzer get-finding-v2 \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-organization \ 
  --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```json
{
```
For more information, see Reviewing findings in the AWS IAM User Guide.

- For API details, see GetFindingV2 in AWS CLI Command Reference.

get-finding

The following code example shows how to use get-finding.

AWS CLI

To retrieve information about the specified finding

The following get-finding example retrieves information about the specified finding in your AWS account.
aws accessanalyzer get-finding \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-organization \
   --id 0910eedb-381e-4e95-adda-0d25c19e6e90

Output:

{
   "finding": {
      "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
      "principal": {
         "Federated": "cognito-identity.amazonaws.com"
      },
      "action": [
         "sts:AssumeRoleWithWebIdentity"
      ],
      "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
      "isPublic": false,
      "resourceType": "AWS::IAM::Role",
      "condition": {
         "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
      },
      "createdAt": "2021-02-26T21:17:50.905000+00:00",
      "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
      "updatedAt": "2021-02-26T21:17:50.905000+00:00",
      "status": "ACTIVE",
      "resourceOwnerAccount": "111122223333"
   }
}

For more information, see Reviewing findings in the AWS IAM User Guide.

- For API details, see GetFinding in AWS CLI Command Reference.

get-generated-policy

The following code example shows how to use get-generated-policy.

AWS CLI

To retrieve the policy that was generated using the `StartPolicyGeneration` API
The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```bash
aws accessanalyzer get-generated-policy \
--job-id c557dc4a-0338-4489-95dd-739014860ff9
```

Output:

```json
{
  "generatedPolicyResult": {
    "generatedPolicies": [
      {
      }
    ],
    "properties": {
      "cloudTrailProperties": {
        "endTime": "2024-02-14T22:44:40+00:00",
        "startTime": "2024-02-13T00:30:00+00:00",
        "trailProperties": [
          {
            "allRegions": true,
            "regions": []
          }
        ],
        "isComplete": false,
        "principalArn": "arn:aws:iam::111122223333:role/Admin"
      }
    }
  }
}
```
For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see GetGeneratedPolicy in AWS CLI Command Reference.

list-access-preview-findings

The following code example shows how to use list-access-preview-findings.

AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following list-access-preview-findings example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```bash
aws accessanalyzer list-access-preview-findings \
   --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```

Output:

```json
{
   "findings": [
      {
         "id": "e22fc158-1c87-4c32-9464-e7f405ce8d74",
         "principal": {
            "AWS": "111122223333"
         },
         "action": [
            "s3:PutObject",
            "s3:PutObjectAcl"
         ]
      }
   ]
}
```
For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see ListAccessPreviewFindings in AWS CLI Command Reference.

**list-access-previews**

The following code example shows how to use list-access-previews.

**AWS CLI**

**To retrieve a list of access previews for the specified analyzer**

The following list-access-previews example retrieves a list of access previews for the specified analyzer in your AWS account.

```bash
aws accessanalyzer list-access-previews \
```

Output:

```
{
   "accessPreviews": [
   
```
For more information, see [Previewing access with IAM Access Analyzer APIs](guide) in the *AWS IAM User Guide*.

- For API details, see [ListAccessPreviews](guide) in *AWS CLI Command Reference*.

### list-analyzed-resources

The following code example shows how to use `list-analyzed-resources`.

#### AWS CLI

**To list the available widgets**

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```bash
aws accessanalyzer list-analyzed-resources \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --resource-type AWS::IAM::Role
```

**Output:**

```
{
    "analyzedResources": [
      {
        "resourceArn": "arn:aws:sns:us-west-2:111122223333:Validation-Email",
        "resourceOwnerAccount": "111122223333",
        "resourceType": "AWS::SNS::Topic"
      },
      {
        "resourceOwnerAccount": "111122223333",
```
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListAnalyzedResources in AWS CLI Command Reference.

**list-analyzers**

The following code example shows how to use list-analyzers.

**AWS CLI**

**To retrieve a list of analyzers**

The following list-analyzers example retrieves a list of analyzers in your AWS account.

```
aws accessanalyzer list-analyzers
```

**Output:**

```
{
   "analyzers": [
    {
      "createdAt": "2024-02-15T00:46:40+00:00",
      "name": "UnusedAccess-ConsoleAnalyzer-organization",
      "status": "ACTIVE",
```
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListAnalyzers in AWS CLI Command Reference.

list-archive-rules

The following code example shows how to use list-archive-rules.
**AWS CLI**

**To retrieve a list of archive rules created for the specified analyzer**

The following `list-archive-rules` example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```bash
aws accessanalyzer list-archive-rules \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

**Output:**

```json
{
   "archiveRules": [
      {
         "createdAt": "2024-02-15T00:49:27+00:00",
         "filter": {
            "resource": {
               "contains": [
                  "Cognito"
               ],
            },
            "resourceType": {
               "eq": [
                  "AWS::IAM::Role"
               ]
            }
         },
         "ruleName": "MyArchiveRule",
         "updatedAt": "2024-02-15T00:49:27+00:00"
      },
      {
         "createdAt": "2024-02-15T23:27:45+00:00",
         "filter": {
            "findingType": {
               "eq": [
                  "UnusedIAMUserAccessKey"
               ]
            }
         },
         "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",
         "updatedAt": "2024-02-15T23:27:45+00:00"
      }
   ]
}
```
list-findings-v2

The following code example shows how to use list-findings-v2.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following list-findings-v2 example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```bash
aws accessanalyzer list-findings-v2 \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

Output:

```json
{
  "findings": [
    {
      "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
      "createdAt": "2021-02-26T21:17:24.710000+00:00",
      "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
      "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolUnauth_Role",
      "resourceType": "AWS::IAM::Role",
      "resourceOwnerAccount": "111122223333",
      "status": "ACTIVE",
      "updatedAt": "2021-02-26T21:17:24.710000+00:00",
      "findingType": "ExternalAccess"
    },
    ...
  ]
}
```
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListFindingsV2 in AWS CLI Command Reference.

list-findings

The following code example shows how to use list-findings.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following list-findings example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```
aws accessanalyzer list-findings \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

Output:

```
{
   "findings": [
      {
```
Actions and scenarios

```json
"id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
"principal": {
  "Federated": "cognito-identity.amazonaws.com"
},
"action": [
  "sts:AssumeRoleWithWebIdentity"
],
"resource": "arn:aws:iam::111122223333:role/Cognito_testpoolUnauth_Role",
"isPublic": false,
"resourceType": "AWS::IAM::Role",
"condition": {
  "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
},
"createdAt": "2021-02-26T21:17:24.710000+00:00",
"analyzedAt": "2024-02-16T18:17:47.888000+00:00",
"updatedAt": "2021-02-26T21:17:24.710000+00:00",
"status": "ACTIVE",
"resourceOwnerAccount": "111122223333"
},
{
"id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
"principal": {
  "Federated": "cognito-identity.amazonaws.com"
},
"action": [
  "sts:AssumeRoleWithWebIdentity"
],
"resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
"isPublic": false,
"resourceType": "AWS::IAM::Role",
"condition": {
  "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
},

"updatedAt": "2021-02-26T21:17:50.905000+00:00",
"status": "ACTIVE",
"resourceOwnerAccount": "111122223333"
}
]
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListFindings in AWS CLI Command Reference.

**list-policy-generations**

The following code example shows how to use `list-policy-generations`.

**AWS CLI**

**To list all of the policy generations requested in the last seven days**

The following `list-policy-generations` example lists all of the policy generations requested in the last seven days in your AWS account.

```bash
aws accessanalyzer list-policy-generations
```

Output:

```
{
   "policyGenerations": [ 
      {
         "completedOn": "2024-02-14T23:43:38+00:00",
         "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbc6f2",
         "principalArn": "arn:aws:iam::111122223333:role/Admin",
         "startedOn": "2024-02-14T23:43:02+00:00",
         "status": "CANCELED"
      },
      {
         "completedOn": "2024-02-14T22:47:01+00:00",
         "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
         "principalArn": "arn:aws:iam::111122223333:role/Admin",
         "startedOn": "2024-02-14T22:44:41+00:00",
         "status": "SUCCEEDED"
      }
   ]
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.
For API details, see ListPolicyGenerations in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To retrieve a list of tags applied to the specified resource**

The following list-tags-for-resource example retrieves a list of tags applied to the specified resource in your AWS account.

```bash
aws accessanalyzer list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "Zone-of-trust": "Account",
        "Name": "ConsoleAnalyzer"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

For API details, see ListTagsForResource in AWS CLI Command Reference.

**start-policy-generation**

The following code example shows how to use start-policy-generation.

**AWS CLI**

**To start a policy generation request**

The following start-policy-generation example starts a policy generation request in your AWS account.
aws accessanalyzer start-policy-generation
   --policy-generation-details '{"principalArn":"arn:aws:iam::111122223333:role/Admin"}'
   --cloud-trail-details file://myfile.json

Contents of myfile.json:

{
   "accessRole": "arn:aws:iam::111122223333:role/service-role/AccessAnalyzerMonitorServiceRole",
   "startTime": "2024-02-13T00:30:00Z",
   "trails": [
      {
         "allRegions": true,
      }
   ]
}

Output:

{
   "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}

### start-resource-scan

The following code example shows how to use `start-resource-scan`.

**AWS CLI**

**To immediately start a scan of the policies applied to the specified resource**

The following `start-resource-scan` example immediately starts a scan of the policies applied to the specified resource in your AWS account.
This command produces no output.

For more information, see [IAM Access Analyzer policy generation](https://docs.aws.amazon.com/iam/latest/UserGuide/iam-access-analyzer-policy-generation.html) in the *AWS IAM User Guide*.

- For API details, see [StartResourceScan](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/start-resource-scan.html) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to the specified resource**

The following `tag-resource` example adds a tag to the specified resource in your AWS account.

```bash
aws accessanalyzer tag-resource \
   --tags Environment=dev,Purpose=testing
```

This command produces no output.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/tag-resource.html) in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from the specified resources**

```bash
aws accessanalyzer untag-resource \
   --tags Environment=dev
```
The following `untag-resource` example removes tags from the specified resource in your AWS account.

```bash
aws accessanalyzer untag-resource \
   --tag-keys Environment Purpose
```

This command produces no output.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/untag-resource.html) in [AWS CLI Command Reference](https).

### update-archive-rule

The following code example shows how to use `update-archive-rule`.

**AWS CLI**

**To update the criteria and values for the specified archive rule**

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```bash
aws accessanalyzer update-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyArchiveRule \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

This command produces no output.

- For API details, see [UpdateArchiveRule](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/update-archive-rule.html) in [AWS CLI Command Reference](https).

### update-findings

The following code example shows how to use `update-findings`.
AWS CLI

To update the status for the specified findings

The following update-findings example updates the status for the specified findings in your AWS account.

```bash
aws accessanalyzer update-findings \
   --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500 \
   --status ARCHIVED
```

This command produces no output.

validate-policy

The following code example shows how to use validate-policy.

AWS CLI

To request the validation of a policy and returns a list of findings

The following validate-policy example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty Sid element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`.

```bash
aws accessanalyzer validate-policy \
   --policy-document file://myfile.json \
   --policy-type RESOURCE_POLICY
```

Contents of `myfile.json`:
Output:

```json
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element.",
            "findingType": "SUGGESTION",
            "issueCode": "EMPTY_SID_VALUE",
            "locations": [
                {
                    "path": [
                        {
                            "value": "Statement"
                        },
                        {
                            "index": 0
                        }
                    ]
                }
            ]
        }
    ]
}
```
The sts:AssumeRole action is invalid with the following principal(s): cognito-identity.amazonaws.com. Use a SAML provider principal with the sts:AssumeRoleWithSAML action or use an OIDC provider principal with the sts:AssumeRoleWithWebIdentity action. Ensure the provider is Federated if you use either of the two options."}
Actions and scenarios
The following actions: sts:TagSession are not supported by the condition key cognito-identity.amazonaws.com:aud. The condition will not be evaluated for these actions. We recommend that you move these actions to a different statement without this condition key.

(findingsDetails) "The following actions: sts:TagSession are not supported by the condition key cognito-identity.amazonaws.com:aud. The condition will not be evaluated for these actions. We recommend that you move these actions to a different statement without this condition key.

  ]}
The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Image Builder examples using AWS CLI**
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions
create-component

The following code example shows how to use create-component.

AWS CLI

To create a component

The following create-component example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
    --cli-input-json file://create-component.json
```

Contents of create-component.json:

```
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
    "changeDescription": "Initial version."
    "platform": "Windows",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
```
For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/elasticbeanstalk/latest/dg/eb-imagebuilder-cli.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateComponent](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/createsubscription.html) in *AWS CLI Command Reference*.

### create-distribution-configuration

The following code example shows how to use `create-distribution-configuration`.

**AWS CLI**

**To create a distribution configuration**

The following `create-distribution-configuration` example creates a distribution configuration using a JSON file.

```bash
aws imagebuilder create-distribution-configuration \
    --cli-input-json file:/create-distribution-configuration.json
```

**Contents of `create-distribution-configuration.json`**:

```json
{
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references",
                "amiTags": {
                    "KeyName": "{{ssm:parameter_name}}"
                },
                "launchPermission": {
                    "userIds": ["123456789012"]
                }
            }
        }
    ]
}
```
The following code example shows how to use `create-image-pipeline`.

**AWS CLI**

To create an image pipeline
The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```bash
aws imagebuilder create-image-pipeline \
  --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```json
{
  "name": "MyWindows2016Pipeline",
  "description": "Builds Windows 2016 Images",
  "imageTestsConfiguration": {
    "imageTestsEnabled": true,
    "timeoutMinutes": 60
  },
  "schedule": {
    "scheduleExpression": "cron(0 0 * * SUN)",
    "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
  },
  "status": "ENABLED"
}
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImagePipeline in AWS CLI Command Reference.
**create-image-recipe**

The following code example shows how to use create-image-recipe.

**AWS CLI**

**To create a recipe**

The following create-image-recipe example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```bash
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

**Contents of create-image-recipe.json:**

```json
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components": [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-english-full-base-x86/xxxx.x.x"
}
```

**Output:**

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImageRecipe in AWS CLI Command Reference.

**create-image**

The following code example shows how to use create-image.

**AWS CLI**

**To create an image**

The following create-image example creates an image.

```bash
aws imagebuilder create-image \
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImage in AWS CLI Command Reference.

**create-infrastructure-configuration**

The following code example shows how to use create-infrastructure-configuration.

```bash
```

Actions and scenarios
To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```bash
aws imagebuilder create-infrastructure-configuration \
--cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```json
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateInfrastructureConfiguration in AWS CLI Command Reference.

**delete-component**

The following code example shows how to use delete-component.

**AWS CLI**

**To delete a component**

The following delete-component example deletes a component build version by specifying its ARN.

```bash
aws imagebuilder delete-component \\
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

**delete-image-pipeline**

The following code example shows how to use delete-image-pipeline.

**AWS CLI**

**To delete an image pipeline**
The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `DeleteImagePipeline` in AWS CLI Command Reference.

**delete-image-recipe**

The following code example shows how to use `delete-image-recipe`.

**AWS CLI**

**To delete an image recipe**

The following `delete-image-recipe` example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImageRecipe in AWS CLI Command Reference.

delete-image

The following code example shows how to use delete-image.

AWS CLI

To delete an image

The following delete-image example deletes an image build version by specifying its ARN.

```
aws imagebuilder delete-image \\
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImage in AWS CLI Command Reference.

delete-infrastructure-configuration

The following code example shows how to use delete-infrastructure-configuration.

AWS CLI

To delete an infrastructure configuration

The following delete-infrastructure-configuration example deletes an image pipeline by specifying its ARN.
aws imagebuilder delete-infrastructure-configuration \

Output:

{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteInfrastructureConfiguration in AWS CLI Command Reference.

get-component-policy

The following code example shows how to use get-component-policy.

AWS CLI

To get component policy details

The following get-component-policy example lists the details of a component policy by specifying its ARN.

aws imagebuilder get-component-policy \
   --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-component/2019.12.03/1

Output:

{
}

- For API details, see GetComponentPolicy in AWS CLI Command Reference.

**get-component**

The following code example shows how to use get-component.

**AWS CLI**

**To get component details**

The following get-component example lists the details of a component by specifying its ARN.

```bash
aws imagebuilder get-component \
    --component-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "component": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1",
        "name": "component-name",
        "version": "1.0.0",
        "type": "TEST",
        "platform": "Linux",
        "owner": "123456789012",
        "data": "name: HelloWorldTestingDocument
description: This is hello world testing document.
schemaVersion: 1.0
phases:
  - name: test
    steps:
      - name: HelloWorldStep
        action: ExecuteBash
        inputs:
          commands:
            - echo "Hello World! Test."
        "encrypted": true,
        "dateCreated": "2020-01-27T20:43:30.306Z",
        "tags": {}
    }
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetComponent in AWS CLI Command Reference.

get-distribution-configuration

The following code example shows how to use get-distribution-configuration.

AWS CLI

**To get the details of a distribution configuration**

The following get-distribution-configuration example displays the details of a distribution configuration by specifying its ARN.

```bash
aws imagebuilder get-distribution-configuration \\
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfiguration": {
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1 and exports to S3",
    "distributions": [
      {
        "region": "us-west-2",
        "amiDistributionConfiguration": {
          "name": "Name {{imagebuilder:buildDate}}",
          "description": "An example image name with parameter references",
          "amiTags": {
            "KeyName": "{{ssm:parameter_name}}"
          },
          "launchPermission": {
            "userIds": ["3577"]
          }
        }
      }
    ]
  }
}
```
"123456789012"

• For API details, see GetDistributionConfiguration in AWS CLI Command Reference.

get-image-pipeline

The following code example shows how to use get-image-pipeline.

AWS CLI

To get image pipeline details

The following get-image-pipeline example lists the details of an image pipeline by specifying its ARN.

aws imagebuilder get-image-pipeline \

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipeline": {
        "name": "MyWindows2016Pipeline",
        "description": "Builds Windows 2016 Images",
        "platform": "Windows",
        "imageTestsConfiguration": {
            "imageTestsEnabled": true,
            "timeoutMinutes": 60
        },
        "schedule": {
            "scheduleExpression": "cron(0 0 * * SUN)",
            "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
        },
        "status": "ENABLED",
        "dateCreated": "2020-02-19T19:04:01.253Z",
        "dateUpdated": "2020-02-19T19:04:01.253Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImagePipeline in AWS CLI Command Reference.

**get-image-policy**

The following code example shows how to use get-image-policy.
AWS CLI

To get image policy details

The following get-image-policy example lists the details of an image policy by specifying its ARN.

```bash
aws imagebuilder get-image-policy \
```

Output:

```json
{
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `GetImagePolicy` in AWS CLI Command Reference.

get-image-recipe-policy

The following code example shows how to use get-image-recipe-policy.

AWS CLI

To get image recipe policy details

The following get-image-recipe-policy example lists the details of an image recipe policy by specifying its ARN.

```bash
aws imagebuilder get-image-recipe-policy \
```

Output:
{  
    "Policy": "{  
    "Version": "2012-10-17",  
    "Statement": [  
    {  
    "Effect": "Allow",  
    "Principal": {  
    "AWS": [  "123456789012" ]  
    },  
    "Action": [  
    "imagebuilder:GetImageRecipe",  
    "imagebuilder:ListImageRecipes"  
    ],  
    "Resource": [  
    ]  
    }  
    ]  
    }"  
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImageRecipePolicy in AWS CLI Command Reference.

get-image

The following code example shows how to use get-image.

AWS CLI

To get image details

The following get-image example lists the details of an image by specifying its ARN.

```bash
aws imagebuilder get-image  
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "image": {
        "name": "MyBasicRecipe",
        "version": "2019.12.03/1",

### get-infrastructure-configuration

The following code example shows how to use `get-infrastructure-configuration`.

**AWS CLI**

To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```bash
aws imagebuilder get-infrastructure-configuration \
```

**Output:**

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfiguration": {
    }
}
```
"name": "MyExampleInfrastructure",
"description": "An example that will retain instances of failed builds",
"instanceTypes": [
    "m5.large",
    "m5.xlarge"
],
"instanceProfileName": "EC2InstanceProfileForImageBuilder",
"securityGroupIds": [
    "sg-a48c95ef"
],
"subnetId": "subnet-a48c95ef",
"logging": {
    "s3Logs": {
        "s3BucketName": "bucket-name",
        "s3KeyPrefix": "bucket-path"
    }
},
"keyPair": "Name",
"terminateInstanceOnFailure": false,
"dateCreated": "2020-02-19T19:11:51.858Z",
"tags": {}
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetInfrastructureConfiguration in AWS CLI Command Reference.

import-component

The following code example shows how to use import-component.

AWS CLI

To import a component

The following import-component example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \
    --cli-input-json file://import-component.json
```
Contents of import-component.json:

```json
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ImportComponent in AWS CLI Command Reference.

list-component-build-versions

The following code example shows how to use list-component-build-versions.

AWS CLI

To list component build versions

The following list-component-build-versions example lists the component build versions with a specific semantic version.

```
```

Output:
The following code example shows how to use `list-components`.

**AWS CLI**

To list all of the component semantic versions

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-ec2-image-builder.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponentBuildVersions](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-component-build-versions.html) in *AWS CLI Command Reference*.
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListComponents in AWS CLI Command Reference.

list-distribution-configurations

The following code example shows how to use list-distribution-configurations.

AWS CLI

To list distributions

The following list-distribution-configurations example lists all of your distributions.

aws imagebuilder list-distribution-configurations

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "distributionConfigurationSummaryList": [
      {
         "name": "MyExampleDistribution",
         "dateCreated": "2020-01-27T20:43:30.306Z"
      }
   ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListDistributionConfigurations in AWS CLI Command Reference.

`list-image-build-versions`

The following code example shows how to use list-image-build-versions.

**AWS CLI**

**To list image build versions**

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```bash
aws imagebuilder list-image-build-versions \
```

**Output:**

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
        {
            "name": "MyBasicRecipe",
            "version": "2019.12.03/7",
            "platform": "Windows",
            "state": {
                "status": "FAILED",
            }
        }
    ]
}
```
"reason": "Can't start SSM Automation for arn
building. Parameter "iamInstanceProfileName" has a null value."

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

For API details, see ListImageBuildVersions in AWS CLI Command Reference.

list-image-pipeline-images

The following code example shows how to use list-image-pipeline-images.

AWS CLI

To list image pipeline pipeline images

The following list-image-pipeline-images example lists all images that were created by a specific image pipeline.

```
aws imagebuilder list-image-pipeline-images \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipelineList": [
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImagePipelineImages in AWS CLI Command Reference.

**list-image-recipes**

The following code example shows how to use list-image-recipes.

**AWS CLI**

**To list image recipes**

The following list-image-recipes example lists all of your image recipes.

```bash
aws imagebuilder list-image-recipes
```

**Output:**

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageRecipeSummaryList": [
   {
      "name": "MyBasicRecipe",

      "tags": {
         "KeyName": "KeyValue"
      }
   },
   {
      "KeyName": "KeyValue"
   }
   ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImageRecipes in AWS CLI Command Reference.

list-images

The following code example shows how to use list-images.

AWS CLI

To list images

The following list-images example lists all of the semantic versions you have access to.

aws imagebuilder list-images

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageVersionList": [
        {
            "name": "MyBasicRecipe",
            "version": "2019.12.03",
            "platform": "Windows",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```
For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/EC2/images/builder/images-builder-users-guide.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListImages](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-images.html) in *AWS CLI Command Reference*.

### list-infrastructure-configurations

The following code example shows how to use `list-infrastructure-configurations`.

**AWS CLI**

#### To list infrastructure configurations

The following `list-infrastructure-configurations` example lists all of your infrastructure configurations.

```bash
aws imagebuilder list-infrastructure-configurations
```

**Output:**

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationSummaryList": [
        {
            "name": "MyExampleInfrastructure",
            "description": "An example that will retain instances of failed builds",
            "dateCreated": "2020-02-19T19:11:51.858Z",
            "tags": {}
        },
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/infrastructureconfiguration-name-a1b2c3d45678",
            "name": "infrastructureConfiguration-name-a1b2c3d45678",
            "dateCreated": "2019-12-16T18:19:01.038Z",
        }
    ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListInfrastructureConfigurations in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a specific resource**

The following list-tags-for-resource example lists all of the tags for a specific resource.

```bash
aws imagebuilder list-tags-for-resource \
```

Output:

```json
{
   "tags": {
      "KeyName": "KeyValue"
   }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-component-policy**

The following code example shows how to use put-component-policy.
AWS CLI

To apply a resource policy to a component

The following put-component-policy command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-component-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```bash
aws imagebuilder put-component-policy
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutComponentPolicy in AWS CLI Command Reference.

put-image-policy

The following code example shows how to use put-image-policy.

AWS CLI

To apply a resource policy to an image
The following put-image-policy command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1 \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutImagePolicy in AWS CLI Command Reference.

**put-image-recipe-policy**

The following code example shows how to use put-image-recipe-policy.

**AWS CLI**

**To apply a resource policy to an image recipe**

The following put-image-recipe-policy command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-recipe-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.
aws imagebuilder put-image-recipe-policy \ 
    example-image-recipe/2019.12.02 \ 
    --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect": 
    "Allow", "Principal": [ "AWS": [ "123456789012" ] }, "Action": 
    [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], 
    "Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image- 
    recipe/2019.12.02" ] } ] }'

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
example-image-recipe/2019.12.02/1"
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutImageRecipePolicy in AWS CLI Command Reference.

**start-image-pipeline-execution**

The following code example shows how to use start-image-pipeline-execution.

**AWS CLI**

**To start an image pipeline manually**

The following start-image-pipeline-execution example manually starts an image pipeline.

aws imagebuilder start-image-pipeline-execution \ 
mywindows2016pipeline

Output:

{

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see StartImagePipelineExecution in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example adds and tags a resource to EC2 Image Builder using a JSON file.

```bash
aws imagebuilder tag-resource \
   --cli-input-json file://tag-resource.json
```

**Contents of tag-resource.json:**

```json
{
   "tags": {
   "KeyName": "KeyValue"
   }
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes a tag from a resource using a JSON file.

```bash
aws imagebuilder untag-resource \
   --cli-input-json file://tag-resource.json
```

Contents of `untag-resource.json`:

```json
{
   "tagKeys": [
      "KeyName"
   ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-distribution-configuration

The following code example shows how to use update-distribution-configuration.

AWS CLI

To update a distribution configuration

The following update-distribution-configuration example updates a distribution configuration using a JSON file.

```bash
aws imagebuilder update-distribution-configuration \
```

Actions and scenarios
Contents of `update-distribution-configuration.json`:

```json
{
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateDistributionConfiguration in AWS CLI Command Reference.

`update-image-pipeline`

The following code example shows how to use `update-image-pipeline`. 
AWS CLI

To update an image pipeline

The following update-image-pipeline example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \
   --cli-input-json file://update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```json
{
   "imageTestsConfiguration": { 
      "imageTestsEnabled": true,
      "timeoutMinutes": 120
   },
   "schedule": { 
      "scheduleExpression": "cron(0 0 * * MON)",
      "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
   },
   "status": "DISABLED"
}
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateImagePipeline in AWS CLI Command Reference.
**update-infrastructure-configuration**

The following code example shows how to use `update-infrastructure-configuration`.

**AWS CLI**

**To update an infrastructure configuration**

The following `update-infrastructure-configuration` example updates an infrastructure configuration using a JSON file.

```bash
aws imagebuilder update-infrastructure-configuration \
   --cli-input-json file:/update-infrastructure-configuration.json
```

Contents of `update-infrastructure-configuration.json`:

```json
{
   "description": "An example that will terminate instances of failed builds",
   "instanceTypes": ["m5.large", "m5.2xlarge"],
   "instanceProfileName": "EC2InstanceProfileForImageFactory",
   "securityGroupIds": ["sg-a48c95ef"],
   "subnetId": "subnet-a48c95ef",
   "logging": {
      "s3Logs": {
         "s3BucketName": "bucket-name",
         "s3KeyPrefix": "bucket-path"
      }
   },
   "terminateInstanceOnFailure": true,
   "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

**Output:**

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```
Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

create-replication-set

The following code example shows how to use create-replication-set.

AWS CLI

To create the replication set

The following create-replication-set example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

aws ssm-incidents create-replication-set \

Output:

```
{
   "replicationSetArns": [
      "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
   ]
}
```

For more information, see [Using the Incident Manager replication set](#) in the [Incident Manager User Guide](#).

- For API details, see [CreateReplicationSet](#) in [AWS CLI Command Reference](#).

### create-response-plan

The following code example shows how to use `create-response-plan`.

**AWS CLI**

**To create a response plan**

The following `create-response-plan` example creates a response plan with the specified details.

```
aws ssm-incidents create-response-plan \
   --chat-channel '{"chatbotSns": ["arn:aws:sns:us-east-1:111122223333:Standard_User"]}' \
   --display-name "Example response plan" \
   --incident-template '{"impact": 5, "title": "example-incident"}' \
   --name "example-response" \
   --actions '[["ssmAutomation": {"documentName": "AWSIncidents-CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT", "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"}]]' \
   --engagements '[["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]]
```
Output:

```json
{
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see [Incident preparation](https://aws.amazon.com/documentation/incidentmanager/getting-started/) in the *Incident Manager User Guide*.

- For API details, see [CreateResponsePlan](https://docs.aws.amazon.com/cli/latest/reference/ssm-incidents/create-response-plan.html) in *AWS CLI Command Reference*.

### create-timeline-event

The following code example shows how to use `create-timeline-event`.

**AWS CLI**

**Example 1: To create a custom timeline event**

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
    --event-data ""example timeline event""" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```json
{
    "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

**Example 2: To create a timeline event with an incident note**

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
```

```
--event-data ""New Note""
--event-type "Note"
--incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"
--event-time 2023-06-20T12:06:00.000
--event-references '
["resource":"arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"]'

Output:

```
{
  "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
  "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see CreateTimelineEvent in AWS CLI Command Reference.

**delete-incident-record**

The following code example shows how to use delete-incident-record.

**AWS CLI**

**To delete an incident record**

The following delete-incident-record example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record
  --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see Incident tracking in the Incident Manager User Guide.

- For API details, see DeleteIncidentRecord in AWS CLI Command Reference.

**delete-replication-set**

The following code example shows how to use delete-replication-set.
AWS CLI

To delete the replication set

The following delete-replication-set example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```bash
aws ssm-incidents delete-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see DeleteReplicationSet in AWS CLI Command Reference.

delete-resource-policy

The following code example shows how to use delete-resource-policy.

AWS CLI

To delete a resource policy

The following delete-resource-policy example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```bash
aws ssm-incidents delete-resource-policy \
   --policy-id "be8b57191f0371f1c6827341aa3f0a03" \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

**delete-response-plan**

The following code example shows how to use `delete-response-plan`.

**AWS CLI**

**To delete a response plan**

The following `delete-response-plan` example deletes the specified response plan.

```bash
aws ssm-incidents delete-response-plan \
   --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For API details, see [DeleteResponsePlan](https://docs.aws.amazon.com/cli/latest/reference/ssm-incidents/delete-response-plan.html) in *AWS CLI Command Reference*.

**delete-timeline-event**

The following code example shows how to use `delete-timeline-event`.

**AWS CLI**

**To delete a timeline event**

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```bash
aws ssm-incidents delete-timeline-event \
   --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c" \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [*Incident details*](https://docs.aws.amazon.com/ssm/latest/IncidentManagerUserGuide/index.html) in the *Incident Manager User Guide*.
get-incident-record

The following code example shows how to use get-incident-record.

AWS CLI

To get an incident record

The following get-incident-record example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
   "incidentRecord": {
      "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
      "automationExecutions": [],
      "creationTime": "2021-05-21T18:16:57.579000+00:00",
      "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
      "impact": 5,
      "incidentRecordSource": {
         "createdBy": "arn:aws:iam::111122223333:user/draliatp",
         "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
         "source": "aws.ssm-incidents.custom"
      },
      "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",
      "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
      "notificationTargets": [],
      "status": "OPEN",
      "title": "Example-Incident"
   }
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see GetIncidentRecord in AWS CLI Command Reference.
get-replication-set

The following code example shows how to use get-replication-set.

AWS CLI

To get the replication set

The following get-replication-set example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```bash
aws ssm-incidents get-replication-set \\
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
    bb3f-413c-08df53673b57"
```

Output:

```json
{
    "replicationSet": {
        "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "createdTime": "2021-05-14T17:57:22.010000+00:00",
        "deletionProtected": false,
        "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
        "regionMap": {
            "us-east-1": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE"
            },
            "us-east-2": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE",
                "statusMessage": "Tagging inaccessible"
            }
        },
        "status": "ACTIVE"
    }
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see GetReplicationSet in AWS CLI Command Reference.
**get-resource-policies**

The following code example shows how to use `get-resource-policies`.

**AWS CLI**

**To list resource policies for a response plan**

The following command-name example lists the resource policies associated with the specified response plan.

```bash
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

**Output:**

```json
{
   "resourcePolicies": [
      {
         "ramResourceShareRegion": "us-east-1"
      }
   ]
}
```

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [GetResourcePolicies](#) in *AWS CLI Command Reference*.
**get-response-plan**

The following code example shows how to use `get-response-plan`.

### AWS CLI

**To get details of a response plan**

The following command-name example gets details about a specified response plan in your AWS account.

```
aws ssm-incidents get-response-plan \
--arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

**Output:**

```
{
   "actions": [
      {
         "ssmAutomation": {
            "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
            "documentVersion": "$DEFAULT",
            "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
            "targetAccount": "RESPONSE_PLAN_OWNER.Account"
         }
      },
      {
         "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
         "chatChannel": {
            "chatbotSns": [
            ]
         },
         "displayName": "Example response plan",
         "engagements": [
            "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
         ],
         "incidentTemplate": {
            "impact": 5,
            "title": "Example-Incident"
         }
      }
   ],
   "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
   "chatChannel": {
      "chatbotSns": [
      ]
   },
   "displayName": "Example response plan",
   "engagements": [
      "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
   ],
   "incidentTemplate": {
      "impact": 5,
      "title": "Example-Incident"
   }
}
```
"name": "Example-Response-Plan"
}

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see GetResponsePlan in AWS CLI Command Reference.

get-timeline-event

The following code example shows how to use get-timeline-event.

AWS CLI

To get details of a timeline event

The following get-timeline-event example returns details of the specified timeline event.

aws ssm-incidents get-timeline-event \\
  --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \\
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"

Output:

```
{
  "event": {
    "eventData": "Incident Started",
    "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
    "eventTime": "2021-05-21T18:16:57+00:00",
    "eventType": "Custom Event",
    "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  }
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see GetTimelineEvent in AWS CLI Command Reference.

list-incident-records

The following code example shows how to use list-incident-records.
AWS CLI

To list incident records

The following command-name example lists the incident records in your Amazon Web Services account.

```bash
aws ssm-incidents list-incident-records
```

Output:

```json
{
   "incidentRecordSummaries": [
      {
         "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
         "creationTime": "2021-05-21T18:16:57.579000+00:00",
         "impact": 5,
         "incidentRecordSource": {
            "createdBy": "arn:aws:iam::111122223333:user/draliatp",
            "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
            "source": "aws.ssm-incidents.custom"
         },
         "status": "OPEN",
         "title": "Example-Incident"
      }
   ]
}
```

For more information, see Incident list in the Incident Manager User Guide.

- For API details, see ListIncidentRecords in AWS CLI Command Reference.

list-related-items

The following code example shows how to use list-related-items.

AWS CLI

To list related items

The following list-related-items example lists the related items of the specified incident.
aws ssm-incidents list-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"

Output:

```json
{
    "relatedItems": [
        {
            "identifier": {
                "type": "OTHER",
                "value": {
                    "url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"
                }
            },
            "title": "Example related item"
        },
        {
            "identifier": {
                "type": "PARENT",
                "value": {
                    "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/oi-8084126392ac"
                }
            },
            "title": "parentItem"
        }
    ]
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see ListRelatedItems in AWS CLI Command Reference.

**list-replication-sets**

The following code example shows how to use list-replication-sets.

**AWS CLI**

To list the replication set
The following list-replication-set example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```bash
aws ssm-incidents list-replication-sets
```

Output:

```json
{
  "replicationSetArns": [
    "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
  ]
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see ListReplicationSets in AWS CLI Command Reference.

### list-response-plans

The following code example shows how to use list-response-plans.

#### AWS CLI

**To list the available response plans**

The following list-response-plans example lists the available response plans in your Amazon Web Services account.

```bash
aws ssm-incidents list-response-plans
```

Output:

```json
{
  "responsePlanSummaries": [
    {
      "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
      "displayName": "Example response plan",
      "name": "Example-Response-Plan"
    }
  ]
}
```
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a response plan

The following list-tags-for-resource example lists the tags associated with the specified response plan.

```
aws ssm-incidents list-tags-for-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
    "tags": {
        "group1": "1"
    }
}
```

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

list-timeline-events

The following code example shows how to use list-timeline-events.

AWS CLI

To list timeline events of an incident
The following command-name example lists the timeline events of the specified incident.

```bash
aws ssm-incidents list-timeline-events \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```json
{
    "eventSummaries": [
        {
            "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
            "eventTime": "2021-05-21T22:36:13.766000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
            "eventTime": "2021-05-21T18:58:46.443000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "5abcc812-89c0-b0a8-9437-1c74223d4685",

            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        }
    ]
}
```
For more information, see [Incident details](#) in the [Incident Manager User Guide](#).

- For API details, see [ListTimelineEvents](#) in [AWS CLI Command Reference](#).

### put-resource-policy

The following code example shows how to use `put-resource-policy`.

#### AWS CLI

**To share a response plan and incidents**

The following command-name example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```bash
aws ssm-incidents put-resource-policy
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"

```

---

Actions and scenarios 3622
The following code example shows how to use start-incident.

```bash
aws ssm-incidents start-incident \
```

Output:

```
{
  "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see [Incident creation](#) in the *Incident Manager User Guide*.

- For API details, see [StartIncident](#) in *AWS CLI Command Reference*.

---

**start-incident**

The following code example shows how to use start-incident.

**AWS CLI**

**To start an incident**

The following start-incident example starts an incident using the specified response plan.

```bash
aws ssm-incidents start-incident \
```

Output:

```
{
  "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see [Incident creation](#) in the *Incident Manager User Guide*.

- For API details, see [StartIncident](#) in *AWS CLI Command Reference*. 

---

Actions and scenarios
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a response plan**

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```bash
aws ssm-incidents tag-resource \\   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \\   --tags '{"group1":1}'
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a response plan**

The following `untag-resource` example removes the specified tags from the response plan.

```bash
aws ssm-incidents untag-resource \\   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \\   --tag-keys ['"group1"']
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.
update-deletion-protection

The following code example shows how to use update-deletion-protection.

AWS CLI

To update replication set deletion protection

The following update-deletion-protection example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```bash
aws ssm-incidents update-deletion-protection \
--arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
--deletion-protected
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see UpdateDeletionProtection in AWS CLI Command Reference.

update-incident-record

The following code example shows how to use update-incident-record.

AWS CLI

To update an incident record

The following command-name example resolves the specified incident.

```bash
aws ssm-incidents update-incident-record \
--arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
--status "RESOLVED"
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see UpdateIncidentRecord in AWS CLI Command Reference.
**update-related-items**

The following code example shows how to use update-related-items.

**AWS CLI**

**To update an incidents related item**

The following update-related-item example removes a related item from the specified incident record.

```bash
aws ssm-incidents update-related-items \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
   --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"}}}'
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see UpdateRelatedItems in AWS CLI Command Reference.

**update-replication-set**

The following code example shows how to use update-replication-set.

**AWS CLI**

**To update a replication set**

The following command-name example deletes the us-east-2 Region from the replication set.

```bash
aws ssm-incidents update-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
   --actions '[["deleteRegionAction": {"regionName": "us-east-2"}]]'
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.
update-response-plan

The following code example shows how to use update-response-plan.

AWS CLI

To update a response plan

The following update-response-plan example removes a chat channel from the specified response plan.

```bash
aws ssm-incidents update-response-plan \
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
  --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see UpdateResponsePlan in AWS CLI Command Reference.

update-timeline-event

The following code example shows how to use update-timeline-event.

AWS CLI

To update a timeline event

The following update-timeline-event example updates the time that the event occurred.

```bash
aws ssm-incidents update-timeline-event \
  --event-id 20bccc812-8a94-4cd7-520c-0ff742111424 \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebccc812-85f5-b7eb-8b2f-283e4d844308" \
  --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.
Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

*accept-page*

The following code example shows how to use *accept-page*.

**AWS CLI**

*To accept a page during and engagement*

The following *accept-page* example uses an accept code sent to the contact channel to accept a page.

```
aws ssm-contacts accept-page \
  --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3" \
  --accept-type READ  \
  --accept-code 425440
```
This command produces no output

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see AcceptPage in AWS CLI Command Reference.

activate-contact-channel

The following code example shows how to use activate-contact-channel.

AWS CLI

Activate a contact's contact channel

The following activate-contact-channel example activates a contact channel and makes it usable as part of an incident.

```
aws ssm-contacts activate-contact-channel \\
   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \\
   --activation-code "466136"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ActivateContactChannel in AWS CLI Command Reference.

command-name

The following code example shows how to use command-name.

AWS CLI

To delete a contact

The following command-name example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \\
   --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejr"
```
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see CommandName in AWS CLI Command Reference.

create-contact-channel

The following code example shows how to use create-contact-channel.

AWS CLI

To create a contact channel

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```bash
aws ssm-contacts create-contact-channel
  --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
  --name "akuas sms-test"
  --type SMS
  --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
  "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see CreateContactChannel in AWS CLI Command Reference.

create-contact

The following code example shows how to use create-contact.

AWS CLI

To create a contact
The following `create-contact` example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the `create-contact-channel` command with the output ARN of this command. After you have created contact channels for this contact use `update-contact` to update the plan.

```bash
aws ssm-contacts create-contact \
  --alias "akuam" \
  --display-name "Akua Mansa" \
  --type PERSONAL \
  --plan '{"Stages": []}'
```

Output:

```json
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CreateContact](#) in *AWS CLI Command Reference*.

### deactivate-contact-channel

The following code example shows how to use `deactivate-contact-channel`.

AWS CLI

**To deactivate a contact channel**

The following `deactivate-contact-channel` example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the `activate-contact-channel` command.

```bash
aws ssm-contacts deactivate-contact-channel \
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*. 
For API details, see DeactivateContactChannel in AWS CLI Command Reference.

**delete-contact-channel**

The following code example shows how to use delete-contact-channel.

**AWS CLI**

**To delete a contact channel**

The following delete-contact-channel example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

For API details, see DeleteContactChannel in AWS CLI Command Reference.

**delete-contact**

The following code example shows how to use delete-contact.

**AWS CLI**

**To delete a contact**

The following delete-contact example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

For API details, see DeleteContact in AWS CLI Command Reference.
describe-engagement

The following code example shows how to use describe-engagement.

AWS CLI

To describe the details of an engagement

The following describe-engagement example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```bash
aws ssm-contacts describe-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

Output:

```json
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements via CLI",
    "StartTime": "2021-05-18T18:25:41.151000+00:00"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DescribeEngagement in AWS CLI Command Reference.

describe-page

The following code example shows how to use describe-page.

AWS CLI

To list the details of a page to a contact channel
The following describe-page example lists details of a page to a contact channel. The page will include the subject and content provided.

```
aws ssm-contacts describe-page \
```

Output:

```
{
   "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
   "Sender": "cli",
   "Subject": "cli-test",
   "Content": "Testing engagements via CLI",
   "PublicSubject": "cli-test",
   "PublicContent": "Testing engagements via CLI",
   "SentTime": "2021-05-18T18:43:29.301000+00:00",
   "ReadTime": "2021-05-18T18:43:55.708000+00:00",
   "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see [Contacts](https://docs.aws.amazon.com/incidentmanager/latest/userguide/) in the *Incident Manager User Guide*.

- For API details, see [DescribePage](https://docs.aws.amazon.com/cli/latest/reference/ssm-contacts/describe-page.html) in *AWS CLI Command Reference*.

**get-contact-channel**

The following code example shows how to use get-contact-channel.

**AWS CLI**

**To list the details of a contact channel**

The following `get-contact-channel` example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```
Output:

```json
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
    "Name": "akuas sms",
    "Type": "SMS",
    "DeliveryAddress": {
        "SimpleAddress": "+15005550199"
    },
    "ActivationStatus": "ACTIVATED"
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [GetContactChannel](#) in *AWS CLI Command Reference*.

### get-contact-policy

The following code example shows how to use `get-contact-policy`.

**AWS CLI**

**To list the resource policies of a contact**

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```bash
aws ssm-contacts get-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```json
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam",
    "Policy": "{
        "Version": "2012-10-17",
        "Statement": [ {
            "Sid": "SharePolicyForDocumentationDralia",
            "Effect": "Allow",
            "Principal": {"AWS": "222233334444"},
        } ]
    }
}
```
get-contact

The following code example shows how to use get-contact.

**AWS CLI**

**Example 1: To describe a contact plan**

The following get-contact example describes a contact.

```
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Alias": "akuam",
    "DisplayName": "Akua Mansa",
    "Type": "PERSONAL",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
```
Example 2: To describe an escalation plan

The following `get-contact` example describes an escalation plan.

```
aws ssm-contacts get-contact \
--contact-id "arn:aws:ssm-contacts:us-east-2:11112223333:contact/example_escalation"
```

Output:

```
{
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:11112223333:contact/example_escalation",
   "Alias": "example_escalation",
   "DisplayName": "Example Escalation",
   "Type": "ESCALATION",
   "Plan": {
```
"Stages": [
  {
    "DurationInMinutes": 5,
    "Targets": [
      {
        "ContactTargetInfo": {
          "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
          "IsEssential": true
        }
      }
    ]
  },
  {
    "DurationInMinutes": 5,
    "Targets": [
      {
        "ContactTargetInfo": {
          "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/alejr",
          "IsEssential": false
        }
      }
    ]
  },
  {
    "DurationInMinutes": 0,
    "Targets": [
      {
        "ContactTargetInfo": {
          "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/anasi",

list-contact-channels

The following code example shows how to use list-contact-channels.

AWS CLI

To list the contact channels of a contact

The following list-contact-channels example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
  [
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Name": "akuas email",
      "Type": "EMAIL",
      "DeliveryAddress": {
        "SimpleAddress": "akuam@example.com"
      },
      "ActivationStatus": "NOT_ACTIVATED"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Name": "akuas sms",
      "Type": "SMS",
      "DeliveryAddress": {
        "SimpleAddress": "+15005550100"
      },
      "ActivationStatus": "ACTIVATED"
    }
  ]
}
```
For more information, see **Contacts** in the *Incident Manager User Guide*.

- For API details, see **ListContactChannels** in *AWS CLI Command Reference*.

### list-contacts

The following code example shows how to use `list-contacts`.

**AWS CLI**

**To list all escalation plans and contacts**

The following `list-contacts` example lists the contacts and escalation plans in your account.

```bash
aws ssm-contacts list-contacts
```

**Output:**

```json
{
   "Contacts": [
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
         "Alias": "akuam",
         "DisplayName": "Akua Mansa",
         "Type": "PERSONAL"
      },
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/alejr",
         "Alias": "alejr",
         "DisplayName": "Alejandro Rosalez",
         "Type": "PERSONAL"
      },
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/anasi",
         "Alias": "anasi",
         "DisplayName": "Ana Carolina Silva",
         "Type": "PERSONAL"
      }]
}
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListContacts in AWS CLI Command Reference.

**list-engagements**

The following code example shows how to use list-engagements.

**AWS CLI**

**To list all engagements**

The following list-engagements example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```bash
aws ssm-contacts list-engagements
```

Output:

```json
{
  "Engagements": [
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Sender": "cli",
      "StartTime": "2021-05-18T20:37:50.300000+00:00"
    },
    {
      "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListEngagements in AWS CLI Command Reference.

### list-page-receipts

The following code example shows how to use list-page-receipts.

**AWS CLI**

**To list page receipts**

The following command-name example lists whether a page was received or not by a contact.

```bash
aws ssm-contacts list-page-receipts \
   --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"
```

**Output:**
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListPageReceipts in AWS CLI Command Reference.

**list-pages-by-contact**

The following code example shows how to use list-pages-by-contact.

**AWS CLI**

To list pages by contact

The following list-pages-by-contact example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```
Output:

```javascript
{
   "Pages": [
   {
      "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Sender": "cli",
      "SentTime": "2021-05-18T18:43:29.301000+00:00",
      "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
      "ReadTime": "2021-05-18T18:43:55.708000+00:00"
   }
   ]
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListPagesByContact](#) in *AWS CLI Command Reference*.

**list-pages-by-engagement**

The following code example shows how to use `list-pages-by-engagement`.

**AWS CLI**

To list pages to contact channels started from an engagement.

The following `list-pages-by-engagement` example lists the pages that occurred while engaging the defined engagement plan.

```bash
aws ssm-contacts list-pages-by-engagement \\
   --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0"
```

Output:

```javascript
{
   "Pages": [
```

Actions and scenarios

3644
The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list tags for a contact

The following list-tags-for-resource example lists the tags of the specified contact.

```bash
aws ssm-contacts list-tags-for-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```json
{
   "Tags": [
      {
         "Key": "group1",
         "Value": "1"
      }
   ]
}
```

For more information, see [Tagging](#) in the *Incident Manager User Guide*. 

---

For more information, see [Contacts](#) in the *Incident Manager User Guide*. 

• For API details, see [ListPagesByEngagement](#) in *AWS CLI Command Reference*. 

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.
- For API details, see `ListTagsForResource` in *AWS CLI Command Reference*.

### put-contact-policy

The following code example shows how to use `put-contact-policy`.

**AWS CLI**

**To share a contact and engagements**

The following `put-contact-policy` example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```bash
aws ssm-contacts put-contact-policy
   --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

This command produces no output.

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see `PutContactPolicy` in *AWS CLI Command Reference*.

### send-activation-code

The following code example shows how to use `send-activation-code`.

**AWS CLI**

**To send an activation code**

The following `send-activation-code` example sends an activation code and message to the specified contact channel.

```bash
aws ssm-contacts send-activation-code
```
This command produces no output.

For more information, see [Contacts](mailto:Incident Manager User Guide) in the Incident Manager User Guide.

- For API details, see [SendActivationCode](mailto:AWS CLI Command Reference) in AWS CLI Command Reference.

### start-engagement

The following code example shows how to use `start-engagement`.

**AWS CLI**

**Example 1: To page a contact's contact channels**

The following `start-engagement` pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements via CLI"
```

Output:

```
{
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"
}
```

For more information, see [Contacts](mailto:Incident Manager User Guide) in the Incident Manager User Guide.

**Example 2: To page a contact in the provided escalation plan.**
The following start-engagement engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation"
    --sender "cli"
    --subject "cli-test"
    --content "Testing engagements via CLI"
    --public-subject "cli-test"
    --public-content "Testing engagements via CLI"
```

Output:
```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see StartEngagement in AWS CLI Command Reference.

**stop-engagement**

The following code example shows how to use stop-engagement.

**AWS CLI**

**To stop an engagement**

The following stop-engagement example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.
For API details, see StopEngagement in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a contact**

The following `tag-resource` example tags a specified contact with the provided tag key value pair.

```bash
aws ssm-contacts tag-resource \
